Transparent colloidal solns. of Al_2O_3, ThO_2, and SiO_2 were heated at 75°C. The solns. gradually became cloudy. With Al_2O_3, flocculation finally occurred, accompanied by a sharp decrease in viscosity. The additivity law held for the addn. of electrolytes as long as flocculation did not occur. For flocculated Al_2O_3 hydrosols at low electrolyte concns., all the electrolyte was apparently fixed on the flocculate.

3154. Buzágh, Aladár and Kugler, Elvira. **The effect of electrolytes on the strength of bentonite films. Effect of electrolytes on the strength of bentonite membranes.** *Magyar Kém. Lapja* **4**, 466-72 (1949); *Kolloid-Z.* **115**, 155-60 (1949).—*C.A.* **44**, 4749*f*; **45**, 21*g*.

Bentonite films were prepd. as follows: A 0.5% soln. of stearic acid in EtOH was poured onto a glass plate and the excess soln. poured off. After drying of this film 37 ml of a 3% bentonite soln., prepd. as above, in NaCl, $MgCl_2$, $AlCl_3$, NaOH, Na_2CO_3, Na_2SO_4, or Na_3PO_4 was poured onto each 100 cm^2 surface and dried in a horizontal position at room temp. Films of bentonite could be sepd. from the plate and from the fat layer easily; their thickness averaged 0.1 mm. The strengths obtained with increasing amts. of electrolytes gave curves of max.-min. character but with two maximums. For NaCl, Na_2SO_4, $MgCl_2$, and $AlCl_3$ the value of the first max. was the highest observed strength, the min. was low and broad.

3155. Caillère, S. and Hénin, S. **Transformation of minerals of the montmorillinite family into 10-A micas.** *Mineralog. Mag.* **28**, 606-11 (1949).—*C.A.* **43**, 6121*f*.

Attempts were made to alter montmorillonite, nontronite, and vermiculite with KCl and KOH solns. and to follow changes by x-rays and differential thermal analysis. Attempts were also made to transform phlogopite and illite into montmorillite and to follow these changes by x-rays.

3156. Davydov, A. T. and Lisovina, G. M. **The exchange adsorption of cations by bentonite.** *Kolloid. Zhur.* **11**, 308-10 (1949).—*C.A.* **44**, 900*d*.

A bentonite from Crimea, which passed through a sieve having 900 openings/cm^2 and was dried at 50°C, increased in vol. 2.5 times in H_2O in 0.1 *N-N* solns. of NaCl and $CaCl_2$. For the cation exchange between bentonite satd. with Mg, Ca, Sr, or Ba and NaCl or KCl, an equation was: $(1/a_2) = (1/S) + [ka^{1/2}/(c_o - a_1)]$; a_1 was the amt. of bivalent cation remaining in bentonite, a_2 the amt. displaced (both in mg equiv. per 100 g bentonite), $S = a_1 + a_2$, c_0 the original concn. of the univalent cation, and k a const.

3157. Gabbard, James L. and Thompson, Maurice R. **The effect of sodium hydroxide upon the electrodeposition of electrodialyzed kaolin.** *J. Electrochem. Soc.* **95**, 329-43 (1949).—*C.A.* **43**, 6091*c*.

Fractions of Georgia kaolin of definite particle-size range were suspended for use in pH titration curves with NaOH as base. The corresponding yield in g/coulomb upon electrodeposition was detd. by using the same partly neutralized suspension from the pH measurements. Addnl. evidence was obtained that clay acted similarly to a weak monobasic acid upon titration, and that a hyperbolic relation held approx. for the yield upon electrodeposition at any pH.

3158. Gad, G. M. and Barrett, L. R. **Constitution of some Egyptian clays.** *Mineralog. Mag.* **28**, 587-97 (1949).—*C.A.* **43**, 6121*b*.

Chem. analyses for SiO_2, Al_2O_3, and H_2O base-exchange measurements, x-ray powder data, rates of dehydration on heating, and differential thermal analysis data were given for White and for Red Aswan clay and for Sinai kaolin.

3159. Ganguly, A. K. **Base-exchange properties of quartz and silica gel.** *Science and Culture* **14**, 337-8 (1949).—*C.A.* **43**, 5885*f*.

Finely divided silica gel and quartz both showed base exchange capacities when titrated with 0.005 *N* KOH in the presence of KCl, but little with NH_4OH in the presence of NH_4Cl. Quartz showed less capacity than silica gel.

3160. Ganguly, A. K. **Reactivity of exchange spots of silicate minerals.** *Science and Culture* **14**, 341-2 (1949).—*C.A.* **43**, 5885*g*.

Presence of 3 types of bonding sites in silicate minerals was confirmed by low-concn. reagent studies of absorption and exchange.

3161. Goldschmidt, W. B. **The practical importance of cation-exchange studies in Lowveld soils.** *S. African J. Sci.* **46**, 159-63 (1949).—*C.A.* **44**, 7473*b*.

The exchange of Ca, Mg, K, and Na and the easily sol. Fe and Al were detd. in 15 Lowveld soils by leaching with 0.05 *N* HCl. Results obtained by using 1.0 *N* NH_4Cl were inconsistent. In the high-rain fall areas, all values were low except Al, which was high.

3162. González, F. García. **Effect of pH on the cation-exchange capacity of montmorillonite and kaolinite.** *Anales real soc. españ. fís. y quím.* **45B**, 1067-74 (1949).—*C.A.* **44**, 7617*f*.

The exchange capacity of the bentonites and kaolins was const. for pH from 4.5 to 8.5; different samples of bentonite had values from 55 to 95 and kaolins 6 or 19 milli-equiv./100 g. Capacities of the clays increased with increasing pH (20-30 or 30-50 milliequiv./100 g).

3163. Hazel, Fred; Parker, J. A., and Schipper, Edgar. **Low-temperature studies with colloidal silicic acid.** *Science* **110**, 161-2 (1949).—*C.A.* **43**, 8800*i*.

The rate of thawing had a profound effect on colloidal silicic acid systems frozen at temps. below -55 C. Slow thawing permitted the formation of crystals resulting in the dehydration of colloid particles thus providing loci for coagulation. In the case of rapid freezing and thawing there was no time for this phenomenon to occur.

3164. Hazel, Fred; Schock, Richard U. Jr., and Gordon, Maxwell. **Interaction of ferric ions with silicic acid.** *J. Am. Chem. Soc.* **71**, 2256-7 (1949).—*C.A.* **43**, 8237*d*.

Sols of silicic acid prepd. by ion exchange were used to titrate solns. of various salts:

$BaCl_2$, $LaCl_3$, $CuSO_4$, $CrCl_3$, $Al_2(SO_4)_3$, $AlCl_3$, and $FeCl_3$. Interaction was greatest with the last two, as shown by an increase in H-ion concn., and, in the case of the $FeCl_3$, by a discharge of the color of the soln. As the sol was aged, its activity decreased.

3165. Koganovskiĭ, A. M. **The sorption of colloids. II. Isotherms of sorption of hydrophobic colloids by gels of iron and aluminum hydroxides.** *Kolloid. Zhur.* **11**, 417-19 (1949).—*C.A.* 44, 2819*g*.

The amt. adsorbed (x/m) increased with the equil. sol concn (c) for the sorption of Ag and Ag_2O sols by Al_2O_3 gel contg. 87% H_2O; x/m as function of c had at least one max. and one min. for the sorption of gum arabic and $Al(OH)_3$ by Fe_2O_3 gel (contg. 90% H_2O) and of $Fe(OH)_3$ by Al_2O_3 gel. In one instance the sudden decrease of x/m was assocd. with change of dispersity of the gel.

3166. Krishnamoorthy, C. and Overstreet, Roy. **Theory of ion-exchange relationships.** *Soil Sci.* 68, 307-15 (1949).—*C.A.* 44, 2156*c*.

A theory of ionic distribution as applied to mineralogically pure systems was presented in which the ion-exchange process was at equil. and was completely reversible. The treatment was in terms of the partial free energies of the ions involved in the exchange process. For a system of 2 phases the partial molal free energy of any free electrolyte must have been the same in both phases at equil.

3167. Malquori, Alberto and Marimperti, Luigi. **The surface activity of argillaceous materials. V. Fixation of phosphorus on different types of clay.** *Ann. chim. applicata* **39**, 453-9 (1949).—*C.A.* **45**, 9785*e*.

The clay was treated for 24 hrs with a soln. of $Ca(H_2PO_4)_2$ in a satd. soln. of $CaSO_4$. At pH 7.2-7.4 the quantity adsorbed was different for every type of clay. The adsorption curve for every clay as a function of the pH passed through a max. at pH 3.2-3.5. The fixation at this point was an anion exchange.

3168. Perkins, Alfred T. **Reactions of muscovite, bentonite, and their treated residues.** *Soil Sci.* 67, 41-6 (1949).—*C.A.* 43, 3957*f*.

Grinding greatly increased the base-exchange capacity of muscovite and its reaction with acid and base. It activated bentonite so that aggregation or polymerization occurred when the mineral was suspended in water. Base-exchange capacity was decreased by prolonged grinding, which indicated decompn. of the mineral. Reaction with acid and base was greatly increased, and swelling in water suspension was decreased.

3169. Sato, Koichi. **Reversible coagulation of thixotropic gels.** *J. Sci. Research Inst. Tokyo* 44, 14-22 (1949) (in English).—*C.A.* 44, 905*i*.

A cyclic process could be observed with the thixotropic gels of V_2O_5 and Fe_2O_3, but not with bentonite, Al_2O_3, and agar-agar gels, in which the gel would transform into the state of "reversible coagulate" by slow pitching and rolling motion, thence into the sol by vigorous shaking, and from there return to the gel form either reversibly by further mech. agitation or by standing (rheopexy). If the process was repeated too often, the reversible coagulate turned into an irreversible one. Coagulation of the V_2O_5 sol by dil. H_2SO_4 was observed with crossed polaroids.

3170. Schikore, Werner and Pankow, Traute. **Adsorptive purification in phosphorescence chemistry. II. Removal of traces of manganese from zinc sulfate solutions.** *Z. anorg. Chem.* **258**, 15-17 (1949).—*C.A.* 43, 5688*g*.

$ZnSO_4$ soln. was freed from a trace of Mn by heating to the b.p. with colloidal PbO_2, freshly prepd. by hydrolysis of $(NH_4)_2PbCl_6$, letting stand overnight, and filtering. Traces of Pb in the filtrate could be removed by adsorption on Al_2O_3. $ZnSO_4$ was then recovered from the filtrate by evapn. and heating to 500°C. The product gave clear white cathodic fluorescence and a white phosphorescence but no red fluorescence such as was obtained in the presence of Mn.

3171. Schofield, R. K. **Effect of pH on electric charges carried by clay particles.** *J. Soil Sci.* **1**, 1-8 (1949).—*C.A.* 44, 2683*f*.

The clay was treated repeatedly with 50 ml portions of a soln. 0.2 N in NH_4Cl and 0.001 N in HCl, until the decanted soln. regained its original pH, and contained no exchangeable cations. The clay was washed 5 times with 50 ml portions of 0.2 N KNO_3. The combined washings were titrated with alkali to a pH of 6 and then analyzed for NH_4^+ and Cl^-. In the pH range of 6 to 7.5, Cl^- was not adsorbed on the clay, and the increase in net neg. charge was due to an increase in the no. of neg. charges. From a pH of 6 to 2.5, the amt. of Cl^- adsorbed increased from zero to 1.5 milliequiv./100 g of oven-dried soil and a decrease in the net neg. charge was due to an increase in pos. charges rather than a decrease in the no. of neg. charges.

3172. Sen-Gupta, N. C. and Indra, M. K. **A comparative study of the electrochemical and other properties of clays.** *J. Indian Chem. Soc., Ind. and News Ed.* **12**, 100-2 (1949).—*C.A.* **44**, 9213*a*.

Buffer-capacity curves of bentonite clay suspensions resemble viscosity and yield-value curves. When the concn. of the colloid remains const., the viscosity may increase because of (a) increased hydration of the colloid or (b) the colloid may undergo partial flocculation.

3173. Sharov, V. S. **Rate of motion of cations in a clay suspengel during electrolysis.** *Kolloid, Zhur.* **11**, 283-6 (1949).—*C.A.* 44, 404*i*.

Elec. field of 5 v./cm was applied for 2-3 hrs to the cell Pb/M bentonite/Cu bentonite/M bentonite/Pt; the clays contained 80% moisture. The penetration of M^{++} into Cu bentonite and of Cu^{++} into M bentonie was detd. by "development" with $K_4Fe(CN)_6$. The mobility was 28, 32, 30 and 28×10^{-6} cm/sec per v./cm for Cu^{++}, Ba^{++}, Ca^{++}, and Mg^{++}.

3174. Sinha, S. K. **Turbidity of colloidal suspensions of layer lattice minerals.** *J. Indian Chem. Soc.* 26, 221-6 (1949).—*C.A.* 44, 2328*d*.

The variation of turbidity with diln. was measured for 3 series of aq. suspensions of prepd. dispersions of montmorillonite, kaolinite, and muscovite of controlled exchange base content. In each system turbidities increased with diln. along hyperbolic curves, attained max. at concns. of the order of ½ to 2 or 3 g/10 liter, and fell off sharply with further diln. For bentonite, with exchange base equal to exchange capacity, concns. at the max. were Na > K > Ba > H, for kaolinite, K > Ba > Ca, and for muscovite, K > Na.

3175. TOTH, S. J. AND PRINCE, A. L. **Estimation of cation-exchange capacity and exchangeable calcium, potassium, and sodium contents of soils by flame photometer techniques.** *Soil Sci.* 67, 439-45 (1949).—*C.A.* 43, 7620*i*.

The flame photometer could be adapted to soil analysis if the general nature of the soil exts. was known. The Na concn. normally found in podzolic soils was not high enought to interfere with the Ca test. The standard K curve was not affected by Na concn. up to 50 p.p.m. or Ca concn. up to 100 p.p.m.

3176. VECCHI, GASTONE. **Method for determining the swelling of bentonites.** *Chimica e industria* (Milan) **31**, 351-7 (1949).—*C.A.* 46, 1224*e*.

The sample was put into a 500-cc. glass cylinder which was then filled with distd. water. After shaking, the height of sedimentation was measured as a function of time. The best value of the ratio water to bentonite was 3. Max. swelling was obtained when the shaking time exceeded 12 hrs.

3177. VOLKRINGER, H. AND VALLADAS-DUBOIS, SUZANNE **Influence of adsorption on the absorption spectra of neodymium.** *J. chim. phys.* 46, 388-95 (1949).—*C.A.* 44, 428*b*.

The visible spectrum of Nd adsorbed on Al_2O_3 corresponded with that of freshly pptd. $Nd(OH)_3$, with displacement of the bands (about 20 A.) toward shorter wavelengths. The displacement was not the same for all bands. On MgO, the adsorbed Nd gave a spectrum almost identical with that of $Nd(OH)_3$ except for addnl. bands at 4290-300 and 4310 A. Nd salts, both cryst. and dissolved, gave spectra unlike either $Nd(OH)_3$ or the adsorbed ions. A mixt. of Al_2O_3 and cryst. salt gave the spectrum of the salt.

3178. WIKLANDER, LAMBERT. **Adsorption equilibria between ion exchangers of different nature. I. Release of cations from soil by adsorption on exchange resins.** *Kgl. Lantbruks Hogskol. Ann.* 16, 670-82 (1949).—*C.A.* 44, 778*g*.

The distribution of a univalent ion in equil. with H ion between two acidoids of different properties mixed in different proportions was calcd. on the basis of theory. By an appropriate choice of proportions of the mixt. the ion could be almost completely adsorbed on the stronger ion. The effect of the time of contact, grain size of the resin, and the proportions of the mixts. was studied with a mineral soil satd. with various cations and a sulfonated ion-exchange resin "Wolfatit K."

3179. BARR, MARTIN AND GUTH, EARL P. **The pH of suspensions of Volclay bentonite in distilled water and Clark-Lubs buffer solutions.** *J. Am. Pharm. Assoc.* 39, 646-7 (1950).—*C.A.* 45, 928*b*.

Suspensions of Volclay bentonite in distd. H_2O were alk. by hydrolysis; the pH fell as the bentonite to H_2O ratio increased, and the suspensions were resistant to acid buffering with Clark-Lubs buffers because of the cation exchange property of the bentonite.

3180. BARRIOL, JEAN AND BLOCH, JEAN MICHEL. **The thixotropy of suspensions of montmorillonite.** *Compt. rend.* 230, 2211-13 (1950).—*C.A.* 44, 10453*a*.

Montmorillonite gels showed a thixotropy characterized by the relation $F = \mu\ a_o$, where μ was the modulus of rigidity referred to the elastic deformation, F the tangetial force capable of rupturing the gel, a_o the angle at which rupture first occurred. A series of gels of varying concn. with varying from 250 to 22,000 c.g.s. gave the same value for a_o of 0.025 radian, indicating the same internal structure.

3181. BARSHAD, ISAAC. **The effect of the interlayer cations on the expansion of the mica type of crystal lattice.** *Am. Mineral.* 35, 225-38 (1950).—*C.A.* 45, 505*h*.

The interlayer expansion of air-dry vermiculite and montmorillonite satd. with Mg, Ca, or H ions was equal to two unimol. layers of H_2O, but those satd. with Ba, Li, or Na ions were equal to one unimol. layer of H_2O. Air-dry vermiculite satd. with K, NH_4, Rb, or Cs showed no expansion, whereas montmorillonite satd. with respect to ions showed expansion of one mol. layer of H_2O. When immersed in hot anhyd. glycerol, Mg, Ca, Ba, H, Li, or Na vermiculite showed expansion of one layer of glycerol mol.; respective montmorillonites showed expansion of two layers.

3182. BIRKS, L. S. AND SCHULMAN, J. H. **The effect of various impurities on the crystallization of amorphous silicic acid.** *Am. Mineralogist* 35, 1035-8 (1950).—*C.A.* 47, 6827*e*.

Carbonates of Mg, Ca, Sr, Ba, and Mn, when added as impurities to amorphous silicic acid, caused it to transform to quartz several hundred degrees above its stability limit.

3183. BLOCH, J. M. **The effect of grinding on the crystal structure and on the properties of montmorillonite.** *Bull. soc. chim. France* **1950**, 774-81.—*C.A.* 45, 2288*h*.

Under the influence of prolonged grinding the montmorillonite lost its capacity for fixing and exchanging cations. A certain proportion of the Al_2O_3, the MgO, and all the inter-cryst. OH ions were progressively liberated. X-ray examn., electron micrographs, and the chem. studies indicated that the cryst. structure of the montmorillonite was destroyed by the grinding.

3184. BLOCH, J. M. **The fixation of silver halides on montmorillonite.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 3, 32-4; 4, 61 (1950) (in French).—*C.A.* 47, 941*a*.

Complexes of montmorillonite-AgCl with NH_4, Na, Li, Ni, and Hg were obtained by treating montmorillonite-Ag with the corresponding metal chloride. They have the same chem. properties. When the NH_4 complex is heated, NH_4Cl is volatilized. Decompn. by heat occurred at 400 °C.

3185. Booth, A. H. **Thickening of sodium chloride crystallization layers by specific adsorption of foreign ions.** *Nature* **165**, 968-9 (1950).—*C.A.* 44, 9761*h*.

On NaCl crystals growing in the presence of Cd or Pb ions, the layers were frequently observed to be more than 25,000 A. thick and clearly visible under transmitted light with magnifications less than 100 X. In the absence of foreign ions the layers were visible only under dark-field illumination and high magnification. By use of radioactive isotopes of high specific activity, it was shown that Cd, when present in a concn. of less than 1 γ/ml in a crystg. soln. of NaCl, was carried down almost completely by the first 5% of the crystals, but Zn, Mn, and Bi remain completely in soln.

3186. Borland, J. W. and Reitemeier, R. F. **Kinetic exchange studies on clay with radioactive calcium.** *Soil Sci.* **69**, 251-60 (1950).—*C.A.* 44, 9601*e*.

The Ca in soln. was in kinetic equil. with the Ca of Ca-satd. clays replaceable by NH_4OAc. The radioactive Ca added to soln. equilibrated with solid Ca of the clay after shaking for ½ hr. The exchange was effective for kaolinite, halloysite, hydrous mica, beidellite, and montmorillonite.

3187. Broda, E. and Erber, J. **Manganese dioxide as a radiocolloid.** *Monatsh.* **81**, 53-60 (1950).—*C.A.* 44, 8737*g*.

Neutron irradiation of cryst. or aq. $KMnO_4$ produced Mn^*O_2 radiocolloid (* denotes radioactivity). In constrast to $Po^*(OH)_x$ and $Pb^*(OH)_2$, Mn^*O_2 was also stable in acid soln. and was irreducible. Mn^*O_2 sepd. from the soln. by filtration in which the colloidal material was adsorbed. Addn. of certain ions (e.g. phosphate) prior to irradiation stabilized the colloid and increased the dispersion so that sepn. by simple filtration was no longer possible.

3188. Burriel, F. and Caldas, E. Fernandez. **Coprecipitation phenomena in analysis. I. Coprecipitation of vanadium by the hydroxides of iron, chromium, and aluminum.** *Anales real soc. expan., fis. y quim.* **46B**, 37-46 (1950).—*C.A.* 44, 9863*i*.

The disturbing effect of V (as VO_3^-) in the analysis of Ba was eliminated by copptn. with $Al(OH)_3$. Al was added to a soln. contg. groups III, IV, and V before neutralization; upon adding NH_4OH, all the VO_3^- was adsorbed on the $Al(OH)_3$. The amt. of VO_3^- retention for 0.046 g Fe, Cr, and Al was 0.015, 0.031, and 0.062 g, resp.

3189. Buzágh, Aladár. **The properties of bentonite sols and bentonite gels.** *Magyar Kem. Folyoirat* **56**, 7-10 (1950).—*C.A.* 45, 5383*d*.

The correlation of activity of H ions to the concn. of suspensions was an exponential function in H-montmorillonite suspensions. Cond. of such suspensions depended not only on the size but also on the form of the particles. The stability of such suspensions in relation to increasing NaOH concns. showed a characteristic curve with one max. This max. depended on the dispersity grade of the suspension, although the amt. of NaOH required to neutralize the montmorillonite was independent of the dispersity grade.

3190. Canals, E.; Marignan, R.; Cordier, S., and Bonnier, J. **Adsorption of some metallic ions in dilute solutions. III. Effect of temperature.** *Ann. pharm. franc.* **8**, 372-5 (1950).—*C.A.* 44, 9769*e*.

The adsorption increased with temp. The laws deduced from the previous data were confirmed experimentally.

3191. Chatterjee, B. and Marshall, Charles E. **The ionization of magnesium, calcium, and barium clays.** *J. Phys. & Colloid Chem.* **54**, 671-81 (1950).—*C.A.* 44, 8199*e*.

Hydrogen bentonite membranes, pretreated at 410°C were used to det. the ion activities. In the activity curves presented for montmorillonite, beidellite, illite, and kaolinite clays 3 distinct regions were readily apparent and 2 other regions could be inferred. Over a broad zone in the middle range, varying in extent with the specific clay and the cation, addn. of a bivalent base caused practically no increase in cationic activity. Starting at 70-80% neutralization a region of very rapid increase of cationic activity occurred, extending through the point of equivalence and somewhat beyond it. With still further addns. of base the slope of the activity curve decreased again.

3192. Dekker, A. J. and Urquhart, Helén M. A. **Capacity of porous alumina layers.** *Can. J. Research* **28B**, 541-50 (1950).—*C.A.* 45, 2795*a*.

Porous Al_2O_3 layers could be formed by anodic oxidation in H_2SO_4. The porosity was detd. by capacity measurements in a satd. soln. of boric acid plus ammonia. Expts. showed that the base of the pores was sepd. from the metal by a thin insulating barrier layer and that the ultimate thickness of the barrier layer remained const. after a crit. value was reached.

3193. Elving, Philip J. and Van Atta, Robert E. **Precipitation in homogeneous solution. Separation and determination of barium, strontium, and calcium.** *Anal. Chem.* **22**, 1375-8 (1950).—*C.A.* 45, 1461*c*.

Ba, Sr, and Ca could be sepd. quantitatively as readily filterable SO_4 ppts. by digestion of an aq. MeOH soln. contg. Me_2SO_4. Hydrolysis of the latter furnished the pptg. SO_4 ion. Small amts. of Sr interfered, but large amts. of Ca, Al, Fe, and NH_4, and moderate amts. of Na, K, and Mg did not. Ba could be detd. precisely in mixts approximating the compn. of barytes samples. Sr and Ca could be pptd. by modified procedures in higher concns. of MeOH.

3194. Eriksson, Erik. **The determination of pH in in colloidal suspensions.** *Kgl. Lantbruks Hogskol. Ann.* **17**, 92-100 (1950).—*C.A.* 45, 5488*b*.

The activity of ions, particularly H^+ was discussed thermodynamically. Expts. with H-ion-satd. bentonite, electrodialyzed Molner humus, Amberlite IR-100 resin satd. with H-ions and Amberlite IR-400 resin satd. with OH-ions showed that as the suspensions settled, differences could be observed in the pH of the soln. if the satd. KCl junction was moved into and out of contact with the settling particles. The same kind of movements of the glass electrode had no such effect.

3195. EVVA, FERENC. **Grain-size distribution investigation in suspensions of alumina hydrate.** *Aluminium* **2**, 276-8 (1950).—*C.A.* **45**, 8324*a*.

As an av. of 25 expts. the value of k could be calcd. from the equation $k = 1.00 - 0.096s$, where s denoted the vol. d. in %. A method was described for the detn. of the d. of Al_2O_3 hydrate with a standard volumetric flask instead of a pycnometer. The actual d. values of 2 samples from an Al_2O_3 plant were 2.17 and 2.26 g/ml.

3196. FORSLIND, ERIK. **The interaction between the exchangeable ions and the adsorbed water layers in montmorillonite.** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam 1950*, **I**, 110-13, 427; **IV**, 58.—*C.A.* **46**, 1199*a*.

The interaction mechanism between the exchangeable ions, e.g., Na, K, Li, Mg, Ca, and the H_2O lattice (a cryst. structure of the H_2O adsorbed on montmorillonite was assumed), was considered from the wave-mech. point of view. The exptl. work was carried out to test the validity of the theoretical predictions.

3197. FRICKE, R. AND NEUGEBAUER, W. **Chemical and physical ion adsorption from aqueous solution on aluminum oxide.** *Naturwissenschaften* **37**, 427 (1950).—*C.A.* **45**, 4522*b*.

With 99.996% pure γ-Al_2O_3 (1 g) and 50 ml of 0.1 *M* pure $CuCl_2$ soln. adsorption equil. at 20°C was not attained after 120 hrs. Initially, the adsorbed amt. showed a dip followed by a steady rise. The chem. adsorption of Cu (total adsorption minus Cu equiv. of adsorbed Cl equiv.) as a percentage of total Cu adsorption increased from 27 to 50% during the 120-hr period. Chemically adsorbed Cu was replaced by dissolved Al. The adsorption was about double that of Brockmann Al_2O_3 (contg. Na).

3198. GRUNER, E. **Hydrodynamic properties of clay minerals.** *Ber. deut. keram. Ges.* **1950**, 81-99.—*C.A.* **44**, 10456*f*.

Cation adsorptions and dipole mols. detd. swelling characteristics and other hydrodynamic properties. Thixotropy was essentially a function of nonpolar mols.

3199. GRUNER, E. AND VOGEL, R. E. **Swelling behavior of calcium and sodium bentonites and its explanation.** *Kolloid-Z.* **118**, 100-10 (1950).—*C.A.* **45**, 1406*h*.

There was a range of OH-ion concn. in which Ca and Mg bentonites were more swellable than Na bentonite slimes. A difference in swelling was noted between freshly formed bentonite salts and natural or aged bentonites.

3200. HAUTH, W. E. JR. **Behavior of the alumina-water system.** *J. Phys. & Colloid Chem.* **54**, 142-56 (1950).—*C.A.* **44**, 3769*c*.

In suspensions of Al_2O_3 H^+ ions were adsorbed by the O of the Al_2O_3 by broken surface bond forces to form a unimol. layer. These Al_2O_3 colloidal particles had a pos. charge. In suspensions deflocculated by $(CH_3)_4NOH$, OH^- ions surrounded the Al_2O_3 particles giving them a neg. charge. The viscosity of dry-ground suspensions was highest around a neutral pH and was higher for suspensions of higher sp. gr. At the same pH and sp. gr., wet-ground suspensions had a higher viscosity.

3201. HAZEL, J. FRED AND SCHIPPER, EDGAR. **Low-temperature studies with colloidal silicic acid.** *J. Colloid Sci.* **5**, 532-40 (1950).—*C.A.* **45**, 3688*f*.

Silica sols prepd. from Na silicate with mineral acids and with ion-exchange resins were frozen at from -15° to -65°C and at -190°C, and the extent of flocculation after thawing was detd. The stability of the colloidal systems increased with decreasing temp. of freezing or aging, with increasing rate of thawing, or with addn. of LiCl or $CaCl_2$.

3202. HOFMANN, ULRICH AND KLEMEN, RICHARD. **Loss on heating of the ability of lithium ions to exchange in bentonite.** *Z. anorg. Chem.* **262**, 95-9 (1950).—*C.A.* **44**, 7618*b*.

On heating to 105 to 125°C the inner-cryst. expansive capacity of exchangeable Li ions in bentonite was lost. At 105°C half the Li ions lost their ability to exchange, whereas the OH ions of the silicate layers remained intact at 200°C. H, Ca, and Na ions showed similar effects, but at higher temps.

3203. HONDA, MASATAKE. **Exchange equilibrium of weak electrolytic ion exchangers. I. Equilibrium of chloride, acetate, and sulfate ions.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **71**, 405-7 (1950).—*C.A.* **45**, 6456*c*.

Mixts. of Cl^- and OAc^- were adsorbed on anion exchanger ROH in the presence of Na salts. Relations between exchange capacity $E = E_{Cl^-} + E_{OAc^-}$ and $pH + p(Cl^- + OAc^-)$ and $pH + \frac{1}{2}\ p(SO_4)$ were expressed in graphs.

3204. HOYOS, ANGEL DE CASTRO. **Influence of the fixation of potassium on the hydration of montmorillonite.** *Anales edafol. y fisiol. vegetal Madrid* **9**, 381-429 (1950); *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* **2**, 73-4; **4**, 61 (1950).—*C.A.* **45**, 6322*b*.

The effects of successive substitution of K for H ion, effects of fixation and nature of fixation on the amt. of H_2O adsorbed, and the mechanism of the imbibition were studied. K was fixed preferentially between the lamina, and, on a smaller scale, between the particles. Capillary imbibition was considered to consist of various partial phenomena, one of which was the sepn. of the particles.

3205. JEPHCOTT, C. M. AND JOHNSON, J. H. **Solubility of silica and alumina.** *Arch. Ind. Hyg. Occupational Med.* **1**, 323-40 (1950).—*C.A.* **44**, 4311*i*.

All forms of Al_2O_3 depressed markedly the soly. of quartz and diatomaceous earth. The forms of Al_2O_3 that were the most effective in depressing SiO_2 soly. were those for which the solubilities were least affected by SiO_2. The ability of different forms of Al_2O_3 to depress the soly. of SiO_2 was not proportional to their own soly.

3206. KRISHNAMOORTHY, C. AND OVERSTREET, ROY. **An experimental evaluation of ion-exchange relationships.** *Soil Sci.* **69**, 41-55 (1950).—*C.A.* **44**, 4750*a*.

Ion-exchange equations were subjected to exptl. test with one bentonite clay, 3 soil colloids, and 3 synthetic resins. Unsatisfactory values were obtained when H was one of the ions considered or when adsorbents were mixed together.

3207. KRISHNAMOORTHY, C. AND OVERSTREET, ROY. **Behavior of hydrogen in ion-exchange reactions.** *Soil Sci.* **69**, 87-95 (1950).—*C.A.* **44**, 6995*d*.

The H ion acted differently than other ions in exchange reactions of soil colloids. Ion-exchange constants for ion pairs involving H could be calcd. by the use of an abitrarily defined and experimentally detd. (f)H (adsorbed). The ion-exchange const. found for the H-Cs pair on 1.15 g of Utah bentonite was 0.225; for the H-Ca pair on 1.0 g of cation exchange resin IR-100 it was 6.65×10^{-3}

3208. LÓPEZ CASTRO, TOMÁS. **Identification of a Portugese montmorillonite.** *Rep. Port., Ministerio econ., Dir.-geral minas e serv. geol., Estud., notas e trabal., Serv. fomento mineiro* **6**, 132-44 (1950) (English summary).—*C.A.* **46**, 6044*c*.

Clay from Gueral, Barcelos, was shown by chem. analysis, dehydration data, and base exchange to be slightly impure montmorillonite.

3209. MANEGOLD, I. E. **Spontaneous and prepared suspensions. I. II.** *Kolloid-Z.* **118**, 11-26; 93-100 (1950).—*C.A.* **45**, 1406*d*.

Spontaneous or free suspensions occurred when there was no difference in d. of dispersed particles and dispersing medium, whether gaseous or liquid. In thixotropic gels electrostatic repulsion was a factor and became greater than the force of gravity. Thixotropy was discussed with particular reference to bentonite.

3210. MCLEAN, E. O. **Reciprocal effects of magnesium and potassium as shown by their cationic activities in four clays.** *Soil Sci. Soc. Am., Proc.* **14**, 89-93 (1949) (Pub. 1950).—*C.A.* **45**, 1711*e*.

The clay systems were prepd. from electrodialyzed montmorillonite, beidellite, halloysite, and grundite-illite suspensions. The presence of Mg in the system was accompanied by an increase in the activity and the fraction active of the K when compared to K-H systems. The montmorillonite displayed a greater fraction active of the K present as the latter was displaced by more Mg than the other clays. The other clays showed a decreased fraction active as lower satns. with K were encountered. Very small satns. with K caused the activity of Mg to drop to very low values in the montmorillonite.

3211. MCLEAN, E. O. **Interrelations of potassium, sodium, and calcium as shown by their activiities in a beidellite clay.** *Soil Sci. Soc. Am., Proc.* **15**, 102-6 (1950) (Pub. 1951).—*C.A.* **46**, 206*c*.

Increasing the base satn. of beidellite clay increased the cationic activities so that the active fraction of the total present was increased. Na exerted striking effects upon K and Ca. Na had a greater activity than K at all satn. levels except the lowest, which means that Na has on an av. a slightly lower mean free bonding energy than K. When identical equivs. of Na and K were added to the clay suspension, both where their totals equaled 100% base satn. and below, the Na activity was from 4 to 8 times that of K.

3212. MENZEL, R. G. AND JACKSON, M. L. **Mechanism of sorption of hydroxy cupric ion by clays.** *Soil Sci. Soc. Am., Proc.* **15**, 122-4 (1950) (Pub. 1951).—*C.A.* **46**, 206*e*.

Cupric solns. equilibrated with K clays often showed (a) increase in H-ion concn. and (b) sorption of more meqs. of Cu by the clay than the no. of meqs. of K released. Hydroxy cupric ion constituted at least 50% of the Cu sorbed by kaolinite or montmorillonite from cupric solns. only 1% hydrolyzed. Hydroxy cupric ion sorption was increased by increasing cupric ion concn. or increasing the pH of the cupric soln.

3213. MERRILL, REYNOLD C. AND SPENCER, ROBERT W. **Gelation of sodium silicate—effect of sulfuric acid, hydrochloric acid, ammonium sulfate, and sodium aluminate.** *J. Phys. & Colloid Chem.* **54**, 806-12 (1950).—*C.A.* **44**, 8739*d*.

The times required for mixts. of a 3:3 ratio sodium silicate with H_2SO_4 and HCl, $(NH_4)_2SO_4$, and Na aluminates to form gels at various concns. and ratios of gelling agent to silicate were given. Different mechanisms were involved in gelation by acids, NH_4 salts and Na aluminate.

3214. M'EWEN, MARJORIE B. AND MOULD, D. L. **Gelation of montmorillonite.** *Nature* **166**, 437-8 (1950).—*C.A.* **45**, 2288*i*.

The combination of optical and elastic studies on sols of Wyoming bentonite contg. particle sizes 15-20 mμ showed that the gelation was due to the formation of a fibrillar network in which the plates were aggregated end to end into the form of flat, ribbon-like filaments. The effect of the addn. of uni- and bivalent electrolytes on the rigidity made it possible to discriminate between the random-mesh and the elec. theories that have been proposed to explain the gelation of a lyophobic sol.

3215. MOOKERJEE, SHANKARANANDA. **Ionic antagonism in cation-exchange reactions. I.** *Science and Culture* **15**, 361-2 (1950).—*C.A.* **45**, 4112*h*.

Various cations, both as individuals and as mixts., were added to montmorillonite satd. with a different cation, and the amts. entering the clay by exchange estd. The observed total exchange was found in many cases to be less (antagonism) or greater (superadditivity) than the exchange calcd. by additivity.

3216. MUKHERJEE, S. K. AND GHOSH, S. **Cation exchange with the colloidal clay salts of silver.** *J. Phys. & Colloid Chem.* **54**, 1110-21 (1950).—*C.A.* **45**, 1406*f*.

Two Ag clays, a bentonite and a kaolinite, were prepd. and their properties studied in the presence of KNO_3, $Ba(NO_3)_2$, and $Th(NO_3)_4$. The Ag^+ activity was measured with the Ag-AgCl electrode. The Ag colloids were stable; the Ag bentonite was 9% dissocd. throughout 70 days and the Ag kaolinite was initially 42.6% dissocd. to a value of about $\frac{1}{3}$ this value in 47 days. Equil. values were obtained only after 5-7 days of reaction. Results indicated that exchange probably took place discontinously and at stages that were characterized by different equil. consts.

3217. Olphen, H. van. **Stabilization of montmorillonite sols by chemical treatment. I. Properties of sodium and calcium montmorillonite sols. II. Effect of polymetaphosphates, sodium metasilicate, oxalate, citrate, and orthophosphate on sodium and calcium montmorillonite sols.** *Rec. trav. chim.* **69**, 1308-12 (1950), *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* **3**, 63-5 (1950).—*C.A.* **45**, 2745*e,f*.

From ultramicroscopic and relative-viscosity data, the micelles were found to be minute flat crystal plates with an av. thickness of about 5 crystal lattice layers and an av. diam.-thickness ratio of a few hundred. This was verified by electron-microscope and x-ray studies. The following factors contributed to stabilization by polymetaphosphates (Calgon), Na metasilicate, and Na oxalate: (a) a charging effect due to adsorption of the anions to the edges of the micelles, (b) a decrease in the Na ion activity in the mixt. of stabilizer and flocculating salt, and (c) an inactivation of strongly flocculating Ca ions by complex formation or pptn.

3218. Shukla, G. K. and Ghosh, G. **Relation between viscosity and gelation of an iron silicate sol.** *J. Indian Chem. Soc.* **27**, 323-30 (1950).—*C.A.* **45**, 1843*e*.

The viscosity and structural flow of a ferric silicate sol. prepd. from $FeCl_3$ and Na silicate solns. increased with increasing purification by dialysis. With increased dialyzing time the Cl content decreased to a small const. value, the Fe content continuously decreased and the SiO_2 content remained nearly const.

3219. Terem, Haldun N. **The system aluminum oxide-water.** *Rev. faculté sci. univ. Istanbul* **15A**, 343-62 (1950) (in French).—*C.A.* **45**, 6898*i*.

The hydration of Al_2O_3 obtained by pptn. with NH_4OH from an aq. soln. of an Al salt depends upon the salt used. The samples prepd. from $Al_2(SO_4)_3$ contained no definite hydrate, any water present apparently being adsorbed. The chloride produced the dihydrate, the nitrate both the di- and monohydrate. Hydrates were identified by inspection of the temp.-water content curves. As the pH of pptn. increased, the size of the micelles of colloidal Al_2O_3 decreased.

3220. Twyurupa, I. G. **Desorption of cations from soils and clays.** *Trudy Pochvennogo Inst. im. V. V. Dokuchaeva Akad. Nauk S.S.S.R.* **31**, 5-72 (1950).—*C.A.* **47**, 240*g*.

The desorption of exchangeable cations, especially Ca and Mg, diminished with the narrowing of the ratio between the soln. (with a constant concn. of cations) and sorbent, (different sources of kaolinite, and montmorillonite). A sharp decline in desorption took place when the ratio dropped below 5:1. Replacement of bivalent cations by a univalent cation decreased sharply with diln., i.e. a constant quantity of cations but of variable concn. The removal of cations from the lower horizons of the soil profile was much faster than from the upper layers contg. more org. matter. Slightly decompd. org. matter of a young meadow on a chernozem-like soil had no influence on the desorption of exchangeable Ca.

3221. Berestneva, Z. Ya.; Koretskaya, T. A., and Kargin, V. A. **The mechanism of formation of colloidal particles of aluminum hydroxide.** *Kolloid. Zhur.* **13**, 323-6 (1951).—*C.A.* **46**, 2375*f*.

$Al(OH)_3$ sols were prepd. by mixing of $AlCl_3$ and NH_3 solns. and subsequent dialysis. Fresh sols contained spheres (visible in an electron microscope) showing no crystallinity (electron-diffraction patterns). A few days later the sol contained honeycomb structures. Some weeks later, microcrystals of hydrargillite were identified.

3222. Donges, E. **Sodium thiohydroxyferrate gel.** *Z. anorg. u. allgem. Chem.* **267**, 131-6 (1951).—*C.A.* **46**, 5402*i*.

A dark-green, rigid, stable gel corresponding to $Na(S_2Fe^{II}OH.xH_2O)$ was formed at room temp. when dil. aq. $FeSO_4$ and excess dil. aq. Na_2S_2, in concn. ranges shown, were mixed. The pH range for stable gel formation was 10.5-11.5.

3223. Edel'man, L. I. and Rebinder, P. A. **Structure formation and elastic-plastic properties of aluminum hydroxide gels.** *Kolloid. Zhur.* **13**, 142-50 (1951).—*C.A.* **45**, 6008*f*.

The starting $Al(OH)_3$ sols were prepd. by hot hydrolysis of Al diacetate and aging for 3 months or 3 yrs or by peptizing pptd. $Al(OH)_3$ with HCl and dialysis. The 0.5% sols became thixotropic on addn. of 0.25-0.6 mole NaCl, 0.003-0.02 mole Na_2SO_4, or 0.002-0.003 mole Na_2HPO_4/liter. The mech. behavior of the gels between two concentric cylinders of which one, on a torsion wire, was turned from the equil. position, could be described by means of 5 independent parameters. The increase of the gel concn. from 0.2% to 1% increased all these parameter about 20-50 fold.

3224. Ganguly, A. K. **Base-exchange capacity of silica and silicate minerals.** *J. Phys. & Colloid Chem.* **55**, 1417-28 (1951).—*C.A.* **46**, 2875*b*.

The base-exchange capacity of the H-ion systems of quartz, mica, silica gel, kaolinite, montmorillonite, and their sedimented clay fractions (less than 2 μ) was detd. by reacting with an equal vol. of satd. KCl overnight with occasional shaking and titrating with 0.05 N KOH. The exchange spots on the lattice surface were not of equal value, and there were definite levels of energy of interaction. The H ion of OH groups bonded to Si, Al, and Mg showed decreasing acid function in the order mentioned.

3225. Ganguly, A. K. and Mukherjee, S. K. **The cation-exchange behavior of heteroionic and homoionic clays of silicate minerals.** *J. Phys. & Colloid Chem.* **55**, 1429-46 (1951).—*C.A.* **46**, 2875*d*.

Colloidal salts were prepd. by the addn. of the desired base to the H-clay fractions of bentonite, kaolinite, illite, and mica. Symmetry values for Na, K, NH_4, Ca, and Ba colloidal salts were detd. on exchange with chlorides of Na, K, NH_4, Ba, Ca, and Mg. The symmetry values against all cations increased with diminishing pH. If the values were corrected for H ions, the lyotrope effect persisted to pH 3.0. Exchange isotherms over a range of

0.25 to 4 times the symmetry concn. were characterized by well-defined inflections.

3226. GLAESER, RACHEL. **Determination of the base-exchange capacity in montmorillonite.** *Mem. services chim. état* **36**, No. 1, 65-7 (1951).—*C.A.* **46**, 10502*i*.

With NaOH or LiOH, a large excess of base must be added to overcome the effects of the alk. hydrolysis of the montmorillonite.

3227. GRASSHOF, H. **The adsorption of inorganic ions on alkali-free aluminum oxide.** *Angew. Chem.* **63**, 96-7 (1951).—*C.A.* **45**, 3682*e*.

Data were reported which showed that there was no difference in the behavior of alkali-free and alkali-contg. Al_2O_3 towards inorg. ions.

3228. MACKENZIE, ROBERT C. **A micromethod for determination of cation-exchange capacity of clay.** *J. Colloid Sci.* **6**, 219-22 (1951).—*C.A.* **45**, 9822*f*.

The NH_4OAc method for detg. the cation-exchange capacity of clay was modified to permit detns. on 10-50 mg samples. Results agreed within a few percent with those obtained by the usual macromethod.

3229. MALQUORI, ALBERTO. **Stability of the adsorbent mineral complex of the soil.** *Chimica e industria* **33**, 15-17 (1951).—*C.A.* **45**, 7283*d*.

Hydrous silicates of the 2:1 lattice type were less stable than those of the 1:1 type. The products of degradation or regeneration coating the particles detd. much of the colloidal behavior of clay. The inorg. adsorbent complex of a healthy mature soil was in dynamic equil., and when satd. with Ca its base-exchange capacity was const.

3230. MUKHERJEE, S. K. AND RAO, VENUGOPAL. **Turbidity of aqueous suspensions of bentonites in relation to cation exchange.** *Indian Soc. Soil Sci. Bull.* No. **6A**, 115-20 (1951).—*C.A.* **47**, 6078*d*.

Suspensions of fixed colloid content of the various homoionic bentonite salts had turbidities which varied irregularly for several days, but finally attained steady values which followed the lyotropic series: turbidity being high for strong absorption and low for weak. For varied concns. in the Ba/NH_4-system, high turbidities correlated with strong Ba adsorption; i.e., at a given concn. a Ba-clay with NH_4Cl gave higher turbidity than an NH_4-clay with $BaCl_2$.

3231. OTSUBO, YOSHIO. **Decomposition mechanism of montmorillonite by acid.** *J. Chem. Soc. Japan,* Pure Chem. Sect. **72**, 573-7 (1951).—*C.A.* **46**, 3465*c*.

It was postulated that the treated clay was made up of a complex mixt. of montmorillonite and special silicic acid which was formed by the partial decompn. of clay particles. Two general types of structural formulas of acid- and acid-alkali-treated clays were compared with each other.

3232. PIRET, EDGAR L.; EBEL, R. A; KIANG, C. T., AND ARMSTRONG, W. P. **Diffusion rates in extraction of porous solids. I. Single-phase extractions.** *Chem. Eng. Progress* **47**, 405-14 (1951).—*C.A.* **45**, 8323*b*.

Aq. solns. of KCl, NaCl, K_2CrO_4, $CuSO_4$, and AcOH were extd. from three types of carrier solids of increasing complexity: single capillaries, tubes contg. beds of small glass beads and porous alumina spheres. The transfer mechanism was verified as diffusional. Equations were derived for the extn. of a single-phase solute from spheres in the case of batchwise, countercurrent, and parallel operation. Validity of the equation for batchwise operation was verified by extns. from porous Al_2O_3 spheres under several conditions of concn., solvent vol, and temp.

3233. SAMSON, H. R. **A note of the fluorescence of Wyoming bentonite.** *Am. Mineralogist* **36**, 160-61 (1951).—*C.A.* **47**, 6831*f*.

Fluorescence of clays moistened with a soln. of Zn uranylacetate was due to Na Zn uranylacetate, a strongly fluorescent salt, pptd. by the exchangeable Na^+ of the clay mineral. Naturally occurring montmorillonites fluoresced more or less intensely, depending on the quantity of Na^+ present. A sample of Wyoming bentonite leached with $CaCl_2$ soln. to remove all cations other than Ca^{2+} was nonfluorescent.

3234. SCHUYLENBORGH, J. VAN. **The electrokinetic behavior of freshly prepared γ-AlOOH, α- and γ-Al(OH)$_3$.** *Rec. trav. chim.* **70**, 985-8 (1951) (in English).—*C.A.* **46**, 6900*a*.

Isoelec. pH values, x-ray diffraction patterns, dehydration temps. (by differential thermal analysis), and phosphate adsorption values were reported for 3 Al hydroxides prepd. under various conditions. More complete crystn. of the Al and Fe hydroxides was assocd. with lower values for the isoelec. pH and the phosphate adsorption.

3235. SLABAUGH, W. H. AND CULBERTSON, J. L. **The effect of certain reagents on the properties of bentonite colloids. I. Inorganic salts.** *J. Phys. & Colloid Chem.* **55**, 744-57 (1951).—*C.A.* **45**, 6814*h*.

When various salts were added to H bentonite the viscosity of the system showed a sharp min. The addn. of electrolytes produced partial neutralization of the adsorbed diffuse layer, base-exchange equil. between the electrolyte and the H bentonite, and modification of the forces which det. the structure of the colloid.

3236. SPENCER, R. W.; MIDDLETON, A. B., AND MERRILL, R. C. **Gelation times of various silica sols; effect of low temperatures.** *Ind. Eng. Chem.* **43**, 1129-32 (1951).—*C.A.* **45**, 6458*i*.

Gelation times at 8°C and 25°C were detd. for mixts. of dil. H_2SO_4 or $(NH_4)_2SO_4$ with a dil. $Na_2O.3.3SiO_2$ contg. 1-6% silica. For each silica concn. the gel times of the solns. with the higher sulfate-silicate ratios are longer at 8°C than at

25°C, whereas the solns. of lower sulfate-silicate content required longer times to gel. At both temps., the gel time was more sensitive to slight changes in H_2SO_4 concn.

3237. Tewari, Swarup Narain and Ghosh, Satyeshwar **Hydrated aluminum oxide. I. Precipitation of the hydrated oxide by alkali solutions under various conditions.** *Kolloid-Z.* **124**, 69-72 (1951).—*C.A.* **46**, 2945*b*.

$AlCl_3$ was treated with NaOH, alone and in the presence of NaCl and Na_2SO_4, and with NH_4OH to obtain complete pptn. of the $Al(OH)_3$, and the amt. of alkali required for this pptn. was detd. The alkali demand approached the theoretical equiv. as the starting concn. of $AlCl_3$ was reduced. Larger than necessary amts. of alkali favored adsorption of the cation (OH^-, Cl^-). The adsorption capacity of the hydrous oxide was lowered as the temp. of pptn. was raised.

3238. Tukh, I. I.; Tugusheva, K. I., and Karisma, N. E. **Beneficiation of refractory clay by electroösmosis.** *Steklo i Keram.* **8**, No. 8, 10-12 (1951).—*C.A.* **46**, 3230*h*.

Electroösmosis of 15 kg of clay for 6 hrs yielded 19.5 kg of clay having 42.4% moisture. Further osmosis for 2 hrs did not yield addnl. results. The moisture content could be reduced to 40% by increasing c.d. Best results were obtained without addn. of electrolyte.

3239. Vecchi, G. **Swelling of bentonites. II. Effects of grinding.** *Chimica e industria* (Milan) **33**, 705-8 (1951).—*C.A.* **46**, 3721*h*.

Bentonite from Puglia was suspended in distd. H_2O in the wt ratio 1:3, ground in 3-liter jars with flint balls, and rotated at 3000 rotations/hour. The swelling was measured by the vol. increase of suspensions in 500-ml cylinders after 48 hrs. Const. temp. was important. Since the natural bentonite studied contained about 10% CaO, the soln. of Ca^{2+} during grinding brought about the evident effects on swelling, namely a partial flocculation when the Ca^{2+} concn. reached a critical value. When the Ca^{2+} was leached away by dil. HCl (1:12) the sedimentation time increased so greatly that the swelling could not be measured.

3240. Venturello, Giovanni and Burdese, Aurelio. **Absorption spectra of ions adsorbed on pure activated alumina.** *Ann. Chim. (Rome)* **41**, 148-54 (1951).—*C.A.* **45**, 9367*c*.

Pure Al_2O_3 was prepd. from Al-Hg. The absence of a chem. interaction between adsorbed ion and Al_2O_3 to give metal-O bonds was shown. Al_2O_3 of "chromatographic grade" behaved differently.

3241. Venturello, Giovanni and Burdese, Aurelio. **Reversibility of the adsorption ions by activated alumina.** *Ann. chim.* **41**, 155-62 (1951).—*C.A.* **45**, 9334*f*.

The adsorption of Cu^{++} by pure Al_2O_3 was only partly reversible; the amt. irreversibly bound increased with the length of time allowed for adsorption, and was larger when the adsorbent was activated at a higher temp. The change from reversible to irreversible adsorption was thought to involve a gradual loss of coördinated H_2O mols. on the part of the adsorbed ion, resulting in stronger interaction with the adsorbent.

3242. Yeager, E.; Bugosh, J., and Hovorka, F. **The measurement of ultrasonic vibration potentials (Debye effect) with pulse techniques.** *Proc. Phys. Soc.* (London) **64B**, 83-4 (1951).—*C.A.* **46**, 8466*f*.

Measurements were reported for solns. of KCl and with colloidal suspensions of silica.

3243. Beyer, Gerhard H.; Jacobs, Alfred, and Masteller, Richard D. **Production of a hafnium concentrate by adsorption.** *J. Am. Chem. Soc.* **74**, 825-7 (1952).—*C.A.* **46**, 5398*b*.

Hf was concd. from a naturally occurring feed material contg. 2 wt % HfO_2 (based on Hf and Zr content) to an approx. 90 wt % HfO_2 in 2 cycles. Adsorption and differential stripping with mineral acids was used at room temp. Each cycle consisted of the absorption of $HfCl_4$ and $ZrCl_4$ in MeOH soln. on activated silica gel, subsequent stripping of the gel using a MeOH-HCl strip soln., and finally a H_2SO_4 strip soln. Approx. 70% of the original Hf adsorbed could be recovered as high-Hf concentrate.

3244. Burriel, F.; Ramírez-Muñoz, J., and Fernández-Caldas, E. **Inhibiting effect of aluminum on the masking of barium by vanadate ions during analysis.** *Anal. Chim. Acta* **6**, 197-207 (1952) (in English).—*C.A.* **46**, 7462*a*.

The adsorbing power of $Al(OH)_3$ for vanadate ions was used to avoid the masking of Ba^{2+} resulting from the presence of vanadate ions in test material of qual. analysis, where the latter hindered the detection of Ba at the corresponding point during the systematic analysis. Various exptl. conditions were studied at concns. corresponding to those of the macro-, semimicro-, and microanalytical type.

3245. Delgado Rodriguez, Miguel. **The characteristics of a bentonite from Spanish Morocco.** *Anales edafol. y fisiol. vegetal* (Madrid) **11**, 141-50 (1952).—*C.A.* **47**, 4808*i*.

A salmon-colored, friable bentonite from Villa Sanjurjo, Spanish Morocco, contg. thin plates of biotite had the compn.: SiO_2 50.21, Al_2O_3 25.23, Fe_2O_3 2.27, MgO 1.84, CaO 1.53, K_2O 3.03, TiO_2 0.29, H_2O 15.40. Its H_2O imbibition (60 min.) was 81.7%, its cation-exchange capacity (meq.) 79%.

3246. Duval, J. E. and Kurbatov, M. H. **The adsorption of cobalt and barium ions by hydrous ferric oxide at equilibrium.** *J. Phys. Chem.* **56**, 982-4 (1952).—*C.A.* **47**, 2012*i*.

A study of the adsorption of Ba and Co ions in quantities less than 10^{-8} g per 30 cc. soln. showed that, under comparable conditions, the ratio of the amt. of Co ion to the amt. of Ba ion adsorbed was greater than 1 and sometimes as large as 4. At pH values higher than 6.5 the log of the amt. of the radioactive Co and Ba adsorbed was linear with respect to pH.

3247. Gutierrez Rios, Enrique and Lopez-Gonzalez, Juan de D. **Action of strong acids on the silicates of the isomorphous montmorillonite-beidellite series. I. Characterization, constitution, and modifications in chemical composition.** *Anales edafol. y fisiol. vegetal* (Madrid) **11**, 225-54 (1952).—*C.A.* **47**, 2092*f*.

Two samples of minerals of the montmorillonite group from Spanish Morocco were studied. Solns.

of HCl and H_2SO_4 destroyed to some extent the cryst. structure of the silicates. The products formed from the acid treatment retained certain characteristics of the original material, as evidenced by the dehydration curves. The extent of this similarity depended on the concn. and nature of the acid used. As the crystn. structure was destroyed, the Si which had formerly been combined with Al, Fe, and Mg was deposited on the surface of the crystal in "open" structure and was easily sol. in a boiling 5% Na_2CO_3 soln.

3248. GUTIÉRREZ RIOS, ENRIQUE AND LOPEZ-GONZÁLEZ, JUAN DE D. **Action of strong acids on the silicates of the isomorphic montmorillonite-beidellite series. II. Modification of the superficial physicochemical properties.** *Anales edafol. y fisiol. vegetal* (Madrid) **II**, 527-38 (1952).—*C.A.* 47, 4254*e*.

Detns. of Ba^{++} cation exchange and hydration capacties and methylene blue adsorption were made in aq. media on 2 Spanish bentonites previously treated with H_2SO_4 and HCl solns. in the concn. range 5-20%. In general, these values dropped as percentage of free SiO_2 increased, i.e. as a function of acid strength employed. One bentonite showed a sharp rise in the range 5-10% H_2SO_4, possibly because of an increase of neg. charges on the surface of the crystal layers after removal of cations from the silicate without sensible modification of the crystal structure.

3249. HÖPPLER, F. **Measurement of the rheologic and thixotropic behavior of bentonite suspensions.** *Kolloid-Z.* **128**, 87-92 (1952).—*C.A.* 47, 3084*f*.

Hydrogels of a Wyoming montmorillonite and a synthetic bentonite were observed in a *rheoviscometer*. In this instrument a 2-cm sphere on a rod was passed downward through a gel or soln. in tubes of graduated sizes under different loads. The distance of travel of the sphere was shown on a dial, and time was measured with a stop watch. Flow curves for 4-day-old gels were quite different for the 2 kinds of bentonites.

3250. ILER, R. K. **Polymerization of silicic acid; catalytic effect of fluoride.** *J. Phys. Chem.* 56, 680-3 (1952).—*C.A.* 46, 8943*d*.

The observed max. stability of silicic acid in aq. soln. at about pH 1.5 was due to the catalytic effect on polymerization and gelation of the hydroxyl ion above this pH and of the fluoride below it. The catalytic action of fluoride was inhibited by traces of Al, Be, Th, and Fe which formed complex fluorides.

3251. KEYSER, WILLY L. DE AND AMELICKX, SEVERIN. **Polytypes of argillaceous and micaceous minerals.** *Compt. rend.* **234**, 446-8 (1952).—*C.A.* 46, 8454*g*.

A study of the mechanisms of crystal growth by the successive building up of unit structures and the effects of the O—OH bonds between layers of atoms on the cryst. symmetry.

3252. KOBOZEV, N. I.; EVDOKIMOV, V. B.; ZUBOVICH, I. A., AND MAL'TSEV, A. N. **Magnetochemistry of active centers. I. Magnetic and catalytic properties of dilute layers.** *Zhur. Fiz. Khim.* 26, 1349-73 (1952).—*C.A.* 47, 5745*b*.

The susceptibility χ_1 of the catalytically active layer was found. With $CoCl_2.6H_2O$ adsorbed on SiO_2gel, $\bar{\chi}_a$ was practically equal to the susceptibility (χ_s) of the pure salt $= 47 \times 10^{-6}$, at surface coverage (α) down to about 0.01, but then increased rapidly as α decreased. With $Ni(NO_3)_2.6H_2O$ on SiO_2gel, χ_a coincided with $\bar{\chi}_s$ only at high $\alpha \sim 0.14$; at $\alpha = 0.01$, $f = \chi_a/\chi_s = 2.3$ the increase of χ_a with the diln, was particularly marked with $Ni(NO_3)_2.6H_2O$ on charcoal. With Pt on Al_2O_3 gel, f increased from 1300 to 36,000 with α decreasing from 0.006 to 0.0001. The catalytic activity (a) of Ag on $BaSO_4$ or $BaCO_3$ with respect to decompn. of H_2O_2 showed paramagnetism. For dil. layers of Fe^{+++} on charcoal (up to 0.1% Fe), both χ_1 and a pass through 2 maxima. There was a definite relation between the catalytic activity and the paramagnetism of the adsorbed active substance.

3253. MATSUKURA, SHÔICHI AND NAIKI, TOSHIO. **Physicochemical properties of clay. I. The sedimentation volume of bentonite suspension.** *Oyô Butsuri* (J. Applied Phys.) **21**, 204-5 (1952).—*C.A.* **46**, 11613*c*.

The sedimentation vol. V of dry bentonite in H_2O was measured as a function of time t at various concn. c. An empirical formula, $V = a + b \log t$, was found, a and b being const. dependent on the sample and on c. As c was increased, the suspension changed abruptly from sol to gel state at a certain c.

3254. MIESSEROV, K. G. **Exchange adsorption of aluminum on silica gel.** *Doklady Akad. Nauk S.S.S.R.* **87**, 809-12 (1952).—*C.A.* 47, 4165*i*.

Samples of the same silica gel were treated 24 hrs with $Al(NO_3)_3$ solns. of a stated conc., washed, dried, and heated 3 hrs at 450-500 C. Treatment with $Al(NO_3)_3$ resulted in adsorption of Al and increase of exchange acidity with hydrolytic acidity remaining practically unchanged. These results were interpreted on the assumption of 2 terminal HO groups at each Si atom on the surface of silica gel. The no. of HO groups, calcd. by the surface area of the silica gel, was 1100 milliequiv./100 g, whereas the max. amt. of active HO groups detd. by the expts. was not over 29. The activity of a silica gel was detd. by the no. of pairs of HO groups. The adsorption of Al consisted not in direct replacement of H ions by Al ions but rather in a reaction between the Ho groups and basic forms of Al in the soln. with elimination of H_2O.

3255. MITRA, R. P. AND MATHUR, H. B. **Titration curves of the clay minerals attapulgite and nontronite.** *J. Phys. Chem.* **56**, 633-7 (1952).—*C.A.* 46, 8459*h*.

Hydrogen attapulgite and hydrogen nontronite showed three inflections in their potentiometric and conductometric titration curves, indicating three stages of neutralization with the base. All H ions on the surface, including those dissocd. from the available OH groups were replaced by Ba ions by treating hydrogen attapulgite with a N $BaCl_2$ soln. of pH 9.0.

3256. OHTA, NOBUTO. **Catalytic hydrolysis of chlorobenzene to phenol in the vapor phase. IV. Method of adding the copper component to the silica gel catalyst.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 47, 51-4 (1952).—*C.A.* 47, 3100*h*.

The rapid deterioration of silica gel-$CuCl_2$ catalyst was found to be due to the effect of Cu^{++}. A more stable and almost equally active catalyst was obtained by mixing silica gel dried at 110 °C with a wet gel of $Cu(OH)_2$ (nonelectrolyte) aged (necessary) suitably (possible to add as much as 20% as CuO).

3257. ONO, SOZABURO AND WATANABE, TAKEHIKO. **Colloidal properties of bentonite. III. Influence of electrolytes on the coagulation states of bentonite.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **73**, 844-7 (1952).—*C.A.* **47**, 6106*f*.

The electrolytic coagulation of a suspension of bentonite from Yamagata Prefecture was observed. In one case coagulation took place through the rapid dehydrating acting of the cation; there was a linear relation between the hydrated ionic radius of the cation and the min. concn. of the cation which caused coagulation.

3258. PARKS, W. L. AND WHITE, J. L. **Boron retention by clay and humus systems saturated with various cations.** *Soil Sci. Soc. Am. Proc.* **16**, 298-300 (1952).—*C.A.* **47**, 242*i*.

Under moist conditions base-satd. kaolinite and bentonite clays retained more B than H-satd. clays, except in the NH_4 bentonite. Drying the clays resulted in more retention in the H-satd. clays than in the basic systems, except for Mg bentonite.

3259. PENDLETON, JOHN D. **Dissociation and diffusion of electrolytes from clays as determined by the Donnan membrane equilibrium.** *Virginia J. Sci.* **3**, 178- 201 (1952).—*C.A.* **47**, 940*i*.

Montmorillonite and Mardin clays were studied and the diffusion and membrane potentials were interpreted in light of the probable components.

3260. PENNER, S. S. **The effect of silica gel on the decomposition of hydrogen peroxide.** *J. Am. Chem. Soc.* **74**, 2754-7 (1952).—*C.A.* **46**, 9399*g*.

A study of the thermal decompn. of H_2O_2 in basic silica gels, formed by the addn. of Na silicate to H_2SO_4, showed that the formation of the gel had no effect on the stability of H_2O_2 at room temp. The existence of reaction chains was indicated in the thermal decompns. in the gel by a wall effect and in the photodecompns. by quantum yields that were appreciably greater than one. The 1st-order rate of the decompn. of H_2O_2 and the rate const. for the decompn. in the presence of the Cl-Cl couple were the same in silica sol and gel. Estimates of quantum yields of H_2O_2 decompn. at a band near 3650 A. in silica gel were 6.9 and 10.7; the same order of magnitude as those found in silica sol, 5.0 and 6.5

3261. PLANK, C. J. **Activity of silica-alumina cracking catalysts—a simple pH test.** *Anal. Chem.* **24**, 1304-6 (1952).—*C.A.* **46**, 10821*h*.

The pH of an NH_4OAc soln. was affected by the adsorption of NH_4^+ ions on silica-Al_2O_3 gels and was a quant. measure of the cracking activity as detd. by the CAT-A test. There was very little correlation between surface area and activity with silica-Al_2O_3 catalysts.

3262. RAO, BALABHEEM. **Exchangeable bases in clays in relation to their ceramic properties. I. Clays of Hyderabad.** *Trans. Indian Ceram. Soc.* **11**, 216-19 (1952).—*C.A.* **47**, 5653*h*.

The clay samples were mixed with *N* $NH_4C_2H_3O_2$, shaken, and centrifuged. The sepd. liquid was removed, and the clay was washed with alc. and again centrifuged. Washing was repeated until the filtrate was free from NH_4. Total exchange capacity was detd. by estg. NH_4 in the treated clays. All clays tested were practically nonacid. High water of plasticity and poor casting properties of Kamthana clay were caused by high content of exchangeable Ca^{++} and sol. sulfates.

3263. SCHUYLENBORGH, J. VAN AND VERVELDE, G. J. **Titration curves of dialyzed clay minerals.** *Rec. trav. chim.* **71**, 609-22 (1952) (in English).—*C.A.* **46**, 11015*g*.

Titration expts. were carried out on dil. suspensions of dialyzed samples of kaolinite, illite, and bentonite clays. NaOH and KOH solns. were used as titrants and the H and Na or K ion activities were measured with glass electrodes. The titration curves were analyzed on the basis of a theory describing the clay suspensions as a system of 2 solns., one of which was the clay particle which may be considered an "island" of a soln. of a weak clay acid surrounded by the aq. "external" soln. Theoretical titration curves for the clays were calcd. and found to be in good agreement with the exptl. curves.

3264. SOSINSKII, M. L. **Study of the particle size and shape in bentonite hydrosols by means of dynamic and electric birefringence.** *Kolloid. Zhur.* **14**, 192-6 (1952).—*C.A.* **46**, 8465*a*.

The extinction angle ψ of the streaming birefringence of dil. bentonite suspensions was $>45°$; hence the suspension was polydisperse. Fractions of bentonite obtained by centrifuging for t min. were approx. unidisperse. The coeff. D of rotational diffusion, calcd. from ψ, increased from 0.5 sec^{-1} at $t=3$ to 2.7 sec^{-1} at $t=40$ min.

3265. TEWARI, SWARUP NARAIN AND GHOSH, SATYESHWAR **Hydrated aluminum oxides. II.** *Kolloid-Z.* **127**, 27-30 (1952).—*C.A.* **46**, 8999*a*.

Samples of hydrated Al_2O_3 with different chem. characteristics were prepd. by mixing solns. of $AlCl_3$ and NaOH, using 10% excess alkali, exact equivs., and 10% less than equiv. alkali. OH ion was preferentially adsorbed on the last and H ion on the first. The degree of adsorption of these ions decreased with rising temp. and increasing aging.

3266. TRAMBOUZE, YVES; MOURGUES, LOUIS DE, AND PERRIN, MARCEL. **Acidities of mixed silica-alumina gels.** *Compt. rend.* **234**, 1770-2 (1952).—*C.A.* **46**, 8463*f*.

By measuring the protonic acidity and the Lewis acidity of several mixed silica-alumina gels, it was shown that the acidity was max. for a gel of about 25% Al_2O_3 corresponding to the formula $Na_2O.Al_2O_3.6SiO_2$. The ratio of Na/Al in the gel was about 1 for low values of Al_2O_3 and decreased almost linearly with increasing Al_2O_3.

3267. WHITNEY, ROBERT S. AND PEECH, MICHAEL. **Ion activities in sodium-clay suspensions.** *Soil Sci. Soc. Am., Proc.* **16**, 117-22 (1952).—*C.A.* 46, 8302*h*.

A study was made of dissocn. and hydrolysis of Na-clay as a function of the degree of Na^+ satn. of the clay and the concn. of NaCl in the clay suspension. The activities of Na^+, H^+, HCO_3^-, and Cl^- in the clay suspension were measured by the Donnan equil. method. From the Donnan distribution of ions between the 2 phases, it was possible to apportion the observed Na^+ activity in the clay suspension to Na^+ dissocd. from the clay and to diffusible Na salts present in the clay suspension.

3268. BARBIER, GEORGES AND CHABANNES, JEAN. **The adsorption of borates by clay.** *Compt. rend.* **236**, 966-7 (1953).—*C.A.* 47, 6077*b*.

Adsorption of borates was studied in order to foresee the effect of periodic addns. of borate to cultivated soils. The quantity adsorbed passed through a min. at about pH 5.2; it increased strongly with increasing pH. The adsorption was reversible, but on drying the clay soil a part of the adsorbed borate was fixed.

3269. COOK, MELVIN A.; CUTLER, IVAN B.; HILL, GEO. RICHARD; WADSWORTH, MILTON E., AND OBLAD, ALEX G. **A mechanism of cation- and anion-exchange capacity.** *J. Phys. Chem.* **57**, 1-6 (1953).—*C.A.* 47, 4688*f*.

The cation exchange capacity of dialyzed clay minerals was attributed to an acid-base ion-pair adsorption process in which one ion of the ion-pair was adsorbed on the solid or colloidal particle in the compact double layer, while the other remained hydrated and occupied the diffuse double layer. In cation exchange the compact double layer was the OH ion; in anion exchange of polyamine resins the H ion was the compact double layer.

3270. CUTLER, IVAN B. AND COOK, MELVIN A. **A theory of cation-exchange reactions with clay minerals.** *J. Am. Ceram. Soc.* **36**, 165-70 (1953).—*C.A.* 47, 6624*h*.

The clay minerals kaolinite, montmorillonite, beidellite, and illite, and the bases NaOH KOH, and NH_4OH were used. The results showed that at least 3 equil. reactions were involved in base exchange. They were equil. between active and inactive sites, free and adsorbed H ions, and free and adsorbed cations other than H ions. Free energy computations supported the accuracy of the derived equil. consts. The weak-acid properties of the clay minerals were due to the instability of the active site assocd. with a H ion, and (or) forces other than ionic that bind the H to the active site.

3271. DMITRENKO, O. I. AND RYABININA, A. A. **Effect of accompanying electrolytes on the molecular adsorption of silver salts by mixed gels of silicic acid and sesquioxides of iron and aluminum.** *Kolloid. Zhur.* **15**, 29-35 (1953).—*C.A.* 47, 4685*g*.

More of Ag^+ was adsorbed from an acetate buffer (pH 4.63) than from a $AgNO_3$ soln. at the same pH. This was due to formation of AgOAc which was less sol. and, hence, better adsorbed than $AgNO_3$. The adsorption from a soln. of AgOAc only was even greater because in the reaction between $AgNO_3$ and acetate buffer HNO_3 formed. Adsorption of Ag_2SO_4 was greater still. This inverse relation between adsorption and soly. showed that mols. rather than ions were adsorbed. $Fe_2O_3.2SiO_2$ and $Al_2O_3.2SiO_2$ were used as adsorbents.

3272. GAINES, GEORGE L. JR. AND THOMAS, HENRY C. **Adsorption studies on clay minerals. II. A formulation of the thermodynamics of exchange adsorption.** *J. Chem. Phys.* **21**, 714-18 (1953).—*C.A.* 47, 6735*a*.

Formulas were given summarizing the methods for the computation of the requisite activity coeffs. The effects of the solvent, which was considered as an independently variable component, were taken into account.

3273. GINELL, W. S. AND SIMON, G. P. **Preparation of tagged spherical clay particles.** *Nucleonics* **11**, No. 3, 49-51 (1953).—*C.A.* 47, 6268*f*.

The naturally occurring exchangeable cations in montmorillonite clay could be replaced by fission-product cations. When the mineral structure was altered by heating at 900-1000 °C, exchange properties were lost and radioactive ions were rigidly bound within the mineral. Spherical beads from 0.5 to 20 μ in diam. could be prepd. by passing the clay, suspended in a stream of O_2, through a gas torch. Inactive cations could be introduced into the clay, the spheroidizing process carried out, and the spheres irradiated in a nuclear reactor to produce spheres tagged with cations other than fission-product cations.

3274. HÉNIN, STÉPHANE AND LE BORGNE, EUGÈNE. **Causes of magnetic properties of certain soils.** *Compt. rend.* **236**, 736-8 (1953).—*C.A.* 47, 5594*h*.

When certain soils were fractionated into sand, mud, and clay it was found that the magnetic susceptibility (x) of the clay was by far the greatest. The Fe compd. causing the susceptibility could be extd. with aq. HCl. The magnetic properties of soils were therefore ascribed to γ-Fe_2O_3 on the clay fraction rather than Fe_3O_4 in the sand.

3275. NEIMARK, I. E. AND SHEINFAIN, R. YU. **The effect of the washing liquid on the formation process of the structure of silica gel.** *Kolloid. Zhur.* **15**, 45-50 (1953).—*C.A.* 47, 4685*f*.

Silica gels were made by adding H_2SO_4 to water glass to pH 3.5, washing, and drying at 200 °C. The porosity was detd. from the apparent sp.gr. and the adsorption of MeOH. It was approx. 0.33 cc/g when distd. H_2O or acidified tap water was used for washing, but exceeded 0.6 cc/g when tap water or a soln. of $Ca(HCO_3)_2$ in distd. H_2O was used.

3276. PLANK, C. J. **The adsorption of ions from buffer solutions by silica, alumina, and silica-alumina gels.** *J. Phys. Chem.* **57**, 284-90 (1953).—*C.A.* 47, 6214*c*.

Silica gel adsorbed NH_4^+ ions from NH_4OAc and $(NH_4)_2HPO_4$ solns. Al_2O_3 gel showed both anion and cation adsorption. SiO_2-Al_2O_3 gel had the properties of a polybasic acid in which the acid sites varied over a wide pK_a range. It adsorbed only NH_4^+ ions from acetate and sulfate solns. With $(NH_4)_2SO_4$ solns. the equil. distribution of NH_4^+ and H^+ between gel and soln. was similar to that shown by a true strong acid exchanger. With both acetate and sulfate solns. the total adsorption capacity of SiO_2-Al_2O_3 gel increased rapidly with increasing ionic strength of the soln.; this showed increased ionization of the weak acid sites on the catalyst. SiO_2-Al_2O_3 gel adsorbed both NH_4 and HPO_4^{--} from $(NH_4)_2HPO_4$ solns.

3277. SCHMALZ, W. **The sorption of phosphoric acid ions on calcium and ammonium bentonite.** *Z. Pflanzenernahr. Dung. Bodenk.* **60**, 181-94 (1953).—*C.A.* **47**, 7143*h*.

Ca-bentonite and NH_4-bentonite were prepd. by repeated treatment of bentonite with 0.1 *N* $Ca(OAc)_2$ and NH_4OAc, resp. Solns. of $(NH_4)_2HPO_4$, KH_2PO_4, and Na_2HPO_4 of concns. 0.1, 0.05, and 0.01 mg P_2O_5/cc were percolated through columns of Ca-bentonite and $Ca(H_2PO_4)_2$, KH_2PO_4, and Na_2HPO_4 solns. of concn. 0.1 mg P_2O_5/cc through NH_4-bentonite. More P_2O_5 was taken up by Ca-bentonite from more concd. solns., but the more dil. solns. were relatively faster exhausted. The exchange of K or Na from Ca was not equiv., owing to the loosely bound Ca, the participation of H_2 (as shown by the difference in pH changes during expts. with KH_2PO_4 and Na_2HPO_4, and expts. with H_3PO_4), and the formation of Ca phosphates. The cation exchange did not affect P_2O_5 sorption.

3278. WILLIAMS, F. J.; NEZNAYKO, M., AND WEINTRITT, D. J. **The effect of exchangeable bases on the colloidal properties of bentonite.** *J. Phys. Chem.* **57**, 6-10 (1953).—*C.A.* **47**, 4688*h*.

General base-exchange processes were detd. for purified clays. In the absence of excess electrolytes the viscosity and filter losses were a function of the exchangeable Na, but the relation was not linear. For systems contg. Na and Ca salts the viscosity and gel strength passed through maxima characteristic of flocculation phenomena corresponding to a Na/Ca ratio of 40/60, though high quantities of total salts may likewise cause flocculation.

II-5. Inorganic Solids With Organic Solutions

3279. DUMAZERT, C. AND MEMMI, A. **Adsorption and elution of small quantities of glucides.** *Trav. membres soc. chim. biol.* **23**, 1094 (1941).—*C.A.* **37**, 54[4].

Some sugars were adsorbed from dilute solutions by a mixt. of $Ca(OH)_2$ and $Cu(OH)_2$. To isolate glucose (0.25 to 0.75 g/liter); dissolve 2 g of cryst. $CuSO_4$ in half of the soln. and suspend 5 g of CaO in the remainder. Mix the 2 portions and shake or stir rapidly for at least 30 min. Filter or centrifuge, and treat the ppt. with 100 cc. of 2 *N* H_2SO_4. Filter off the $CaSO_4$, ppt. the Cu with H_2S, remove the H_2SO_4 with $CaCO_3$ and evaporate *in vacuo*. The recovery was 67-76% of the original glucose.

3280. SUZUKI, KEIZO. **Sedimentation volumes of some inorganic powders in organic liquids.** *J. Chem. Soc. Japan* **62**, 888-95 (1941).—*C.A.* **41**, 5360*g*.

The sedimentation vols. of finely powdered inorg. substances such as ZnO, PbO, Fe_2O_3, Al_2O_3, SiO_2, $PbSO_4$, $BaSO_4$, $PbCO_3$, $CaCO_3$, Na_2CO_3, $PbCl_2$, NaCl, S, C, PbS, ZnS, and $CuFeS_2$, in pure org. liquids such as C_6H_6, $C_6H_5NO_2$, $C_6H_5NH_2$, and $C_5H_{11}OH$, as well as in their satd. aq. solns., were detd. From the results the lyophilic tendency of the substances was discussed.

3281. AKAMATSU, HIDEO. **Adsorption at the solid-liquid interface. I. Adsorption of some fatty acids by glass.** *Bull. Chem. Soc. Japan* **17**, 141-6 (1942).—*C.A.* **41**, 4349*g*.

A method of detg. relatively small amts. of adsorption was devised. To measure the change of concn. of soln. before and after the adsorbing procedure, the d. detn. using the float method was applied. Expts. were described on the adsorption of some fatty acids from toluene by glass powder.

3282. AKAMATSU, HIDEO. **Adsorption at the solid-liquid interface. II. The thickness of the adsorption layer.** *Bull. Chem. Soc. Japan* **17**, 161-5 (1942).—*C.A.* **41**, 4349*h*.

Spherical particles of glass were prepd. The sp areas, microscopically detd., were 1810 cm^2 for one portion of the powder and 4690 cm^2 for another. Benzoic and palmitic acids were adsorbed from benzene solns. The area occupied by one mol. proved to be 25-38 $A.^2$ for benzoic acid and 40-70 $A.^2$ for palmitic acid. The thickness of the adsorption layer was monomol. and, in most cases, the layer was not so closely packed as anticipated for the insol. films on water.

3283. AKAMATSU, HIDEO. **Adsorption at the solid-liquid interface. III. Polar and nonpolar adsorption.** *Bull. Chem. Soc. Japan* **17**, 260-7 (1942).—*C.A.* **41**, 4350*a*.

Carboxylic acids were readily adsorbed at a glass-benzene interface even in low concn. Alcs. were also adsorbed, but were not as easily adsorbed as carboxylic acids, and the adsorption did not take place until the concn. of the soln. increased beyond a certain range. Nitrobenzene, aniline, and $CHCl_3$ were not adsorbed at the glass-benzene interface when the concn. of the soln. was about 0.1 *M*. Crushed glass powder adsorbed benzoic acid ten times as much as did spherical glass powder with the same surface area.

3284. BARTELL, F. E. AND BENNER, FRANK C. **Adsorption at solid-liquid interfaces. Determination of adsorption by adhesion-tension and interfacial-tension measurements on binary organic liquid systems.** *J. Phys. Chem.* **46**, 847-59 (1942).—*C.A.* **37**, 1911[5].

Data were obtained at the solid-liquid interface by measurement of adhesion-tensions against silica for the entire concn. range of the binary org. solns. isooctane-isoamyl alc., and isooctane-cyclohexanol. The values showed that for a given alc., the adsorption was very nearly the same at the silica-isooctane and at the water-isooctane interfaces. The calcd. surface concn. of alc. indicated that the surface layer need not be more than of unimolecular thickness.

3285. HARKINS, WILLIAM D. AND LIVINGSTON, H. K. **Energy relation of the surfaces of solids. II. Spreading pressure as related to the work of adhesion between a solid and a liquid.** *J. Chem. Phys.* **10**, 342-56 (1942).—*C.A.* **36**, 4388^3.

The total energy required to sep. H_2O from solids of the general type of $BaSO_4$, TiO_2 and $ZrSiO_4$ was 600-1000 ergs/cm^2, whereas to sep. C_8H_{18} from these solids required 150-250 ergs/cm^2. The work of adhesion was the sum of 3 terms which might be detd. exptly.: (1) The solid, initially in a vacuum, was immersed in the vapor of the liquid with a decrease of free energy. (2) The free energy of transfer of the solid from the interior of the liquid to the interior of the satd. vapor, without a change in any other interfacial areas than that of the solid represented by S, and that of the solid-liquid interface. (3) The free surface energy of the liquid.

3286. KAMAYACHI, Z.; KAMISEKI, E., AND MITACHI, K. **Improvement on the crystallizing process of Rochelle salt crystal to be used as piezoelectric vibrating elements.** *J. Inst. Elec. Engrs. Japan* **62**, 17 (1942).—*C. A.* **42**, 14*d*.

The crystal could be made to develop artificially in a desired direction by suppressing its development in another direction by using a glass plate. The development was carried out by the temp.-decrease method. The products were almost equal to the ordinary semicrystal with respect to the crystal capacity and the inner state of the crystal by photographic observation.

3287. KARLOVITZ, LÁSZLÓ. **Activated adsorption of indicators on efflorescent crystal surfaces.** *Magyar Chem. Folyoirat* **48**, 115-21 (1942); *Chem. Zentr.* **1943**, **I**, 1360.—*C.A.* **38**, 3567^4.

Indicators (dimethyl yellow, aminoazobenzene, methyl red, alizarin and crystal violet) were adsorbed on efflorescent crystal surfaces (bole, talc, fuller's earth, efflorescent Ca, Al, Zn sulfates, etc.) from solns. in benzene and also in the dry state with production of the acid (red) color. On uneffloresced surfaces adsorption took place with yellow color (e. g., dimethyl yellow on $Al_2(SO_4)_3$, $MgCO_3$, etc.).

3288. LANGER, A. **Exchange of radioactive silver with silver chloride suspensions.** *J. Chem. Phys.* **10**, 321-7 (1942).—*C.A.* **36**, 4411^1.

Ag ions in soln. exchanged constantly with Ag ions in AgCl. The exchange was not limited to the surface of the crystals, but was propagated into the ppt., probably by self-diffusion. The time necessary to obtain a given fraction of complete exchange for a given amt. of ppt. depended mainly on the area of the crystal surface.

3289. MONJI, M. AND SHIMODA, M. **Growing velocity of the Rochelle salt crystal.** *J. Inst. Elec. Engrs. Japan* **62**, 214 (1942).—*C.A.* **42**, 14*c*.

To find the conditions necessary to prep. a complete Rochelle salt crystal, the growing velocity of the crystal was studied with a microscope. The crystal was prepd. by the temp.-decrease method by varying the temp. very slowly. The velocity was not equal in the 3 directions and decreased at the Curie point.

3290. NICHOLSON, DOUGLAS G. **Adsorption of simple and complex cobalt ions on titanium dioxide.** *J. Am. Chem. Soc.* **64**, 2820-2 (1942).—*C.A.* **37**, 814^9.

The data indicated that TiO_2 suspended in water or glacial acetic acid solutions of cobalt acetate adsorbed cobalt ions in a relatively short time. Coordination of cobalt ions with o-phenanthroline materially reduced this adsorption tendency. o-Phenanthroline formed a coordination compound with cobalt acetate in glacial acetic acid.

3291. SAKAGUCHI, TAKEICHI. **Adsorption indicators for silver titration.** *J. Pharm. Soc. Japan* **62**, 404-14 (1942).—*C.A.* **45**, 2362*c*.

Indicators used for the microdetn. of proteins could be used for titration of Ag halides. For estn. of chlordide ion tetrabromophenolphthalein ester was used as an indicator. The end point was a change to purple from yellow-green. Tetrabromobenzaurin changed to purple from greenish blue. 2,6-Dichlorophenolindophenol changed to reddish purple from blue. For titration of iodide ion tetrabromophenolphthalein ester, tetrabromobenzaurin, and tetrabromorosolic acid were excellent when the soln. was acidified with AcOH. 2,6-Dichlorophenolindophenol could be used for titration of 0.0025 *N* KI with 0.1 *N* $AgNO_3$ with a color change of red to green.

3292. BODFORSS, SVEN. **Adsorption of amine ions on colloidal silver iodide.** *Kgl. Fysiograf. Sällskap. Lund Handl.* **54**, No. 12, 20 pp. (1943).—*C.A.* **41**, 2958*f*.

Metaniline yellow colored an acid AgI hydrosol blue by adsorption on the deformed micelles and served simultaneously as a protective colloid to make the sol. very stable. Other Ag halides also gave adsorption pigments with metaniline yellow but to a lesser degree. Org. amines (as hydrochlorides) displaced metaniline yellow, giving a red color. The displacement effect of a series of amines could be detd. by titration to a color change.

3293. GIBADLO, FRANK. **Estimation of colloidal properties of ferric oxide and iron oxide purifying material.** *Gas Age* **91**, No. 9, 24-5, 42-3 (1943).—*C.A.* **37**, 3992^7.

A method for estg. and rating the colloidal properties of Fe_2O_3 and Fe oxide purifying materials by treatment with K tartrate and KOH soln. was examd. The oxides went into soln., the amt. dissolved depending on the temp. to which they had previously been subjected. Expts. showed that the method gave comparable results with the adsorption of malachite green, but possessed the advantages that it was direct and was not affected by substances normally present in spent oxides.

3294. GROTE, FRIEDRICH. **The adsorptive properties of lead chromate and its effect on the determination of lead as chromate.** *Z. anal. Chem.* **126**, 129-32 (1943).—*C.A.* **38**, 697[3].

If Pb^{++} was pptd. as $PbCrO_4$ by the addn. of $Cr_2O_7^{--}$ to a buffered AcOH soln., the theoretical factor for converting the wt of $PbCrO_4$ to Pb was 0.6411, but after drying at 105° and 160°C, the factor 0.6378 was better if the conditions stated were followed. The pos. error was believed caused by adsorption of CrO_4^{--} by the $PbCrO_4$ ppt. which lowered the % of Pb in the ppt. Expts. showed that the adsorption was proportional to the quantity of Pb^{++} present so that an empirical factor was justifiable.

3295. HEDVALL, J. A. AND NORD, S. **The influence of stoichiometric variations on photoactivated adsorption.** *Z. Elektrochem.* **49**, 467-71 (1943).—*C.A.* **38**, 5150[6].

Black HgS showed practically no difference in adsorptive power whether or not it was illuminated, while red HgS adsorbed up to 6 times as much phenolphthalein when illuminated as in the dark. These different behaviors were undoubtedly assocd. with the different electronic structures of the 2 modifications. Black HgS was a conductor, while the red modification exhibited the internal photoelec. effect, i.e., it was an insulator in the dark and a conductor when illuminated.

3296. HEDVALL, J. A. AND NORD, S. **Photoadsorption effects in the system pigment-fluid phase.** *Arkiv Kemi, Mineral. Geol.* **17A**, No. 11, 11 pp. (1943).—*C.A.* **39**, 2694[1].

The adsorption by red and black HgS of phenolphthalein from aq. EtOH and by CdS of α-naphtholphthalein from similar solns. were investigated under varying light conditions. Light had little effect on adsorption by black HgS, but red HgS adsorbed six times as much phthalein in light as in darkness. Black HgS and irradiated red HgS were conductors, whereas in darkness red HgS was an insulator. CdS adsorbed phthalein much more when irradiated than in darkness.

3297. KISTIAKOWSKY, G. B. AND VAN WAZER, JOHN R. **The radioactive exchange and adsorption of methyl bromide with several inorganic bromides.** *J. Am. Chem. Soc.* **65**, 1829-34 (1943).—*C.A.* **38**, 20[2].

For $AlBr_3$, which was an active catalyst for reactions of MeBr, the activation energy for the exchange with MeBr was 4.6 kg-cal. For $BaBr_2$, which was a less-active catalyst, the activation energy for the exchange was 12 kg-cal; and for KBr, which was not a catalyst, the rate of exchange was too slow to detect. From detns. of the adsorption of MeBr on $BaBr_2$, the differential heat of adsorption was found to be about −3 kg-cal.

3298. NUTTING, P. G. **Adsorptive forces active through glass.** *Science* **97**, 74-5 (1943).—*C.A.* **37**, 1316[9].

A piece of hard-glass tubing (0.8 mm diam., 100 cm long, wall thickness 0.1 mm) was mounted vertically. The time of flow was 50-500 sec. A S-free crude oil gave a time of flow of 110 sec with a water jacket, and 103 sec without. The adsorbed layer was calcd. to be about 0.0065 mm with water outside the tube, or about 100 mols. in thickness. The adsorption of OH^- or other anions on one side of a glass wall would enhance the adsorption of an electropos. material on the opposite side by a measurable amt. through at least 0.1 mm of glass.

3299. TAI, A. P. AND CHEN, C. L. **Effect of salts on the adsorption of erythrosin on silver halides.** *J. Chinese Chem. Soc.* **10**, 22 (1943).—*C.A.* **38**, 4490[7].

Using AgBr, AgCNS and AgCl as adsorbents, the effect of K halides on the adsorption of erythrosin was studied. The order of halide ions arranged according to their dye-displacing effect was irregular and did not follow Paneth-Fajans' rule.

3300. WILLEMS, J. **Oriented intergrowths of phenols with carbonates of the calcite group and $NaNO_3$.** *Z. Krist.* **105**, 53-68 (1943).—*C.A.* **38**, 671[5].

The correlation of parallel orientation with approx. coincidence of common lattice dimensions was discussed for α-hydroquinone with all members of the calcite group and $NaNO_3$; for *p*-hydroxybiphenyl, 3-hydroxypyrene, *d*-glucose and succinic acid with calcite alone; for napthazarin with dolomite and magnesite; and salicylic acid with siderite.

3301. WILLEMS, J. **Oriented growth of hydroquinone on mica.** *Z. Krist.* **105**, 144-8 (1943).—*C.A.* **38**, 2867[5].

Crystals of α-hydroquinone from C_6H_6 or $CHCl_3$ soln. on basal cleavages of muscovite were oriented with the *c* axis [0001] of hydroquinone parallel to [100], (110) or (110) of the mica. The differences in lattice spacing for the 2 substances for the parallel positions vary from 8.5% to 5.8%. Oriented growths were obtained with margarite, lepidolite and zinnwaldite.

3302. WILLEMS, J. **Oriented growth of urotropine on gypsum.** *Z. Krist.* **105**, 149-54 (1943).—*C.A.* **38**, 2867[4].

The crystals of urotropine were not sharp, but approx. measurements showed that they were oriented on the (010) cleavage of gypsum with (110) parallel to gypsum (010), and [110] parallel to gypsum [301].

3303. WILLEMS, J. **Oriented growth of hydroquinone on barite and celestite.** *Z. Krist.* **105**, 155-7 (1943).—*C.A.* **38**, 2867[6].

The *c* [0001] distance of 5.62 A. in α-hydroquinone was only 3.3% and 4.8% greater than that of the [010] direction of barite and celestite, resp., and the needle-like crystals oriented themselves parallel to [010] on the (001) cleavages of barite and clestite.

3304. ABELIUK, R. C. **Application of adsorption indicators in volumetric precipitation.** *Anales quim. y farm.* **1944**, 4-8, 11-14 (in *Rev. quim. farm.* (Santiago, Chile) No. 24, 4-14 (1945)).—*C.A.* **39**, 2707[7].

The methods of Fajans and Kolthoff were found the most accurate provided the soln. was not acidic; the ppts. were colloidal and small amts. were detd. with pre-formed ppts. These methods were exact and rapid and were suited for the detn. of halogens in water.

3305. Damerell, V. R. and Mattson, Raymond. **Effect of surface-active agents upon dispersions of calcium carbonate in xylene.** *J. Phys. Chem.* **48**, 134-41 (1944).—*C.A.* **38**, 3532[8].

The degree of dispersion of $CaCO_3$ in xylene (judged by sedimentation and ultramicroscopic analysis) was improved by the addn. of surface-active agents; Zn dioctyl sulfosuccinate, Aerosol OT, Ba dioctyl sulfosuccinate, Aerosol MA (Na dihexyl sulfosuccinate), lecithin and Mg oleate were most effective. The colloidal particles were positively charged in these systems except when lecithin was the dispersing agent.

3306. Romanovski, Vsevolod. **Effect of organic liquids on the packing of quartz powder.** *Compt. rend.* **218**, 278-9 (1944).—*C.A.* **40**, 1377[4].

Quartz particles with a mean diam. of 7 μ were allowed to settle from aniline, acetone, MeOH, EtOH, HOAc, Et_2O, xylene, C_6H_6, $CHCl_3$, and CCl_4 at 18°C, and the vol. of the packed quartz was detd. Gray gels were obtained in the last 4 liquids. The "indexes of free space" were much larger than those obtained in the presence of ions, so that the mechanism proposed for the adsorption of ions could not apply to adsorption of org. liquids.

3307. Sheppard, S. E.; Lambert, R. H., and Swinehart, D. **The adsorption of gelatin to silver bromide.** *J. Chem. Phys.* **13**, 372-7 (1945).—*C.A.* **39**, 5150[8].

Exptl. data were presented illustrating a specific case of amphipathic adsorption--of gelatin to AgBr. There was mutual coagulation of the Ag hydrosol and protein, followed by peptization in excess of dissolved protein.

3308. Tarte, P. **Adsorption of amino acids by barium sulfate.** *Rev. can biol.* **4**, 477-87 (1945).—*C.A.* **40**, 2054[8].

The adsorption of the Ba salts of amino acids by $BaSO_4$ in aq. soln. revealed a very definite parallel between the adsorbability and the soly. of the salts. For sepn. of aspartic from monocarboxylic amino acids, the mixt. (a few mg) was adsorbed on $BaSO_4$, and then eluted with 2 × 100 cc. double-distd. water (which removed monocarboxylic acid) and then with 3 × 100 cc. 0.02 *N* AcOH (which removed aspartic acid). For the sepn. of aspartic and glutamic acids, the elution was performed with 4 × 100 cc. 0.001 *N* AcOH (which removed glutamic acid), and then with 3 × 100 cc. 0.02 *N* AcOH.

3309. Tarte, P. **The adsorption of amino acids by barium sulfate.** *Bull. soc. roy. sci. Liège* **14**, 231-42 (1945).—*C.A.* **43**, 3687a.

$BaSO_4$ (15 μ) was aged 15 days in water, activated by treatment with 1% $BaCl_2$, and washed with water until the filtrate was Ba-free. The surface did not absorb glycine, alanine, leucine, valine, serine, methionine, cystine, phenylalanine, tyrosine, typtophan, histidine, lysine, or arginine, but did adsorb glutamic acid and aspartic acid. Glutamic acid was slowly eluted by water, rapidly by 0.001 *N* AcOH. Aspartic acid was not eluted by either water or 0.001 *N* AcOH, but was eluted by 0.01 *N* AcOH.

3310. Bigelow, W. C.; Pickett, D. L., and Zisman, W. A. **Oleophobic monolayers. I Films adsorbed from solution in nonpolar liquids.** *J. Colloid Sci.* **1**, 513-38 (1946).—*C.A.* **41**, 2948*e*.

Certain types of polar org. mols. were adsorbed from solns. in nonpolar solvents onto rigorously cleaned solid surfaces to form well-oriented monolayers that imparted pronounced oleophobic as well as hydrophobic properties to the surfaces. In order for a compd. to adsorb as an oleophobic monolayer, the mols. must have a polar group at one extremity and a Me group at the opposite extremity and must be capable of forming a close-packed orientation

3311. Cohn, Charlotte. **Adsorption by hydrosols.** *Compt. rend.* **223**, 1022-4 (1946).—*C.A.* **41**, 1907[a].

Studies were made of colloidal $Fe(OH)_3$ and $Th(OH)_4$, $Fe_4[Fe(CN)_6]_3$ and $Cu_2Fe(CN)_6$, and As_2S_3 as adsorbents. In general, triphenylmethane dyes (fuchsin, malachite green) were feebly adsorbed. However, 10 mg of As_2S_3 in aq. soln. took up 12 mg of phenosafranine and 10 mg of $Fe_4[Fe(CN)_6]_3$ or $Cu_2Fe(CN)_6$ took up 11 mg of Victoria Blue. Congo Red could be almost completely adsorbed, as could tannin. Simply rinsing with alc. was often sufficient for elution. Lactoflavin, saffron, alizarin, orcein, cochineal, and blue litmus were all adsorbed strongly by As_2S_3 and much less by the ferrocyanides.

3312. Lyalikov, K. S. **An experimental verification of Ostwald's formula.** *Compt. rend. acad. sci. U.R.S.S.* **52**, 425-7 (1946).—*C.A.* **41**, 1531a.

Rates of growth of AgBr crystals suspended in 1% gelatin soln. were detd. by statistical analysis of photomicrographs. The existence of a linear relation between the rate of growth and $1/r^2$ (r = crystal radius) led to the conclusion that the relation between the soly. and crystal size of AgBr was in accordance with Ostwald's law.

3313. Mehrotra, R. C. **Adsorption indicators. II. Dyes derived from cinchomeronic acid and quinolinic acid as adsorption indicators in argentometric titrations.** *Proc. Natl. Acad. Sci. India* **15A**, 148-52 (1946); **16A**, 31-6 (1947).—*C.A.* **44**, 3397*f*.

At the end point with resorcinolquinolein and resorcinolcinchomeronein the color changed from light pink to deep pink when titrating Cl^- against Ag^+ within the pH 2-12. The indicators were suitable for argentometric titration of $(SCN)^-$, Br^- (not in ammoniacal soln. or at pH > 6) and I^- (sensitive as low as 0.001 *N*). When a neutral soln. of KI was titrated against $AgNO_3$, tetrabromoresorcinolquinolein of tetrabromoresorcinol-cinchomeronein indicated the end point as a disappearance of pink; in acidic or ammoniacal soln. the suspension changed from yellow to pink at the equiv. point.

3314. Mushran, Sukhdeo Prasad and Prakash, Satya. **Negatively charged colloidal solutions of various ferric salts. IV. Negatively charged ferric tungstate sol.** *J. Indian Chem. Soc.* **23**, 445-50 (1946).—*C.A.* **42**, 808*d*.

Negatively charged ferric tungstate sols were prepd. by mixing solns. of $FeCl_3$, Na tungstate, NaOH, and glucose or glycerol. Conds. and extinction coeffs. of the dialyzed sols were obtained.

3315. Sheppard, S. E.; O'Brien, A. S., and Beyer, G. L. **Amphipathic adsorption. I. The adsorption of polyvinyl alcohol on silver bromide.** *J. Colloid Sci.* **1**, 213-20 (1946).—*C.A.* **40**, 4932^5.

A standard AgBr sol. that adsorbed 10 mg of 3,3′-diethyl-9-methylthiacarbocyanine bromide per g of AgBr at satn. adsorbed 13-14 mg of polyvinyl alc. per g. The polyvinyl alc. used had a mol. wt of approx. 40,000 (100 times the mol. wt of the org. Br). Adsorbed org. Br was not displaced by polyvinyl alc. but adsorbed polyvinyl alc. was very largely displaced by org. Br.

3316. Faĭdysh, V. P. **Stabilizing action of the anions of monobasic fatty acids on arsenic trisulfide hydrosol.** *Kolloid. Zhur.* **9**, 151-6 (1947).—*C.A.* **47**, 946*a*.

K salts of fatty acids increased the concn. (c_0) of KCl required for coagulating an As_2S_3 hydrosol (3 g/liter), due to the OH^- present in soap solns. If c was the concn. of KCl, corrected for the OH^- effect, required in the presence of x millimol./liter of K salt, then $c - c_0$ increased by the factor 1.3 when the chain length of the acid increased by one C. Thus $c - c_0$ was (at $x = 20$) 17.9, 22.3, 29.7, and 37.3 for K formate, acetate, propionate, and butyrate, resp.

3317. Hutchinson, E. and Rideal, E. K. **Adsorption and lubrication at crystal surfaces. I. Boundary lubrication of sodium nitrate.** *Trans. Faraday Soc.* **43**, 435-8 (1947).—*C.A.* **42**, 1477*e*.

For clean dry crystals of $NaNO_3$ and NH_4NO_3 the coeff. of friction was 0.50 ± 0.05. Results for various solns. of surface-active compds. in nitrobenzene showed that at low concns. the coeff. of friction was markedly dependent on the concn. of lubricant. In sufficiently concd. solns., however, all straight-chain paraffin derivs. gave more or less the same coeff. of friction, 0.12. The adhesion of the film to the surface may be effected by the use of polymeric materials contg. a large no. of adsorbable polar groups.

3318. Hutchinson, E. **Adsorption and lubrication at crystal surfaces. II. Adsorption of paraffin chain compounds on sodium nitrate.** *Trans. Faraday Soc.* **43**, 439-42 (1947).—*C.A.* **42**, 1477*g*.

Solns. of nitroöctadecane, stearic acid, octadecyl alc., and Et heptadecyl ketone in benzene, CCl_4, or petr. ether were used. The adsorption did not follow a simple Langmuir isotherm. The free energy change was greater for the more readily adsorbed mols. Boundary lubrication of $NaNO_3$ crystals was achieved through the adsorption of a boundary film.

3319. Mehrotra, R. C.; Tiwari, R. D., and Dube, H. L. **Resorcinol-succinein as adsorption indicator in argentometric titrations.** *Current Sci. (India)* **16**, 119 (1947).—*C.A.* **41**, 5049*h*.

Two drops of the indicator (0.2% alc. soln.) sufficed for 20 cc. of titration mixt. Comparison was made with fluorescein. Titration was possible in neutral or just alk. solns., but failed in acid solns.

3320. Mehrotra, R. C.; Tiwari, R. D., and Dube, H. L. **Adsorption indicators. I. Resorcinol-succinein as adsorption indicator in argentometric titrations.** *J. Indian Chem. Soc.* **24**, 165-6 (1947).—*C.A.* **42**, 5373*f*.

A 1% soln. in 50% EtOH was used as indicator. The indicator compared favorably with ordinary fluorescein as an adsorption indicator. In titrating Cl^-, 0.1 *N* $AgNO_3$ should be used. With I^- the reagent could be 0.1-0.00025 *N*.

3321. Zocher, Hans. **Anisotropy of crystal surfaces.** *Anais acad. brasil cienc.* **19**, No. 1, 43-50 (1947).—*C.A.* **42**, 5295*e*.

Coatings of methylene blue or neutral red dyes on crystal surfaces, particularly the micas, exhibited films of pronounced dichroism. Heating, or boiling in acids, except HF, did not alter the surface state.

3322. Damerell, V. R. and Vogt, M. J. **The effect of surface-active agents upon dispersions of lead monoxide in xylene.** *J. Phys. & Colloid Chem.* **52**, 363-7 (1948).—*C.A.* **42**, 2837*f*.

Sedimentation analysis of suspensions of PbO in xylene showed that S, lecithin, oleic acid, and sodium dioctyl sulfosuccinate (Aerosol OT) were effective in lowering the av. size of the PbO particles. Analysis was made on suspensions of 0.5 g of PbO in 500 ml of xylene and 0.001 mol. of the surface-active agent.

3323. Dreyer, John F. and Ertel, Charles W. **Orientation of the surface of glass.** *Glass Ind.* **29**, 197-8 (1948).—*C.A.* **42**, 4317*d*.

A thin amorphous layer capable of orientation by rubbing could be developed on glass and many other solids. The surface of glass must be clean and basic in character before being rubbed with the slurry. A polarization soln. of dichroic materials was then flooded on, which when dry, produced a polarized film.

3324. Ernsberger, F. M. and France, Wesley G. **Some physical and chemical properties of weight-fractionated lignosulfonic acid, including the dissociation of lignosulfonates.** *J. Phys. & Colloid Chem.* **52**, 267-76 (1948).—*C.A.* **42**, 2491*f*.

Lignosulfonic acid was prepd. from the waste liquor of a sulfite pulp process by using ion exchange. By means of fractional diffusion, 3 fractions were obtained. Studies of the adsorption isotherms on Portland cement, for instance, indicated a pronounced increase of surface activity with increasing mol. wt. The dissocn. of the acid and of its NH_4, Na, Ba, and Ca salts were detd. by cond. measurements and led to moderate degrees of dissocn. (20-60%).

3325. Kameyama, K and Okabe, H. **Adsorption of ripening retarders by the silver halide grains.** *J. Soc. Sci. Phot. Japan* **11**, No. 3, 1-6 (1948); *Science et inds. phot.* **21**, 88 (1950).—*C.A.* **44**, 4354*f*.

Cystine, glutathione, and Vitamin B_1 were strongly adsorbed by AgBr and could cover it with a unimol. layer; methionine and lanthionine, which were not adsorbed, were not ripening retarders.

3326. KOSHURNIKOV, G. S. AND MOKIEVSKII, V. A. **Effect of organic additions on the crystallization of alkali metal halides.** *Zhur. Obshchei Khim.* **18**, 569-71 (1948).—*C.A.* **43**, 13*c*.

The crystal forms appearing on evapn. of satd. solns. of NaCl, KCl, and KI at room temp. were observed under the polarizing microscope. In the presence of PhBr. about 60-70% of the NaCl crystals were cut along the octahedron plane, with many crystals cut on both sides along one of the ternary axes, oriented perpendicularly to the surface of the soln.; the same effect, but to a lesser extent, was found with KCl, no effect with KI. Addn. of $PhNH_2$ or of PhOH to NaCl, KCl, and KI resulted in a similar picture. The effect was explained by adsorption of the org. matter on planes with the greatest surface energy.

3327. MEHROTRA, R. C. **Congo red as an adsorption indicator.** *Anal. Chim. Acta* **2**, 36-44 (1948).—*C.A.* **43**, 61*a*.

Congo red was proposed as a new adsorption indicator for argentometric titrations. It had both acidic and basic properties, and by being adsorbed by both positively and negatively charged particles with different colors, the color change was particularly sharp (blue to red). The addn. of dextrin as a protective colloid made the color changes even sharper. It was readily reversible, and was applicable to the titration in either direction. The best pH range was 3-5.

3328. MUELLER, GRETCHEN B. **The mechanism of adsorption of some dyestuff anions on silver halides.** *Univ. Microfilms Pub.* **No. 1066**, 88 pp (microfilm $1.10, paper enlargements $8.80); Microfilm Abstracts **8**, No. 2, 35-6 (1948).—*C.A.* **43**, 4536*i*.

3329. NEWTON, AMOS. S. **Artificial radioelements as tracers in the study of the adsorption of eosin and erythrosin on silver bromide.** *Univ. Microfilms Pub.* **No. 1067**, 32 pp (microfilm $1.65, paper enlargements $13.20); Microfilm Abstracts **8**, No. 2, 139-40 (1948).—*C.A.* **43**, 4536*i*.

3330. SISLER, HARRY H.; BUSH, JACK D., AND ACCOUNTIUS, OLIVER E. **Addition compounds of chromic anhydride with some heterocyclic nitrogen bases.** *J. Am. Chem. Soc.* **70**, 3827-30 (1948).—*C.A.* **43**, 2534*b*.

The reactions of CrO_3 with pyridine, α-picoline, β-picoline, γ-picoline, quinoline, and isoquinoline were studied. CrO_3 was almost completely reduced by isoquinoline at room temp. α-Picoline was more easily oxidized by CrO_3 than was β- or γ-picoline or pyridine, and tended less to coordinate with CrO_3. $CrO_3 \cdot 2C_5H_5N$, $CrO_3 \cdot 2C_6H_7N$ (β), and $CrO_3 \cdot 2C_6H_7N$ (γ) reacted with liquid NH_3 at −33°C in a manner similar to CrO_3.

3331. THIELE, HEINRICH AND LUCK, HANS. **The directive effect of various ions on anisotropic colloids.** *Z. Naturforsch.* **3b**, 393-402 (1948).—*C.A.* **44**, 405*a*.

Addn. of surface-active substances to sols. of V_2O_5, Fe_2O_3, 3-hydroxy-mercuri-5-sulfosalicylic acid inner salt (Hg sulfosalicylic acid) and benzopurpurin produced transitory double refraction without gelation. Electrolytes diffusing from a dissolving crystal oriented the particles in Fe_2O_3 and V_2O_5 sols either radially or tangentially. If the cation had the higher mobility, it led the anion in the diffusion front and pulled the elongated neg. V_2O_5 particles into a radial orientation. If the anion had the higher mobility the orientation was tangential and the birefringence pos. Since the Fe_2O_3 sol was pos., it showed the opposite behavior.

3332. VENTURELLO, G. AND BURDESE, A. **II. Discontinuous adsorption of purpurin in aqueous solution on calcite and on aragonite.** *Gazz. chim. ital* **78**, 271-5 (1948).—*C.A.* **42**, 8576*i*.

Two forms of $CaCO_3$ were chosen in a study on the influence of cryst. structures with identical chem. compns. Discontinuous isotherms were obtained, particularly in the isotherm of purpurin on pptd. $CaCO_3$. However, the isotherms of aragonite showed a greater no. of discontinuties than those of calcite.

3333. ZUEV, YU. S. **Effect of surface-active substances on the mechanical properties of concentrated zinc oxide suspensions.** *Kolloid. Zhur.* **10**, 413-5 (1948).—*C.A.* **43**, 7777*i*.

The yield stress of 78 wt % suspensions of ZnO in liquid petrolatum was reduced by addn. of a few % of "aerosol OT," oleic acid, and particularly of oxidized petrolatum. The yield stress of 78% ZnO in linseed oil was slightly increased by "aerosol OT;" much increased by oleic acid and reduced by oxidized petrolatum.

3334. ANDERSON, SCOTT. **Orientation of methylene blue molecules adsorbed on solids.** *J. Optical Soc. Am.* **39**, 49-56 (1949).—*C.A.* **43**, 5665*i*.

The orientation of methylene blue mols. adsorbed on rubbed glasses was detd. Reflection spectra made with polarized visible radiation demonstrated that the long axis of the mols. was perpendicular to the direction in which the glass was originally rubbed.

3335. BIRD, L. H. **Adsorption of quinine from fluorimetric standard solutions.** *New Zealand J. Sci. Technol.* **30B**, 334-5 (1949).—*C.A.* **45**, 5059*i*.

Quinine, when used as a standard fluorescing soln., gave trouble by adsorbing to the tubes and causing the concn. in the soln. to fall progressively. This could be prevented by (1) satg. the adsorptive capacity of the tubes with quinine sulfate, stirring, discarding, and refilling with fresh soln. (2) Rendering the tubes nonadsorptive by filling with 30% NaOH and raising the temp. to the b.p. for 1 min., followed by washing and drying.

3336. BUCKLEY, H. E. **Habit modification in crystals as a result of the introduction of impurities during growth.** *Discussions Faraday Soc.* **1949**, No. 5, 243-54.—*C.A.* **44**, 2316*b*.

No direct relation could be traced between deposition of impurity on certain crystal faces and modification of habit. The concn. of dye and the crystal faces developed were given for a large no. of dyes and K_2CrO_4, K_2SO_4, $KClO_4$, and NH_4ClO_4 crystals.

3337. Butchart, A. and Whetstone, J. **The effect of dyes on the crystal habit of some oxy-salts.** *Discussions Faraday Soc.* **1949**, 254-61.—*C.A.* **44**, 2322*h*.

The effect of a large no. of dyes on the habit of NH_4NO_3, $(NH_4)_2SO_4$, KNO_3, and $NaNO_3$ was investigated. No theory involving the fitting of these dyes on one given crystal plane for each salt was found capable of explaining the facts. In all cases, the crystal planes on which growth was limited by the dyes consisted of alternate pos. and neg. ions.

3338. Chu, Jean Chien-Han. **The influence of excess ions on the adsorption of dye ions on crystallized silver bromide and lead sulfate. Solubility and electrical conductance of some lithium salts in ethyl ether.** *Univ. Microfilms* (Ann Arbor, Mich.) *Pub.* **No. 1169**, 167 pp. (microfilm $2.09, paper enlargements $16.70); Microfilm Abstracts **9**, No. 2, 31-2 (1949).—*C.A.* **43**, 8790*g*.

3339. Ewles, J. and Farnell, G. C. **The luminnescence of wetted solids.** *Proc. Phys. Soc.* (London) **62A**, 216-24 (1949).—*C.A.* **44**, 443*d*.

The luminescent spectra of water, heavy water, and alcs., as well as some other liquids with different neg. radicals when adsorbed by various finely divided ionic solids were detd. The adsorbed mols. had very abnormal adsorption regions indicating considerable changes in energy levels. Luminescence bands made at low temps. were reported for the following water-wetted solids: SiO_2, $SiO_2(D_2O)$, CaF_2, LiF, NaF, NaCl, KCl, BeO, Al_2O_3, $CaCO_3$, and $HgCl_2$; wetted by alcs., SiO_2, $SiO_2(D_2O)$, CaF_2, LiF, NaF, NaCl, KCl, BeO, Al_2O_3, $CaCO_3$, $HgCl_2$. $SiO_2(CH_3OH)$, $SiO_2(C_2H_5OH)$, $KCl(C_2H_5OH)$, $NaCl(CH_3OH)$, and $NaCl(C_2H_5OH)$.

3340. Fenimore, Charles P. and Thraikill, Arthur. **The mutual habit modification of sodium chloride and dipolar ions.** *J. Am. Chem. Soc.* **71**, 2714-17 (1949).—*C.A.* **43**, 7772*d*.

Glycine, pyridine, betaine, and β-alanine in aq. NaCl solns. modified the crystal habit of growing NaCl; the first caused the formation of dodecahedra, the other 2 give octahedra. Glycine and β-alanine were themselves modified by NaCl.

3341. Greiner, Leonard and Vold, Robert D. **Suspension of manganese dioxide in detergent solutions.** *J. Phys. & Colloid Chem.* **53**, 67-88 (1949).—*C.A.* **43**, 3688*h*.

The non-ionic detergent, alkaryl polyethoxyethanol, showed no suspending power, whereas cationic $[(C_8H_{17}C_6H_4OC_2H_4OC_2H_4)Me_2(PhCH_2)NCl]$ and anionic [Na oleate, $(NaSO_3C_6H_4C_{12}H_{25})$, (Na dioctylsulfosuccinate), and p-$MeC_6H_4SO_3H$] agents suspended powd. MnO_2 at low concns.

3342. Krasnovskii, A. A. and Gurevich, T. N. **Desorption of gas on wetting powders.** *Kolloid. Zhur.* **11**, 172-5 (1949).—*C.A.* **43**, 7289*h*.

When dry powder was wetted by a liquid, gas was evolved. TiO_2, FeO, and two specimens of Fe_2O_3 adsorbed palmitic acid from toluene solns. (0.12 *M* or greater). Assuming that 1 mol. of palmitic acid occupied 20.5×10^{-16} cm^2, the surface areas of the powders were 8.9, 6, and 6.7-7.3 m^2/g, resp. One mol. of evolved gas was present per $24\text{-}32 \times 10^{-16}$ cm^2 of the powder surface. The gas contained no CO_2, but was not analyzed otherwise. Wetting TiO_2 by H_2O, 0.1 *N* H_2SO_4, or 0 1 *N* NaOH liberated less gas (1/20 to 1/2, approx.) than wetting with palmitic acid + toluene. The vol. desorbed could be used for characterizing powders.

3343. Kukharenko, T. A. and Borozdina, L. A. **The nature of the exchange reaction between humic acid and calcium acetate.** *Kolloid. Zhur.* **11**, 244-50 (1949).—*C.A.* **44**, 405*e*.

The rate of reaction between 2 specimens of humic acid (63.8 and 65.7% C) and $Ca(OAc)_2$ solns. increased with temp. (20-100°C), but the final amt. of AcOH liberated was independent of temp. It increased with the concn. of $Ca(OAc)_2$ and was not affected by addn. of $CaCO_3$. Hence, $Ca(OAc)_2$ reacted with the CO_2H groups of humic acid without affecting its OH groups.

3344. MacEwan, D. M. C. and Talib-Uddeen, O. **Adsorption complexes of α-zinc hydroxide.** *Nature* **163**, 177-8 (1949).—*C.A.* **43**, 3308*e*.

α-$Zn(OH)_2$ showed interlayer adsorption such as some clays. A complex was formed with 8-hydroxy-5,7-dinitro-2-naphtholsulfonic acid. This complex also adsorbed water, MeOH, EtOH, ethylene glycol, glycerol, acetonitrile, and propionitrile.

3345. Mehrotra, R. C. **Argentometric titrations of thiocyanate ions with adsorption indicators.** *Anal. Chim. Acta* **3**, 69-72 (1949) (in English).—*C.A.* **43**, 8300*b*.

Three new adsorption indicators, bromothymol blue, bromocresol purple, and bromophenol blue, were compared with fluorescein in their applicability to the titrations of CNS^- against Ag ions. The first 2 gave sharp end-points in dilns. up to 0.02 *N* and 0.01 *N*, resp.

3346. Mehrotra, R. C. **Tetrabromophenolsulfonpthalein as adsorption indicator. I. Volumetric estimation of thallium.** *Anal. Chim. Acta* **3**, 73-7 (1949) (in English).—*C.A.* **43**, 8300*c*.

A new method was described for detg. Tl with bromophenol blue as adsorption indicator. The color change, yellow to green, was sharpest (over a pH range 4-8) when Tl nitrate or sulfate was added to the iodide, and when the concns. of the titrating solns. were 0.04-0.2 *N*. The reverse titration, though less satisfactory could be carried out if some care was taken. Pb^{++} interfered, but this could be prevented by previous pptn. as $PbSO_4$; CNS^- and CrO_4^{--} also interfered.

3347. Mehrotra, R. C. **Tetrabromophenolsulfonpthalein as adsorption indicator. II. Volumetric estimation of silver and thallium.** *Anal. Chim. Acta* **3**, 78-82 (1949) (in English).—*C.A.* **43**, 8300*e*.

Ag and Tl together could be detd. as follows: first, ppt. both ions with an excess of KI, and titrate the excess with $TlNO_3$, in the presence of bromophenol blue as adsorption indicator. Ag alone could then be detd. in another sample by adding a known vol. of KCNS, and titrating the excess with Ag^+ and with bromophenol blue as adsorption indicator. Tl^+ did not interfere with this titration. The detn. of Br^- and I^- by titration with Ag^+ ions in ammoniacal soln., with bromophenol blue as adsorption indicator, was also described.

3348. Mehrotra, R. C. **Phenyl-1-naphthylamine-azobenzene-p-sulfonic acid as adsorption indicator.** *J. Indian Chem. Soc.* **26**, 511-14 (1949).—*C.A.* 44, 6334*i*.

The dye in pH 3-5 indicated the end point in argentometric titrations with very sharp and reversible color change both in the titrations of halide ions against Ag ions, as well as in the reverse titrations of Ag ions against halide.

3349. Robinson, James V. **Viscosity of suspensions of spheres.** *J. Phys. & Colloid Chem.* **53**, 1042-56 (1949).—*C.A.* 44, 904*d*.

The viscosities of suspensions of glass spheres in various media, such as S.A.E. No. 30 and 50 motor oils, castor oil, corn sirup, polyethylene glycol, and sucrose soln., were detd. by means of rotational viscometers at 35°C. The sp viscosity of the suspensions was directly proportional to the vol. concn. and inversely proportional to the vol. of free liquid in the suspension.

3350. Schafer, Harold. **N-Methyldiphenylamine Red as adsorption indicator in the argentometric determination of chloride and bromide in an acid solution.** *Z. anal. Chem.* **129**, 222-9 (1949).—*C.A.* 44, 69*h*.

In strongly acidic solns., N-Methyldiphenylamine Red was a good adsorption indicator for titrating Cl^- or Br^- with Ag^+. When the halogen anion was in excess, the indicator was adsorbed by AgCl, giving a blue-gray color with a slightly violet tinge. Exactly at the equiv. point a red-violet color was obtained. The reagent acted as oxidation-reduction indicator when in the reduced condition and as adsorption indicator in the oxidized form.

3351. Ukihashi, Hiroshi and Kikuchi, Shinichi. **Adsorption of resorcinol on silver bromide.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* **52**, 240-2 (1949).—*C.A.* 45, 4155*g*.

The adsorption of resorcinol on AgBr of uniform grain was studied. The adsorption followed Freundlich's adsorption isotherms, and the adsorbed quantity corresponded to a unimol. layer on the surface of AgBr.

3352. Washburn, E. Roger; Eby, Harold H., and Skiles, B. F. **Colloidal barium sulfate in acetic acid.** *J. Phys. & Colloid Chem.* **53**, 1190-5 (1949).—*C.A.* 44, 2329*g*.

Sols. and gels of $BaSO_4$, prepd. by mixing $Ba(OAc)_2$ and H_2SO_4 each in HOAc soln. (concns. from 0.477 to 0.005 *M*) were observed over periods up to 1 year. No visible settling occurred. Percentage of incident light transmitted was detd. As the sols. aged, increased cloudiness was noted. The most concd. sols. gelled in 12-14 days.

3353. Whetstone, J. **The effect of crystal-habit modification on the setting of inorganic oxy-salts.** *Discussions Faraday Soc.* **1949**, No. 5, 261-6.—*C.A.* 44, 2322*i*.

Expts. were reported on the changes in crystal habit of NH_4NO_3, $(NH_4)_2SO_4$, and KNO_3 crystals by dyes. The effect of the dyes most effective in reducing setting (Acid Magenta for NH_4NO_3, Amaranth for $(NH_4)_2SO_4$, and Na 1,4-diaminoanthraquinone-2-sulfonate for KNO_3) was due to the extreme thinness and fragility of the platy crystals produced in their presence. No dye was found that would reduce the caking tendency of $NaNO_3$ or modify its crystal habit.

3354. Barrington, M. G.; Fleet, D. E., and McLaughlin, R. R. **The water repellency of silicone-treated sintered glass plates.** *Can. J. Research* **28F**, 461-3 (1950).—*C.A.* 45, 2724*e*.

Pyrex sintered glass funnels of fine, medium, and coarse porosity, made water-repellent by treatment with Dow-Corning fluids DC 500 or DC 200, were subjected to hydrostatic pressure by means of water or water and Hg columns and a leveling bulb. Plates of fine porosity withstood heads of approx. 300 cm of water.

3355. Buckley, H. E. **The growth and habit modifications of crystals.** *Mem. Proc. Manchester Lit. & Phil. Soc.* **92**, 77-123 (1950-51).—*C.A.* 46, 5922*i*.

The effects of 488 dyes on the crystal growth of KCl, $KClO_3$, K_2SO_4, K_2CrO_4, NH_4ClO_4, $K_2Cr_2O_7$, potash, alum, and borax were tabulated. The relative effectiveness of the dyes in causing habit modification was measured in terms of the weight of inorg. substance modified by one grain of dye.

3356. Cruse, K. and Mittag, R. **Color formation by adsorption.** *Z. Elektrochem.* **54**, 418-21 (1950).—*C.A.* 45, 4996*d*.

By adsorption on MgO and elution with benzene, *m*-dinitrobenzene(DNB) could be sepd. from *s*-trinitrobenzene(TNB). On MgO adsorbed DNB was blue, and adsorbed TNB red. The formation of a red adsorption band of TNB and a deep red color when a benzene soln. of TNB was treated with Na alcoholate was attributed to formation of an excited state due to polarization of the nitro group by the MgO dipole in the first case and the Na alcoholate dipole in the second.

3357. Danilov, V. I. and Ovsienko, D. E. **Crystallization of hydroquinone on single crystals of calcite.** *Dopovidi Akad. Nauk Ukrain.* R.S.R. **1950**, 205-8.—*C.A.* 46, 6455*h*.

Hydroquinone, which could be supercooled 15-20°C, was supercooled 3-4°C in the presence of calcite. When hydroquinone crystals were exposed to calcite for 25 days, supercooling was only 1.5-2.0°C; on heating 40-50°C above the m.p., supercooling of 3-4°C was again attained.

3358. Engel, W. and Holzapfel, L. **Organic compounds of silicic acid. XVIII. Organic silicates.** *Kolloid-Z.* **119**, 160-4 (1950).—*C.A.* 45, 4523*a*.

The adsorption of sugar on quartz from aq. soln. showed highest results with galactose. It was bound tighter to the quartz surface than others such as glucose. Proteins were adsorbed only in the presence of glycocoll which lowered the adsorption value of galactose.

3359. Figurovskiĭ, N. A. and Ushakova, N. N. **Regulation of dispersion of barium sulfate precipitate by organic addends.** *Zavodskaya. Lab.* **16**, 1063-71 (1950).—*C.A.* 45, 1843*a*.

Increase of particles size and narrowing of the range of the disperse state of $BaSO_4$ was achieved by addn. to the soln. of picric acid, pyridine, or salicylic acid. Na oleate led to particle-size increase accompanied by coagulation of the highly disperse portion of the ppt.

3360. KAINUMA, YOSHIRO AND UYEDA, RYOZI. **The structure of adsorbed organic long-chain molecules on the cleavage surface of molybdenite.** *J. Phys. Soc. Japan* **5**, 199-200 (1950) (in English).—*C.A.* **45**, 1836*a*.

Unidentified patterns observed in the electron-diffraction photographs of the cleavage surface of Mo were caused by the adsorption of long-chain hydrocarbon mols. The plane of the chain was parallel to the surface, and the individual chain links were parallel to the sides of the hexagon of the base crystal.

3361. KIRIYAMA, RYOITI. **Velocities of crystal growth. II. Adequate velocities of crystal growth of strontium formate dihydrate and of barium formate.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **71**, 125-7 (1950).—*C.A.* **45**, 4534*g*.

From the assumption that the velocity of growth at a certain temp. is proportional to the degree of supersatn. and the surface area of the crystal, it followed that the velocity had a max. at a certain concn.

3362. KIRIYAMA, RYOITI. **Velocities of crystal growth. III. Anisotropies of the velocities of crystal growth of strontium formate dihydrate.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **71**, 188-90 (1950).--*C.A.* **45**, 4534h.

Circular disks of Sr formate dihydrate crystals cut perpendicular to *b* or *c* axes were placed in slightly superstd. aq. solns., evapg. at a const. temp., and the resulting growth was detd. after a few days. The ratios $\Delta c/\Delta a$ and $\Delta b/\Delta a$ increased with temp. This anisotropy was discussed in connection with adequate velocity of crystal growth.

3363. KUL'BERG, L. M. AND BULANZHE, I. N. **Mixed adsorption indicators in precipitation methods.** *Zavodskaya Lab.* **16**, 387-97 (1950).—*C.A.* **44**, 10576a.

Investigation of titrations of Cl, Br, and I salts by $AgNO_3$, SO_4 by $BaCl_2$, and F salts by $Ca(NO_3)_2$ with mixed indicators resulted in selections of several combinations which gave the most sharp color changes (best shown in $AgNO_3$ titrations); each combination had a best pH range and usually elevated temp. caused increased errors. A temp. under 35°C was recommended. Protective colloids were investigated; of those studied (gelatin, dextrin, and starch), gelatin showed the best effect and 0.1-10 ml. 1-2% soln. prevented coagulation of the colored ppts. and eliminated color change at the equivalence point.

3364. MACAROVICI, CONST. GH. AND CEAUSESCU, D. **Sulfamides. IV. Titration of sulfamides with silver nitrate in the presence of adsorption indicators. V. Control of sulfamides used as drugs.** *Analele Acad. Rep. Populare Romane, Ser.: Mat., Fiz., Chim.* **3**, Mem. 21, 1-27 (1950).—*C.A.* **45**, 8403*a*.

Sulfanilamide in alk. EtOH soln. could be titrated with 0.1 *N* $AgNO_3$ with dephenylcarbazone as adsorption indicator (color of ppt. changes to blue) providing too much NaOH was not present (0.05 *N* alcholic sulfanilamide, *N* aq. NaOH, 0.1 *N* $AgNO_3$, 8 drops 0.3% alcoholic diphenylcarbazone). Sulfathiazole (0.02 *N*) in neutral EtOH could also be titrated with a 0.5% aq. soln. of sol. eosin as adsorption indicator. The end point was reached when the ppt. and soln. were pink. It was possible to titrate not only pure sulfamides but also com. products used as drugs.

3365. MANNELLI, GIOVANNI AND ROSSI, M. L. **Adsorption indicators. I. II. III.** *Ann. chim. (Rome)* **40**, 163-5; 166-74; 175-80 (1950).—*C.A.* **45**, 10123*a*.

Martius Yellow was proposed in argentometry which gave a brick-red color in presence of excess Ag^+. Experiences with adsorption indicators (Trypan Blue, Fuchsin, and Neutral Red) furnished a variety of color changes in the argentometric detn. of halide ions. Bordeaux Red and Orange II were preferentially adsorbed on AgI over AgCl and could be utilized for a simultaneous detn. of I^- and Cl^- in a single operation. The first end point was yellow-orange for AgI, the second deep rose for AgCl.

3366. MEHROTRA, R. C. **Argentometric titrations of thiocyanate ions with adsorption indicators.** *Anal. Chim. Acta* **4**, 38-42 (1950).—*C.A.* **44**, 6346*i*.

The useful range of applicability of 6 new adsorption indicators for the titration of thiocyanate ions was discussed. Bromocresol green which can be used over a pH range 2.0-4.5, served as a very sharp indicator and gave well-defined end points for concns. as low as 0.002 *N* in the presence of 0.001-0.005 *N* HNO_3 soln. The supernatant suspension was yellow and the coagulation of AgCNS began quite early, but the particles remained colorless up to the equiv. point, when they developed a deep blue shade. The end point was very sharp and quite reversible.

3367. MEHROTRA, R. C. **Titrimetric precipatation of mercurous ions with the aid of adsorption indicators.** *Z. anal. Chem.* **130**, 390-5 (1950).—*C.A.* **44**, 8824*c*.

The indicator, tetraiodophenolsulfophthalein, was better than bromophenol blue for titrating Cl^- or Br^- with $HgNO_3$ soln. It helped to coagulate the ppt. of mercurous halide and imparted to it a pale yellow color which at the end point changed to deep violet.

3368. PUTSEĬKO, E. K. AND TERENIN, A. N. **Accumulation of electrons of a semiconductor in organic dyes adsorbed thereon.** *Doklady Akad. Nauk S.S.S.R.* **70**, 401-4 (1950).—*C.A.* **45**, 5018*e*.

Adsorption of methylene blue on TlI (40° to 70°C) gave rise, in addn. to the proper photocond. of TlI (max. in the 4000-A. region), to a sensitized photocond. in the range of absorption of the dye (around 6500 A.). If, in addn. to intermittent illumination with light absorbed by the adsorbed methylene blue, TlI was simultaneously exposed to const. illumination with wave lengths (4358 and 4047 A.) and photocond. was measured by the condenser method, without application of an elec. field, the spectral curve was unchanged, but the magnitude was substantially increased. Similar observations were made with phosphors ZnS:CdS(Cu), with crystals of CdS, PbO, TlBr + TlI, etc. Evidently, in TlBr and HgI_2 the trapping levels preexist in the semiconductor, independently of adsorption.

3369. Sass, O. E. and Bertram, Fritz. **Acid violet 4BL as an adsorption indicator.** *Chem.-Ztg.* 74, 734 (1950).—*C.A.* **45**, 5060*e*.

Acid violet 4BLwas a good argentometric adsorption indicator for detg. Cl^-. The chloride titration could be done in a soln. contg. up to 3%HNO_3. The end point was blue-green → violet. The titration was successful in solns. contg. excess of Na_2HPO_4, Na_2SO_4, NH_4NO_3, CH_3COONa, $CuSO_4$, $Cr_2(SO_4)_3$, and $Al_2(SO_4)_3$. The dye could be used with solns. contg. as little as 0.001% Cl^-.

3370. Schulek, E. and Pungor, E. **Argentometric determination of chloride, bromide, and thiocyanate by back-titration with adsorption indicators.** *Anal. Chim. Acta* 4, 109-17 (1950).—*C.A.* **44**, 9867*d*.

To det. (0.3-1.5 mg) Cl^-, (0.8-4.0 mg) Br^-, or (0.6-3.0 mg) CN^- in an aq. soln., add 1 drop of p-ethoxy- or p-methoxychrysoidine indicator soln., neutralize carefully, and add a measured vol. of 0.01 *N* $AgNO_3$. Coagulate the ppt. by warming and shaking with 1 g of KNO_3 or NH_4NO_3, cool, dil. to 80-100 ml, add 6-8 drops more of the indicator soln. and titrate the excess Ag^+ with 0.01 *N* KI soln. The color change was red to yellow, and the ppt. a deep raspberry red at the end point.

3371. Schulek, E. and Pungor, E. **Theory of adsorption indicators. Dye adsorbates as acid-base indicators.** *Anal. Chim. Acta* 4, 213-27 (1950).—*C.A.* 44, 10575h.

$AgNO_3$ solns. were titrated with alkali chlorides in the presence of p-ethoxysoidine as indicator. Dyestuff-adsorbates were formed, the colors of which depended on the properties of the surface, the ions already present, and their concns. These adsorbates were sensitive to pH, and could therefore serve as indicators for acid-base reactions. This behavior seemed to be the most characteristic of the adsorbates on AgI with which the sharpest color change could be observed.

3372. Sierra, F and Hernández Cañavate, J. **The cupric-o-dianisidine system as an oxy-adsorption indicator in silver determinations.** *Anales real soc. espan. fis. y quim.* **46B**, 557-68 (1950).—*C.A.* 45, 5060*f*.

A mixt. of aq. 1% $Cu(NO_3)_2$ soln. and o-dianisidine in 95% EtOH (1g/100 ml) was used as an indicator in detns. of 0.001-0.1 *N* Ag with standard KCNS solns. This indicator gave satisfactory results in the presence of Pb, Cu, Cr, Co, and Ni, and in the presence up to 20% of concd. HNO_3 for 0.1 *N* Ag solns. and up to 5% for 0.01 *N* Ag solns.

3373. Boer, J. H. de and Houben, G. M. M. **Misleading color reactions.** *Proc. Koninkl. Nederland. Akad. Wetenschap.* **54B**, 421-9 (1951).—*C.A.* 46, 10875*c*.

The adsorption of dyes on the surface of inorg. salts caused a shift of the dye-absorption spectra to longer wave lengths. Any Al oxide, sufficiently dried, adsorbed *p*-nitrophenol from solns. in org. solvents with a yellow, phenolphthalein with a red, and *o*-nitrophenol with a deep-orange color. The fewer the OH groups on the surface and the less polar the solvent, the stronger and deeper was the color of the adsorbed dye layer. Water, if present, was preferentially adsorbed and no color appeared.

3374. Buzágh, Aladár. **Influence of polar and nonpolar compounds on the adhesivity of quartz particles.** *Acta Chim. Hung.* **1**, 182-95 (1951) (in German).—*C.A.* 45, 10008*f*.

The adhesivity, the cataphoretic migration velocity, and the sediment vol. of homodisperse quartz particles of microscopic size were detd. in primary alcs., in alc. solns. of electrolytes, and in mixts. of polar and nonpolar compds. Adhesivity increased, and cataphoretic migration velocity diminished when the alc. concn. in aq. alc. solns. was reduced. The effect on the adhesivity depended definitely upon the no. of C atoms in the alc. Quartz showed strong adhesivity in nonpolar liquids, such as aliphatic and aromatic hydrocarbons. Polar groups, such as OH, CHO, CO_2H, and NO_2, had a reducing effect on adhesivity. In mixts. of nonpolar and polar compds. the adhesivity diminished as the concn. of polar components increased.

3375. Chang, Y. L. **Orientation of methylene blue molecules adsorbed on solids and crystallized in a membrane.** *Science Record* (China) 4, 134-47 (1951).—*C.A.* **46**, 4882*d*.

A drop of a 4% MeOH soln. of methylene blue was allowed to fall on different types of substrates, and the orientation of the methylene blue mols. was detd. by examg. the surfaces through a Polaroid screen. Highly oriented films were obtained on both muscovite and lepidolite. The methylene blue mols. lay flat on the (010) face of a gypsum crystal with the long axis of the mol. parallel to the intersection between (010) and (111) faces. On the faces surrounding (010) the mols. were oriented with their long axis perpendicular to the resp. faces and with the *c* axis parallel to the lines of intersection between (010) and the resp. face.

3376. Green, R. W. and Walsh, J. P. **Protection of of the wet enamel surface by adsorbed films.** *J. Dental Research* **30**, 218-24 (1951).—*C.A.* 45, 5878*e*.

The power to protect the intact dental enamel surface from decalcification by acid was possessed by primary aliphatic amines, contg. 8, 10, 12, 14, 16, 18 C atoms, resp., and was exerted from soln. in either H_2O or paraffin oil. Powd. Ca phosphate was similarly protected.

3377. Hanson, Roberta M. and Gould, C. W. **Talc as an adsorbent for sulfonated azo dyes.** *Anal. Chem.* **23**, 670-3 (1951).—*C.A.* **45**, 6384*g*.

The adsorptive behavior of talc toward pairs of similar sulfonated azo dyes was compared. Aq. pyridine solns. 0-10 % served as developer. In some cases the column was pre-washed with 5 *M* aq. NaOH. Adsorption depended on the no. and positions of the anionic functional groups in the mol.

3378. HERNÁNDEZ CAÑAVATE, JUAN. **New argentometric determinations with adsorption indicators.** *Anales univ. Murcia* (Spain) **10**, 275-362 (1951-52).—*C.A.* **47**, 5301*i*.

Good results were obtained with the Cu^{2+}-benzidene system in a weakly citric acid soln. as indicator. The detns. could be made in the presence of Pb^{2+} and Cu^{2+} and in the presence of 20 times as much Cu as Ag. Good results were also obtained with Cu^{2+}-toluidine in citric acid or dil. H_2SO_4 as indicator.

3379. HIRST, W. AND LANCASTER, J. K. **Effect of water on the interaction between stearic acid and fine powders.** *Trans. Faraday Soc.* **47**, 315-22 (1951).—*C.A.* **45**, 8331*d*.

The interaction between stearic acid in PhH and the evacuated powders TiO_2, SiO_2, TiC, SiC, Cu, Cu_2O, CuO, Zn, and ZnO were investigated at 18°C, with dry soln. and those contg. traces of water, and with powders whose surfaces were covered by adsorbed layers of water. No attempt was made to remove oxide films. For TiO_2, SiO_2, TiC, and SiC, the shape of the desorption isotherm was characteristic of phys. adsorption and the presence of water merely reduced the amt. of acid adsorbed. On the reactive dry powders Cu, Cu_2O, CuO, and Zn, the acid was physically adsorbed; the water initiated chem. reaction. The initial rate of reaction depended on the quantity of water present, and with Cu_2O, the presence in soln. of about 1 part water in 10^5 increased the amt. of acid taken up in the first two hrs by a factor of 15 compared with dry conditions. The ZnO powder reacted even under the driest conditions obtainable.

3380. KISELEV, A. V. AND KRASIL'NIKOV, K. G. **Uni- and multimolecular adsorption from solution on a nonporous adsorbent.** *Doklady Akad. Nauk S.S.S.R.* **77**, 831-4 (1951).—*C.A.* **45**, 6455*e*.

Adsorption isotherms from solns. of PhOH in C_7H_{16} on $BaSO_4$ powder of surface area 9.7 m^2/g were detd. At 20°C, the isotherm leveled off at a relatively low concn., 25 millimole/liter (i.e. 0.1 of satn.) and the adsorption remained practically unchanged up to satn. of the soln. At 40°C, the isotherm was S-shaped, beginning to rise at approx. a relative concn. $c/c_s = 0.6$ ($c_s = 1.3$ mole/liter). From this point on, adsorption was multimol. A similar isotherm was found with MeOH in C_7H_{16} on $BaSO_4$.

3381. KUL'BERG, L. M. **Adsorption-topochemical reactions for the identification of fluorides of calcium, barium, and strontium.** *Doklady Akad. Nauk S.S.S.R.* **76**, 73-6 (1951).—*C.A.* **45**, 5568h.

Bromophenol blue, bromocresol purple, alizarin, and phenol red were satisfactory. Change in color of indicator during adsorption on fluorides was not directly related to the pH of their satd. solns. Indicator solns. were prepd. from 1-2 mg of indicator and 10 ml alc. and used: (1) Identification of CaF_2, SrF_2, and BaF_2. (2) Differentiating synthetic from natural CaF_2. (3) Differentiating freshly made from "old" CaF_2. (4) Detection of CaF_2 impurity in SrF_2 and BaF_2.

3382. SIERRA, F. AND HERNÁNDEZ CAÑAVATE, J. **New silver determinations with Cu^{2+}-tolidine and Cu^{2+}-benzidine as oxi-adsorption indicators.** *Anales real soc. españ. fís. y quím.* **47B**, 269-76 (1951).—*C.A.* **45**, 8937h.

The Cu^{2+}-tolidine oxi-adsorption system as an indicator was recommended as being much more sensitive than Cu^{2+}-benzidine, and results were much more reproducible with it in all concns. of Ag.

3383. SIERRA, F. AND HERNÁNDEZ CAÑAVATE, J. **III. Determinations with Cu^{2+}-*o*-dianisidine as the oxi-adsorption indicator.** *Anales real soc. españ. fís. y quím.* **47B**, 277-80 (1951).—*C.A.* **45**, 8938*a*.

Ag solns. were evaluated with Br^- and I^- in strongly acid media with Cu^{2+}-ω-*o*-dianisidine as the indicator: To 5-10 ml Ag soln. add 2 drops $Cu(NO_3)_2$ soln. (contg. 1% Cu), 2 ml *N* HNO_3, and 6 drops *o*-dianisidine. An equal vol. H_2O was then added, and then dropwise the evaluated KI or KBr soln.

3384. SIERRA, F. AND HERNÁNDEZ CAÑAVATE, J. **New argentimetric determination of chlorides, with meriquinonoid derivatives of benzidine, tolidine, and *o*-dianisidine as adsorption indicators.** *Anales real soc. españ. fís. y quím.* **47B**, 439-45 (1951).—*C.A.* **46**, 379*i*.

The ferric complexes of benzidine, tolidine, and *o*-dianisidine acted as adsorption indicators on AgCl. The resistance to HNO_3 of these indicators was much greater than that of phenosafranine. The adsorbed colors were blue or violet in all cases.

3385. SIERRA, F. AND SÁNCHEZ, J. A. **Adsorption indicators in determinations involving mercurous ions and bromides.** *Anales real soc. españ. fís. y quím.* **47B**, 446-52 (1951).—*C.A.* **46**, 380a.

The ferric complexes of *o*-tolidine, benzidine, and *o*-dianisidine acted as adsorption indicators in the titration of Hg_2^{++} with Br^-. The indicators were reversible and the changes sharp; the 1st and 2nd changed from blue to rose and the 3rd from violet-blue to violet with Br^-.

3386. SUBRAHMANYA, R. S.; ROA, M. R. A., AND DOSS, K. S. GURURAJA. **The effect of wetting agents on the adsorption of crystal violet by glass.** *Proc. Indian Acad. Sci.* **34A**, 324-8 (1951).—*C.A.* **47**, 6734*i*.

The effect of Igepon T and Aerosol O T on the adsorption of crystal violet from aq. soln. by 100-150-mesh glass powder was studied over a pH range of 3.7 to 9.1. With no wetting agent adsorption rose from 0.013 mg of dye per g of glass powder at pH 3.7 to 0.089 mg/g at pH 9.1. In acid soln. dye adsorption rose sharply with small addn. of wetting agent and then decreased slowly to zero at high concn.

3387. WEST, W. AND CARROLL, B. H. **Energy transfer in the photosensitization of silver halide photographic emulsions: optical sensitization, supersensitization, and antisensitization.** *J. Chem. Phys.* **19**, 417-27 (1951).—*C.A.* **45**, 9405*d*.

Dyes in the cooperative state were most susceptible to the increase of sensitization caused by supersensitizers. Exptl. evidence was furnished, including correlations between optical sensitization and supersensitization with the type of absorption spectrum of the adsorbed dye.

3388. WHETSTONE, J. **Modification of crystal habit of inorganic salts with dyes.** *Nature* **168**, 663-4 (1951).—*C.A.* **46**, 2869*e*.
The modification of crystal habit of many inorg. salts by dye mols. may be due to the incorporation of dye mols. in one or more of the edge-faces of these layers, retarding the growth of a crystal face.

3389. ADITYA, S. AND GHOSH, B. N. **Stannic oxide. I. Adsorption of monobasic organic acids and the effect of salts on it.** *J. Indian Chem. Soc.* **29**, 92-6 (1952).—*C.A.* **46**, 8929*h*.
The adsorptions of hydroxyacetic, chloroacetic, trichloroacetic, formic, propionic, and acetic acids and mixts. with their Na salts and NaCl or Na_2SO_4 on β-stannic oxide hydrate, 33.4% H_2O, were detd. The extent of adsorption depended on the anion, the H-ion activity and the effect of the electrolyte system on the pos. charge.

3390. ADITYA, S. AND GHOSH, B. N. **Stannic oxide. II. Adsorption of polybasic acids and the effect of salts on it.** *J. Indian Chem. Soc.* **29**, 123-6 (1952).—*C.A.* **46**, 8929*i*.
Adsorption of polybasic acids on SnO_2 was markedly greater than that of monobasic acids; it decreased in the order: citric acid, oxalic, tartaric, malic, fumaric and maleic, malonic, succinic.

3391. BORIN, A. V. **Absorption spectra of dibenzothiacarbocyanin dyes on the boundary surface between silver bromide and gelatin gel.** *Doklady Akad. Nauk S.S.S.R.* **86**, 1141-3 (1952).—*C.A.* **47**, 5796*h*.
A layer of gelatin (10% soln.) was poured on a layer of fused AgBr and the set gelatin film was stripped; a drop of a soln. of 3,3′-dimethyl-9-ethyl-4,4′,5,5′-dibenzothiacarbocyanine in MeOH was then placed either on the side of the gelatin film having faced the AgBr (side I) or on the opposite side, and the absorption spectra of the dye in the 2 instances were compared. The spectrum on side I showed increased absorption in band β (around 540 mμ) and decreased absorption in the *J* band (around 650 mμ) as compared with the spectrum of the opposite side.

3392. CUNNINGHAM, W. A.; DUNHAM, R. M., AND ANTES, L. L. **Hydration of gypsum plaster.** *Ind. Eng. Chem.* **44**, 2402-8 (1952).—*C.A.* **47**, 288*a*.
Photomicrographic studies indicated that the hydration of the hemihydrate occured by the process of first dissolving and then crystg. as needle-like gypsum ($CaSO_4 \cdot 2H_2O$) crystals. The rate of soln. was affected by the addn. of accelerators, such as NaCl, and retarders, such as glue, gelatin, borax, citric acid, and hog bristles.

3393. DARUWALLA, E. H. AND NABAR, G. M. **Behavior of a mixture of negatively charged colloidal iron and chromium hydroxides.** *Kolloid-Z.* **127**, 33-8 (1952).—*C.A.* **46**, 8466*d*.
The stability of $Fe(OH)_2$, $Fe(OH)_3$, and $Cr(OH)_3$, prepd. by reaction of $FeSO_4$, $FeCl_3$, $Cr_2(SO_4)_3$ with definite amts. of NaOH, was detd. in the presence of nonelectrolytes, (peptizing agents, sugar, glycerol) and electrolytes (pptg. agents, Na_2SO_4, $MgSO_4$, $Al_2(SO_4)_3$). Glycerol was unsuitable for peptizing $Fe(OH)_2$, but it could peptize $Cr(OH)_3$ even at relatively high concns. However, $Fe(OH)_2$ could be easily peptized by glycerol in the presence of $Cr(OH)_3$.

3394. GAUDIN, A. M. AND CHANG, C. S. **Adsorption on quartz, from an aqueous solution, of barium and laurate ions.** *Trans. Am. Inst. Mining Met. Engrs., Tech. Pub.* No. **3244B** (in *Mining Eng.* **4**, 193-201) (1952).—*C.A.* **46**, 2350*f*.
Radioactive Ba and radioactive-carbon-labeled lauric acid were used to study the adsorption of Ba and laurate at equil. on a sample of ground quartz. Quartz adsorbed Ba from soln. The presence of Na up to 6 millimol. per liter did not materially affect Ba adsorption at Ba concn. of 0.06 millimol. per liter. Quartz adsorbed laurate from soln., the adsorption being a function of laurate concn. but independent of pH (8.8 to 11.4). Laurate adsorption increased slightly with increase of Na concn., and rapidly with Ba concn.

3395. JACOBI, BERNHARD. **The colloid chemistry of emulsion polymerization.** *Angew. Chem.* **64**, 539-43 (1952).—*C.A.* **47**, 344*f*.
The growth of colloidal particles was treated and an adsorption-titration method for detg. the growth was described in detail. Detns. of the inner surface of emulsions were reported by means of electron-microscope photographs, ultracentrifuge measurements, and N_2 adsorption by the B.E.T. method.

3396. JAMES, T. H. AND VANSELOW, W. **Chromatographic study of the adsorption of various substances by silver bromide.** *Colloque sensibilité phot., Paris, 1951, Science et inds. phot.* **23A**, 122-5 (1952).—*C.A.* **47**, 4774*c*.
Ag ion displaced adsorbed 3,3′-diethyloxacarbocyanine ion from AgBr surface, whereas bromide ion caused the dye to be more strongly held. Conversely, bromide displaced the merocyanine dye, 4-[2-(3-ethyl-2-benzothiazolinylidene)ethylidene]-3-methyl-1-(*p*-sulfophenyl)-5-pyrazolone and Ag ion caused it to be held more tightly.

3397. JAMES, T. H. AND VANSELOW, W. **Chromatographic investigations related to photographic theory. II. Adsorption of developing agents and sodium sulfite.** *J. Am. Chem. Soc.* **74**, 2374-6 (1952).—*C.A.* **47**, 6799*e*.
The previous investigation was extended to include dyes which did not have a pos. charge and hence would not attract the negatively charged developer ions. *p*-HOC_6H_4OH, *o*-HOC_6H_4OH, and H_2NOH displaced some adsorbed dyes from the AgBr surface and hence must themselves become adsorbed in ionized form by that surface.

3398. KOSHURNIKOV, G. S. **Effect of organic additives on solution of crystals.** *Zhur. Priklad. Khim.* **25**, 1316-18 (1952).—*C.A.* **47**, 4173b.
Crystals of $CuSO_4$(3-3.5 mm) were added to a satd. soln. of $CuSO_4$ in H_2O, and the system was

treated with the additives while the cell was traversed with d.c. at 6×10^{-5} amp. $PhNH_2$ retarded soln. but $PhNO_2$ accelerated it and PhBr had little effect. The results were apparently caused by differential adsorption of the org. materials on crystals faces.

3399. MANNELLI, GIOVANNI AND ROSSI, M. L. **Adsorption indicators. IV.** *Anal. Chim. Acta* **6**, 333-6 (1952) (in French).—*C.A.* **46**, 7460g.

A new adsorption indicator, Red Acid 6B, was used for the argentometric titration of halide ions. It is applicable for very dil. solns. of I^-.

3400. O'CONNOR, D. J. AND BRYANT, F. **Adsorption of amino acids on sparingly soluble inorganic solids.** *Nature* **170**, 84-5 (1952).—*C.A.* **46**, 9378*h*.

Aspartic acid and glycine were adsorbed on synthetic zeolite and the following inorg. compds.: natural ZnS, PbS, $PbMnO_4$, $PbSO_4$, $BaSO_4$, $PbCrO_4$, and fused $PbCrO_4$, by column operation, and on the zeolite, fused $BaCrO_4$, and natural and synthetic inorg. compds. by batch operation. In each case the zeolite adsorbed the most acid.

3401. POURADIER, JACQUES AND ROMAN, JANINE. **Factors influencing the adsorption of gelatin by the surface of crystalline silver halide.** *Science et inds. phot.* **23**, 4-13 (1952).—*C.A.* **46**, 2433e.

Adsorbed gelatin was defined as that not removed from the AgBr by washing in water at 50°C. The adsorption isotherm for a de-ashed gelatin at 40°C was detd. with pptd. AgBr at pAg 6. At low concn. adsorption of gelatin from the soln. was nearly complete. No desorption of gelatin was observed when AgBr pptd. in the presence of gelatin was dild. with water and agitated for 5 days at 40°C. The amt. of gelatin adsorbed increased with increasing mol. wt, but the amt. of fraction 190,000 was only roughly double that of 30,000.

3402. SCHULEK, E. AND PUNGOR, E. **Adsorption phenomena on the surface of nascent silver iodide particles.** *Anal. Chim. Acta* **7**, 243-54 (1952) (in German).—*C.A.* **47**, 4685*i*.

AgI crystals were quickly obtained upon pptn. in the presence of *p*-ethoxychrysoidine; they were stable in the beginning, aged spontaneously with time, or coagulated with the help of artificial means in such a manner that only a few of their active spots were lost in the process.

3403. SEIFERT, H. **Modification of the habit of growing crystals by impurities [considered] as an adsorption problem.** *Z. Elektrochem.* **56**, 331-8 (1952).—*C.A.* **46**, 10765*d*.

The effect of glycine on NaCl crystals was described. When grown at 40°C from solns. contg. more than 12 g glycine per 100 g satd. NaCl soln., the NaCl crystals tended toward (rhombic) dodecahedra. The approx. fit of the 110 planes of NaCl with the 100 planes of glycine could not explain the detailed observations.

3404. WEISS, ARMIN AND HOFMANN, ULRICH. **Reactions inside the layer lattice of carnotite.** *Z. Naturforsch.* **7b**, 362-3 (1952).—*C.A.* **47**, 4166h.

A synthetic carnotite of the cation exchange capacity of 220 meq./100 g air-dry powder exchanged its K^+ against Na^+, Mg^{2+}, Ni^{2+}, arginine, lysine, and aromatic amines. The Ni ions were pptd. and fixed with a MeOH soln. of $(MeC{:}NOH)_2$. In both cases H ions instead of the metal ions were exchangeable after the pptn. α-Benzil dioxime, however, was incapable of pptg. the Ni inside the layers.

3405. WEST, W.; CARROLL, B. H., AND WHITCOMB, D. H. **Adsorption of sensitizing dyes in photographic emulsions.** *J. Phys. Chem.* **56**, 1054-67 (1952).—*C.A.* **47**, 4772a.

Many sensitizing cyanine dyes were adsorbed to the grains of photographic emulsions according to the Langmuir equation, the mols. in the satd. monolayer being oriented. Less well adsorbed dyes often exhibited a discontinuity between adsorption as isolated mols. and a coöperative phase with different spectral characteristics. Polylayer adsorption also occurred, and merocyanines conformed to Langmuir of approx. Freundlich curves, according to the class.

3406. BEISCHER, D. E. **Radioactive monolayers: a new approach to surface research.** *J. Phys. Chem.* **57**, 134-8 (1953).—*C.A.* **47**, 6725*f*.

C^{14}-tagged stearic acid monolayers could be formed on the surfaces of various solid materials and heated so that the monolayers reacted with the solid surfaces. When the excess unreacted monolayers were removed by benzene, there remained a radio-autograph on the surface. Results were reported for Pt, vitreous SiO_2, glass, mica, Cu, Pb, molybdenite, and brucite surfaces.

3407. DUNBAR, J. C. AND MITCHELL, T. J. **Electrodeposition of powdered inorganic materials from suspension in organic liquids.** *J. Sci. Food Agr.* **4**, 190-6 (1953).—*C.A.* **47**, 6275*c*.

The amt. of deposit increased with increasing dielec. const. in the series $MeCO_2Et$, AmOH, BuOH, PrOH, EtOH, MeOH. The deposition of $MgCO_3$ from cyclohexanone was in agreement with the dielec. const. of the liquid, but $CaCO_3$ did not electrodeposit from this compd.

3408. EWING, WARREN W. AND LIU, FRED W. J. **Adsorption of dyes from aqueous solutions on pigments.** *J. Colloid Sci.* **8**, 204-13 (1953).—*C.A.* **47**, 6215*a*.

Anatase, rutile, and ZnO with surface areas known from electron-microscope or B.E.T. measurements were used as adsorbents for purified Crystal Violet and purified Orange II from aq. solns. at room temp. One isotherm was also detd. at 60°C and 93°C. The data were consistent with the B.E.T. theory of multilayer adsorption. The areas calcd. for the adsorbents were consistent with the known values if the cross-sectional areas of the adsorbates were 80 A.^{2} for Crystal Violet and 70 A.^{2} for Orange II.

II-6. Inorganic Solids With Inorganic Solutions

3409. Bradley, R. S. **Surface reaction between oxonium ions and mica.** *Trans. Faraday Soc.* **35**, 1361-6 (1939).—*C.A.* **34**, 1532^4.

Sheets of freshly cleaved muscovite were immersed for short times in solns. of pH between 2.5 and 6 at 25°C; they were then quickly withdrawn and plunged into KOH to check the reaction and then washed with distd. water. A drop of dil. NH_4I was allowed to dry slowly on the mica and the crystals formed differed from the oriented tetrahedral crystals found on untreated mica surfaces. A mixture of oriented tetrahedra and unoriented cubes occurred, the proportion of the latter increasing with the time of immersion in the acid soln.

3410. Polesitskii, A. **Exchange of bromine-ions between silver bromide and a bromine solution.** *Compt. rend. acad. sci. U.R.S.S.* **24**, 668 (1939).—*C.A.* **34**, 1902^3.

Exchange of Br ions between freshly coagulated AgBr and KBr soln. was studied. The exchange was found to proceed very rapidly at first (10% exchange in the first min.) then the ratio dropped abruptly, requiring 20 to 30 hrs to reach completion. This was attributed to aging of the ppt. "Preaged" ppts. were found to have slower rates of exchange, and melted AgBr showed no exchange.

3411. Ruyssen, R. and Verstraete, E. O. K. **Streaming potential and surface conduction in the sulfur diaphragm.** *Natuurw. Tijdschr.* **22**, 93-103 (1940).—*C.A.* **37**, 2978^4.

Calcn. of the "wall cond." of the S showed that Ba^{++} was distinctly less adsorbed than K^+; at higher concns. the "wall cond." in the presence of K^+ and Ba^{++} was practically additive. The av. ζ-potential of S in pure water was −50 mv.; the S was still not discharged by 1000 μ-equiv. of $BaCl_2$, but was discharged by 500 μ-equiv. of KCl 500 μ-equiv. of $BaCl_2$. The active surface of the S was 700 m^2/kg.

3412. Balarev, V. D. **Disperse structure of solid systems and its thermodynamic foundation. V. VI. Application of the Gibbs-Thomson equation for crystals.** *Kolloid-Z.* **97**, 300-4 (1941); **98**, 43-5 (1942).—*C.A.* **36**, 5689^9.

Observations on petization and turbidity phenomena were reported for $BaSO_4$. The order of magnitude of the sepd. particles was 0.1μ. The equil. dimensions of the free $BaSO_4$ particles were approx. 1/10th that of the prepd. KCl crystal. The thermodynamic treatment was based on ideal crystals in 3 directions. In reality, not only real intergrown conglomerates but also the real uncombined crystals capable of existence, had to be differentiated from the ideal.

3413. Gleditsch, Ellen and Rona, Elisabeth. **Investigation of the exchange of ions between salts and saturated solutions.** *Arch. Math. Naturvidenskab.* **44**, 53-62 (1941).—*C.A.* **38**, 1938^4.

The exchange of Cu in the systems $CuSO_4$-satd. $CuSO_4$ soln., CuI-satd. $CuSO_4$ soln., and CuBr-satd. $CuSO_4$ soln. and that of the halogens in the systems CuI-NaI soln. and CuBr-NaBr soln. were investigated. The corresponding radioisotopes were used for the solns., and the activities of the solid phases were detd. after varying intervals.

3414. Kerékgyartó, Jenö. **Radioactive-kinetic research on the exchange process on heteropolar crystal surfaces.** *Magyar Chem. Folyóirat* **47**, 121-48 (1941).—*C.A.* **38**, 3903^9.

The dissolved ions were either adsorbed directly on the surface or the surface particles were exchanged for them. The first was true adsorption and was, among other things, responsible for charging of the surface, but the exchange of ions could be evaluated by the detn. of the abs. interfacial surface. The exchange process for detg. interface had been tested from 3 points of view. First, the surface phenomena mentioned above were sepd. from each other. Second, the magnitude of the exchange capacity of the surface was detd. The 3rd question was whether the sum of the elementary surfaces of the surface mols. capable of exchange agreed with the total surface or not. The facts found so far showed that in many cases the entire surface was not exchanged.

3415. Orr, W. J. C. **An attempted isotopic separation by fractional crystallization.** *Trans. Faraday Soc.* **37**, 587-90 (1941).—*C.A.* **36**, 1544^3.

A continuous flow of satd. NaCl soln. in a 9% CH_3OH-water mixt. moved upward in a long column, while a continuous stream of NaCl crystals, pptd. from the satd. soln. as it reached the top, passed down the column. After one month's continuous operation the shift in the at. wt of Cl was less than 0.05 of an at.-wt unit.

3416. Verstraete, E. O. K. **Determination of the adsorbed and free polythionic compounds in colloidal sulfur.** *Meded. Kon. Vlaamsche Acad. Wetensch., Letteren Schoone Kunsten Belgie, Klasse Wetensch.* **3**, 3-10 (1941).—*C.A.* **37**, 4288^9.

In the prepn. of colloidal S from H_2SO_4 and $Na_2S_2O_3$, large amts. of polythionic compds. always appeared, particularly pentathionic compds., which acted to stabilize the sol. After purification and prolonged electrodialysis there was in the sol. an equio. between adsorbed and free $H_2S_5O_6$ and $Na_2S_5O_6$, the development of which could be followed by acidimetric and iodometric titration of the sol., the ultrafiltrate (the filtrate after pptn. with KNO_3), and by detn. of the residue of ash in the ppt. so obtained.

3417. Bachelet, Maurice. **Chemical process of extraction and determination of radioactinium.** *J. phys. radium* [8], **3**, 171-6 (1942).—*C.A.* **38**, 4190^2.

The sepn. of Rd-Act from solns. of rare earth elements was based on its being carried down with $La(OH)_3$ during its partial pptn. The first 4% of $La(OH)_3$ contained 97% of the Rd-Act. If Fe was present, the ppt. also contained Fe $(OH)_3$, but treatment with a mixt. of alkali carbonates and sulfides brought only the Rd-Act into soln.

3418. Baur, Emil. **The behavior of sodium chloroaurate of extreme dilution and the separation of gold from sea water.** *Helv. Chim. Acta* **25**, 1202-25 (1942).—*C.A.* **37**, 5898^7.

Adsorption of gold from dil. solns. (several mg Au/m^3) by glass, zeolite, charcoal, coke, cellulose, sawdust, PbS, and sulfur sol was discussed. Many of the published values for gold content of sea water may be in error owing to adsorption of the metal by the glass walls of the vessel in which the samples were stored. A method of analysis for these small amts. of gold was given. Extn. of gold from sea water by means of adsorbents was considered.

3419. Boutaric, Augustin and Berthier, Paulette. **Test of the addition rule for magnetic properties during adsorption phenomena.** *J. chim. phys.* **39**, 129-33 (1942).—*C.A.* **38**, 3173^9.

In mixts. of colloidal solns. of $Fe_2(OH)_6$ and in those of Fe_2Cl_6 with adsorbed substances, it was shown that the frequently confirmed addn. rule for magnetic susceptibilities lost its applicability. The rule could be sustained only on the assumption that the magnetic susceptibility of the dissolved subs. decreased as a result of the adsorption.

3420. Dolique, R. and Macabet, L. **Ion exchange on zeolites in toxicology.** *Bull. sci. pharmacol.* **49**, 161-4 (1942).—*C.A.* **38**, 5447^4.

A zeolite filter retained Zn, Pb and Ba as well as Ca. Pb and Ba were adsorbed in even larger quantities. However, these metals were more easily released from the filter. Hg as a salt with a strong acid was not retained by zeolites.

3421. Føyn, Ernst andGleditsch, Ellen. **The ion exchange between salts and their saturated solutions.** *Arch. Math. Naturvidenskab* **45**; 91-9 (1942).—*C.A.* **38**, 2542^4.

The exchange velocities of Cu^+, Pb^{++}, Cl^-, Br^- and I^- in satd. solns. were studied by means of radioactive tracers. The exchange velocity of Cu^+ was 20 times that of the halide ions. For the lead halides, the exchange velocities of Pb^{++} and Br^- were about equal, but greater than that of I^-.

3422. Kargin, V. A. and Tolstaya, M. A. **Exchange adsorption of AgI sols.** *J. Phys. Chem. (U.S.S.R.)* **16**, 115-23 (1942).—*C.A.* **37**, 6515^7.

Exptl. data were given for the ph and the amts. of NaOH and of $AgNO_3$ adsorbed on the sol and in the ultrafiltrate both before and after coagulation. The adsorption of HI on AgI was weaker than that of BaI_2 either alone or as a mixt

3423. Kurzke, H. and Rottgardt, J. **Decolorization of alkali halide crystallites. II. Decolorization studies of microcrystalline layers colored by cathode rays.** *Ann. Physik* **41**, 584-96 (1942).—*C.A.* **37**, 4946^9.

Micro-crystals of KBr were prepd. either by pptn. from a suspension or by condensation from vapor, preferably the latter. Coloring was produced by 16-kv. cathode rays. Decolorization was accelerated by moisture and by high temp., and was slower in large crystals. The decolorization time increased linearly with the amt. of exposure used to produce the initial color.

3424. Tendeloo, H. J. C. and Voorspij, A. J. Zwart. **Adsorption electrodes. IV. Glass electrodes.** *Rec. trav. chim.* **61**, 531-8 (1942).—*C.A.* **37**, 5912^6.

Membranes made of CaF_2 and Corning glass 015 showed a certain activity as Ca electrodes; however, the observed e.m.f.'s did not agree with the theoretical values. Studies were made of the behavior, as electrodes, of glasses consisting of 6% CaO and variable amts. of Li_2O, Al_2O_3 and SiO_2, fused onto glass tubes as thin, very fragil membranes. Measurements in KCl, then in $CaCl_2$ and then in KCl soln. again, indicated that adsorption phenomena play a significant role in the potential values of a glass membrane.

3425. Težak, Božo. **The process of precipitation. II. Relation between the phenomena of precipitation and the fine structure of the electrokinetic double layer on silver chloride surfaces in aqueous sodium chloride solutions.** *Z. physik. Chem.* **A190**, 257-71 (1942).—*C.A.* 37, 4609^9.

The time-pptn. curves (detd. by Tyndall measurements) of $AgNO_3$ solns. of const. concns. in relation to the changing concn. of the NaCl solns. were used to study crystal boundaries. Below 20°C with systematic change in the concn. of the NaCl solns. from 0.1 to 0.0001 *N* a periodic connection existed between the stability of the AgCl particles and the NaCl concn. The pptn. curve showed 2 distinct max. at 0.04 and 0.004 *N* as well as 2 min. at 0.02 and 0.002 *N*. These could be explained by a consideration of the effects of the direct particle growth and the enlargement of the secondary particles through coagulation.

3426. Težak, Božo. **Information on precipitation reaction. III. The effect on the size and valence of the cations on the electrokinetic double charge on AgCl surfaces in aqueous solutions.** *Z. physik. Chem.* **191A**, 270-83 (1942).—*C.A.* **37**, 6519^1.

The speed of pptn. of AgCl from solns. of $AgNO_3$ by reaction with various concns. of Li, Na, K, Rb, Cs, Mg, Ca, Se, Ba, Al and Th chlorides was detd. Math. equations were derived relating the effect of the size and charge of the metal ion.

3427. Troelstra, S. A. and Kruyt, H. R. **Electrophoretic measurements on hydrophobic colloids.** *Kolloid-Z.* **101**, 182-9 (1942).—*C.A.* **38**, 4850^7.

Exptl. results on sols of AgI and Fe_2O_3 were reported. The electrophoretic curves of AgI sol with the nitrates of Ba, Mg, Al, La and Th were very uniform. The various valence groups were distinctly sepd., since also the relaxation effect was eliminated to a large extent in the medium of relatively high electrolyte content. For the sake of comparison the results of extinction measurements on the coagulation of a AgI sol with various salts were considered.

3428. Daudel, Raymond. **Exchange reactions.** *Compt. rend.* **216**, 666-7 (1943).—*C.A.* **38**, 2283^7.

To det. concn. of solute *A*, add an excess of radioactive reagent B^* to produce ppt. AB^*. Then add *BC* (sol., not radioactive) which comes quickly to equil. with B^*, but reacts slowly if at all with AB^*. Sep. BC, det. its radioactivity, thereby the amt. of free B^*, and, therefrom, A.

3429. Hafner, Harold C. and Jones, Frank L. **Adsorption of ions by leached surface films on glass.** *J. Am. Ceram. Soc.* **26**, 55-6 (1943).—*C.A.* **37**, 2147^9.

The leaching of glass by acid or neutral solns. may be complicated by the selective adsorption of certain ions within the hydrated SiO_2 film formed on the glass surface. The rate of release of acid-sol. elements to the attacking soln. was therefore not necessarily in accordance with the amts. present in the body of the glass.

3430. Krestinskaya, V. N. **Adsorption of ions during the coagulation of ferric hydroxide sol.** *J. Gen. Chem. (U.S.S.R.)* **13**, 780-9 (1943) (English summary).—*C.A.* **39**, 854^6.

On coagulation of three positively charged sols of $Fe(OH)_3$ by electrolytes, no adsorption of cations (NH_4, Mg, Ba, Na) took place. Sols of $Fe(OH)_3$ having counter ions (NO_3^-) showed adsorption, in equivalent amts., of anions: Cl, SO_4, oxalate and OH.

3431. Kuroya, Hisao; Aimi, Masasuke, and Tsuchida, Ryutaro. **Asymmetric adsorption of complex salts on quartz. II. Asymmetric adsorption and configuration of complex salts.** *J. Chem. Soc. Japan* **64**, 995-8 (1943).—*C.A.* **41**, 4731*i*.

The adsorption of the 8 complexes, $[Co(en)_3]Br_3.3H_2O$, $[Cr(en)_3]Cl_3.3.5H_2O$, *cis*-$[Co(en)_2(NO_2)_2]NO_3$, $[Co(en)_2ox]Br$, $[Co(en)_2CO_3]Cl.H_2O$, α-$[Co(glycine)].2H_2O$, *cis*-$[Co(en)_2NH_3Br]Br_2.2H_2O$, $[Co(oxin)_3]$ (ox = oxalate radical, oxin = 8-hydroxyquinoline) by fine *d*-quartz powder were studied. A close relation was confirmed between the adsorption and the spatial configuration of the complex.

3432. Langer, A. **Exchange of radioactive silver and bromide with silver bromide suspensions.** *J. Chem. Phys.* **11**, 11-15 (1943).—*C.A.* **37**, 815^8.

The exchange of radioactive Ag^+ and Br^- ions with aq. AgBr suspensions was studied. Both constituents of the AgBr lattice exchanged with the ions in soln. A strong dependence of the exchange rate on the amt. of surface of the ppts. used, for both Ag^+ and Br^-, was observed. A pronounced difference was found in the exchange rate for Br^- if dye mols. were adsorbed on the ppt. prior to the exchange expts. The rate for Ag was not affected by the presence of the adsorbed dye mols.

3433. Lyle, A. K. **Theoretical aspects of chemical attack of glasses by water.** *J. Am. Ceram. Soc.* **26**, 201-4 (1943).—*C.A.* **37**, 4213^5.

The effect of time and temp. on the chem. attack of glasses by water was represented by the equation: $a \log N = \log \theta - b/T + c$, where N = attack, θ = time, T = abs. temp. °K, a, b, and c were experimentally detd. consts. The const. b was independent of the glass compn. and of the size and shape of the sample being tested, and had a value of 5080 for tests of ordinary glass containers.

3434. Sata, Naoyasu and Ito, Shigeru. **The irregular series of colloidal solutions due to electrolytes. VII. Comparative experiments on the adsorption of silver nitrate upon various sulfide precipitates.** *Bull. Chem. Soc. Japan* **18**, 131-3 (1943).—*C.A.* **41**, 4357a.

Adsorption of $AgNO_3$ by HgS and As_2S_3 ppts. was studied. The adsorption by HgS was nonpolar, whereas that by As_2S_3 was an exchange adsorption of As and Ag. The adsorbed quantity of $AgNO_3$ was analyzed by Volhard's method. The intensity of the adsorption was far greater by As_2S_3 than by HgS.

3435. Schwab, Georg-Maria and Schwab-Agallidis, Elly. **Kinetics of reprecipitation.** *Kolloid-Z.* **104**, 67-78 (1943).—*C.A.* **38**, 2871^7.

The velocity of the transformation of $PbCrO_4$ to $PbSO_4$ in H_2SO_4 soln. was proportional to the 1.65-power of the H-ion concn. The increase in rate with increasing SO_4^{--} was due to adsorption. The velocity was inversely proportional to the CrO_4-ion concn. The soln. equil. was strongly repressed by the presence of SO_4^{--} owing to their adsorption on the $PbCrO_4$. The growth of $PbSO_4$ nuclei occurred partly in the free soln. and partly at the surface of the $PbCrO_4$.

3436. Taboury, Martial F. and Queuille, Jean. **Adsorption of selenious ion on various precipitates. Application.** *Compt. rend.* **217**, 150-2 (1943).—*C.A.* **38**, 5470^5.

Se in the form of selenious ions could be detd. by adsorption on Fe_2O_3. A soln. of $FeCl_3$ which would give 60-240 mg Fe_2O_3 was added to 1 liter of H_2O contg. 0.2-20 mg Se. The soln. was boiled and NaOAc added to give an easily filterable ppt. The ppt. was dissolved in HCl and the soln. reduced by $SnCl_2$ after which the Se was detd. colorimetrically. The adsorption followed the equation $x/m = Kc^{1/n}$, where $1/n = 0.5$. Na_2SO_4 reduced the quantity adsorbed. Similar results were obtained with Cr salts but about 10 times the quantity of NaOAc was necessary. With Cr salts, $1/n = 0.6$.

3437. Tendeloo, H. J. C. and Voorspuij, A. J. Zwart. **Adsorption electrodes. V. Glass electrode, ion exchange and electrode properties.** *Rec. trav. chim.* **62**, 784-92 (1943) (in English).—*C.A.* **39**, 1107^8.

With Corning 015 glass, H ions formed a firm bond to the glass surface and the electrode behaved as a practically ideal H electrode up to high pH values. Alteration in the proportion of Na, K or Ca in the original glass caused no fundamental change in the electrode properties. Incorporation of Al_2O_3 in a network of SiO_4 tetrahedra had a marked influence on the electrode properties of a glass in that the appearance of mixed or Na-electrode functions occurred at lower pH values.

3438. Težak, Božo. **Precipitation processes. IV. The relation between crystallization and coagulation phenomena in the precipitation of AgCl.** *Z. physik. Chem.* **192**, 101-11 (1943).—*C.A.* **38**, 2545^4.

$BaCl_2$ solns. of varying concns. were added to $AgNO_3$ solns. of const., low concn. and the pptn.

process was studied tyndallometrically. A characteristic pptn. max. (max. turbidity at the end of 30 min.) was found in the region of concns. approx. 10 times those necessary to satisfy the soly. product const. On one side of this max. (region of high Cl^-) a large no. of small particles appeared, whereas on the other side (region of low Cl^-) the particles were larger.

3439. VENTURELLO, GIOVANNI. **Ion adsorption by aluminum hydroxide.** *Atti reale accad. sci. Torino, Classe sci. fis. mat. nat.* **79**, 275-87 (1943-44).—*C.A.* **41**, 4992e.

When a soln. of $Al_2(SO_4)_3$ contg. Cu and Ni ions was pptd. with NH_4OH, the adsorption of the ions by the ppt. followed the law of Freundlich if the soln. was sufficiently dild. In the presence of high amts. of NH_4OH or NH_4 salts, the adsorption decreased probably because of the formation of complex ions (as $Cu(NH_3)_4^{++}$) which had a greater ionic radius and were less adsorbed. The ppt. and washed $Al(OH)_3$ had a lower adsorbing power.

3440. VERSTRAETE, E. O. K. **Ionic exchange by colloidal sulfur. I. Exchange in lyophobic colloidal systems.** *Kolloid-Z.* **102**, 251-67 (1943).—*C.A.* **37**, 5899⁹.

An analytical procedure for detg. pentathionates in both free and bound conditions enabled both the acid and salt to be estd. The degree of dispersion of the S particle was considered as well as its shape and size. The influence of cations on coagulation varied over a wide range and the valence rule held except for Th. Anion effects were also indicated. Other influences studied were diln., H_2S, H^+ and OH^-.

3441. VERSTRAETE, E. O. K. **Ionic exchange for colloidal sulfur. II. Ionic exchange for lyophobic colloidal systems.** *Kolloid-Z.* **103**, 25-42 (1943).—*C.A.* **38**, 2542⁶.

The ionic exchange of H^+ with other cations for "Selmi" type S sols was investigated. Pentathionic and tetrathionic only were present as shown by described tests. Data on ion exchange depended largely on the concn. of the electrolyte present. For alk. cations exchange was $K > Na > Li$ and for alk. earths $Ba > Sr > Ca > Mg$.

3442. YADAVA, B. P. AND CHATTERJI, A. C. **Charge and stability of colloids. I. Adsorption of oppositely charged ions under different conditions.** *J. Indian Chem. Soc.* **20**, 25-32 (1943).—*C.A.* **37**, 6519².

The adsorption of Ba^{++} on As_2S_3 and SO_4^{--} on $Fe(OH)_3$ were analytically detd. for concns. necessary for coagulation, and for equiv. concns. in the presence of previously coagulated sols. The differences were utilized to calc. charge per particle. Charges were about 7×10^{-5} e.s.u. on both 75-mμ As_2S_5 and 50-mμ $Fe(OH)_3$ particles, and were increased to about 8×10^{-5} e.s.u. by stabilization with carbohydrates or with H_2S or HCl, resp.

3443. YADAVA, B. P. **Charge and stability of colloids. VI. Study of the adsorption of precipitating and stabilizing ions by As_2S_3 and $Fe(OH)_3$ sols at their coagulating concs.** *J. Indian Chem. Soc.* **20**, 223-6 (1943).—*C.A.* **38**, 1934⁸.

The adsorption of K, Ba and Al on As_2S_3 and of Cl, SO_4, Fe $(CN)_6^{III}$ and $Fe(CN)_6^{IV}$ on Fe $(OH)_3$ sols was detd. for a series of coagulating concns. The trends in mol. ratios were of the order: K:Ba:Al adsorbed = 50:5:1 from coagulating concns. K:Ba:Al = 330:10:1 and similarly for the anions 50:5:1.1:1 from 660:5:1.8:1.

3444. AUSTIN, A. T.; HARTUNG, E. J., AND WILLIS, G. M. **Membrane permeability. IV. Improved apparatus for measuring diffusion rates, and the permeability of Cu ferrocyanide to eleven solutes.** *Trans. Faraday Soc.* **40**, 520-30 (1944).—*C.A.* **39**, 2241³.

The effect of surface charge in detg. the selectivity of $Cu_2Fe(CN)_6$ was shown. Where enhanced selectivity was due to adsorbed $Fe(CN)_6^{-4}$, it might be reduced by reaction of these ions with Cu^{++}. Diffusion rates in millimols./hr through $Cu_2Fe(CN)_6$ from M/5 solns. at 25°C were tabulated for KCl, KNO_3, KIO_3, KOAc, KBr, KI, KCNS, K_2SO_4, $K_2C_2O_4$. Sucrose and $K_4Fe(CN)_6$ showed no diffusion and a trace of diffusion, resp.

3445. IIJIMA, S. **Occlusion of potassium chromate by an aluminum hydroxide precipitate.** *Bull. Inst. Phys. Chem. Research (Tokyo), Chem. Ed.* **23**, 99-106 (1944).—*C.A.* **43**, 7775*a*.

By means of a specially designed balance, occlusion of K_2CrO_4 by $Al(OH)_3$ ppts. was detd. Freundlich's isothermal adsorption equation could be applied for the relation between the amt. of K_2CrO_4 occluded and its concn. The amt. of K_2CrO_4 occluded by 1 g $Al(OH)_3$ at 25°C was 0.19 and 0.05 g when its concn. was 0.1 and 0.034 *N*, resp.

3446. IMRE, L. **Applicability of the radioactive-indicator method to the determination of the surface area of solids. II.** *Kolloid-Z.* **106**, 39-46 (1944).—*C.A.* **38**, 3531¹.

The exchange adsorption of K_2CrO_4 and of $Pb(NO_3)_2$ on $BaSO_4$ and the adsorption of $Pb(NO_3)_2$ on $PbCrO_4$ and PbS were detd. for various ratios of adsorbed material to adsorbent. An activation factor was defined by means of the following equation: $X^* = X.\exp^{E/RT}$, where X was the total no. of ions (exchangeable) in the solid wall and the soln., and X^* was the no. of active exchange positions on the surface. The numerical value of E was calcd. from the variation in the exchange adsorption with temp. From this the total no. of surface mols. were calcd. The results agreed with those obtained by microscopic methods.

3447. KRESTINSKAYA, V. N. AND KHAKIMOV, Z. V. **Mechanism of adsorption of silver sulfate on sols of ferric hydroxide.** *J. Gen. Chem. (U.S.S.R.)* **14**, 70-6 (1944) (English summary).—*C.A.* **39**, 854⁴.

Adsorption of Ag_2SO_4 on 4 sols of $Fe(OH)_3$ was studied. In no instance was there observed a mol. adsorption; only SO_4 ions were adsorbed. Ag^+ was not adsorbed by the micelles. $Fe(OH)_3$ sol prepd. from the nitrate did not display this, because it lacked the Cl^-. Ultrafiltrates of the sols showed the presence of FeO only; thus, basic Fe salts were apparently the stabilizers in these sols.

3448. NIKOLAEV, A. V. **Protective films on salts and their utilization.** *Vestnik Akad. Nauk. S.S.S.R.* **1944**, No. 4-5, 57-61.—*C.A.* **39**, 1584³.

The soly. of NaCl in satd. Glauber salt soln. was greatly reduced if the soln. was added to NaCl that was not powd. The result was due to formation of a protective film of solid Na_2SO_4. Gypsum, calcite and slaked lime exhibited the same effect with numerous salt solns.

3449. Polesitskiǐ, A. E. and Murin, A. **Diffusion in the solid phase in the ionic exchange between the precipitates of silver halides and aqueous solutions.** *Doklady Akad. Nauk S.S.S.R.* **45**, 254-6; *Compt. rend. acad. sci. U.R.S.S.* **45**, 238-40 (1944).—*C.A.* **39**, 5147⁵.

The rate of diffusion of Ag ions in cryst. AgCl and AgBr was at least 1000 times larger than that of the Cl and Br ions. Diffusion of Ag ion within the solid probably played an important role in interchange of Ag ions between pptd. Ag halides and surrounding soln. Exchange of Ag ions was hindered only slightly, whereas exchange of Br ions was decreased sharply, when recrystn. of pptd. AgBr was inhibited by adsorbed dye.

3450. Schwab, Georg-Maria. **Oriented films on thallium halides.** *Naturwissenschaften* **32**, 32-3 (1944).—*C.A.* **40**, 2730³.

TlCl or TlBr monocrystal cylinders were treated with Br, I, or Ag ions in soln. TlBr would grow on TlCl in films oriented parallel to the base lattice; at first at 50% mixed crystal was formed. TlI grew poorly on TlCl and only amorphously. TlBr in I soln. covered itself with an oriented film of a 70% TlI mixed crystal. AgCl grew with orientation on TlCl in a few min., likewise AgBr on TlBr.

3451. Spaulding, G. H. and McNabb, W. M. **Removal of Hg from solutions of Hg $(NO_3)_2$ by HgS.** *J. Franklin Inst.* **237**, 207-12 (1944).—*C.A.* **38**, 2542³.

The data indicated that the removal of Hg from dil. solns. of Hg $(NO_3)_2$ by HgS was an adsorption process which followed a Freundlich isotherm. At higher concns. of Hg ion, compd. formation took place, yielding a compd. of the possible formula $2HgS.Hg(NO_3)_2$.

3452. Steinour, Harold H. **Rate of sedimentation.** *Ind. Eng. Chem.* **36**, 840-7 (1944).—*C.A.* **38**, 6019⁷.

Sedimentation rates were observed in nonflocculated suspensions of 2 fine, emery-powder fractions (prepd. by air sepn.) in water alone or water contg. 0.12% of Na hexametaphosphate as dispersant and of a coarse emery powder (prepd. by sieving) in diethyl phthalate. Similar observations were made for flocculated suspensions of the 2 fine powders and a still finer com. emery in 0.12% $ZnSO_4$ soln. In concd. suspensions of either kind liquid must flow past the individual, ultimate particle during sedimentation.

3453. Yadava, B. P. and Chatterji, A. C. **Charge and stability of colloids. IX. The release of counter ions from ferric hydroxide sol on the addition of pairs of electrolytes.** *J. Indian Chem. Soc.* **21**, 357-63 (1944).—*C.A.* **39**, 2685⁵.

The release of Cl^- from $Fe(OH)_3$ sol upon addn. of the paired combinations of KIO_3, K_2SO_4 and K citrate solns. was observed. In nearly all cases the release was greater than an additive value for the individual electrolytes.

3454. Yadava, B. P. **Charge and stability of colloids. X. The release of counter ions from chronic hydroxide sol on the addition of pairs of electrolytes.** *J. Indian Chem. Soc.* **21**, 364-9 (1944).—*C.A.* **39**, 2685⁶.

The Cl^- release from $Cr(OH)_3$ sol was parallel with that from $Fe(OH)_3$.

3455. Jones, Grinnell and Wood, Lloyd A. **The measurement of potentials at the interface between vitreous silica and solutions of KCl by the streaming-potential method.** *J. Chem. Phys.* **13**, 106-21 (1945).—*C.A.* **39**, 2257⁸.

Improvements in the technique for the detn. of the zeta potential at the interface between a nonconducting solid and an aq. soln. of an electrolyte were developed. Zeta-potentials of vitreous silica capillaries in contact with solns. of KCl 10^{-3}, 10^{-4}, and 10^{-5} *N* were detd.

3456. Kolb, Harry J. and Comer, Joseph J. **Habit modification of ammonium dihydrogen phosphate crystals during growth from solution.** *J. Am. Chem. Soc.* **67**, 894-7 (1945).—*C.A.* **39**, 3475⁵.

The habit modification was explained by adsorption of foreign metal ions on the crystal surface, and the degree of tapering may be correlated with the soly. product of the metal hydroxide. Reticular densities of the $NH_4H_2PO_4$ crystal planes were presented to illustrate the compatibility of the adsorption theory with the crystal structure.

3457. Kurbatov, J. D.; Kulp, J. L., and Mack, Edward, Jr. **Adsorption of strontium and barium ions and their exchange on hydrous ferric oxide.** *J. Am. Chem. Soc.* 67, 1923-9 (1945).—*C.A.* **40**, 785³.

The adsorptions at different concns. of Sr and Ba on hydrous ferric oxide at pH 8 and 25°C were compared. Two procedures were used: (1) the copptn. procedure and (2) the adsorption procedure. Radioactive-tracer technique was used. The quantity of adsorbent, temp., pH, salt concn., time, and procedure were maintained const. The ratio of adsorbed g atoms of Sr or Ba to their g ions in soln. increased with diln. The time interval between titration of the sample and removal of soln. for measurement was 30 min. The Sr adsorption was irreversible in 30 min. if the concn. of Sr in soln. was reduced. No exchange between adsorbed Sr and Ba ions in soln. was detected. However, exchange of adsorbed Sr occurred if Ba ions were introduced into the soln.

3458. Sierra, F. and Monllor E. **Some case of adsorption by interchange.** *Anales fis y quim. (Madrid)* **41**, 234-48 (1945).—*C.A.* **44**, 3333b..

A preliminary note describing the formation by pptn. of double salts of the type $M_1Hg(SCN)_4 \cdot M_2Hg(SCN)_4$ and the possibility of their modification through interchange of ions with others present in the soln. Data were given for the effect of concn. of ions of M_1 and M_2.

3459. Veiler, S. Ya. and Rebinder, P. A. **The elasto-plastic properties and the thixotropy of disperse systems.** *Compt. rend. acad. sci. U.R.S.S.* **49**, 345-8 (1945).—*C.A.* **40**, 5963⁵.

A thin plate of mica attached to a glass thread was suspended from a quartz spring in a vessel contg. the liquid to be investigated. A motor lowered the vessel continually at a const. speed of 3.3 μ/sec. The mica plate was immersed in the suspension and the extension of the spring at any given displacement of the plate was read with a microscope. The ultimate shearing stress was independent of the dimensions of the plate and shape of the vessel.

3460. Barbier, Georges; Chabannes, Jean, and Miallet, P. **Adsorption of phosphate ions at the surface of clay colloids by the medium of the alkaline earth metals.** *Ann. agron.* **16**, 7-33 (1946).—*C.A.* **40**, 7467^4.

Compds. formed by the adsorption of phosphate ions from soln. by clay particles contg. adsorbed Ca ions could be easily distinguished from true Ca phosphates by working at concns. of P_2O_5 sufficiently low to prevent pptn. of Ca phosphates even in alk. media. These compds. differed from other adsorbed phosphates (such as ferric) by the speed of formation: equil. was attained in hrs rather than in months as with ferric and years in neutral solns. Adsorption of P_2O_5 by Ca clays was initially more rapid than by Ba, Sr, and Mg clays in that order, maintained a higher level, and was increased by alkalization between pH 7.0 and 8.0.

3461. Dankov, P. D. **The crystalochemical mechanism of the iuteraction between a crystal surface and foreign elementary particles.** *J. Phys. Chem. (U.S.S.R.)* **20**, 853-67 (1946) (in Russian).—*C.A.* **41**, 2295*f*.

Orientation took place when the difference between the lattice spacings of the two crystals was smaller than $[2a\sigma/(C_1 + C_2)]^{1/2}$, a being the relevant lattice spacing of the new crystal, σ its surface tension and C_1 and C_2 its moduli of elasticity. When ionic crystals grew on metals or vice versa, the results depended on whether the interaction between new and old crystal faces had an at. or an ionic mechanism.

3462. Dey, Arun K. and Ghosh, Satyeshwar. **The amphoteric nature of hydrated stannic oxide and the determination of its isoelectric point.** *Proc. Natl. Acad. Sci. India* **15A**, 143-7 (1946).—*C.A.* **44**, 3335*b*.

Hydrated SnO_2 was prepd. by pptn. from $SnCl_4$ soln. with NH_4OH. To 2 cc. samples of the suspension (0.2225 g atom Sn/liter) various amts. of 0.01 *M* NaOH or H_2SO_4 were added, and $K_4Fe(CN)_6$, $AgNO_3$, Orange II, and methylene blue were used as adsorbates. When the alkali concn. was higher than 1×10^{-4} *M*, the basic groups were adsorbed, and the acidic groups were adsorbed when the alkali concn. was lower than this value.

3463. Douglas, G. Vibert; Goodman, N. R., and Milligan, G. C. **The nature of replacement.** *Econ. Geol.* **41**, 546-53 (1946).—*C.A.* **42**, 8718*g*.

Expts. were performed to explain the process by which chalcocite replaced pyrite. A crystal of pyrite set in a bakelite mold had a connecting "well" of dist. water made conducting by 1 drop of HCl. The Pt cathode of a 6-v. dry-cell series was placed in the well, but not in contact with the crystal. The bakelite block was immersed halfway in satd. $CuSO_4$ soln. with a Cu grid just below. After 90 hrs the Cu plating was removed from the crystal. The crystal showed distinct alteration tentatively identified as chalcocite.

3464. Krishna, Bal and Ghosh, Satyeshwar. **The kinetics of reduction between resorcinol and silver tartrate in the light of catalytic activity of colloidal silver.** *Proc. Natl. Acad. Sci. India* **15A**, 153-60 (1946).—*C.A.* **44**, 3341*h*.

The kinetics of reduction of Ag tartrate indicated that the reaction was autocatalytic and unimol. with respect to the Ag salt. The temp. coeff. of the reaction for 10°C was approx. 2.5, the addn. of colloidal Ag increased the unimol. velocity consts. by 2 to 3 times, and the induction period disappeared and H^+ acted as a retarding agent. AgOH was the most probable intermediate product in the reduction of Ag salts.

3465. Mukherjee, N. R. **The theory of crystal growth and its application to the design of industrial crystallizers.** *J. Imp. Coll. Chem. Eng. Soc.* **2**, 68-75 (1946).—*C.A.* **41**, 5002*d*.

The main processes concerned with crystal formation were diffusion, lattice formation, and adsorption. Fundamental data required for crystallizer design included detns. of heats of crystn. and soln., of work required to form crystal surfaces, and of rate of nucleus formation as a function of super-satn.

3466. Mushran, Sukhdeo Prasad and Prakash, Satya. **Negatively charged colloidal solutions of various ferric salts. III. Negatively charged mixed sol of ferric oxide and ferric molybdate.** *J. Indian Chem. Soc.* **23**, 413-19 (1946).—*C.A.* **42**, 16*h*.

Negatively charged ferric molybdate sols were prepd. by petizing freshly pptd. ferric molybdate with caustic soda in the presence of glucose or glycerol. The sols obeyed the Schulze-Hardy coagulation rule and had pH values lying between 7.39 and 7.64.

3467. Nasanen, Reino. **The effect of acid and base addition on the precipitation curve of barium carbonate.** *Suomen Kemistilehti* **19B**, 24-6 (1946) (in German).—*C.A.* **41**, 5365*b*.

There was a marked deviation, increasing with NaOH, between the observed and calcd. values of P, the reciprocal of the slope of the tangent of inflection (in the pptn. of $BaCO_3$ by titration of Na_2CO_3 soln. with 0.2 *N* $BaCl_2$ soln. in the presence of HCl or NaOH). The deviation was concluded to be due to adsorption of the base by the ppt.

3468. Ratner, A. P. and Kantor, T. V. **Adsorption of mesothorium II on barium sulfate.** *Compt. rend. acad. sci. U.R.S.S.* **52**, 47-50 (1946) (in English).—*C.A.* **41**, 1906*f*.

Ms-Th II was prepd. from a soln. of Ms-Th I, contg. Ra and an excess of Ba salts, by adding $La(NO_3)_3$ and pptg. $La(OH)_3$ with NH_3. The ppt. was dissolved in HCl, and repptd. to purify it of Ra and Ms-ThI, washed, dissolved in a satd. soln. of $BaSO_4$ in HCl of the concn. desired for the expts., and dild. with the same soln. until the concn. of $La(NO_3)_3$ was 1×10^{-4} g per 10 ml. The expts. consisted in mixing this soln. with specially prepd. $BaSO_4$ suspensions, centrifuging, and comparing the radioactivity of the supernatant liquid with that of the original. Preliminary expts. showed that adsorption equil. was established in about 10 min.

3469. Royer, Louis. **A new mode of KCl overgrowth on mica.** *Compt. rend.* **226**, 95-6 (1946).—*C.A.* 42, 2832*a*.

Some KCl crystals, obtained during the same expt., were joined along an octahedral face, in one of the two right-angle positions. It was necessary to prove that there was no substance in the soln. capable of modifying the crystal form and that the new orientation was always along a plane of the KCl cube, *p*(001), regardless of what crystal faces were developed externally.

3470. Sierra, F. and Monllor, E. **The effect of certain factors in crystalline precipitation.** *Anales fís y quím. (Madrid)* **42**, 303-14 (1946).—*C.A.* **41**, 6797*e*.

When Zn^{++} was added as acetate, tartrate, citrate, or oxalate to ppt. $ZnHg(SCN)_4$, the speed of pptn. decreased in the above order, owing to variation in the strength of complexing of Zn^{++} by the anion, and to adsorption of the latter. The shape and habit of the crystals formed were affected by both the anion of the Zn salt and the cation of the $Hg(SCN)_4^{--}$ salt.

3471. Süe, Pierre. **Colorimetric microchemical analysis of a precipitate adsorbed by an adsorber.** *Ann. chim. anal.* **28**, 26 (1946).—*C.A.* **40**, 2765[7].

Five γ of Ag or 1 γ of Ni could be detd. by pptg. AgI or the Ni dimethylglyoxime together with several times as much $BaSO_4$– ($BaCl_2$ + $(NH_4)_2SO_4$) in 3.5 ml of soln. The white $BaSO_4$ helped to collect the smaller ppt. and the color could serve for detg. Ag or Ni. Similarly, Ag_2S could be deposited on $BaSO_4$.

3472. Wood, Lloyd A. **The measurement of the potential at the interface between vitreous silica and pure water.** *J. Am. Chem. Soc.* **68**, 437-41 (1946).—*C.A.* **40**, 2711[2].

An app. for the production of streaming potentials was described in which the liquid was in contact only with SiO_2 and Pt, suitable for measurements with water of high purity. The zeta-potential of vitreous SiO_2 in contact with water of high purity was probably about -177 millivolts.

3473. Zimens, Karl E. **Exchange reactions with solids.** *Arkiv Kemi, Mineral. Geol.* **A21**, No. 16, 32 pp. (1946) (in German).—*C.A.* **41**, 904[d].

The kinetics of heterogeneous exchange reactions were considered, and applications to problems of corrosion, reactions of solids, and heterogeneous catalysis were cited. The use of a self-diffusion coeff. was suggested for the study of disorders in crystal lattices.

3474. Andreasen, A. H. M.; Krebs, K.; Dalsgaard-Pederson, N. Aa.; Damradt-Petersen, E., and Kjaer, B. **Production of monodispersed particle systems of barium sulfate, copper oxide, and mercuric iodide.** *Inst. Chem. Engrs. and Soc. Chem. Ind., Road and Bldg. Materials Group, Symposium on Particle Size Analysis Feb. 4,* **1947**, 4-13 *Suppl. to Trans. Inst. Chem. Engrs.* **25**, (1947).—*C.A.* **44**, 5183*i*.

It was shown that the transmitted light intensity passed through a min. at almost the particle size where the scattered light intensity passed through a max. This particle size was near the wave length of the light used (e.g. 0.4-0.8 μ) for white substances, but considerably smaller for colored particles (e.g. 0.07 to 0.2 μ for pyrolusite).

3475. Canal, P. **Selective coloration of polished calcite surfaces.** *Rev. inst. franc. pétrole* **2**, 235-43 (1947).—*C.A.* **42**, 4015h.

Calcite and dolomite were distinguished by selective staining of polished calcite surfaces by a large no. of inorg. reagents. The nature of stains produced by $FeCl_3 + (NH_4)_2S_x$, $AgNO_3 + KCrO_4$, $Ni(NO_3)_2$, and $Zn(NO_3)_2$ was investigated by x-ray diffraction methods. A stable, durable, colored film resulted only if the coloring agent crystd. in similar form to the calcite.

3476. Cottin, Maurice and Haïssinsky, Moïse. **Exchange in binary and ternary systems: periodate-iodine.** *Compt. rend.* **224**, 1636-8 (1947).—*C.A.* **41**, 7219*e*.

By use of radioactive Na, the exchange between $NaIO_4$ and $NaIO_3$ in 0.02 *N* HNO_3 soln. was investigated. I_2 acted as a catalyst, but other reduction-oxidation catalysts such as $Ce(NO_3)_3$ and $KReO_4$ acted more as inhibitors for the reaction. The strong catalytic action of I_2 therefore implied exchange in the systems IO_3^-/I_2 and IO_4^-/I_2.

3477. Dey, Arun K. and Ghosh, Satyeshwar. **The conditions of precipitation of cupric hydroxide from cupric salts by soluble hydroxides. I. Reaction between solutions of cupric sulfate and sodium hydroxide.** *J. Indian Chem. Soc.* **24**, 181-4 (1947).—*C.A.* **42**, 6216*c*.

The amt. of NaOH needed for the complete pptn. of Cu in soln. was about 10% less than the equiv. quantity, and this behavior was explained on the basis of hydrolytic adsorption of the SO_4^{--} by $Cu(OH)_2$. This type of adsorption occurred at 30°C, but at 50°C and 80°C became negligible, and complete pptn. occurred practically with equiv. quantities.

3478. Ethrington, C. G. and Hughes, J. W. **Determination of small quantities of manganese in caustic soda.** *Analyst* **72**, 472-5 (1947).—*C.A.* **44**, 9862*f*.

The method depended on the complete adsorption of Mn on $Mg(OH)_2$ pptd. by addn. of 15 ml of 10% $MgSO_4$ soln. to 10% aq. NaOH. The $Mg(OH)_2$ was sepd. by reverse filtration and the Mn detd. by the periodate method.

3479. Glazman, Yu. M. and Tartakovskaya, B. E. **The adaptation phenomenon in the coagulation of hydrophobic colloids by electrolytes.** *Kolloid. Zhur.* **9**, 241-54 (1947).—*C.A.* **47**, 947*c*.

To a neg. AgI sol (0.002 *M*) *m* drops of salt soln. were added, the ppt. was filtered 24 hrs later, and the turbidity *a* of the filtrate detd. The curve *a* vs. *m* was an inverted S. When the sol. was coagulated by adding 1 drop of coagulant soln. every 24 hrs for *n* days, and then filtered 24 hrs after the last drop, a predetd. value of *a* was reached when *n* was less than *m* ("neg. adaptation"). The ratio $(m-n)/m$ was 0.18-0.22, independently of the value of *a* (which was varied 8-fold) and of the coagulant (KCl, KNO_3, $BaCl_2$ $Ba(NO_3)_2$, and $CeCl_3$); *n* varied from 14 to 24.

Diln. of the AgI sol. slightly raised the coagulating concn. of $CeCl_3$ and $BaCl_2$ and slightly lowered that of KCl.

3480. Gorodetskaya, A. V.; Frumkin, A. N., and Titievskaya, A. S. **Adhesion of mercury to glass in electrolyte solutions.** *J. Phys. Chem. (U.S.S.R.)* **21**, 675-88 (1947) (in Russian).—*C.A.* **42**, 2159*h*.

A horizontal glass plate was slowly lowered onto a Hg meniscus in an aq. electrolyte soln., and the time detd. that was required by Hg to displace the aq. film and to make contact with the glass. After the contact was established, the plate was lifted, and the max. values of the contact angle θ between glass, Hg, and soln. detd. In solns. of Na_2SO_4, NaOH, and H_2SO_4 the time was smaller and θ greater, the more dil. the soln.

3481. Grimley, T. B. and Mott, N. F. **The contact between a solid and a liquid electrolyte.** *Discussions Faraday Soc.* No. **1**, 3-11 (1947).—*C.A.* **42**, 8579*e*.

The difference of elec. potential between the Ag and solid AgBr was of the order of 1.4 v.; the distribution of the charge in the double layer was also discussed. In the region of the phase boundary area, calcns. showed that the concn. of vacant lattice points exceeded by several powers of ten the concn. in the bulk of the crystal.

3482. Harbury, Lawrence. **Solubility and melting point as functions of particle size. II. The induction period of crystallization.** *J. Phys. & Colloid Chem.* **51**, 382-91 (1947).—*C.A.* **41**, 3677*f*.

The theoretical aspects of crystn. from supersatd. solns. were discussed, considering selective adsorption, impurities, mobility on crystal surfaces, blocking agents, and lattice defects.

3483. Hubicki, Wlodzimierz. **The mechanism of precipitation of lead phosphate.** *Ann. Univ. Mariae Curie-Sklodowska Lublin-Polonia, Sec.* **AA**, 2, 103-23 (1947).—*C.A.* **43**, 3305*c*.

The reaction between $Pb(NO_3)_2$ and Na_2HPO_4 or Na_3PO_4 in soln. was investigated by conductometric and potentiometric analysis. The ions of Pb which disappeared during this reaction were compensated by ions of H and Na in accordance with the theory of the mobility of ions in an infinitely dil. soln. The pH of the soln. of Na_3PO_4 titrated by means of $Pb(NO_3)_2$ was lower than that of the $Pb(NO_3)_2$ soln. used because of ion adsorption on the surface of the amorphous $Pb_3(PO_4)_2$.

3484. Jacobi, E. **Adsorption of artificially radioactive cadmium ion on silver chloride.** *Helv. Phys. Acta* **20**, 166-72 (1947).—*C.A.* **41**, 5388*g*.

Adsorption increased with neg. charge of the surface owing to Cl^- and decreased with increasing soly. of the adsorption complex and temp. In the presence of HNO_3, 2 effects occurred: (1) coagulation of the ppt. by the acid; (2) low soly. of the adsorption complex. In dil. soln., quant. pptn. required 0.25 *N* acid and boiling temp. for min. adsorption. The tracer was 6.7-hr Cd.

3485. Kurbatov, M. H. and Kurtabov, J. D. **Adsorption isotherm for determination of barium in quantities as low as 10^{-10} gram atom.** *J. Am. Chem. Soc.*, **69**, 438-41 (1947).—*C.A.* **41**, 3394*e*.

An adsorption isotherm for Ba on hydrous Fe_2O_3 could, with proper precautions as to pH and salt concn., be used for analysis of solns. of $BaCl_2$ contg. as little as 10^{-10} g atoms.

3486. Mather, Katharine. **Relation of absorption and sulfate test results on concrete sands.** *A.S.T.M. Bull.* **144**, 26-31 (1947).—*C.A.* **41**, 2548*a*.

Statistical analysis of absorption and $MgSO_4$ test values for 409 sand samples showed a high correlation; 60 to 65% of the variation in sulfate test results was attributable to variation in adsorption.

3487. Mushran, S. P. and Prakash, Satya. **Negatively charged colloidal solutions of various ferric salts. V. Negatively charged ferric arsenate sol.** *J. Indian Chem. Soc.* **24**, 389-95 (1947).—*C.A.* **42**, 5304*c*.

Sols were prepd. by mixing solns. of $FeCl_3$, KH_2AsO_4, NaOH, and glucose or glycerol. Conductance and extinction coeffs. of the dialyzed sols were obtained. Positively charged ferric arsenate sols were also prepd.

3488. Mushran, S. P. **Negatively charged colloid solns. of various ferric salts. VI. Negatively charged ferric phosphate sol.** *J. Indian Chem. Soc.* **24**, 396-402 (1947).—*C.A.* **42**, 5304*d*.

Sols were prepd. by mixing solns. of $FeCl_3$, KH_2PO_4, NaOH, and glucose or glycerol. Conductance and extinction coeffs. of the dialyzed sols were obtained.

3489. Pieruccini, Renzo. **Introducing aluminum, iron, lead, and molybdenum into synthetic apatites.** *Mem.* **54**, 12 pp. (1947).—*C.A.* **42**, 3290*h*.

Minor constituents of apatites (Al, Fe, Pb, and Mo) were introduced synthetically into the crystals, where they were found to be contained, resp., as Al_2O_3 1.88, Fe_2O_3 0.03-0.05, PbO 0.07, and MoO_3 0.01%. However, some intensely colored crystals may contain up to 2% Fe_2O_3. Al replaced Ca and P.

3490. Shapiro, I. and Kolthoff, I. M. **Aging of precipitates and coprecipitation. XXXIX. Low-temperature conductivity of silver bromide.** *J. Chem. Phys.* **15**, 41-6 (1947).—*C.A.* **41**, 2300*g*.

An expression was proposed for the elec. cond. of AgBr. In agreement with theoretical expectations, $x = 3.0 \times 10^5 \exp(-18{,}000/RT) + A_i \exp(-8300/RT)$, in which A_i varied in proportion in the active surface of the product. A pellet prepd. from freshly pptd. AgBr had about 500 times as large a cond. as a pellet prepd. from fused AgBr. The temp. effect was accounted for by the contribution of the active surface.

3491. SIERRA, F. JIMENEZ. **The physicochemical study of hydrolytic adsorption from the viewpoint of chemical analysis.** *Anales univ. Murcia (Spain)* **1947/1948**, 859-91.—*C.A.* **43**, 6882*h*.

The pH evolved in the formation of $BaSO_4$ was measured in pptn. from (a) solns. of Na_2SO_4 and K_2SO_4, with the gradual addn. of $BaCl_2$; (b) the same solns. in the presence of KCl; and (c) solns., resp., of Rb_2SO_4, Cs_2SO_4, Li_2SO_4, and $MgSO_4$. There was formed a polar network contg. some surface spots occupied by K^+, SO_4^{--} ions superficially attached, sufficient quantities of H^+ and K^+ counter-ions to neutralize the elec. charge caused by the excess SO_4^{--}.

3492. TAYLOR, C. B. **Reduction of potassium permanganate in the presence of glass.** *Nature* **160**, 56-7 (1947).--*C.A.* **41**, 7212*c*.

O_2 was absorbed by distd. H_2O from 0.0125 *N* $KMnO_4$, acidified with H_2SO_4, in the presence of glass beads, crushed plate, crushed bottle, and crushed Pyrex glass, and crushed Vitreosil. With 100 g of each, crushed to comparable dimensions, the amt. absorbed was 0.63-0.87 p.p.m. If once-used glass was washed with distd. H_2O and reused, no O_2 was absorbed. Glass was reactivated by drying in thin layers in air at 30° and 140°C, and in N_2 or O_2 at 140°C.

3493. TENDELOO, H. J. C. **The potential of ion-exchanging substances.** *Discussions Faraday Soc.* No. **1**, 293-8 (1947).—*C.A.* **42**, 8581*b*.

Depending on its compn., a glass could function nearly exclusively as an electrode for H ions or for other ions as well, if it contained Al_2O_3. A "dissocn. const." of the glass could be calcd.; this appeared to be greater for glass contg. Al_2O_3 than for Corning glass 015. A theory based on ion-exchange and the adsorption formula of Langmuir was developed for the potential of a glass electrode, and was in accordance with exptl. results.

3494. WEYL, W. A. **Some practical aspects of the surface chemistry of glass. IV.** *Glass Ind.* **28**, 408-12, 428, 430, 432 (1947).—*C.A.* **42**, 2412*d*.

Base-exchange reactions of wet glass surfaces and reactions with water, acids, and alk. solns. were described. The behavior of Be^{2+}, Al^{3+}, and Zr^{4+}.as neg. catalysts in the chem. attack and mech. abrasion of glass was an important phenomenon of surface chemistry.

3495. ZETTLEMOYER, A. C.; ZETTLEMOYER, E. A., AND WALKER, W. C. **Active magnesia. II. Adsorption of fluoride from aqueous solutions.** *J. Am. Chem. Soc.* **69**, 1312-15 (1947).—*C.A.* **41**, 5772*e*.

Studies of the adsorption of F^- from solns. of NaF on a series of activated MgO showed that the rates of F^- adsorption and of hydration increased with increasing surface area for powdered magnesia. However, no correlation was found between surface area and the equil. amounts of F^- adsorbed.

3496. ARTÉS, OCTAVIO CARPENA. **Volumetry and potentiometry of sulfates as affected by hydrolytic adsorption.** *Anales univ. Murcia*, **1948-49**, 288-355.--*C.A.* **44**, 4371*i*.

The pH changes occurring during the pptn. of $BaSO_4$ were detd. upon the gradual addn. of $BaCl_2$ at 18°C to the sulfates of Li, Na, K, Rb, Cs, Mg, Ni, and Zn and to mixts. of some of these with KCl, LiCl, HCl, and colloids. The reaction of $Ba(NO_3)_2$ and $Ba(AcO)_2$ with K_2SO_4, and the reverse reactions were studied in the same manner. For the analysis of the sulfates of NH_4, Ca, and Mg it was recommended to adjust the pH to between 5 and 8 by addn. of 0.1 *N* HCl or KOH, and to titrate 20 to 100 ml with any of the above electrodes. For the analysis of $NiSO_4$ or $ZnSO_4$ the pH was adjusted to between 4 and 6.

3497. BARRER, R. M. **Synthesis of a zeolitic mineral with chabazitelike sorptive properties.** *J. Chem. Soc.* **1948**, 127-32.—*C.A.* **42**, 4423*a*.

A new group of minerals having rectangular crystals, nearly isotropic, weakly birefringent, was synthesized from analcite, leucite, and pptd. alumino-silicates by autoclaving a mixt. of the aluminosilicate an equal vol. of $BaCl_2$, $BaBr_2$, KCl, or KBr, and H_2O equal to the apparent vol. of the solids in a stainless steel autoclave at 180-220°C for 2-6 days.

3498. BUCHANAN, A. S. AND HEYMANN, E. **Electrokinetic potential and surface structure of barium sulfate.** *Nature* **161**, 649, 691 (1948).--*C.A.* **42**, 5302*h*.

Zeta potential of recrystd. $BaSO_4$ against satd. soln. was of the order of + 25 mv. and reproducible to 1 mv. for each sample. That of natural barite was much less. The difference was ascribed to the structure of the surface (much more regular for the natural product) as shown by optical and electron microscopes.

3499. BUCHANAN, A. S. AND HEYMANN, E. **The electrokinetic potential of barium sulfate.** *Proc. Roy. Soc. (London)* **A195**, 150-62 (1948).—*C.A.* **43**, 4924*a*.

The electrokinetic potential of recrystd. $BaSO_4$ was investigated against its satd. soln. in water by the streaming potential method. The potential was pos. The potential of natural barite was also pos. but smaller. The difference was due to irregularity of surface and consequent distortion of the lattice for the recrystd. variety. The results could not be explained by selective adsorption of ions from soln.

3500. COHN, CHARLOTTE. **Adsorption by hydrosols.** *Compt. rend.* **226**, 1819-21 (1948).—*C.A.* **42**, 7130*e*.

Certain hydrosols (thorium hydroxide, arsenic sulfide, and ferric and copper ferrocyanides) were capable of concg. particles suspended in various aq media. A suspension of polishing rouge so fine as to appear blue by transmitted light and which did not settle out after 24 hrs was cleared up by the addn. of 8 mg As_2S_3 and a few drops of satd. alum to a liter of the suspension. After 12 to 24 hrs, the flocculate was collected, the As_2S_3 dissolved in several drops of NaOH soln., and the rouge thus concd. to a vol. one thousandth that of the original.

3501. DEY, ARUN K. AND GHOSH, SATYESHWAR. **The nature of hydrated ferric oxide. II. Adsorption of various ions by the hydrated oxide in**

acidic, alkaline, and neutral media. *Proc. Natl. Acad. Sci. India* **17A**, 93-9 (1948).—*C.A.* **45**, 9411*d*.

The adsorption of Na^+, Cu^{++}, Cl^-, $C_2O_4^{--}$, $Fe(CN)_6^{----}$ by hydrated Fe_2O_3 depended on pH. In alk. soln. adsorption of cations was prominent. In acid soln. anions mainly were adsorbed.

3502. Erdey-Grúz, Tibor; Hunyár, Andor; Pogány, Eva, and Váli, Alajos. **Differences of concentrations caused by diffusion and the effect of glass diaphragms on diffusion rate.** *Hung. Chim.* **1**, No. 3, 7-26 (1948).—*C.A.* **43**, 8773*g*.

Diffusion expts. were carried out with electrolytes (KCl, LiCl, NMe_4Cl, KBr, $LiC_2H_3O_2$, $BaCl_2$, and $MgCl_2$) in the presence of PrOH, sucrose, AcOH, propionic acid, butyric acid, crotonic acid, succinic acid, malic acid, citric acid and As_2O_3. The electrolyte was present at the beginning of the expt. only in the soln. on one side of the diaphragm. The concn. of the various added org. substances (excepting As_2O_3) seemed to grow in that part towards which the ions were diffusing. The quantity of transported substances was higher than the quantity of water transported by the diffusing ions at the same time with their hydrate sphere.

3503. Fricke, R. **Study of chemical properties of surfaces of difficultly soluble substances by combined physical and chemical adsorption.** *Naturwissenschaften* **35**, 344-5 (1948).—*C.A.* **44**, 2819*i*.

Pure hydroxides of La, Sm, Er, and Y were prepd. by pptn. of nitrates with NaOH, crystn. of the hydroxides and washing followed by dehydration (all in Ag crucibles) and rehydration. Upon treatment of the hydroxides with a HCl soln. the adsorbed total Cl was detd. electrometrically, the chemically adsorbed Cl by pH detn. The chem. adsorption (normal KCl soln.) decreased in the series from La to Y from 6.7% of the total to 0.4%.

3504. Fuks, G. I. **Structured ferric hydroxide sols obeying Poiseuille's law.** *Kolloid Zhur.* **10**, 155-8 (1948).—*C.A.* **43**, 5259*a*.

$Fe(OH)_3$ hydrosols of 6.2-8.6% Fe_2O_3 prepd. by diln. of old concd. sols showed initially a drop in viscosity η over 3-10 days. At the end of that period slow increase of η set in again and was observed for 6 months; however, η did not attain the initial value of the freshly dild. sols. Addn. of 12-20 milliequiv. NaCl to the normal sols raised η and developed anomalous viscosity; addn. of 5% EtOH or heating at 80°-100°C had the same effect.

3505. Garrels, R. M. and Stine, L. O. **Replacement of calcite by atacamite in copper chloride solutions.** *Econ. Geol.* **43**, 21-30 (1948).—*C.A.* **42**, 8721*a*.

Calcite rhombs were suspended in Cu chloride soln., heated to 55°C and moving at a const. rate of approx. 0.3 cm per second. A film of atacamite formed on the rhombs replacing calcite, although not in quantities equiv. to the amt. of $CaCO_3$ dissolved, and not as a result of a straightforward chem. reaction. At the surface of the calcite, the H ion was tied up by the carbonate ion, which gave a high local concn. of hydroxyl ion.

3506. Goetz, Alexander and Inn, Edward C. Y. **Reversible photolysis of silver sorbed on colloidal metal oxides.** *Rev. Modern Phys.* **20**, 131-142 (1948).—*C.A.* **42**, 4465*i*.

AgO (av. particle size 0.3μ) and the two allotropic modifications of TiO_2, anatase and rutile (max. particle size for both about 0.3μ), were used as substrates. A gel-like suspension of the substrate in distd. water contg. a known amt. of Ag_2O was violently agitated in high-speed homogenizers until microscopic examn. indicated the disappearance of the major portion of the Ag_2O crystals. After exposure of the slurry to 45-55°C for several hrs for attainment of equil., it was dried at 50-60°C in an air stream, ground, and stored in dark-glass containers. Surface reaction proceeded very rapidly since these prepns. became photosensitive within the first few min. of homogenization.

3507. Hebert, Jean and Bioschot, Pierre. **Fixation of arsenic by calcium carbonate.** *Compt. rend.* **226**, 747-9 (1948).—*C.A.* **42**, 5299*i*.

In 5 solns. each contg. 20 g of $CaCO_3$ with amts. of As_2O_5 increasing from 1.25 to 20.0 mg, the percentage of the latter fixed by the $CaCO_3$ was const. The amt. of As_2O_5 fixed after agitation of 1 g of $CaCO_3$ with 25 mg of As_2O_5 in 100 g of water increased with time. The phenomenon was one of reversible adsorption.

3508. Hensley, James W.; Long, Arthur O., and Willard, John E. **Reactions of ions in aqueous solution with glass and metal surfaces.** *J. Am. Chem. Soc.* **70**, 3146-7 (1948).—*C.A.* **43**, 2066*e*.

The extent of sorption of radioactivity tagged ions on flat surfaces was studied by using the Geiger-Muller counter to det. radioactive intensity. Results of sorption of Na, Ag, and Cs ions on glass under varying conditions as well as sorption of Na ions on steel, Al, Ag, and Pt surfaces were reported.

3509. Ishikawa, Fusao; Haga, Hideo, and Haga, Yoshiko. **Stabilization of hydrogen peroxide by colloidal tin oxide. I.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **69**, 35-7 (1948).—*C.A.* **46**, 8485*c*.

SnO_2 sol or gel obtained by the hydrolysis of $SnCl_4$ was a very effective stabilizer for H_2O_2 up to a concn. of 80%.

3510. Kharin, A. N. **Ion exchange in fresh and aged hydrosols of arsenic trisulfide.** *Kolloid Zhur.* **10**, 159-67 (1948).—*C.A.* **43**, 5258*g*.

Ion exchange between the As_2O_3 sol and added $BaCl_2$ or $MgCl_2$ was detd. In young sols, the amts. of Ba or Mg adsorbed coincided with the amt. of acid formed, indicating absence of binding by the intermicellar liquid and absence of mol. adsorption of the chlorides on the micelles; the process, in this case, was pure ion exchange.

3511. Klaarenbeek, F. W. **Chemical properties of glass.** *Verres et refract.* **2**, 293-300 (1948).—*C.A.* **43**, 2745*i*.

The destruction of the glass network by acidified H_2O was due to the absorption of the base by bound O; this was prevented by the presence of preferably absorbed ions such as Be. The penetration of the glass surface by H_2O and acids resulted primarily in an ion exchange and hydration of basic cations. Ca ions were more difficultly exchanged that Na ions and the water penetration impeded by the bivalent ions.

3512. Krige, G. J. R. and Arnold, R. **The aging of aqueous suspensions of magnesium hydroxide.** *J.S. African Chem. Inst.* **1**, 61-75 (1948).—*C.A.* **43**, 8236*d*.

The aging of $Mg(OH)_2$ was studied through the cond. changes occurring in suspensions prepd. by adding Mg amalgam or MgO to water. The measurements were made at 20°C except for 2 with the amalgam at 10°C and 2 at 30°C. The peak cond. was reached rapidly, followed by a slow decrease in cond. coincident with the decrease in soly. of the $Mg(OH)_2$. In the case of the amalgam, greater concn. gave a higher initial cond. and a higher value throughout the aging process, whereas greater concn. of MgO gave a higher initial cond. and a much faster drop in cond. during the aging process.

3513. Kuhnel-Hagen, S.; Hofman-Bang, Niels, and Gjertsen, Poul. **Determination of small quantities of tin in alloys. Isolation by adsorption of stannic acid on manganese dioxide.** *Acta. Chem. Scand.* **2**, 343-51 (1948).—*C.A.* **43**, 2889*h*.

Small amts. of Sn were sepd. from Fe, Cu, and Pb. The Sn was adsorbed on MnO_2. Heat, filter, and dissolve ppt. in 10 ml concd. H_2SO_4. Wash the beaker with 5 ml concd. HNO_3 contg. 2 drops 30% H_2O_2. Reduce stannic ions with Al and titrate with KIO_3 or $KBrO_3$ under anerobic conditions.

3514. Lashkarev, V. E. and Kosonogova, K. M. **Photoelectromotive forces in cuprous oxide.** *Zhur. Eksptl. Teoret. Fiz.* **18**, 927-36 (1948).—*C.A.* **44**, 4772*b*.

The photo-e.m.f. of Cu_2O with Au electrodes was variable. Samples freshly prepd. (by oxidation of Cu at high temp. and quenching in H_2O) and coated with Au by evapn. show often, in light of $\lambda > 0.61\,\mu$, a distinctly pos. (+) effect, which increased on 1-2 hrs heating at 250-350°C *in vacuo* before coating with Au; their photoactivity improved with time. The back side showed also a (+) effect, but 5-20% as large. Heating in air annulled the (+) effect and changed it to a (−) effect owing to accumulation of CuO.

3515. McBain, James W. and Dunn, Robert C. **Sorption from solution by active magnesium oxide.** *J. Colloid Sci.* **3**, 303-11 (1948).—*C.A.* **43**, 17*a*.

The sorption of I_2 from CCl_4 solns. on light-burned com. MgO at 25°C was not complete in 24 hrs. Sorption of I_2 vapor was more direct and significant than sorption from soln. The adsorption of hexadecanol on light-burned MgO at 25°C was studied with $CHCl_3$, EtOH, BuOH, tert-BuOH, C_6H_6, and C_6H_{12} as solvents. Sorption from C_6H_6 and C_6H_{12}, solns. was complete in 2 hrs, but sorption from $CHCl_3$ soln. was slower. The dye 1-o-tolylazo-2-naphthol was sorbed rapidly from CCl_4 soln. on light-burned MgO. The surface area indicated by sorption from soln. was a small fraction of that found by adsorption of N_2 or I_2 vapors.

3516. Mitra, R. P. and Rajagopalan, K. S. **Titration curves of hydrogen micas.** *Nature* **162**, 104-5 (1948).—*C.A.* **42**, 7644*b*.

The H mica was titrated potentiometrically with KOH. First inflection was at pH 6.15-7.3; the 2nd and 3rd were at pH 9.0 and 10.5. The acidity values for the specimen studied were 16.0 and 47.5 milliequiv./100 g dry matter for the 2nd and 3rd inflections.

3517. Mitter, R. P. and Rajagopalan, K. S. **The apparently tribasic acid character of hydrogen mica.** *J. Indian Chem. Soc.* **25**, 591-2 (1948).—*C.A.* **43**, 7302*f*.

Finely ground muscovite was leached with dil. HCl to obtain H-mica by the replacement of exposed K ions by H ions. Aq. suspensions of this H-mica were found to behave as weak tribasic acids from their potentiometric titration curves with NaOH and KOH. The inflections in the curves occurred at pH 7.0, 9.0, and 10.5. The presence of H ions in 3 distinct affinity levels on the surface was indicated.

3518. Nagasawa, Shin. **Stabilization of hydrogen peroxide by colloidal tin dioxide. II. Effect of heavy metal ions on the stability of hydrogen peroxide. III. Effect of colloidal tin dioxide on the behavior of metallic ions.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **69**, 72-5 (1948).—*C.A.* **46**, 9400*a*.

The effect of various metallic ions on the decompn. of H_2O_2 was studied at 50°C. The presence of Fe^{++}, Cu^{++}, or Cr^{+++} gave rise to serious decompn. of H_2O_2. Their amt. should be less than 10^{-6} mol./liter. The presence of SnO_2 gel or sol. prevented the decompg. action of metallic ions.

3519. Paneth, F. A. **Exchange of ions between crystal surfaces and solutions.** *J. chim. phys.* **45**, 205-11 (1948).—*C.A.* **43**, 6047*e*.

3520. Royer, Louis. **Orientation of potassium chloride on the cubic face of mica.** *Compt. rend.* **226**, 262-4 (1948).—*C.A.* **44**, 9764*c*.

The face of a KCl crystal formed on a cubic mica face must be octahedral in order to follow the mica structure. The occurrence of orientated cubic KCl crystals was attributed to small cubic crystals formed in the liquid phase falling onto the mica surface and taking up a preferred orientation.

3521. Shapiro, I. and Kolthoff, I. M. **Aging of precipitates and coprecipitation XLII. Aging of silver bromide and the dry state.** *J. Phys. & Colloid Chem.* **52**, 1319-31 (1948).—*C.A.* **43**, 2071*a*.

Sp. cond. was detd. for compressed AgBr pellets. With well-aged AgBr the log of the sp. cond. was an inverse linear function of the pressure up to at least 3000 atm. provided the effective ratio of length of conductance path to cross-sectional area was used. With freshly pptd. AgBr the above relation was not linear. The sp. cond. decreased very rapidly at low pressures and then approached the behavior of well-aged AgBr at high pressures.

3522. TEŽAK, BOŽO. **Coprecipitation and the relationship between adsorption, occlusion, and mixed-crystal formation.** *Arhiv Kem.* **20**, 16-25 (1948).—*C.A.* 44, 6233*a*.

The x-ray diffraction patterns of cryst. ppts. showed that substitution was more frequent the higher the concn. of the foreign ion in the soln., and that the lattice spacings of primary particles were expanded in proportion to the foreign-ion content. Contamination must be considered as similar to an occlusion, both phenomena being governed by the law of adsorption. The radius of the adsorbing ion in the primary lattice was a factor favoring the formation of two-dimensional crystal films. Another factor was the similarity between the structural pattern of the adsorbing ion and that of the adsorbed ion.

3523. TEŽAK, BOŽO; MATIJEVIC E., AND SCHULZ, K. **Coagulation of silver halides by electrolytes and the Wolfgang Ostwald theory of the activity coefficient.** *Arhiv Kem.* **20**, 1-15 (1948).—*C.A.* **44**, 6234*h*.

The constancy of the activity coeff. was approx. const. and held best for concns. greater than 10^{-2} *N*, and for the univalent coagulating cations. Choice of the concn. range 10^{-5}–10^{-3} *N* avoided the disadvantages of working with high concns. of the sol. For Ag halides at low sol concn. the activity coeff. varied for a given stabilizing ion with the concn. and with the valence of the coagulating cation. The chem. nature of the stabilizing ion was another factor significantly affecting the linearity of the activity coeff. as a function of sol concn., the valance being next in importance. The relative constancy of f_k at sol concns. higher than 10^{-2} was due to a slight effect of adsorption, namely, the dominant cation was adsorbed on the colloidal particle.

3524. THOMSON, G. P. **The growth of crystals.** *Proc. Phys. Soc.* **61**, 403-16 (1948).—*C.A.* **43**, 3684*f*.

New work bearing on the question of the reality of the Volmer layer was described; the data were obtained by interferometric methods. The rate of growth of faces was discussed, and a survey made of epitaxis and of its implications. Earlier results reported for the deposition of different metals on Cu were discussed.

3525. TULLER, ELIZABETH F. AND FULMER, E. I. **Coagulation of hydrous ferric oxide by electrolytes.** *J. Phys. & Colloid Chem.* **52**, 787-808 (1948).—*C.A.* **42**, 5304*e*.

The progress of agglomeration was followed by detg. the change in transmission of light. A uniform method of mixing the colloid with the coagulating electrolyte was employed. It was found that crit. times may be used in detg. the relation of the sol concn. to the coagulation values of an electrolyte.

3526. BIRNBAUM, S. M. AND SHCHIGOL, M. B. **Potentiometric determination of calcium ion in the presence of magnesium ion.** *Zavodskaya Lab.* **15**, 402-4 (1949).—*C.A.* 43, 6938*d*.

The Ca was pptd. from a hot soln. with standard $Na_2C_2O_4$, and the excess back-titrated in ammoniacal soln. with $AgNO_3$. If the oxalate ppt. was not removed, adsorption took place. If Mg concn. did not exceed Ca by over 300%, the Ca detn. was readily made as the Mg remains in soln.

3527. BOURDON, DANIEL AND COTTE, JOANNES. **Adsorption of molybdic acid by ammonium phosphomolybdate.** *Bull. soc. chim. France* **1949**, 429.—*C.A.* **43**, 8971*e*.

The fraction of MoO_3 fixed by NH_4 phosphomolybdate was const. at high acidity (5 *N*) and excess molybdate (4-7% soln. in MoO_3).

3528. BUCHANAN, A. S. AND HEYMANN, E. **Electrokinetic potential of barium sulfate.** *Nature* **164**, 29 (1949).—*C.A.* **43**, 8800*e*.

Freshly ignited $BaSO_4$ either pptd. or recrystd., had a well-reproducible pos. potential against its satd. soln. in water and in alc.-water mixts. However, surface-active impurities, which may originate from rubber joints or filter paper, must be entirely absent. Impurities caused a decrease in pos. potential and even a change to neg. potantial. Ignition to 500-700°C or treatment with hot concd. HNO_3 would restore the original pos. potential of contaminated $BaSO_4$.

3529. BUNN, C. W. AND EMMETT, H. **Crystal growth from solutions. I. Layer formation on crystal faces.** *Discussions Faraday Soc.* **1949**, 119-32.—*C.A.* **44**, 2312*a*.

A 17-year study of the growth of crystals under a microscope was discussed. Crystals in general grew by the spreading of discrete layers one after another across the faces. Layers very often started, not from edges or corners of crystals, but from the centers of faces, spreading outwards towards the edges. The thickness of the layers on many crystals increased as the layers approached the edges of the crystal faces. Dissolved impurities may strongly affect the thickness and the shape of the layers, the effect being highly specific.

3530. BUNN, C. W. **Crystal growth from solutions. II. Concentration gradients and the rates of growth of crystals.** *Discussions Faraday Soc.* **1949**, 132-44.—*C.A.* **44**, 2312*d*.

A concept of crystal growth was developed similar to the current concept of certain chain polymerization reactions, in which the reaction depended on activated mols. and its continuation depended on the maintenance of activated chain-ends. In crystal growth, high-index surfaces appeared to the active surfaces that were capable of adding further mols.

3531. CANALS, E.; MARIGNAN, R., AND CORDIER, S. **Adsorption of some metal ions in very dilute solutions.** *Ann. pharm. franc.* 7, 502-9 (1949).—*C.A.* **44**, 1777*h*.

The adsorption of small quantities of Zn and Cu on $CaCO_3$ was studied. One liter of redistd. H_2O contg. known quantities of the metals was boiled one hr with 50 mg $CaCO_3$, decanted after 10 min., the ppt. centrifuged, dissolved in 0.1 *N* HCl, adjusted to pH 6.7 (bromothymol blue), brought to pH 6.9 by the addn. of Na_2SO_4 and analyzed by polarography. Working at dilns. of 10^{-7} to 2×10^{-6} ion-g/liter, the percentage of adsorbed ions decreased as the concn. increased. In mixed solns. of Cu and Zn, Cu diminished the adsorption of Zn to a degree to make it negligible.

3532. CHERNIKOVA, T. N. AND GAPON, E. N. **Distribution of electrolytes between solid and liquid phases. I. Uptake of silver sulfate by ferric hydroxide.** *Kolloid Zhur.* **11**, 120-6 (1949).—*C.A.* **43**, 6885*i*.

Ag was adsorbed from Ag_2SO_4 solns. by dialyzed $Fe(OH)_3$ sols prepd. from $FeCl_3$, but not by those prepd. from $Fe(NO_3)_3$ or $Fe_2(SO_4)_3$. Electrodialysis reduced the amt. of Ag adsorbed by $Fe(OH)_3$ from $FeCl_3$ 10 to 15 times. Ag was "adsorbed" because it was pptd. as AgCl. SO_4^{++} was taken up from Ag_2SO_4 solns. by $Fe(OH)_3$ sols from $FeCl_3$ and $Fe(NO_3)_3$ because of ion exchange.

3533. COOKE, STRATHMORE R. B. AND DIGRE, MARCUS. **Studies on the activation of quartz with calcium ion.** *Am. Inst. Mining Met. Engrs., Tech. Pub.* No. **2606-BH**, *Mining Eng.* **1**, No. 8, 299-305 (1949).—*C.A.* **43**, 6953*h*.

All cations in the solution tended to adsorb quartz on the surface in the preferential sequence H^+, Ca^{++}, and Na^+. To displace the adsorbed hydrogen ion to any degree, the calcium concn. must be more than 10^5 times the H^+ concn., and the Na^+ concn. must be more than 10^9 times the H^+ concn. Na^+ will commence to displace Ca^{++} at a concn. about 10^3 times the Ca^{++} concn.

3534. D'ALCONTRESS, GUGLIELMO S. **Adsorption by barium sulfate.** *Gazz. chim. ital.* **79**, 609-13 (1949).—*C.A.* **44**, 1778*c*.

The $BaCl_2$ that accompanied ppts. of $BaSO_4$ in gravimetric analyses formed true adsorption compds. between the $BaSO_4$ and excess Ba. The system was studied by adding the theoretical proportion and various excesses of 0.04 *M* $BaCl_2$ to 0.04 *M* Na_2SO_4, allowing to stand 8 hrs, washing the ppts. free of the Cl^-, and analyzing both ppts. and filtrates. With increasing excess of $BaCl_2$, the proportion of adsorbed $BaCl_2$ increased progressively to a max. above which it was const., independent of the excess of $BaCl_2$ originally present.

3535. DEY, ARUN K. **The conditions of precipitation of cupric hydroxide from cupric salts by soluble hydroxides. II. Role of hydration in determining the chemical character of the hydrated oxide.** *Current Sci. (India)* **18**, 123-4 (1949).—*C.A.* **43**, 8295*h*.

Pptd. $Cu(OH)_2$ from $CuSO_4$ and NaOH retained more adsorbed sulfate, when the amt. of alkali used was less than the theoretical equiv. Besides the variation in compn. and phys. character of the ppt., the soly. in NH_4OH also changed. An excess of NaOH produced a ppt. totally insol. in NH_4OH. Aging for a month had no perceptible effect on the hydration of cupric oxide.

3536. DUKE, FREDERICK R.; BEVER, ROBERT J., AND DIEHL, HARVEY. **The rate of precipitation of barium sulfate.** *Iowa State J. Sci.* **23**, 297-300 (1949).—*C.A.* **43**, 6941*f*.

The apparent end point when $Ba(OAc)_2$ was added to a dil. soln. of K_2SO_4 depended on the time elapsing between the addn. of reagent and reading of the app. The rate of pptn. of $BaSO_4$ was represented by: $dP/dT = kS[Ba^{++}]\ [SO_4^{--}]$, where *P* was the no. of moles of $BaSO_4$/liter, k= sp rate const., and *S* was the surface area of the ppt. The assumptions, that ion pairs were precursors of the crystals, that the no. of particles was set by the original concns. of Ba^{++} and SO_4^{--}, and that the particles grew at the same rate, seemed to be justified by the results.

3537. EVANS, U. R. AND PRYOR, M. J. **Passivity of metals. IX. The solubility product of freshly precipitated ferric hydroxide.** *J. Chem. Soc.* **1949**, S157-60.—*C.A.* **43**, 7789*d*.

A value of $10^{-35.5}$ at 20°C was obtained for the soly. product of "gelatinous" $Fe(OH)_3$ by an electrometric method. Pptn. first occurred at pH 3.00.

3538. FRICKE, R. **Influence of adsorption and capillary condensation upon the emanation method of Otto Hahn.** *Z. anorg. Chem.* **259**, 299-302 (1949).—*C.A.* **44**, 4341*e*.

The emanating power of finely divided prepns. labeled with radio-Th first rose with increasing H_2O adsorption and capillary condensation, then dropped. The decline occurred sooner if the prepn. was compressed strongly.

3539. FRICKE, R. AND LÖFFLER I. **Measurements of the basicities of the surfaces of rare earth hydroxides by combined physical and chemical adsorption.** *Z. Elektrochem.* **53**, 161-4 (1949).—*C.A.* **43**, 8244*g*.

Relative basicities of cryst. hydroxides of La, Sm, Er, and Y were measured by treatment with KCl soln. and detn. of loss of Cl ion (phys. adsorption) and change of pH (chem. adsorption).

3540. GALECKI, A. **Silver hydrosols. III. Preparation.** *Bull. soc. amis sci. Poznan, Ser. B, Sci. math. et nat.* No. **10**, 87-111 (1949).—*C.A.* **46**, 319*i*.

Nuclear Ag sols were produced from Ag_2O or $AgNO_3$ in the presence of small amts. of Na_2CO_3, K_2CO_3, KOH, or NH_3, with an ether soln. of P, aq. H_2SO_4, or hydrazine hydrate as reductor. Derived sols were prepd. contg. varying amts of added aq. HCHO. Some Au sols were also prepd. Most favorable titration conditions, possible trouble spots, and reproducibility of results were discussed. Color, fluorescence, opalescence, and ultramicroscope appearance were detd.

3541. GLEDITSCH, E. AND GAPPELEN, P. T. **Ion exchange in solid salts.** *Bull. soc. chim. France* **1949**, D64-7.—*C.A.* **43**, 4534*g*.

An intimate mixt. of an insol. salt with a sol. salt, one of them contaminated with Ra D, was heated and then sepd. by extn. with water. Exchange sets in only at high temps., depending on the m.p.; compression of the mixt. increased the amt. of exchange; regrinding also increased the amt. of exchange. The mixts. studied were $Pb{*}CrO_4Pb(NO_3)_2$, $Pb{*}CrO_4 - PbCl_2$, $PbCrO_4 - Pb{*}Cl_2$, and $Pb{*}SO_4 - PbCl_2$.

3542. HENSLEY, JAMES W.; LONG, ARTHUR O., AND WILLARD, JOHN E. **Reactions of ions in aqueous solution with glass and metal surfaces. Studies with radioactive tracers.** *Ind. Eng. Chem.* **41**, 1415-21 (1949).—*C.A.* **43**, 8233*g*.

The sorption by radio-Na^+ by soft glass was a function of the pretreatment received by the glass and increased with time of immersion, pH and temp. It varied from one to several monolayers; whereas sorption of Cs^+, Ag^+, Br^-, and CO_3^{--} was always less than one monolayer. Na^+ sorption on steel, Pt, Ag, and Al was generally less than one monolayer. A radioactive impurity in the Na_2CO_3 solns. was selectively adsorbed relative to the Na^+.

3543. Hermans, J. J. **Light scattering by charged particles in electrolyte solutions.** *Rec. trav. chim.* **68**, 859-70 (1949).—*C.A.* **44** 2824*b*.

From the assumption that a colloid particle with its double layer could be treated as a sep. unit, math. formulas were developed for compact spherical particles and random coils. The scattering power of ions were related to the *N* of the soln. Ions surrounding a colloid particle reduced the scattering power of the particle. The effect of ions on light scattering may become appreciable.

3544. Honda, Masatake. **Ion-exchange resins in analytical chemistry. II. Nephelometric determination of sulfate ion.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **70**, 55-7 (1949).—*C.A.* **45**, 4169*g*.

Sulfate ion in water was detd. nephelometrically as $BaSO_4$ in the presence of gelatin. $CaSO_4$ in the gelatin was removed by ion-exchange resins.

3545. Humphreys-Owen, S. P. F. **Crystal growth from solution.** *Proc. Roy. Soc.* **A197**, 218-37 (1949).—*C.A.* **44**, 2318*d*.

Single crystals of the cubic form of $NaClO_3$ were studied in growth from aq. soln. An interferometric technique measured concns. and gradients of concn. contiguous to the crystal. The rates of advance of individual faces were compared with predictions derived from the Nernst supposition. Empirical equations were obtained for the functions that connect the rate of growth with the concn. and gradient distribution along the face.

3546. Imada, Fusao. **Carbons. XXI. Influence of the active carbons (of the anode mixture) on the electromotive force.** *Kogaku Iho, Kyushu Univ.* **20**, 61-8 (1949).—*C.A.* **47**, 5820*b*.

The e.m.f. was measured on a dry air-cell discharging repeatedly for 2-3 hrs at 0-3-hr intervals. The rate of decrease of the e.m.f. in the repeated discharge was proportional to e^{-n}, where n was the no. of discharge, and the rate of decrease with the discharge time was $E = t/(a + bt)$, where E was e.m.f., t was discharge time, and a and b were consts.

3547. Ionin, V. D.; Lubovnikov, M.; Neiman, B., and Nesmeyanov, An. N. **Isotopic exchange of phosphorus among H_3PO_2, H_3PO_3, and H_3PO_4.** *Doklady Akad. Nauk S.S.S.R.* **67**, 463-6 (1949).—*C.A.* **43**, 7815*a*.

In equimol. mixts. $NaH_2P^{32}O_4 + NaH_2PO_2$ (1, 0.025, or 0.1 *M*) heated 80 hrs in closed vessels, no isotopic exchange was detected by radioactivity measurements up to 280°C, at which temp. all the $H_2PO_2^-$ was oxidized to $H_2PO_4^-$. A similar neg. result was found with $H_3PO_4 + H_3PO_3$ up to 280°C, at which H_3PO_3 disappeared. Addn. of 0.0005 *M* NaOH accelerated the oxidation of H_3PO_2 and of H_3PO_3 to H_3PO_4, oxidation being complete at 195°C. On the other hand, addn. of 0.0005-0.001 *M* HCl increased the stability of NaH_2PO_2 which, in mixt. with $NaH_2P^{32}O_4$, could be detected and sepd. even after heating to 300°C.

3548. Jenkins, H. G.; McKeag, A. H., and Ranby, P. W. **Alkaline earth halophosphates and related phosphors.** *J. Electrochem. Soc.* **96**, 1-12 (1949).—*C.A.* **43**, 6925*d*.

White light was obtained in fluorescent lamps from alk. earth halophosphates activated with Sb and Mn. Luminescent properties were discussed as a function of compn. and several possible substitutions. The latter included substitution of Sr or Ba for Ca, of Cl or OH ion for F, of several primary activators in place of Sb, and of other activators in place of Mn in hydroxyapatites.

3549. Kauko, Y.; Hyyrylainen, E. S., and Holmen, H. **Adsorption, ion exchange, and neutralization process in the system slag-calcium hydroxide-water.** *Svensk Kem. Tid.* **61**, 128-40 (1949).—*C.A.* **44**, 505*e*.

The alk. reaction of mixts. of a blast-furnace slag contg. 45.5% CaO and H_2O was due to ion exchange between sol. cations and H ions. Upon addn. of $Ca(OH)_2$ the removed cations reverted to the slag, and at $pH \gtrsim 12.2$ $Ca(OH)_2$ was taken up by a neutralization process forming presumably ortho-silicates and ortho-titanates. Superimposed was the adsorption of cations, which was strongly dependent on the presence of O_2 or CO_2.

3550. Kenny, A. W. and Spragg, W. T. **Preparation of carrier-free phosphorous^{32} from pile-irradiated sulfur. I. Adsorption of phosphorus^{32} on ferric hydroxide and dialyzed iron.** *J. Chem. Soc.* **1949**, S326-S30.—*C.A.* **44**, 9812*i*.

The efficiency of adsorption of radiophosphate on $Fe(OH)_3$ decreased with increase of pH from 10.5 to 13.0. The presence of SO_4^{--} had little effect on the adsorption. On dialyzed Fe in the pH range 1.0-4.0, phosphate adsorption in the presence of sufficient sulfate to complete pptn. of the radiophosphate had been measured. Radiophosphate could be selectively adsorbed by dialyzed Fe from soln. containing Cr and Al at pH 2.0.

3551. Khlopin, V. G. and Merkulova, M. S. **Adsorption of radium on lead sulfate in the presence of surface-active substances.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim Nauk* **1949**, 460-72.—*C.A.* **44**, 6233*h*.

$PbSO_4$ was prepd. by pptn. of a dil. soln. of $Pb(NO_3)_2$ with an equiv. amt. of dil. $MgSO_4$, decanting and washing to const. elec. cond. of the satd. soln., 4.1×10^{-5}, and const. electrokinetic potential (in electroosmosis), 14.8 1.0 mv. Adsorption of Ra was detd. by the emanation method in 2 procedures. In the presence of Ponceau 4 R (P), adsorption equil. was reached in both procedures 20-25 min. faster.

3552. King, E. L. **Radiocolloidal behavior of neptunium and plutonium.** *Natl. Nuclear Energy Ser., Div. IV*, **14B**, *Transuranium Elements, Pt. I*, 434-44 (1949).—*C.A.* **44**, 7622*e*.

Pu(IV) at low acidity and in trace concn. formed a radiocolloid. Pu(IV) tracer could be centrifuged from soln. if the H-ion concn. was less than 0.01 *M*. Np(V) exhibited no radiocolloidal behavior even at a H-ion concn. of 10^{-4} *M*. The adsorption by glass of Pu(IV) in trace concn. increased as the H-ion concn. decreased.

3553. Kobayashi, Koichi. **Velocity of formation of fine crystals of silver chloride. I. and II.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **70**, 125-7, 179-81 (1949).—*C.A.* **45**, 4120*e*.

The time variation of the reaction between Ag^+ and Cl^- was studied by measuring the e.m.f. of concn. cells with respect to Ag^+ under the conditions: (a) with equiv. amts. of both ions, (b) with an excess of either ion, and (c) in the presence of crystal nuclei of AgCl with equiv. amts. of both ions. An equation was given for the reaction velocity between $AgNO_3$ and KCl. The interfacial tension between AgCl and its soln. at the initial state of reaction was detd. to be 20 dynes/cm.

3554. Kubal, J. V. **Properties of the positively charged sol of silver iodide.** *Collection Czechoslov. Chem. Communs.* **14**, 305-19 (1949).—*C.A.* **44**, 2328*i*.

The sol, AgI, was prepd. by mixing dil. solns. of $AgNO_3$ and excess KI, electrodialyzing, and converting to the pos. sol by adding a certain vol. of $AgNO_3$ of known pAg. These solns. were studied by coagulation, addn. of electroytes, and cataphoresis. The addn. of electrolytes increased the value of pAg, resulting in higher stability for the sol. An app. was described to measure the cataphoresis in the presence of electrolytes and in the absence of the products formed by the electrolysis.

3555. Kurbatov, M. H. **Rate of adsorption of barium ions in extreme dilution, by hydrous ferric oxide.** *J. Am. Chem. Soc.* **71**, 858-63 (1949).—*C.A.* **43**, 6035*i*.

The rate of adsorption of Ba ions from a soln. contg. 3×10^{-10} g atoms per liter was studied on a 1×10^{-5} g mole sample of hydrous Fe_2O_3. A steady state in the adsorption was reached after 40 to 60 hrs. The rate of adsorption increased as pH increased from 7.5 to 8.5; it also increased as the concn. of NH_4Cl increased from 3.8×10^{-3} to 0.3 *N*.

3556. Matsuno, Takeo. **Diaphragms for electrolysis. I. Effect of the diaphragm on the ionic diffusion.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* **52**, 227-9 (1949).—*C.A.* **45**, 4115*e*.

A gel contg. NaCl or a mixt. of NaCl and NaOH was prepd. on which was placed a diaphragm, and distd. water poured carefully over it. When the standard sand from Ottawa was used as diaphragm, the diffusion of NaCl decreased logarithmically with increase in depth of the diaphragm. With quartz sand of various sizes, the diffusion of NaCl decreased asymptotically with decrease in particle size. Increase in concn. of NaCl in the gel increased its diffusion linearly up to 0.5 *N* and showed a satn. therefrom.

3557. Neuhaus, A. **Reaction kinetics of oriented precipitations.** *Fortschr. Mineral.* **28**, 58-63 (1949) (Pub. 1950).—*C.A.* **45**, 10017*b*.

If hard substances were first activated by heating, oriented overgrowths may be obtained. Thus, oriented overgrowths of NaCl were obtained on wollastonite and hornblende if these minerals were heated to 500°C, and similarly overgrowths of Ag on NaCl heated at 200-300°C.

3558. Perley, George A. **Composition of pH-responsive glasses.** *Anal. Chem.* **21**, 391-4 (1949)

Comparisons of pH glasses could best be made on the basis of mole per cent composition. The performance of a pH-responsive glass was in part dependent on the role of the ionic radii of the modifying atoms within the silicon-oxygen ($Si\text{-}O_4$) network. The stability, sodium errors, etc., should depend considerably on the electrostatic forces prevailing within the interstices of the network.

3559. Pick, Heinz. **Preparation of reflecting deposits by chemical reactions.** *Z. Physik* **126**, 12-19 (1949).—*C.A.* **43**, 8822*h*.

The deposition of PbS formed by the reaction between Pb acetate and thiourea was studied under a variety of conditions. If the reaction velocity was too great, an adherent deposit was not obtained, while if the concns. of the solns. used were too low, a poor, cryst. layer was formed. The addn. of a very small amt. of some salts such as $CuSO_4$ resulted in the formation of excellent reflecting surfaces.

3560. Pierron, P. **The evolution [of oxygen] from alkaline solutions of hydrogen peroxide and the effect of small quantities of metallic hydroxides or oxides on this evolution.** *Bull. soc. chim. France* **1949**, 754-8.—*C.A.* **44**, 2355*e*.

The rate of O_2 evolution from alk. H_2O_2 solns. was decreased by $Sn(OH)_4$ in all cases, by MgO, CaO, and BaO in a wide range of alkalinities, within a narrow range by ZnO, CdO, and Al_2O_3, and always by the oxides of Ni, Co, Fe, Cu, Pb, Mn, Ag, and Hg. In general, the rate of O_2 evolution was decreased the most by the most stable oxide and increased the most by the least stable oxide.

3561. Singleton, R. H. and Spinks, J. W. T. **Comparison of the direct and indirect radioactive methods for determining the surface area of a strontium sulfate precipitate.** *Can. J. Research* **27B**, 238-57 (1949).—*C.A.* **43**, 6490*c*.

The specific surface of a $SrSO_4$ ppt. was measured: (1) In the direct method of mixing a soln. of active $Sr(OAc)_2$ with a suspension of $SrSO_4$ and detg. the activity of original and final Sr^{90}; no significant corrections were needed for the aging of the ppt., adsorption of the Y^{3+} on the $SrSO_4$, the shaking methods, or the adsorption of Sr^{90} on flint glass. (2) In an indirect method Th B was adsorbed on $SrSO_4$ to give a calcd. surface of 30,800 cm² per g (3) In another indirect method Th B gave a calcd. surface of 21,300 cm² per g.

3562. Skvortsov, V. N. **Chemical reactions of colloidally dissolved substances. V. The zonal structure of silver hydrosol aggregates.** *Kolloid. Zhur.* **11**, 354-8 (1949).—*C.A.* **44** 904*e*.

A Kohlschütter sol contg. about equal amts. of Ag and Ag_2O (0.04 g/liter) was titrated with $FeCl_3$, and the amt. of total Ag that reacted was detd. The sol was titrated also with $KMnO_4$. Ag_2O reacted with $FeCl_3$ before Ag metal. The sol particles consisted of a Ag core covered with Ag_2O.

3563. Stow, R. M. and Spinks, J. W. T. **Exchange of ions between the surface of crystals and solutions.** *J. Chem. Phys.* **17**, 744 (1949).—*C.A.* 44, 408*d*.

Both radioactive anions and cations were used to measure the area of crystals of $SrSO_4$. The crystals prepd. by addn. of excess H_2SO_4 to $SrCl_2$ soln. were washed repeatedly with water and aged 2 yrs in contact with $SrSO_4$ soln. The area detd. with $(Sr^{90})^{++}$ was 14.9×10^3 cm²/g, whereas the area detd. by using $S^{35}O_4^{--}$ was 8.3×10^3 cm²/g. The difference in areas as measured by Sr^{90} and S^{35} was quite beyond the limits of exptl. error.

3564. Tolliday, J. D.; Woods, E. F., and Hartung, E. J. **Membrane permeability. V. Activation energy of diffusion and membrane potentials of potassium chloride through cupric ferrocyanide.** *Trans. Faraday Soc.* **45**, 148-55 (1949).—*C.A.* 43, 5257*b*.

The permeability of the membrane to electrolytes was detd. from 0° to 35°C. The permeability of a membrane at 18°C in 0.2 *M* KCl was 0.0474 millimol./hr. The potential thereafter was 37.6 (1st day) and 37.3 (2nd day) at 19°C. Treatment with Cu^{++} yielded membranes of higher permeability and correspondingly lower potentials and activation energies.

3565. Venturello, Giovanni and Burdese, Aurelio. **Activation of the oxides of magnesium.** *Ann. chim. applicata* **39**, 362-74 (1949).—*C.A.* 45, 8321*b*.

The quantity of I_2 adsorbed from 0.1 *N* solns. of I_2 in CCl_4 was detd. The adsorption of I_2 from a vaporized soln. of CCl_4 was measured to det. the sp surfaces of various types of strongly active MgO, and to compare the adsorbing capacities of the oxides prepd. by special methods. The effects of temp. and of duration of the activation upon the MgO were examd.

3566. Amelinckx, S. **Diffusion phenomena in the growth and solution of crystals in solution.** *J. chim. phys.* **47**, 208-12 (1950).—*C.A.* 44, 10424*c*.

Diffusion fields in these cases spread radially about a center point; and the rate of growth was proportional to $(C_k - C_o)$, where C_o was the satg. concn., and C_k some concn. intermediate between the bulk concn. and C_o. The calcd. distribution conformed with the photographs of Humphreys-Owen for growing $NaClO_3$.

3567. Basinska, Halina. **The stability of silver chloride and silver cyanide sols.** *Roczniki Chem.* **24**, 177-86, 188-91, English summaries 186-7, 191-2 (1950).—*C.A.* 46, 5400*f*.

The absorption of light by the pos. and neg. AgCl and AgCN sols was detd. at 0.1, 1.0, and 10 millimol./liter. The transparencies of the pos. and neg. sols for equal concns. and equal excess of KCl, KCNS, and $AgNO_3$ were compared. At 10 millimol. of AgCl/liter the pos. were more transparent and stable than the neg. ones. At 1 millimol. of AgCl/liter no distinct difference between the pos. and neg. sols were observed. At 0.1 millimol. AgCl/liter the neg. sols began to be more transparent and stable.

3568. Canals, E.; Marignan, R., and Cordier, S. **Adsorption of some metallic ions in dilute solutions. II. Adsorption coefficient; number of active cells.** *Ann. pharm. franc.* **8**, 368-72 (1950).—*C.A.* 44, 9769*e*.

The adsorption was detd. of Cu and Zn in concns. of 5 to 50×10^{-7} gram ion per liter on 50 mg $CaCO_3$ during 1 hr at 20°C. K, expressing the affinity of the adsorbent for the adsorbable substance, was for Cu 63×10^4, for Zn 6.3×10^4. The K at 100°C was 0.140×10^3 for Cu and 0.044×10^3 for Zn. Each active center fixed 5 Cu ions at high temp., and 2 centers fixed 3 Zn ions.

3569. Chassevent, Louis and Domine, Daniel. **The action of water on the structure of porous masses obtained by the hydration of pliant materials.** *Compt. rend.* **230**, 2096-8 (1950).—*C.A.* 44, 11056*c*.

Plasters of various compns., e.g. hydrated portland cements, were kept in water for extended periods. In the course of several days, phys. changes were observed which resulted in a decrease of resistance and an increase in the apparent vol. The resistance decreased rapidly in the first hrs following the end of the hydration. After 7 days the diminution was 30% after which it varied but little.

3570. Correns, Carl W. **The geochemistry of diagenesis. I. The behavior of calcium carbonate and silica.** *Geochim. et Cosmochim. Acta* **1**, 49-54 (1950) (in German).—*C.A.* 45, 3305*d*.

A discussion, based on soly. curves in H_2O and in sea water, of the soln. and pptn. of $CaCO_3$ and SiO_2 in sediments. Evolution of CO_2 caused pptn. of SiO_2; silicification of wood may be caused by evolution of CO_2 during the decompn. of the wood.

3571. Čůta, F. and Velebil, Z. **Potentiometric determination of hydroxide or bicarbonate in sodium carbonate by Winkler's method.** *Chem. Listy* **44**, 193-8 (1950).—*C.A.* 45, 5569*c*.

By elimination of CO_2 and efficient stirring, the titration of the hydroxide remaining after the pptn. with $BaCl_2$ was quant. Adsorption of the hydroxide on $BaCO_3$ or formation of acidic or basic Ba carbonates was not observed.

3572. Dey, Arun K. and Ghosh, Satyeshwar. **Studies in the nature of hydrated ferric oxide. I. Influence of temperature and concentration on the nature of the precipitate obtained by the interaction of solutions of ferric chloride and sodium hydroxide.** *J. Indian Chem. Soc.* **27**, 65-70 (1950).—*C.A.* 45, 1893*f*.

Hydrated Fe_2O_3 was completely pptd. by less than the theoretical amt. of NaOH. Adsorption of Cl^- decreased and that of Na^+ increased with increasing amt. of NaOH. The ppt. formed at higher temp. with excess NaOH was yellow and resistant toward acids.

3573. Donnet, J. B. **Birefringence of vanadium pentoxide sols.** *J. chim. phys.* **47**, 698-702 (1950).—*C.A.* 45, 4116*b*.

The difference in the exptl. and calcd. values of the diffusion coeff. was due to the combined effects of poly-dispersion, slow flocculation, and particle growth of colloidal V_2O_5 sols.

3574. DOUGLAS, H. W. AND WALKER, R. A. **Electrokinetic behavior of Iceland spar against aqueous electrolyte solutions.** *Trans. Faraday Soc.* **46**, 559-68 (1950).—*C.A.* **45**, 21*e*.

The zeta potential of pure Iceland spar was detd. against CO_2-free water, its own satd. soln., and the effect of increasing concn. of $CaCl_2$, $BaCl_2$, $Pb(NO_3)_2$, $MgCl_2$, NaCl, NaOH, Na_2CO_3, and $(NaPO_3)_6$. The initial potential and its variation with dissolved electrolytes depended on the pretreatment. In particular, etching of the spar with very dil. mineral acid caused the potential to shift irreversibly to more neg. values, an effect consistent with irregular pitting of the surface as shown by the electron microscope.

3575. DUBUISSON, A. **Study of plasters.** *Rev. materiaux construction trav. publ., Ed. C*, No. **418**, 228-32, 259-64, No. **420**, 282-7 (1950).—*C.A.* **45**, 4422*i*.

Dehydration of $CaSO_4 \cdot 2H_2O$ did not show evidence of formation of the intermediate compd. $CaSO_4 \cdot \frac{1}{2}H_2O$. Rehydration of sol. anhydrite in air at 17°C and 80% relative humidity produced the compd. $CaSO_4 \cdot \frac{2}{3}H_2O$. The mechanism for hydration of anhydrite was transformation directly into $CaSO_4 \cdot \frac{2}{3}H_2O$, with liberation of 2612 cal/g mol. wt, thence hydration to $CaSO_4 \cdot 2H_2O$, with liberation of 3480 cal/g mol. wt.

3576. FRICKE, R. **Hydrolytic adsorption on pure acid oxides.** *Naturwissenschaften* **37**, 428 (1950).—*C.A.* **45**, 4533*d*.

Pure amorphous titanic acid from its tetraethyl ester adjusted 1 N KCl soln. to pH slightly below 5; pure SiO_2 from the ortho ethyl ester gave pH from 3 to 4 with 1 N KCl.

3577. GAUR, HARISH CH. AND BHATTACHARYA, A. K. **Influence of adsorption of $Fe(CN)_6^{---}$ and Cd^{++} ions, and that of hydrolysis on the composition of cadmium ferricyanide.** *Current Sci.* **19**, 176-7 (1950).—*C.A.* **44**, 9852*b*.

A fairly stable sol of concn. 2.5 g/liter was prepd. by mixing $CdSO_4$ and $K_3Fe(CN)_6$ solns. in the mol. ratio 1:1.25. The sol was dialyzed for 5 days, and mixed with $CdSO_4$ and $K_3Fe(CN)_6$ solns., resp., at several concns. The release of $Fe(CN)_6^{---}$ per g of complex was much greater in the undialyzed sol. Both hydrolysis and adsorption contributed to variations in the compn. of the compd.

3578. GLAZMAN, YU. M. AND STRAZHESKO, D. N. **Investigation by the tracer method of the coagulation of lyophobic sols by electrolytes. Adsorption of ions of the same sign.** *Doklady Akad. Nauk S.S.S.R.* **75**, 411-13 (1950).—*C.A.* **45**, 3220*d*.

The amt. of neg. ions PO_4^{---} and SO_4^{--} adsorbed by the neg. hydrosols of AgI (0.01 *M*) and HgS and As_2S_3 (0.008 *M*) was detd. by tagging the anions with radioactive P^{32} and S^{35}, resp. The amts. adsorbed on HgS and As_2O_3 were ~0.8 and ~0.9 millimole/g, resp.; adsorption of SO_4^{--}, none on AgI or HgS, and ~2.1 millimole/g on As_2S_3. Pos. Sr^{++} ions (tagged with radioactive Sr^{89}) were adsorbed to the extent of 47.6 millimole/g on AgI, 16.8 on HgS, and 63.9 on As_2S_3.

3579. KIRIYAMA, RYOITI. **Velocities of crystal growth. IV. Final-stage velocity of crystal growth in the supersaturated solution.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **71**, 243-5 (1950).—*C.A.* **45**, 4534*i*.

The rate of the increase of wt of crystal grains of Sr formate dihydrate and Ba formate in satd. solns. were detd. by means of a thermobalance at 25-50°C. The formal activation energy for the final stage of crystal growth of Sr formate dihydrate was 615 kcal./mol. at 27.3-52.0°C and that of Ba formate 3.7 kcal./mol. at 25.2-55.8°C. These reaction velocities were proportional to concn. and temp. and inversely to the viscosity of soln.

3580. KONDO, SEI-ICHI AND SUITA, TOKUO. **Absorption spectra of colored potassium chloride containing several kinds of impurities.** *J. Phys. Soc. Japan* **5**, 200-1 (1950) (in English).—*C.A.* **45**, 1868*h*.

The absorption curves and dielec. dispersion of KCl crystals contg. NaCl, AgCl, and TlCl were studied after irradiation with x-rays. The anomalous color found in these crystals, which disappeared upon exposure to light, was explained in terms of the dipolar rotation of pairs of vacancies in an elec. field.

3581. KOZAKEVITCH, PAUL. **The structure of adsorbed films formed by mineral substances.** *J. chim. phys.* **47**, 24-32, 600 (1950).—*C.A.* **44**, 6229*d*; *C.A.* **45**, 2742*a*.

The Schofield-Rideal equation was applied to the surface-tension measurements of various metal and metal oxide solns. Na on Sn formed a liquid layer, Ba on Hg formed a layer as in an ordinary cryst. structure, H_2O on $AgTl(NO_3)_2$ formed the tetrahedral structure, Na_2O, on FeO showed the 100 plane as in cryst. Na_2O, and P_2O_5 on FeO formed a plane tetrahedral network as in glassy P_2O_5. The surface covol. B was calcd. incorrectly in an earlier paper and the correct results were given here.

3582. MALKINA, A. D. AND DERYAGIN, B. V. **Adhesion of quartz fibers in aqueous media.** *Kolloid. Zhur.* **12**, 431-47 (1950).—*C.A.* **45**, 1841*i*.

A vertical quartz fiber 25-40μ thick was fixed vertically. A horizontal quartz fiber, 80-120μ thick, was pressed against it by a force *P* for a time *t*. When the latter was moved away, the former might follow it until the contact was severed by the elastic forces. Their magnitude was calcd. from the flexion of the fiber, and from them the specific adhesion energy *f* (ergs./cm²) was calcd. In water and aq. solns. *f* was independent of *P* (varied between 0.014 and 0.084 dynes) but increased with *t*. When a fiber was pressed against another, the hydrate layers between the solids gradually melted away; the distance between the solid surfaces decreased, and their attraction increased.

3583. Malquori, Alberto and Wiklander, L. **Influence of alternate wetting and drying on potassium and magnesium fixation and base-exchange capacity of synthetic aluminum and iron silicates.** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam* **1950**, **I**, 141-6.—*C.A.* **46**, 1839*h*.

Alternate wetting and drying was used to simulate artificial aging. Both Al and Fe silicates fixed K (3.4-4.5% of that added) and particularly Mg (13-17%) in a nonexchangeable form, the degree of fixation reaching a practically const. value even after a few days. Al silicates fixed more Mg than did Fe silicates. The results also showed an increase in exchange capacity with increasing SiO_2:R_2O_3 ratio.

3584. Marques, Branca Edmée. **New data on the behavior of polonium in acid solutions.** *Rev. quim. pura e apl.* **33**, 123-47 (1950).—*C.A.* **47**, 3080*f*.

In acid soln. Po was adsorbed in paraffin. In wettable surfaces such as glass, mica, and quartz, adsorbed Po was distributed uniformly. The Po retained by the surface was proportional to the time the soln. of HNO_3 had been in contact with the surface and to the concn. of Po. Freundlich's law was valid at tracer-level concn. for Po.

3585. Martínez, Francisco Bermejo. **A new method for determining the ion-exchange capacity of artificial zeolites.** *Inform. quím. anal. (Madrid)* **4**, 1-8 (1950).—*C.A.* **44**, 6989*e*.

An improved method first sats. the zeolite with Ba ion by treating with N $Ba(OAc)_2$. Excess Ba^{++} was then eliminated by washing with water and with 95% EtOH. The Ba retained by the zeolite was displaced by washing with N NH_4Cl, and subsequently pptd. and weighed as $BaSO_4$. While previous methods required as long as 16 to 24 days, this method required less than two.

3586. Martínez, Francisco Bermejo. **Methods of obtaining, analysis, testing, and properties of zeolites.** *Anales edafol. y fisiol. vegetal* **9**, 29-81 (1950).—*C.A.* **44**, 10961*i*.

Several series of zeolites were prepd. by means of different known wet processes and chemically analyzed. All products agreed with the general formula $Na_2O.Al_2O_3.xSiO_2.y\ H_2O$. The activity of these products, based on the exchange capacity with respect to Ba^{++} was detd. No strict relation was found between the exchange capacity of bases and other properties of zeolites (chem. compn., adsorption of methylene blue, porosity, hygroscopicity).

3587. Murin, A. N. **Mechanism of the ion exchange between a solution and a precipitate.** *Doklady Akad. Nauk S.S.S.R.* **74**, 65-8 (1950).—*C.A.* **45**, 423*a*.

Rates of exchange of Ag^+ and Br^- were detd. with 3 types of AgBr: freshly pptd., aged, and fused. In the course of the exchange, the surface area of freshly pptd. AgBr, when stirred with a KBr soln., decreased to 30% of its initial value in 20 min. The exchange of Ag ions was quite fast with all 3 prepns. of AgBr. The exchange of Br^- took place through recrystn., whereas in the exchange of Ag^+, self-diffusion in the solid might be rate-detg. especially in the case of aged ppts.

3588. Okáč, A. and Bezděk, M. **Adsorption of bivalent metals during the precipitation of trivalent metals with ammonia.** *Chem. Listy* **44**, 300-5 (1950).—*C.A.* **45**, 3682*f*.

Adsorption of Co, Ni, Mn, Cu, Zn, and Cd by the ppts. of Fe, Al, and Cr hydroxides was followed exptly. in 3 pptns. The amts. of ions adsorbed after the 3rd pptn. are (in %) 20.7, 8.3, 17.7, 1.1, 1.2, 0 in $Fe(OH)_3$, 95.4, 93.1, 49.6, 0.8, 23.7, 0 in $Al(OH)_3$, and 46.9, 29.9, 58.1, 15.6, 38.0, and 12.9 in $Cr(OH)_3$.

3589. Okáč, A. and Bezděk, M. **Imperfections in systems of qualitative separation of cations.** *Pubs. faculté sci. univ. Masaryk* No. **319**, (Rada E4), 9-22 (1950) (Russian and French summaries).—*C.A.* **46**, 6039*b*.

The sepn. of trivalent metals (Fe, Al, Cr) and bivalent metals (Ni, Co, Cu, Mn, Zn, Cd) with NH_4OH was studied. $M(OH)_3$ and $[M(NH_3)_x]^{2+}$ were formed in excess NH_4OH. The copptn. of bivalent metals was least with $Fe(OH)_3$, where it was due mostly to adsorption, and adsorption isotherms of parabolic shape were obtained. The greatest adsorption was shown by metals which can be oxidized to the trivalent state in NH_4OH solns. (Co, Mn, Ni).

3590. Osawa, Toshiyuki. **Purity of precipitate and crystal. II. Coprecipitation of ferric ion and ammonium ion with calcium oxalate.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **71**, 68-70 (1950).—*C.A.* **45**, 5001*b*.

There was a close relation between the soly. of a Ca oxalate and the quantity of pptn. of the coexisting ions such as ferric or NH_4 ions. At 20° the soly., 2×10^{-4} mol./liters corresponded to min. copptn.

3591. Osawa, Toshiyuki. **Purity of precipitate and crystal. III. The relation between the solubility of oxalates of Ca, Sr, Ba, Cd, Cu, Ag, Pb, and Zn and the coprecipitation with ferric ion.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **71**, 191-4 (1950).—*C.A.* **45**, 5001*c*.

The soly. was studied for each of these oxalates for the min. amt. of copptn. of ferric ion, and the results were summarized.

3592. Ôsawa, Toshiyuki. **Purities of precipitate and crystal. IV. The investigation or presumption of solubility by coprecipitation phenomena.** *Bull. Chem. Soc. Japan* **23**, 244-7 (1950) (in English).—*C.A.* **46**, 2378*i*.

By comparison of its capacity to coppt. Fe^{+++} with that of other oxalates of known soly., the soly. of ZnC_2O_4 was inferred to be about 1.1 to 1.6×10^{-4} mol./liter at room temp.

3593. Pieruccini, R. **A sensitive method for the spectral detection and the determination of arsenic by means of adsorption in ferric hydroxide.** *Spectrochim. Acta* **4**, 189-99 (1950).—*C.A.* **45**, 2364*e*.

For the estn. of As in very dil. solns. use is made of the facility with which $Fe(OH)_3$ adsorbs As from solns. Arsenic-free $FeCl_3$ is added to the soln., followed by pptn. with NH_4OH and soln. of the ppt. in dil. acid. This soln. is absorbed by C electrodes and tested spectrographically. The method is applicable to 0.1 mg As in 24 liter of soln., and can be used to test the freedom of reagents from this element.

3594. SCHUYLENBORGH, J. VAN; ARENS, P. L., AND KOK, J. G. J. **Electrokinetic behavior of freshly prepared γ- and α- FeOOH.** *Rec. trav. chim.* **69**, 1557-65 (1950).—*C.A.* **46** 8466*b*.

The isoelec. curves of α-FeOOH and γ-FeOOH, prepd. in different ways, and of $Fe(OH)_3$ were detd. The isoelec. point (pH) decreased as the moist ppts. were dried and as the soln. from which they were pptd. became more dil. It was concluded that α-FeOOH, γ-FeOOH, and Al hydroxides were forming very slowly in the soil, and were aging at the same time, consequently mutual pptn. with negatively charged SiO_2 was very improbable.

3595. SEN, BINAYENDRA NATH. **Asbestos partition chromatography.** *Australian J. Sci.* **13**, 49-50 (1950).—*C.A.* **45**, 1901*g*.

Qual. sepn. of some cations, e.g. Cu-Cd and As-Sb-Sn, was obtained by ascending development from aq. soln. on strips of asbestos millboard.

3596. SHISHNIASHVILI, M. E. **Adsorption of electrolytes on aluminosilicic gels and new basic salts of aluminum.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1950**, 169-77.—*C.A.* 44, 8733*b*.

Gels were prepd. by mixing 0.1 N solns. of $Al(NO_3)_3$ or $AlCl_3$ and Na_2SiO_3, and prolonged electrodialysis. In this process, the chem. compn. of the gel changed progressively; thus, an initial gel Al_2O_3. 2.4 SiO_2 had, at the end of the electrodialysis, the compn. Al_2O_3.1.65 SiO_2. At the same time, the amt. of exchangeable Al decreased constantly, with the result that a highly dialyzed gel contained no exchangeable Al. The acidity which did appear in such highly purified gels under the action of salts, was due to hydrolytic splitting of the adsorbed salt.

3597. STRAZHESKO, D. M. AND GLAZMAN, YU. M. **Relation between the adsorption of coagulator ions and their concentration in solution.** *Dopovidi Akad. Nauk Ukrain. R.S.R.* **1950**, 283-5 (in Ukrainian).—*C.A.* **46**, 318*c*.

The adsorption of $Sr(NO_3)_2$ (0.01 – 0.1 *M*) in coagulation of hydrosols of AgI (10 millimole/liter), HgS, and As_2S_3 (8 millimole/liter), was investigated by tagging with radioactive Sr^{89}. With c = concn. of $Sr(NO_3)_2$ the amts. adsorbed, at the concns. c, $5c$, and $10c$, were: on AgI, 47.6 micromole/g (4.17%), 184.7 (3.47), 315.1 (2.96); on HgS, 16.8 (5.16), 46.8 (2.87), 83.3 (2.56); on As_2S_3 63.9 (12.58), 90.2 (3.55), 118.5 (2.33).

3598. TANANAEV, I. V. AND RUDNEV, N. A. **Physicochemical analysis of systems significant in analytical chemistry. XVIII. Theory of precipitation of barium sulfate from the point of view of turbidimetric analysis.** *Zhur. Anal. Khim.* 5, 82-9 (1950).—*C.A.* **44**, 4815*i*.

The systems studied were $BaSO_4$-C_2H_5OH-H_2O and $BaSO_4$-$BaCl_2$-C_2H_5OH-H_2O. Equiv. quantities of H_2SO_4 and $BaCl_2$ solns. were combined in a mixt. of H_2O and EtOH, the total vol. being 50 ml. Where an excess of $BaCl_2$ was desired it was added simultaneously with the stoichiometric quantity of $BaCl_2$. The alc. in the final mixt. made up 0.50% and the excess $BaCl_2$ was 0-0.3 *M*. The light absorption of the suspension increased sharply with the alc. content and reached a max. at 30% of alc. after which it dropped sharply. The behavior of the maxima on the curves under the influence of excess $BaCl_2$ was observed. The effect of $BaCl_2$ was to augment the effect of EtOH.

3599. TANANAEV, I. V. AND RUDNEV, N. A. **Physicochemical analysis of systems significant in analytical chemistry. XIX. Investigation of the system $BaSO_4$-NaCl-C_2H_5OH-H_2O from the point of view of turbidimetry.** *Zhur. Anal. Khim.* **5**, 281-5 (1950).—*C.A.* **45**, 59*f*.

The solns. studied were prepd. by adding to 12.50 ml of 0.004 M H_2SO_4 a NaCl soln., alc. H_2O, and finally $BaCl_2$ soln. to make the total vol. 50 ml. The quantity of $BaCl_2$ in all solns. was equiv. to the H_2SO_4. The concn. of NaCl was 0-1 M and the alc. content was 0-50% by vol. From the time $BaCl_2$ was added, extinction readings were taken at definite intervals after 0.25-5 min. Time was an important factor in the behavior of this system. By plotting time vs. extinction 4 types of curves were obtained depending on the alc. and NaCl content. NaCl increased somewhat the soly. of $BaSO_4$ while alc. had the opposite effect. It was observed that the form of the ppt. differed depending on the presence of $BaCl_2$ and NaCl.

3600. TIAN, ALBERT. **Chemical inactivity of adsorbed potassium permanganate.** *Compt. rend.* **230**, 442-3 (1950).—*C.A.* **44**, 5245*b*.

If $BaSO_4$ was pptd. in a soln. of $KMnO_4$ the color varied from cyclamen to light rose as the $KMnO_4$ concn. decreased from 0.5 N to 0.005 N. If the reducer remained in aq. soln. several days, the color of the ppt. faded, owing to the reversibility of the adsorption, whereby the H_2O freed the MnO_4^- very slowly. The color did not fade on exposure to the sun or at a temp. of 70°C for weeks, even in linseed oil.

3601. TRUJILLO, R. AND MARTINEZ, J. BELTRAN. **Insoluble hexavanadates. I. Silver hexavanadate.** *Anales real soc. españ. fís. y quím.* **46B**, 639-44 (1950).—*C.A.* **45**, 4595*a*.

The successive formation of $Ag_2H_2V_6O_{17}$ and $Ag_4V_6O_{17}$ from $AgNO_3$ and $H_4V_6O_{17}$ solns. was confirmed conductiometrically. The addn. of $AgNO_3$ to $(NH_4)_4V_6O_{17}$ showed no compd. formation conductometrically. The taking up of about 60 moles of NH_3 per mole of $Ag_4V_6O_{17}$ was probably adsorption.

3602. UZUMASA, YASUMITSU AND OKURA, TAKESHI. **Aging of precipitates. Change of the electrical charge of precipitates in the course of aging.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **71**, 616-18 (1950).—*C.A.* **45**, 6456*b*.

The existence of the phenomenon that the particle size of ppts. becomes finer at an earlier stage of aging was verified by the observation of the elec. charge on the particles of the ppts. of $BaSO_4$, $CaCO_3$, and $CaC_2O_4.H_2O$.

3603. UZUMASA, YASUMITSU AND OKURA, TAKESHI. **Aging of precipitates. Effect of aging on the adsorbability of precipitate.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **71**, 587-90 (1950).—*C.A.* **45**, 6456*a*.

The particular phenomenon in which the particle size became finer in the earlier stage of aging was observed with the ppts. of $CaCO_3$ and $Fe(OH)_3$. This phenomenon was verified by the measurement of the adsorption of $[Cu(NH_3)_4]^{++}$ or methylene-blue on the ppt.

3604. Uzumasa, Yasumitsu and Okura, Takeshi. **Aging of barium sulfate precipitate.** *J. Chem. Soc. Japan*, Pure Chem. Sect,, **71**, 259-62 (1950).—*C.A.* **45**, 4526*g*.

The $BaSO_4$ ppt. prepd. by the addn. of $Ba(OH)_2$ to excess H_2SO_4 was filtered with a coarse filter paper of 1.5-μ interstices, and the residue weighed. During the course of aging of $BaSO_4$ ppt. formed under various conditions there was a stage (or in some cases stages) where the particles of the ppt. became much finer.

3605. Uzumasa, Yasumitsu and Okura, Takeshi. **Aging of precipitates. II. Adsorbability of barium sulfate precipitate and change of its apparent volume.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **71**, 314-16 (1950).—*C.A.* **45**, 4999*c*.

The existence of the particular stage where the particle size of $BaSO_4$ ppt. became finer during its aging was verified by the measurement of the adsorption of methylene blue and of Fe^{+++} on the ppt., and by the detn. of the apparent vol. of the ppt. with the centrifuge.

3606. Uzumasa, Yasumitsu and Okura, Takeshi. **Aging of precipitates. III. Aging of calcium oxalate.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **71**, 497-500 (1950).—*C.A.* **45**, 6455*i*.

The particle size became finer in an earlier stage of aging the ppt. of calcium oxalate. The change took place only when there was a certain excess of oxalate ion in the mother liquor, whereas no perceptible change occurred in case an excess of Ca ion existed in the soln.

3607. Vogel, Richard C. and Gibson, George. **Migration of sodium ions through quartz plates in an electric field. I.** *J. Chem. Phys.* **18**, 490-4 (1950).—*C.A.* **44**, 9221*c*.

The only important mechanism of current flow was the migration of Na ions through the quartz plate. The activation energy was from 22 to 25 kcal. and depended upon the potential gradient. The rate of migration of the Na ions was essentially independent of the concn. of the Na ions.

3608. Wadsley, A. D. **A hydrous manganese oxide with exchange properties.** *J. Am. Chem. Soc.* **72**, 1781-4 (1950).—*C.A.* **44**, 6327*i*.

A hydrous Mn oxide of the approx. formula $(Na, Mn)Mn_3O_7.nH_2O$ was prepd. by the oxidation of Mn hydroxide in aq. alk. suspension. The hydrous oxide readily formed metal complexes which were not considered to be true compds. The complexes were formed by the substitution of metal ions for Na ions.

3609. Yamamoto, Takemaro. **Effect of cations on the growth of crystals of barium sulfate from aqueous solutions.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **71**, 56-8 (1950).—*C.A.* **45**, 5001*g*.

The effects of the concn. of solns., the order of mixing, and of foreign cations were studied in the pptn. of $BaSO_4$. The largest crystals were obtained by adding 0.2 ~ 0.5 *N* $(NH_4)_2SO_4$ or H_2SO_4 to 0.02 *N* $BaCl_2$. In the presence of H^+, Cu^{++}, Mg^{++}, Ca^{++}, Zn^{++}, Cd^{++}, Al^{3+}, La^{3+}, Ce^{3+}, ZrO^{++}, Cr^{3+}, Mn^{++}, Fe^{3+}, Co^{++}, Ni^{++}, Th^{4+}, and UO_2^{++}; the faces *c* (001) and *q* (011) developed, the crystal elongating in the direction of *a*- or *b*-axis.

3610. Zabolotskiĭ, T. V. and Nelyubin, V. K. **Change of crystal faces of ammonium nitrate under the influence of various ions.** *Doklady Akad. Nauk S.S.S.R.* **75**, 215-17 (1950).—*C.A.* **46**, 803*b*. Microscopic observation was made of the changes brought about in crystal habit (from needle to isometric forms) by the following ions: K, Na, Ca, Ba, Zn, Cd^{2+}, Pb^{2+}, Fe^{3+}, Cr^{3+} all introduced as nitrates; NH_4 salts of Cl^-, SO_4^{2-}, PO_4^{3-}; salts KCl, $MgSO_4$, $MgCl_2$, in variable concns. The crystn.-impeding effects of adsorption films and anomalous cryst. solns. were discussed, especially for the valency effects.

3611. Abdurashitov, S. A. and Pashaev, B. P. **The diffusion of inorganic salts through porous media that were saturated with water.** *Trudy Inst. Fiz. i Mat., Akad. Nauk Azerbaidzhan. S.S.R., Ser Fiz.* **5**, 54-8 (1951) (in Russian).—*C.A.* **48**, 3104*e*.

The diffusion of 0.02 *N* aq. solns. of KCl, $MgCl_2$, $CaCl_2$, $CaSO_4$, and $K_2CO_3.2H_2O$ through sand was measured according to an electrocond. method. The sand was satd. with water. The measurements were extended as long as 30 days. The cond. curves plotted with respect to time showed a point of inflection for KCl, $MgCl_2$, and $CaCl_2$, but not for $CaSO_4$ and K_2CO_3.

3612. Barve, P. M. and Jambotkar, A. K. **Mutual coagulation of colloidal solutions. Interaction between colloidal antimony sulfide and colloidal ferric hydroxide and the equilibrium dialyzate of colloidal ferric hydroxide.** *J. Indian Chem. Soc.* **28**, 453-8 (1951).—*C.A.* **46**, 6466*c*.

The coagulating power of colloidal $Fe(OH)_3$ was due to two factors: that of the colloidal particles and that of the intermicellar electrolytes. If the latter were removed by dialysis, more $Fe(OH)_3$ was required to ppt, an equal amt. of Sb_2S_3 by mutual coagulation.

3613. Basińska, Halina and Orylska, Krystyna. **Coagulation of silver thiocyanate sol.** *Roczniki Chem.* **25**, 472-80, in English 480-1 (1951).—*C.A.* **46**, 8935*c*.

Coagulation values of AgCNS soln. were detd. by measurements of light absorption. The effect of substances lowering the dielec. const. of the dispersing medium was investigated.

3614. Bernard, René; Davoine, François, and Hirtz, Jean. **Study of thin adsorbed layers by radioactive trace elements.** *Compt. rend.* **232**, 1826-8 (1951).—*C.A.* **46**, 2876*c*.

Tritolyl phosphate contg. radioactive P^{32} was used to measure its adsorption on glass disks. Layers formed at room temp. rapidly reached 12 A. (approx. unimol. layer) and increased in thickness less rapidly for several weeks.

3615. Berne, E. **A new type of ion-exchange column for the separation of radioactive bromine or chlorine.** *Acta Chem. Scand.* 5, 1260-6 (1951) (in English).—*C.A.* 46, 4860*f*.

Small amts. of Br^- were adsorbed from neutral solns. contg. BrO_3^- on an exchanger consisting of AgO adsorbed on diatomaceous earth. The Br^- was eluted with a soln. contg. NaI and Ba^{++} and the eluate passed through the H form of Amberlite IR-120 to remove Ag^+ and Ba^{++}.

3616. Booth, A. H. **Anomalous cocrystallization of radioactive trace quantities of foreign ions with sodium chloride crystals. I. Correlation with crystallographic effects.** *Trans. Faraday Soc.* 47, 633-40 (1951).—*C.A.* 45, 9976*i*.

The formation of tracescale "anomalous mixed crystals" is caused by strong adsorption of the foreign ions on specific crystal planes. Among a group of metal ions, all of which modify the habit of NaCl, Cd and Pb cocrystallize strongly with NaCl from solns. contg. the foreign ions in radioactive trace amts. $PbCl_2$ and $CdCl_2$ strongly inhibit crystn. of NaCl, thicken the crystn. layers and form oriented overgrowths on the (100) face.

3617. Booth, A. H. **Anomalous cocrystallization of radioactive trace quantities of foreign ions with sodium chloride crystals. II. Examination of the criteria distinguishing anomalous mixed crystals from internal-adsorption compounds.** *Trans. Faraday Soc.* 47, 640-5 (1951).—*C.A.* 45, 9977b.

The inclusion of Th B in the crystals could be prevented by the presence of an excess of another adsorbable substance (Cd^{++}) and cubo-octahedral crystals showed, in autoradiographs, a localized distribution of the Th B. Inclusion took place only during active crystal growth; Th B did not migrate into the NaCl crystals during recrystn. unless there was active growth of small crystallites to larger ones.

3618. Burkhard, P. N.; Bacon, L. R., and Wegst, Walter F. **Action of alkaline solutions on glass surfaces.** *Proc. Am. Soc. Brewing Chemists* 1950, 83-100 (1951).—*C.A.* 45, 8730*d*.

The inhibiting action of Na aluminate, Na zincate, Na berylliate, and a no. of tannins was investigated. Various types of beer bottles were used in the study. It was demonstrated that the presence of the aluminate and zincate in alk. soln. decreased corrosion and actually protected glass. A 30°C rise in temp. tripled the corrosive action in the bottle washing range. Na_3PO_4, when employed partially to replace NaOH, increased corrosion.

3619. Charmandarian, M. O. and Andronikova, N. N. **The colloidal solution of ferric hydroxide in the presence of sulfate ions.** *Bull. soc. chim. France* 1951, 327-9.—*C.A.* 46, 319*h*.

$MgCO_3$ was added to solns. of $Fe_2(SO_4)_3$ to prep. colloidal agglomerates. The amt. of $MgCO_3$ required for pptn. and the chem. properties of the ppt. were given.

3620. Dmitrenko, O. I.; Kargin, V. A., and Ryabinina, A. A. **Molecular uptake of silver salts by iron hydroxide.** *Kolloid. Zhur.* 13, 3-10 (1951).—*C.A.* 45, 3688*i*.

Gels obtained by hydrolyzing $FeCl_3$ in H_2O were dialyzed and electrodialyzed for months. The elec. resistance *R* of the gels increased during this treatment, e.g. from 8 (gel *A*) to 135 (gel *B*) and then remained almost const. (*C*); *R* of distd. H_2O was 70 in these units. The uptake by gel *A* was due to Cl^- in it, the uptake by gel *B* to OH^- (which substitutes for Cl^- during dialysis) and to true mol. adsorption, and the uptake by *C* was small because the sample was partly cryst. and the electrolytes were removed from the surface of the micelles. Gels prepd. by hydrolysis of $Fe(NO_3)_3$ behaved similarly.

3621. Fyfe, W. S. **Note on base exchange in New Zealand laumontite and natrolite.** *New Zealand J. Sci. Technol.* 32B, No. 5, 28-9 (1951).—*C.A.* 45, 10436*e*.

The suitability of laumontite and natrolite as cation-exchange materials was discussed.

3622. Gaudin, A. M.; Spedden, H. R., and Corrineau, M. P. **Absorption of silver ion by sphalerite.** *Trans. Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 3142-B (in *Mining Eng.* 3, 780-4) (1951).—*C.A.* 45, 8949*g*.

Sphalerite was crushed, ground, sized, and purified by treating with H_2O_2. After washing, the mineral was formed into columns consisting of 12 to 15 g of sphalerite in a length of 10 cm and a cross-section less than 1 cm. The particles were in the size range of about 48 to 325 mesh. Radioactive Ag^{110} and ordinary $AgNO_3$ formed a test soln. When the concn. of the influent soln. was very low, 10^{-6} moles per liter, all of the Ag was removed by the sphalerite.

3623. Gest, H.; Ballou, N. E.; Abraham, B. M., and Coryell, C. D. **Co-separation of aqueous barium ion with solid lanthanum fluoride.** *Natl. Nuclear Energy Ser.* Div. IV 9, Radiochem. Studies: The Fission Products, Book 1, 145-56 (1951).—*C.A.* 47, 5760*c*.

The co-sepn. of Ba ion with LaF_3 was studied with Ba^{140} as a tracer. The source of Ba activity was neutron-irradiated uranyl nitrate. Data obtained for the co-sepn. with internally formed LaF_3 (ppt. formed in the presence of the foreign ion) of the order of 200 mg/liter was represented by the empirical Freundlich equation $x/m = 0.0135\ c^{0.40}$, where *x* is mg/liter of Ba ion carried down, *c* is mg/liter of Ba ion remaining in soln. and *m* is mg/liter of LaF_3.

3624. Gest, H.; Burgus, W. H., and Davies, T. H. **Co-separation of aqueous fluozirconate ion with solid lanthanum fluoride.** *Natl. Nuclear Energy Ser. Div.* IV 9, *Radiochem. Studies: The Fission Products, Book* 1, 157-69 (1951).—*C.A.* 47, 5760*e*.

Using carrier-free Zr^{95} as a tracer, surface adsorption was primarily responsible for the co-sepn. of Zr as $BaZrF_6$ with both (1) externally formed and (2) internally formed LaF_3. The data were satisfactorily described by the Langmuir adsorption equation, $x/m = k_1c/(1 + k_2c)$, where in (1), $k_1 = 0.05$ and $k_2 = 2.3$ and in (2), $k_1 = 0.053$ and $k_2 = 0.71$. The adsorption was found to be reversible. A surface of 58.3 m^2/g was calcd. for externally formed LaF_3.

3625. GEST, H. AND GLENDENIN, L. E. **Co-separation of aqueous fission products with manganese dioxide.** *Natl. Nuclear Energy Ser.*, Div. IV, **9**, *Radiochem. Studies: The Fission Products*, Book I, 170-5 (1951).—*C.A.* 47, 5839f.

In dil. HNO_3, MnO_2 was effective as a general scavenger for the fission-product elements Nb, Te, Zr, and possibly others. In concns. above 10*M*, Nb, Te, and Mo were specifically removed. The co-sepn. of Nb^{95} with externally formed, freshly pptd. wet MnO_2 in 10*M* HNO_3 was quant. after 30 min. of contact.

3626. GHOSH, B. N.; CHAKRAVARTY, S. N., AND KUNDU, M. L. **Adsorption of ions by hydrated manganese dioxide in relation to its electrical charge and the concentration of the hydrogen ions liberated.** *J. Indian Chem. Soc.* **28**, 319-22 (1951).—*C.A.* **46**, 5928*h*.

The neg. charge of $6.16\ (MnO_2, MnO).43.15H_2O$ prepd. by reaction of $MnSO_4$, $KMnO_4$, and H_2SO_4 was lowered and reversed in the presence of bivalent cations in the order $Ba > Ca > Mg$. The exchange adsorption was detd. in 0.2 *N* to 0.0125 *N* chloride and acetate solns. The adsorption of Cl ion is much less than that of the bivalent cations.

3627. GHOSH, B. N.; CHOWDHURY, R. N. ROY, AND BURMAN, D. P. **Effect of electrolytes on the stability and electrokinetic potential of vanadium pentoxide and chromium hydroxide sols.** *J. Indian Chem. Soc.* **28**, 1-6 (1951).—*C.A.* **45**, 8851*f*.

The electrokinetic potentials of V_2O_5 and pos.-charged Cr hydroxide sol. were measured by the electroendosmotic method, and the coagulation by different electrolytes was measured. Chlorides of Na, K, Mg, Ba, Ca, and Al were used. As the concn. of the electrolyte increased, the electrokinetic potential of the sol decreased. The potential of pos.-charged Cr hydroxide sol and the rate of coagulation were measured in the presence of ferrocyanide, oxalate, sulfate, hydroxide, and benzoate of K.

3628. HENSLEY, JAMES W. **Adsorption of tagged phosphate ions on glass surfaces as related to alkaline attack.** *J. Am. Ceram. Soc.* 34, 188-92 (1951).—*C.A.* **45**, 7320*g*.

Sorption was measured by means of a tracer technique, with radioactive $Na_3PO_4.12H_2O$. Radioautographs were prepd. to show the distribution of sorbed phosphate. Phosphate ions were not sorbed appreciably at room temp. by a clean, fused glass surface, but when the surface layer was removed, as by alk. attack, sorption was rapid. Three types of glasses were tested: "Pittsburgh Noncorrosive" microscope slides, soft-glass weighing bottles, and "Pyrex" beakers. Sorption of phosphate ions on a glass surface was a good indicator of alk. attack but various factors complicate the process.

3629. HOLLIDAY, A. K. AND DAVIES, K. N. **Some properties of colloidal silver bromide.** *Fundamental Mechanisms of Phot. Sensitivity (Butterworths Sci. Pubs., London)* **1951**, 56-60.—*C.A.* 45, 9336*h*.

Electrophoretic-mobility measurements on AgBr sols indicated that the ζ-potential depended primarily on the concn. of Ag or Br ions in the electrolyte. When $AgNO_3$ was used to give high Ag-ion concns., adsorption of nitrate ion appeared to increase with time, reducing the initially high ζ values and rendering the sol unstable. The use of AgF largely prevented this and a fairly stable sol resulted.

3630. JACOBS, G. **Centrifugation potentials and the effect of electrolytes on the ζ-potential of the arsenious sulfide sol.** *Mededel. Koninkl. Vlaam. Acad. Wetenschap., Belg., Klasse Wetenschap.* **13**, No. 7, 3-28 (1951).—*C.A.* 46, 5400*i*.

The sedimentation potential, V, of a sol in a centrifugal field where ω was the angular velocity was proportional to ω^2, as required by theory. The effects of KCL, Na_2SO_4, $K_4Fe(CN)_6$, HCl, $BaCl_2$, $[Co(NH_3)_5Cl]Cl_2$, $[Co(NH_3)_4CO_3]NO_3$, and Na_2S, resp., on the ζ-potential of As_2S_3 sols (4-56 g/liter) were studied. Potentials were somewhat less than those detd. by electrophoresis.

3631. JUNG, L.; STASIW, O., AND TELTOW, J. **Tarnish reaction of sulfur-containing silver bromide crystals with bromine and with silver.** *Z. physik. Chem.* **198**, 186-99 (1951).—*C.A.* 47, 30*d*.

The bleaching of brown AgBr crystals, contg. about 0.1 mol. % of Ag_2S, with Br or Ag obeys the laws of tarnish reactions. Under conditions where the reaction is rapid, it obeys the parabolic law $N_L K_A = (S^2/2t) N_\upsilon$; N_L is the Loschmidt no., K_A Wagner's tarnish const., S thickness of tarnish zone, t elapsed time, N no. of mols. per sp. vol. of reaction products, and υ electron consumption per indicator mol. The value of the tarnish consts. depends on the concn. of $CdBr_2$ used to dil. (in solid soln.) the AgBr.

3632. KANEKAR, C. R. AND SUBRAHMANIAM, K. E. **Optical properties of zirconium hydroxide gels.** *J. Univ. Bombay*, Sect. A, **19**, Pt. 5 (Science, No. 29), 28-34 (1951).—*C.A.* 46, 4886*e*.

$Zr(OH)_4$ gels were prepd. by mixing $Zr(NO_3)_4$ and $NaC_2H_3O_2$ solns. The colloidal particles first became slightly spherical in shape or isotropic in nature, and subsequently gradually increased in size and anisotropy. The addn. of acids did not modify the course of gelation. HCl and HNO_3 addn. inhibited the agglomeration of the particles, whereas H_2SO_4 hastened the agglomeration; the HCl and HNO_3 had a peptizing effect on the particles, while the H_2SO_4 had a coagulating effect.

3633. KAYSER, F.; BLOCH, J. M., AND GOMMERY, G. **The adsorption of molecules of sodium hydroxide, sodium chloride, and sodium citrate by sodium montmorillonite.** *Bull. soc. chim. France* **1951**, 462-5.—*C.A.* **46**, 318*d*.

Montmorillonite previously satd. with Na adsorbed approx. 75 millimoles of NaOH per 100 g of the mineral clay. The NaOH was removed by repeated washing with doubly distd. H_2O. NaCl and Na citrate were not adsorbed by the clay.

3634. KRESTINSKAYA, V. N. AND ABDULLINA, N. G. **Adsorption of alkali metal and alkaline earth metal ions by a colloidal solution of sulfur during its coagulation.** *Kolloid. Zhur.* **13**, 289-97 (1951).—*C.A.* **45**, 9998*e*.

Raffo sols were coagulated by salts, and the amt. *a* of the coagulating cation adsorbed by the ppt. was detd. The coagulating concn. was about 0.01 g equiv./liter for $BaCl_2$ and $CaCl_2$, 0.20 for $MgCl_2$, 0.075 for CsCl and $RbNO_3$, 0.10 for KCl, 0.81 for NaCl, and 5.3 for LiCl. The exchange adsorption seems to have secondary importance in the coagulation of S sols. In acidified S sol, K^+ is strongly adsorbed during coagulation.

3635. KRISHNAMURTI, K, AND KARBELKAR, N. V. **Adsorbed ions as efficient coagulators of sols.** *Science and Culture* **16**, 576 (1951).—*C.A.* 46, 5401*b*.

The coagulating power for an appositely charged sol of Fe^{+++}, Ag^+, and other ions adsorbed in colloidal sols is greater than that of the same ions in soln. The close approach of the double layers of the colloidal particles is responsible for the increase in coagulating power.

3636. KRUMMENERL, T. **Inhibition of grain growth in silver bromide crystals.** *Fundamental Mechanisms of Phot. Sensitivity* (Butterworths Sci Pubs., London) **1951**, 74-77.—*C.A.* 45, 9406*b*.

Adsorption of AgBr by H_2SnO_3 or Al_2O_3 sols caused "attachment inhibition" of grain growth, although the surface of the AgBr was still partially free. The inhibiting substances must be present in relatively high concn. to be effective, and a hydrophilic colloid was necessary for stabilization. Inhibition of grain growth by strongly adsorbed agents which cover the AgBr surface is termed "adsorption inhibition," and relatively small amts. of such agents are effective.

3637. KURBATOV, M. H.; WOOD, G. B., AND KURBATOV, J. D. **Application of the mass law to adsorption of bivalent ions on hydrous ferric oxide.** *J. Chem. Phys.* **19**, 258-9 (1951).—*C.A.* 45, 4113*b*.

The hydrous oxide was treated as an ion exchanger, and factors such as pH and anion concn. related quantitatively to adsorbate and adsorbent quantities by a mass-law expression. Predicted relations were verified by expts. on the adsorption of Sr, Ba, Ra, and Co ions on hydrous Fe_2O_3 from solns. contg. 10^{-9} g-atom of metal per ml.

3638. KURBATOV, M. H.; WOOD, G. B., AND KURBATOV, J. D. **Isothermal adsorption of cobalt from dilute solutions.** *J. Phys. & Colloid Chem.* **55**, 1170-82 (1951).—*C.A.* 46, 803*h*.

Adsorption of Co from very dil. solns. (10^{-5}-10^{-6} *M* or less) on hydrous Fe_2O_3 was measured. The exptl. technique involved the use of Co^{55} and Co^{66} as tracers to det. the amt. of Co removed from the soln. by the adsorbent. The adsorption isotherms indicated a region in which Henry's law held. Decreased quantities of adsorbent and increased salt concn. decreased the fraction of Co adsorbed from a soln. of given concn. Increasing the pH and quantity of adsorbent increased the fraction of Co adsorbed.

3639. LA MER, VICTOR K. AND DINEGAR, ROBERT H. **The limiting degrees of supersaturation of the sparingly soluble sulfates.** *J. Am. Chem. Soc.* **73**, 380-5 (1951).—*C.A.* 45, 4530*a*.

The max. limiting concns. of SO_4^{--} that can coexist in aq. soln. with Ba^{++} and Sr^{++} ions, resp., without producing rapid visible pptn. were investigated for a variety of conditions. To avoid possibility of local inhomogeneities in concn. as a result of the direct mixing of reagents leading to premature nucleation, SO_4^{--} was generated homogeneously by chem. reactions in the presence of the cations. The uncorrected ratio for $BaSO_4$ varied from 55 to 48; when corrected to unit activity coeff., assuming the activity coeff. of $BaSO_4$ behaved like that of $ZnSO_4$ and $CdSO_4$, the ratio assumed a const. value of 21.5. This corrected ratio varied little if at all with ionic strength except on the addn. of specific foreign neutral salts. The ratio decreased with rising temp.

3640. MACKOR, E. L. **The properties of the electrical double layer. II. The zero point of charge of silver iodide in water-acetone mixtures.** *Rec. trav. chim.* **70**, 747-62 (1951).—*C.A.* 46, 6463*d*.

Electrophoretic measurements in a modified microcuvette showed that the concn. of Ag^+ at the zero point of charge of AgI was multiplied 1000 times in going from pure water to 10 mole % acetone. Further addn. of acetone had little effect on χ, but increased the standard thermodynamic potential of Ag^+ and decreased the concn. of Ag^+ at the zero point of charge.

3641. MACKOR, E. L. **The properties of the electrical double layer. IV. The stability of the silver iodide sol in water-acetone mixtures.** *Rec. trav. chim.* **70**, 841-66 (1951).—*C.A.* 46, 6463*f*.

The flocculation of a AgI sol by Na, Ba, and La perchlorates was studied in H_2O-acetone mixts. Up to 30-40 vol. %, acetone stabilized the sol. At high acetone concns. the stability dropped off rapidly.

3642. MATSUMURA, GENTARO. **Preparation of silver colloid.** *J. Am. Chem. Soc.* **73**, 2375 (1951).—*C.A.* 45, 9997*d*.

A gray-pink colloidal soln. of Ag was prepd. by decompg. at 1010°C for 30 min. a mixt. of $AgNO_3$ soln. kneaded with pulverized MgO and treating the product with dil. AcOH to dissolve MgO, filtering, and electrodialyzing.

3643. MIURA, MASAJI AND MATSUO, HIROSHI. **Studies on the coprecipitation of nitrate ion with barium sulfate. I.** *J. Sci. Hiroshima Univ.* Ser. A, **15**, 149-53 (1951).—*C.A.* 47, 6297*f*.

The amts. of NO_3 ion copptd. from 0.005-0.15 *M* solns. of KNO_3 with $BaSO_4$ on addn. of $Ba(OH)_2$ and H_2SO_4 solns. were detd. The results fitted the adsorption isotherm, $x = m[lc/(1+lc)]^n$, where l, m, and n were consts., c was concn. of adsorbate in soln., and x was the amt. adsorbed.

3644. NEMTSOVA, V. V.; RADUSHKEVICH, L. V.; LUK'YANOVICH, V. M., AND CHMUTOV, K. V. **Mechanism of the aging of a vanadium pentoxide sol.** *Doklady Akad. Nauk S.S.S.R.* **77**, 297-9 (1951).—*C.A.* 45, 6013*a*.

Particle size distribution curves were constructed from electron-microscopic measurements of 200-250 particles of V_2O_5 hydrosols prepd. by the action of 10% HCl on NH_4 metavanadate, and allowed to stand for different lengths of time. The growth proceeded essentially over slow oriented coagulation. Crystn. from true soln. played a role in the growth of the particles. However, in a normal sol, the amt. of V_2O_5 in true soln. was small, and the growth must be due mainly to coagulation.

3645. Ôsawa, Toshiyuki. **Purity of precipitate and crystal.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **72**, 463-5 (1951).—*C.A.* **46**, 1848*e*.

The copptn. mechanism of Fe^{+++} by various oxalates was studied. In BaC_2O_4 the mechanism was mainly the occlusion of the mother liquor in the ppt. and the formation of complex salt between BaC_2O_4 and $Fe_2(C_2O_4)_3$. In Sr, Cd, Cu, Zn, Pb, and Ag oxalates occlusion in the ppt. was the main cause of copptn.

3646. Ôsawa, Toshiyuki. **The purity of precipitates and crystals. VII. Coprecipitation phenomena by various silver salts.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **72**, 570-3 (1951).—*C.A.* **46**, 5388*i*.

The relation between the solubilities of silver salts and the copptn. of manganous, K, and NO_3 ions was studied, and the results were summarized. The relative amts. of the copptd. manganous ion were in the order: chloride > bromide > iodide.

3647. Pruckner, Franziska; Schulenburg, M. von der, and Schwuttke, G. **Identification of adsorbed substances by reflection spectra.** *Naturwissenschaften* **38**, 45-6 (1951).—*C.A.* **46**, 1869*f*.

Numerous examples are given showing that the reflection spectra obtained by spectroscopy of materials adsorbed chromatographically are very similar to their adsorption spectra in soln. Often the maxima of the extinction curve are shifted to the red and somewhat flatter.

3648. Quintin, Marguerite. **Variations in the oxidation-reduction potential during the precipitation of ferrous and ferric hydroxides.** *Compt. rend.* **232**, 1303-5 (1951).—*C.A.* **45**, 7854*h*.

The effect of pH on the oxidation-reduction potential of an equimol. mixt. of $FeCl_2$ and $FeCl_3$ was studied in the absence of O_2. The soly. product of $Fe(OH)_3$, at pH 2 was 4×10^{-38}. Pptn. of $Fe(OH)_2$ began at pH 5, yielding a soly. product of 1.65×10^{-15}. It was possible that traces of O_2 might be responsible for the fact that the curves of *E vs.* pH did not follow the theoretical path.

3649. Ramsauer, Rembert. **Effects of liquids on the mechanical surface area increase of glass.** *Glastech. Ber.* **24**, 239-47 (1951).—*C.A.* **46**, 801*a*.

The grinding wear of glass by an abrasive depended not only on its hardness, but on the specific adsorption properties and the mol. constitution of the suspension liquid. The changes of the surface energy brought about by the liquid were detd. not only by the Gibbs adsorption isotherm but by the nature of the glass. Expts. were made with glass spheres (a K Pb silicate glass was used) ground during a standard time with a defined abrasive grain size and a const. amt. of liquid, in a porcelain ball-mill. For the adsorption of the liquid on glass, an approximative method was shown by measuring the sedimentation vol. of glass powder from a suspension in the liquid concerned. The polar or nonpolar groups in the mol. constitution of the liquid were sharply characterized by the elementary relation.

3650. Rastogi, M. C. **Distribution of the sparingly soluble salts in periodic structures. II.** *J. Indian Chem. Soc.* **28**, 732-4 (1951).—*C.A.* **46**, 8936*c*.

$Ba_3(PO_4)_2$ forms Liesegang rings sepd. by clear spaces in agar. The concn. of pptn. per g of gel in the rings exceeds greatly that in the clear spaces between. HgI_2 in agar, and $Ag_2S_2O_3$, $Ag_4Fe(CN)_6$, Ag molybdate, and Ag borate in gelatin, however, form bands sepd. by areas of peptized sol.

3651. Reiss, Howard. **The growth of uniform colloidal dispersions.** *J. Chem. Phys.* **19**, 482-7 (1951).—*C.A.* **45**, 9336*e*.

Much interest was recently focused upon the prepn. of monodispersed colloids by use of the "growth-by-diffusion" process. An assembly of competing particles, growing by diffusion, developed the squares of their radii at equal rates. This condition provided a mechanism leading toward uniformity.

3652. Rozen, B. Ya. **Iodine and bromine adsorption on mineral adsorbents from aqueous solutions.** *Doklady Akad. Nauk S.S.S.R.* **81**, 243-5 (1951).—*C.A.* **47**, 21*c*.

A study of the adsorption of I_2 and Br_2 on clays and muds, including a consideration of the effect of the following ions on the adsorptions: K^+, Na^+, Mg^{++}, Ca^{++}, SO_4^{--}, and Cl^-. The adsorption of I_2 and Br_2 from aq. solns. with addn. of 1, 3, 5, and 10% of the salts that affect the adsorption was effected on the following adsorbents: (1) quartz sands, (2) clays, and (3) aged $Al(OH)_3$. There was an increase of the adsorption of I_2 and Br_2 in the presence of the following salts: KCl, NaCl, $MgCl_2$, $CaCl_2$, K_2SO_4, Na_2SO_4, $MgSO_4$, and $CaSO_4$. The silica and the aged $Al(OH)_3$ adsorbents had almost identical adsorption capacities.

3653. Rubia Pacheco, J. de la and Blasco López-Rubio, F. **Turbidometry of barium sulfate.** *Inform. quim. anal.* (Madrid) **5**, 1-6 (1951).—*C.A.* **45**, 10134*e*.

The detn. of Ba^{2+} as $BaSO_4$ obeyed Beer's law, either in neutral solns. or solns. slightly acidic with HCl. The detn. of SO_4^{2-} was equally valid if solid Ba acetate was used as the pptg. reagent in a neutral soln. The results obtained showed that in detg. Ba, the coexistence of $BaSO_4$ with an excess of SO_4^{2-} impeded the turbidifying action of the Cl, while in the case of sulfates, the acetate ions caused the protecting action.

3654. Schweitzer, George K. and Nehls, James. **Precipitate-ion exchange reactions using radiosilver^{111}.** *J. Phys. & Colloid Chem.* **55**, 215-21 (1951).—*C.A.* **45**, 4579*c*.

The rate of exchange between radio-Ag^{111} ions and a Ag-salt ppt. was measured at 40, 50, and 60°C. From the data the activation energy for the movement of Ag ions through the Ag-salt lattice was calcd. The following values in kcal./mol. were obtained with the following salts: AgBr 15.0, AgI 11.8, AgCN 16.0.

3655. Shapiro, D. A. **Relation between the electromotive force of diffusion in pit-holes and the adsorptive properties of the rocks.** *Doklady Akad. Nauk S.S.S.R.* 77, 637-40 (1951).—*C.A.* 46, 10775*i*.

The e.m.f. of diffusion at the boundary of 2 porous rocks with different adsorptive properties, satd. with different concns. of a uni-univalent salt, did not in general obey Nernst's law, as a result of preferential adsorption of anions or cations. The anomaly decreased with decreasing pore size of the rock and with increasing satn. with gas and petroleum.

3656. Shively, R. R. Jr. and Weyl, W. A. **The color change of ferrous hydroxide on oxidation.** *J. Phys. & Colloid Chem.* 55, 512-15 (1951).—*C.A.* 45, 6012*a*.

The oxidation of white $Fe(OH)_2$ to deep-brown $Fe(OH)_3$ went through deep-blue and olive intermediate products which owed their strong light absorption to an exchange of electrons via the outer electron shell of the hydroxide ions. By coprecipitating $Fe(OH)_2$ with other hydroxides the distance over which such an exchange can occur depended on the state of deformation of the hydroxide ions, which was greater for $Cd(OH)_2$ than for $Zn(OH)_2$ and for $Be(OH)_3$ than for $Al(OH)_3$.

3657. Sinitsyn, P. G. **Exchange of Ba^{++} and H^+ ions on permutite.** *Zhur. Fiz. Khim.* 25, 82-6 (1951).—*C.A.* 45, 6006*h*.

The adsorption of Ba ions was studied on a permutite. It took two months to reach adsorption equil. Buffered solns. of pH between 4 and 12 were used. The quantity adsorbed *S* (milliequiv. Ba/100 g dry permutite) depended linearly on pH, in agreement with $S = a + b(\text{pH})$ but 2 straight lines were obtained, intersecting at pH = 8.5 and the slope was larger in the alk. than in the acid range.

3658. Spitsyn, Vikt. I. and Ippolitova, E. A. **Titanium phosphates.** *Zhur. Anal. Khim.* 6, 5-14 (1951).—*C.A.* 45, 4592*i*.

Ti was pptd. from $TiCl_4$ and $TiOSO_4$ solns. with NaH_2PO_4. The compn. approximated closely the formula $2TiO_2.P_2O_5$. For effective pptn. the NaH_2PO_4 soln. should be taken in a 5-10 fold excess, depending on the pH. In mildly acid medium, the ppt. was very stable. At 3*N* with respect to HCl, the ppt. formed with great difficulty, also the P_2O_5 in the ppt. diminished. In alk. medium, the compn. of the ppt. changed because of hydrolysis. Pyrophosphate gave a product that dissolved in excess precipitant. Titanic acid ppts. adsorbed phosphate ions to an extent depending on the degree of dispersion and age of the titanic acid.

3659. Stasiw, O. **Optical properties of silver bromide with additives at low temperatures.** *Z. Physik* 130, 39-50 (1951).—*C.A.* 45, 9366*g*.

The elementary process in the photochem. formation of colloidal Ag in crystals of AgBr with added Ag_2S (~0.01 mole %) was studied. Photochemically active complexes formed between sulfide ions and displaced Ag ions and between sulfide ions and bromide holes. The reaction products from these complexes diffused through the crystal and formed complexes between a displaced Ag ion, a sulfide ion, and a bromide hole which aggregated and formed colloidal Ag.

3660. Težak, Božo. **Methorics of precipitation from concentrated electrolyte solutions. I. Effect of uni-and bivalent cations [in combination with] sulfate components on the peptization of barium sulfate by an excess of barium chloride.** *Arhiv Kem.* 23, 30-43 (1951).—*C.A.* 46, 9937*i*.

Pptd. $BaSO_4$ was digested with successive portions of H_2O and the larger particles centrifuged off after 24 hrs. The turbid supernatant fluid was examd. tyndallometrically. For univalent cations the peptization increased in the order, K, Na, H, Li, whereas for the bivalent cations it was greater than with Li, increasing in the order Zn, Mn, Cd. The pos. charge of adsorbed univalent cations neutralized not only the valence charge of the primary plane, but also neutralized the charges of the SO_4^{--} adsorbed on it. The bivalent and trivalent (Al, La, and Th) ions in sufficient concn. acted similarly. A tendency towards assocn. led to agglomeration of primary into secondary structures.

3661. Aditya, S. **Stannic oxide. Nature of stannic oxide negative sol.** *J. Indian Chem. Soc.* 29, 296-300 (1952).—*C.A.* 47, 3083*e*.

A 0.775% sol of SnO_2 with pH 6.40 was prepd. Addn. of neutral salts liberated H ion in decreasing order: Ba, Ca, Na, K. This was confirmed by titration with the corresponding bases. With the same cation, the decreasing order or adsorption of anion according to the rate of decrease of pH was: oxalate, sulfate, chloride.

3662. Bender, Max and Mouquin, Henry. **Brownian movement and electrical effects.** *J. Phys. Chem.* 56, 272-8 (1952).—*C.A.* 46, 7402*f*.

Elec. effects were assocd. with cell walls and environment of the particle. Brownian movement made in deep cells could not be duplicated in shallow ones. It was noted that with decreasing pH the cell-wall charge decreased faster than the particle charge and became opposite in sign; thus an attraction was created between particle and cell wall. Qual. observations showed that the particle was not attached to the cell wall but was held in position many mol. diams. distant. The ionic type and concn. of the medium were found to affect the Brownian movement.

3663. Benzimra, Andrée and Collet, Luc Henry. **Electrolysis through a semipermeable membrane of copper ferrocyanide.** *Compt. rend.* 234, 434-5 (1952).—*C.A.* 46, 6523*a*.

It was found by electrolysis of 10^{-1} to 10^{-4} *M* solns. of HCl, H_2SO_4, NaCl, KCl, $CuCl_2$, and others, across a semipermeable membrane of Cu ferrocyanide, at a medium voltage (about 12 v.), that the same form of current *vs.* voltage curve was obtained. Precise measurements with a 10^{-2} *M* soln. of $CuCl_2$ and Cu electrodes showed that the membrane did not introduce any e.m.f. into the circuit.

3664. Charmandarian, M. O. and Andronikova, N. N. **The behavior of a colloid in the presense of electrolyte during the process of its formation.** *Bull. soc. chim. France* **1952**, 97-9.—*C.A.* **46**, 6463*b*.

The effects on sol stability of NaCl, Na_2SO_4, $MgCl_2$, and $MgSO_4$ present during the prepn. of $Fe(OH)_3$ colloids was studied. A sharp change in stability was noted at a crit. concn. of the sulfates. The chlorides delayed the coagulation more than did the sulfates.

3665. Charmandarian, M. O. and Andronikova, N. N. **The reciprocal action of sodium chloride and ferric chloride on the colloidal solution of nondialyzed ferric hydroxide.** *Bull. soc. chim. France* **1952**, 95-7.—*C.A.* **46**, 6465*i*.

In sols contg. 8.02 and 20.1 g Fe_2O_3/liter NaCl reduced the stabilizing action of $FeCl_3$. The order of coagulation depended upon the concns. of $FeCl_3$, NaCl, and the colloid itself.

3666. Chatterji, A. C. and Rastogi, M. L. **Adsorption tendency of freshly precipitated, difficultly soluble salts for their ions.** *Z. anorg. u. allgem. Chem.* **268**, 89-97 (1952).—*C.A.* **46**, 6459*g*.

The adsorption of components of the mother liquor by several difficultly sol., freshly pptd. salts was investigated in the light of competing theories of adsorption.

3667. Craig, R. A. and Hartung, E. J. **Membrane permeability. VI. Permeability to mixtures of electrolytes and the effect of concentration.** *Trans. Faraday Soc.* **48**, 964-9 (1952).—*C.A.* **47**, 4692*e*.

The cupric ferrocyanide membrane was less effective in restricting the diffusion of electrolyte at higher concns. The permeability at 25°C to solns. contg. equimolar amts. of KCl and KNO_3 or KCl and NaCl was measured. Measurements of relative penetration rates were obtained by allowing a soln. of the electrolytes to flow on one side of the membrane and detg. the concns. of each electrolyte in the effluent from the other side.

3668. Curti, Renato; Colombo, Umberto, and Clerici, Fortunato. **Chromatography with specific adsorbents.** *Gazz. chim. ital.* **82**, 491-502 (1952).—*C.A.* **47**, 4689*d*.

The base adsorbent was prepd. from Na silicate which had been treated with AcOH and dried under different conditions; the sp adsorbents were prepd. by preliminary treatment (before AcOH treatment) with the org. compds. The dimensions of the granules did not affect the specificity, and only the form of the adsorption curve depended on these dimensions. The ease of elution of the dyes indicated that van der Waals forces were the only bonds between adsorbent and dye.

3669. Davies, K. N. and Holliday, A. K. **Electrophoresis of silver bromide sols. I. Establishment of reproducible electrophoretic mobilities in presence of excess silver ion.** *Trans. Faraday Soc.* **48**, 1061-6 (1952).—*C.A.* **47**, 5214*e*.

When $AgNO_3$ was added to a AgBr sol, variable electrokinetic behavior was observed, and the sol coagulated and darkened in white light. The substitution of AgF for $AgNO_3$ gave well-defined, reproducible electrophoretic mobilities, and a stable and light-insensitive sol. Addn. of $AgNO_3$ subsequent to the extended use of AgF gave equally good results. The important factor in obtaining reproducibility was the avoidance of contamination of the AgBr by material from the contg. vessels.

3670. Davies, K. N. and Holliday, A. K. **Electrophoresis of silver bromide sols. II. Effect of added electrolyte on the electrokinetic ζ-potential.** *Trans. Faraday Soc.* **48**, 1066-73 (1952).—*C.A.* **47**, 5214*g*.

The ζ-potential of AgBr detd. in various electrolytes was compared with the theoretical surface potential derived from the lattice defect distribution in the AgBr crystal. A value of the concn. of lattice defects in unit vol. of crystal was calcd. from the exptl. data and compared with the value obtained from cond. measurements. Nonlattice anions giving insol. compds. with Ag^+ adsorbed strongly at low pAg; other nonlattice anions adsorbed appreciably only when present in high concn. Nonlattice cations appeared to adsorb weakly irrespective of pAg.

3671. Dempster, P. B. and Ritchie, P. D. **Surface of finely ground silica.** *Nature* **169**, No. 4300, 538-9 (1952).—*C.A.* **46**, 8788*a*.

The existence of a highly sol. surface layer on quartz particles was demonstrated. All siliceous dusts examd. possessed a high-soly. layer which blended smoothly into a less sol. core.

3672. Gaudin, A. M.; Spedden, H. R., and Laxen, P. A. **Adsorption of sodium ion on quartz.** *Trans. Am. Inst. Mining Met. Engrs., Tech. Pub.* No. **3276-B** (in *Mining Eng.* 4, 693-6 (1952)).—*C.A.* **46**, 7485*c*.

When a mineral particle is fractured, bonds between the atoms are broken. The unsatisfied forces that appear at the newly formed surface account for the adsorption of ions at the mineral surface. In developing a flotation theory, a study was made of Na ion adsorption from an aq. soln. on quartz. Adsorption of Na increased with concn. of Na ion but less rapidly than in proportion to it. Increasing the concn. of cations other than H or Na decreased somewhat the adsorption of Na ion.

3673. Gilbert, Jacques. **Structure of arsenic sulfide sols.** *Compt. rend.* **234**, 1616-18 (1952).—*C.A.* **46**, 7844*c*.

Sols of As_2S_3 were better conductors and more strongly acid than the original solns. of H_2S and As_2O_3 from which they were formed. The acid strength was 3×10^{-8} *N* for 0.01 *M* As_2S_3, with a variance of 10-20% dependent on the degree of dispersion. The micelles were charged negatively through preferential adsorption of anions, with H ions forming a pos. atm.

3674. Gleditsch, Ellen and Salveson, Aamund. **The exchange of ions between a salt and its saturated solution.** *Bull. soc. chim. France* **1952**, 523-7.—*C.A.* **46**, 10777*d*.

The exchange of ions between $Pb(NO_3)_2$ crystals and satd. solns. of the salt were studied with RaD as the radioactive indicator. If the crystals were made radioactive and placed in their satd.

soln. exchange occurred in a Fruendlich-type isotherm at 20°C; exchange was greatest for the smallest crystals and decreased as the crystals became larger in size.

3675. GYULAI, Z. AND BIELECK, S. **Transition layer between growing crystals and their solution.** *Acta Phys. Acad. Sci. Hung.* 1, 199-207 (1952) (in German).—*C.A.* 47, 1455*a*.

At the surface of contact between the crystal and the soln. there exists a transition layer in which the ions and the H_2O mols. are partly arranged in such a manner as to form the continuation of the crystals. When the equil. in the transition layer is disturbed at one point, the partly arranged ions add themselves on the crystal. Such a disturbance occurs mostly at the points and edges of the crystal. The formation of layers and of steps in crystals can be explained only by the presence of a transition layer.

3676. HAUTOT, A. AND SAUVENIER, H. **Mechanism of desensetizer action. II. Adsorption of desensitizers on grains of silver halide.** *Bull. soc. roy. sci. Liege* 21, 95-101 (1952).—*C.A.* 47, 4230*a*.

Density vs. log. intensity was plotted for emulsions densensitized, then washed for increasing periods at room temp. Initial desensetization by a factor between 10 and 10^3 was changed by prolonged washing to a factor between 2 and 5. Desensitizers were more strongly adsorbed on the most sensitive grains. All desensitizers appeared to trap photoelectrons; in addn. CrO_3 appeared to oxidize the nuclei of the latent image as they formed.

3677. HERSHENSON, H. M. AND ROGERS, L. B. **Errors in volumetric analysis arising from adsorption.** *Anal. Chem.* 24, 219-20 (1952).—*C.A.* 46, 2951*f*.

The error resulting from adsorption of Ag^+ on soft glass was shown to be appreciable even when the solns. were not extremely dil.

3678. HIYAMA, SHIMPEI AND FUKUI, HIROSHI. **A consideration of the hydrating mechanism of calcined gypsum.** *Gypsum* 1, 233-5 (1952) (English summary).—*C.A.* 46, 10575*a*.

Natural gypsum calcined 2.5 hrs at 165°C and aged 18 hrs was hydrated to flakes of gypsum by adding citric or succinic acid (larger flakes with the 1st; the strength rather low in both) and to needles by adding H_3BO_3, NaCl, $ZnSO_4$, $CaCl_2$, $Al_2(SO_4)_3$, Na_2SO_4, $(CO_2Na)_2$, adipic acid, malonic acid, AcONa, or sebacic acid (ranked from the largest needles; the strength high in larger needles). The addn. of org. acids produced generally smaller crystals than that of sulfate needles.

3679. HONIGMANN, B. **Modification of the habit of sodium chloride crystals in saturated solution under the influence of temperature oscillations.** *Z. Elektrochem.* 56, 342-5 (1952).—*C.A.* 46, 10771*f*.

Crystals of NaCl were immersed in satd. soln. in closed vessels contg. excess NaCl in the bottom. The temp. was oscillated over ranges of 0.1, 2, and 5° around 20°C in various expts. The period of the temp. oscillation was 20 min. At the end of the expts., crystals originally cubes (001) exhibited faces 001, 111, 012, (011?). Crystals originally octahedra (111) (from solns. contg. urea) exhibited faces 111, 001, 012, 011. Crystals originally dodecahedra (011) (from solns. contg. glycine) exhibited faces 011, 001, 111, (012?).

3680. HUBBARD, DONALD AND CLEEK, GIVEN W. **Deuterium- and hydrogen-electrode characteristics of lithium-silica glasses.** *J. Research Natl. Bur. Standards* 49, 267-71 (1952) (Research Paper No. 2363).—*C.A.* 47, 5222*h*.

pH and pD response curves as a function of compn. pass through a max. of 59 mv./pH or pD at approx. 82% SiO_2, limited on the low-silica end by poor chem. durability and tendency towards devitrification. On the high-silica end the response drops and hygroscopicity and deuterioscopicity decrease. The glasses showed more swelling in acid-H_2O than in acid-D_2O solns.

3681. HUBBARD, DONALD AND GOLDMAN, RICHARD G. **Heterogeneous equilibria at the glass electrode-solution interface.** *J. Research Natl. Bur. Standards* 48, 428-37 (1952).—*C.A.* 46, 10017*a*.

Aq. acidic solns. leached alkalies from silicate glass and left a silica-rich layer that acted as negatively charged nonmigratabld ions. The migratable ions in the system behaved according to the distribution law and Donnan membrane theory. In the alk. region the rate of soln. of all glasses exceeded the rate of swelling. Glasses contg. over 74% SiO_2 and poor in durability showed high $Ag(NH_3)_2{}^+$ in the surface. If the SiO_2 content was below 74%, soln. and sloughing occurred, and Ag at the interface decreased rapidly to zero.

3682. ILER, R. K. **Polymerization of silicic acid; retarding effect of chromate ion.** *J. Phys. Chem.* 56, 678-9 (1952).—*C.A.* 46, 8943*e*.

The chromate ion retards the gelling of aq. silicic acid in the pH range of 1 to 2. An unstable silico-chromic acid in equil. with free acids is probably formed. Since gel time varies inversely with the square of the concn. of silicic acid, the amt. of silicic acid combined with chromic acid can be calcd.

3683. JACOBS, G. **Centrifugation potentials and the influence of electrolytes on the ζ-potential of the As_2S_3 sol.** *Trans. Faraday Soc.* 48, 355-62 (1952).—*C.A.* 46, 9936h.

The disperse phase moved away from the rotation axis and retains its charge, but the smaller counter ions remained behind. This gave rise to a potential difference between 2 points in the soln. at different distances from the rotation axis. The effect of several electrolytes on the ζ-potential of concd. As_2S_3 sol was detd. There was a strong decrease of the ζ-potential when small amts. of KCl were added.

3684. KERN, RAYMOND. **The effect of the rate of evaporation of aqueous solutions of alkali halides on the faces of crystalline precipitates.** *Compt. rend.* 234, 970-1 (1952).—*C.A.* 46, 9372*h*.

Crystals were obtained by evapn. from a microscope slide of glass or of Pt and observed with a microscope. Rate of evapn. was controlled by (*a*) working at room temp. in free space, in an enclosed chamber, or by desiccants of various drying strengths, (*b*) heating the microscope stage in such a way as to regulate evapn. Salts studied were LiF, NaF, NaCl, KCl, KBr, and KI. Slow evapn. gave only the 100 faces.

3685. Kern, Raymond. **Effect of the rate of evaporation of nonaqueous solutions of alkali halogen salts on crystal faces developed.** *Compt. rend.* 234, 1379-80 (1952).—*C.A.* 46, 9373*a*.

Solns. in MeOH and EtOH, Me_2CO, MeCOPh, and dioxane were studied. In every case slow evapn. produced only cubes, whereas an increased rate produced octahedra. For a given solvent, the crit. rate of evapn. necessary to produce octahedra increased in the order NaCl, KCl, KBr, NH_4I, KI, RbI.

3686. Kern, Raymond. **The effect of the rate of evaporation of solutions of cesium chloride-type alkali halides on the crystal faces obtained.** *Compt. rend*, 234, 1696-7 (1952).—*C.A.* 46, 10761*g*.

When aq. solns. of CsBr, CsCl, or CsI are evapd. slowly, the rhombic dodecahedral form (110) is obtained. At high rates of evapn. the cube form (100) is obtained. The formation of dendrites makes it impossible to det. the forms of NH_4Cl and NH_4Br. For low rates of evapn. (low degrees of supersatn.) planes with low elec. fields, i.e. planes contg. both cations and anions, form the faces, (100) for NaCl-type and (110) for CsCl-type lattices.

3687. Kind, V. V. **New hypothesis of cement hardening.** *Tsement* **18**, No. 2, 4-6 (1952).—*C.A.* 47, 287*a*.

H_2O penetrates the lattice and microcrevices of clinker minerals, and in consequence the latter are ruptured. The fragments are hydrated and disintegrate further. The hydration products go into soln. until they sat. the available H_2O. Hydration continues within the satd. soln. forming hydrated mols. which remain near the seat of the hydration reaction. The hydrated mols. aggregate into larger units (colloids) and forming a gel. The colloids crystallize and recrystallize, gradually the crystals grow together pressing out the H_2O and hardening the gel.

3688. Kubaschewski, Oswald and Krusenstjern, Arvid v. **Porosity of anodized layers.** *Metalloberfläche* A6, No. 7, 97-102 (1952).—*C.A.* 46, 10961*e*.

Macropores in anodized Al can be found by observing the action of $CuSO_4$ or $HgCl_2$ solns. on the base metal through an anodized layer or by testing for the loci of passage of elec. current through the layer. Microporosity is indicated by the increase in weight if $Pb(NO_3)_2$, $CuSO_4$, or $K_2Cr_2O_7$ solns. are absorbed.

3689. Kurbatov, M. H. and Wood, Gwendolyn B. **Rate of adsorption of cobalt ions on hydrous ferric oxide.** *J. Phys. Chem.* **56**, 698-701 (1952).—*C.A.* 46, 8480*e*.

Co 60 was used as a radioactive tracer. The rate of adsorption of Co from soln. by freshly pptd. Fe_2O_3 was 1st order at a concn. of 8.4×10^{-8} g atoms Co per liter. At 2×10^{-6} g atoms Co per liter, the rate was complex, showing two 1st-order curves with 1 hr and 5.8 hrs half lives, resp.

3690. Landsberg, Rolf. **The semipermeability of copper cyanide membrane.** *Z. physik. Chem.* 199, 266-79 (1952).—*C.A.* 46, 8935*i*.

The p.d. between different solns. on two sides of Cu ferrocyanide membranes was measured. Where the two solns. were the same uni-univalent electrolyte with concns. differing by a factor of 10, a p.d. smaller than expected was obtained. This effect increased with increasing abs. concn., and was greater for F than for Na.

3691. Loening, E. E. and Farnell, G. C. **Photographic behavior of the silica/silver-ion system.** *Phot. J.* 92B, 187-94 (1952).—*C.A.* 47, 4231*a*.

The photographic properties of a system produced by adsorption of Ag ions and OH ions on silica were studied. The standard sample consisted of 200 mg silica immersed in 5 ml 0.001 *M* $AgNO_3$ at pH 7.4-7.6. Exposures were normally made at 0°C and were physically developed in a hydroquinone-quinone-citric acid-$AgNO_3$ soln. Adsorption of Ag ions by the silica was accompanied by adsorption of OH ions. The developability of colloidal Ag deposited on glass showed a similar behavior, suggesting that the rapid fading of the latent image resulted from coagulation of colloidal Ag. Systems formed with silica contg. an adsorbed gelatin layer were more sensitive than those without gelatin.

3692. Long, Arthur O. and Willard, John E. **Reactions of ions in aqueous solution with glass. Studies with radioactive tracers.** *Ind. Eng. Chem.* 44, 916-20 (1952).—*C.A.* 46, 5939*d*.

The simultaneous sorption and desorption of Na ions by glass was studied with Na^{24} and Na^{22}. The initial rate of desorption was greater than was the rate of sorption, but both became nearly const. after this initial interval. Effects of leaching of neutron-irradiated glass samples showed that water and 0.1 *N* HNO_3 were almost equally effective and that pretreatment by soaking the glass sample in a foreign-ion soln. did not remove all of the available Na^+.

3693. Lydersen, Dagfin and Gjems, Odd. **Conductometric titration of sulfate.** *Z. anal. Chem.* 137, 189-95 (1952).—*C.A.* 47, 1006*i*.

The conductometric titration of SO_4^{--}, in solns. of the K or NH_4 salt, were shown to be inexact because of adsorption by the $BaSO_4$ ppt. The error depended partly upon the concn, of the titrated soln. but should be taken into consideration in exact work.

3694. Matijević, E. and Težak, B. **Coagulation mechanism of hydrophobic sols (discussion of experimental results with silver halide sols in the nascent state).** *Kolloid-Z.* 125, 1-13 (1952).—*C.A.* 46, 6466*a*.

The effects of opposite ion charge, amt. of ions, and sol concn. on the electrolyte coagulation of the Ag halide sols were established. The applicability of the coagulation method for detg. the complex-forming ions in electrolyte solns. was indicated with $Th(NO_3)_4$ and $Al(NO_3)_3$ solns. The general state of the electrolyte soln. was of utmost importance in coagulation of hydrophobic colloid systems.

3695. MATSUURA, NIRO. **Effects of impurities in the electrolyte on the electrodeposition of zinc. VI. Coprecipitation of antimony with iron hydroxide.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 73, 873-6 (1952).—*C.A.* 47, 6275*c*.

The amt. of Sb copptd. with Fe hydroxide was expressed by Langmuir's adsorption isotherm $x/m = c/-(14.2 + 0.58\ c)$, where x = copptd. Sb, m = pptd. $Fe(OH)_3$, c = concn. of Sb in mg/liter which was in equil. with Sb copptd. Radioactive Sb^{125} was used as tracer.

3696. MILLER, V. B.; NEĬMAN, M. B., AND SAZONOV, L. A. **General method for studying coprecipitation and adsorption with tagged atoms.** *Zhur. Anal. Khim.* 7, 269-80 (1952).—*C.A.* 47, 1541*a*.

In a system contg. Ba and Sr copptn. was studied with the aid of radioactive Ba^{140} and Sr^{89}. Ba was pptd. as $BaCrO_4$ and Sr as $SrSO_4$. The expts. were carried out at different concns. of $BaCl_2$ and $SrCl_2$, and in a wide range of pH. Under specified conditions, H^+ concn. prevented pptn. of $BaCrO_4$. In solns. having a molar Sr:Ba ratio of 5:1, max. copptn. took place at pH 7.5. The max. copptn.-pH relationship found experimentally was in good agreement with the Langmuir adsorption isotherm. Copptn. of Sr was greatly reduced in the presence of 0.01% of gelatin.

3697. NICOL, A. **Action of water on three anhydrous crystalline calcium silicates.** *Bull. soc. chim. France* 1952, 418-21.—*C.A.* 46, 7719*h*.

$CaO.SiO_2$, $2CaO.SiO_2$, and $3CaO.SiO_2$ were prepd. by melting together CaO and SiO_2 in stoichiometric proportions. The finely powdered products were made into a paste with water, covered with a layer of water, and let stand for more than a year in a bell jar at 16-20°. It was found that hydration was accompanied by production of hydrated SiO_2, $Ca(OH)_2$, and $CaCO_3$.

3698. OSAWA, TOSHIYUKI. **Purities of precipitate and crystal. VIII. Relations between coprecipitation and the solubility of carbonates.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 73, 320-3 (1952).—*C.A.* 47, 383*c*.

Copptn. of Mg^{++}, NO_3^-, and UO_2^{++} with the carbonates of Mg, Ni, Mn, Zn, Ca, Ag, Ba, Sr, Pb, Cu, and Cd was studied.

3699. ROBERTSON, W. D. **Precipitation of colloidal ferric oxide by corrosion-inhibitor ions.** *J. Phys. Chem.* 56, 671-2 (1952).—*C.A.* 46, 7403*a*.

The pptn. values with respect to a Fe_2O_3 sol, 1 g/liter, were detd. for the following anions used as corrosion inhibitors: PO_4^{---}, WO_4^{--}, CrO_4^{--}, $Cr_2O_7^{--}$, MoO_4^{--}, SO_4^{--}, OH^-, IO_3^-, NO_2^-, Cl^-, ClO_4^-, ClO_3^-, NO_3^-. The colloidal pptg. power of anions was not a significant factor in the corrosion-inhibition mechanism.

3700. RYDBERG, JAN AND RYDBERG, BRITTA. **Adsorption on glass and polyethylene from solutions of thorium and thorium complexes in tracer concentrations.** *Svensk Kem. Tidskr.* 64, 200-11 (1952) (in English).—*C.A.* 47, 5210*h*.

Radioactive Th^{234} was obtained in $HClO_4$ soln. from $UO_2(NO_3)_2$ solns. by extn. with ether and ion-exchange sepn. Its β-particle emission was used for measurements. The carrier was Th^{232} as $Th(ClO_4)_4$. Polyethylene bottles were treated with HCl; some were coated with Silicone C-25 and baked to 250°. Iena and Pyrex glassware were subjected to a detailed cleaning procedure. The adsorption on polyethylene rose to pH 7 and probably decreased beyond pH 9. The difference was attributed to glass acting as a cation exchanger contg. weak acid groups and polyethylene adsorbing neutral mols.

3701. SCHMID, GERHARD AND JETTER, ALBRECHT. **The preparation of seeds and nuclei for precipitation reactions with ultrasonics.** *Z. Elektrochem.* 56, 760-7 (1952).—*C.A.* 47, 3082*f*.

A $BaSO_4$ pptn. effected in the presence of dil. HCl gave a coarse, polydisperse ppt.; pptn. usually began 6 sec. after mixing. When the ppt. was treated with 175 kc, 6-8 watt/cm² ultrasonics, there was no change. Treatment during pptn. gave a finer, but even more polydisperse, ppt. It was possible to prep. denucleated glass vessels. When a pptn. without irradiation was effected in such a vessel, the ppt. was monodisperse, with all particles of the largest size 17μ, and the pptn. time 15 sec. When a $BaSO_4$ ppt. was mixed with water, irradiated, and filtered, the filtrate contained nuclei, but the residue was unchanged. Addn. of this filtrate to another $BaSO_4$ pptn., without irradiation, produced smaller particles and faster rates.

3702. STENHOUSE, JAMES F. AND ARMSTRONG, W. M. **The aqueous oxidation of pyrite.** *Trans. Can. Inst. Mining Met.* 55 (in *Can. Mining Met. Bull.* No. 477, 49-53) (1952).—*C.A.* 46, 3470*i*.

Pyrite oxidized at a measurable rate at lower temps. in caustic aq. solns. than in air. The aq. oxidation of pyrite in these solns. under O_2 pressure was investigated by measuring the effect of reaction variable on O consumption by the reactions.

3703. STOCK, D. I. **Microspherical aggregation of barium sulfate.** *Nature* 170, 423 (1952).—*C.A.* 47, 2571*d*.

$BaSO_4$ (10 g) shaken mechanically in 50 ml of dry benzene for 24 hrs formed spheres 0.5-1 mm in diam. Violent irregular shaking for 30 min. broke the spheres to yield a flocculate. Spheres reformed after regular mech. shaking. Similar results were obtained in Et_2O but not in dioxane. Basic Pb carbonate did not form spheres.

3704. TEWARI, SWARUP N. **The nature of hydrated chromium oxide. III. Dependence of the oxide character on the adsorption of different amphoteric oxide ions.** *Kolloid-Z.* 129, 140-3 (1952).—*C.A.* 47, 4686*d*.

Adsorption series for hydrated chromium oxides made by addn. of NaOH solns. to $CrCl_3$ solns. were established. Among the cations, Ba was adsorbed less than Ag or Cu. The oxalate ion was adsorbed more than thiosulfate, and chromate and ferrocyanide were the anions adsorbed least. In keeping with the amphoteric nature of $Cr(OH)_3$, the cations were adsorbed most strongly when the oxides were pptd. with an excess of NaOH, and the anions were adsorbed most strongly when the pptn. was brought about with a deficiency of NaOH.

3705. ADLER, I. AND STEIGMAN, J. **The interaction of uranyl ions with $UX_1(Th^{234})$ in acid solution.** *J. Phys. Chem.* **57**, 440-3 (1953).—*C.A.* **47**, 7288*b*.

Studies were made of the rate of adsorption of UX_1 from acid uranyl nitrate solns. by means of a C-coated Geiger-Müller tube. A max. was noted in the adsorption-time curve. The effects of different acids, thicknesses of absorbent coating, and temps. were examd. The max. was due to the opposing processes of adsorption and desorption of the uranyl salts.

3706. ATEN, A. H. W. JR.; STEINBERG, H.; HEYMANN, D., AND FONTIJN, A. **Absence of chromium exchange in solid chromic chromate.** *Rec. trav. chim.* **72**, 94 (1953) (in English).—*C.A.* **47**, 6739*f*.

Chromic sulfate, labelled with Cr^{51}, pptd. at pH 5 with a soln. of chromate to give a solid with Cr^{+++} to CrO_4^{--} in a ratio of almost 2. When the compd. was dissolved and pptd. as $PbCrO_4$, a γ-counter showed less than 1% exchange. Thus, in the course of the treatment, the Cr atoms of Cr^{+++} and of CrO_4^{--} were not equiv. at any stage.

3707. HARMSEN, G. J.; SCHOOTEN, J. VAN, AND OVERBEEK, J. TH. G. **Viscosity and the electroviscous effect of the silver iodide sol. I. Influence of the viscosity gradient and of aging of the sol.** *J. Colloid Sci.* **8**, 64-71 (1953).—*C.A.* 47, 5215d.

A fresh AgI sol, prepd. by mixing solns. of $AgNO_3$ and KI so as to have a slight excess of KI, followed by electrodialysis and electrodecantation, decreased in viscosity with aging, primarily owing to the effect of I^- liberated on aging.

3708. ROCHE, BOUCHETAL DE LA AND PEROT, G. **The ion-exchange power of the insoluble salt of Madrell.** *Bull. soc. chim. France* **1953**, 307-9.—*C.A.* **47**, 6577*d*.

The salt of Madrell was a good exchanger of cations and its exchange power was comparable to the exchange power of com. products. The salt of Madrell may be highly polymerized.

3709. RUDNEV, N. A. **Investigation of coprecipitation of sulfides by use of radioactive indicators.** *Zhur. Anal. Khim.* **8**, 3-10 (1953).—*C.A.* 47, 4698*a*.

Copptn. of sulfides was studied with radioactive Zn^{65}, Co^{60}, and Fe^{59}. The study was made in solns. at various concns. in which the tagged ions were present either in equimol. quantities or in considerably smaller concns. The original salts were chlorides, except Ag which was taken as nitrate and As taken as $NaAsO_2$. The precipitant was H_2S passed through 25 ml of soln. at a rate of 50-60 bubbles/min. at 18-20°. The amt. of Zn pptd. was with HgS 40.2, CuS 11.2, CdS 9.5, Bi_2S_3 3.7, and with SnS_2 3%. The amt. of Co pptd. was with SnS_2 8.1, HgS 5.5, and CdS 3.4%. The amt. of Fe pptd. was with SnS_2 8.9, Sb_2S_3 6.5, CdS 3.2, and As_2S_3 2.8%.

3710. TEŽAK, BOŽO; MATIJEVIC, E.; SCHULZ, K.; MIRNIK, M.; HERAK, J.; VOUK, V. B.; SLUNJSKI, M.; BARIC, S.; KRATOHVIL, J., AND PALMAR, T. **The mechanism of coagulation of lyophobic sols as revealed through investigations of silver halide sols in statu nascendi.** *J. Phys. Chem.* 57, 301-7 (1953).—*C.A.* 47, 6219*i*.

The coagulation values of several neutral electrolytes were detd. for Ag halide sols with various concns. of stabilizing ions. The coagulations were observed tyndallometrically. The following electrolytes were tested: Li, Na, K, Rb, Cs, Ca, uranyl, Al, Th, and strychnine sulfates or nitrates in the case of neg. sols, and $NaNO_3$, SO_4, Cr_2O_7, PO_4, OAc, propionate, butyrate, valerate, and citrate in the case of pos. sols.

3711. VAN HOOK, ANDREW AND REARDON, EDWARD J. **Liesegang rings on metallic bases.** *Nature* **171**, 177(1953).—*C.A.* 47, 4172*f*.

Liesegang rings of Ag_2CrO_4 can be formed on metallic bases.

II-7. Metals With Various Solutions

3712. ROTH, ALBERT. **The structures of electrolytically-prepared aluminum oxide.** *Z. anorg. allgem. Chem.* **244**, 48-56 (1940).—*C.A.* 35, 2762³.

Al sheets, 99.995% pure, were oxidized by a.c. or d.c. in solns. of H_2SO_4 or $H_2C_2O_4$ for various periods of time with various current ds. and at temps. of 22° or 30°C. They were then washed, dried, and the surface film was x-rayed with Co radiation. In each case the product initially obtained was amorphous. When samples of the oxides were heated for 4 hrs at temps. from 600° to 1000°C a change to γ-Al_2O_3 occurred.

3713. BEINERT, H. AND BONHOEFFER, K. F. **Passivity of iron and the Ostwald-Lillie concept of nerve conductance. III. Oscillographic investigations of the cathodic behavior of passive iron and of platinum in nitric acid.** *Z. Elektrochem.* 47, 536-45 (1941).—*C.A.* **36**, 4396².

The general run of the potential curves depended on the kind of Fe used, the concn. of the acid, the temp. and particularly on the HNO_3 content. The results could be explained by the assumption that the unimol. layer of a surface oxide was reduced at the "intermediate potential." For activation it was sufficient that the current reduced a part of this oxide layer. The rest was reduced spontaneously by localized currents.

3714. ERBACHER, OTTO. **Different types of local solubility cells.** *Korrosion u. Metallschutz* 17, 5-13 (1941).—*C.A.* **35**, 7352⁶.

Soly. cells were caused by the presence of areas of different solubilities on the metal surface. The formation of such anodes on Pb and Bi was proved by the use of isotopic radioactive elements as indicators in prepg. radiographs of the metal surfaces.

3715. Likhtman, V. I. and Rebinder, P. A. **Effect of glide-plane orientation in single crystals of tin on their adsorption-promoted deformation.** *Compt. rend. acad. sci. U.R.S.S.* 32, 130-1 (1941) (in English).—*C.A.* 37, 813^2.

The relation of the initial angle of orientation X_0 of the glide plane to the effect of surface-active substances on deformation was measured. The adsorption effect was at max. when λ_0 was approx. 45°C. Plastic deformation was facilitated by adsorption of surface-active substances, which penetrated the microcracks developed along the gliding plane and formed films thereon.

3716. Rebinder, P. A.; Likhtman, V. I., and Maslennikov, V. M. **Deformation of single crystals of metals as facilitated by adsorption of surface-active substances.** *Compt. rend. acad. sci. U.R.S.S.* 32, 125-9 (1941) (in English).—*C.A.* 37, 812^9.

Pure single crystals of Sn and Zn were used. The stresses were applied to the crystals kept in air, a purified nonpolar paraffin, or in the paraffin to which oleic acid was added. The deformation was greatly facilitated by the presence of the surface-active oleic acid. The optimum concentration of the latter was 0.2% of the paraffin oil.

3717. Suito, Eiji. **Thermal analysis of the catalytic action of colloids. III. Effect of acid and base on the catalytic decomposition of hydrogen peroxide by colloidal platinum.** *Rev. Phys. Chem. Japan* 15, 155-70 (1941) (in English).—*C.A.* 45, 937*f*.

The catalytic decompn. of H_2O_2 by Pt sol was unchanged in type (1st-order reaction) when 0.00001-0.1 *M* H_2SO_4 or 0.00001 *M* KOH was added either to H_2O_2 (series *A*) or to Pt sol (series *B*) before mixing, but deviated to the 2-nd order reaction when 0.0001-0.1 *M* KOH was similary added. The effect of the ions adsorbed on the solid surface of the colloidal particles was discussed.

3718. Brdička, Rudolf. **The adsorption of reduced methylene blue on the dropping-mercury electrode.** *Z. Elektrochem.* 48, 278-88 (1942).—*C.A.* 37, 5661^3.

Polarographic reduction of methylene blue produced a complex wave between pH 4.92 and 9.24. A small anomalous wave, which was independent of concn., preceded the main wave obtained at concns. above 10^4M. The anomalous wave was considered due to the adsorption of undissocd. leucomethylene blue which reached a limit when the surface of the Hg drop was covered. The following values were calcd.: the max. no. of adsorbed mols. = 10^{14} mols./cm^2; their vol. = 0.606 l./mole; and their adsorption energy = 11.2 kg.-cal./mole.

3719. Brdička, R. **The polarographic behavior of riboflavin. II. The adsorption of the reduction products and their oscillographic investigation.** *Z. Elektrochem.* 48, 686-93 (1942).—*C.A.* 37, 5661^5.

The anomalous wave appearing before the main reduction of riboflavin was considred due to the reduction products in the light of results obtained with methylene blue. Detailed analysis of the current-voltage curves with due consideration of semiquinone formation seemed to indicate that only the leuco form of riboflavin was adsorbable. The kinetics of the adsorption phenomenon were studied with a cathode-ray oscillograph. At certain applied voltages, the current-time curves thus obtained showed 2 delayed maxima, due to the sep. adsorption of the semiquinone and leuco forms of riboflavin.

3720. Hampel, J. **Reactions of solid substances. CXXV. Course of the sintering process in copper powder as followed by its adsorption capacity for dissolved dyestuffs.** *Z. Elektrochem.* 48, 82-4 (1942).—*C.A.* 37, 295^4.

The Cu powder was prepared and heated in H_2. An alc. soln. of Congo red and aq. solns. of eosin, methylene blue and rhodamine were studied. The adsorption curves of these dyestuff solutions were very similar and showed maximum adsorption at 200°C.

3721. Müller, Otto H. **Oxidation-reduction potentials measured with the dropping-mercury electrode. IV. Polarographic study of α-hydroxyphenazine:** *J. Biol. Chem.* 145, 425-41 (1942).—*C.A.* 37, 836^5.

The polarographic wave decreased with an increase in the dropping time of the Hg electrode. It was, therefore, impossible to show the existence of this tautomer with a stationary electrode. This represented the first real difference between potentiometric and polarographic data pertaining to reversible org. systems.

3722. Vavruch, Ivan. **Application of polarography and conductometry to the evaluation of refined sugars.** *Z. Zuckerind. Böhmen Mähren* 66, 43-50 (1942).—*C.A.* 38, 5099^5.

Polarographic and cond. measurements were made upon 64 samples of refined sugar produced from massecuites of varying purity, and the limits within which the ratio between the mg molasses and the ash content of the white sugar may vary were detd. A simple factor was established from the exptl. results.

3723. Vavruch, Ivan. **Electrolytic adsorption coefficients of refined sugar and molasses.** *Z. Zuckerind. Böhmen Mähren* 66, 35-40 (1942).—*C.A.* 38, 6585^9.

The suppression of the 0 max. was detd. and the electrolytic adsorption coeffs. were calcd. for aq. solns. of refined sugar and molasses. Molasses suppressed the 0 max. approx. 1000 times as much as refined sugar. The electrolytic adsorption coeff. of refined sugar was about the same as HCOOH, while molasses was near acid fuchsin.

3724. Wüstefeld, A. **Adsorption properties and plasticity of phosophate surface layers on ingot steel.** *Kolloid-Z.* 101, 82-7 (1942).—*C.A.* 38, 5446^5.

The inter-relations between phosphate layer, lubricant and the shaping of ingot Fe were investigated. Surprisingly, phosphate layer was essentially harder than the Fe. A distinct layer, difficultly sol. in fat solvents, was deposited on phosphate layer soaked for 15 hrs in various 2% soap solns. The soap soln, functioned as a lubricant through the adsorption of soap on phosphate layer. The adsorption layer was independent of the thickness of phosphate layer. Phosphate layer made drawing easier chiefly through its adsorptive powers for lubricants and its high plasticity.

3725. Bonhoeffer, K. F. **The theory of periodic chemical reactions in excitable systems.** *Ber. Verhandl. sachs. Akad. Wiss. Leipzig, Math-phys. Klasse*· **95**, 57-70 (1943).—*C.A.*39, 1801^{4}.
For the math. treatment of a periodic reaction, such as the polarization of an Fe wire in HNO_3, the characteristic variables for the state of the system were the degree of excitation x and the refractivity y. The change of state was then: $dx/dt = f(s,y)$ and $dy/dt = g(x,y)$. The variation of dx/dt as a function of x when $y = 0$ was discussed.

3726. Ghosh, Bholanath. **Spreading of liquids on mercury surface.** *J. Indian Chem. Soc.* **20**, No. 10, 349-54 (1943).—*C.A.* **38**, 3181^{5}.
The spreading of water, contg. traces of HCl, H_2SO_4, HNO_3, H_3PO_4, NaCl, KCl, RbCl, CsCl, and colloidal graphite soln. irradiated by x-rays, on a Hg surface was studied. The number of H^+ or alkali ions necessary to produce a film of unit area was evaluated.

3727. Haller, Robert. **The explanation of dyeing processes.** *Kolloid-Z.* **105**, 147-9 (1943); *Chem. Zentr.* **1947**, **I**, 18-19.—*C.A.* **41**, 6051e.
From the varying results of expts. on the coloring of films of Al_2O_3 produced anodically on sheet Al and the Al_2O_3 used for chromatographic adsorption analysis with org. dyes (as alizarin, Ponceau G, methylene blue, brilliant green), it was concluded that the color effect on eloxated Al was a function of the particular degree of dispersion of the Al_2O_3 grains deposited on the metal.

3728. Harms, H. **A method for the determination of the absolute number of molecules adsorbed from binary mixtures on defined metal surfaces.** *Kolloid-Z.* **103**, 202-10 (1943).—*C.A.* **38**, 3528^{7}.
The change in concn. occurring in the liquid mixt. upon adsorption was detd. The effective metal surface was found by using Hg spheres leaving a capillary under pressure, whose size distribution was detd. Back transport of adsorbed mols. was prevented by means of an air space. The method was applied between -45° to 83°C to aq. and alc. solns. of naphthol yellow.

3729. Stackelberg, M. V., and Schutz, H. **Quantitative estimation of surface-active substances by polarographic adsorption analysis.** *Kolloid-Z.* **105**, 20-6 (1943) —*C.A.* **38**, 5163^{3}.
The max. of a polarogram can be suppressed by surface-active substances which were adsorbed at the Hg surface. Examples were soaps, gelatin and dyes. The degree of accuracy of adsorption analysis by polarographic methods was brought within 2% by standardization with solns. under the same conditions as used for analysis.

3730. Vavruch, Ivan. **Effects of sulfites on the height of the polarographic 0 maximum.** *Z. Zuckerind. Bohmen Mahren* **66**, 161-3 (1943).—*C.A.* **38**, 5100^{8}.
Sulfites did not have a noticeable effect on the 0 max. of a normal wt sucrose soln. in 0.002 *N* K_2SO_4 until their concn. was 3 times as high as that normally found in com. refined sugar. The suppression of the 0 max. in some refined sugars was caused mainly by surface-active substances which occurred in small quantities in every refined sugar.

3731. Vavruch, Ivan. **The effects of the medium on the height of the polarographic oxygen maximum of the refined sugar.** *Z. Zuckerind. Bohmen Mahren* **67**, 61-71 (1943).—*C.A.* **41**, 7145*c*.
Alkalies present in concns. up to 4 x 10^{-3} N in 1 N sugar solns. produced no polarographically detectable changes when the soln. was heated to 70°C. Polarographically inferior sugars readily underwent decompn. when heated to 140°C (15 min. to 5 hrs) either as solid or in soln. The increased formation of capillary-active substances at the higher temp. reduced the 0 max. The 0 max. was increased after only 24 hrs in a vacuum, since volatile substances, which account for the characteristic odor, escaped.

3732. Devaux, Henri. **Crystallization of substances from solutions spread on mercury.** *Compt. rend.* **219**, 565-7 (1944).—*C.A.* **40**, 1371^{6}.
The crystn. of salts such as $CuSO_4$, $ZnSO_4$, $MgSO_4$, Na_2SO_4, iron sulfate, etc., from films of solns. only several mols deep was described. Two zones were observed within the film: a section of very finely developed crystals within which new nuclei formed and grew continuously, and a zone, immediately at the base of these crystals, which was entirely free of crystals and undoubtedly only unimol. The sepn. was very sharp. The segregation was ascribed to adsorptive forces at the Hg surface.

3733. Erbacher, Otto. **Is the adsorption of cations on metal surfaces primary or secondary?** *Z. Elektrochem.* **50**, 9-11 (1944).—*C.A.* **38**, 6155^{9}.
A review of the author's earlier expts. led to the conclusion that the adsorption of cations was primary.

3734. Fischer, Hellmut. **Primary or secondary adsorption of ions from water solutions on metal surfaces.** *Z. Elektrochem.* **50**, 11-13 (1944).—*C.A.* **38**, 6155^{9}.
Electrolysis inhibitors, whether cations or anions, underwent primary adsorption, which was defined as adsorption on the active centers of the metal surface.

3735. Pavelka, Fritz. **Protective film on aluminum. IV. Some experiments on the adsorption of chloride ions on the protective film on aluminum and its effect.** *Kolloid-Z.* **109**; 145-9 (1944).—*C.A.* **41**, 5002*b*.
Behavior in the elec. oxidation was explained by noting the time required for the attainment of certain c.d. or the slope of the oxidation curve in certain regions. Observation of the behavior during the electrolytic formation of a protective film on Al afforded a very sensitive means of detecting the presence of Cl^-.

3736. Van Rysselberghe, Pierre and Alkire, George J. **Polarographic reduction of carbon dioxide.** *J. Am. Chem. Soc.* 66, 1801 (1944).—*C.A.* 39, 28^3.

Study of CO_2 in 0.1 *M* Me_4NCl showed that CO_2 exhibited well-defined reduction waves with a half-wave potential of -2.24 ± 0.01 v. The slope dE/du varied between 0.359 and 0.614 v. (E = cathodic potential, u = ratio of the current to the diffusion current.)

3737. Williams, Kenneth T. and Johnson, Clarence M. **Determination of soluble pectin and pectic acid by electrodeposition.** *Ind. Eng. Chem., Anal. Ed.* 16, 23-5 (1944).—*C.A.* 38, 700^4.

Since the sol. pectinous materials were negatively charged colloids, it was possible to deposit them on the anode of a suitable electrolytic system. The outfit consisted of a Hg-filled side arm and Pt wire to serve as cathode and a disk of 45-mesh Pt gauze as anode. To a low-ash soln. contg. 5-50 mg of pectin, add 58 ml of water and 42 ml of 95% EtOH. With the electrolytic vessel in ice water apply 5-20 milliamps. directly from a 220-v. circuit. At the end of 5 hrs withdraw the anode, wash in EtOH and weigh.

3738. Benedicks, Carl and Rubens, Gerhard. **The effect of liquids on the strength of glass and hardened steel.** *Jernkontorets Ann.* **129**, 37-106 (1945).—*C.A.* 41, 3030*d*.

Certain tensile tests showed a quicker break with wet specimens than in parallel dry tests. These tests definitely showed that the presence of a liquid might have a strong effect on the tensile strength. A theory was presented explaining the effect of a liquid on the strength of a material, according to which the liquid contained in a crack on the surface of the material had two effects. At the outer end of the crack the liquid caused a decrease in the strength, at the deeper sections it had a strengthening effect. At the wider part the liquid might decrease the cohesive force, at the narrow part it might produce a "gluing" effect.

3739. Cassie, A. B. D., and Baxter, S. **The water repellency of fabrics and a new water repellency test.** *Textile Institute* 36, 1945.

3740. Mokrushin, S. G. **Formation of monomicellar films of colloidal hydroxides of metals on the surface of hydrosols.** *Compt. rend. acad. sci. U.R.S.S.* 47, 110-12; *Doklady Akad. Nauk S.S.S.R.* 47, 113-15 (1945).—*C.A.* 40, 4276^3.

It was possible to study the formation and to est. the thickness of films in the colloidal hydroxides of Fe, Al, and Cr. When a polished Cr plate was immersed in a soln. of colloidal $Fe(OH)_3$, the surface film adhered to the plate by its dry (hydrophobic) surface; when the plate was withdrawn, the surface film became attached by its lower (hydrophilic) surface. The layer adhering by its hydrophilic surface could be washed off by distd. water. The first layer could be dried on the plate, and the process repeated. With $Fe(OH)_3$, the surface film reached 37.3A, after 12-14 days.

3741. Morlock, Robert. **The spreading of liquids on metals as a function of their surface condition.** *Comm. tech. états et propriétés surface métaux, Journées états surface.* Oct. 1945, 219-22.—*C.A.* **42**, 3640*e*.

The spreading of a liquid on a mechanically polished metallic surface was similar to that on an amorphous surface like glass. If the cryst. structure was reëstablished, no spreading took place, either for polar or nonpolar liquids, if no capillary forces were involved.

3742. Müller, Otto H. **Oxidation-reduction potentials measured with the dropping-Hg electrode. V. Anomalous polarographic waves in dilute solutions of certain dyes.** *Trans. Electrochem. Soc.* 87, 22 pp. (1945).—*C.A.* 39, 2934^2.

In the polarographic analysis of many dyes representing reversible oxidation-reduction systems, in addn. to the "regular" wave with a half-wave potential equal to the E'_0 of the system. a small wave, the anomalous wave, was found at a more pos. potential. The sepn. of these waves varied with different *dyes* and was largest in the *thiazines;* it decreased under a variety of conditions in a similar way as anomalies (deviations from Beer's law) found in spectroscopic studies of such dyes, and thus suggested a common cause. The results were discussed in connection with the selective adsorption of the leuco form of the dyes.

3743. Taylor, Cyril S.; Tucker, C. M., and Edwards, Junius D. **Anodic coatings with crystalline structure on aluminum.** *Trans. Electrochem. Soc.* **88**, 8 pp (preprint) (1945).—*C.A.* 39, 5184^9.

An x-ray diffraction pattern corresponding to that of γ alumina was obtained when the formation potential was above about 100 v. The formation of a cryst. coating did not seem to be a characteristic of the electrolyte, for cryst. coatings were obtained with a variety of electrolytes.

3744. Chakravarti, B. and Ghosh, S. **Preparation of silver sol. by the reduction of organic salts of silver. I.** *Proc. Natl. Acad. Sci. India* **15A**, 82-5 (1946).—*C.A.* 44, 3769*g*.

Ag sol was prepd. by suspending Ag citrate (from $AgNO_3$ and Na citrate, washed free of electrolyte) in cond. H_2O and reducing it with H_2. The sols obeyed Beer's law on diln. for the absorption in the visible spectrum. Although sols were easily formed by reduction of Ag salts of multivalent anions (tartrate and citrate), they were not obtained from HCOOAg or AcOAg.

3745. Deryagin, B. and Smolinanskiĭ, M. **A tribometric method of measuring adsorption on a solid-solution interface. Applications to the study of the lubricating action of adsorbed layers.** *Compt. rend. acad. sci. U.R.S.S.* **54**, 137-40 (1946) (in English).—*C.A.* 41, 2625*h*.

The surface-active substances (stearic acid, palmitic acid, myristic acid, caproic acid, octyl alc., and cetyl alc.) were deposited in a thin film of paraffin oil from a benzene soln. upon a smooth plate. The coeff. of friction of the surface of the plate was then measured by means of a slider supported by three steel needles. The detd. coeff. of friction was a measure of the quantity of active agent adsorbed on the plate. The data were found to fall on continuous curves representing the Langmuir isotherm.

3746. Khristov, St. G. **Mechanism of overvoltage at the active hydrogen electrode.** *Annuaire univ. Sofia, Faculté phys.-mat.* 43, *Livre* 2, 63-73 (1946-1947).—*C.A.* 43, 8284*h*.

The overvoltage was due to the adsorption of protons on the electrode; this created a potential barrier through which succeeding protons must approach the electrode. Quantum-mech. treatment of overvoltage at the active H electrode resulted in a general theory for both H-and metal electrode overvoltage.

3747. Kruykova, T. A. **Effect of the adsorption of surface-active substances on the movement of drops during the flow of mercury from a dropping electrode.** *J. Phys. Chem. (U.S.S.R.)* **20**, 1179-86 (1946) (in Russian); *Acta Physicochim U.R.S.S.* **22**, 381-91 (1947) (in English).—*C.A.* **41**, 3004*e*, 6823*f*.

Addn. of surface-active compds. (amyl alc., phenol, methylene blue, K oleate) to 0.001 *N* $PbCl_2$ + satd. KCl lowered the first part of the polarographic wave and often simulated an addnl. wave. Similar effects were shown by starch, gelatine, agar, and saponin in various electrolytes. In the growing drop the Hg surface moved up. This caused concn. of adsorbed surface-active substances near the upper part of the drop (i.e., its base). Consequently, the upper part had a lower surfacd tension than the lower part, and this difference in surface tensions worked against the rising of the surface.

3748. Morize, Pierre and Lacombe, Paul. **Study of the oxidation of aluminum by air, at ordinary temperature, by measuring the potential.** *Compt. rend.* **222**, 658-9 (1946).—*C.A.* 40, 5983^2.

Refined Al (99.99%) was freed of its oxide coating by electrolytic means, with a bath contg. 2 cc. Ac_2O to 1 cc. $HClO_4$ (sp. gr. 1.61) (contact with air or water was avoided). The metal was then immersed in acetone and finally washed in abs. alc. When placed in a 3% NaCl soln. (air-free) the Al so prepd. gave an e.m.f. of -1.20 v. referred to a satd. calomel electrode, whereas mechanically polished Al gave -0.74 v., both at room temp.

3749. Soda, Norimune and Okamoto, Shoji. **Effect of temperature on boundary friction.** *Oyo Butsuri (Applied Phys.)* **15**, No. 3-4, 9-13 (1946).—*C.A.* 41, 5293*c*.

In the static friction, controlled by the mol. arrangement between the 2 surfaces in contact, a loss of mol. orientation at the transition temp. reflected immediately on the friction. In the dynamic friction, concerned with many unorderly mols. covering orderly mol. layers, a breakdown in the mol. arrangement at the transition temp. did not directly affect the friction.

3750. Thiesse, Xavier and Belon, Suzanne. **Wetting power and the activation energy of adsorption upon a dropping-mercury cathode.** *Compt. rend.* **223**, 794-6 (1946).—*C.A.* 41, 4021*g*.

The height of the maximums due to O-adsorption obtained on the polarogram showed that the variation of O desorption as a function of *c*, the concn. of surface-active agent, was represented by $1-(\Delta H/H_0) = e^{-Kc}$. H_0 was the height of the max. for O-adsorption in a soln. of aerated H_2O contg. 50 mg NaCl/liter, ΔH was equal to $H-H_0$, where H is the height of the max. for concn. *c*, and *K*, the adsorption const. for each compd., was the vol. of soln. contg. 1 g of wetting agent and for which $\Delta H/H_0 = 1 - 1/e$.

3751. Van Rysselberghe, Pierre. **Polarographic reduction of carbon dioxide. II. Polymerization and adsorption at the dropping-mercury cathode.** *J. Am. Chem. Soc.* 68, 2047-9 (1946).—*C.A.* **41**, 35*g*.

In general, polarographic reduction waves follow equations of the type $E = E_{1/2} + (RT/\alpha F) \ln[i/(i_d - i)]$ where E = abs. value of the cathode potential, $E_{1/2}$ = abs. value of the half-wave potential, R = molar gas const., T = abs. temp., F = 1 faraday, i = reduction current, i_d = limiting diffusion current, α is a small integer representing the no. of electrons. A theory was based upon the sharing of 2 H^+ and 2 electrons by more than 1 mol. of the reducible substance, and the establishment of an adsorption equil. of the reduction product between the dropping-Hg cathode and the soln.

3752. Bigelow, W. C.; Glass, E., and Zisman, W. A. **Oleophobic monolayers. II. Temperature effects and energy of adsorption.** *J. Colloid Sci.* 2, 563-91 (1947).—*C.A.* 42, 2490*i*.

The temp. was detd. at which the oleophobic property (produced by films deposited on Pt from a soln. of the polar compd.) disappeared. When cetane was used as the solvent, the temp. increased with the concn. of polar compd. in soln. but reached a max. at 0.5% concn. for octadecanol, stearic acid, and octadecylamine. The max. temps. for these 3 compds. were 41°, 73°, and 104°C. For films deposited from bicyclohexyl solns. on Pt, the max. value of the temp. was 60°C higher for any given compd. than the max. value for cetane solns.

3753. Bowden, F. P. and Grew, K. E. W. **An experimental determination of the capacity of the double layer.** *Discussions Faraday Soc.* No. **1**, 91-4 (1947).—*C.A.* 42, 8667*f*.

The capacity at the interface between Hg and aq. soln. of H_2SO_4 was detd. by measurement of the velocity of the charge at the interface with very small c.d. The value (20 microfarads/cm^2) was considerably higher than the values previously obtained by the same method, but was in good agreement with the values obtained in the electrocapillary method and in expanding surface method. Over the limited range of potential the 3 methods agreed in giving values for the capacity of 20-21 microfarads/cm^2.

3754. BRDICKA, R. **Measurements of quantities concerning the adsorption of certain reducible compounds of their reduction products at the dropping-mercury electrode.** *Collection Czechoslov. Chem. Communs.* 12, 522-40 (1947).—*C.A.* 42, 5355*d*.

If one of the oxidation-reduction forms should be absorbed on the Hg drops, the free energy change which occurred would shift the polarographic wave to more neg. potentials if only the oxidized form was adsorbed. At low concns. of the oxidation-reduction system the Hg drops would be unsatd. and a single wave would appear. Above a certain concn. 2 waves would follow the normal wave at more neg. values if the oxidized form only was adsorbed (e.g., phenosafranine), or precede the normal wave at more pos. potentials if the reduced form only was adsorbed (e.g. methylene blue and lactoflavin).

3755. CHAMIÉ, C. AND HAÏSSINSKY, M. **Deposit of polonium on mercury.** *J. chim. phys.* 44, 197-8 (1947).—*C.A.* 42, 5300*c*.

From a study of the effects of pH and time of contact and of agitation it was concluded that Po in soln. as ions but not in the colloidal state was adsorbed by metallic Hg. A distribution equil. was not involved, because Po adsorbed on Hg was not readily released at either low or high pH.

3756. CHANDA, BIMAL. **Quantitative studies on the anodic oxidation of aluminum.** *Trans. Indian Inst. Chem. Engrs.* 1, 67-71 (1947-48).—*C.A.* 44, 8264*h*.

Oxide coatings were formed on sheets of 99.4% Al foil by electrolysis. Increasing the electrolyte concn. from 10 to 20% H_2SO_4 had little effect on thickness of oxide film, but increased the amt. of Al dissolved in the electrolyte. Raising temp. from 85° to 105°F resulted in marked increase in Al dissolved and in the formation of a more porous and lighter film which was unsuitable for dyeing. Tests were made with Brilliant Croceine 9B. The optimum dipping time was 5-10 min. The amt. of dye absorbed was not affected by dye concn. but was almost linear with oxidation time (thickness of oxide film).

3757. COTTON, PIERCE. **The spreading of fatty acids on vaporized metallic films.** *Compt. rend.* 22, 1005-7 (1947).—*C.A.* 43, 4923*h*.

Drops of oleic and pelargonic acids were found to spread on a Ag surface vaporized on a glass or quartz carrier, provided the metal film thickness was less than 1 $m\mu$ for oleic and 2 $m\mu$ for pelargonic acid.

3758. GRUZ, T. ERDE AND VARGA, E. **The effect of nonelectrolytes on the electrode potentials of amalgams and on the amalgamated metals.** *Hung. Acta Chim.* 1, No..2, 18-27 (1947).—*C.A.* 42, 8676*g*.

The potentials of resting and dropping amalgams of Bi, Pb, Cd, Tl, and Zn were detd. in solns. of various isoamyl alc., benzyl alc., o-toluidine, o-cresol, p-cresol, butyric acid, and valeric acid. To make the solns. elec. conductors, Na_2SO_4 was added and both solns. and app. were carefully freed of O_2. The potentials were detd. partly by the adsorption of ions and neutral dipole mols. on the liquid side of the boundary between metal and soln., partly by adsorption of metal ions on the amalgam side of the double layer.

3759. HERR, W. **The behavior of ions of more and less noble metals on metallic surfaces and the determination of absolute values of ion adsorption by means of radioactive indicators.** *Angew. Chem.* A59, 155-7 (1947).—*C.A.* 42, 1120*h*.

The size of a metallic surface could be found from measurements of the electrochem. exchange between metal atoms and more noble ions. Theoretical considerations and data for the adsorption of Pb ions from acid soln. of various concns., with ThB as indicator, were presented.

3760. KOLOTYRKIN, YA. AND BUNE, N. **Hydrogen overvoltage on lead electrode and the static potential of lead dissolving in sulfuric acid.** *J. Phys. Chem.* (U.S.S.R.) 21, 581-7 (1947) (in Russian).—*C.A.* 41, 6821*b*.

The H-overvoltage was detd. in dil. H_2SO_4, O_2 being carefully excluded. At low current densities, the Pb was covered with adsorbed O_2. The processes of soln. and deposition of Pb did not affect the overvoltage-current relationship.

3761. LIKHTMAN, V. I.; REBINDER, P. A., AND YANOVA, L. P. **The effect of the rate of deformation and the temperature on the magnitude of the adsorptive reduction in the strength of single crystals of tin and lead.** *Doklady Akad. Nauk, S.S.S.R.* 56, 827-30 (1947); *Chem. Zentr.* 1948, II, 471-2.—*C.A.* 44, 8189*h*.

Cylindrical single crystals of very pure Sn and Pb were prepd. By the use of special app. the rate at which the crystals were drawn was varied from 0.05 to 1000% per min. The crystals were drawn in air, in petroleum oil, and in the latter with the optimum addn. (about 0.2%) of the following surface-active substances: oleic acid, palmitic acid, and cetyl alc. Measurements were made at 20° and 100°C. The max. adsorption effect for Sn at 20° was at a rate of 5% elongation per min. At 100°C, the max. effect was observed at 240% per min.

3762. LUKOVTSEV, P. D. **Theory of the hydrogen overvoltage.** *J. Phys. Chem.* (U.S.S.R.) 21, 589-98 (1947) (in Russian).—*C.A.* 41, 6821*d*.

Equations for overvoltage were derived by assuming that the desorption of H occurred simultaneously by two processes (combination of 2 adsorbed H atoms and reaction of an absorbed H with H+) and that the probability of each process depended on the inhomogeneity of the solid surface.

3763. MOKRUSHIN, S. G. **Surface layer of colloidal solutions and the size of colloidal particles.** *Trans. Faraday Soc.* 43, 1-2 (1947).—*C.A.* 41, 4994*e*.

The spontaneous formation of very thin, invisible surface films has been found to result from surface or two-dimensional coagulation in a positively charged hydrosol. The film thickness of colloidal $Fe(OH)_3$ was about 3-4 $m\mu$. The micelles of $Fe(OH)_3$ were of a plate-like shape.

3764. Ríus, A. and Knecht, J. A. **Electrochemical passivity of lead.** *Anales fís. y. quím. (Madrid)* **43,** 367-88 (1947).—*C.A.* **41,** 6797*a*.

Pb was rendered passive by treatment with various reagents and the passivity did not disappear on treatment with solns. of $Ba(NO_3)_2$, Na_2CO_3, Na_2SO_3, $NaHSO_3$, hydroquinone, pyrogallic acid, or H_2SO_4. Passivity was destroyed rapidly by $Na_2S_2O_6$, H_2O_2 in acid medium, $K_3Fe(CN)_6$ in alk. medium, H_2CrO_4, $HMnO_4$, NH_4CAc, $(NH_4)_2SO_4$. The film causing passivity contained pores readily penetrated by metallic Hg.

3765. Stout, H. P. **The electrodeposition of hydrogen on palladium.** *Discussions Faraday Soc.* No. **1,** 107-14 (1947).—*C.A.* **42,** 8668*i*.

The electrodeposition and electro-soln. of H_2 at Pd electrodes in aq. solns. of H_2SO_4 were irreversible processes. The linear *V* vs. log *i* relation was due to a rate-detg. process in the formation of gaseous H_2. The max. quantity of H_2 taken up by Pd electrolytically corresponded to a ratio of 0.65 atom of H to 1 atom of Pd, in agreement with the view that H_2 dissolved ionized, its electrons going to fill up the vacant *d* states of the Pd, which numbered about 0.6 per atom.

3766. Stout, H. P. **The energy of activation in the electrodeposition of oxygen.** *Discussions Faraday Soc.* No. **1,** 246-7 (1947).—*C.A.* **42,** 8668*c*.

Published work on the electrodeposition of O_2 at a Pt electrode showed that the reaction in acid and alk. solns. proceeded differently, whereupon it was to be expected that the energy of activation in the 2 cases was different. The energy of activation for deposition on Pt from 0.2 *N* H_2SO_4 was 18.7 kcal. at the reversible potential of 0.9 v. against a satd. calomel electrode at a temp. of 35°C.

3767. Tverdovskiĭ, I. P. and Frumkin, A. N. **Relation between the wetting of mercury and the nature of the solvent.** *J. Phys. Chem. (U.S.S.R.)* **21,** 819-24 (1947) (in Russian).—*C.A.* **42,** 2160*b*.

N_2 bubbles (0.15-0.4 mm diam.) were placed on, or pressed against, a Hg surface in 0.3 *N* NH_4NO_3 solns. in alc.-H_2O mixts., the Hg polarized cathodically, and the interfacial tension σ_{12} at the Hg-soln. boundary and contact angle θ (through the soln.) were detd. as functions of the applied voltage V. In H_2O θ passed through a max. (about 100°C) at the V of the electrocapillary max. N_2 was sepd. from Hg by a film of the soln. which was thick enough to have properties of the bulk phase.

3768. Uhlig, H. H. **Passivity in chromium-iron alloys: adsorbed iron films on chromium.** *Am. Inst. Mining Met. Engrs., Inst. Metals Div., Metals Technol.* **14,** No. 6, *Tech. Pub. No.* **2243,** 10 pp. (1947).—*C.A.* **41,** 7186*d*.

Fe brought into contact with Cr was passive at the interface. This was demonstrated by electroplating or evapg. Fe on a Cr surface and immersing in 3 N HNO_3. A residual film of Fe always remained on the Cr surface. Fe apparently was adsorbed on the surface of Cr in a manner similar to adsorption of alkali metals on W, previously studied in the field of electron emission. The chem. properties of Fe so adsorbed were changed and the Fe behaved as a passive metal.

3769. Vorisková, M. **Adsorption effect on the polarographic curves of pyocyanine.** *Collection Czechoslov. Chem. Communs.* **12,** 607-19 (1947) (in Eng.).—*C.A.* **42,** 5354*i*.

The polarographic reduction of pyocyanine (α-hydroxy-methylphenazine) was investigated over the pH range 0-12. At higher concns. above 10^{-4} M two waves of unequal height appeared, the first being always higher by a value that was independent of the concn. In alk. solns. up to a pH of 10 an extra wave appeared at more pos. potentials the height of which was likewise independent of the concn. of α-hydroxy-methylphenazine. These anomalies were due to the adsorption of undissocd. mols. of dihydropyocyanine.

3770. Bon, Francois. **Adsorption on the surface of mercury in contact with electrolytic solutions.** *Ann. phys.* [12], **3,** 680-724 (1948).—*C.A.* **44,** 6748*i*.

The effect was studied by measuring the surface tension (γ) by the drop-wt method, keeping the Hg-drop cathode as function of concn. (*c*) at several const. applied voltages (E). The γ vs. log *c* iso-voltage plots were characterized by a network of similar curves. If O_2 was eliminated from the solns., the ion concn. in the epiphase was const. in each portion of the iso-voltage curves. Similar three-sloped curves have been found for solns. of KCl, $CaCl_2$, $BaCl_2$, NH_4Cl, Li_2SO_4, AcOH, $(COOH)_2$, and NaOH.

3771. Bonhoeffer, K. F.; Brauer, Elfriede, and Langhammer, Günter. **II. Cathodic polarization of iron in nitric acid.** *Z. Elektrochem.* **52,** 29-37 (1948).—*C.A.* **43,** 7792*a*.

The potentials of passive Fe wires (0.01-0.92% C) in HNO_3 (d. = 1.4) contg. urea bore no simple relation to their C contents. Below a certain c.d., the rheobase, cathodic polarization did not activate Fe in concd. HNO_3, but lowered the potential somewhat. A c.d. equal to the rheobase activated in about 0.1 sec, and the potential went through characteristic changes. In a few tenths of a sec the Fe again became passive, and its potential rose even above the original value. This after-potential was assocd. with a dullness of the surface, which brightened as the potential dropped to its normal passive value.

3772. Bonhoeffer, K. F.; Haase, Vera, and Langhammer, Günter. **III. The refractory state of newly passive iron in concentrated nitric acid.** *Z. Elektrochem.* **52,** 60-7 (1948).—*C.A.* **43,** 7792*d*.

Fe that has just become passive again after cathodic activation is in a refractory state as regards reactivation. Detn. of the threshold or the rheobase gives a quant. measure of this state. Its decay with time parallels that of the after-potential. Both it and the after-potential are due to a relatively thick film of Fe oxide impregnated with HNO_2.

3773. BONHOEFFER, K. F. AND LANGHAMMER, G. **IV. Theory of the cathodic polarization of iron in nitric acid.** *Z. Elektrochem.* 52, 67-72 (1948).—*C.A.* 43, 7792*f*.

The variables chosen were: *x*, the degree of activity, or excitation, measured by the potential; and *y*, the degree of refractivity, measured by the threshold. Trajectories in the *x*, *y*-plane were constructed and shown to account qualitatively for the threshold, the rheobase, accommodation, periodicity, and various details of the refractory state.

3774. BONHOEFFER, K. F. AND GERISCHER, HEINZ. **V. Anodic behavior of copper in hydrochloric acid.** *Z. Elektrochem.* 52, 149-60 (1948).—*C.A.* 43, 7792*e*.

On a Cu anode in HCl at certain c.d. a surface film formed and dissolved periodically. This behavior was studied in detail. At a sufficient c.d. a white layer of CuCl formed on the anode, starting at the edges. As soon as the anode was covered, a dark coloration swept over it from the edges inward. This was Cu_2O, formed because of depletion of H ions in the pores of the CuCl layer. With its formation the anode potential drop increased sharply by as much as 16 v. The self-accelerating formation and dissolving of Cu_2O were essential to the periodicity.

3775. BRENNER, ABNER; RIDDELL, GRACE, AND SEEGMILLER, ROBERT. **Chromated protein films for the protection of metals.** *J. Electrochem. Soc.* 93, No. 3, 55-62 (1948).—*C.A.* 42, 2911*d*.

Steel, Zn, Al, and brass were protected from corrosion by the use of chromated protein films. Either casein, albumin, or gelatin was applied to the metal surface by dipping. The film was impregnated with chromate, which acted as an inhibitor of corrosion and hardened the film, by adding the salt to the protein soln. or by a sep. immersion.

3776. DEVAUX, HENRI. **The use of thin films on mercury for the determination of the positions of the attractive poles of molecules and of the role of these poles in various physical properties of matter.** *Compt. rend.* 226, 1649-51 (1948).—*C.A.* 42, 6208*f*.

Thin films of aq. $CuSO_4$ spread very evenly on a Hg surface proved there was a strong attraction between $CuSO_4$ and Hg. Since the soly. of $CuSO_4$ in water was greatly reduced when present in a thin film on such a substrate, it was concluded that the hydrophilic pole was blocked by the union with Hg.

3777. ERBACHER, OTTO; HERR, WILFRID, AND WIEDEMANN, MALENE. **Metal-ion adsorption on metal surfaces.** *Z. Naturforsch.* 3a, 637-45 (1948).—*C.A.* 43, 5254*f*.

The adsorption of Pb^{++}, Bi^{3+}, and Th^{4+} ions on Au, Ag, Ni, and Hg was detd. in solns. of 0.1 *N* HNO_3, HCl, and H_2SO_4. Curves for Hg deviated from the isotherms of solid metals by showing less adsorption. The effect of solvent, salt soly., normal potential corresponding to the ion, ion charge as well as hydration of the ion, and of adsorbed metal on the adsorption process was discussed with Freundlich adsorption isotherms.

3778. GUITTON, L. **Conditions for passivation of stainless steels and its practical application.** *Metal Treatment* 15, 3-13 (1948).—*C.A.* 42, 4508*d*.

It has been found necessary to subject the surfaces to sensitization by uniform acid corrosion before the actual passivation. The sensitizing soln. which had been found to give the best results was a mixt. of HNO_3 10% by vol. and NaF 2% by wt employed below 60 °C. Sensitization accelerated passivation in an oxidizing medium and considerably increased its stability. Passivation of 18-8 steel corresponded to the adsorption of O_2 on the surface of the metal.

3779. GUITTON, LOUIS. **The passivity of stainless steels and the phenomena of adsorption.** *Compt. rend.* 226, 805-7 (1948).—*C.A.* 42, 7139*g*.

18/10 Cr/Ni and Cr/Mn steels were rendered passive in 10% HNO_3. A preliminary sensitization with HF-HNO_3 increased the passivity considerably and eliminated the sharp drop in potential which otherwise occurred during the first 10 min. Samples rendered passive after sensitization resisted the action of H_2SO_4. Unsensitized specimens showed a preliminary unstable passivity, brief activity, and finally a permanent stable passivity. The passivity was ascribed to adsorption of O_2.

3780. HAISSINSKY, M. **Relations between exchange phenomena and electrochemical phenomena.** *J. chim. phys.* 45, 224-31 (1948).—*C.A.* 43, 6891*b*.

There was apparently no correlation of the initial rate of exchange between tagged metals and solns. of their salts and the electrochem. potential of the metals. It was postulated that the exchange reaction $M = M^{n+}$ was very rapid, practically reversible, and independent of the nature of the metal or of the state of the surface.

3781. HAISSINSKY, M.; COTTIN, M., AND VARJABEDIAN, B. **Exchange between metals and their ions in solution. I. Preliminary experiments.** *J. chim. phys.* 45, 212-23 (1948).—*C.A.* 43, 6890*f*.

Expts. with tagged atoms indicated that the dependence on time was $\log x = a \log t + \log b$, where *x* was the quantity of metal exchanged in g atoms and *a* and *b* were consts. The anion strongly affected the rate of exchange. With Pb the exchange decreased in the order chloride, nitrate, acetate for 0.0001 M solns., but in 0.1 *N* solns. acetate exchanged faster than nitrate. With Bi chloride solns. exchanged faster than did nitrate solns.; the chloride solns. exchanged faster than sulfate up to 2 min., but for longer times the order was inverted. For Cu, the exchange of acetate, sulfate, and nitrate solns. was about the same; the bromide was 100 times as fast; and the chloride was still faster initially but then diminished. For Mn the rate of exchange was too slow to permit conclusions except that sulfate solns. exchanged slightly more rapidly than did the nitrate solns.

3782. HICKLING, A. AND TAYLOR, D. **Anodic behavior of metals. V. Copper.** *Trans. Faraday Soc.* 44, 262-8 (1948).—*C.A.* 43, 47*a*.

The initial build-up of anodic polarization at a Cu anode, detd. by using the cathode-ray oscillograph, was in 2 stages in NaOH solns.: (a) charging of a double layer, and (b) formation of an oxide film upon the anode. Cu_2O was initially formed but it was almost at once oxidized to CuO. The thickness of the film when O_2 evolution first commenced was some 4 mols. in 0.1 *N* NaOH. With Pt, Au, and Ni the oxide film was formed before the O_2 evolution potential was reached was about 1 mol. thick.

3783. KAPPANNA, A. N. AND JOSHI, K. M. **The reaction between mercury and nitric acid. A kinetic study.** *J. Indian Chem. Soc.* **25**, 547-54 (1948).—*C.A.* **43**, 7305*g*.

When Hg was added to HNO_3, kept continously stirred, in the range of concns. of 4 *N* to 7 *N*, the soln. of the metal started after an interval of time (period of passivity). The period of passivity was greater in dil. solns. than in concd. solns. for a given rate of stirring. At the same concn. the period of passivity was greater in more rapidly stirred solns. At 22°C, when the concn. of HNO_2 was approx. 0.0012 *N*, soln. of the Hg began. HNO_3 contg. 0.0012 *N* HNO_2 initially had no period of passivity.

3784. KEILIN, BERTRAM. **Adsorption at the dropping-mercury electrode.** *J. Am. Chem. Soc.* **70**, 1984 (1948).—*C.A.* **42**, 7642*e*.

Increasing concns. of horse albumin decreased the diffusion current of the polarogram shown by the dye *p*-hydroxyphenylazobenzenearsonic acid to an asymptotic value of 25% of the true value. A const. protein concn. gave const. reduction in current independent of dye concn.

3785. KOSHURNIKOV, G. S. **Adsorbed layers as a passivating factor.** *Zhur. Obshchei Khim.* **18**, 388-97 (1948).—*C.A.* **43**, 28*b*.

Adsorption from aq. solns. (10 ml) of pure PhOH, BuOH, and $BuCO_2H$ on powders of pure Fe, Al_2O_3, and tech. Fe_2O_3 (1 g) were detd. in 30 min. runs. The adsorbed layers of PhOH on Fe resisted energetic washing with H_2O and lowered the rate of soln. of Fe in 1% H_2SO_4, e.g., vol. of H_2 evolved after 5, 15, and 40 min., without PhOH 3.28, 10.78, and 31.12, with adsorbed PhOH 1.99, 8.95, and 28.62. Strong passivating effects were obtained if a d.c. was passed during the adsorption, and the adsorbed film was subsequently condensed with urotropine. Similar effects were also obtained by preliminary electrolytic treatment prior to adsorption.

3786. MAXTED, E. B. **Detoxication of catalyst poisons. VI. Use of a revivable filter column.** *J. Chem. Soc.* **1948**, 1091-3.—*C.A.* **43**, 1536*e*.

Spent Pt catalyst can be detoxicated by treatment with dil. aq. Na molybdate. By filtering tech. benzene through a column of treated catalyst thiophene was removed by adsorption. Upon exhaustion, the catalyst was revived *in situ* by brief hydrogenation followed by a Na molybdate treatment. In the detoxication process adsorbed thiophene was converted first to thiophane.

3787. PCHELIN, V. A. **The surface properties of proteins.** *Soveshchanie po Belka Akad. Nauk S.S.S.R. (5-ya Konferents. Vysokomolekulyar. Soedineniyam)* **1948**, 83-93. —*C.A.* **43**, 2842*b*.

The surface layer of 0.5% egg albumin was obtained by slowly replacing the soln. below the surface layer with flowing pure H_2O. The surface layer was then deposited on a Cr plate and its thickness detd. by comparing reflection from it with reflection from a standard plate on which varying thicknesses of albumin had been deposited. The layer was adsorbed on surfaces from soln., avoiding uptake from the surface of the soln., the thickness was 4 monolayers on Cr and 2 on glass.

3788. POTAU, M. **Phenomena related to the adsorption of salts by mercury.** *Anales real soc. espan. fis y. quim.* **44A**, 445-56 (1948).—*C.A.* **43**, 4922*e*.

When a crystal of an alkali halide was immersed in Hg covered with H_2O, the crystal dissolved much more rapidly at the interface than in the bulk H_2O phase. This was probably due to the intense adsorption of the salt at the Hg-H_2O surface. The effect was not observed with crystals of tartaric acid. Small NaCl crystals placed on a Hg-H_2O interface dissolved in less than half the time required to dissolve crystals of the same dimensions on a glass-H_2O interface.

3789. RAMARAO, G. **Passivity of magnesium.** *J. Indian Chem. Soc.* **25**, 243-4 (1948).—*C.A.* **43**, 2076*e*.

Mg exhibited passivity when exposed to air in the presence of ultraviolet radiations. The extent of passivity was measured by the displacement of Cu from a soln. of $CuSO_4$. The moisture carried by the air, under the influence of ultraviolet rays, produced an oxide film that passivated the Mg surface. The same current of air in the dark swept off partly any film and slightly activated the surface.

3790. SANDELL, E. B. **Colorimetric determination of traces of gold.** *Anal. Chem.* **20**, 253-6 (1948).—*C.A.* **42**, 3695*h*.

Traces of Au could be isolated by pptn. with $SnCl_2$ with Te as collector and detd. colorimetrically or photometrically with 5-(*p*-diethylaminobenzylidene) rhodanine as reagent.

3791. TOURKY, A. RIAD AND EL-WAKKAD, S. E. S. **Studies on some metal electrodes. I. Oxide-film formation on copper, and the evaluation of the standard electrode potential of the metal.** *J. Chem. Soc.* **1948**, 740-9.—*C.A.* **42**, 8092*c*.

The standard electrode potential of Cu was evaluated by varying the pH of the soln. and by removing oxide initially present by reduction with H_2 or subjecting the Cu electrode to high vacuum at elevated temp. By comparing the results obtained in and out of contact with air in buffers initially free from Cu ions, a set of conditions could be chosen leading to the evaluation of the true standard electrode potential. The Cu electrodes were prepd. by electrodeposition on Pt plates, 1 x 1 cm.

3792. Vyskočil, A. **The protection of iron by means of metal layers.** *Chemie* (Prague) **4**, 184 (1948).—*C.A.* **46**, 2469*g*.

The protection achieved by the layer depends on whether the protective layer acts as cathode (Sn, Cu, Ni) or as an anode (Zn, Al) with respect to the Fe. In order to achieve protection the protective layer must be continuous.

3793. Zuev, Yu. S. **Determination of the adhesion forces between particles in the sediments of suspensions.** *Kolloid. Zhur.* **10**, 281-8 (1948).—*C.A.* **43**, 7777*d*.

Suspensions of Zn in C_6H_6 were studied. The yield stress increased linearly with the depth of sediment. Some surface-active substances ("Aerosol OT," oxidized petrolatum, oleic acid, and raw linseed oil) accentuated the increase in dispersity observed on shaking the suspension; some other substances (octyl and cetyl alc. and isoamyl stearate) were less active.

3794. Bockris, J. O'M. and Conway, B. E. **Studies in hydrogen overpotential. Effect of catalytic poisons at platinzed platinum and nickel.** *Trans. Faraday Soc.* **45**, 989-99 (1949).—*C.A.* **44**, 3813*i*.

The effect of As_2O_3 in HCl on H-overvoltage at platinzed Pt electrodes and that of traces of As_2O_3, CO, CS_2, KCN, and $PtCl_4$ on the rate of H_2 evolution at a Ni cathode was detd. A limiting current of about 3 x 10^{-3} amp./cm^2 in *N* aq. HCl occurred at 0.1 *M* in As_2O_3. The variation of H-overvoltage with time at const. c.d. was considerable, erratic, and of long duration in the presence of traces of impurities, but was considerably reduced by pre-electrolysis. Impurities of 10^{-10} mole/liter affected the rate of H_2 evolution reaction on Ni cathodes.

3795. Bowden, E. P. and Moore, A. C. **Physical and chemical adsorption of long-chain compounds on metals.** *Research* (London) **2**, 585-6 (1949).—*C.A.* **44**, 3766*c*.

Pure metal foils were made artificially radioactive and dipped in a C_6H_6 soln. of the long-chain compd. If the film were held by phys. forces only, it could be desorbed unchanged. If, however, chem. reaction had taken place, the film on removal would bring radioactive metal with it. Octadeyl alc. was adsorbed on surfaces of Zn, Cd, Cu, Pt, and Au and then removed. In no case was any reaction observed; the adsorption was entirely phys. However, with Zn, Cd, and Cu the film reacted with the metal. When Et stearate was used, there was no reaction with Au or Pt, but with Zn, Cd, and Cu slight reaction was observed.

3796. Brummage, K. G. **Structure of stearic acid films on copper.** *Nature* **164**, 244-5 (1949).—*C.A.* **44**, 6695*g*.

Cu stearate was present after a Cu surface was covered with stearic acid. The same pattern was obtained with other fatty acids.

3797. Buinov, N. N.; Demenev, N. V.; Shur, A.S., and Fedorova, G. G. **The structure of metallic films obtained on the surface of aqueous solutions of metal salts by action of reducing gasses. I. The structure of platinum films.** *Kolloid. Zhur.* **11**, 289-98 (1949).—*C.A.* **44**, 901*h*.

Pt films (prepd. on H_2O by passing H_2 over the surface of Pt salt solns.) were transferred on collodion films, and examd. in an electron microscope. The films started as sep. crystals smaller than the limit of the electron microscope (30 A.) and later combined to aggregates (0.5-1μ) which had no definite shape, but showed preferred angles of 90° and 120°. The aggregates not only lay in the surface but formed also under the surface. When the av. thickness of the film was less than 120 A., the aggregates formed branched chains.

3798. Burgers, W. G. **Crystal growth in the solid state (recrystallization).** *Physica* **15**, 92-106 (1949) (in English).—*C.A.* **44**, 398*f*.

The crystn. of metal grains in a solid matrix was contrasted with crystn. from soln. or vapor phases; the first situation did not usually lead to growth of crystals with geometrical faces. As example, Al growing in a quasi-isotropic fine-grained sheet gave almost circular grains. Counting of these grains and measurement of their diams. gave the dependence of rate of nucleation and rate of growth on temp., degree of deformation, and time of heating. The final crystals were formed from nuclei already present in the cold-worked metal, not from nuclei spontaneously formed during annealing.

3799. Chamie, C. and Filcakova, H. **The adsorption of polonium by mercury in different solutions.** *J. chim. phys.* **46**, 174-5 (1949).—*C.A.* **43**, 7791*a*.

The chloride, oxychloride, nitrate, and acetate of Po in combination with the solvents HCl, CH_3-COOH, acetone, MeCOEt, $CH_3COCH_2COCH_3$, alc., and NH_4OH were placed in contact with Hg, and the deposition of Po was measured. A deposition was found in all cases of true solns., but none in the case of colloidal suspensions. The Po formed an amalgam that diffused into the Hg.

3800. Chaudron, Georges; Lacombe, Paul, and Youssov, Georges. **A new determination in the absence of oxygen of the solution potential of electrolytically polished aluminum.** *Compt. rend.* **229**, 201-3 (1949).—*C.A.* **43**, 8912*d*.

Since the prior detn. of the potential of electrolytically polished Al, -1.20 v., was much lower than the theoret. -1.95 v., the measurement was repeated with an app. in which the prepn., purification, and potential detn. could be made without exposure to O_2. A value of -1.60 v. in 3% NaCl soln. was obtained by this procedure.

3801. Coffin, C. C. and Tingley, I. I. **The exchange of silver ions between aqueous solutions and surfaces of metallic silver.** *J. Chem. Phys.* **17**, 502-3 (1949).—*C.A.* **43**, 7791*b*.

The exchange of Ag ions between solns. of $AgNO_3$ and surfaces of metallic Ag was studied with a radioactive isotope (Ag^{110}, half-life 225 days). On the basis of measured areas, etched and polished surfaces of annealed Ag foil exchanged with 0.1 *N* $AgNO_3$ solns. to depths of about 10 and 100 at. layers, resp. Cryst. surfaces appeared to retain their entire activity which, however, was so low (10-20 counts above background) that the exptl. results were highly uncertain. Cryst. Ag by itself showed little tendency to exchange with ions in soln. but received a deposit of metal when it was mixed with noncryst. Ag.

3802. Finks, A. J. and Petito, N. J. **Penetration of sintered metals by solution of surface-active agents.** *Anal. Chem.* **21**, 1101-2 (1949).—*C.A.* **43**, 8791*d*.

"Seepage values" were detd. by passage of aq. solns. of wetting agents through a series of 5 stainless steel filtering crucibles with progressively smaller pore sizes for the sintered filtering element, these sizes being 65, 35, 20, 10, and 5 microns, resp. The most effective wetting and penetrating agents gave lowest values.

3803. Grahame, David C. **Measurement of the capacity of the electrical double layer at a mercury electrode.** *J. Am. Chem. Soc.* **71**, 2975-8 (1949).—*C.A.* **44**, 54*a*.

A small drop of Hg was surrounded by a large Pt gauze sphere and the capacity of the system (Hg soln. - Pt) was sensibly that of the double layer in contact with the Hg. Improvements were made in the detn. of the d.c. potential and in timing the fall of the drop, from which its size and area were detd. The differential capacity in a 0.1 *N* soln. of KCl was detd. at 25°C over a range of 0-1.90 v. relative to the *N* calomel electrode.

3804. Greenhill, E. B. **Adsorption of long-chain polar compounds from solution on metal surfaces.** *Trans. Faraday Soc.* **45**, 625-31 (1949).—*C.A.* **43**, 8789*h*.

The compds. used were stearic acid, Et stearate, and octadecyl alc. The isotherms showed satn. of the surface occurred at very low concn. with stearic acid, whereas alc. and esters required much higher concn. Although the initial rate was very rapid, final equil. may not be reached for many hours. The adsorption process appeared to be the same for thoroughly cleaned and reduced powders as for oxide-coated powders. With the clean powders, however, the adsorption increased in some cases owing to an increase in the surface area brought about by the reduction and degassing procedure at 200°-250°C.

3805. Greenhill, E. B. **Lubrication of metal surfaces by mono- and multi-molecular layers.** *Trans. Faraday Soc.* **45**, 631-5 (1949).—*C.A.* **43**, 9424*c*.

Lubricating layers of stearic acid, Et stearate, octadecyl alc., and the stearates of Cu and Ag were deposited on a flat metal surface and the friction between this surface and a clean slider of the same metal was detd. Where a metal could be lubricated by a soln. of one of these compds. in paraffin oil, 1 or 3 deposited layers sufficed; where a paraffin soln. did not provide lubrication, more than 3 layers were necessary.

3806. Hackerman, Norman and Schmidt, Harold R. **The adsorption of organic corrosion inhibitors on iron and steel surfaces.** *J. Phys. & Colloid Chem.* **53**, 629-38 (1949).—*C.A.* **43**, 6559*g*.

The films formed by org. corrosion inhibitors on steel and Fe surfaces were studied by electron diffraction. Depending on the conditions, both oriented and unoriented surface films were formed. Naphthenic acid, cyclohexylamine, cyclohexanone, cetyl alc., and stearic acid were used as film formers on steel surfaces. Treatment of the films with hydrocarbon solvents showed that the intensity of adsorption on the metal surface was a property of the specific substances employed.

3807. Hackerman, Norman and Schmidt, Harold R. **The role of adsorption from solution in corrosion inhibitor action.** *Corrosion* **5**, 237-43 (1949).—*C.A.* **43**, 6559*i*.

Adsorption isotherms were run at 40°C for stearic acid, stearyl alc., succinimide, dibutylthiourea, and p-amino-biphenyl, two methods being used. (1) A C_6H_6 soln. of the inhibitor was shaken with a weighed amt. of powd. steel, and aliquot portions of the C_6H_6 soln. were analyzed for the inhibitor. (2) A glass column was packed with steel powder, and jacketed for temp. control. Inhibitor solns. could be flowed through the column under any desired condition, and a corrosive soln. could also be used to det. the extent of desorption. Of the substances studied, only the stearic acid gave measurable results. Part of the stearic acid was desorbed by C_6H_6, but not all.

3808. Hickling, A. and Wilson, W. H. **Increase of oxygen overpotential at a platinum anode by reducing agents.** *Nature* **164**, 673 (1949).—*C.A.* **44**, 3815*a*.

The presence of low concns. of certain reducing agents, which normally function as depolarizers, brought about very substantial increases in the potential at which O_2 was evolved at a Pt anode. The phenomenon was studied by polarizing a clean Pt-wire anode in an inert electrolyte until the potential became substantially steady, and a quantity of the oxidizable substance added. The elevations of anode potentials were observed after 2 min. with a variety of addn. agents.

3809. Kamienski, B. **Potentiometric chromatography. III. Preparation and testing of the electrometric adsorption element.** *Bull. intern. acad. polon. sci., Classe sci. math. et nat.*, Ser. A, **1949**, 157-60 (in English).—*C.A.* **45**, 8377*c*.

The Hg drop making contact with a Pt electrode was kept in position by a glass filter so that the Hg did not break contact with the Pt when the app. was tilted. Pure silicic acid for coating the other Pt electrode was prepd. The app. exhibited large potential changes when exposed to bright sunlight, AcOH, NH_3, or CO_2 vapors.

3810. Kamienski, B. **Potentiometric chromatography. IV. Electrometric selective adsorption. The antimony electrode.** *Bull. intern. acad. polon. sci., Classe sci. math. et. nat.*, **Ser. A, 1949**, 171-82.—*C.A.* **45**, 8377*e*.

It was possible to use the elec. adsorption element as a very sensitive device for detecting very dil. solns. of acids and bases flowing out of the adsorption tube. A microelectrode of Sb was constructed and similar results were obtained as with the micro quinhydrone electrode. Potential changes were observed when different substances passed the adsorption tube. Tswett's classical chromatography of leaf was investigated with the method of potentiometric chromatography. When the element was filled with Zn, Cd, Sn, Bi, or other metals, cations could be checked qualitatively by their effect on the potential of the metal.

3811. Koshurnikov, G. S. **Adsorptive passivation of iron with protein layers.** *Zhur. Priklad. Khim.* **22**, 698-702 (1949).—*C.A.* **43**, 8246*c*.

Best passivation towards 10% H_2SO_4 was obtained by 15-min. immersion in a soln. contg. gelatin 0.2, concd. HNO_3 7.5, PhOH 0.25, $K_2Cr_2O_7$ 0.5 g, in 20 ml H_2O, with subsequent rinsing and wiping off the excess. The protective action consisted in the formation of a gelatin-nitrophenolic film on the HNO_3-etched iron surface. The films were even more resistant to other acids, HCl and AcOH, but provided no protection against salt solns.

3812. Koshurnikov, G. S. **Passivation of iron by adsorptive-lacquer coatings.** *Zhur. Priklad. Khim.* (J. Applied Chem.) **22**, 809-11 (1949).—*C.A.* **44**, 851*b*.

The passivating effect of adsorbed layers of PhOH-HCHO, PhOH-urotropine, $NO_2C_6H_4OH$-gelatin, phosphate-casein, against 10% H_2SO_4, was strongly increased by addnl. coating with a film of Bakelite with subsequent polymerization. On an Fe surface without adsorbed layer, the Bakelite film was completely detached after exposure to 10% H_2SO_4 for 18-21 hrs, whereas a film formed on an adsorptively protected surface still adhered to the metal after exposure for 128 hrs.

3813. Kryukova, T. A. and Frumkin, A.N. **Retardation of tangential movements of the surface of mercury drops by butyl alcohol solutions.** *Zhur. Fiz. Khim.* **23**, 819-27 (1949).—*C.A.* **43**, 8911*e*.

Hg was dropped from a glass capillary (radius 0.006 cm) into 3 N KCl + 0.003 N $HgCl_2$ at the rate (v) of 1 drop in 0.6 or 2.2 sec. It was cathodically polarized. When the tangential movement of the drop surface was stopped by addn. of gelatin, the current became 2.2 and 4.0. When BuOH was added instead of gelatin, the current was reduced; minima of this current were observed in 0.03 M BuOH and at about -0.7 v. At e.m.f. less than -0.4 v. and above -1.4 v. the effect of BuOH was very small. If the adsorption process were the slowest part of the reaction, the retardation, would have been independent of v; this gave the lower limit for the rate of the adsorption process.

3814. Kuz'min, L. L. and Poroikove, V. A. **Overvoltage of hydrogen on porous iron.** *Zhur. Priklad. khim.* (J. Applied Chem.) **22**, 572-7 (1949).—*C.A.* **44**, 52*d*.

Cathode potentials of pressed, electrolytic, or reduced Fe powder 3.6 x 1.2 x 0.3 cm tablets were measured, at 20 ± 0.2°C, in a 15% KOH soln. in a stream of H_2, against a satd. calomel electrode, at 7 c.d. from 0.5 to 10.0 amp/dm. The tablets were made with 20% (of the wt of the Fe powder) of a 4% soln. of rubber in gasoline; the nature of the binder had no significant influence. Increase of the pressure (from 1000 to 2000 kg/cm^2) at const. temp. (950°C) and time (2 hrs) raised E in all cases, most markedly with the finest reduced Fe powder; this corresponded to a reduction of the porosity from 51 to 36%. Variations of the temp. of pressing, between 600 and 950°C, had no significant effect on E at low c.d. Best results, i.e., lowest overvoltages, were obtained, for electrolytic Fe powder, at pressing temp. 700-800°C, and for the finer reduced powder, at 600°C.

3815. Leidheiser, Henry, Jr. and Meelheim, Richard **The influence of crystal face in the catalytic deposition of cobalt on a single crystal of copper.** *J. Am. Chem. Soc.* **71**, 1122-4 (1949). —*C.A.* **43**, 6063*b*.

Electrolytically polished monocryst. spheres of Cu were immersed in HCOOK solns. of a Co salt at 180-250°C and Co was catalytically deposited on the surface. The relative catalytic activities of the crystal faces of Cu in order of decreasing activity were: (210), (310), (321), and (320); (311) and (211); (100); (331) and (221); (110); and (111). The results were correlated with the spacing between Cu atoms and the spacing between O atoms in the formate mol.

3816. Loshkarev, M.; Krivtsov, A., and Kryukova, A. **A new type of chemical polarization. II. Experimental proof of existence and study of the properties of adsorption layers.** *Zhur. Fiz. Khim.* **23**, 221-31 (1949).—*C.A.* **43**, 5316*b*.

The differential capacity of electrodes in 0.5 N Na_2SO_4 satd. with p-naphthol, thymol, and Ph_2NH was detd. It had a max. for Ag, Cu, Hg, Sn, Bi, and Pb electrodes at the potentials E_3 -1.19, -1.19, -1.20, -1.24, -1.30, and -1.35, v. relative to satd. Hg_2Cl_2 electrode; thus, the potentials at which desorption occurred varied much less than the potentials (E_0) of the zero charge of various metals. Adsorbed films were removed by desorption rather than by reduction, except for PhCOMe and alizarin oil which were both reduced and desorbed.

3817. Loshkarev, M. and Kryukova, A. **A new type of chemical polarization. I. Cathodic deposition of metals on mercury in the presence of additions.** *Zhur. Fiz. Khim.* **23**, 209-20 (1949). —*C.A.* **43**, 5315*i*.

When the voltage applied to a cell Hg | Hg_2Cl_2, satd. KCl | 0.05 N metal sulfate + N H_2SO_4 | dropping-Hg cathode increased, the current strength increased, remained const., and then rapidly increased again. The permeability of adsorbed films of surface-active substances increased when the at. wt of the penetrating ion increased and its charge (hence, the intensity of electrostatic field) decreased.

3818. Machu, W. **Kinetics of the destruction and of the formation of covering layers on metallic surfaces, particularly of phosphate coatings.** *Osterr. Chem.-Ztg.* **50**, 148-57 (1949).—*C.A.* **43**, 9014*h*.

During corrosion the cathodic layers were destroyed under growth of the anodic areas and decrease of the corrosion rate. The rate *k* for iron in 1 *N* Na_2SO_4 soln. = 0.0028, for iron coated with Mn phosphate, and treated with K_2CrO_4, in 3% NaCl soln. *k* = 0.000017 (without K_2CrO_4, *k* = 0.000044) for iron coated with Zn phosphate, in air *k* = 0.000002 - 0.000006. Protective phosphate coatings were formed by deposition at cathodic areas.

3819. MEDALIA, A. I., AND KOLTHOFF, I. M. **Redox recipes. I. Reaction between ferrous iron and peroxides. General considerations.** *J. Polymer. Sci.* **1**, 377-98 (1949).—*C.A.* 43, 8829*c*.

A mechanism with Fe^{++} and OH perhydroxyl radicals as intermediates was presented, which accounted for the exptl. observations in the ferric-Fe^{+++} -catalyzed decompn. of H_2O_2. The reaction between H_2O_2 and Fe^{++} induced the reaction between H_2O_2 and various org. compds.; this induced reaction was a chain reaction that was initiated by the active intermediates (ferryl Fe or OH radical) formed in the primary reaction.

3820. MOSES, SAUL. **The nature of adhesion.** *Ind. Eng. Chem.* **41**, 2338-42 (1949).—*C.A.* **44**, 903*d*.

Data were given on the adhesion of polystyrene deposited from acetone or benzene, Me methacrylate polymer deposited from acetone and MeCOEt, and copolymer of vinyl acetate and vinyl chloride deposited from acetone systems to Al alloy. The adhesion depended on the presence of a fluid or mobile state at or near the film-metal interface.

3821. PALACIOS, JULIO AND VIGNON, MARIA TERESA. **Electrode potentials resulting from adsorption.** *Anales real. soc. espan. fis. y quim.* **45A**, 125-44 (1949).—*C.A.* 44, 9276*i*.

In the cell [Cu/$CuSO_4$ (aq.)/Pt] the current flowed unceasingly and the Pt electrodes became coated with Cu to the extent of about 1 mg/cm^2. Similar phenomena occurred in the cell Zn/$ZnSO_4$ (aq.)/Hg. The potentials of Pt and C electrodes in solns. of $CuSO_4$ and $CuCl_2$ and of Pt, Ag, Fe, and Cu in solns. of $ZnSO_4$ and $ZnCl_2$ were measured. The e.m.f. resulted from the tendency of the electrode to incorporate cations from the soln. into their own crystal lattices.

3822. PATRIE, J. **The mechanism of electrolytic oxidation and the formation of layers of aluminum oxide.** *Rev. aluminum* 26, 397-403 (1949). 27, 3-7 (1950).—*C.A.* 44, 4805*d*.

An Al anode in a d-c circuit was polarized by an anodic oxide film (about 0.1 μ thick) formed as result of the discharge of OH ions on the electrode. The growth of this film was dependent on the superposition of 2 opposing phenomena in the electrode: (1) some OH ions passed through the barrier and deposit on the metallic anode oxidizing the Al, (2) there was an inverse ionization phenomenon depending on the dissolving power of the bath on the Al and the oxidation conditions. These factors det. the thickness of the film formed.

3823. PAULI, WOLFGANG. **The color and constitution of colloidal gold.** *Helv. Chim. Acta* **32**, 795-810 (1949) (in German).—*C.A.* 43, 6885*g*.

Au sols were composed of chloro and bromo as well as chlorohydroxo mixed complexes, not of elementary Au. The color change, red to blue, was due to coagulation of these ions. The coagulation was a 3-step process. To account for the color of colloidal Au a mutual action between colorless ionic surface complexes and the Au particle nuclei was necessary.

3824. PRYOR, M. J. AND EVANS, U. R. **Passivity of metals. X. The mechanism of direct solution of ferric oxide.** *J. Chem. Soc.* **1949**, 3330-6.—*C.A.* 44, 4842*b*.

α-Ferric oxide dissolved comparatively rapidly in HF or concd. HCl, which readily formed sol. complexes with ferric ions. In dil. soln. of HCl, H_2SO_4, which did not easily form these complexes, the rate of soln. fell off with time, and the resulting solns. contained Fe^{++}. The fact that the soln. was the same in dil. solns. of HCl, H_2SO_4, and $HClO_4$ of equiv. concns., and was not influenced by addnl. Cl^-, suggested that the important step in the reaction was the combination of adsorbed H^+ with O ions belonging to the oxide lattice.

3825. RIES, HERMAN, E. JR.; JOHNSON, MARVIN F.L., AND MELIK, JOHN S. **Adsorption-desorption isotherm studies of catalysts. III. Nitrogen and stearic acid adsorption by supported catalysts and their components.** *J. Phys. & Colloid Chem.* **53**, 638-61 (1949).—*C.A.* **43**, 6897*g*.

Unreduced supported Co catalysts were investigated by the low-temp. adsorption of N_2 (B.E.T.) and the adsorption of stearic acid (in benzene soln.). Both the supporting materials proper and the supports coated with Co compds. were studied to det. the effect of support structure on the structure of the supported catalyst. An unsupported catalyst, mostly $CoCO_3$ and the same substance supported on diatomaceous earth, TiO_2 (anatase), silica gel, and Al_2O_3 were investigated.

3826. SHAFRIN, ELAINE G. AND ZISMAN, W.A. **Hydrophobic monolayers adsorbed from aqueous solutions.** *J. Colloid Sci.* 4, 571-90 (1949).—*C.A.* **44**, 2325*h*.

Hydrophobic monolayers were formed on Pt by adsorption of n-alkyl primary amines from aq. solns. The contact angle of the soln. from which the monolayer was formed at the treated Pt surface was measured at room temp. as a function of soln. concn. and pH for the C_4, C_8, C_{12}, C_{14}, and C_{16} amines. The angle varied from 0° to 90°, increasing in general with conc. and reaching a max. at a pH near 10 for the short-chain amines (through C_{12}). The max. appeared at acid conditions for hexadecylamine. The highest contact angle observed with the individual amines increased with chain length, from 52° for C_4 to 89° for C_{16}.

3827. TÖDT, FRITZ. **Effect of local galvanic couples in oxide coatings of metals.** *Arch. Metallkunde* 3, 273-8 (1949).—*C.A.* **44**, 960*c*.

Local electrolytic effects at metal surfaces were either due to the presence of a nobler metal or to oxide films. This action could be measured on the basis of increased rate of soln. with aeration or directly by reading the potential between the aerated metal surface (Fe, Cu, Pt) and a less noble electrode.

3828. Tödt, Fritz. **Electrochemical behavior and rate of formation of oxide films on metal surfaces, especially iron.** *Metalloberfläche* 3, A170-3 (1949).—*C.A.* 44, 2869*h*.

Metals covered with a thin oxide layer formed a galvanic element with Cd in a strong salt soln. until the oxide was reduced. Hence, the total no. of coulombs produced was an indication of the amt. of oxide present. Exposure of Fe for 5 min. in air gave an oxide film of about 200 A.

3829. Veselovskiĭ, V. I. **Photoelectrochemical processes on iron in the presence of hydrogen peroxide.** *Zhur. Fiz. Khim.* **23**, 1095-1105 (1949).—*C.A.* 44, 929*c*.

Cathodically polarized or scraped Fe was not light-sensitive in *N* NaOH. Fe coated with an oxide film (about 100 A thick) by anodic polarization or by heating in air became (in *N* NaOH) less noble on illumination with wave lengths shorter than 460 mμ. In darkness the current I_o between this electrode and a Ag/Ag_2O electrode was very small as long as the polarization voltage V was less than 0.3 v. and rapidly increases with V at greater anodic polarization of Fe. In light, the current I_1 was noticeable at $V = -0.3$ v., increased with V linearly until O_2 evolution starts (at +0.3 v.) and increased more rapidly with V at V more than 0.3 v.

3830. Yoneda, Yukio. **Fundamental research on anodic reaction. II. Activation energy of anodic oxygen-producing reaction on some electrode materials in 0.1 *N* sodium hydroxide.** *Bull. Chem. Soc.* (Japan) 22, 266-73 (1949) (in English).—*C.A.* 45, 4582*a*.

The mechanism of an electrode reaction could be detd. from the activation energy which was independent of the surface area. By using Pt, magnetite, and natural graphite anodes in aq. 0.1 *N* NaOH (carbonate- and chloride-free) and stirring with O_2 the resp. activation energies of the O-producing reactions for the temp. range 25-65 °C were detd. From the overvoltage on Pt, measured potentiometrically 30 min. after closing the circuit, an activation energy of 15.9 ± 2.0 kcal. and α of 0.353 ± 0.017 were calcd.; from the oscillographically measured overvoltage a calcd. activation energy of 13.8 ± 0.6 kcal. and α of 0.488 ± 0.008 resulted. For the magnetite the activation energy was 26.2 ± 3.2 kcal. and α 2.24 ± 0.23.

3831. Audubert, R. and Bonnemay, M. **Overvoltage and adsorption.** *J. chim. phys.* 47, 204-7 (1950).—*C.A.* 45, 7895*h*.

The discharge of H ions on a platinized Pt electrode could take place either directly or through the intermediary of an adsorption process. Exptl. results were best explained with both concepts; at low overvoltages, the adsorption process predominated.

3832. Bryan, J. M. **Action of boiling distilled water on aluminum.** *J. Soc. Chem. Ind.* (London) 69, 169-73 (1950).—*C.A.* 44, 10647*a*.

Protective films on Al were believed to be α-$Al_2O_3.H_2O$ (bohmite). Following an initial rapid reaction between O_2-free boiling distd. water and high-purity Al, the film acquired a limiting thickness of about 2.5×10^{-4} cm (48-hr immersion). H_2 was evolved until the film had acquired its limiting thickness. Oxygen gas had almost no effect on the rate or extent of film formation. High-purity Al (99.9930%) was attacked more vigorously by boiling water and formed thicker films than less pure Al (99.25-99.83%) or alloys of Al with Mn or Mg.

3833. Cook, G. B. and Hudswell, F. **The preparation of thin layers of uranium oxide.** *J. Sci. Instruments* 27, 230-1 (1950).—*C.A.* 44, 10424*d*.

The layers were prepd. on Pt or stainless steel foil. The area to be covered was defined by painting the perimeter with nitrocellulose lacquer. Uranyl acetate dissolved in pyridine was then painted on the foil and was ignited after drying. The thickness of deposit could be detd. by direct weighing.

3834. Dekker, A. J. and Geel, W. Ch. van. **The rectifying properties of the system aluminum-alumina-electrolyte under alternating current.** *Phillips Research Repts.* 5, 303-14 (1950).—*C.A.* 45, 2795*f*.

For an Al_2O_3 film 0.35 microns thick the conduction current (Al neg.) was given by $(i_c) \approx 2 \times 10^{-7} V^2$. The leakage current (Al pos.) was given by $(i_i) \approx 2 \times 10^{-11} V^2$, where (i) was in amp./cm^2 and V was in volts. The system had high capacitance because of the thinness of the oxide film. The structure of the oxide film was not stable, but depended upon the direction of the applied potential. When the Al was pos. the film became stable.

3835. Erbacher, Otto. **The electrostatic hinderance of ion adsorption on metal surfaces.** *Z. Elektrochem.* 54, 369-74 (1950).—*C.A.* 45, 3682*d*.

In the case of ion adsorption on metal surfaces, the Ostwald (Freundlich) isotherm could not be interpreted as the summation of Langmuir isotherms belonging to different active centers, but was conditioned by the electrostatic interaction of the adsorbed ions.

3836. Erdey-Grúz, Tibor. **Oscillographic analysis. The possibilities of a surface investigating method.** *Magyar Kém. Folyóirat* 56, 83-7 (1950).—*C.A.* 45, 3260*d*.

The polarization capacity of a metallic surface depended on the condition of this surface and on the changes occurring thereon. The correlation of the polarization capacity with the changes in potential served as a basis for detg. the conditions of the metallic surface and its changes, even when the surface area was unknown. Examples showed the suitability of the oscillographic method for the study of surface processes of metals.

3837. Fensham, P. J. **Self diffusion in polycrystalline tin.** *Australian J. Sci. Research* 3A, 105-8 (1950).—*C.A.* 45, 411*f*.

The rate of vol. diffusion in polycrystals of tin was in general agreement with the measurements of self-diffusion rates in different crystallographic directions within single crystals. The rate of diffusion along the grain boundaries was generally considerably higher than that of vol. diffusion, except along boundaries between twins or crystals of similar orientation.

3838. FENSHAM, P. J. **Self diffusion in tin crystals.** *Australian J. Sci. Research* **3A**, 91-104 (1950).—*C.A.* 45, 411*d*.

The rate of self diffusion in single crystals of white tin of various orientations was measured by use of the radioactive isotope Sn^{113}. Diffusion was anisotropic, the ratio of the coeffs. parallel and perpendicular, resp., to the tetragonal (*c*) axis being approx. 2 at 180° and 3 at 223°. The anisotropy was discussed in terms of the vacancy mechanism of diffusion.

3839. HAASE, L. W. **Corrosion behavior in very dilute aqueous solutions. IV. Corrosion on copper.** *Werkstoffe u. Korrosion* 1, 390-3 (1950).—*C.A.* 45, 1486*i*.

In dil. aq. solns., Cu had a closely defined dissolving power, which depended only slightly on the state of the Cu, but which caused and limited the formation of inhibiting films within an extended range. Under suitable conditions, a carbonaceous film, which formed on the Cu in water, could be protective, while with water contg. impurities, a local cell action could cause attack on the Cu.

3840. HACKERMAN, NORMAN AND GLENN, E. E., JR. **Orientation of a polyfunctional organic molecule at a steel surface.** *J. Phys. & Colloid Chem.* 54, 497-505 (1950).—*C.A.* 44, 6229*b*.

Electron diffraction patterns of SAE 1020 and evapd. Fe surfaces after adsorption and desorption of alkylpyrrolidinedione (Tretolite Co. K115, mol. wt. 350) at concns. of 0.0001, 0.001, 0.01, 0.1, and 1.0% in Skelly-solve B (hexane, 2-methylpentane and 3-methylpentane mixt) showed firm adsorption in an oriented 2-dimensional layer from the 2 dil. solns. The alkylpyrrolidinedione mol. with the cyclic portion having 3 adjacent polar groups could cover the surface from a 0.0001% soln. if the cyclic portion was flat and from a 0.01% soln. if the cyclic portion was vertical.

3841. HAISSINSKY, M. AND PAPPAS, A. **Isotopic exchange between selenium and its ions in aqueous solutions.** *J. chim. phys.* 47, 506-13 (1950).—*C.A.* 44, 9777*a*.

Tracer expts. with radioactive Se showed that Se atoms from the amorphous solid exchanged rapidly with those in a HCl soln. 0.1 *M* with respect to SeO_2, provided the normality of the acid was 5.5 or greater. The rate of exchange increased with increase in acid strength, reaching a value of 40% in 1 hr, when the HCl was 10 *N*. Measurements at 1°, 16°, and 33°C indicated a temp. coeff. for the exchange corresponding to an energy of activation of 6 kcals. per mole.

3842. KATZ, W. **Velocity of solution of copper in various salt solutions and the mechanism of copper corrosion.** *Werkstoffe u. Korrosion* 1, 393-9 (1950).—*C.A.* 45, 1487*a*.

By means of polarization curves and corrosion current measurements, the Cu corrosion was distinguished as a cathodically regulated process. The thickness of the H atom film on the Cu surface was measured in different salt solns. It decreased with increasing Cu content of the solns., in a manner variable with the different anions. In chloride solns. the thickness of the layer decreased from 36 to a fraction of a layer, and was here the thinnest; for Na acetate the decrease was lowest with a greater layer thickness.

3843. LAITINEN, H. A. AND ONSTOTT, E. I. **Adsorption and reduction of tetrachloroplatinate (II) ion at the dropping-mercury electrode.** *J. Am. Chem. Soc.* 72, 4565-70 (1950).—*C.A.* 45, 4579*f*.

$PtCl_4^{--}$ ion must be adsorbed on the dropping-Hg electrode to be reduced at potentials more pos. than about 1 volt (*vs.* standard calomel electrode). The desorption process did not appear to be reversible, although the desorption half-wave potential was independent of the $PtCl_4^{--}$ ion concn. Added adsorbents shifted the desorption half-wave potential to more pos. values.

3844. LOSHKAREV, M. A. AND GRECHUKHINA, T. N. **Adsorption chemical polarization and cathodic deposition of alloys from noncomplex electrolytes.** *Zhur. Fiz. Khim.* 24, 1502-10 (1950).—*C.A.* 45, 5537*e*.

The electrodeposition of Pb, Cu, Sn-Pb, Cu-Pb, and Cu-Sn was studied. The exptl. technique and the deposition of Sn were described. The work showed the effect of org. agents (phenol, naphthol, aromatic amines) and colloids (gelatin) on the cathodic deposition of metals and alloys from aq. electrolytes without formation of cationic complexes. It was found in all cases that gelatin increased the polarization and improved the quality of the deposit.

3845. LOSHKAREV, M. A. AND KRYUKOVA, A. A. **Changes of polarographic waves under the action of adsorption processes on mercury.** *Doklady Akad. Nauk. S.S.S.R.* 72, 919-22 (1950).—*C.A.* 44, 9827*d*.

Inhibition of the electrode process, as distinct from the mere effect of suppression of surface motion of the Hg, was proper only to a limited no. of surface-active substs., those which formed the closest-packed adsorbed films. Most effective in that respect were homologs of PhOH (xylenols, carvacrol, *m*-cresol, thymol), ethers of PhOH (phenetole, eugenole, anethole), 1 and 2-naphthols, the camphane group (camphor, borneol), secondary and tertiary aromatic amines (diphenylamine, tribenzylamine, diethylaniline), aromatic alcs. ($PhCH_2OH$), methol, etc.

3846. MIGNOLET, J. C. P. **Studies in contact potentials. II. Vibrating cells for the vibrating condenser method.** *Discussions Faraday Soc.* 8, 326-331 (1950).

Cells were described for measuring surface potentials of films adsorbed on evaporated metal deposits. Essentially they were electrically-driven, hollow tuning forks. The accuracy was ±1 or 2mV on individual contact potential measurements and ±10 or 20mV on surface potential determinations.

3847. PATRICK, WALTER A. AND LITTLER, CLARENCE L. **Method of measuring the absolute potential of aqueous half-cells.** *J. Phys. & Coll. Chem.* 54, 1016-27 (1950).—*C.A.* 45, 479*g*.

The abs. potential of a calomel half-cell had been measured. A freshly prepd. electrode was dipped into a soln. contg. a reactive ion and also an identical stationary electrode. A transient current owing to formation of a Helmholtz double layer at the fresh electrode was observed and measured with a cathode ray oscilloscope. Changes in the concn. of the reactive ion led to a change in, and finally, a reversal of the transient current, at which point the p.d. between the electrode and the soln. must be zero.

3848. PATRICK, WALTER A. AND WAGNER, HERMAN B. **Mechanism of oxygen reduction at an iron cathode.** *Corrosion* 6, 34-8 (1950).—*C.A.* 44, 2391*e*.

Expts. were reported with Fe-Hg cells, and a description of the procedure and diagrams of the app. were given. Data on current, c.d., % absorption on cathodic soln., and percent yield of H_2O_2 indicated that the greatest yields of H_2O_2 were obtained in alk. solns. with small c.ds. Possibly H_2O_2 was also formed in acidic solns., but it was more quickly reduced further to the OH ion which reacted to form H_2O.

3849. PRYOR, M. J. AND EVANS, U. R. **The reductive solution of ferric oxide in acid. I. The reductive solution of oxide films present on iron. II. Reductive solution of powdered ferric oxide.** *J. Chem. Soc.* **1950**, 1259-74.—*C.A.* 45, 489*h*.

The soln. in dil. acid of films formed by heat-treatment of Fe was not direct soln. as Fe (III) ions; it was reductive soln. as Fe (II) ions. Thin films dissolved quickly and regularly by uniform cathodic action on the surface; thicker films, slowly and irregularly because of preferential reaction around discontinuities. The rate and the current efficiency of reductive soln. of α-ferric oxide powders diminished with an increase in the temp. of the previous ignition of the oxide, with an increase in the time of reduction, and with an increase in pH of the electrolyte. Results with HCl, H_2SO_4, and $HClO_4$ were practically identical.

3850. STRAZHESKO, D. M. AND TARTAKOVS'KA, B. E. **Electrostatic adsorption of ions in nonaqueous solutions.** *Dopovidi Akad. Nauk Ukraïn. R.S.R.* **1950**, 109-12 (in Ukrainian).—*C.A.* **46**, 324*e*.

Hydrogen and oxygen (air) electrode potentials of platinized Pt were measured in 0.01 *N* solns. of HCl and NaOH in MeOH + H_2O and EtOH + H_2O mixts. of different compns. and in the pure alcs. The reversible H potential varied very little with addn. of the alcs. to H_2O. In contrast, the pos. potential of the irreversible air electrode was strongly lowered in the presence of alcs., particularly EtOH. The org. substance decreased strongly the electrostatic adsorption of anions.

3851. SUTRA, GENEVIÉVE. **Hydrogen overvoltage.** *Compt. rend.* **230**, 644-5 (1950).—*C.A.* 44, 5728*g*.

The irreversible deposition of H_2 was considered to occur according to the following mechanism: Adsorption of protons on the surface of the cathode occurred until a certain concn. was reached and the surface became satd. The liberation of H_2 began at this point. There existed a fixed ratio, K, between the free and adsorbed protons, which varied with the affinity of the metal for protons.

3852. SUTRA, GENEVIÈVE. **Hydrogen overvoltage.** *Compt. rend.* **230**, 749-50 (1950).—*C.A.* 44, 5728*i*.

The relation between the overvoltage and the work required to ext. the electrons was compared for a no. of unpolished metal surfaces, and no correlation existed. (Pt, Au, Ag, Ni, Mo, Sn, graphite, Ta, Hg.) The work function (x) was const. at 5 v. The heat of adsorption was shown to be somewhat variable with the overvoltage.

3853. SUTRA, GENEVIÉVE. **Hydrogen overvoltage in the course of electrolysis.** *Compt. rend.* **230**, 842-4 (1950).—*C.A.* 44, 5729*a*.

The slow liberation of H_2 at the cathode was considered a reversible process. It was shown that the overvoltage was independent of the H ion concn. of the electrolyte, and had the form $n = C \log 1/s$, where s was the soly. of protons in the cathode. The soly. of H in Co, Ni, Cu at 600-1000°K. followed the relation $\ln s = a - b/T$.

3854. TÖDT, FRITZ. **The current output of galvanic cells caused by transfer of oxygen as a measure of the oxidation and initial corrosion of metals.** *Werkstoffe u. Korrosion* **1**, 49-51 (1950).—*C.A.* 44, 4806*a*.

Studies were made on the amt. of O_2 produced at a Pt electrode, and an attempt was made to explain the initial corrosion of metals on the basis of a galvanic cell reaction. The metal surface was charged with amts. of O_2 lying between 10^{-9} and 10^{-12} g equivs./cm^2.

3855. TÖDT, FRITZ. **The formation and the electrochemical decomposition of the oxide layer on metals.** *Z. Elektrochem.* **54**, 485-94 (1950).—*C.A.* 46, 7905*g*.

Expts. were carried out to show that measurements of current intensity in a cell with a Pt cathode and an unpolarizable anode allowed the detn., with great accuracy (down to 10^{-12} mol./cc.), of the amt. of O_2 absorbed at the cathode in the form of oxide layers. The cathode depolarization by O_2 was detd. quant., and the corresponding quantity of electricity allowed the calcn. of the amt. of O_2 absorbed by the metal cathode and the detn. of the thickness of the oxide film. At the same time, the method could be used for detn. of the amt. of dissolved O_2 with a precision superior to any chem. method and without taking samples of the soln.

3856. TÖDT, FRITZ. **The reaction of atmospheric oxygen dissolved in water on metal surfaces.** *Chem.-Ztg.* 74, 254-6 (1950).—*C.A.* 46, 8546*b*.

Except in the cases of Cr and Al, on which an O or oxide coating served to protect from attack, a simple electrochem. model with the oxide layer as cathode and the ground metal as anode served for the theoretical explanation of O corrosion of metals. Two independent methods of expt. led to this conclusion. The elec. output of a Pt, Cu, or Ni cathode was found to depend on the quantity of electrochemically effective O or oxide at the surface. An oxide layer on a Pt surface yielding as little as 10^{-7} coulomb/cm^2 could be measured. Also, an O-content of 3 parts per billion could be measured.

3857. Wakkad, S. E. S. El and Hickling, A. **Anodic behavior of metals. VI. Cobalt.** *Trans. Faraday Soc.* **46**, 820-4 (1950).—*C.A.* **45**, 2796*b*.

The initial build-up of anodic polarization at a Co anode was detd. with the cathode-ray oscillograph. In alk. solns., CoO was first formed but this was further oxidized to Co_2O_3 when the surface was only partly covered with the lower oxide. In hot concd. alkali solns. continuous soln. of CoO to give CoO_2^{--} ions may occur. In the passivation of a Co anode the Co_2O_3 formed a protective layer, essentially 1 mol. thick, which was further oxidized to CoO_2 before O evolution commenced.

3858. Wakkad, S. E. S. El and Wakkad, Mrs. S. E. S. El. **Oxide film formation on the surface of metals in aqueous solutions and evaluation of their standard potentials. II. Mercury electrode.** *J. Phys. & Colloid. Chem.* **54**, 1371-83 (1950).—*C.A.* **46**, 7911*a*.

The behavior of the Hg electrode in solns. varying from pH 0 to pH 14 and initially free from Hg^{++} was studied. The true thermodynamic potential (e_{25}) of a standard Hg electrode out of contact with air was 0.7971 v. and 0.7988 v. in the presence of air.

3859. Weiser, Harry B. and Merrifield, Paul. **The concept of critical zeta potential for hydrophobic sols.** *J. Phys. & Colloid Chem.* **54**, 990-8 (1950).—*C.A.* **45**, 419*i*.

Moving—boundary expts. on Au and Se sols showed that the ζ-potential as computed by the Helmholtz-Smoluchowski equation was the crit. stabilizing factor for monodisperse lyophobic colloids.

3860. Wickert, Kurt. **The significance of the activity of metal surfaces in electrochemical reactions.** *Metalloberfläche* **4**, A181-6 (1950).—*C.A.* **45**, 2795*h*.

A reaction with metal surfaces was possible in the presence of electron receptors only, since the metal always acted as electron donor. Free electron transfered between metal and electron acceptor was necessary for electrochem. reactions. It was found that in this case also, the surface prepn. was very important for Evans elements with low electrolytic resistance. Passive surfaces did not lose metal cathodically, and metals whose activity surpassed a certain value lost more weight cathodically than anodically. The Evans principle should be corrected to allow for this activity.

3861. Wickert, Kurt; Böhnert, E., and Pilz, H. **The solubility of iron in hydrochloric acid in the first second.** *Werkstoffe u. Korrosion* **1**, 106-7 (1950).—*C.A.* **44**, 5683*i*.

In test of the soly. of Armco Fe in HCl, both with and without an inhibitor, $(CH_2)_6N_4$ was used as the inhibitor in concns. up to 0.75%. The action of the inhibitor was effective only in later sec, if an active surface was present. On polished surfaces there was no great difference in the action of HCl during the first sec, with or without inhibitor. The inhibitor appeared to form a film on the metal surface; the time required for this film formation was an important factor in decreasing soly.

3862. Wolstenholme, G. A. and Schulman, J. H. **Metal-monolayer interactions in aqueous systems. II. Adsorption of long-chain compounds from aqueous solution onto evaporated metal films.** *Trans. Faraday Soc.* **46**, 488-97 (1950).—*C.A.* **44**, 9773*f*.

Evapd. films of Cu and Ag with hydrophilic surfaces were immersed in aq. solns. of surface-active long-chain compds. and the contact angles detd. Na dodecyl sulfate was adsorbed on the surface of Cu films that were exposed to O_2, and the rate of increase of the contact angle depended on the temp. and on the concn. of long-chain ions in soln. Sol. fatty acids formed adsorbed monolayers on Cu surfaces that had been exposed to air, but not to O_2 alone and not on Ag surfaces that had been exposed to O_2 or air. Adsorption on evapd. metal films was extremely sensitive to impurities in air, possibly CO_2 and S-contg. compds.

3863. Bateman, J. B. and Harris, Margaret W. **Measurement of properties of thin films on chromium by the reflection of polarized light.** *Ann. N.Y. Acad. Sci.* **53**, 1064-81 (1951).—*C.A.* **46**, 4876*d*.

Results were presented of polarization measurements on aliphatic acid layers transferred to Cr by Blodgett's method. Glass slides coated with Cr were examd. in a polarizing assembly suitable for the measurement of elliptically polarized light. The desired no. of paired aliphatic acid monolayers was then transferred to the slide, and the polarimetric measurements repeated.

3864. Bowden, F. P. and Moore, A. C. **Physical and chemical adsorption of long-chain compounds on radioactive metals.** *Trans. Faraday Soc.* **47**, 900-8 (1951).—*C.A.* **46**, 2372*c*.

A metal foil about 0.001 cm thick and a few cm^2 in area was used as the adsorbing surface. It was irradiated with neutrons and washed until no further radioactivity was extd. The adsorption of a long-chain fatty acid, alc., or ester on Pt and Au was phys. On Zn, Cd, or Cu the adsorption could be followed by chem. reaction. The metal soap formed was physically attached to the surface and in the presence of solns. of the adsorbate a relatively thick film of soap may be formed adjacent to the metal surface.

3865. Brumbaugh, Robert J. **Corrosion resistance of zirconium-effect of oxygen, nitrogen, carbon, and hafnium.** *Ind. Eng. Chem.* **43**, 2878-80 (1951).—*C.A.* **46**, 6070*e*.

Corrosion tests were carried out with Zr and Ti contg. small amts. of impurities at 35°C, in quiescent solns. of NaOH, NH_4OH, H_2SO_4, HNO_3 of various concns. Standard grade Zr (2.5% Hf) was less resistant than low-Hf Zr. Corrosion resistance of Zr was slightly superior to that of Ti in most media and quite superior in dil. H_2SO_4 and in both dil. and concd. HCl. Addn. of small amts. of O_2, N_2, and C resulted in a slight decrease in corrosion resistance of low-Hf alloy with the effect being most pronounced in concd. HCl. N_2 alloys of Zr were less resistant than either carbon or oxygen alloys.

3866. Cook, E. L. and Hackerman, Norman. **Adsorption of polar organic compounds on steel.** *J. Phys. & Colloid Chem.* 55, 549-57 (1951).—*C.A.* 45, 5590*c*.

Adsorption from a benzene soln. of higher-mol. aliphatic acids, amine alcs., and esters on SAE 1020 steel powder (specific surface area of 0.10 m^2/g) exhibited irreversible and reversible adsorption. Total adsorption and irreversible adsorption were in the following decreasing order: acids, amines, alcs., esters. The total adsorption was a function of mol. wt and polar group, and exceeded the calcd. amt. necessary for a complete close packed monolayer by 20-70%. The extent of the irreversible adsorption was independent of the above factors and yielded incomplete surface coverage.

3867. Daniel, S. G. **Adsorption on metal surfaces of long-chain polar compounds from hydrocarbon solutions.** *Trans. Faraday Soc.* 47, 1345-59 (1951).—*C.A.* 46, 6459*d*.

The adsorption of the alc. and ester was 90% or more complete in 3 min. for all metals examd. Pt, Au, Ag, Ni, Fe, Cr, Sn, and Al gave time-adsorption curves similar to those obtained with the alc. and ester. The adsorption of the acids on Cu, Pb, Zn, and Cd increased continually with time. When reaction between adsorbate and the metal surface occurred, it was the phys. properties of the reaction products, the metal soaps, that detd. the observed behavior.

3868. Evans, U. R. and Davies, D. E. **The pitting of zinc by distilled water and dilute solutions.** *J. Chem. Soc.* **1951**, 2604-14.

The pitting occurred as a result of electrolytic effects. A necessary condition for pitting: small anodic areas shall be surrounded by anodic and large cathodic areas. The ratio of effective cathodic area to anodic area determined the intensity of attack, which explained the sharp pitting produced by distilled water. For concentrated solutions, the total corrosion was greater, but the attack less intense. The corrosion products were oriented zinc oxide, some beta-hydroxide, and negatively charged collodial particles.

3869. Frumkin, A. N.; Iofa, Z. A., and Bagotskiĭ, V. S. **Reply to N. I. Kobozev.** *Zhur. Fiz. Khim.* **25**, 1117-31 (1951).—*C.A.* 46, 6527*g*.

From the theoretical standpoint, desorption of at. H was ruled out because, at a c.d. of 0.1 $amp./cm^2$ with $\eta = 1.3$ v., a calcn. showed that the surface coverage θ was $1.8.10^{-11}$; then the velocity of desorption was $0.8.10^{-13}$ $mol./cm^2$ sec, which corresponded to $0.8.10^{-8}$ $amp./cm^2$. Rough calcns. showed that electrochem. desorption, $H_a + H_3O^+ + e \rightarrow H_2 + H_2O$; or recombination, $2H_a \rightarrow H_2$, are much more rapid processes than $H_a \rightarrow H$.

3870. Gerischer, Heinz. **Alternating-current polarization of electrodes with a potential-determining step for equilibrium potential.** *Z. physik. Chem.* **198**, 286-313 (1951).—*C.A.* 46, 4934*c*.

The electrode was considered as a double-layer condenser with a parallel kinetic polarization resistance. The latter could be divided into a contribution arising from the discharge process and another from transport and reaction processes of substances participating directly in the discharge process. Specific cases treated were: pure diffusion, diffusion accompanied by a homogeneous reaction, and diffusion accompanied by a heterogeneous reaction, such as adsorption.

3871. Grahame, David C. **The role of the cation in the electrical double layer.** *J. Electrochem. Soc.* **98**, 353-50 (1951).—*C.A.* 45, 10101*b*.

The differential capacities of 0.1 *N* solns. of the chlorides of Li, Na, K, Rb, Cs, H, NH_4, Mg, Ca, Sr, Ba, Mn, Co, Ni, Al, La, and Pr against a Hg surface were measured at various potentials at 1000 cycles per sec. The data showed that the nature of the cation made only a very small difference in the differential capacity of the elec. double layer.

3872. Grubitsch, Heribert. **The measurement of oxide films on platinum.** *Werkstoffe u. Korrosion* 2, 85-9 (1951).—*C.A.* 45, 7453*i*.

The O-covering of the Pt surface was proportional to the abs. surface, not to the active surface. It was indicated that the proportionality assumed by Tödt between the O-covering or current strength and the disconnect-time of a Pt electrode in an O-contg. electrolyte was in error.

3873. Grubitsch, Heribert and Väyrynen, Hilkka. **The solution rate of iron in 0.1 *N* hydrochloric acid in the first seconds.** *Werkstoffe u. Korrosion* 2, 362-5 (1951).—*C.A.* 46, 2889*b*.

The increased soln. rate in 0.1 *N* HCl in the first few sec. was due to the presence of an oxide coating in the case of polished test specimens. Tests on specimens free of oxide (reduced in H_2) showed an increase in the initial soln. rate in both aq. and ethereal HCl.

3874. Hickling, A. and Wilson, W. H. **The anodic decomposition of hydrogen peroxide.** *J. Electrochem. Soc.* **98**, 425-33 (1951).—*C.A.* 46, 43*h*.

By using anodes of Pt, platinized Pt, Ni, Au, and graphite, H_2O_2 was decompd. anodically under all conditions except at very high c. ds. The process postulated for decompn. in alk. solns. was $HO_2^- = H^+ + O_2 + 2e^-$. This reaction took place rapidly and was diffusion controlled, beginning at low anodic potentials. The process was independent of the electrode material. In neutral or acid solns. however, the processes proceeded at potentials about 10 times higher than in alk. solns.

3875. Johnston, R. J. and Ubbelohde, A. R. **A wedge effect at amalgam-electrolyte surfaces.** *Proc. Roy. Soc.* (London) **A206**, 275-86 (1951).—*C.A.* 47, 3727*g*.

When amalgams were formed by discharge of Li^+, Na^+, K^+, Ca^{2+}, Ba^{2+}, Mg^{2+}, NH_4^+ at a Hg cathode in a glass vessel, at a min. potential characteristic of each, a wedge of electrolyte penetrated between the amalgam and the glass. This effect was not observed with Ag^+, Zn^{2+}, Cd^{2+}, or H^+. There was a very strong adsorption of discharged metal atoms at the interface. A theoretical calcn. showed that a large drop in γ was assocd. with large metal atom polarizability.

3876. KAHAN, GEO. J. **Hydrophobic films on solid surfaces.** *J. Colloid Sci.* 6, 571-5 (1951).—*C.A.* 46, 2876*g*.

Hydrophobic films were formed on Pt by immersion in 0.1% aq. K stearate of pH = 9.5 and various aq. long-chain quaternary ammonium halides over the pH range 1.5-11.0. In contrast hydrophobic films could be formed on glass only with the quaternary ammonium compds. The formation of hydrophobic films on Pt by either cationic or anionic agents is prevented by pretreating the Pt with $SnCl_2$ or Na metasilicate solns.

3877. KAPPANNA, A. N. AND DEORAS, BHANU RAMCHANDRA. **Anodic oxidation of formate ion.** *J. Indian Chem. Soc.* **28**, 287-94 (1951).—*C.A.* **46**, 6521*i*.

At low c.d., CO_2 was the only gaseous product in the anodic oxidation of formate ion at 30°C, with HCOONa and HCOOH solns. and a Pt anode. Above 12.5 ma./cm^2 O_2 evolution started while at 50 ma./cm^2, CO and H_2 were obtained.

3878. LOSHKAREV, M. A. AND KRYUKOVA, A. **Change in polarographic waves under the influence of adsorptive processes on mercury.** *Zhur. Anal. Khim.* 6, 166-77 (1951).—*C.A.* 45, 8919*e*.

The effects studied were those of gelatin, xylidine, benzyl alc., camphor, carvacrol, methyl blue, β-naphthol, menthol, and tribenzylamine. Formation of adsorbed layers changed both the shape and the position of polarographic waves of Cu, Cd, Cr, and Sn in H_2SO_4. This was caused by hampering surface movement of the Hg as well as by blocking electrode processes.

3879. MACGILLAVRY, D.; SINGER, J. J. JR., AND ROSENBAUM, J. H. **Metal-solution potentials of nickel in foreign-ion solutions.** *J. Chem. Phys.* **19**, 1195-2202 (1951).—*C.A.* **46**, 1370*e*.

Ni showed stationary potentials in KOH and phosphate buffer solns. when O_2 was excluded. The stable potentials were reversible with respect to a change of pH. Ni was unable to displace H_2 from 0.1 M H_3PO_4 soln.; Ni dissolved only on admission of air.

3880. MACKOR, E. L. **The properties of the electrical double layer. I. Thermodynamics of the double layer on silver iodide and mercury.** *Rec. trav. chim.* **70**, 663-74 (1951) (in English).—*C.A.* **46**, 6463*c*.

A comparison of thermodynamically derived equations for various parameters of the double layer on AgI and on the polarized Hg electrode emphasized the similarities of these double layers and led to a better understanding of the AgI system.

3881. MACKOR, E. L. **The properties of the electrical double layer. III. The capacity of the double layer on mercury and on silver iodide.** *Rec. trav. chim.* **70** 763-83 (1951).—*C.A.* 46, 6463*e*.

Data on the capacity of the Hg electrode in NaF solns. were interpreted by the use of the double layer. The adsorptions of $AgClO_4$ and of NaI on AgI from H_2O, acetone, and 25 vol. % acetone, resp., were detd. electrometrically. Analogies with the Hg electrode were used to calc. the capacities of the mol. condenser on AgI in these solns.

3882. MIZUGUCHI, JUN. **Surface action of a lead peroxide electrode in electrolytic oxidation. III.** *J. Electrochem. Soc. Japan* 19, 380-3 (1951).—*C.A.* 46, 4931*c*.

Some org. compds. such as glucose, formalin, gluconic acid, oxalic acid, and formic acid were electrolyzed in a 5% H_2SO_4 soln. with Pt and Pb-PbO_2 anodes, resp., and the oxidation products were estd. In spite of the fact that the O-overvoltage of a PbO_2 anode was nearly equal to or lower than that of Pt, the oxidation power of a PbO_2 anode was much higher than that of Pt.

3883. UNO, SHŌHEI AND ICHIJI, NAOJI. **The freezing of gold, platinum, and arsenious sulfide sols. I.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 588-90 (1951).—*C.A.* 46, 5400*h*.

The coagulation of the sols of Au, Pt, and As_2S_3 resulting from freezing-thawing was studied. Urea showed protective action for the sols against the action of freezing-thawing.

3884. UNO, SHŌHEI AND ICHIJI, NAOJI. **The freezing of gold, platinum and arsenious sulfide sols. II. Protective action of hydrophilic colloids against the coagulation caused by freezing.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, 72, 607-10 (1951).—*C.A.* 46, 5932*e*.

Freezing Au no. was defined as the wt in mg of the colloid added to 10 ml of sol. that prevented the color change of the colloid with freezing. For the sake of differentiation, Zsigmondy's Au no. was denominated as NaCl-thawing Au no. Both values were detd. for hydrophilic sols of gelatin, casein, agar, gummi arabic, egg white, sodium oleate, potato starch, dextrin, sol. starch, and sodium alginate, against the sols of Au, Pt, and As_2S_3.

3885. UNO, SHŌHEI; ICHIJI, NAOJI, AND KOBAYASHI, AKIO. **The freezing of gold, platinum and arsenious sulfide sols. III. Protective action of alcohols, sugars, and urea against the coagulation caused by freezing. IV. Factors that determine the freezing gold numbers of alcohols, sugars, or urea, and the possibility of concentration of sols by freezing.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 72, 877-80; 880-2 (1951). —*C.A.* 46, 6465*g*.

The coagulation of Au, Pt, or As_2S_3 sols on thawing was prevented by the presence of alcs., sugars, or urea. The protecting action of alcs. from MeOH to raffinose was studied. The protecting action of alcs., sugars, or urea changed with the modes of freezing and the properties of sols.

3886. VETTER, KLAUS J. **The condition of passive iron, particularly in nitric acid.** *Z. Elektrochem.* 55, 274-80 (1951).—*C.A.* 45, 9948*g*.

The slight corrosion of passive Fe was detd. and found to be independent of the potential of the Fe. The addn. of Cl^- increased the corrosion. A.C. measurements gave similar values for the capacity of the double layer (55 microfarads/cm^2) in concd. HNO_3 as with Pt.

3887. ANTROPOV, L. I. **The nature of cathodic reactions.** *Zhur. Fiz. Khim.* **26**, 1688-93 (1952).—*C.A.* 47, 4767*c*.

The usual cathodes belong to 2 groups. In one group (Pt, Pd, Ni, and Co) the rate of H_2 evolution was limited by the rate of recombination of H atoms. The H-overvoltage was independent of pH, and the concn. *c* of H atoms in the cathode surface was greater than corresponds to equil. The electrolytic H was markedly absorbed, and unsatd. org. compds. were cathodically hydrogenated (by the H adsorbed on the cathode) while polar groups were reduced with difficulty. In a second group (Hg, Zn, Pb, and Mg) the rate of H evolution was limited by the rate of discharge of H^+.

3888. Baker, Hayward R.; Shafrin, Elaine G., and Zisman, Wm. A. **The adsorption of hydrophobic monolayers of carboxylic acids.** *J. Phys. Chem.* **56**, 405-12 (1952).—*C.A.* **46**, 7399*d*.

An adsorption technique was extended to the study of monolayers physically adsorbed on Pt from aq. solns. of varying concns. of various mono- and dicarboxylic acids. The conditions for max adsorption lie between pH 4 and 6. Both the shape of the contact angle-pH curves and the positions of the points of inflection agreed well with the theoretical results previously predicted.

3889. Benesch, Ruth E. and Benesch, Reinhold. **The role of adsorption in the reduction of organic mercury compounds at the dropping-mercury electrode.** *J. Phys. Chem.* **56**, 648-53 (1952).—*C.A.* **46**, 9450*i*.

It was shown that the product resulting from the addn. of one electron to certain org. Hg compds. was adsorbed at the dropping-Hg electrode. The no. of mols. adsorbed per unit area was detd. by several methods with good agreement. Expts. were made with PhHgOH showing that the wavelike irregularity on the 1st wave was caused by the adsorption of reduction products on the Hg surface. The height of the prewave had no significant temp. coeff. between 0° and 63°C; this again confirmed the adsorption phenomena.

3890. Berwick, I. D. G. and Evans, U. R. **The cause of the chemical resistance of stainless steel.** *J. Appl. Chem. (London)* **2**, 576-90 (1952).—*C.A.* **47**, 1562*i*.

Austenitic steels were studied electrochem. The theory that the passivity of stainless steels was due to a physically adsorbed layer of O_2 was tested. Below a certain concn. of O_2 stainless steel never became passive; above this concn., the reciprocal of the time needed was a linear function of the O_2 added. This indicated that an oxide film was formed according to the logarithmic law. A trace of O_2 was needed to prevent attack on stainless steel by dil. acid, and passivity sometimes broke down in plants at inaccessible corners where renewal of O_2 was insufficient.

3891. Bockris, J. O'M. and Azzam, A. M. **Kinetics of the hydrogen-evolution reaction at high current densities.**
Trans. Faraday Soc. **48**, 145-60 (1952).—*C.A.* **46**, 8543*a*.

H_2 evolution as a function of electrode potential was detd. up to c.d. > 100 amp./cm^2. The overpotential was detd. on Hg, W, Ag, Ni, Pt, and Pd electrodes in 5 *N* HCl at c.ds. from 10^{-3} to about 100 amp./cm^2. Combination of at. H was not the rate-detg. process at c.ds. above those of the order of 10 amp./cm^2 on any metal. On Hg electrodes the path was slow discharge followed by rapid electrochem. desorption; that on Ni was slow discharge followed by the at. combination desorption.

3892. Bockris, J. O'M. and Pentland, N. **Mechanism of hydrogen evolution at copper cathodes in aqueous solutions.** *Trans. Faraday Soc.* **48**, 833-9 (1952).—*C.A.* **47**, 3725*f*.

Purified solns. of 0.0001 - 0.1 *N* HCl and 0.005 - 0.15 *N* NaOH were used from 10° to 40°C over a c.d. range of $10^{-8} - 10^{-2}$ amp./cm.^{2} In alk. soln., discharge from Na^+ was negligible under exptl. conditions. The desorption step was catalytic combination of H atoms at low c.d.; at higher c.d. desorption by the electrochem. step may become important.

3893. Bonnemay, M. **The poisoning of hydrogen electrodes.** *J. chim. phys.* **49**, No. 7-8, 142-6 (1952).—*C.A.* **47**, 980*i*.

Platinized Pt electrodes were poisoned by acting as anodes in an electrolysis of HCl, under conditions evolving Cl_2. The effect of poisoning conditions on the current-overpotential curves when the electrodes were used as H electrodes was studied. Temp. of poisoning and of measurement had no effect. The same quantity of electricity did not give the same degree of poisoning, since this also increased with the poisoning potential. The mechanism of poisoning may be due to the occupation of adsorption sites on the Pt by Cl, so that the discharge of H could only occur without adsorption.

3894. Bonnemay, Maurice; Makram, Helmy, and Royon, Jean. **The diffusion of ions across metallic coatings.** *Compt. rend.* **235**, 955-7 (1952).—*C.A.* **47**, 4175*d*.

The porosity of electrodeposited metal coatings was examd. by 2 methods. The potential of a Cu electrode plated with Cr and immersed in 2 *N* $CuSO_4$ was detd. as a function of time and Cr thickness. In the other method Cu was activated by neutron irradiation, plated with Cr, immersed in a $CuSO_4$ soln. and the increase of Rd-Cu in soln. detd.

3895. Carmo, Anta, Maria do and Cottin, Maurice. **Isotopic exchange between silver metal and its ions in solution.** *Compt. rend.* **234**, 1686-8 (1952).—*C.A.* **46**, 10778*b*.

Ag^{110} was placed in a 0.2 *M* soln. of $AgNO_3$ for a no. of hrs at 100-150°C. The phases were then sepd., and the soln. was analyzed for Ag^{110}. The amt. of exchange increased with the quantity of metal originally present, the temp., and the time of contact.

3896. Danon, J. and Haïssinsky, M. **Electrodeposition from very dilute solutions and heterogeneity of the electrode surface.** *J. chim. phys.* **49**, C123-30 (1952).—*C.A.* **46**, 4934*i*.

The crit. potential for the cathodic deposition of Bi on Au (previously polarized) varied with the concn. according to Nernst's law of electrochemistry down to about 3×10^{-16} *N*. Without previous polarization the deposition at this concn. was characterized by an undervoltage. The distribution of Bi between a nitrate soln. of Bi^{+++} (10^{-12} to 8×10^{-7} *N*) and a Ag electrode at potentials equidistant from the crit. potential followed 2

Freundlich isotherms, one of which had an exponent less than 1 at very low concn. and the other an exponent larger than 1.

3897. EVANS, U. R. AND BERWICK, I. D. G. **Passivity of metals. XI. Anodic behavior of iron oxide films.** *J. Chem. Soc.* **1952**, 3432-7.—*C.A.* 47, 1555*e*.

The visible oxide film on Fe was immediately auto-reduced by dil. H_2SO_4; anodic polarization preserved the film and O_2 was evolved. During anodic treatment, the film acquired a charge of excess O in its outer layers; this must be removed from the whole surface before localized reduction of the ferric oxide could start.

3898. FRUMKIN, A. N. **Adsorption of organic substances and electrode processes.** *Doklady Akad. Nauk S.S.S.R.* **85**, 373-6 (1952).—*C.A.* **46**, 10956*i*.

Adsorption of org. substances on electrodes was classified: (1) The electrode process, in the absence of an adsorbed layer, was detd. by the rate of the reaction not by the supply of the reactant, e.g. the discharge of H^+ ions. (2) The reaction in the absence of an adsorbed layer was fast enough for the chem. polarization to be negligible in comparison with the concn. polarization. (3) The adsorbed layer could, by inhibiting the tangential motion, affect the current intensity without altering significantly the rate of the reaction itself. (4) The adsorbed layer opposed the penetration of the reaction particles to the electrode.

3899. GRAHAME, D. C.; POTH, M. A., AND CUMMINGS, J. I. **The differential capacity of the electrical double layer The role of the anion.** *J. Am. Chem. Soc.* **74**, 4422-5 (1952).—*C.A.* 47, 28*b*.

There was a strong correlation between the shape of the capacity curves and the soly. of the corresponding Hg(I) salts. Anion pairs which exhibited the same general soly. relations (NO_3^- ClO_4^-, CO_3^{--}, OH^-) also showed similar capacity curves. The results were used to calc. the surface charge d. of the elec. double layer.

3900. GREGORY, J. N.; HILL, J. F., AND MOORBATH, S. **Diffusion of thoron in solids. III. Diffusion and recoil in multimolecular films of barium stearate by emanating-power measurements.** *Trans. Faraday Soc.* **48**, 643-51 (1952).—*C.A.* **47**, 977*c*.

Films of Ba stearate on Pt slides, contg. 1 or 2 layers of equil. Rd-Th, Th X, were investigated as a function of temp. and thickness of the layer. The multilayer thickness at which the recoil fraction of the emanating power diminished to zero was a direct measurement of the recoil range of Th from Th X.

3901. HILLSON, P. J. **Adsorption and hydrogen over-voltage.** *J. chim. phys.* **49**, C88-96; *Trans. Faraday Soc.* **48**, 462-73 (1952).—*C.A.* **46**, 4933*i*.

The strength with which surface-active agents were adsorbed on metallic electrodes on which H_2 was being evolved was studied by the effect which they had upon overvoltage and the capacity of the electrodes. The adsorbates studied were hexyl alc., caproic acid, hexylamine hydrochloride, and *p*-toluenesulfonic acid. The electrode metals were Ni, W, Ag, Ta, and Au. The metals differed considerably in their behaviors toward the adsorbed materials. These differences were correlated with the energy of adsorption of H_2 and O_2 on the metals.

3902. IOFA, Z. A.; LYAKHOVETSKAYA, E. I., AND SHORIFOV, K. **Influence of halide ions on the adsorption of organic cations on the surface of iron.** *Doklady Akad. Nauk S.S.S.R.* **84**, 543-6 (1952).—*C.A.* **46**, 9378*c*.

At small polarizations, $[(iso\text{-}Am)_4N]_2SO_4$ in pure 1 *N* H_2SO_4 had almost no effect on either the cathodic or the anodic polarization of pure Fe; at higher polarization, with increasing adsorption of the org. compd., the overvoltage of H discharge increased. On addn. of 1 *N* HCl, the surface charge of the Fe became more neg., the $(iso\text{-}Am)_4N^+$ ions were more easily adsorbed and, as a consequence, the cathodic and anodic reactions were considerably slowed down. This point of view was borne out by direct detns. of the adsorption of $(PhCH_2)_3N$ in 1 *N* H_2SO_4 on Fe powder prepd. by decompn. of $Fe(CO)_5$ and reduced in H_2 at 350-400°C. The surface area of the Fe powder was at least 0.4×10^4 cm^2/g.

3903. ITO, GORŌ. **Effects of surface conditions of aluminum on its corrosion.** *Repts. Sci. Research Inst.* (Japan) **28**, 220-4 (1952).—*C.A.* 47, 4271*e*.

Com. pure Al plates 1 mm thick (annealed 30 min. at 400°C) were polished with emery paper or electrolytically, and the p.d. between each treated Al plate and a 1 *N* standard colomel cell in 3% NaCl detd. The various increases observed of the p.d. with time (sec) after different treatments were attributed to the presence or formation of Al_2O_3 surface films, between which (through fissures) and the metal surface some polarization seemed to have occurred.

3904. KOBOZEV, N. I. **The adsorption theory of hydrogen overvoltage. I. Overvoltage and the energy of the bond Me—H. II. Desorption of hydrogen from polarized cathodes.** *Zhur. Fiz. Khim.* 26, 112-34; 438-50 (1952).—*C.A.* 47, 4766h.

H_2 taken up by cathodes such as Hg (high overvoltage) left these chiefly by emission of H atoms from metal hydrides. Chem. recombination of H atoms was probably only when the degree of coverage of the metal surface by H atoms was great.

3905. KOVALENKO, P. N. AND BAGDASAROV, K. N. **Electrode polarization in the electrolysis of copper in the oxalate buffer solution.** *Zhur. Fiz. Khim.* 26, 605-10 (1952).—*C.A.* 47, 3722*f*.

The polarization *E* during cathodic deposition of Cu on a Pt grid was different from that on dropping Hg. The large *E* on Pt must have been due to retarded crystn. of Cu. The stability consts. of $[Cu(C_2O_4)_2]^{2-}$ and $[Cu(C_2O_4)_3]^{3-}$ were approx. 8×10^{-8} and 12×10^{-10}.

3906. LOSHKAREV, M. A. AND KRYUKOVA, A. A. **Effect of adsorbed films on the discharge of univalent metals on mercury.** *Zhur. Fiz. Khim.* **26**, 731-6 (1952).—*C.A.* 47, 3722*i*.

$(PhCH_2)_3N$ and $(Bu_4N)_2SO_4$ 0.005 *M*) greatly lowered the limiting current of Tl^+ (from 0.05 *N* Tl_2SO_4 + 6 *N* H_2SO_4) and Ag^+ (from 0.025 *N* Ag_2SO_4 + 6 *N* H_2SO_4) at 25°C and −15°C; at −15°C also, camphor slightly lowered the current. $PhNH_2$ (0.5 *M*) also retarded discharge of Ag^+ on dropping Hg.

3907. LOVELAND, J. WEST AND ELVING, PHILIP J. **Application of the cathode-ray oscilloscope to polarographic phenomena. I. Differential capacity of the electrical double layer.** *J. Phys. Chem.* 56, 250-5 (1952).—*C.A.* 46, 7904b.
The change in capacity effects were shown for the adsorption and desorption of octyl alcohol in 0.5 *M* Na_2SO_4 soln. at a dropping-Hg electrode.

3908. LOVELAND, J. WEST AND ELVING, PHILIP J. **Application of the cathode-ray oscilloscope to polarographic phenomena. III. Potentials of adsorption-desorption capacity peaks and surface charge density relationships exhibited by alcohols at aqueous saline solution-mercury interfaces.** *J. Phys. Chem.* 56, 935-41 (1952).—*C.A.* 47, 2058*b*.
Differential capacity oscillograms for the satd. solns. of octyl and heptyl alcs. showed 4 capacity peaks on each of the cathodic and anodic sweeps rather than the expected 2 peaks, indicating double-film formation. A satd. soln. of amyl alc. gave only 2 adsorption-desorption capacity peaks in each trace, indicating the formation of a mono-film layer. The lower the mol. wt of the alc., the greater was the potential span between capacity peaks for the satd. solns. Adsorption processes depended directly on the surface charge existing at the Hg surface.

3909. LOVELAND, J. WEST AND ELVING, PHILIP J. **Application of the cathode-ray oscilloscope to polarographic phenomena. IV. Peak and minimum capacities of adsorption-desorption processes exhibited by alcohols at aqueous saline solution-mercury interfaces.** *J. Phys. Chem.* 56, 941-5 (1952).—*C.A.* 47, 2058*d*.
The capacities of the adsorption and desorption peaks assocd. with film formation for satd. and supersatd. solns. of amyl, hexyl, heptyl, and octyl alcs. were measured from differential capacity oscillograms. The adsorption-desorption processes taking place at low applied neg. potentials gave rise to capacities about twice as great as those at more neg. potentials. Desorption processes were found generally to give higher capacities than adsorption processes, especially with alcs. of higher mol. wt.

3910. LOVELAND, J. WEST AND ELVING, PHILIP J. **Application of the cathode-ray oscilloscope to polarographic phenomena. V. Influence of frequency, concentration, and structure of alcohols on film formation at aqueous saline solution-mercury interfaces.** *J. Phys. Chem.* 56, 945-8 (1952).—*C.A.* 47, 2058*f*.
The resistance of an alc. film layer at the potential of the most neg. capacity peak varied inversely with the square of the voltage-sweep frequency. The variation of peak capacities with voltage-sweep rates provided a procedure for detg. relative rates of adsorption and desorption of film layers at a Hg-aq. soln. interface. The potential differences between the capacity peaks for the 8 isomeric amyl alcs. decreased, going from the tertiary to the secondary to the primary alcs.

3911. MACNEVIN, WM. M. AND LEVITSKY, MICHAEL. **Reproducible platinized platinum electrodes for anodic polarography.** *Anal. Chem.* 24, 973-5 (1952).—*C.A.* 46, 8539*d*.
A Pt microelectrode coated with electrolytically deposited Pt gave appreciably more current in anodic polarography than did one of uncoated Pt. Reproducible currents were obtained with successively prepd. electrodes when prepd. by a specified procedure. Pt black had much greater current response than a bright deposit (obtained from spectroscopically pure chloroplatinic acid). Salts of Zn, Ni, Cd, and Fe had no marked effect while those of Pb, Hg^{2+}, and Cu were especially effective in producing Pt black.

3912. MAŠEK, JIŘÍ. **Polarographic reduction of inorganic anions containing oxygen. II. Mechanism of discontinuity.** *Chem. Listy* 46, 385-9 (1952).—*C.A.* 46, 10959*b*,
A mechanism of discontinuous reduction of O-contg. inorg. anions, was checked by oscillographic curves expressing the dependence of the current on time. At a certain distance from the electrode, adsorption of multivalent cations led to the formation of a max. inhomogeneity of the elec. field into which deformed anions were drawn because of interference in reduction.

3913. MATYÁŠ, MILOŠ. **Adsorption of some aliphatic alcohols on the dropping-mercury electrode.** *Chem. Listy* 46, 65-8 (1952).—*C.A.* 46, 10957*f*.
MeOH and EtOH were not adsorbed on the dropping-Hg electrode; they shifted the half-wave potentials of Cd and Pb to pos. values and decreased their diffusion currents. BuOH, iso-BuOH, AmOH, iso-AmOH, and octanol were adsorbed on the electrode; they did not affect the diffusion currents and shifted the half-wave potentials of bivalent metals (Cd and Pb) to more neg. values.

3914. MELIK-GAĬKAZYAN, V. I. **The kinetics of adsorption of surface-active substances on the mercury electrode.** *Zhur. Fiz. Khim.* 26, 560-80 (1952).—*C.A.* 47, 5817*d*.
The double layer was established in less than 1 microsec. Data of capacitance and resistance in electrolyte solns. contg. various alcs. (Bu, amyl, hexyl, octyl) showed that the slow step of the adsorption of these org. mols. was their diffusion to the electrode surface. A slow adsorption step was clearly ruled out.

3915. MELIK-GAĬKAZYAN, V. I. **Formation of multilayers at the mercury-solution interface and its effect on the differential capacity of the double layer.** *Zhur. Fiz. Khim.* 26, 1184-90 (1952).—*C.A.* 47, 5817*f*.
The effect was studied by measurements of differential capacity of the double layer. In solns. (CsCl, KCl, LiCl, HCl, $AlCl_3$, $BaCl_2$, $MgCl_2$ and KCl + $La_2(SO_4)_3$) addn. of octyl alc. in concns. not less than 1/2 that corresponding to satn. (10^{-3} *M*)

was accompanied by multilayer formation at potentials near the null potential of the Hg electrode.

3916. MERKER, R. L. AND ZISMAN, W. A. **Competitive adsorption from solution between hydrophobic and hydrophilic molecules and ions.** *J. Phys. Chem.* 56, 399-404 (1952).—*C.A.* 46, 7399*b*.

Studies of the adsorption of water-sol. amines and their ions in aq. soln. of various pH values showed that hydrophobic films on Pt were primarily due to the pickup of free amine in the more alk. regions of the pH scale. In the less alk. regions hydrophobicity was due to the adsorption of amine ion. Similarly, in the case of water-sol. carboxylic acids, the hydrophobic films in the more acid regions were due to undissocd. acid mols.

3917. NESTEROVA, V. I. AND FRUMKIN, A. N. **The platinum electrode. IX. Adsorption of oxygen by platinized platinum at its contact with molecular oxygen and at anodic polarization.** *Zhur. Fiz. Khim.* 26, 1178-83 (1952).—*C.A.* 47, 3727*d*.

A platinized Pt sheet was satd. with H_2 in a soln. which was removed. The wet sheet was kept in O_2 for t days and then immersed in N H_2SO_4, after which it was cathodically polarized. The change in potential ϕ of the electrode with the amt. of electricity supplied was slow in 2 potential regions (0.9-0.8 and 0.3-0.1v., resp., relative to N H_2 electrode) and rapid at other ϕ. When dry sheets of platinized Pt were kept in O_2 at a high temp. for 1 hr, the uptake of O_2 increased to 200°C; the smaller uptake at 300°C was not, and the negligible uptake at 400°C was assocd. with a decrease in electrode surface; this decrease was due to recrystn. rather than to dissoln. of Pt. The adsorbed amt. of O_2 was less than a monolayer.

3918. OBRUCHEVA, A. D. **The platinum electrode. X. Study of the adsorption of oxygen by smooth platinum by the electrochemical method.** *Zhur. Fiz. Khim.* 26, 1448-57 (1952).—*C.A.* 47, 4766*e*.

A Pt wire was anodically polarized in N H_2SO_4 for several hrs and then cathodically polarized; the potential of this cathode first decreased, then remained almost stationary and then decreased again. The ratio of the equiv. of O_2 taken up during anodic to H_2 taken up during cathodic polarization was 0.1 for heavily platinized Pt contg. 0.06 g Pt black on 1 cm^2, 0.23 for 0.001 g/cm^2, and 0.55 for smooth Pt. Both O_2 and H_2 penetrated into smooth Pt and only slowly reappeared on the surface.

3919. PALACIOS, J. AND BAPTISTA, A. **The adsorption of cations by metals demonstrated with radioactive tracers.** *Compt. rend.* 234, 1676-7 (1952).—*C.A.* 46, 10775*f*.

Pieces of metals were placed in 0.27 M $ZnSO_4$ solns. rich in Zn^{65} tracer. Analysis of the metals after immersion from 14 to 45 hrs indicated that Ag adsorbed the most Zn, and in decreasing order, Fe, Cu, Au, Pt, and Pd. Autoradiographs of Al foil in the $ZnSO_4$ soln. showed that the Zn adsorbed was isolated in a no. of small domains over the surface of the foil.

3920. PERMITINA, N. G. AND SHLYGIN, A. I. **Relation between adsorptive and catalytic stages in the hydrogenation process in the presence of a liquid phase.** *Zhur. Fiz. Khim.* 26, 956-9 (1952).—*C.A.* 47, 3677*f*.

A platinized-Pt electrode was immersed in 0.1 N H_2SO_4 or KOH and satd. with H_2; then EtMeC(OH)C⋮CH was added, and the vessel was shaken for an hr. The hydrogenation was a zero-order reaction, and its rate was in H_2SO_4 3 times as great as in KOH.

3921. PERRY, E. J. AND WINKLER, C. A. **The reaction between silver and triphenylmethyl chloride.** *Can. J. Chem.* 30, 235-44 (1952).—*C.A.* 46, 6914*a*.

Initially, the reaction in toluene was very fast and in accordance with a logarithmic growth law both at 65.4° and 44.9°C; at 44.9°, however, long before the crit. film thickness of 1.6×10^{-6} cm was reached, there occurred a very sudden decrease in the rate of reaction at a well defined and quite reproducible film thickness of 80A. In MeCN the over-all rate was considerably faster than in toluene and the crit. film thickness occured at a temp. about 40°C below that in toluene.

3922. PICCARDI, GIORGIO AND FERRONI, ENZO. **The action of water on copper.** *Ann. chim.* (Rome) 42, 607-9 (1952).—*C.A.* 47, 3082*d*.

Not only did multidistd. water dissolve Cu, but the reaction depended on the phys. state of the Cu in the soln. When multidistd. water was brought briefly in contact with a well-scoured capsule of Cu, and then used to prep. colloidal Au, the soln. turned the characteristic ruby red; this showed that some Cu was present in ionic form.

3923. POUND, GUY M. AND LAMER, VICTOR K. **Kinetics of crystalline-nucleus formation in supercooled liquid tin.** *J. Am. Chem. Soc.* 74, 2323-32 (1952).—*C.A.* 46, 8480*f*.

Oxide-coated droplets of molten Sn of a narrow size range were supercooled at 120°C below their m.p. of 232°C. The droplets were of the order of magnitude of 5 μ in diam., and the specimens each consisted of several g of about 10^{10} of these droplets. Rate of nucleation of crystals in the supercooled liquid droplets was measured dilatometrically as a function of temp. and droplet size. The solidification rate increased rapidly with decrease in temp. and increased in droplet size.

3924. RANDLES, J. E. B. **Kinetics of rapid electrode reactions. II. Rate constants and activation energies of electrode reactions.** *Trans. Faraday Soc.* 48, 828-32 (1952).—*C.A.* 47, 3723*i*.

The rate const. of the oxidation-reduction reaction at an inert electrode was defined in terms of the magnitude of the exchange current at the electrode when it was in equil. with equal concns. of the reduced and oxidized components. The energy of activation calcd. from the temp. dependence of this rate const. was shown to correspond to that potential of the electrode which made the energy barrier of the reaction sym.

3925. Randles, J. E. B. and Somerton, K. W. **Kinetics of rapid electrode reactions. IV. Metal-ion-exchange reaction at amalgam electrodes.** *Trans. Faraday Soc.* **48**, 951-5 (1952).—*C.A.* 47, 6280*b*.

The rate consts. k and heats of activation ΔH were investigated for the dil. metal amalgam and aq. metal ion reactions: Tl^+, Cd^{2+}, Pb^{2+} in M KNO_3; Zn^{2+} in either M KNO_3, KCl, KBr, KCNS, KI; Cu^{2+} in M KNO_3; $CuEn_2^{2+}$in En-HClEn; $Cu(NH_3)_2^+$ in NH_4Cl-NH_3; Bi^{3+} in M $HClO_4$ or HCl; Na^+, K^+, Cs^+ in M NMe_4OH. A dil. amalgam dropping electrode was used to obtain a reproducible and uniform electrode surface.

3926. Schiessl, S. v. **Thickness of oil films on metallic surfaces.** *Kolloid-Z.* **129**, 84-91 (1952).—*C.A.* 47, 5761*f*.

An interferometric method was described to det. the thickness as a function of time, when vertical sepn. of 2 plates under a given force took place. From hydrodynamics an equation was derived contg. the initial distance h_0. Agreement between theory and expt. was good for various oils of different chem. constitution.

3927. Shafrin, Elaine G. and Zisman, Wm. A. **The spreading of liquids on low-energy surfaces. IV. Monolayer coatings on platinum.** *J. Colloid Sci.* **7**, 166-77 (1952).—*C.A.* 46, 7399*i*.

Contact-angle measurements were made on oleophobic, hydrophobic films formed by immersing freshly flamed Pt surfaces in $C_{16}H_{34}$ solns. of $C_{18}H_{37}NH_2$. A linear relation was found between cos θ and the surface tension of homologous series of liquids. The free surface energy of the coated Pt was probably not much more than 28.5 ergs./cm². Glass coated with long-chain amine had similar, but not identical, spreading behavior.

3928. Simnad, Massoud T. **Radioisotopes in the study of metal surface reactions in solutions.** *Symposium on Properties of Metallic Surfaces* (Inst. Metals, London) **1952**, 23-58.—*C.A.* 47, 2610*d*.

The chief characteristics of radioisotopes, their advantages and limitations in tracer work, and the effect of radiation on matter were discussed. The passivating action of chromates was studied with the aid of tagged chromate ions in soln. Self diffusion and isotopic exchange in surface films and aq. solns. were discussed in view of their important part in governing the behavior of metals in soln.

3929. Sutra, Geneviève. **Hydrogen overvoltage.** *J. Chim. phys.* **49**, C66-9 (1952).—*C.A.* 46, 4934*e*.

A new mechanism of H overvoltage was presented in which H^+ was adsorbed on the surface of the cathode and the proton penetrated inside the cathode. When the metal was satd., evolution of gaseous H occurred

3930. Tödt, Fritz. **The measurement of the cathodic reduction of oxygen by appropriate model elements.** *Z. Elektrochem.* **56**, 165-9 (1952).—*C.A.* 46, 8540*e*.

The capacity of O microelements with cathodes of Pt or Au and Cd anodes was measured in 1% NaCl soln. of pH 8-8.5 with c.ds. of 6 and 1.5×10^{-8} amp./cm², resp. Films of less than a monoat. layer at a given depolarization current did not change much to a higher resistance in the outer circuit.

3931. Tödt, Fritz; Kahan, S., and Schwarz, W. **Influence of the diffusion layer on the electrochemical determination of oxygen and the oxide layers of metals.** *Z. Elektrochem.* **56**, 19-23 (1952).—*C.A.* 46, 9451*f*.

The quantity of current in coulombs/cm² betwee an aerated Pt cathode and an Al anode sepd. by a diaphragm was measured and the drop in c.d. with time recorded and plotted. A 0.1% NaCl soln. brought to a pH of 8-9 with 0.01 N NaOH was the electrolyte. Measurements were made in an O_2-rich and an O_2-poor soln., both with and without stirring.

3932. Trivedi, A. K. M. and Patani, M. J. **Hydration of colloidal arsenic sulfide.** *J. Indian Chem. Soc.* **29**, 747-50 (1952).—*C.A.* 47, 5216*g*.

When As_2S_3 was coagulated by a low concn. of NaCl, the coagulum was hydrated, but most of the stabilizing ion appeared in the supernatant liquid, and the coagulum was irreversible.

3933. Vetter, Klaus J. **The active state and the spontaneous repassivation of current-activated iron in nitric acid.** *Z. Elektrochem.* **56**, 106-15 (1952).—*C.A.* 46, 7850*i*.

Exptl. results obtained previously by an oscillographic method on the activation of Fe in HNO_3 by passage of current, and the subsequent spontaneous repassivation, were discussed.

3934. Vetter, Klaus J. and Booss, Hans Jürgen. **The protective layer on freshly passivated iron and its relationship to the refractoriness of this iron.** *Z. Elektrochem.* **56**, 16-19 (1952).—*C.A.* 46, 9042*g*.

The Fe content and reducing properties of the black protective coating on passive Fe showed it to be Fe_3C, left behind by the soln. of Fe. It dissolved slowly in HNO_3, reaching a value of 3-25 γ Fe/cm² per 5 min. after 30 min. with the formation of Fe^{3+}, CO_2, and HNO_2 which was detd. from the HNO_3/HNO_2 oxidation-reduction potential on Pt. The layer did not cause the passivity; the slowly falling refractoriness was caused by the steady formation of HNO_2.

3935. Wicke, E. and Weblus, B. **Capacity of polarization, adsorption, and overvoltage on platinum.** *Z. Elektrochem.* **56**, 169-76 (1952).—*C.A.* 46, 8540*f*.

The capacity of polarization measured with a.c. gave a figure for the adsorption of H_2 at the electrode. Its dependence upon the compn. of the electrolyte was investigated with N HCl, N NaCl + 0.1 N HCl, and N $AlCl_3$ + 0.1 N HCl. No influence of the additive cation was observed. The results showed that the slow discharge of the H ions at the surface of the Pt cathode was responsible for the overvoltage.

3936. Yanagisawa, Masaaki. **Surface diffusion and electro-surface diffusion of mercury on tin foils.** *Ôyô Butsuri* (J. Applied Phys.) **21**, 18-20 (1952).—*C.A.* 46, 10779*a*.

The rate of growth of amalgam layer on Sn foils, etched and nonetched with dil. HCl, was measured at 12-95°C. The activation energies of the surface diffusion of Hg were calcd. as 5180 cal and 3540 cal for etched and nonetched surface, resp.

3937. BERG. T. G. OWE. **Passivity of iron.** *Z. Metallkunde* **44**, 82 (1953).—*C.A.* 47, 5334*f*.
The behavior of a metal in the activation region influenced its passivity. Measurements of soln. rate of Cu and Fe in HNO_3 with and without agitation were mentioned.

3938. BONHOEFFER, KARL FRIEDRICH. **Passivity of iron.** *Z. Metallkunde* **44**, 77-81 (1953).—*C.A.* 47, 5334*e*.
Anodic treatment with H_2SO_4 with varying c.ds. yields min. passivation, depending on agitation. True passivation c.ds. and potential were detd. One must distinguish the true passivating c.d. (17 amp./cm^2 in $1N$ H_2SO_4) from the 1 min. passivation maintaining c.d. of 7 amp./sq. cm. which was the equiv. c.d. for the corrosion of passive Fe in this acid. HNO_2 was furnished by the initial Fe going into soln. The presence of differing amts. of HNO_2 was responsible for the differences in behavior of aged or freshly passivated Fe.

3939. BRYSON, ALEXANDER AND LOWY, S. LENZER. **Separation of zinc and cadmium by the use of activated copper.** *Analyst* **78**, 299-303 (1953).—*C.A.* 47, 6891*c*.
Cu powder was prepd. from CuO by heating in H_2. Cool and grind in a mortar. To a soln. contg. not over 0.5 g of Cd + Zn add Na_2CO_3 till a permanent ppt. formed, add KCN in an amt. 10 times the wt of Cu + Cd, 10 g of K Na tartrate, and dil, to 100 ml. Heat nearly to boiling, and add Cu powder in small portions. Continue until added Cu remained red for several min. In this way Cd was pptd. and Zn stayed in soln.

3940. HACKERMAN, NORMAN AND POWERS, R. A. **Surface reactions of chromium in dilute $Cr^{51}O_4^{--}$ solutions.** *J. Phys. Chem.* **57**, 139-42 (1953).—*C.A.* 47, 7288*e*.
The adsorption of chromate, dichromate, and hydrogen chromate ions on a Cr surface was detd. as a function of ion concn. and pH. The anions were tagged with radiochromium-51. Max. adsorption corresponded to a monolayer. Hydroxyl, sulfate, and chloride ions reduced adsorption. Adsorbed anion could be removed only by boiling in concd. HNO_3.

3941. KIKUCHI, MINORU AND KANEKO, NORIMASA. **Metal coloring by electrodeposition of a thin film. I.** *J. Electrochem. Soc. Japan* **21**, 17-20 (1953).—*C.A.* 47, 6796*g*
When a soln. composed of Cu tartrate (0.1-0.2*M*) and NaOH (1-2*M*) was electrolyzed with a C anode and Cu (or brass, Au, or Pt) cathode at 25° the cathode plate was colored by a coating of a thin film on the surface of the plate.

3942. TÖDT, F. AND MEYER, W. **Potentials on platinized platinum with cathodic charging with special consideration of the reversible hydrogen electrode.** *Z. Elektrochem.* 57, 29-33 (1953).—*C.A.* 47, 6279*f*.
By using platinized Pt as cathode totally immersed in electrolyte (dil. HCl, NaOH, or buffers), a const, potential was reached in a few min. With increasing c.d. the potential became more neg., because of increasing alky. around the cathode. The no. of coulombs necessary for removing O adsorbed by exposure of the electrode to air was detd. The surface became nearly satd. in 5 min. and completely so in 1 hr. A platinized Pt surface took up 100 times as much O_2 as bright Pt.

3943. WAHLIN, H. B. AND NAUMANN, VIRGIL O. **The transmission of hydrogen through palladium by electrolysis.** *J. Appl. Phys.* **24**, 42-4 (1953).—*C.A.* 47, 3726*a*.
Whenever a metal was made the cathode in a dil. H_2SO_4 bath, the transmission of H_2 could be observed by means of its reaction with atm. O_2. A more detailed study of the transmission through Pd showed that the area of the surface at which the H_2 left was the principal controlling factor.

II-8. Ionic Exchange, Principally in Columns

3944. BHATNAGAR, S. S.; KAPUR, A. N., AND BHATNAGAR, MAHENDRA SARUP. **Adsorptive properties of synthetic resins. III.** *J. Indian Chem. Soc.* **16**, 261-8 (1939).—*C.A.* 34, 301^2.
Adsorption of acids by acid-catalyzed phenol-formaldehyde resin or by acid-catalyzed resorcinol-formaldehyde resin increased in the order: HCOOH, CH_3COOH, butyric acid. With NH_3-catalyzed phenol-formaldehyde resin, NH_3-catalyzed resorcinol-formaldehyde resin, or *m*-phenylenediamine-formaldehyde resin, the above order was reversed. Refluxing (NH_3-catalyzed resorcinol-formaldehyde resin) with HCl did not change the order of adsorption of acids from that of the untreated resin.

3945. SAMUELSON, OLOF. **Use of base-exchanging substances in analytical chemistry. II.** *Svensk. Kem. Tid.* **51**, 195-206 (1939).—*C.A.* 34, 1271^2.
With the aid of 3.2 g of the organolite (a sulfonic acid) it was possible to remove all Al^{+++} from a soln. contg. a little more than 2 milliequiv. of $Al_2(SO_4)_3$, and H^+ ions replaced the Al^{+++} in the soln. The H^+ equiv. to the SO_4^{--} could then be titrated with NaOH to a methyl red end point. The organolite could be regenerated by washing with 200 ml of 2 N HCl followed by pure water. With about 5 g of organolite which was satd. with NH_4^+ ions, it was possible completely to remove a little over 2 milliequiv. of K^+, and the anions were left in the filtrate.

3946. COHN, WALDO E. **The anion-exchange separation of ribonucleotides.** *J. Am. Chem. Soc.* **72**, 1471-8 (1940).—*C.A.* 44, 5954*a*.
The nucleotides of ribonucleic acid were sepd. from each other and from the corresponding free bases and ribosides by successive elution from strong base anion exchangers with weak acids and buffers of controlled pH and anion concn. The expts. utilized principally 200-400 mesh Dowex-1,

a strong base anion exchanger; Dowex 2 and Amberlite IRA-400 were also employed with similar results.

3947. SAMUELSON, OLOF. **Base-exchanging substances in analytical chemistry. IV.** *Svensk. Kem. Tid.* **52**, 241-7 (1940).—*C.A.* **35**, 1340⁷.

Known $FeCl_3$ and $Al_2(SO_4)_3$ were added to $CaHPO_4$ in *N* HCl. These solns. were passed through a layer of H-satd. sulfonic acid organolite. The Fe and Al were completely held back, quantitatively sepg. them from HPO_4^{--}. The Fe and Al were then washed out of the organolite with dil. HCl. The recoveries were very good. Minerals contg. Ca, Fe, Al and P were analyzed with this sepn.

3948. SCHWARTZ, M. C.; EDWARDS, W. R., JR., AND BOUDREAUX, GRACE. **Removal of chlorides and sulfates by synthetic resins.** *Ind. Eng. Chem.* **32**, 1462-66 (1940).

A synthetic organic resin was prepared from *m*-phenylenediamine, fromaldehyde, and HCl. A variety of aq. solns. containing either Cl^- or SO_4^{--} were treated and the effect of the various factors detd. in removing the solutes. The process appeared to be one in which whole mols. were removed, and ion exchange was of very minor proportions if it occurred at all.

3949. ELVING, PHILLIP J.; DANZIG, MEYER H., AND BACHMAN, G. BRYANT. **Synthetic resins and base-exchange phenomena.** *Proc. Indiana Acad. Sci.* **51**, 136-45 (1941) (Pub. 1942).—*C.A.* **37**, 198⁴.

A review of the general field.

3950. KOT, A. A. **Causes of a decrease in the exchange capacity of glauconite.** *Teplosilovoe Khoz.* **1941**, No. 1, 31-3.—*C.A.* **37**, 4507⁸.

As a result of insufficient utilization of a water-purification plant the glauconite was coated with $Al(OH)_3$ and org. substances. Washing with 0.5% NaOH restored the exchange capacity.

3951. PROKHOROV, F. G. AND YANKOVSKIĬ, K. A. **Experimental studies and the results of a year's operation of the first H cation-exchange plant.** *Teplosilovoe Khoz.* **1941**, No. 3, 8-12.—*C.A.* **37**, 6779⁴.

The industrial H cation-exchange plant for the softening of water with a total hardness of 12-14° and a carbonate hardness of 11-13° (chloride content 7 mg/liter) was equipped with filters having a bituminol lining 4-5 mm thick as a protection against corrosion. After a year's operation the outer layers of this coating had run off as a result of the filters standing unused for long periods at a relatively high temp. (in summer up to 35-50°C). Sulfurated lignite was used as a softening agent. It was shown to be a good H and Na ion-exchange material and as satisfactory as glauconite.

3952. PROKHOROV, F. G. AND YANKOVSKIĬ, K. A. **Results and six months' operating experience with the hydrogen-cation exchange installation at the Dulevo factory.** *Izvest. Vsesoyuz. Teplotekh. Inst. im. Feliksa Dserzhinskogo* **14**, No. 1, 3-9 (1941).—*C.A.* **38**, 3401⁵.

The cation-exchange material was prepd. by treating lignite with 18-20% oleum. Washing with H_2O removed the excess acid, dust and coal particles less than 0.2 mm. Under the same conditions, the filter resistance was less, the softening action practically the same, and the exchange capacity 2.5-3 times as great as with a glauconite filter. Best results were obtained by regeneration with a mixt. of NaCl and HCl.

3953. SAMUELSON, OLOF. **The dynamic equilibrium in filters of ion-exchanging substances.** *Svensk. Kem. Tid.* **53**, 422-34 (1941).—*C.A.* **38**, 3889⁷.

An equation contg. an empirical const. was derived; it agreed well with the exptl. results. The thickness of the filter layer, the velocity of filtration and the concn. of the soln. were varied in expts. with a sulfonic acid organolite derived from a synthetic resin. A considerable sepn. of the cations of a soln. could be achieved by filtering through an organolite filter.

3954. SAMUELSON, OLOF. **Use of base-exchange material in analytical chemistry.** *Svensk. Kem. Tid.* **54**, 124-34 (1942).—*C.A.* **38**, 2896⁶.

A sulfonic acid organolite was used of which the com. product was powd. and treated with 25% HCl to remove Fe. The detn. of SO_4^{--} in solns. contg. Na, K, Ca, Al, Fe or Cr was explained after passage through a filter of organolite satd. with H_2. Phosphate analyses could be carried out by this method. Various metal ions could be sepd. after preliminary formation of complexes, e.g., Fe and Al with HPO_3.

3955. WIESENBERGER, E. **Organic base exchange in microchemical analysis.** *Mikrochemie ver. Mikrochim. Acta* **30**, 176-80 (1942).—*C.A.* **37**, 4654⁹.

Artificial resins (such as Wofatit-K) should stand in water overnight to make them swell. Place them in 7% HCl soln. for about 30 min. and wash with water until no more acid can be detected with methyl red in the washings. Samples of 5-7 mg of KCl, $NaClO_3$, K_2SO_4, KNO_3, $FeSO_4.(NH_4)_2SO_4.6H_2O$, $ZnSO_4.7H_2O$, $NiSO_4.7H_2O$, $MgSO_4.7H_2O$, and $CuSO_4.5H_2O$ were analyzed. The salt and moist Wofatit were stirred and filtered through a tube with fritted glass filter at the bottom into a quartz flask. Wash with gentle suction and about 20 ml of water added in 1-ml portions. The filtrate would contain H^+ equiv. to the displaced cations and also equiv. to the anions present.

3956. WILBRANDT, W. **Kinetics of ion exchange through selectively permeable membranes.** *Arch. ges. Physiol. (Pflügers)* **246**, 274-90 (1942).—*C.A.* **38**, 4850⁴.

Ion exchange depended not only upon the concn. product of the ions but also upon electrostatic conditions. The dependence of the rate of exchange and of the two gradients upon ionic concn. and mobility was derived for varying ratios of the two ionic mobilities. For very large values of this ratio the potential reached, at the membrane, a value equal to the Donnan potential. If the valence nos. of the ions were different, the above three quantities become a function of the valence ratio.

3957. DOLIQUE, R. AND MACABET, L. **Some natural and synthetic zeolites. I. Preliminary determinations: physical tests and chemical analyses.** *Bull. soc. chim.* **10**, 72-9 (1943).—*C.A.* **38**, 2542[8].

A standard method was sought for comparing the power of exchange of Na ⇄ Ca by some natural and synthetic zeolites. The phys. tests were: granulometric analysis, true and apparent d., resistance to crushing, dehydration, rehydration, and porosity. Most of the samples corresponded to the known zeolite formula $n\mathrm{SiO_2.Al_2O_3.Na_2O}.x\mathrm{OH}$, the Al being substituted in some by Fe, and Na by Ca.

3958. DOLIQUE, R. AND MACABET, L. **Some natural and synthetic zeolites. II. Exchange sodium ⇄ calcium by the so-called constant-volume method.** *Bull. soc. chim.* **10**, 80-8 (1943).—*C.A.* **38**, 2543[3].

The exchange $Z.\mathrm{Na_2} + \mathrm{CaCl_2} \rightleftarrows Z.\mathrm{Ca} + 2\mathrm{NaCl}$ (Z = silico-aluminic block) was studied. A const.-vol. method was used in which Na-zeolite was reacted with a known vol. of 0.1 *N* or 0.01 *N* $\mathrm{CaCl_2}$ soln., detg. at regular intervals the Ca remaining in soln. The operation was continued until equil. The velocity of decalcification was $dx/dt = K_0 - K_2x + Kx^2 - K'x^3$, and the four coeffs. K_0, K_1, K and K' were calcd. from the exptl. data. The exchange was affected more by the porosity than by the hardness, and, in general, the velocity of exchange decreased with increasing porosity.

3959. DOLIQUE, R. AND MACABET, L. **Some natural and synthetic zeolites. III. Exchange sodium ⇄ calcium by the variable-volume method.** *Bull. soc. chim.* **10**, 88-98 (1943).—*C.A.* **38**, 2543[7].

A known $\mathrm{CaCl_2}$ soln. was passed over a known wt of zeolite. The liquid was collected at the outlet of the app. until Ca began to pass. The total vol. of soln. purified was noted. The zeolite was washed with distd. H_2O and a concd. NaCl soln. circulated to restore its exchangeable Ca ions. The same decalcification was repeated, but the flow was continued until the Ca content of the soln. was the same at the inlet as at the outlet. The vol. passed through was noted. A graph showing the Ca contents of the solns. leaving the app. as ordinates and the vols. passed through at const. velocity as abscissas allowed easy detection of a good and poor zeolite.

3960. GOEHRING, MARGOT AND DARGE, ILSE. **Determination of sulfate in the presence of interfering cations.** *Z. anal. Chem.* **125**, 180-4 (1943).—*C.A.* **37**, 3016[3].

Ca, Fe and Cr interfered with the formation of pure $\mathrm{BaSO_4}$. If, however, the soln. was first filtered through a synthetic resin (e.g., Wolfatit) the interfering ions were removed and in the filtrate the sulfate could be pptd. with $\mathrm{Ba^{++}}$ successfully.

3961. KEMMER, F. AND THOMPSON, J. **Acid-regenerated zeolites.** *Power Plant Eng.* 47, No. 6, 82-5 (1943).—*C.A.* **37**, 5527[8].

The exchange capacity and various acidities of carbonaceous zeolites were described. Tables showing exchange capacity made it possible, knowing the original raw water, to predict precisely the exchange values and characteristics.

3962. NILLSON, NILS. **Organic ion-exchangers and their use.** *Tek. Tid.* 73, K91-8 (1943).—*C.A.* **39**, 3970[1].

A brief review of the production, testing, and field of use of artificial resins having base-exchange properties.

3963. RUSSELL, R. G. AND PEARCE, D. W. **Fractionation of the rare earths by zeolite action.** *J. Am. Chem. Soc.* **65**, 595-600 (1943).—*C.A.* **37**, 3363[4].

No cation was encountered of which the valence or the size was so large that it was unable to enter into base-exchange reactions. Fractional sepns. within the rare earth group were obtained by means of zeolite action when concd. solns., contg. sufficient ions to exceed the capacity of the exchange material, were used. The rare earth ions of decreasing (crystal) ionic radius were held more firmly in the zeolite lattice, while the larger ions were held less firmly. By regeneration of the base-exchange material the rare earth ions could also be removed in a fractional manner, the largest (most loosely held) ions being removed first.

3964. SAMUELSON, OLOF. **Fractionation of sulfite waste liquor.** *Svensk Papperstidn.* 46, 583-6 (1943) (German and English summaries).—*C.A.* **38**, 2487[6].

The adsorption of the acids of sulfite waste liquor was studied by the use of an org. cation exchanger (organolite) with an artificial resin base. When a no. of pure acids of low mol. wt were compared, it was found that the amt. of acid held by the exchanger increased as the mol. wt of the acids decreased. If the acids liberated from sulfite waste liquor were passed through a filter of such an organolite which was satd. with $\mathrm{HO^-}$, the greater part of the lignosulfonic acid would pass through it. The acids adsorbed had a low MeO and S content and consisted largely of carboxylic acids.

3965. TRAUTZ, MAX AND NIENHAUS, HEINRICH. **Exchange capacities, vapor-pressure isotherms and heats of wetting of some technical $\mathrm{H^+}$ exchangers.** *J. prakt. Chem.* **162**, 181-217 (1943).—*C.A.* **38**, 2544[1].

An exchanger was defined as a solid colloidal absorbent of large surface area which in contact with solns. rapidly established the following equil.: $SA + LB = SB + LA$, where S was the adsorbent, L the soln., and A and B were ion types. The general mode of investigation of exchangers was outlined and then applied specifically to 3 exchangers: $\mathrm{H^+}$ Dusarite, $\mathrm{H^+}$B200, and $\mathrm{H^+}$C200. Photomicrographs showed that the particles ranged from 0.4 to 0.9 mm in size, and consisted of charcoal and some other gleaming brittle granules. True d. (s) of the samples were detd. in a H_2O-filled pycnometer.

3966. WALTON, H. F. **Equilibria in a carbonaceous cation exchanger.** *J. Phys. Chem.* 47, 371-82 (1943).—*C.A.* **37**, 5298[9].

Partition relations were studied for H, Na, K, Ca and Ba ions between H_2O and Zeo-Karb, a $\mathrm{H_2SO_4}$-treated coal. For any pair of cations, the distribution of the ions could be explained by assuming the exchanger to consist of 2 or more solid acids of different dissocn. const. The greatest deviation from the law of mass action was in the case of Ca and H ions.

3967. FRIZZELL, LAURENCE D. **Quantitative separations with an exchange adsorber.** *Ind. Eng. Chem., Anal. Ed.* **16**, 615-16 (1944).—*C.A.* **39**, 35^7.

"Zeo-Karb" was efficient in sepg. cations from anions in solns. of $FeCl_3$, $CuSO_4$, $Na_2C_2O_4$, $NH_4H_2PO_4$ and $Ca(BO_2)_2$. For a quant. sepn. the total ion concn. should have been low and the pH about 4. The procedure applied to 0.1 *N* solns. of $K_2Cr_2O_7$, $KBrO_3$ and KIO_3 resulted in a reduction of the cations. The I^- in 0.1 *N* KI was oxidized to free I_2.

3968. GUSTAVSON, K. H. **Determination by means of organolites of complex formation in basic chromium (III) salts.** *Svensk Kem. Tid.* **56**, 14-23 (1944).—*C.A.* **39**, 4557^8.

The aq. soln., contg. up to 0.1 milliequiv. of Cr per cc., was filtered through a cation-binding organolite ("Wofatit KS and K" and "Wofatit M") to remove the complex cations; the complex anions were removed analogously and the uncharged complexes were left in the soln. The bound complexes could be eluted with 10% NaCl soln., or preferably with 3-6 *N* HCl, and analyzed. The 1st filtrate contained H^+ equiv. to the adsorbed cations. In the 2nd filtrate the complexly bound acid residues and Cr were detd.

3969. KLEMENT, ROBERT. **Separation of orthophosphoric acid by means of the ion-exchange resins. I. Wofatit.** *Z. anal. Chem.* **127**, 2-5 (1944).—*C.A.* **39**, 475^6.

Wofatit M was useful for removing H_3PO_4 from solns. contg. no trivalent cation. Wofatit KS was valuable in removing H_3PO_4 from solns., but allowing all other ions to pass through. The H_3PO_4 could be removed from the resin by washing the column with HCl.

3970. MAGISTAD, O. C.; FIREMAN, MILTON, AND MABRY, BETTY. **Comparison of base-exchange equations founded on the law of mass action.** *Soil Sci.* **57**, 371-9 (1944).—*C.A.* **38**, 6457^6.

Suspensions of Ca-satd. Fallbrook sandy loam in in equil. with solns. contg. NaCl or NH_4Cl were studied with regard to the accuracy of fit of the observed data with that obtained by the application of various base-exchange equations founded on the law of mass action. The effect of Na percentage of soln., of varying vol. and diln., of varying amt. of soil, of soln. concn. and diln., and of temp. were reported.

3971. MUELLER, EDWARD R. **Resinous ion exchange applications.** *Paper Trade J.* **119**, No. 12, 30-3 (1944).—*C.A.* **38**, 6443^9.

A brief comparison of the ion-exchange action of zeolites and of resins, with a brief discussion of the applications of the latter.

3972. NACHOD, F. C. AND SUSSMAN, SIDNEY. **Removal of electrolytes from solutions by ion exchange.** *J. Chem. Education* **21**, 56-8 (1944).—*C.A.* **38**, 1936^2.

The chemistry of the demineralization process by means of cation and anion exchangers was reviewed.

3973. NACHOD, F. C. AND WOOD, W. **The reaction velocity of ion exchange.** *J. Am. Chem. Soc.* **66**, 1380-4 (1944).—*C.A.* **38**, 5130^7.

The reaction rate was detd. by following the rate with which ions from soln. were removed by the solid ion exchanger, or conversely, the rate with which exchangeable ions were released from the exchange material into the soln. The reactions were second-order bimol. reactions; the values could be calcd. by using concns. instead of activities. The rate of anion exchange or acid absorption was very much slower than the rate of the cation-exchange reactions; this suggested a different reaction mechanism for this class of exchangers.

3974. NELSON, RAYMOND AND WALTON, HAROLD F. **Cation exchange at high pH.** *J. Phys. Chem.* **48**, 406-10 (1944).—*C.A.* **39**, 1001^8.

Measurements were made on the uptake of K ions by Zeo-Karb from solns. of pH 3.8 to 12.5. As with Ca, almost linear increase of uptake with pH was found. It indicated that Zeo-Karb contained weak acidic groups with dissocn. const. of the order of 10^{-13}. Measurements on the uptake of Ni, Cu and Zn from ammoniacal salt solns. indicated that Cu was absorbed principally as $Cu(NH_3)_2^{++}$, Ni as $Ni(NH_3)_4^{++}$ and Zn as a complex or complexes of intermediate compn

3975. RYZNAR, JOHN W. **Preparation and purification of hydrous oxide sols. by ion exchangers.** *Ind. Eng. Chem.* **36**, 821-3 (1944).—*C.A.* **38**, 5711^6.

Inorg. anion exchangers were metallic oxides, whereas the org. were synthetic resins of the *m*-phenylenediamine-CH_2O type as well as other resins of amine-aldehyde condensation type. A substantially electrolyte-free silicic acid sol. was prepd. by passing a Na silicate soln. through an acid-regenerated cation-exchange material. When anion exchangers were utilized, metals forming insol. hydrous oxides could be used to form the corresponding oxide sols. A sol. formed outside of the exchange bed could be purified by passing through an acid-regenerated cation- and then through an alkali-regenerated anion-exchange bed.

3976. SAMUELSON, OLOF. **Investigations of complex salt solutions with the use of organic ion exchangers. I.** *Svensk Kem. Tid.* **56**, 277-81 (1944).—*C.A.* **40**, 3358^6.

The combination of Na hexametaphosphate with Fe^{+++} was carried out with varying amts. of suitably prepd. 0.1 *N* $NaPO_3$, which were mixed with 1 cc. of 0.1 mol. of $FeNH_4(SO_4)_2$ soln., and the mixt. was passed through a column of tech. synthetic-resin sulfonic acid ion exchanger 12 mm in diam. and 200 mm high. The "cation soln." obtained was heated for 30 min. almost to boiling temp. and the Fe then detd. When the $NaPO_3$ soln. was replaced by NaCl soln., the Fe was adsorbed quantitatively.

3977. SHOEMAKER, M. J. **Dealkalizing by a two-zone hydrogen zeolite system.** *Proc. Ann. Water Conf., Eng. Soc. Western Penna.* **5**, 1-9 (1944).—*C.A.* **39**, 5374^9.

A water of uniform alky. was obtained from 2 H-zeolite exchangers operated in series. Only the first exchanger was regenerated with acid. The second unit served as a H-ion accumulator, taking up acid liberated by the first unit during the first part of its cycle, and completing dealkalization when the first unit was partially exhausted.

3978. THOMAS, HENRY C. **Heterogeneous ion exchange in a flowing system.** *J. Am. Chem. Soc.* **66**, 1664-6 (1944).—*C.A.* **38**, 6177[9].

A math. description was given of the performance of a cation-exchange column for the case in which the rate of the exchange was detd. by a second-order law. The effect of the reverse reaction was included without approximation.

3979. BOUTSERIN-GALLAND, ANDREE (MME.). **Phenomena of ion exchange and simultaneous adsorption by free humic acid or humic acid associated with an inorganic support.** *Bull. soc. chim.* **12**, 116-20 (1945).—*C.A.* **40**, 7457[5].

The ion-exchange powers of 2 widely different lignite samples and of humic acid prepd. from one of them were compared by treatment with $CaCl_2$ solns. The removal of impurities, so that samples with very low ash were obtained, often resulted in greatly enhanced ion-exchange properties. A method of prepg. very pure humic acid from lignite was described.

3980. BURTON, D. AND LEE, G. **Determination of the acid and salt content of vegetable-tanning extracts and liquors-the error caused by excessive dilution.** *J. Intern. Soc. Leather Trades Chem.* **29**, 204-9 (1945).—*C.A.* **40**, 2332[9]

Total salt could be detd. by measuring increase in acidity after passing the soln. through a base-removing resin. The analytical soln. (filtered) was used. Tests with 15 g quebracho-formaldehyde resin and with Zeocarb H1 (0.5 to 1 mm diam.) showed that not over one milliequiv. of salt in 200 ml could be passed through the resin before regeneration.

3981. CARSON, J. F., JR. AND MACLAY, W. D. **1,4-Anhydro-DL-xylitol.** *J. Am. Chem. Soc.* **67**, 1808-10 (1945).—*C.A.* **40**, 64[7].

Xylitol (80 g) and 0.8 g $PhSO_3H$ were heated at 155-60°C in N_2 for 45 min., the dark viscous liquid in 400 ml H_2O passed through Amberlite IR-4 to remove the $PhSO_3H$, and the 61 g of the dry sirup distd. at 0.01 mm in a short-path still. The yield of 1,4-anhydro-DL-xylitol, *m* 37-8°C, n_D^{25} 1.4977, d_4^{25} 1.354 (the sirup crystd. after standing 1 yr) was 65%.

3982. DAVIS, LANNES E. **Theories of base-exchange equilibriums.** *Soil Sci.* **59**, 379-95 (1945).—*C.A.* **39**, 5159[6].

The Donnan equil. between colloidal suspensions contg. salts of 2 cations and filtrates obtained from such suspensions was discussed. On theoretical grounds, mass-action-law equations for the Donnan equil. should have yielded equil. values that were const. solely when the variables were activities. The Donnan systems involved true equilibriums between 2 phases, the prepn. of which involved a base exchange.

3983. DAVIS, LANNES E. **Kinetic theory of ionic exchange for ions of unequal charge.** *J. Phys. Chem.* **49**, 473-9 (1945).—*C.A.* **40**, 2370[9].

The oscillation vol. theory of Jenny was discussed and extended to the case of ions of unequal charge, and a simple approx. equation was derived. The oscillation vol. theory implied that ionic exchange was a complex ionic redistribution in the colloidal suspension.

3984. HOLMES, E. LEIGHTON. **Some properties of organic ion-exchanger materials.** *J. Soc. Dyers Colourists* **61**, 39-40 (1945).—*C.A.* **39**, 2168[1].

Cation-exchangers could be regarded as either insol. salts or acids: in either case the H or metallic portion of the complex mol. was mobile and replaceable. The anion-exchangers could be regarded as insol. bases, and their basicity was entirely dependent upon the presence of basic N groupings. Developments in anion-exchangers had centered around the prepn. of resins of increased basic strength. Materials, other than synthetic resins, put forward as anion-exchangers comprised insol. dyestuffs, proteins, and dry metallic oxido gels.

3985. KOZAK, R. AND WALTON, H. F. **Separation of metal ions by cation exchange.** *J. Phys. Chem.* **49**, 471-2 (1945).—*C.A.* **40**, 2371[2].

An attempt was made to sep. Cu and Ni, Cd and Zn, and Ag and Cu ions by cation exchange. Zeo-Karb (a sulfonated coal) did not give quant. sepn., but it was improved by increasing the length of the column from 2 to 6 ft. The method was deemed less practical than chem. sepn.

3986. NACHOD, F. C. AND WOOD, W. **The reaction velocity of ion exchange. II.** *J. Am. Chem. Soc.* **68**, 629-31 (1945).—*C.A.* **39**, 2245[1]

If the cation was kept const. and the anion varied in a series of H^+-ion exchange expts., the rate of approach of equil. exchange was the same, but the values obtained with salts of weak acids were very much larger as contrasted with strong acid salts. The cation-exchange capacity increased as a function of the charge of the cation; however, the univalent ions exchanged with faster rate than the bivalent ions. The variation of rate consts. among the cations was generally what would be expected from their respective diffusion rates. Diffusion alone was not the rate-detg. factor but other effects, such as ionic size, charge, and steric availability of the exchange position in the exchanger played a decided role.

3987. RUNNEBERG, GÖRAN AND SAMUELSON, OLOF. **Ion-exchange substances in analytical chemistry. VII. Determining alkalies in the presence of phosphate ions.** *Svensk Kem. Tid.* **57**, 91-5 (1945).—*C.A.* **40**, 2416[8].

The exchange material was ground to pass 0.5 mm diam. and layered in 14 mm diam. and 100 to 150 mm depth, then satd. with H^+ ions by passing HCl through it. The method was tested with solns. of 0.1 *N* Na^+, K^+, Li^+, and 0.4 *N* $HPO_4^=$. After one of these solns. had percolated through the column, the filter layer was treated with 55 cc. 5 *N* HCl and 100 or more cc. distd. H_2O. The recovery of alkalies was very good.

3988. RUNNEBERG, GÖRAN. **Ion-exchange substances in analytical chemistry. VIII. Determining potassium in the presence of sulfates.** *Svensk Kem. Tid.* **57**, 114-7 (1945).—*C.A.* **40**, 2416[9].

Solns. containing K which could not be readily analyzed for K_2O on account of the presence of

SO_4^{--}, were sepd. by the org. ion exchanger. The samples were passed through 120 mm layers of org. ion exchanger to remove the K_2O. Then the column was washed with 100 cc. 5 *N* HCl and 100 cc. distd. H_2O, the resulting KCl soln. was evapd. to dryness, dried at 130°C, dissolved in H_2O and titrated with stand. $AgNO_3$ soln.

3989. Runneberg, Göran and Samuelson, Olof. **Ion-exchange substances in analytical chemistry. X. Determination of alkali in the presence of chromate, molybdate, tungstate, phosphomolybdate, phosphotungstate, and silicotungstate.** *Svensk Kem. Tid.* **57**, 250-4 (1945).—*C.A.* **40**, 2417^6

Na^+, and K^+ salts of these anions could not be sepd. and detd. by the H^+ satd. org. ion exchanger. The solns. were then satd. with NH_4^+ ions and passed through the column. NH_4OH was passed through until it came through alk. and then the column was washed with H_2O. The above anions passed through the exchanger layer completely free of all Na and K ions and the Na^+ and K^+ were recovered by treating the exchanger with 5 *N* HCl.

3990. Samuelson, Olof. **Ion-exchange substances in analytical chemistry. IX. Experiments with solutions containing nitrates and perchlorates.** *Svensk Kem. Tid.* **57**, 158-68 (1945).—*C.A.* **40**, 2417^2.

Salts of HPO_4^{--}, NO_2^-, ClO_4^- and Li^+, Na^+, K^+, NH_4^+, Mg^{++}, Ca^{++}, Sr^{++}, Ba^{++}, Zn^{++}, Mn^{++}, Co^{++}, Ni^{++}, Al^{+++}, Fe^{+++}, Cr^{+++} were passed through the org. ion exchanger. In general, 0.5 g of the sample was dissolved in 50 cc.H_2O and passed through a 130 mm layer of the exchanger followed by 200 cc. distd. H_2O. The anion was calcd. from the titration. 50 cc. 5 *N* HCl was then put through the column, followed by 100 cc. H_2O. Acid and water were evapd. to dryness, and the residue dried and weighed; it was taken up in 50 cc. H_2O passed through a H^+ satd. cation exchanger, washed as before and treated with HCl in the same way and titrated to give the cation. The results were within 0.4% of the truth. CN complex compds. $K_3Fe(CN)_6$, $K_4Fe(CN)_6$, $K_3Cr(CN)_6$, $K_3Co(CN)_6$, $K_4Mo(CN)_8 2H_2O$, $K_4W(CN)_8 \cdot 2H_2O$ were also investigated.

3991. Samuelson, Olof. **Determination of the total lime content of sulfite cooking acid (tower or raw acid).** *Svensk Papperstidn.* **48**, 55-6 (1945).—*C.A.* **39**, 3157^7.

A method was described for detg. the total CaO content in sulfite cooking acid. The SO_2 was first replaced by HCl. The free acid in the resulting soln. was titrated with NaOH. The metal cations were then exchanged against H ions, and the acids thus liberated were again titrated with the 2 titrations. The analysis might have been carried out in 20 to 30 min., and the error was less than 0.5%.

3992. Sussman, Sidney and Mindler, Albert B. **Ion exchange. Old process finds new uses.** *Chem. Industries* **56**, 789-95 (1945).—*C.A.* **39**, 2833^5.

3993. Sussman, Sidney; Nachod, Frederick C., and Wood, Wm. **Metal recovery by anion exchange.** *Ind. Eng. Chem.* **37**, 618-24 (1945).—*C.A.* **39**, 3502^9.

The metals studied comprised exchange and recovery of Cr, V, Mo, Fe, Pt, Pd, and Au. Expts. comprised both dynamic (tube) and static (equil.) types. Cr recovery was studied most extensively. The chromate removal by the chloride and sulfate salts of the anion exchanger was about the same, i.e., 3.09 and 3.05 milliequiv. per g of exchanger resin. Recovery of the Cr with alk. regenerants, such as NH_4OH, averaged 80-90%.

3994. Applezweig, Norman. **Semimicro ion-exchange column.** *Ind. Eng. Chem., Anal. Ed.* **18**, 82 (1946).—*C.A.* **40**, 1066^9.

The column was a 9-mm condenser tube carrying a 3-way stopcock and an overflow tube.

3995. Bauman, W. C. **Improved synthetic ion-exchange resin.** *Ind. Eng. Chem.* **38**, 46-50 (1946).—*C.A.* **40**, 971^9.

An improved nuclear sulfonic-type resin formed by condensing *o*- and *p*-phenolsulfonic acids with CH_2O was produced. Its exchange capacity (32,000 grains $CaCO_3$ per ft^3) was higher than previously known cation-exchange materials in both sodium and acid cycles. The resin was stable and without color throw over a wide range of pH up to 100°C and showed excellent stability to rapid changes in salt concn.

3996. Bishop, John A. **Covalent adsorption on base-exchange resins. I. Adsorption of monobasic acids.** *J. Phys. Chem.* **50**, 6-12 (1946).—*C.A.* **40**, 2711^3.

The adsorption on Amberlite IR-3 of AcOH, $CH_2ClCOOH$, $CHCl_2COOH$, HCl, $(COOH)_2$, and tartaric acid was studied. The adsorption might have been correlated by regarding the process as one of salt formation. In concd. solns. direct adsorption of unionized mols. may have produced greater adsorption than was predicted from the equation and the ionization consts. of the acids.

3997. Eastmond, E. John. **Spectrographic determination of calcium in microbiological culture media.** *J. Opt. Soc. Am.* **36**, 57-60 (1946).—*C.A.* **40**, 1556^5.

The chief problem was to prep. standards. This was solved by removal of Ca from the actual medium by use of a cation-exchange column of Amberlite IR-100 operated in a K cycle.

3998. Fedorova, G. V. **Use of sulfocoal [sulfonated coal] for analytical purposes.** *Izvest. VTI (Vseoyuz. Teplotekh. Inst. im. Feliksa Dzerzhinskogo)* **15**, No. 2, 28-9 (1946).—*C.A.* **40**, 5509^6.

A base-exchange reaction was used to det. Cl^- and $SO_4^=$ in natural and feed waters using sulfonated, ash-free coal (30-40 g) in a buret over a layer of quartz.

3999. Gapon, E. N. **Ion exchange between solid and liquid phases. III.** *J. Phys. Chem. (U.S.S.R.)* **20**, 297-302 (1946).—*C.A.* **40**, 5616^6.

It was assumed that the surface charge of an adsorbent was detd. by the potential and capacity of the elec. double layer and that this potential was detd. only by the activity of the alkali (for cation adsorption) or acid (for anion adsorption) whereas the capacity depended on the activity of all electrolytes in the soln.

4000. Gustavson, K. H. **Investigation of complex formation in chromium salts by means of organolites (a preliminary summary).** *J. Intern. Soc. Leather Trades Chem.* **30**, 264-79 (1946).—*C.A.* **41**, 877*c*.

Wofatit KS (1g) treated with excess 67% acid Cr sulfate (free from neutral salts) absorbed 0.158 g Cr_2O_3. By treatment of Wofatit KS with excess NaCl its cationic exchange power was detd. to be 2.01 mg equiv. per g. The calcd. equiv. wt of Cr fixed was 79, corresponding to one pos. charge per atom Cr or $Cr_2(OH)_2SO_4^{++}$. Acid-treated organolites were prefered to Na organolites except when the Cr complex was acid-sensitive, e.g., sulfito-chromates. NaCl did not displace Cr completely from the organolite but HCl did.

4001. Gustavson, K. H. **Investigation of complex formation in chromic salts by the organolite method. IV. The formation of hydroxochlorochromic chlorides.** *Svensk Kem. Tid.* **58**, 274-6 (1946).—*C.A.* **41**, 7790*i*.

A 66% acid $CrCl_3$ free from neutral NaCl was prepd. from pure hydrous Cr_2O_3 and HCl. A part of this was aged 4 weeks, then treated with given amts. NaCl, warmed to 98°C for 5 min., and aged 4 weeks. These solns. were passed through columns of Wofatit KS. The samples to which no NaCl was added had 330 milliequiv./liter Cr and 218 Cl and the one having 2 *M* NaCl contained 330 and 2200 milliequiv./liter, resp.

4002. Jaag, Ed. **Research with base-exchange material.** *Textil-Rundschau* **1**, 99-105 (1946).—*C.A.* **41**, 6003*b*.

The exchange capacity of base-exchange materials was detd. The quantity of water softened was taken as a measure of the exchange capacity of the material under test. Graphs reported showed that the hardness increased very rapidly as soon as it was no longer 0. Tests were run on a no. of com. materials, including natural and artificial zeolites, artificial resins, and materials having an activated-C-base. The values used were a mean of those obtained after the 3rd and 4th regenerations. In general, the artifical resin materials showed very good exchange capacity and the artificial zeolites good capacity, while the materials having an activated charcoal base were intermediate between these two.

4003. Kaganov, I. N. **Ion exchangers.** *Sakharnaya Prom.* **19**, No. 3, 20-1 (1946).—*C.A.* **41**, 2825*b*.

The prepn. and functioning of natural and synthetic, org. and inorg., base and acid exchangers were reviewed briefly.

4004. Lindner, R. **Separation of rare earths by radiometric adsorption analysis.** *Naturwissenschaften* **33**, 369-70 (1946).—*C.A.* **43**, 6101*b*.

La could be readily sepd. from Pr; in a mixt. of equal parts, 49% of the La was recovered in pure form. La, being more basic, was adsorbed least. Elements from Ce to Sm showed some irregularities. Ce could readily be sepd. from La and Pr. The differences in adsorption of Pr, Nd, and element 61 were very little. Sm showed unusual adsorption, stronger even than Y. Element 61 was easily sepd. from Sm.

4005. Myers, Robert J. **Synthetic-resin ion exchangers.** *Advances in Colloid Science* **I**, 317-51 (1946).

This review was divided as follows: (1) Types of ion-exchange resins; (2) nature of exchange by synthetic resins; (3) methods of examination of synthetic-resin ion exchangers; (4) chemical properties in static systems; (5) chemical properties in dynamic systems; (6) applications of synthetic-resin ion exchangers.

4006. Ryznar, John W. **A new method of preparation and purification of some hydrous oxide sols.** *Colloid Chemistry* **6**, 1113-17 (1946).—*C.A.* **40**, 2595^2.

Pure and stable silica sols. could be obtained by passing Na silicate through an acid-regenerated exchange bed. Ferric hydroxide sol. could be freed from Cl^- by passage through an alkali-regenerated anion exchanger. Combinations of cation and anion exchangers were also used.

4007. Samuelson, Olof. **Investigations of complex salt solutions with the use of organic exchangers. III. Investigations of bivalent zinc, nickel, cobalt and copper chloride solutions.** *Iva* **17**, 17-22 (1946).—*C.A.* **40**, 6360^9

Expts. were carried out with a synthetic-resin sulfonic acid ion exchanger on *N* solns. of Ca, Zn, Ni, Co, and Cu chlorides. In no case was Cl^- adsorbed. After equil. was reached the exchanger was washed with distd. water until free of Cl^-, treated with 5 *N* HCl, the soln. evapd., and the residue fumed with H_2SO_4. The residue from this treatment was dissolved in H_2O, and sulfate detd. by the ion-exchanger method, with titration with 0.1 *N* NaOH. The exchange capacity was the same for all ions investigated. Conclusions on the effect of different types of complexes on the adsorption of chlorides could be drawn only if the complexes were very stable.

4008. Samuelson, Olof. **The use of ion-exchange materials in analytical chemistry. XI.** *Iva* 17, 5-9 (1946).—*C.A.* 40, 5657^9.

The detn. of various anions by an ion-exchange method was studied by percolating solns. of bromides, iodides, chlorates, bromates, and iodates through a layer of an org. H^+ exchanger. BrO_3^- and IO_3^- were reduced, but it was possible to exchange the cation for H^+ in the other cases. The concn. of the anions could be detd. by titration of the H^+ with NaOH. Cr^{+++} salts could be sepd. even in hot solns.

4009. Samuelson, Olof. **The use of ion-exchange substances in analytical chemistry. XII. Cadmium salts.** *Svensk Kem. Tid.* **58**, 247-51 (1946).—*C.A.* **41**, 1571*h*.

Cd^{++} was quantitatively sepd. from the anions Cl, Br, I, NO_3 ClO_4 AcO, C_2O_4, SO_4, and HPO_4 by passing neutral solns. through a 160-mm layer of H^+ satd. Wofatit KS in 0.2-0.4-mm granules. The rate of filtration was more significant than the concn. of Cd^{++} A satisfactory technique consisted of drawing a 50-cc. soln., neutralized to methyl red, through the filter layer in about 10 min.

4010. Sillén, Lars Gunnar and Ekedahl, Erik. **Filtration through a sorbent layer. II. Experiments with an ion exchanger; theory, apparatus, and preliminary results.** *Arkiv. Kemi, Mineral. Geol.* **A22**, No. 16, 12 pp. (1946).—*C.A.* 41, 4682*d*.

The actual performance of a cation exchanger was compared with that predicted from theoretical considerations. The system investigated was: $Ag^+(soln.) + H^+(adsorbed) \rightleftarrows Ag^+(adsorbed) + H^+(soln.)$. The thoroughly washed sorbent (a sulfonated org. material) in a glass filter funnel was first brought to equil. with HNO_3 of the desired concn. Then $AgNO_3$ soln. was passed through the exchanger at a measured const. rate. The e.m.f. (E_c) of a pair of Ag-AgI electrodes, one immersed in the influent soln., the other in the effluent soln., was detd. as a measure of the ratio a_o/a of the concns. of Ag^+ in influent soln. and effluent soln.

4011. Tiger, H. L.; Sussman, S.; Lane, M., and Calise, V. J. **Desalting sea water—a practical chemical method.** *Ind. Eng. Chem.* **38**, 1130-7 (1946).—*C.A.* 41, 237*f*.

Desalting briquets contained Ag zeolite and Ag_2O which removed Na, Ca, Mg, and Cl. Sulfate reduction, where required, was accomplished with $Ba(OH)_2 8H_2O$. The briquets also contained activated charcoal to remove taste (arising from the plasticizer in the Vinylite resin desalting bag), stearic acid to act as an internal lubricant for the briquetting process, and bentonite clay to disrupt the briquet when in contact with sea water. Six briquets, packed with Vinylite desalting bag which included a filter, occupied the space of 0.7 pint of H_2O, and produced 6 pints of drinkable H_2O.

4012. Walton, H. F. **Ion exchange.** *J. Chem. Education* **23**, 454-8 (1946).—*C.A.* 40, 6904^7.

Ion-exchange phenomena were described, together with various applications and lecture demonstrations.

4013. Ackermann, A. **Measurement of the efficiency of ion exchangers.** *Bull. soc. chim. France* **1947**, 619-25.—*C.A.* 42, 2490*g*.

A 0.01 *N* chloride soln. was passed at 10-10.5 cc./min. through 20 g of a sulfated carbon exchanger (27.4 cc. in a tube 3.9 $cm^2 \times 81$ mm high) and the cation exchanged for H. The amt. of soln. passed to the break point (when cation appeared in filtrate) was 134, 130, 124, 87, 78, and 91 cc./g of exchanger for Ba, Ca, Mg, K, Na, and NH_4, resp.

4014. Ayres, John A. **Purification of zirconium by ion-exchange columns.** *J. Am. Chem. Soc.* **69**, 2879-81 (1947).—*C.A.* 42, 1522*c*.

The cation exchanger was Amberlite IR-100 and the anion exchanger Amerlite IR-4. When solns. contg. 10 g $ZrO(NO_3)_2$ were poured through the H-form of Amberlite IR-100 (5-6 ml/min.) 98% of the Zr remained in the effluent. With the Na-form of the resin, 99% of the Zr passed through. The capacity of the resin for Zr was 0.00084 mole/100 cc. of resin. $Fe(NO_3)_3.9H_2O$ (2 g) in 200 ml of the Zr stock soln. was passed through the column. Essentially all the Zr passed through; about 98% of the iron was absorbed. A similar expt. was carried out for mixt. of Ti and Zr. Essentially all the Zr passed through whereas about 5/6 of the Ti was absorbed. Be was completely removed by the ion-exchange resin.

4015. Barzakovskiĭ, V. P. **Ion exchange on solid organic substances.** *Prirsoda* **36**, No. 5, 47-51 (1947).—*C.A.* 42, 1679*e*.

4016. Bauman, W. C. and Eichhorn, J. **Fundamental properties of a synthetic cation-exchange resin.** *J. Am. Chem. Soc.* **69**, 2830-6 (1947).—*C.A.* **42**, 1366*h*.

The analysis of Dowex 50 in the sodium form was C 26.8, H 7.0, S 8.9, Na 6, O (by difference) 51.3, and H_2O 41.4%. Glass electrode titration with 2 *N* NaOH showed 4.92 milliequivs. of exchangeable-H per g of oven-dried H resin. This accounted for 8.4% S, the other 0.5% presumably being present as sulfone cross links. The constitution of each spherical particle appeared to be that of a homogeneous gel, consisting of a basic hydrocarbon cross-linked skeleton which limited the linear motion of the SO_3^- anions.

4017. Bhatnagar, M. S. **Studies on organic adsorbents. II. Adsorption of acids and alkalies by resorcinol-formaldehyde resins.** *J. Sci. Ind. Research (India)* **6B**, No. 12, 185-8 (1947).—*C.A.* 44, 3332*g*.

The increase in adsorption of a homologous series of fatty acids in aq. solns. was proportional to the length of the hydrocarbon chain. The adsorption was true adsorption, and was decreased by the substitution of polar groups. The amt. of HCOOH adsorbed was twice that of $(COOH)_2$, and 3 times that of aconitic acid. In hydroxy- and nitroaromatic acids the adsorption increased with the increase in the value of group moments in the order: $COOH > Cl > OH > NO_2$; with substituted acids the order was $o < m < p$.

4018. Boyd, G. E; Schubert, J., and Adamson, A. W. **The exchange adsorption of ions from aqueous solutions by organic zeolites. I. Ion-exchange equilibria.** *J. Am. Chem. Soc.* **69**, 2818-29 (1947).—*C.A.* 42, 1780*g*.

In the simple case of the simultaneous competitive adsorption of two singly charged cations, A^+ and B^+, by an org. zeolite, by analogy with the Langmuir adsorption mechanism the equation for the adsorption of A^+ could be written: $(X/m)_{A^+} = kb_1 C_{A^+}/(1 + b_1C_{A^+} + b_2C_{B^+})$, where $(X/m)_{A^+}$ was the amt. of A^+ ion adsorbed per unit wt of adsorbent, C_{A^+} and C_{B^+} are the respective equil. concns. (activities) of A^+ and B^+ in soln., k, b_1, and b_2 were consts. In very small initial concns. of A^+, the complete adsorption of A^+ would not desorb enough B^+ to cause a detectable change in C_{B^+}. Hence, a $C_{A^+}/(X/m)_{A^+}$, C_{A^+} plot should have been linear. This was checked experimentally.

4019. Boyd, G. E.; Adamson, A. W., and Myers, L. S., Jr. **The exchange adsorption of ions from aqueous solutions by organic zeolites. II. Kinetics.** *J. Am. Chem. Soc.* **69**, 2836-48 (1947).—*C.A.* 42, 1781*g*.

In terms of the base-exchange reaction $A^+ + BR = AR + B^+$, where A^+ and B^+ were the exchanging monovalent cations. The over-all transport of mass was: (1) diffusion of A^+ through the soln. to the adsorbent particles; (2) diffusion of A^+ through the adsorbent particles; (3) chem. exchange between A^+ and BR at the exchanging positions in the interior of the particles; (4) diffusion of the displaced cation B^+ out of the interior of the exchanger; and (5) diffusion of the displaced cation B^+ through the soln. away from the adsorbent particles.

4020. BOYD, G. E.; MYERS, L. S., JR., AND ADAMSON, A. W. **The exchange adsorption of ions from aqueous solutions by organic zeolites. III. Performance of deep adsorbent beds under non-equilibrium conditions.** *J. Am. Chem. Soc.* **69**, 2849-59 (1947).—*C.A.* **42**, 1782*c*.

The exptl. work was done with Amberlite IR-1 as adsorbent. An exptl. method for the continuous recording of the concn. history of the effluent from a deep bed was developed with radio-isotope equipment and techniques. The concn. histories in various alkali metal exchange expts. had the same form as the curves predicted by theory over a wide range of relative concn. Good agreement was found between the values of the distribution coeff. A dependence of desorption rate of flow and on macrocomponent-ion concn. was indicated, and it was shown that it was possible to apply the transfer theory procedure to column desorption data.

4021. DJURFELDT, RALPH; HANSEN, JENNY, AND SAMUELSON, OLOF. **Ion-exchange substances in analytical chemistry. XIII. Acetates and oxalates.** *Svensk Kem. Tid.* **59**, 13-18 (1947).—*C.A.* **41**, 3009*b*.

Acetate and oxalate solns. were percolated through a layer of an org. cation exchanger. The following cations were quantitatively withheld when assocd. with the anions, CH_3COO^- and $C_2O_4^{--}$: Li, Na, K, NH_4, Mg, Ca, Ba, Sr, Zn, Mn, Co, Ni, Cd, and Cu. Fe, Al, and Pb were given in the CH_3COO^- list, but omitted under $C_2O_4^{--}$. Even small amts. of $C_2O_4^{--}$ afforded ample complex formation to vitiate this percolation as a quantitative method for Fe and Al. Al and Be were withheld 100%, but the Fe was exchanged completely only when 2 milliequivs. were not dild. to more than 500 cc. and this freshly made up.

4022. EIDINOFF, MAXWELL LEIGH. **Method for extending study of metal ion-cation exchanger isotope fractionation.** *J. Chem. Phys.* **15**, 527 (1947).—*C.A.* **41**, 6142*h*.

Isotope fractionation in cation-cation exchanger equil. could be studied more readily by the addn. of 5-50 microcuries of radioisotopes to the element. Some excellent pairs were $Be^{7,9}$, $Be^{9,10}$, $Na^{22,23}$, $Na^{23,24}$, $K^{39,41,42}$, $Ca^{40,41,45}$.

4023. EKEDAHL, ERIK AND SILLEN, LARS GUNNAR. **Filtration through a sorbent layer. III. Sorption experiments with an ion exchanger.** *Arkiv. Kemi, Mineral., Geol.* **25A**, No. 4, 26 pp (1947) (in English).—*C.A.* **42**, 7112*a*.

The reaction studied was the replacement of H^+ by Ag^+ with a com. sulfonic acid base cation exchanger. Results were automatically recorded.

4024. HARRIS, DARWIN H. AND TOMPKINS, EDWARD R. **Ion exchange as a separation method. II. Separations of several rare earths of the cerium group (lanthanum, cerium, praseodymium, and neodymium).** *J. Am. Chem. Soc.* **69**, 2792-2800 (1947).—*C.A.* **42**, 1835*g*.

Expts. with mixts. of Y and Ce showed that Dowex 50 was much superior to the Amberlite resins IR-1 and IR-100 for the sepn. of rare earths by the citrate-elution technique. With Dowex 50 it was possible to get essentially complete sepns. between several rare earths of the Ce group in a single adsorption-elution cycle. Pr was sepd. in trace and in bulk amts. from Ce. Ce was sepd. from La.

4025. HELRICH, KENNETH AND RIEMAN, WILLIAM III. **Determination of phosphorus in phosphate rock. Separation from cations by ion-exchange resin.** *Anal. Chem.* **19**, 651-2 (1947).—*C.A.* **41**, 6836*g*.

Phosphate rock digested with hot 12 *N* HCl gave a soln. contg. Ca^{+2}, H_3PO_4, and HCl. If the soln. was evapd. to dryness and baked at 100°C for an hr, any H_2SiO_3 would be dehydrated and probably some HF lost. If the residue was taken up in dil. HCl and filtered and then run through a column of ion-exchange resin, the Ca^{+2} and other cations would be deposited on the resin and the final effluent would contain merely HCl and H_3PO_4. The titration to pH 4.6 served to convert all HCl to NaCl and the H_3PO_4 to NaH_2PO_4. Subsequent titration to pH 9.0 converted the $H_2PO_4^-$ to HPO_4^{-2}.

4026. JOHNSON, WARREN C.; QUILL, LAURENCE L., AND DANIELS, FARRINGTON. **Rare earths separation developed on Manhattan Project.** *Chem. Eng. News* **25**, 2494 (1947).—*C.A.* **41**, 7305*b*.

The methods for sepg. the rare earths by adsorption on Amberlite resins were outlined chronologically. Credit for certain developments was assigned to individuals and groups.

4027. KETELLE, B. H. AND BOYD, G. E. **The exchange adsorption of ions from aqueous solutions by organic zeolites. IV. The separation of yttrium-group rare earths.** *J. Am. Chem. Soc.* **69**, 2800-12 (1947).—*C.A.* **42**, 1782*h*.

Radioisotopes were used, and the sepn. was followed by means of a counting cell. Various theoretical factors involved in the studies were surveyed. Studies were made under various conditions of temp. and pH with Amberlite IR-1 or Dowex-50 as the ion-exchange resin and the citrate elution technique. The fractionation of the heavy rare earths could be made so complete that the method was established as a promising procedure for the quant. analysis of rare earths for cationic impurities. A sample of Er_2O_3, previously exhaustively purified, in which all other rare earths were reported absent by spectrographic analysis, was shown to contain 10 p.p.m. of Tm by irradiation of the Er_2O_3 with neutrons and subsequent chromatographic sepn.

4028. KUNIN, ROBERT AND MYERS, ROBERT J. **Rates of anion exchange in ion-exchange resins.** *J. Phys. & Colloid Chem.* **51**, 1111-30 (1947).—*C.A.* **42**, 21*f*.

The rate-detg. step for the anion exchange was the rate of diffusion of the ions through the gel structure. The rate was shown to follow the parabolic diffusion law and to depend on the degree of satn. of the exchange resin as well as the concn. of ions. Furthermore, the energy of activation of the exchange reaction with HCl was 6600 cal, in good agreement with the activation energy for the diffusion of HCl in water. The effect of a neutral salt (NaCl) on the reaction rate of HCl was also in agreement with the diffusion theory.

4029. Kunin, Robert and Myers, Robert J. **The anion-exchange equilibria in an anion-exchange resin.** *J. Am. Chem. Soc.* **69**, 2874-8 (1947).—*C.A.* **42**, 3237c.

For the acid-adsorption cycle, the titration curves for the neutralization of HCl, H_2SO_4, HNO_3, H_3PO_4, $HC_2H_3O_2$, $H_2C_2O_4$, citric acid, HCOOH, benzoic acid, and salicylic acid by the hydroxyl form of Amberlite IR4B in water and in neutral salt solns. were detd. For the regeneration cycle, the titration curves were obtained for the reaction between the chloride and sulfate forms of the resin and solns. of NaOH, Na_2CO_3, $NaHCO_3$, and NH_4OH. Evidence was obtained that indicated that all 3 types of processes were true anion-exchange reactions.

4030. Lur'e, Yu Yu. **Organic exchange masses-organolites. Their use in analytical chemistry.** *Zavodskaya Lab.* **13**, 532-9 (1947).—*C.A.* **42**, 4484g.

Details were given for the prepn. of sulforesorcinol cationite, sulfophenol cationite, and methylated *m*-phenylenediamine resin. Ordinary peat was used as a cationite and was found to absorb about 11% by wt of Pb^{+2} from the effluent waters of Pb dressing plant.

4031. Lur'e, Yu Yu and Filippova, N. A. **Use of organolites in analytical chemistry. I.** *Zavodskaya Lab.* **13**, 539-47 (1947).—*C.A.* **42**, 4484h.

A dil. soln. of Ni, Co, and Cu salts could be enriched by means of cationites by about 40 times or more. The loss of metal in the total cycle of absorption and regeneration amounted to 1-2%. It was possible to use cationites for quant. sepn. of amphoteric metals from anions and nonamphoteric cations by absorbing them with cationite and then extg. with alkali solns. It was possible to sep. Sb, Mo, W, Zn, and Al from all the elements which formed basic hydroxides (Fe, Cu) and from As which remained with the other anions as an arsenite ion.

4032. Marinsky, J. A.; Glendenin, L. E., and Coryell, C. D. **The chemical identification of radioisotopes of neodymium and element 61.** *J. Am. Chem. Soc.* **69**, 2781-5 (1947).—*C.A.* **42**, 1811g.

A sample which contained essentially the Pr group (Pr, Nd, and 61) with very little Ce, Sm, Eu, and Y was isolated with about 15 mg of La carrier from a rare earth fission-product elution fraction. The rare earth activities were adsorbed on an Amerlite IR-1 column and eluted with a 5% soln. of NH_4 citrate at pH 2.75. Fractions of the eluate were collected. Four β-peaks and one γ-peak were found, the γ-peak being assocd. with the third β-peak. The first peak was identified as due to traces of 57-day Y^{61}. Considerable quantities of 61^{147} could be prepd. as the result of the industrial application of nuclear power.

4033. Mayer, Stanley W. and Tompkins, Edward R. **Ion exchange as a separation method. IV. A theoretical analysis of the column separation process.** *J. Am. Chem. Soc.* **69**, 2866-74 (1947).—*C.A.* **42**, 3237f.

A simple theoretical analysis of the ion-exchange column sepn. process based on the analogy of the ion-exchange sepn. column to the fractional-distn. or extn. column was developed for the case in which the distribution coeff. of the solute between the solid and liquid phases remained const. throughout the column. The theory was also applied to detn. of the purities of the rare earths sepd. by this process.

4034. Monroe, Watson H. **Rapid oxidation of glauconite in glauconitic sand.** *Bull. Am. Assoc. Petroleum Geol.* **31**, 1509-11 (1947).—*C.A.* **42**, 845f.

Samples of glauconite from greensand deposits of N.J. retained their characteristic green color and hardness after several years in storage. Glauconite from the Upper Cretaceos Eutaw formation of the Gulf Coastal Plain was softer and upon exposure to weathering oxidized rapidly to limonite.

4035. Oda, Ryohei and Shimizu, Hiroshi. **Studies on ion-exchange synthetic resins. I. Fundamental studies on the removal of salt from sea water. II. Optimum amount of resin and practical capacity.** *Chem. High Polymers* (Japan) 4, 135-8 (1947).—*C.A.* **45**, 2705i.

Fundamental studies were carried out with 0.5-0.6 *N* NaCl and HCl. Resin prepd. from natural rubber and H_2SO_4 was used as a cation exchanger A, and *m*-phenylenediamine-HCHO resin was used as an anion exchanger B. The optimum quantity corresponding to 25 cc. of sea-water was greater than 7 g for A and 5-6 g for B. Continuous shaking for 4 hrs was desirable.

4036. Oda, Ryohei; Shimizu, Hiroshi, and Nakayama, Yorhiro. **Mechanism of ionic exchange adsorption in ion-exchanging synthetic resins.** *Repts. Chem. Research Inst. Kyoto Univ.* **16**, 41 (1947).—*C.A.* **45**, 7813i.

Natural rubber was resinified with H_2SO_4 and then sulfonated with fuming H_2SO_4 to a cation-exchanging resin, which was allowed to adsorb statically, by exchange, various cations from 0.1 *N* solns. of their chlorides. In terms of the amt. adsorbed (millieq./g resin), the univalent cations ranked from the smallest as Li, Na, K, and NH_4 (1.21, 1.31, 1.38, and 1.40, resp.); the bivalent cations as Ni, Cd, Mg, Ca, and Ba (1.33, 1.38, 1.42, 1.47, and 1.56, resp.).

4037. Oda, Ryohei; Shimizu, Hiroshi, and Nakayama, Yoshiro. **Preparation of a few ion-exchange synthetic resins.** *Repts. Inst. Chem. Research, Kyoto Univ.* **16**, 43-5 (1947).—*C.A.* **45**, 9199g.

Catalyzed with H_2SO_4, resorcinoldiglycolic acid and HCH were condensed into a hard ion-exchange resin. The product from 2 g resorcinoldiglycolic acid, 2.3 formalin, and 2 cc. 88% H_2SO_4 heated 7 hrs without adding H_2O in a H_2O bath was the best; this showed in 0.5 *N* HCl the exchange value 7.2 with 0.5 *N* NaOH, and 4.1 millimol./g with 0.5 *N* NaCl.

4038. PENISTON, QUINTIN P.; FELICETTA, VINCENT F., AND MCCARTHY, JOSEPH L. **Sulfite waste liquor analysis. Determination of sulfate by a conductometric titration method.** *Anal. Chem.* **19**, 332-4 (1947).—*C.A.* **41**, 4308*c*.

10 ml of waste liquor were passed through an ion-exchange column contg. Amberlite IR-100 to replace Ca^{+2} or Mg^{+2} with Na^{+}. Water was added to 100 ml + 5 ml of 5% HCHO and the soln. was dild. to 300 ml with 75% iso-PrOH. At room temp. the SO_4^{-2} was titrated with standard $BaCl_2$ conductometrically. A slight excess of reagent was added as shown by the elec. resistance and the SO_4^{-2} content calcd. from an elec. cond. graph.

4039. PROKHOROV, F. G. AND KORNEYEVA, M. G. **Organic cation-exchangers.** *Izvest. VTI* **16**, No. 6, 1-6 (1947); *Chem. Zentr.* **1948**, **I**, 1046.—*C.A.* **44**, 8021*d*.

The manuf., compn., and properties of Wofatite P, C, D, K, and KS, Seocarb, Amberlite IR-100, and the Russian Sulfocoals (brown or mineral coal treated with oleum contg. 20% SO_3) were reported. Wofatite P showed the greatest resistance to hot, alk. waters. The Sulfo-coals were satisfactory in acid media.

4040. PROKHOROV, F. G. AND YANKOVSKII, K. A. **Dynamic activity of cationites towards cations.** *Zavodskaya Lab.* **13**, 656-9 (1947).—*C.A.* **43**, 3268*d*.

Solns. of chlorides (nitrates in the case of Ag and Pb), $\sim 3.6 \times 10^{-3}$ *N*, were filtered through a 0.5 m column of a typical cation exchanger (40 g, grain size 0.60-0.75 mm, dry vol. 60 ml, wet vol. 83 ml) in a 1.5-cm-diam. tube, at a linear rate of 10 m/hr, and the amt. of filtrate collected until 1st appearance of the cation filtered was detd. The activity of the exchanger (g equiv./m^2) until 1st appearance of the given cation in the filtrate was found to be: Li 66.5, Na 93.5, K 168.0, NH_4 133.5, Cs 144.0, Ag 188.5, Be 158.5, Mg 189.0, Ca 201.0, Cu 201.0, Sr 189.0, Cd 176.5, Ba 208.0, Pb 236.5, Mn 169.0, Ni 189.0, Co 183.0.

4041. RICHES, J. P. R. **Preliminary experiments on the use of synthetic resins in the estimation of trace elements.** *Chemistry & Industry* **1947**, 656-8.—*C.A.* **42**, 837*i*.

4042. SPEDDING, F. H.; VOIGHT, A. F.; GLADROW, E. M., AND SLEIGHT, N. R. **The separation of rare earths by ion exchange. I. Cerium and yttrium.** *J. Am. Chem. Soc.* **69**, 2777-81 (1947).—*C.A.* **42**, 1520*d*.

The sepn. of macro quantities of rare earths of spectrographic purity by adsorption on Amberlite-type resins and subsequent elution with such agents as citric acid-ammonium citrate soln. at controlled pH depended on the fact that the rare earths formed complexes with citrate ions. If the pH was suitably adjusted, competition was set up for the rare earth ions between the citrate complexes and the active centers of the resin. Since the equil. consts. for the rare earth citrate complexes varied slightly among the different rare earths, their rates of travel down the column differed sufficiently to lead to their sepn. The resin used was Amberlite IR-1. The effect of various factors including the concn. of the eluant, the pH of the element, the ratio Ce/Y in the starting sample, and the length of columns were established by which Ce and Y, of spectrographic purity, could be sepd. in macro quantities.

4043. SPEDDING, F. H.; VOIGT, A. F.; GLADROW, E. M.; SLEIGHT, N. R.; POWELL, J. E.; WRIGHT, J. M.; BUTLER, T. A., AND FIGARD, P. **The separation of rare earths by ion exchange. II. Neodymium and praseodymium.** *J. Am. Chem. Soc.* **69**, 2786-92 (1947).—*C.A.* **42**, 1520*g*.

Optimum conditions for the sepn. by means of 5% citrate solns. were: pH = 2.55, sample wt 0.25 to 0.50 g (as oxide) per cm^2 of resin bed, flow rate 1.5-3.0 cm/min. Column diam. did not appreciably affect sepn. In a test expt., a column 64 mm in diam. with a bed 175 cm long was used. The sample was 0.25 g/cm^2 and analyzed 51.7% Pr. The flow rate was 1.5 cm/min. and the pH was 2.55. The break-through came at 184.1, which, at this flow rate, was approx. 2.5 days after the start of the elution. 22% of the Nd was obtained of spectroscopic purity, and more than 50% of the original Nd was eluted with a purity > 98% Nd.

4044. SPEDDING, F. H.; FULMER, E. I.; BUTLER, T. A.; GLADROW, E. M.; GOBUSH, M.; PORTER, P. E.; POWELL, J. E., AND WRIGHT, J. M. **The separation of rare earths by ion exchange. III. Pilot plant scale separations.** *J. Am Chem. Soc.* **69**, 2812-18 (1947).—*C.A.* **42**, 1521*a*.

Detailed procedures were outlined for the pilot-plant scale sepn. of the rare earths using Amberlite IR-100 and 0.5% citric acid-ammonium citrate solns. as eluant. Twenty-four columns 4 in. in diam. and with resin bed 8 ft long were used. The pH of the eluant was 3.9, and 0.1% phenol was used to prevent mold growth. Large samples of rare earths of high purity were obtained by these procedures.

4045. THEIS, EDWIN AND THORSTENSEN, T. C. **Studies relative to cationic chromium complexes through the use of cationic exchange resins.** *J. Intern Soc. Leather Trades Chem.* **31**, 137-43 (1947).—*C.A.* **41**, 4942*f*.

The effect of addn. of Na_2SO_4, HCOONa, and $Na_2C_2O_4$ to 33% basic Cr sulfate liquor was studied. The stock liquor, free from neutral sulfate, was prepd. by SO_2 reduction of CrO_3 and adjustment of basicity with $Ba(OH)_2$. Twenty-five ml of soln. contg. 1% Cr was treated with 100 g wet "Ionac Resin C-200" for 15 min., drained, and washed. Cationic Cr, and accompanying complexly bound anions, were detd. by difference from analysis of the filtrate and washings, and also by eluting the absorbed Cr compd. with 20% HCl. The salt-free liquor contained 90% of total Cr as cations. Addn. of 0.2 to 6 moles $Na_2C_2O_4$ caused rapid decrease in percentage of cationic Cr to 15% at max. $Na_2C_2O_4$. All cationic bound sulfate was displaced in the presence of more than 2 moles $Na_2C_2O_4$. Oxalate acidity of the cationic Cr complex increased to 47% at max. $Na_2C_2O_4$.

4046. THOMAS, G. GARROD AND DAVIES, C. W. **Ion-exchange resins as catalysts.** *Nature* **159**, 372 (1947).—*C.A.* **41**, 3995*i*.

Ion-exchange resins, in the H form, offered several advantages as acid catalysts. Amberlite

IR-100, a synthetic resin which had one equiv. sulfonic acid group in 500 g resin, was used as catalyst for ester hydrolysis. This resin was more efficient than HCl by factors of 1.7 for MeOAc, 2.3 for EtOAc, and 9.8 for BuOAc.

4047. Thompson, R. B. and Roberts, E. J. **Design and operation of ion-exchange installations.** *Chem. Eng. Progress* **1**, No. 3, *Trans. Am. Inst. Chem. Engrs.* **43**, 97-102 (1947).—*C.A.* **41**, 2284*g*.

Lab. studies were discussed dealing with factors of design, net capacities, effective strength of exhaustion solns., effective anion removal, acid efficiency, capacities of anion exchangers, anion exchangers, and the factors of design in com. size units.

4048. Tiselius, A.; Drake, B., and Hagdahl, L. **Group separation of amino acids by adsorption analysis.** *Experientia* **3**, 21-6 (1947) (in English).—*C.A.* **41**, 4407*i*.

Amino acid mixts. were divided into four groups. The soln. (50 mg of mixed amino acids in 10 ml 5% HOAc) was forced through 3 filters in series contg. (1) charcoal, (2) Wofatit C, and (3) Wofatit KS, resp., and washed with 50 ml 5% HOAc. The No. 1 filter contained the aromatic amino acids. About 1 liter 20% HOAc was passed through filters No. 2 and 3. Filter No. 2 was eluted with 500 ml *N* HCl and the eluate was evapd. to give the basic amino acids. Filter No. 3 was eluted with 750 ml *N* HCl, the eluate was evapd., and the residue, which contained acidic and neutral amino acids, was dissolved in 10 ml H_2O and poured through filter No. 4 contg. Amberlite IR-4. The neutral amino acids were removed by washing with 100 ml H_2O. The acidic amino acids were eluted with 250 ml *N* HCl.

4049. Tompkins, Edward R.; Khym, Joseph X., and Cohn, Waldo E. **Ion exchange as a separation method. I. The separation of fission-produced radioisotopes, including individual rare earths, by complexing elution from Amberlite resin.** *J. Am. Chem. Soc.* **69**, 2769-77 (1947).—*C.A.* **42**, 1834*h*.

The ion-exchanger used was Amberlite IR-1. When an aq. soln. contg. cation M^{+n} was brought into contact with the resin, M^{+n} in the soln. exchanged with those cations originally held in the resin by its free acid groups: $n\mathrm{RH} + \mathrm{M}^{+n} \rightleftarrows \mathrm{R}_n\mathrm{M} + n\mathrm{H}^+$. The final equil. concns. of M^{+n} and H^+ depended principally upon the activities of the two cations and upon the respective affinities of each for the resin. The effective concn. of an ion might have been lowered by complex formation, and thus any cation might have been effectively replaced from its resin compd. by a relatively dil. soln. of a second cation contg. a compd. which would complex the other cation.

4050. Tompkins, Edward R. and Mayer, Stanley W. **Ion exchange as a separation method. III. Equilibrium studies of the reactions of rare earth complexes with synthetic ion-exchange resins.** *J. Am. Chem. Soc.* **69**, 2859-65 (1947).—*C.A.* **42**, 1835*h*.

The exchange consts. for several rare earths, equilibrated with the NH_4^+ compd. of Dowex 50 resin, varied. A study of the citrate complexes showed that the one in which three H_2Cit^- ions were combined with a rare earth ion was responsible for the relatively large sepn. factors between these elements. A preliminary, comparative study of the effectiveness of several exchangers (Dowex 50, Dowex 30, Duolite C, and Amberlite IR-1) and complexing agents (citric acid, tartaric acid, lactic acid, sulfosalicylic acid, ethyl acetoacetate, acetylacetone, oxalic acid, citric acid in 50% EtOH) was made. When Dowex 50 was used in the column, the concn. of the rare earth ions in the soln. could not exceed 3×10^{-4} *M* without adversely affecting the sepn. With Amberlite IR-1, this concn. should have been below 10^{-6}*M*. The pH of the citrate soln. should not have been greater than 3.2

4051. Tsuda, Kyôsuke. **Ion-exchange resins.** *Kagaku no Ryôike* (J. Japan. Chem.) **1**, 2-7 (1947).—*C.A.* **44**, 3180*e*.

In Japan prevailing practical applications were in obtaining pure water for pharmaceutical uses, for storage batteries, in purifying glucose, in removing catalyst Ni from sorbitol to be used in manufg. ascorbic acid, in removing salts from sea water, etc.

4052. Austerweil, G. **The determination of the efficiency of ion-exchangers.** *Bull Soc. Chim. France* **1948**, 948-52.—*C.A.* **43**, 1881*d*.

The exchangers were a large monomeric mol. of quinone-imine complex resembling aniline black, an amino polystyrene, a trimethanolmelamine-formaldehyde resin polymerized with the aid of an amino group attached to a heterocyclic compd., and a synthetic resin of a metaphenylene diamine-formaldehyde base polymerized with the aid of an amino group as above but attached to an aromatic cyclic compd. Exchangers in which the amino group did not take part in the polymerization hydrolyzed less than the others, but their capacity was not so great.

4053. Austerweil, Geza. **Method for evaluating the efficacy of anion exchangers.** *Compt. rend.* **226**, 799-801 (1948).—*C.A.* **42**, 7133*c*.

The amt. of Cl^- fixed by a given amt. of exchanger from HCl solns. of pH values 0, 1, 2, and 3 was meas. The characteristic const. of the material K was derived from the formula $1 + (m - m')/m = K^{\mathrm{pH}}$, where m was the quantity of chloride taken up at satn. from a soln. of known strength. Melamine formaldehyde resin and aminostyrene polymer were tested to show K values 1.214 and 1.174, resp.

4054. Baroni, Alessandro. **Possibilities and uses of ion-exchange resins.** *Materie plastiche* **14**, 15-16 (1948); *Materie plastiche* **10**, 31 (1944).—*C.A.* **42**, 5589*e*.

4055. Bergman, M. **Simple and fast method for determination of permanent hardness in water.** *Can. Chem. Process Inds.* **32**, 1125 (1948).—*C.A.* **43**, 1886*d*.

Ion exchange resins (Amberlite IR-100H and IR-4B) were rinsed with distd. water and 40 g of each was placed in two 1-liter bottles. Tap water (300 ml) was added to the bottle contg. Amberlite IR 100H, the contents well agitated and the bottle left standing 1 min. The soln. was decanted through a filter and 25 ml of filtrate meas. into an Erlenmeyer flask and the balance poured into the bottle contg. Amberlite IR-4B; the soln. was well shaken and left standing 1.5 min. The soln. was decanted through a filter into the first bottle and left standing 1 min. From the decanted soln. a 25 ml sample was added to the 25-ml sample previously put into the Erlenmeyer flask. The combined sample was titrated with 0.02 *N* NaOH by using methyl orange.

4056. Cohn, Waldo E. and Kohn, Harold W. **Ion-exchange separation of the alkali metals.** *J. Am. Chem. Soc.* **70**, 1986 (1948).—*C.A.* **42**, 6234*f*.

Dowex-50 resin was used to sep. a neutron-activated mixt. of 1.0 mg Na, 10 mg, K, 8 mg Rb, and 13 mg Cs as their chlorides. Elution was begun with 0.15 *N* HCl at a flow rate of approx. 0.3 ml per min. Various fractions were collected and analyzed radiometrically for Na^{24}, K^{42}, Rb^{86}, and Cs^{134}

4057. Cohn, Waldo E.; Parker, George W., and Tompkins, Edward R. **Ion exchangers to separate, concentrate, and purify small amounts of ions.** *Nucleonics* **3**, No. 5, 22-33 (1948).—*C.A.* **43**, 4129*c*.

Results showed that 100-1000 millicuries of major fission species could be sepd. by ion exchange with radiochem. purities of 95-98% and assocd. with less than 1-5 mg of total solids. The original solns. contained 100 times this amt.

4058. Consden, R.; Gordon, A. H., and Martin, A. J. P. **Separation of acidic amino acids by means of a synthetic anion-exchange resin.** *Biochem. J.* **42**, 443-7 (1948).—*C.A.* **42**, 6542*d*.

The glutamic and aspartic acids in a wool hydrolyzate were sepd. at pH 2.5 using Amberlite IR4. Likewise, optically active cystic acid was isolated by this procedure from Cl_2-treated wool.

4059. Cristy, Geo. A. and Lembcke, Richard E. **Purification of formalin by ion-exchange treatment.** *Chem. Eng. Progress* **44**, 417-20 (1948).—*C.A.* **42**, 4803*a*.

Ion-exchange treatment was found to be a practical method for removing formic acid and dissolved metals from formalin. Development of the process was described including lab., pilot-plant, and com. operations.

4060. Frush, H. L. and Isbell, H. S. **Amides of glucuronic, galacturonic, and mannuronic acids.** *J. Research Natl. Bur. Standards* **41**, 6, 609-13 (1948).

The preparation of uronic acids was described. An aq. soln. of the 1-amino uronamide was treated with an acid or a suitable cation exchange resin that replaced the glycosylamino group by a hydroxyl. Free amides-stable, crystalline substances were formed that should have proven useful representatives of a new class of carbohydrate derivatives.

4061. Gapon, E. N. and Gapon, T. B. **Chromatographic ion-exchange adsorption. I. Theory of ion-exchange chromatograms.** *Zhur. Fiz. Khim.* **22**, 859-69 (1948).—*C.A.* **42**, 8572*a*.

Equations were derived for ion exchange during filtration of solns. of mixts. of uni-univalent electrolytes through an ion exchanger contg. mobile univalent ions.

4062. Gapon, E. N. and Gapon, T. B. **Chromatographic ion-exchange adsorption. II. Description of ion-exchange chromatograms.** *Zhur. Fiz. Khim.* **22**, 979-90 (1948).—*C.A.* **43**, 465*a*.

The kinetics of the exchange adsorption of 2 and 3 ions and the formation of chromatograms were discussed.

4063. Gapon, E. N. and Gapon, T. B. **Dynamics of ion exchange.** *J. Applied Chem.* **21**, 937-47 (1948).—*C.A.* **44**, 9210*f*.

Consideration of an exchange column subdivided into layers, with the electrolyte soln. passed through in portions, showed that the increase of the adsorbed mole fraction of an ion was detd. by its initial mole fractions in the adsorbed state and in soln., the ion exchange const., and the ratio of the abs. amt. of exchanged ions in soln. and in the solid adsorbent.

4064. Gregor, Harry P. **A general thermodynamic theory of ion-exchange processes.** *J. Am. Chem. Soc.* **70**, 1293 (1948).—*C.A.* **42**, 6201*a*.

The sp. vol. of a strong (sulfonic) acid resin meas. in water with various cations in the exchange position was: $H^+ = 1.283$; $Na^+ = 1.665$; $K^+ = 1.434$; $Cs^+ = 1.388$; $Mg^{++} = 1.665$; $Ca^{++} = 1.585$; $Ba^{++} = 1.453$; $Ag^+ = 1.283$ cc./g. When an alkali metal resin was equilibrated with soln. of the same ion, the sp. vol. decreased with increasing concn. and usually became less than the vol. of the next heavier member of the group equilibrated with pure water.

4065. Gregor, Harry P. and Bregman, J. I. **Characterization of ion-exchange resins. I. Acidity and number of constituent cation-exchange groups.** *J. Am. Chem. Soc.* **70**, 2370-3 (1948).—*C.A.* **42**, 9008*h*.

Investigations of the resinous ion-exchange process were possible only on an empirical level without a knowledge of the physicochem. properties of the resins themselves. In order to det. the nos. and kinds of exchange groups making up a resin, 2 techniques were developed. The first was a direct titration of the resin with base in the presence of neutral electrolyte; the second involved addn. of the salt of a weak acid to the resin and detn. of the extent of reaction by back-titration of the buffer. The rate of diffusion of the exchanging ion to a strong acid group was greater than for a weak acid group. A true cation-exchange resin was defined as a solid phase contg. dissociable cations which would exchange for any other cation independently of the nature of the anion of the exchanging cation in soln. A base adsorbent was a solid phase contg. dissociable cations which would exchange for any other cation only when weak acid anions or hydroxyl ions were the anions of the exchanging cation in soln.

4066. Hamada, Hiroshi. **The equilibrium of exchange reaction by ion-exchange resins. I.** *Kagaku no Ryoike* **2**, 83-4 (1948).—*C.A.* **44**, 2820*c*.

An equation was developed in the exchange reaction $RA + B^+ = RB + A^+$ when the mutual action among ions at exchangeable sites was ignored, liquid phase was taken as gas phase, and electrostatic energy predominant in exchange reaction was included in the exchange heat. In such ideal case, the exchange reaction proceeded according to the law of mass action, though it was a heterogeneous system.

4067. Hems, B. A.; Page, J. E., and Waller, J. G. **The use of ion-exchange resins for separation of basic amino acids.** *J. Soc. Chem. Ind.* **67**, 77-80 (1948).—*C.A.* 42, 5485*c*.

An improved method for sepg. arginine, histidine, and lysine, from protein hydrolyzates was reported. Three anion exchange resins, De-Acidite B, De-Acidite C, and Asmit were examd. Of these De-Acidite C had the greatest capacity for removing HCl from aq. solns. and was used for removing mineral acid from hydrolyzates of the proteins. Four cation exchange resins, Zeo Karb HI, Zeo Karb 215, Zeo Karb 216 and Durasit H, were tested. The third, a carboxylic acid resin, offered special advantages. The second a sulfonic acid resin, had the greatest capacity for individual amino acids and was most extensively used. The large vol. of eluents provided the principal objection to the technique. Elution of adsorbed acids by shaking the resin mechanically with eluates required even greater vols. than the column procedure.

4068. Heymann, E. and O'Donnell, I. J. **Anion-exchange resins. "Acid adsorption" or "anion exchange"?** *J. Colloid Sci.* **3**, 479-81 (1948).—*C.A.* **43**, 335*b*.

Reaction of the acid HA with exchange resins of the polyamine type may have involved (1) anion exchange (RNH_3^+ with adsorbed OH^- yielded RNH_3^+ with adsorbed A^-) or (2) acid adsorption (RNH_2 yielded RNH_3^+ with adsorbed A^-). An unambiguous choice between these possibilities was difficult to perform in aq. systems because H_3O^+ was always present as a proton carrier. Expts. in nonaq. systems would have been more satisfactory.

4069. Juda, Walter and Carron, Morris. **Equilibrium and velocity of the sodium-hydrogen exchange on carbonaceous exchangers in contact with chloride solutions.** *J. Am. Chem. Soc.* **70**, 3295-3310 (1948).—*C.A.* 43, 2848*b*.

The equil. and velocity of the Na-H exchange on 4 com. carbonaceous exchangers in contact with Cl-ion solns. were accounted for by relations identical in form, resp., with a mass-action equation and a 2nd-order rate equation of simultaneous opposing reactions. The concn. equil. consts. $K_{H/Na}$, were const. within 20% over a concn. range of 0.001-1*N*.

4070. Klement, Robert and Dmytruk, Rudolf. **Separation of oxalic and tartaric acids by means of resin exchange (Wofatite).** *Z. anal. Chem.* **128**, 109-10 (1948).—*C.A.* 42, 5805*b*.

The removal of H_3PO_4 by means of resin had already been described. The same treatment would also serve to remove oxalate and tartrate ions presence of which complicated the usual procedure of qual. analysis.

4071. Klement, Robert and Dmytruk, Rudolf. **Separation of phosphoric acid by means of the ion-exchange resin, Wofatite. II.** *Z. anal. Chem.* **128**, 106-9 (1948).—*C.A.* 42, 5799*h*.

To det. Na in the presence of phosphate, it was necessary to remove the latter. Wofatite M proved satisfactory for removing PO_4^{-3} provided the plumped resin in a glass tube was allowed to remain in contact with 100 ml of 5 *N* HCl for 10 min. and then, after the acid had been allowed to drain slowly, washed with water, then with 35 ml of satd. NaCl soln., and finally with water again.

4072. Klyachko, V. A. **Use of ion-exchange resins for analytical purposes.** *Zavodskaya Lab.* **14**, 1257-9 (1948).—*C.A.* 44, 10571*h*.

Complete ion exchange for H did not take place on filtration of dil. salt solns. through the resin columns. Each individual substance had to be examd. in this connection with due precautions as to effects of hydrolysis or counter-ion effects.

4073. Krishnamoorthy, C.; Davis, Lannes E., and Overstreet, R. **Ionic exchange equations derived from statistical thermodynamics.** *Science* **108**, 439-40 (1948).—*C.A.* **43**, 464*g*.

An equation for the equil. distribution of ions between the adsorbent and the soln. was derived by using statistical methods. It was assumed that the partition function was independent of the ionic distribution or that the energy of mixing was zero. This was probably true for completely dissocd. ions but not apparently for H ions and perhaps other ions. A satisfactory equil. const. averaging 367 ±14 was obtained for the distribution of La and Cs ions with the synthetic resin IR-100.

4074. Lister, B. A. and Smith, M. L. **The fractionation of cerium (III) and neodymium mixtures on an ion-exchange column.** *J. Chem. Soc.* **1948**, 1272-5.—*C.A.* **43**, 6535*e*.

Eleven 1.1-m columns in series (1 cm diam.) were packed with Zeokarb H. I. P. The columns were filled with water and 1 *M* or 0.25 *M* Ce Nd nitrate soln. was started through the first column at a rate of 1.4 ml/min. When the percolate contained Ce-Nd, the initial reservoir was changed back to water and flow was continued as long as Ce-Nd was washed out. The first and last fractions showed an increase in Nd concn. the last due to diln. of the soln. with the following water. The sepn. was better with the dil. soln.

4075. Lur'e, Yu. Yu. and Filippova, N. A. **Use of organolites in analytical chemistry.** *Zavodskaya Lab.* **14**, 159-72 (1948).—*C.A.* **42**, 8696*b*.

Cation-exchange expts. were conducted with phenolic cationite (Wofatit P). The following sepns. could be made: (1) Zn and Al from Fe by selective extn. with NaOH from the NH_4^+-satd. cationite. (2) Sb and Sn from As by passing the soln. through H^+-satd. cationite to adsorb Sb and Sn only and then extg. with dil. HCl. (3) Bi from Cu or Pb by passing the soln. through K^+-satd. cationite to adsorb both then extg. Bi with 1% KI soln. (acidified with H_2SO_4 to give 0.1 *N* concn.) and detg. colorimetrically. (4) Bi from Sb as thiocyanates by means of cationite provided the thiocyanate concn. was exactly 6%.

4076. Malquori, Alberto and DeAngelis, Giorgio. **Ammonium-ion exchangers.** *Ann. Chim. applicata* **38**, 469-81 (1948).—*C.A.* **44**, 4166*h*.

A general study of ion exchangers including zeolites, permutites, Wofatit, bentonite, and synthetic resin exchangers.

4077. Oda, Ryohei; Shimizu, Hiroshi, and Nakayama, Yoshio. **Ion-exchange synthetic resins. IV.. Preparation of resins by condensation of Phenoxyacetates with formaldehyde. V. Hydrogen-calcium exchange with phenoxyacetate-formaldehyde resin. VI. Sodium-calcium exchange. VII. Regeneration conditions after sodium-calcium exchange.** *Chem. High Polymers* (Japan) 5, 21-2; 22-4; 24-5; 26-7 (1948).—*C.A.* 46, 1185*a*.

H_2SO_4 was the catalyst. No condensation took place with NaOH. A hard, brown resin was obtained with 98% H_2SO_4 at 140-50 °C. The H-Ca exchange capacity of this resin (RCOOH type) was low. Na-Ca exchange took place easily with 0.5 *N* NaOH. Ca-Na exchange was carried out by passing 0.5 *N* NaCl through the resin after Na-Ca exchange.

4078. Oda, Ryohei and Shimizu, Hiroshi. **Ion-exchange synthetic resins. VIII. Reasons for the decrease of the break-through capacity after repeated sodium-calcium exchange. IX. Quantitative consideration on the decrease of break-through capacity after repeated sodium-calcium exchange. X. Practical break-through capacity of sodium-calcium exchange of phenoxyacetate-formaldehyde resin.** *Chem. High Polymers* (Japan) 5, 86-7; 87-9; 89-91 (1948).—*C.A.* 46, 1185*a*.

The decrease of the break-through capacity after repeated Na-Ca exchange under const. regeneration conditions was noted. The practical-break-through capacity was 1.2 milliequiv./g when 0.5 *N* NaCl (500% of the theoretical amt.) was used as the regenerating soln.

4079. Oda, Ryohei; Shimizu, Hiroshi, and Nakayama, Yoshio. **Ion-exchange synthetic resins. XIII. Characteristics of several cation-exchange resins.** *Chem. High Polymers* 5, 115-16 (1948).—*C.A.* 46, 1185*g*.

For Na-Ca exchange RCOOH > RSO_3H, and for its regeneration RSO_3H > RCOOH; for H-Ca exchange RSO_3H > RCOOH, and for its regeneration RCOOH > RSO_3H. KH-1 had the highest exchange capacity and break-through capacities.

4080. Reid, Allen F. **Multistage ion-exchange system for the fractionation of solute. Radium-barium fractionation.** *Ind. Eng. Chem.* 40, 76-8 (1948).—*C.A.* 42, 4004*f*.

Selective absorption of a portion of the ions in a through-going soln. by an exchange cell and regeneration by the acidified output soln. of a previous cell comprised a repetitive cycle for the continuous sepn. of the fractions. Application of the method to a pilot plant for the concn. of Ra-Ba mixts. was discussed.

4081. Schubert, Jack. **The use of ion exchangers for the determination of physical-chemical properties of substances, particularly radiotracers, in solution. I. Theoretical.** *J. Phys. & Colloid Chem.* 52, No. 2, 340-50 (1948).—*C.A.* 42, 5300*i*.

The possibilities were pointed out of using ion exchangers with radiotracers for (a) the detn. of dissocn. consts. of complex ions, (b) the rapid detection and evaluation of the relative complex-forming properties of org. salts, (c) detns. of the activity coeff. of tracer substances in the presence of large concns. of a foreign electrolyte, (d) the detection and study of radiocolloids, (e) the detection of the state of a radio-element in soln., and (f) the detn. of the charge and relative basicity of a cationic radio-element.

4082. Schubert, Jack and Richter, J. W. **II. The dissociation constants of strontium citrate and strontium tartrate.** *J. Phys. & Colloid Chem.* 52, No. 2 350-7 (1948)—*C.A.* 42, 5301*a*.

The ion-exchange method was used at 25 °C and pH 7 to det. the dissocn. consts. of Sr citrate and tartrate. The total concn. of radio-Sr (53-day Sr 89) was approx. 10^{-11} mole per liter; the ionic strength of the solns. was furnished by NH_4 salts. The pK_c for Sr citrate was 2.81 when the NH_4-ion concn. was 0.16_5 per liter; under the same conditions pK_c for tartrate was 1.69. As the pH increased from 5 to 8, the amt. of radio-Sr adsorbed by the cation exchanger (Amberlite IR-1) increased steadily and markedly.

4083. Schubert, Jack and Richter, John W. **Cation-exchange studies on the barium citrate complex and related equilibria.** *J. Am. Chem. Soc.* 70, 4259-60 (1948).—*C.A.* 44, 5193*f*.

The ion-exchange method was used to measure the dissocn. consts. (K_c) of the Ba citrate complex ion $(BaCit)^-$ and the exchange consts. for equil. between Ba^{140} or Sr^{89} ions and the cation-exchange resin Amberlite IR-1. At pH 7.2 and concn. of NH_4^+ of 0.16_5M, K_c was 0.005 at 25 °C and about 0.008 at 37 °C; at 25 °C and 1.05 *M* $NH_4^+ K_c$ was 0.017. The corresponding values of K_c for $(SrCit)^-$ were 0.0015, 0.002, and 0.0066. Although Ba was much less strongly bound by citrate than was Sr, its affinity for the exchanger was slightly greater.

4084. Simirnov, A. S. and Peremyslova, E. S. **Sorption of acids on anionites.** *Doklady Akad. Nauk. S.S.S.R.* 62, 787-9 (1948).—*C.A.* 43, 1238*b*.

The sorption consisted in actual exchange of the anion of the acid for the OH of the amino-resin, rather than in an addn. of the acid mol. The sorption of org. acids was detd. in the filtration of 0.016 *N* solns. of the acids, flowing at a linear rate of 3m/hr through 10 g of the anionite resin in a column 180 mm high, until 1st appearance of the acid in the filtrate. The amts. adsorbed, $PrCO_2H$ 1.14, AcOH 1.33, HCO_2H 2.18, CH_2ClCO_2H 2.65, CCl_3CO_2H 2.65, CCl_3CO_2H 2.78 milli-equiv./g did not obey Traube's rule according to which adsorption should rise with the mol. wt.

4085. Spedding, F. H.; Fulmer, E. I.; Ayers, Buell; Butler, T. A.; Powell, Jack E.; Tevebaugh, A. D., and Thompson, Robert. **Improved ion-exchange method for separating rare earths in macro quantities.** *J. Am. Chem. Soc.* 70, 1671-2 (1948).—*C.A.* 42, 6260*d*.

Sepn. of the rare earths in large amts. was markedly increased by eluting with 0.1% citric acid soln. in the pH range 5.0-5.5. The pH of the soln. which came from the Amberlite IR-100 column varied with the rare earth that was being eluted and differed by approx. 0.005 pH unit for adjacent elements. From 1:1 mixts. of Nd and Pr or Nd and Sa, 60 to 90% of each element could be obtained spectrophotometrically pure.

4086. STREET, KENNETH JR. AND SEABORG, G. T. **The ion-exchange separation of zirconium and hafnium.** *J. Am. Chem. Soc.* **70**, 4268-9 (1948).—*C.A.* **43**, 4169*b*.

By the HCl elution of the oxy-chlorides, prepd. from a mixt. of Zr and Hf oxides contg. 30% HfO_2, adsorbed on a cation-exchange resin (Dowex 50), a 66% yield of approx. 99.9% HfO_2 was obtained. The process was adaptable to gram quantities.

4087. THOMPSON, JOSEPH AND MCGARVEY, FRANCIS X. **Factors governing the performance of anion exchangers.** *Chem. Inds.* **63**, 55-6 (1948).—*C.A.* **42**, 7907*c*.

The rate of acid removal and the total exchange capacity of resin anion exchanger Amberlite IR-4B increased with valence of acid anion. Regenerants could be rated in order of efficiency: $NaOH > NH_4OH > Na_2CO_3 > NaHCO_3$. A minimum bed depth of 20 in. was required. Optimum flow rate was 3 gal per ft^3 per min. A min. flow should have been maintained to prevent ion bleeding.

4088. TOLLIDAY, J. D.; THOMPSON, G. W. H., AND FORMAN, G. **The use of ion-exchange resins for the determination of cations.** *J. Soc. Leather Trades' Chemists* **32**, 291-308 (1948)—*C.A.* **42**, 9218*d*.

Comparative studies were made with quebracho-HCHO resin, Amberlite IR 100, Ionac C 200 and Zeo-Karb 215, all in the H cycle: both the batch and the column methods were used. Adsorption isotherms by the batch method were obtained for benzoic, gallic, acetic, formic, tartaric, and lactic acids on Amberlite IR 100 at 20°. Equil. was reached in 60 min. Adsorption of benzoic acid was very marked, that of gallic acid considerably lower; adsorptions of the aliphatic acids were still lower but appreciable. The Freundlich equation was applicable in all cases. The Na^+ break-through point for Amberlite IR 100 was well below the total cation-adsorbing capacity of the resin. The useful exchange capacity of quebracho-HCHO resin was much lower than those of Amberlite IR 100, Ionac C 200, and Zeo-Karb 215.

4089. TOMPKINS, EDWARD R. **Separation of radium from barium by the use of an ion-exchange column procedure.** *J. Am. Chem. Soc.* **70**, 3520-2 (1948).—*C.A.* **43**, 2090*d*.

By the use of a high-capacity cation-exchange resin (Dowex 50), the Ra in a soln. contg. 20 γ Ra, 20 mg Ba, and 20 mg Sr, including Ba and Sr tracers, was essentially completely sepd. from Ba and Sr. The compn. of each fraction of the effluent was detd. from the α, β, and γ-ray activity and Al absorption and decay curves of radioactivity.

4090. USTRENKO, YU I. AND DATSENKO, O. V. **Determination of calcium and magnesium in iron ore by ion adsorbents.** *Zavodskaya Lab.* **14**, 1323-7 (1948).—*C.A.* **43**, 4176*e*.

The method was based on adsorption of Ca and Mg by ion-exchange resin (Wofatite R), while Fe and Al remained in soln. as complex-ions. 0.5 g of sample was dissolved in 15 ml of concd. HCl, the soln. was evapd. to sirup and then dild. to 30 ml with 6 *N* HCl, the result was filtered and evapd. to 2-3 ml, whereupon it was dild. with water to 30 ml and treated with a ml of 20% tartaric acid, and the soln. was passed through the adsorbent column (prepd. with 5 treatments of concd. HCl at 70-80°C and washed with water) at 5 ml per min., washing the column with water 3-4 times, and eluting with 2.5 *N* HCl. Ca and Mg were detd. as usual in the eluate. Checks within 0.05-0.1% were obtained.

4091. WIKLANDER, LAMBERT AND GIESEKING, J. E. **Exchangeability of adsorbed cations as influenced by the degree of saturation and the nature of the complementary ions with special reference to trace concentrations.** *Soil Sci.* **66**, 377-84 (1948).—*C.A.* **43**, 3687*c*.

Amberlite IR-1 and radioactive K, Ba, Na, and Sr were used. With increasing K content the exchangeability of K decreased when Na was the complementary ion. In the same way the exchangeability of Sr decreased with falling Sr content when combined with Na, but increased when combined with Ba. For both K and Sr, the percentage replacement approached a limit at very low degrees of satn. The exchangeability of an ion approached a certain limit when the concn. of the ion grew infinitesimally low.

4092. ADAMSON, A. W. AND GROSSMAN, JACK J. **A kinetic mechanism for ion-exchange.** *J. Chem. Phys.* **17**, 1002-3 (1949).—*C.A.* **44**, 2324*h*.

The kinetics of the zeolitic ion exchange of univalent ions in dil. soln. was explained by diffusion of the ions through a bounding liquid film.

4093. AUSTERWEIL, G. **Ion exchange and its applications.** *Nueva ind. quim. (Madrid)* **4**, 271-86 (1949).—*C.A.* **44**, 6203*c*.

A review with emphasis on industrial applications.

4094. BARRER, R. M. **Ion exchange in crystals.** *Bull soc. chim. France* **1949**, D71-83.—*C.A.* **43**, 4534*g*.

A math. discussion and review with 31 references.

4095. BARRER, R. M. **Separations with zeolitic materials.** *Discussions Faraday Soc.* **1949**, No. 7, 135-41.—*C.A.* **45**, 18*h*.

Most natural cryst. zeolites fell into 3 classes of mol. sieve sorbent, each capable of sepg. mixts. by selective occlusion if there were sufficient differences in shape and dimensions between the mols. in the mixt. The mols. removed by occlusion must always be comparatively small. A diversity of modified mol.-sieve sorbents could be produced by cation exchange and by burning out interstitial NH_4^+.

4096. BARRER, R. M. **Transient flow of gases in sorbents providing uniform capillary networks of molecular dimensions.** *Trans. Faraday Soc.* **45**, 358-73 (1949).—*C.A.* **43**, 6488*h*.

Base-exchange reactions made available a series of mordenite crystals enriched in Li^+, Na^+, K^+, NH_4^+, Ca^{++}, and Ba^{++}. The dehydrated crystals provided uniform capillary networks of mol. dimensions for the present investigation. Heterogeneous equil. and flow transients involving gas-sorbent systems were detd. by using the volumetric method in a double sorption system. The zeolites were outgassed for periods of 4-5 hrs at 300-340°C before use, and between runs. Both pos. and neg. temp. coeff. in the relative sorption velocities were observed, the former predominating. Both kinds of temp. coeff. were explained in terms of the diffusion theory developed, and true energies of activation, E, for interstitial diffusion were obtained.

4097. Benin, G. S. and Shnaĭder, E. E. **Evaluation of anion exchangers.** *Sakharnaya Prom.* **23**, No. 6, 23-6 (1949).—*C.A.* **43**, 9296*f*.
The use of 0.1 *N* AcOH was advisable in detn. of the capacity for the absorption of anions. For a complete evaluation it was suggested to use some standard soln. contg. N and coloring matters.

4098. Bjorling, Carl O. **Adsorption analysis of salts of organic acids. A preliminary report.** *Farm. Revy* **48**, 281-5 (1949).—*C.A.* **43**, 5703*c*.
A soln. of salt was filtered through a column of Amberlite IR-100, eluted with water, and titrated. The method gave satisfactory results with Na tartrate, citrate, lactate, and sulfosalicylate, Ca lactate, gluconate, and glycerophosphate, Novalgin, and Na menadiol sulfate.

4099. Calise, V. J. and Lane, Marvin. **Silica removal by a practical ion-exchange process-performance of a commercial installation.** *Ind. Eng. Chem.* **41**, 2554-63 (1949).—*C.A.* **44**, 2149*f*.
Standard cation- and anion-exchange units were followed by a decarbonator and a strongly basic anion exchanger which removed silicic acid. When NaOH was used to regenerate the standard anion-exchange unit, SiO_2 and CO_2 were retained in the early stages of each run and were given up in later stages. With Na_2CO_3 regeneration, SiO_2 was not retained but there was some CO_2 retention. SiO_2 was reduced from 15 parts per million in the raw water to 0-0.5 part per million in the effluent of the SiO_2-removal unit.

4100. Cohn, Waldo E. **The separation of purine and pyrimidine bases and of nucleotides by ion exchange.** *Science* **109**, 377-78 (1949)- *J. Am. Chem. Soc.* **71**, 6, 2275-76 (1949).—*C.A.* **43**, 5440*c*.
Three of the five naturally-occurring bases (cytosine, guanine, and adenine) existed as cations in soln. of pH < 4, had different affinities for cation exchangers, and hence may be eluted successively with HCl or NaCl. The non-ionized bases, thymine and uracil, may be separated by anion exchangers. The nucleotides of yeast nucleic acid (uridylic, cytidylic, guanylic, and adenylic acid) exhibited a weaker exchanger-to-ion bond, and weak acids appeared to be the most practical eluting agents for these materials.

4101. Davies, C. W. **Fractionation of weak electrolyte mixtures by ion-exchange resins.** *Biochem. J.* **45**, 38-41 (1949).—*C.A.* **44**, 1303*f*.
The theoretical basis for the sepn. of weak electrolytes was discussed.

4102. Devlin, Jas. A.; McNabb, Wallace M., and Hazel, Fred. **Preparation of vanadium pentoxide sols by ion exchange.** *J. Franklin Inst.* **248**, 251-3 (1949).—*C.A.* **43**, 8840*a*.
Amberlite IR-100H and Dowex-50 were conditioned by 3 Na-H cycles and used in the H-form. Weighed amts. of NH_4VO_3 were mixed with weighed amts. of the resin, and the mixt. was stirred, filtered, and the sol. analyzed to det. V present as V_2O_5 and as NH_4VO_3. Dowex was more stable in the presence of vanadate, but showed some reducing action after several days.

4103. Duncan, J. F. and Lister, B. A. J. **Ion-exchange studies. I. The sodium-hydrogen system.** *J. Chem. Soc.* **1949**, 3285-96; *Quart. Revs.* (London) **2**, 307-48 (1948).—*C.A.* **44**, 9770*i*; **43**, 3264*d*.
Dowex 50 and Amberlite IR-100H were studied by batch equil., by satn. of a column of exchanger, and by the elution rear boundary obtained when Na ions were exchanged in the column with acid. Solns. of NaCl contg. radioactive Na^{24} were used in conjunction with a Geiger-Müller counter; HCl was the acid used. If a diffuse rear boundary was not produced, calcns. were made on the diffuse front boundary method. Column behavior of Dowex 50 followed the law of mass action, but the Amberlite IR-100H with a pH of 4 or greater showed a small amt. of nonequiv. exchange. Flow rates were maintained at less than 4×10^{-3} cm/sec.

4104. Duncan, J. F. and Lister, B. A. J. **Ion-exchange studies. II. The determination of thermodynamic equilibrium constants.** *Discussions Faraday Soc.* **1949**, No. 7, 104-14.—*C.A.* **45**, 19*i*.
Batch equil. methods and column methods for the Ba-H and La-NH_4 exchange systems were used to evaluate the activities of ions in an exchanger. Radiochem. tracer methods were applied in this crit. examn. of the postulates used by different authors for this type of detn. The mass product varied by about 50%, rising to a max. at an equiv. fraction of about 1/3 for the multivalent ion in the exchanger. The activities in the exchanger may have been incorrectly evaluated because of the effect of some secondary process, such as adsorption soln. of the ions in the exchanger, or swelling of the resin.

4105. Egner, Hans; Eriksson, Erik, and Emanuelsson, Arne. **Composition of atmospheric precipitation. I. Sampling technique. Use of ion-exchange resins.** *Kgl. Lantbruks-Hogskol. Ann.* **16**, 593-602 (1949).—*C.A.* **44**, 385*c*.
Collection app. was made of a glass funnel surrounded by thin stainless steel spikes to discourage birds, and with a filter and an ion-exchange column before the collection reservoir. Prolonged contact of the rain with solids was prevented and the ions to be detd. were caught in the ion exchanger, so that the water could be discarded after it was measd.

4106. Erler, Karl. **Alkalimetric determination of neutral salts of strong acids by means of ion-exchanger Wofatit KS.** *Z. anal. chem.* **129**, 209-12 (1949).—*C.A.* **44**, 73*b*.
A wet column was prepd. with 15-20 g Wofatit KS and allowed to swell for 24 hrs. Then 50 ml of 5 *N* HCl were added and allowed to run through, the column being kept covered always with liquid. It was washed with water until free from Cl. Then concd. NaCl was run through the column, and the column was washed, activated once more with HCl, and washed again. The column could serve for as many as 20-30 analyses.

4107. Furushiro, Kosuke. **Ion-exchange resins.** *J. Soc. Org. Synthetic Chem. Japan* 7, 21-7 (1949).—*C.A.* **44**, 4605*e*.
Anion and cation exchange resins named Diaion K and A, resp., were synthesized. The 1st was condensed from $C_6H_4(OH)SO_3H$ and HCHO into the form

RSO_3Na which was capable of adsorbing anions to 1.9-2.0 mg/g resin below pH 7 (when the SO_3 alone was active) and 3-3.5 times as much above pH 7 (when the PhOH radical also became active). The 2nd was derived from an aromatic amine into the form RNH_2–HCl which was capable of absorbing cations to 0.2-2.0 mg/g resin (equiv. wt of active NH_2 radical).

4108. Grigorvo, O. N. and Tarshis, A. I. **The reactions of ion exchange involving poorly soluble precipitates.** *Kolloid. Zhur.* **11**, 390-4 (1949).—*C.A.* **44**, 2820*a*.

Four ion exchangers were satd. with 0.1 *N* $AgNO_3$, washed until the wash water contained no Ag^+, immersed in 0.1 *N* $BaCl_2$, washed, immersed in 0.1 N $AgNO_3$, etc. The amt. of Ba^{++} and Cl^- taken up from $BaCl_2$, and of Ag^+ taken up from $AgNO_3$, did not change from cycle to cycle. These reactions, in which both ions of the added salt were immobilized (as, e.g., BaM_2 and AgCl, M being the anion of the exchanger) were reversible cation-exchange reactions. A zeolite took up 94-96 milliequiv. Ba^{++}, Cl^-, and Ag^+ per 100 g, a glauconite 9-11 milliequiv., "Wofatit PN" 45-49 milliequiv., and "Sulfocarbon" 32-34 milliequiv.

4109. Gupta, S. L. **Maximum exchange capacities of ion-exchange resins from their titration curves.** *Science and Culture* **14**, 337 (1949).—*C.A.* **43**, 5885*e*.

Potentiometric titration of cation- and anion-exchange resins with NaOH and HCl resp. gave titration curves with inflection points corresponding to the theoretically calcd. capacities. The resins were finely divided and dispersed in H_2O, after dialysis, for the titrations.

4110. Gupta, S. L. **Neutralization curves of ion exchangers.** *Science and Culture* **14**, 539 (1949).—*C.A.* **43**, 8237*c*.

The neutralization curve of a cation exchanger contg. only one type of active group could be expressed by an equation of the type $a = c(1-y) + (k_w/x) + [cyk_a/(k_a+x)] - \{xc(1-y)/[cyk_a/(k_a+x)) + (k_w/x)]\} - x$, where a was the concn. of added base, c was the initial concn. of active groups in the H form, y was the fraction of the total active groups in the soln. phase, k_w was the ion product of water, and x the H-ion concn. The same equation applied to anion exchangers.

4111. Hale, D. K. and Reichenberg, D. **Equilibrium and rate studies of cation-exchange with monofunctional resins.** *Discussions Faraday Soc.* **1949**, No. 7, 79-90.—*C.A.* **45**, 19*c*.

A sulfonated cross-linked polystyrene bead polymer, and a carboxylic-type exchange resin were prepd. Both resins were converted to the H-form, and the H-Na exchange was studied. The exchange-equil. results showed that the amt. of Na^+ taken up by the resins depended on the ratio $[Na^+]/[H^+]$ and not on the $[Na^+]$ and $[H^+]$ separately. The cross-linked polymethacrylic acid behaved as a monofunctional weak acid; the sulfonated cross-linked polystyrene behaved as a monofunctional strong acid. At low concn. of Na^+ in soln. the rate-detg. mechanism was the diffusion of ions through a thin layer of liquid surrounding the resin particle.

4112. Haskell, Vernon C. and Hammett, Louis P. **Rates and temperature coefficients in the hydrolysis of some aliphatic esters with a cation-exchange resin as the catalyst.** *J. Am. Chem. Soc.* **71**, 1284-8 (1949).—*C.A.* **43**, 6064*h*.

Sulfonated coal and two synthetic cation-exchange resins were used. The kinetics of the hydrolysis of methyl acetate, ethyl acetate, ethyl butyrate, ethyl caproate in 70% acetone were studied. The major factor detg. these effects was the loss in internal entropy of the ester when it was fixed on the resins in the transition state.

4113. Heymann, E. and O'Donnell, I. J. **Physicochemical investigation of a cation-exchange resin. I. Resin equilibria.** *J. Colloid Sci.* 4, 395-404 (1949).—*C.A.* **43**, 7785*e*.

The equil. between the sulfonic acid resin Amberlite IR-100 and aq. solns. of various salts were studied by detg. the amt. of acid liberated from the resin as a function of the normality of the salt solns. For salts of strong acids, this approached a limiting value at high normalities that was nearly the same for all salts. The limiting value for salts of weak acids increased with decreasing acid dissocn. const.

4114. Heymann, E. and O'Donnell, I. J. **Physicochemical investigation of a cation-exchange resin. II. Resin conductance.** *J. Colloid Sci.* 4, 405-16 (1949).—*C.A.* **43**, 7785*f*.

The cond. of a plug of swollen Amberlite IR-100 resin contg. various bound cations was detd. in a specially-designed cell. The H resin was a fairly good conductor. Replacement of H with alkali metal ions reduced the cond. by a factor of 6-12, and Ag or multivalent cations reduced the cond. much more. The order of the cond. values for these cations was Mg > Ca > Ag > Ba ≫ La > Th.

4115. Honda, Masatake. **Ion-exchange resins in analytical chemistry. III. Selective adsorbability of anion-exchange resin.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **70**, 101-3 (1949).—*C.A.* **45**, 4169*h*.

Mixts. of 0.033 *N* H_2SO_4, HCl, and H_3PO_4 were passed through a column of anion exchanger. After equil. was reached, the resin was washed with alkali, and the quantities of desorbed acids were measd. The adsorption occurred in the above order from the top of the column, and the ratio of the quantities adsorbed was 50:1:0.03, resp.

4116. Honda, Masatake. **Ion-exchange resins in analytical chemistry. IV. Removal of iron from silicate solutions.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **70**, 103-4 (1949).—*C.A.* **45**, 4169*i*.

Removal of Fe by cation exchangers was applied to Se detn. in steel. Since silicic acid was not adsorbed by anion exchangers, its mixt. with H_3PO_4 could be sepd. by the resin.

4117. Honda, Masatake. **Ion-exchange resins in analytical chemistry. V. Some characteristics of cation exchangers.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **70**, 163-5 (1949).—*C.A.* **45**, 4169*i*.

A cation-exchange resin was prepd. from pure *p*-$HOC_6H_4SO_3H$. About 2/3 of the SO_3H groups were lost during the condensation and 1/3 remained as active groups in the resin formed. The partition ratios of $[Co(NH_3)_6]^{+++}$, $[Co(NH_3)_5Cl]^{++}$, or $[Co(NH_3)_4(NO_2)_2]^+$ to H^+ were 200, 60, and 6 resp., at a concn. of 0.1 *N*.

4118. HONDA, MASATAKE. **Ion-exchange resins in analytical chemistry. VI. Observation of the adsorption band of ion exchangers by Congo red.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **70**, 165-6 (1949).—*C.A.* **45**, 4170*b*.

When a filter paper or cotton fiber dyed with Congo red was placed in a column of cation exchanger, the color was blue in the zone contg. free acid resin and red in the zone which had been exchanged by metals, such as Na. This color change could be used to det. the location of the adsorption layer.

4119. HUFFMAN, E. H. AND LILLY, R. C. **The anion-exchange separation of zirconium and hafnium.** *J. Am. Chem. Soc.* **71**, 4147 (1949).—*C.A.* **44**, 9843*i*.

Adsorption of Zr and Hf as neg. fluo ions on 200-325-mesh Amberlite IRA-400 followed by elution with a mixt. of 0.2 *M* HCl and 0.1 *M* HF at the rate of 6 cc./hr gave excellent sepn. of the 2 elements.

4120. IDLER, DAVID R. **Use of pH indicators with ion-exchange resins.** *J. Am. Chem. Soc.* **71**, 3854 (1949).—*C.A.* **44**, 380*h*.

pH indicators furnished a means of detecting acids adsorbed on a strong base type resin (Amberlite I.R.A. 400). An illustration was the use of phenolphthalein and aspartic acid.

4121. KAKIHANA, HIDETAKE. **Inorganic and analytical chemistry using ion-exchange resin. I. Vanadium-ion exchange in cation-exchange resin column.** *Bull. Chem. Soc. Japan* **22**, 242-7 (1949) (in English).—*C.A.* **45**, 4595*b*.

Tests were carried out with standard V solns. of concn. range 0.6-600.0 γ per cc. and pH range 1-12. The extent of exchange was found for completely regenerated resin, obtained in 1-3 *N* HCl, Na resin, ammonium resin, and resin with OH and sulfonic groups both satd. with Na ions. V at any pH was completely exchanged by the first resin. The extent decreased with pH increase until, at pH 5 and above, V passed quantitatively through the column.

4122. KAYAS, GEORGES. **Separation of sodium and potassium by organic ion exchangers.** *Compt. rend.* **228**, 1002-3 (1949).—*C.A.* **43**, 5698*i*.

The column of Amberlite IR-100 was constructed of thin glass, surrounded by a bronze jacket pierced by a longitudinal slit through which the radioactivity of the column could be followed. The Na in the sample was tagged with Na^{22} formed by irradiating Mg with deuterons in a cyclotron. The Na and K were initially localized in the top 2 cm of the column and were sepd. by development with 0.1 *N* HClO. This eluant was chosen because of the difference in soly. of its Na and K salts. The Na was completely removed and K appeared in the eluent.

4123. KAYAS, GEORGES. **An interesting application of ion exchange in inorganic chemistry.** *Bull. soc. chim. France* **1949**, 883-4.—*C.A.* **44**, 3332*i*.

A soln. of Na_2SO_4 was adsorbed on a column of Amberlite IR-100 and eluted with HCl soln. to obtain an equiv. amt. of NaCl.

4124. KLEMENT, ROBERT. **Application of resin exchangers to the preparation of free acids and their salts.** *Z. anorg. Chem.* **260**, 267-72 (1949).—*C.A.* **44**, 2882*d*.

The prepn. of free acids (HCNS, $H_2PO_3NH_2$, and $H_5P_3O_{10}$) by passing an aq. soln. of the corresponding alkali salt through a column contg. the resin-exchange Wofatit KS was described. The method could be used for the prepn. of other free acids, which in turn could be used for the prepn. of salts that were otherwise difficult to prep.

4125. KORTSCHAK, HUGO P.; GILL, ROBERT F., JR., AND PAYNE, JOHN H. **Regeneration of a cation-exchange resin.** *Ind. Eng. Chem.* **41**, 1406-9 (1949).—*C.A.* **43**, 6872*f*.

Dowex 30 in Na and Ca form was regenerated by HCl and H_2SO_4 solns. HCl was as efficient as H_2SO_4 for regenerating the Na form; the HCl was more efficient than the H_2SO_4 in regenerating the Ca form owing to subsequent exhaustion by the $CaSO_4$ formed. Variation of the concn. of H_2SO_4 had little effect on total capacity for the Na cycle, but the more dil. acid resulted in better max. removal of the Na in the exhaustion phase.

4126. KRAUS, KURT A. AND MOORE, GEORGE E. **Separation of zirconium and hafnium with anion-exchange resins.** *J. Am. Chem. Soc.* **71**, 3263 (1949).—*C.A.* **44**, 8195*f*.

Zr(IV) and Hf(IV) could be sepd. by anion exchange, but the sepn. was not optimum. Partial sepn. at room temp. was achieved by using a 107-cm column of 200-30-mesh Dowex-1 and a mixt. of 0.5 *M* HF-1.0 *M* HCl as eluent. The sepn. was followed by using tracers.

4127. KRAUS, KURT A. AND MOORE, GEORGE E. **Separation of columbium and tantalum with anion-exchange resins.** *J. Am. Chem. Soc.* **71**, 3855 (1949).—*C.A.* **44**, 9843*g*.

The sepn. of Cb and Ta in a 9 *M* HCl-0.05 *M* HF soln. in a 12.5-cm column by means of Dowex-1 was very efficient. Cb eluted relatively rapidly in a sharp, well-shaped band, and the Ta very much more slowly in a somewhat diffuse band with a sharp front edge.

4128. KRESSMAN, T. R. E. AND KITCHENER, J. A. **Cation exchange with a synthetic phenolsulfonate resin. I. Equilibria with univalent cations.** *J. Chem. Soc.* **1949**, 1190-1201.—*C.A.* **43**, 8792*b*.

Cation exchange was studied on a resin prepd. as a cross-linked condensation product of formaldehyde with phenol and Na phenolsulfonate; 96% of the sulfonate groups were free for exchange. The equil. consts. for Li^+, H^+, Na^+, K^+, Rb^+, and Cs^+ were a function of the hydrated ion size expressed as the a° parameter of the Debye-Hückel relation. The equil. were independent of concn. and largely of the anion. The heat of exchange of the K^+-H^+ system was 1.95 kcal/g-mol. and the free energy of the exchange, 0.54 kcal/g-mol.

4129. Kressman, T. R. E. and Kitchener, J. A. **Cation exchange with a synthetic phenolsulfonate resin. II. Equilibria with multivalent cations.** *J. Chem. Soc.* **1949**, 1201-8.—*C.A.* **43**, 8792*d*.

The studies were continued with an NH_4^+ resin and salts of 12 bivalent cations, Al^{3+}, Th^{4+}, and Zr^{4+}. The law of mass action applied to these equil. when concns. were used, rather than activities. Neutralization of all of the sulfonate groups with an equiv. no. of these cations indicated that such multivalent cations were not closely assocd. with their valency no. of sulfonate groups.

4130. Kressman, T. R. E. and Kitchener, J. A. **Cation exchange with a synthetic phenolsulfonate resin. III. Equilibria with large organic cations.** *J. Chem. Soc.* **1949**, 1208-10.—*C.A.* **43**, 8792*e*.

The affinity of quaternary NH_4 salts and the quininium ion increased with increasing size of the ion. The rate of exchange decreased with increasing ionic size. Satn. capacity of the resin for these ions was the same as that of the resin for the inorg. ions previously studied.

4131. Kressman, T. R. E. and Kitchener, J. A. **Cation exchange with a synthetic phenolsulfonate resin. IV. A note on equilibria in presence of nonaqueous solvents.** *J. Chem. Soc.* **1949**, 1211-13.—*C.A.* **43**, 8792*f*.

Univalent cation exchange was studied in mixts. of water and nonaq. solvents. These equil. obeyed the law of mass action when concns. might have been due to the effect of the solvent on the Debye radius values. $MnSO_4$ in aq. EtOH showed a marked incomplete dissocn. compared to water.

4132. Kressman, T. R. E. and Kitchener, J. A. **Cation exchange with a synthetic phenolsulfonate resin. V. Kinetics.** *Discussions Faraday Soc.* **1949**, No. 7, 90-104.—*C.A.* **45**, 19*f*.

Zeo-Karb 215 in the NH_4^+ form was used as the resin in exchange studies involving simple inorg. and substituted quaternary ammonium salts. Exchange velocities, interruption tests, the effect of agitation, and derived kinetic equations were used to det. the mechanisms involved. The data showed that the simple cations in exchange with NH_4^+ obeyed the bounding Nernst film mechanism whereas the substituted quaternary ammonium ions were in general identified with particle diffusion. Measurements on the temp. coeff. of the reactions showed that as long as the cation was small compared with the pores of the resin the energy of activation for diffusion was approx. 5 kcal/mole as was the case for free diffusion in water.

4133. Kunin, Robert and Barry, Ruth E. **Carboxylic, weak-acid type, cation-exchange resin.** *Ind. Eng. Chem.* **41**, 1269-72 (1949).—*C.A.* **43**, 6489*g*.

The exchange characteristics of a uni-functional carboxylic-type cation-exchange resin, Amberlite IRC-50, were given. This type was superior to the sulfonic acid types in equil. involving exchange with H^+ The resin would soften H_2O efficiently in the presence of a large excess of Na^+, but the equil. was such that regeneration with brine was inefficient.

4134. Kunin, Robert and McGarvey, Francis X. **Equilibrium and column behavior of exchange resins. Strong-base anion-exchange resin.** *Ind. Eng. Chem.* **41**, 1265-8, (1949).—*C.A.* **43**, 6489*f*.

The exchange characteristics of a strong-base anion-exchange resin, Amberlite IRA-400, were presented. At low-concn., the order of decreasing exchangeability for the various anions was citrate > sulfate = oxalate > iodide > nitrate > chromate > bromide > thiocyanate > chloride > formate > hydroxyl > fluoride > acetate. Reverse deionization, i.e., a system in which the anion exchanger preceded the cation exchanger, might have been used.

4135. Kunin, Robert and Myers, Robert J. **Exchange equilibria in anion-exchange resins; porous exchangers.** *Discussions Faraday Soc.* **1949**, No. 7, 79-90.—*C.A.* **45**, 19*b*.

Porous modifications of conventional anion-exchange resins of the strong-base and weak-base types were prepd. and examd. for their exchange and phys. characteristics. Decreasing the degree of cross-linking decreased the ion selectivity and increased the ability to adsorb large anions.

4136. Lur'e, Yu. Yu. and Filippova, N. A. **Use of ion-exchange resins in analytical chemistry. IV.** *Zavodskaya Lab.* **15**, 771-9 (1949).—*C.A.* **44**, 475*i*.

Phenol or resorcinol type sulfonated resins removed Ni^{++} and Cu^{++} from solns. of alloys contg. S, if the pH was held at 6 for Ni and 5.5 for Cu; this was best done by adding NH_4OH to a dild. soln. of the sample in HNO_3.

4137. Mariani, Eugenio. **Kinetics of saponification of ethyl acetate by ion-exchanging resins.** *Ann. Chim. applicata* **39**, 717-26 (1949).—*C.A.* **45**, 10016*h*.

Air-dried Amberlite IR-100 (1 g) was agitated with 25 ml of a 0.2 *N* soln. of EtOAc in H_2O or in H_2O-acetone mixts. at different temps., and the velocity of hydrolysis detd. as a function of time (20-50 min.). In H_2O the hydrolysis was more rapid than with an equiv. amt. of HCl. The resin in an aq. soln. of not more than 35% of acetone was also more effective than HCl.

4138. Mills, G. F. and Dickinson, B. N. **Oxygen removal from water by ammine-exchange resins.** *Ind. Eng. Chem.* **41**, 2842-4 (1949).—*C.A.* **44**, 2149*c*.

Anion-exchange resins were treated with Cu^{++}or Ag^+ soln., washed and reduced with 0.5 *N* $Na_2S_2O_4$ Dissolved O_2 was removed from water passed through the reduced resin to a level of less than 0.1 p.p.m. In the lab. expts. 0.24-0.33 of O_2 was removed per mole of Cu and 0.16-0.22 mole of O_2 was removed per mole of Ag to the break-through point.

4139. Oda, Ryohei and Shimizu, Hiroshi. **Ion-exchange synthetic resins. XXII. Exchangeability of inorganic cations. XXIII. Hydration energy of ions and exchangeability.** *Chem. High Polymers* **6**, 346-50, 350-5 (1949).—*C.A.* **46**, 1186*f*.

The cation exchangeability of RSO_3H-type resins was measd. with 0.1 *N* solns. of Li, K, Na, NH_4, Mg, Ca, Ni, Cd, and Ba salts. The relative exchangeability agreed with the lyotropic series.

The hydration energy of ions was calcd. according to the theory of Bernal and Fowler and compared with exchangeability.

4140. REICHELT, H. **Comparative investigations on ion exchange.** *Chem. Tech.* **1**, 28-31 (1949).—*C.A.* **44**, 775*g*.

Expts. were made on H_2O of about 3° carbonate and 8° total hardness, the exchange material being in a vertical glass tube 200 mm diam. with 900 mm depth of material, the direction of flow being reversible. Upward flow gave best results by keeping the exchanger loose and free from slime. The expts. were run until the exit H_2O fell to about 0.15° hardness at which point the material was regenerated.

4141. RICHARDSON, R. W. **Diffusion in ion-exchange media.** *Nature* **164**, 916-17 (1949).—*C.A.* **44**, 2324*i*.

Direct cotton dyes of the aromatic azo Na sulfonate type, in acid form, were selectively adsorbed from soln. by the anion-exchange resin "De-Acidite B." Equil. adsorption of 6 dyes were inversely proportional to mol. size (10 to 30 A.) The resin was thought to contain a network of pores, 10 to 20 A. in diam., which could not be penetrated by larger mols.

4142. ROBINSON, DAVID A. AND MILLS, G. F. **Adsorption of fatty acids from solvents. Duolite A-2 anion-exchange resin.** *Ind. Eng. Chem.* **41**, 2221-4 (1949).—*C.A.* **44**, 5*f*.

The adsorption on Duolite A-2, anion-exchange resin, of a homologous series of carboxylic straight-chain acids increased from acetone, water, and Shell solvent in the order named. The bearing of the results on the mechanism of acid adsorption on anion-exchange resins was discussed.

4143. SPEDDING, FRANK H. **Large-scale separation of rare-earth salts and the preparation of the pure metals.** *Discussions Faraday Soc.* **1949**, No. 7, 214-31.—*C.A.* **45**. 88*h*.

The rare earths could be sepd. by ion-exchange processes with Amberlite IR-100 resin and buffered citrate eluant. The sepn. improved with increase in column length, decrease in pH of eluant, decrease from 5% to 0.5% citrate concn., and decrease of resin particle size. The vol. of eluate increased with decrease in pH and concn. of eluant, increase in column length, and increase in temp. The sepn. of elements of low at. no. was much better than for elements of high at. no. Mold growth in the citrate solns. was temporarily stopped by the addn. of 0.1% phenol.

4144. TOMPKINS, EDWARD R. **Application of ion exchange to the separation of substances in low concentrations.** *Discussions Faraday Soc.* **1949**, No. 7, 232-7.—*C.A.* **45**, 18*g*.

The factors that affected the sepn. of solutes, column efficiency, and the shape of elution curves were enumerated and discussed.

4145. TOMPKINS, EDWARD R.; HARRIS, D. H., AND KHYM, J. X. **The effect of a number of column variables.** *J. Am. Chem. Soc.* **71**, 2504-10 (1949).—*C.A.* **44**, 4798*d*.

The effect of column area, column length and flow rate on the efficiency of an ion-exchange column for applications of vol. reduction and sepn. of fission products was studied for Y and Ce and Y^{91} and $Ce^{141, 144}$ tracers. For max. vol. reduction, the ion-exchange column should have been in the H-form initially and elution of the rare earths should have been made with citrate soln. at a pH of 3.3-3.5. For optimum sepn., it was preferable to elute the mixt. of rare earths from a column in the NH_4 form with citrate at a lower pH.

4146. TOPP, N. E. AND PEPPER, K. W. **Properties of ion-exchange resins in relation to their structure. I. Titration curves.** *J. Chem. Soc.* **1949**, 3299-303.—*C.A.* **44**, 5181*h*.

Synthetic ion-exchange resins were prepd. and titrated with HCl and KOH or NaOH and also in the presence of added NaCl or KCl. The resins were: sulfolated cross-linked polystyrene, cross-linked polymethacrylic acid, phenol-formaldehyde, resorcinol-formaldehyde, sulfonated phenol-formaldehyde, sulfited phenol-formaldehyde, resorcinal-benzaldehydedisulfonic acid-formaldehyde, and resorcylic acid-formaldehyde. If the resin was a strong acid, the exchange capacity was dependent upon the $[Na^+]/[H^+]$ ratio; if the resin was a weak acid, the exchange depended on the pH.

4147. USATENKO, YU. I. AND DATSENKO, O. V. **Determination of phosphorus in phosphorus-copper and ferrophosphorus by the use of cation-exchange agent.** *Zavodskaya Lab.* **15**, 145-7 (1949).—*C.A.* 43, 5336*g*.

The method was based on the fact that Cu, Fe, and other cations were adsorbed by the ion exchange agent (Wofatit R), while P remained in soln. as H_3PO_4 which was detd. volumetrically.

4148. USATENKO, YU. I. AND DATSENKO, O. V. **Determination of molybdenum in ferromolybdenum with the aid of cation exchange.** *Zavodskaya Lab.* **15**, 779-81 (1949).—*C.A.* 44, 478*e*.

0.1 g of sample were dissolved in 10 ml of 5 *N* HNO_3, and 10 ml of concd. HCl. The soln. was evapd. to dryness, taken up in 15 ml of concd. HCl, and dild. to 100 ml. The soln. was passed through a cation-exchange resin at 5 ml/min. It was thereupon washed with H_2O, then with 5% NaOH, and the filtrate was analyzed, after acidification with HCl, for Mo.

4149. WREATH, A. R. AND ZICKEFOOSE, E. J. **Chemical estimation of tetraethyl pyrophosphate.** *Anal. Chem.* **21**, 808-10 (1949).—*C.A.* 43, 8976*g*.

The $(C_2H_5)_4P_2O_7$ in tech. hexaethyl tetraphosphate was detd. by adding 1-2.5 g weighed sample to 50 ml 25% aq. acetone, mixing, letting stand 15 min. at 23-7°C to hydrolyze Et on Amberlite IR-4B, diluting sample and washings to 250 ml with H_2O, pipetting 100 ml aliquot, adding 50 ml 0.10 *N* NaOH, mixing, and back titrating after 30 min. with 0.1 *N* HCl to pH 6 [formation of $Na(C_2H_5)_2PO_4$] with a glass electrode.

4150. YANG, J. T. AND HAISSINSKY, MOISE. **Chromatographic separation of actinium from lanthanum.** *Bull. soc. chim. France* **1949**, 546-7.—*C.A.* 43, 8792*g*.

Mixts. of La, tagged with La^{140}, and mesothorium $2(Ac^{228})$ nitrates, in ratios from $1:10^{-8}$ to $1:10^{-9}$, were passed into a column of Amberlite IR-100 ion-exchange resin 48 cm long and 1 cm in diam. The column was eluted with ammonium citrate solns. of various concns. and pH values, and the effluent was analyzed radiochemically. La was more strongly adsorbed than Ac. Very good sepn. was obtained with pH between 4.5 and 5.5 and citrate concn. below 1%.

4151. Yorston, F. H. **Studies on sulfite waste liquor. I. The action of anion exchangers. III The extraction of sugars.** *Pulp Paper Mag. Can.* **50**, No. 12, 108-11 (1949).—*C.A.* **44**, 4247*g*.

Sulfite waste liquor was deashed with cation-exchange resin Amberlite IR-120 The deashed liquor was passed through columns contg. Amberlite IR-4B and IRA-400. The resins reduced dissolved solids to 70-80%, acidity to 40%, total C to 80-90%, and methoxyl to about 95% of original values. Sugars were recovered by satg. the exchanger with CO_2. Recovery amounted to 60-70%.

4152. Zhukov, I. I. and Brodskaya, N. I. **Connection between exchange capacity and electrokinetic potential.** *Kolloid. Zhur.* **11**, 322-7 (1949).—*C.A.* **44**, 904*a*.

Ion-exchange resins were kept for 2 days in mixts. of 0.01 *N* $BaCl_2$ and $Ba(OH)_2$ or of 0.01 *N* KCl and 0.01 *N* HCl; then the concn. of Ba^{++} or Cl^- and the pH of the supernatant soln. were detd. The rates of electrophoresis of suspended resins in this soln. were measd. Resins prepd. by sulfonation of resin, Wofatit PN, glauconite, and a zeolite adsorbed Ba^{++} more the higher the pH of the resulting soln.; at pH 10.6, 1 g of resin (two samples), Wofatit PN, glauconite, and zeolite took up 6.8, 2.5, 1.9, 0.33, and 0.74 milliequiv. Ba^{++}, resp. The electrokinetic potential was more neg. the higher the pH.

4153. Argersinger, W. J. Jr; Davidson, A. W., and Bonner, Oscar D. **Thermodynamics and ion-exchange phenomena.** *Trans. Kansas Acad. Sci.* **53**, 404-10 (1950).—*C.A.* **45**, 422*h*.

The Na-H exchange equil. on Dowex-50 was investigated. When the activities of the electrolytes in soln. were known and the assumption was made that the resin phase behaved as an ideal solid soln., the apparent equil. const. could be computed. The true equil. const. was obtained by combining the law of chem. equil. with the Gibbs-Duhem equation

4154. Atteberry, R. W. and Boyd, G. E. **Separation of seventh group anions by ion-exchange chromatography.** *J. Am. Chem. Soc.* **72**, 4805-6 (1950).—*C.A.* **45**, 2368*i*.

The halides F, Cl, Br, and I were adsorbed on Dowex-2 and then eluted with *M* $NaNO_3$ at pH 10.4 to sep. the halides. A little I was found in the F fraction. MnO_4^- reacted with the resin. ReO_4^- was eluted with 0.1 *M* $(NH_4)_2SO_4$ and NH_4SCN at pH 8.3-8.5 whereas the elution of TcO_4^- required *M* eluant. The resulting Tc was over 99% pure.

4155. Austerweil, G. V. **Outline of a few fundamental notions governing the exchange of ions.** *Bull. soc. chim. France* **1950**, 1120-5.—*C.A.* **45**, 7407*e*.

A soln. of $CaCl_2$ was run through a column of Na zeolite. The data were discussed and interpreted to show that the characteristics of an ion exchanger were the capacity, the coeff. of exchange, and the activity of the resin. The nature of the exchange was one of adsorption followed by chem. reaction.

4156. Baker, Louis C. W.; Loev, Bernard, and McCutcheon, Thomas P. **Hydrogen-cycle cation exchange for heteropoly acids and salts.** *J. Am. Chem. Soc.* **72**, 2374-7 (1950).—*C.A.* **46**, 6538*c*.

A soln. of $(NH_4)_6H_6[P_2O_2(Mo_2O_7)_9].7H_2O$ passed through a sulfonic acid-type cation-exchange resin showed no evidence of reduction. Similar treatment of $(NH_4)_3H_6[Cr(MoO_4)_6].4H_2O$ gave a pink soln. of the free acid, which on evapn. yielded the green acid. $(NH_4)_3H_5[Co(OH)(MoO_4)_5].3H_2O$ was stable in the solid state but slowly decompd. in soln. Passed through the resin, the soln. had the original color (pH 1.7) and was free of NH_4 ion. A soln. of $13(NH_4)_20.2P_2O_5.8V_2O_5.34WO_3.86H_2O$ passed through the column gave a stable acid soln. (pH 1.6), which on evapn. gave very sol. red-orange solid acid.

4157. Barrer, R. M. **Ion-exchange and ion-sieve processes in crystalline zeolites.** *J. Chem. Soc.* **1950**, 2342-50.—*C.A.* **45**, 417*e*.

Chabazite, $(Ca, Na_2)O.Al_2O_3.4SiO_2.6H_2O$, and analcite, $Na_2O.Al_2O_3.4SiO_2.2H_2O$, were compared by ion-exchange methods. Samples of the crystals of the chabazite were ground before studied, and the analcite was grown hydrothermally: ion-exchange methods used were percolation, hydrothermal exchange, fusion exchange, and vapor phase exchange. Analcite exchanged Na^+ readily for a no. of ions, but exhibited slight exchange for Li^+, Cs^+, Mg^{++} Ca^{++}, or Ba^{++}. A complete ion-sieve effect occurred between Rb^+ (radius 1.48 A.) where exchange took place and Cs^+ (radius 1.65 A.) where no exchange took place. Chabazite exchanged freely with all of the above ions except Mg^{++}

4158. Barrer, R. M. and Riley, D. W. **Influence of ion exchange upon intracrystalline sorption.** *Trans. Faraday Soc.* **46**, 853-61 (1950).—*C.A.* **45**, 4494*e*.

Kr, A, Ne, and He were adsorbed over a series of temps. and pressures in chabazites rich in the ions $(Ca^{++} + Na^+)$, Ba^{++}, Li^+, and NH_4^+. Isosteric heats of sorption showed an inhomogeneity among sorption sites, but among ion-exchange chabazites this inhomogeneity was not marked. Polarization energies in the intense fields adjacent to any cation could account for the very marked effect of ion exchange on the affinity between a nonpolar gas and its intracryst. environment.

4159. Basolo, F. and Steninger, D. H. **Preparation of hydroxoaquabis-(ethylenediamine)-cobalt (III) and hydroxoamminebis-(ethylenediamine)-cobalt (III) salts.** *J. Am. Chem. Soc.* **72**, 5748 (1950).

By means of a strong base anion exchange resin, the replacement by hydroxide ions of chloro, bromo, and iodo ligands coordinated to cobalt (III) in the "Werner-Type" complex was simplified and made more efficient. The resin was used to remove and bind ionic chloride as the hydrochloride. The strongly basic complex hydroxide which formed displaced the coordinated chloro groups, which were in turn removed by the resin. The final product, hydroxo hydroxide was obtained in almost theoretical yield.

4160. BEUKENKAMP, JOHN AND RIEMAN, WM. III. **Determination of sodium and potassium, employing ion-exchange separation.** *Anal. Chem.* **22**, 582-5 (1950).—*C.A.* **44**, 5760*e*.

Na, K, and Mg, held in a column of colloidal Dowex 50, were eluted in the order given by 0.7 *N* HCl, and were easily detd. in the elautes. Effects of elution variables were discussed and exptl. data confirming the theory were given.

4161. BISHOP, JOHN A. **Covalent adsorption on base-exchange resins. II. Adsorption from buffer solutions of straight-chain acids.** *J. Phys. & Colloid Chem.* **54**, 697-702 (1950).—*C.A.* **44**, 8195*h*.

The equation, $\log X = k \log a_{H^+} a_{A^-} + \text{const.}$, where $X =$ adsorption in millimoles of acid per g of resin, was studied using Amberlite IR-400 A.G. and acids and buffer solns. Results predicted by this equation were obtained experimentally for HCl, CH_3COOH, and $CH_2ClCOOH$, and all points for a single acid fell on the same curve, both for the acid solns. and for the buffer solns. Adsorption was attributed to direct reaction as well as to reaction with the displaced OH ions.

4162. BOYD, G. E.; ADAMSON, A. W., AND MYERS, L. S. JR. **Ion charge and exchange rates with ion-exchange polymers.** *J. Am. Chem. Soc.* **72**, 4807-8 (1950).—*C.A.* **45**, 2286*c*.

The equil. exchange rates for uni-, bi-, and trivalent cations on Amberlite IR-1 in dil. HCl diminished rapidly as ionic charge increased. Na^{24}, U^{233}, and Ce^{144} exchanged by film diffusion from 0.001 *N*, 0.003 *N*, and 0.1 *N* HCl, resp., whereas they exchanged by particle diffusion from 0.1 *N*, 0.3 *N*, and 0.5 *N* HCl, resp. Diffusion through the exchange polymer was slower than in aq. soln. and depended only on the nature and compn. of the exchanger, the temp., the ionic strength of the external soln., and the charge of the diffusing ion.

4163. BRAITHWAITE, D. G.; D'AMICO, J. S., AND THOMPSON, M. T. **Effect of chlorine on cation-exchange resins.** *Ind. Eng. Chem.* **42**, 312-15 (1950).—*C.A.* **44**, 3637*b*.

The effects of Cl_2 water were studied at different concns. and pH on regenerated and exhausted cation exchangers. Sulfonated coal and sulfonated phenol-formaldehyde exchangers all eventually disintegrated. Sulfonated styrene-di-vinylbenzene polymers were not attacked by Cl_2.

4164. CASSEL, MARTHE. **Donnan equilibrium and ionic distribution between solutions of electrolytes and sulfonated resins.** *Compt. rend.* **230**, 2286-8 (1950).—*C.A.* **44**, 10417*f*.

The ionic distribution between electrolytic solns. and ion-exchange resins followed the Donnan equil. equations in dil. concns. For concd. solns., the diminution of the amt. of the exchange followed a variation in the ratio of the activity coeffs. of the cations in the external soln. and followed a new distribution represented in a satisfactory manner by an equation of the Freundlich type. Electrolytes studied were KCl, CsCl, NaCl, and NH_4Cl.

4165. CLEAVER, CHARLES S. AND CASSIDY, HAROLD G. **Chromatographic adsorption of amino acids on organic exchange-resins. II.** *J. Am. Chem. Soc.* **72**, 1147-52 (1950).—*C.A.* **45**, 2287*b*.

The countercurrent response of a representative synthetic org. anion-exchange resin (IR-4) toward a typical acidic amino acid (glutamic acid) was studied. The effect of the type of resin, pH of soln., and foreign anion contamination on the response were given in curves. The adsorption varied with the pH as well as with the foreign-anion concn.

4166. COHN, WALDO E. **The anion-exchange separation of ribonucleotides.** *J. Am. Chem. Soc.* **72**, 4, 1471-1478 (1950).

The nucleotides of ribonucleic acid were separated from each other and from the corresponding bases and ribosides by successive elution from strong base anion exchangers with weak acids and buffers of controlled pH and anion concentration. The order of elution at several levels of pH was eastablished for cytidylic, adenylic, guanylic, and uridylic acids.

4167. COSGROVE, J. D. AND STRICKLAND, J. D. H. **Cation-exchange resins. The applicability of the mass-action law to the exchange of univalent ions.** *J. Chem. Soc.* **1950**, 1845-53.—*C.A.* **45**, 1404*i*.

An exptl. test was made of the validity of the mass-action law as applied to the exchange of K, H, and NH_4 ions on phenol-formaldehyde and sulfonated cross-linked polystyrene-type resins. The approx. expression $K' \quad [X_r\ (1-X_r)][(1-X_s)/X_s]$ was calcd. from detns. of the adsorption isotherms and tested for constancy with varying X_{Mr} and X_{Ms}. X_r and X_s were the mole fractions of M^+ on the resin and in soln., resp. Three exptl. techniques were described for obtaining the adsorption data, and plots of K' vs. X_{Mr} and X_{Ms} were given for the exchange of K and H, K and NH_4, and H and NH_4 ions.

4168. D'AMICO, J. S. AND THOMPSON, M. T. **Effect of Chlorine on cation-exchange resins.** *Ind. Eng. Chem.* **42**, 312-15 (1950).—*C.A.* **44**, 3637*b*.

The effects of Cl_2 water were studied at different concns. and pH on regenerated and exhausted cation exchangers. Sulfonated coal and sulfonated phenol-form-aldehyde exchangers all eventually disintegrated. The Cl_2 attacked the methylene bond of the latter to give sol. sulfonic acids of low mol. wt. Sulfonated styrene-divinylbenzene polymers were not attacked by Cl_2.

4169. DAVIES, C. W.; HUGHES, R. B., AND PARTRIDGE, S. M. **Amino acid separations by use of a strong-base resin.** *J. Chem. Soc.* **1950**, 2285-7.—*C.A.* **45**, 207*a*.

Details were given of the sepn. of leucine and glutamic acid or methionine on Dowex 2. Clear-cut separations of two neutral amino acids, leucine and methionine, were obtained. A mixture of glutamic acid and leucine was also separated efficiently.

4170. Davies, C. W. and Nancollas, G. H. **Preparation of carbonate-free sodium hydroxide.** *Nature* **165**, 4189, 237 (1950).

CO_3-free alkali was prepared by passing a solution of NaOH through column containing a strongly basic anion exchange resin in its chloride form.

4171. Davis, Lannes E. **Ionic exchange and statistical thermodynamics. I. Equilibria in simple exchange systems.** *J. Colloid Sci.* **5**, 71-9 (1950).—*C.A.* 44, 6242*c*.

The conditions for ionic exchange equil. were derived from classical thermodynamics and the appropriate ion-exchange terms from statistical thermodynamics.

4172. Davis, Lannes E. **Ionic exchange and statistical thermodynamics. II. Equilibria in irregular systems.** *J. Colloid Sci.* **5**, 107-13 (1950).—*C.A.* 44, 6242*c*.

Irregular ion-exchange systems (i.e., those that did not conform in exptl. behavior to predictions based on a statistically-treated model) were recognized. The internal partition function was markedly affected by strong bond forces. There was a mixt. of 2 "regular" systems having significantly different values for the equil. exchange const.

4173. Davydov, A. T. and Levitskiĭ, I. Ya. **Dependence of the amount of adsorbed cation on the weight of the adsorbent.** *Zhur. Obshcheĭ, Khim. (J. Gen. Chem.)* **20**, 1776-9 (1950); *J. Gen. Chem. U.S.S.R.* **20**, 1837-40 (1950) (Engl. translation).—*C.A.* **45**, 417*d*; **46**, 4883*a*.

The exchange-adsorption isotherm equation of Gapon called for a linear relation between $y = g/a$ and $x = (a/vm)^{1/m}/[C_0 - a/vn]^{1/n}$, where g = wt of adsorbent, a = amt. adsorbed, v = vol. of soln./g adsorbent, C_o = initial concn., m and n = valencies of the ions exchanged. The validity of this relation was confirmed by exptl. data for the exchange of $Ca^{++} + Na^+$, $Ca^{++} + K^+$, $Sr^{++} + Na^+$, $Sr^{++} + K^+$, $Ba^{++} + Na^+$, and $Ba^{++} + K^+$ on glauconite.

4174. Deuel, H.; Solms, J., and Anyas-Weisz, L. **The behavior of soluble polyelectrolytes toward ion exchangers.** *Helv. Chim. Acta* **33**, 2171-8 (1950) (in German).—*C.A.* **45**, 2286*e*.

High-polymer electrolytes such as polygalacturonic acid, polymanuronic acid, and polymetaphosphoric acid were adsorbed by Amberlite IR-4B, in contrast to their low-mol. fragments, which were absorbed like normal ions. Percolation through ion-exchange resins sepd. the low-mol. ions from the high-mol. ions.

4175. Dickel, Gerhard. **New possibilities for the separation of isotopes by means of ion exchangers.** *Z. Elektrochem.* **54**, 353-7 (1950).—*C.A.* **45**, 6885*a*.

The theoretical fundamentals were given for the practically feasible combination of 2 methods of ion exchange, the continuously working residue method and the true countercurrent method. Equations were derived for isotope sepn.

4176. Djourfeldt, Ralph and Samuelson, Olof. **Utilization of ion exchangers in analytical chemistry. XV.** *Acta Chem. Scand.* 4, 165-84 (1950).—*C.A.* 44, 6759*f*.

The effect of the particle size was shown, and an optimal size was recommended. Ion exchange was quant. even for rather acid solns. Conditions for regeneration of the ion exchange column with HCl were studied.

4177. Douglas, D. M.; Elliott, G. A.; Ellis, W. R., and Lee, R. H. **Some attempts to concentrate the K^{40} isotope.** *Proc. Conf. Applications Isotopes Sci. Research, Univ. Melbourne* **1950**, 125-36 (1951).—*C.A.* **45**, 9315*g*.

Cation-exchange expts. utilizing a natural green-sand and a com. zeolite were described. Details were also given of a study utilizing the countercurrent ionic migration method. Neg. results were reported for both procedures.

4178. Ekedahl, E.; Högfeldt, E., and Sillén, L. **Theory of sorption columns.** *Nature*, **166**, 722-723 (1950).

An approach to the calculation of sorption fronts which may be applied to ion exchange methods was developed. A measure of the approach to equilibrium conditions was expressed as a standard function; the function was then used to estimate boundary formation.

4179. Ekedahl, Erik; Högfeldt, Erik, and Sillen, Lars G. **Kinetics and equilibria of ion exchange.** *Nature* **166**, 723-4 (1950).—*C.A.* **45**, 3682*h*.

The apparent equil. const. as a function of the Ag fraction in an ion exchanger was calcd. from results of elution expts. in which a H-ion soln. was percolated at rates from 1 to 70 ml per min. through an ion exchanger satd. with Ag.

4180. Erler, Karl. **Use of exchange resins in analytical chemistry. II. Behavior of Wofatit F toward weak, organic acids.** *Z. anal. Chem.* **131**, 106-13 (1950).—*C.A.* 44, 9855*b*.

The behavior of the exchange resin Wofatit F (cation exchange) of different grain sizes was studied with respect to unpolar adsorption ability for different acids. Mineral acids were hardly adsorbed at all. Weak, org. acids were adsorbed and the effect was greater with increasing mol. wt. The monobasic acids were adsorbed more than were dibasic acids.

4181. Fager, E. and Rosenberg, J. **Phosphoglyceric acid in photosynthesis.** *Science* **112**, 617-618 (1950).

Suspensions of the alga *Scenedesmus obliguus* were illuminated for 10-15 minutes in the presence of excess $C^{12}O_2$. Tracer (HCO_3^-) was added, illumination continued for 30-40 seconds, and the algae killed. The aqueous extract was dialyzed and deionized with a strong acid cation and a weak base anion exchanger. The anion bed was fractionally eluted with dilute ammonia.

4182. Futterknecht, Andre. **Use of ion-exchange resins in analytical chemistry.** *Chim anal.* **32**, 306-8 (1950).—*C.A.* **45**, 2362*g*.

Ion-exchange resins could be used for sepg. most inorg. ions, for sepg. many org. compds., and furnished the only means for rapidly isolating radio-isotopes. Two expts. were described.

4183. Gabrielson, Gunnar and Samuelson, Olof. **Utilization of ion exchangers in analytical chemistry. XVII. Determination of potassium in the presence of sulfate and phosphate.** *Svensk Kem. Tid.* **62**, 221-3 (1950).—*C.A.* **45**, 4169c.

The columns used contained beds (0.8 by 150 mm) of Amberlite IRA-400 (0.12-0.30 mm particle size), pretreated with *N* NaCl. In one series of expts., solns. (50 ml each) contg. 0.25-0.46 g K_2SO_4 were passed through at a rate of 3 ml/min., and the K detd. as perchlorate in the sulfate-free effluent. The method was also applied to the detn. of K in mixts. of KCl with Na_2SO_4 or NaH_2PO_4 (max. relative error: ±0.4%).

4184. Gapon, E. N. and Belenkaya, I. M. **Determination of the absorptive capacity of ion-exchange materials.** *J. Applied Chem. U.S.S.R.* **23**, 1419-20 (1950) (Engl. translation).—*C.A.* **46**, 8460*f*.

A weighed amt. of adsorbent was satd. with Ba^{++} by running 0.1 *N* $BaCl_2$ through it. Without washing, the Ba^{++} was eluted with 0.01 *N* HNO_3 and detd. as $BaSO_4$, and Cl^- was detd. as AgCl. Chernozem (Suma and Budarino) soils, Na Glauconite, alumina, and several zeolites were used.

4185. Gapon, E. N. and Zhupakhina, E. S. **Dynamic method of determination of the adsorption capacity.** *Doklady Akad. Nauk S.S.S.R.* **72**, 721-4 (1950).—*C.A.* **44**, 9769c.

A soln. of $Cu(NO_3)_2$ of a concn. so chosen that adsorption equil. was reached after passage of 200-250 ml and no Cu^{++} detected in the filtrate after passage of the 1st portion, was passed through a column of adsorbent 3-4 cm high, in a tube 2 cm in diam., by portions of 25 ml at a time, and the filtrates analyzed for Cu^{++}. The adsorption capacities of permutites, glauconite, and different kinds of soils were detd.

4186. Guntz, Antoine A. **Multiplication of ions by ion exchangers.** *Compt. rend.* **231**, 227-8 (1950).—*C.A.* **44**, 10462*i*.

If a soln. of a given cation was passed through an acid ion exchanger, and then the H ions thus obtained passed through an exchanger consisting of a neutral insol. salt, the acid salt of which was sol., the no. of cation equivs. in the soln. thus obtained would equal the no. of equivs. of the original cation times a multiplication factor. If the H-ion soln. was passed through $CaCO_3$, the reaction $2H^+ + 2CaCO_3 \rightarrow 2Ca^{++} + 2HCO_3^-$ liberated 2 equivs. of Ca^{++}.

4187. Gupta, S. L. **Titration curves of Amberlites IR-100 and IR-4B.** *Science and Culture* **15**, 325-6 (1950).—*C.A.* **44**, 7618*g*.

The Amberlite IR-100 resin was ground in a mortar and particles that did not settle after 8 hrs. of sedimentation were collected in 0.05 *N* HCl, filtered, and washed free of the HCl. Titration with NaOH in the presence of NaCl gave typical curves in which the addn. of salt before the titration depressed the pH. The same sedimentation procedure was used with the IR-4B resin, and the fine particles were collected in 0.05 *N* NH_4OH. The titration curve with dil. HCl exhibited 2 inflection points characteristic of a dibasic acid.

4188. Gupta, S. L.; Bose, Monisha, and Mukherjee, S. K. **Ion exchange in synthetic resins.** *J. Phys. & Colloid Chem.* **54**, 1098-1109 (1950).—*C.A.* **45**, 1404*f*.

A resorcinol-formaldehyde cation exchange resin and a *m*-phenylenediamine anion exchange resin were prepd. and studied. For the cation resin the exchange capacity with alkalies increased with time of contact, increased with increasing fineness of the samples, and increased when the resin-soln. vol. ratio was decreased. $Ba(OH)_2$ gave a greater exchange capacity than NaOH under the same conditions. The presence of neutral salts increased the exchange capacity, but the NaOH capacity increased relatively more than the $Ba(OH)_2$ capacity.

4189. Hachihama, Yoshikazu; Jodai, Sho; Sato, Hiroshi; Fukui, Eiichi, and Nakamura, Tadashi. **Lignin as raw material of synthetic resins. II. Cation-exchanging resin from sulfite pulping waste liquor.** *Mem. Inst. Sci. Ind. Research Osaka Univ.* 7, 167-8 (1950); *J. Chem. Soc. Japan, Ind. Chem. Sect.* **53**, 365-7 (1950).—*C.A.* **45**, 10659c; **46**, 11505c.

A 50-70% yield of cation-exchange resin was pptd. as a brown mass by refluxing 20 cc. sulfite waste liquor contg. 20% solids, with 4.4 cc. 30% formalin and 4-8 cc. H_2SO_4 (d. 1.80) for 5 hrs. Best resin was obtained in reaction of 2-3 hrs, exchanging 0.35-0.30 millimoles K per g resin.

4190. Higgins, G. H. and Street, K. Jr. **Note on the ion-exchange separation of europium, gadolinium, and terbium.** *J. Am. Chem. Soc.* **72**, 5321-2 (1950).—*C.A.* **45**, 2286*i*.

The elution of Y, Eu, Gd, and Tb from Dowex-50 by 5% NH_4 citrate at 97 °C was studied by use of radioactive tracers. Spectrographic measurements supplementary to the activity measurements showed the sample was sepd. into 3 fractions corresponding to Y, Tb, and Eu and Gd, resp. The more marked sepn. of Tb from Gd than Eu from Gd was related to the half-filled 4f configuration.

4191. Högfeldt, Erik; Ekedahl, Erik, and Sillén, Lars G. **Activities of the components in ion exchangers with multivalent ions. Activities of the barium and hydrogen forms of Dowex 50.** *Acta Chem. Scand.* 4, 828-9; 829-30 (1950).—*C.A.* **44**, 10442*h*.

An equation was developed and applied to exchange reactions on Dowex 50.

4192. Högfeldt, Erik; Ekedahl, Erik, and Sillén, Lars G. **Ion-exchange equilibria. I. The silver-hydrogen equilibrium on Wofatit KS and Dowex 50.** *Acta Chem. Scand.* 4, 1471-89 (1950) (in English).—*C.A.* **45**, 5005c.

The exchange $Ag^+ + HR \rightleftharpoons H^+ + AgR$ (R was the anion framework of the resin) was studied on Wofatit KS and Dowex 50 by chem. and e.m.f. methods of analysis; the equil. was attained from both sides. The mole-fraction range of AgR covered was 0.001-0.98. For the above reaction, the equil. const., *k*, was independent of ionic strength (0.100 and 0.020) for both exchangers.

4193. HOLM, LENNART W. AND WESTERMARK, TORBJORN. **The exchange of isotopic ions in cation exchangers.** *Acta Chem. Scand.* 4, 968-9 (1950).—*C.A.* 45, 2741*i*.

The exchange of Ag with its radioactive isotope was detd. by both batch and column ion exchange studies. The results indicated a rapid exchange between ions on the resin and their isotopic ions in the surrounding soln. and thus confirmed the existence of a dynamic equil. "Labeled" silver nitrate solns. were treated with a sulfonated polystyrene-type cation exchange resin previously satd. with silver ions.

4194. HONDA, MASATAKE. **Ion-exchange resin applied to chemical analysis. VII. Separation of fluoride from heavy metal ions. VIII. Separation of ions by means of the difference of adsorptive properties according to electric charge.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **71**, 59-60; 118-20 (1950).—*C.A.* **45**, 5053*e*; 5053*f*.

F ion could be sepd. from interfering Al, Fe and Be by a cation-exchange resin. Mixts. of Li, Be, and Al salts whose concns. were 20, 16, and 42 mg/liter, resp., were passed through a column of cation-exchange resin and adsorbed. The adsorbed column was washed with 0.1 *N* HCl, 0.05 *N* $CaCl_2$ soln., and 4 *N* HCl successively. The first effluent contained Li, the 2nd Be, and the 3rd Al salts.

4195. HONDA, MASATAKE. **Exchange capacity of anion-exchange resins.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **71**, 183-6 (1950).—*C.A.* **45**, 4523*i*.

The role of anion (A) concn. and pH in liquid phase affecting the exchange capacity of anion exchange resins was studied. In solid phase pH depended upon pA, and according to the membrane equil.- pA + pH in the solid and liquid phases must be equal in equil. Hence the exchange capacity of resins was detd. by pA + pH in liquid phase. This was confirmed by expts. on the adsorption of acetates and chlorides.

4196. HONDA, MASATAKE. **Exchange equilibrium of weak electrolytic exchangers. II. Exchange capacity curves of several weak exchangers and measurement of their internal pH.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **71**, 440-3 (1950).—*C.A.* **45**, 6006*a*.

The exchange capacity curves representing the relations between *E* and pH + pCl were detd. for Amberlites IR-4B and IRA-400 and *m*-phenylenediamine resin. The relation between *E*-(pOH + pNA) was detd. for Amberlite IRC-50. The internal pH values of resins were detd. directly by adsorbed indicators. pH values of polystyrene sulfonic acids, their salts, and IRC-50 (HR form) were 0, 3-6, about 4, resp.

4197. INABA, AYAKO AND SASAKI, TSUNETAKA. **Ion-exchange adsorption by coal. II. On the properties of coal treated with sulfuric acid.** *Mem. Faculty Sci. Kyūsyū Univ. Ser. C, Chem.* **1**, 211-16 (1950) (in English).—*C.A.* **46**, 3828*d*.

Coal grains treated with a mixt. of concd. H_2SO_4 and $K_2Cr_2O_7$ with $HgSO_4$ as a catalyst showed a cation exchange capacity. Four fifths of the Na^+ on coal was exchanged for Ca^{++} in soln. in 30 sec and all of it in 6 mins. The capacity for Ca^{++}-Na^+ exchange equil. was approx. 2 meq./g.

4198. JONES, J. IDRIS. **Coal tar bases. III. By-products of the hydrogenation of pyridine with Raney Ni.** *J. Chem. Soc.* **1950**, 1392-7.—*C.A.* **45**, 618*i*.

Ordinarily, investigations of these by-products involve much difficulty as to separating and characterizing the *N*-*n*-amylpiperidine, owing to the existence of other bases in the same fraction. However, a clear-cut separation of this piperidine derivative from the contaminative bases was made possible by selective elution from a cation exchanger.

4199. JUDA, WALTER AND MCRAE, WAYNE A. **Coherent ion-exchange gels and membranes.** *J. Am. Chem. Soc.* **72**, 1044 (1950).—*C.A.* **45**, 2286*f*.

New resinous sulfonic cation-exchange membranes had unusually high sp. elec. cond. and exchange capacities and a characteristic concn. potential of 54-5 mv., a sp. cond. of 0.02-0.03 ohm^{-1} cm^{-1}, and an exchange capacity of 0.4-0.6 milliequiv. per g of wet H-form material.

4200. JURKIEWICZ, JAN. **Static method of determining the coefficient of ion exchangers.** *Prace Badawcze Glownego Inst. Gornictwa* (Katowice), *Komun.* No. **75**, 12 pp. (1950).—*C.A.* **47**, 1988*h*.

Between 1.5 and 3 g of the ion exchanger was loaded into a small brass tube closed with a metallic gauze on both ends that fit by means of rubber stoppers into the necks of two bottles. One of them contained *V* cc. of a soln. of an ion suited to the type of the exchanger. Its concn. (S_o) must not be less than 5.0 meq./liter. The whole app. was mounted on an automatically revolving device which turned it over periodically; this forced the soln. to flow through the exchanger from one bottle into the other. The method was applied to a Na-ion exchanger Escarbo and it was found to be independent of the S_o and S values. The exchanged ion was Ca^{2+}.

4201. KAGAWA, IKUMI; SATO, SUSUMU, AND KASASHI, RYUZO. **Ion-exchange resins. I. Equilibrium condition of ion-exchange processes. II. Ion-exchange mechanism of anion exchangers.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, **53**, 85-7; 126-8 (1950).—*C.A.* **46**, 8460*i*.

The equil. consts. in the cation exchange between each of KCl, NH_4Cl, $CaCl_2$, $BaCl_2$, and the cation-exchange resin (a sulfonated Bakelite) were detd. The difference of the actions of anion exchanger (OH-resin) and of cation exchanger (sulfonic acid resin) could be attributed to the weak basic character of the former and the strong acidic character of the latter.

4202. KAKIHANA, HIDETAKE; NATSUME, HARUO, AND YASIMA, SHUNICHI. **Electric chromatography with cation-exchange resin column.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **71**, 234 (1950).—*C.A.* **45**, 4599*d*.

Cu^{++} and Co^{++} could be sepd. by means of cation-exchange resin. The column of Amberlite IRC-50 contg. Cu^{++} and Co^{++} was kept in contact with the column which contained Amberite only, and d.c. at 100 v. was applied on the terminals of both columns.

4203. Kayas, Georges. **Complete separation of alkali metals by ion exchange.** *J. chim. phys.* 47, 408-10 (1950).—*C.A.* 45, 61*h*.

Na and K salts were eluted with 0.1 *N* HCl and Rb and Cs salts with *N* HCl. The progress of the sepn. was followed by means of tracers, with Na^{24}, K^{42}, Rb^{86}, and Cs^{134}. A plot of activity of eluant vs. vol. of eluant showed quant. sepn. of these salts by Amberlite IR 100 resin.

4204. Kraus, Kurt A. and Moore, George E. **Adsorption of protactinium from hydrochloric acid solutions by anion-exchange resins.** *J. Am. Chem. Soc.* 72, 4293-5 (1950).—*C.A.* 45, 2286*b*.

The distribution coeff. of Pa(V) between Dowex-1 and HCl soln. as a function of HCl concn. was low below 4 *M* HCl, but rose abruptly above this concn. Pa thus formed a negatively charged chloride complex which had a probable charge of minus one. Pa was quantitatively adsorbed from 8 *M* HCl, and the band was not moved appreciably by washing with 8 *M* HCl.

4205. Krishnamoorthy, C. and Overstreet, Roy. **Behavior of hydrogen ion in exchange reactions.** *Science* 111, 231-2 (1950).—*C.A.* 44, 6700*i*.

It was possible to calc. an adsorption energy for H ion that was consistent with its charge and at. wt. If an adsorbent in its H form was treated with a KCl soln., the equil. const., $k_{RH} = X[X + CK_{ad}]/C[C(T - K_{ad}) - X]$, where T = total exchange capacity of the adsorbent, K_{ad} = adsorbed K^+, C = const., and $X = K_{ad} - [HCl]/[KCl]$. For the synthetic resin "Ion X" the value of k_{RH} was 0.82 milliequiv. per g of adsorbent, and $C = 11.0$.

4206. Kubo, Shoji and Tsutsumi, Chuichi. **Gravimetric determination of phosphorus by the use of cation-exchange resin.** *Rept. Food Research Inst.* (Japan) 3, 87-9 (1950).—*C.A.* 47, 6818*g*.

The sepn. of PO_4^{3-} from interfering cations was made with a cation-exchange resin of H form and it was pptd. with magnesia mixt.

4207. Lisicki, Z. **Thermochemical method of determining the capacity of hydrogen-ion exchangers.** *Przemysl Chem.* 6 (29), 45-6 (1950).—*C.A.* 45, 10435*i*.

A comparative method of successive thermochem. measurements was used to det. the capacity of H-ion exchangers and the heat developed during neutralization. The method permitted the elimination of practically all thermometric and colorimetric corrections.

4208. Lynam, C. G. and Weil, H. **Movable-bed chamber technique in ion exchange.** *Mfg. Chemist* 21, 60-4, 77 (1950).—*C.A.* 44, 7100*b*.

The technique of removing satd. ion-exchange resins, replacing the satd. material with fresh material, and treatment of the satd. resin in a central plant was discussed. Radial-flow ion exchange was introduced as an alternative method.

4209. Mayer, Stanley W. and Schwartz, S. David. **The association of cerous ion with sulfite, phosphate, and pyrophosphate ions.** *J. Am. Chem. Soc.* 72, 5106-10 (1950).—*C.A.* 45, 2286*g*.

The distribution of Ce^{3+} between ion-exchange resin Dowex 50 and solns. of H_2SO_3, H_3PO_4, and $H_4P_2O_7$ was measured. The consts. for the reaction between Ce^{3+} and these acids were calcd. The assocn. consts. for $CeSO_3^+$, $CePO_4$, and $CeP_2O_7^-$ were 1.1×10^8, 3.4×10^{18}, and 1.4×10^{17}, resp.

4210. Mellor, D. P. **A possible method for the removal of trace elements from solutions.** *Australian J. Sci.* 12, 183 (1950).—*C.A.* 44, 10445*b*.

Ion-exchange resins were proposed in which a metal-complex-forming mol. was polymerized leaving some chelate-ring-forming groups free.

4211. Moore, George E. and Kraus, Kurt A. **Adsorption of iron by anion-exchange resins from hydrochloric acid solutions.** *J. Am. Chem. Soc.* 72, 5792-3 (1950).—*C.A.* 45, 3290*h*.

Elution expts. with tracer Fe^{59} and 0.023 cm^2 columns of Dowex-1 showed that the elution const. decreased rapidly with increasing HCl concn. above 1 *M*, reaching the value of 2×10^{-4} at 9 *M*. The behavior of Fe(III) was similar to Pa(V). Al, Cr, and rare-earth ions were practically not adsorbed from strong HCl soln.

4212. Mukherjee, Sudhamoy; Gupta, Manik Lal Sen, and Bhattacharyya, Nath. **Adsorption of acid, bases, and alkaloids by synthetic ion-exchange resins.** *J. Indian Chem. Soc.* 27, 156-68 (1950).—*C.A.* 45, 925*a*.

The adsorption of acids and alkalies on ion-exchange resins followed the Freundlich adsorption isotherm. The total acidities of a series of cationic resins as detd. by potentiometric titration may fall in a different order from that of the adsorptive powers as found from the adsorption isotherms. The anionic resins appeared to give true anion-exchange rather than mol. adsorption of acids. The order of adsorption of alkaloids on a series of cationic resins was dependent on the alkaloid.

4213. Odencrantz, June T. and Rieman, William III. **Determination of arsenic in insecticides. Application of ion exchange.** *Anal. Chem.* 22, 1066-7 (1950).—*C.A.* 44, 9105*c*.

The removal of As by distn. as $AsCl_3$ was avoided by passing a suitable soln. of the sample in dil. HCl through a column of 60-100 mesh Ion-X. After oxidation to As^{+5}, it was separated from interfering cations in 5 minutes by use of a cation exchange resin. Time and space savings were effected most readily when several samples were analyzed simultaneously.

4214. Oguri, Sutezô and Sekine, Yoshirô. **Removal of formic acid from formaldehyde.** *Science (Japan)* 20, 328-9 (1950).—*C.A.* 45, 10436*f*.

Com. HCHO contg. 47 mg HCOOH/100 cc. was treated with one-tenth of its wt of anion-exchange resin. The content of HCOOH was reduced to 6 mg/100 cc. after 20 hrs, and to below 2 mg/100 cc. after 100 hrs of treatment. The pH of the original com. HCHO (3.00) changed to 4.25 after 20 hrs, and reached 6.85 after 100 hrs. The loss of com. HCHO due to the adsorption on anion-exchange resin was within 1.0-1.5%.

4215. Ongaro, Dante. **Determination of exchange capacity of ion exchangers.** *Chimica e industria* 32, 264-8 (1950).—*C.A.* 44, 10444*f*.

Cationic exchangers were regenerated for 15 min. with 100 ml of 5% HCl, followed by 3 washings with distd. water and a 30-min. equilibration with 300 ml distd. water. Anionic exchangers were regenerated similarly with 100 ml of 5% Na_2CO_3 and equilibrated for 30 min. with 600 ml distd. water. The salt-forming capacity of cationic exchangers was detd. by adding a soln. prepd. from 80 ml distd. water and 20 ml *N* NaOH. The liquid was allowed to pass through in 15 min.; this was followed by 4-5 washings with a total of 300 ml of distd. water.

4216. Orlova, L. M. **Determination of free acidity in salt solutions with the aid of organolites.** *Zhur. Anal. Khim.* 5, 370-4 (1950).—*C.A.* 45, 925*c*.

This method consisted of exchanging the cation in soln. against the H of a cationite and titrating the soln. passed through the cationite. As exchange material was used CH_2O-resorcinol resin. The salts studied were K, Ba, Cu^{++}, Cr^{+++}, and Fe^{+++} chlorides and $Al_2(SO_4)_3$. From neutral solns. Cu and Ba absorbed well.

4217. Paléus, Sven and Neilands, J. B. **Preparation of cytochrome c with the aid of ion-exchange resin.** *Acta Chem. Scand.* 4, 1024-30 (1950) (in English).—*C.A.* 45, 2053*b*.

Cytochrome c was chromatographed on conditioned cation exchanger (Amberlite IRC-50). It lodged at the top of the column, and on every trial, a golden-colored impurity, protein in nature, appeared quickly in the effluent. It was eluted with 0.1 *M* $NH_4OHAcONH_4$ at pH 10.8. The original cytochrome c contained 0.24% Fe, and the front and tail fractions from the chromatogram contained 0.447% and 0.461% Fe.

4218. Pedinelli, Mario and Bovelacci, Franco. **An ion-exchange resin.** *Chimica e industria* (Milan) 32, 110-15 (1950).—*C.A.* 45, 3964*d*.

Dekation-K-1 was formed in an acid-catalyzed condensation of an alkali *p*-hydroxyphenylsulfonate with trioxymethylene. In H_2O the resin swelled by 50% of its original vol. The resin was insol. in org. and inorg. solvents and decomp. at 200°C. The exchange capacity was 800 milliequivs./1000 ml and 1.4 milliequivs./g.

4219. Reichard, Peter and Estborn, Bengt. **Preparation of desoxyribonucleosides from thymonucleic acid.** *Acta Chem. Scand.* 4, 1047-53 (1950).—*C.A.* 45, 3807*g*.

The crude desoxyribosides were purified by elution from a cation exchanger (Dowex 50), first with 0.1 *M* NH_4OAc buffer of pH 3.9, followed by 5% NH_3. The nucleosides were further purified by crystn.

4220. Rhodehamel, H. W. Jr.; McCormick, S. L., and Kern, S. F. **Crystalline dihydrostreptomycin base.** *Science* 111, 233 (1950).—*C.A.* 44, 5542*f*.

Dihydrostreptomycin base was prepd. by (1) titration of an aq. soln. of relatively pure dihydrostreptomycin sulfate to pH 12 with $Ba(OH)_2$, or (2) passing an aq. soln. over a strongly basic ion-exchange resin in the hydroxyl cycle.

4221. Saunders, L. and Srivastava, R. **The absorption of quinine by a carboxylic acid ion-change resin.** *J. Chem. Soc.* 1950, 2915-19.—*C.A.* 45, 1839*c*.

Absorption of quinine on Amberlite IRC-50 in acid form, followed the relation $dx/dt = ka(a-x)/x^2$, where a was initial soln. concn. in millimoles/100 ml, x was millimoles absorbed by 5 g of resin, and t was time in hrs. Data were obtained batchwise over 7 days and from column studies. The rate of absorption of quinine was largely controlled by the rate of diffusion of quinine mols. through the resin.

4222. Schubert, J. **Other methods. A. Chromatographic adsorption methods of quantitative separation.** *Natl. Nuclear Energy Ser.*, Div. VIII, 1, *Anal. Chem. Manhattan Project*, 693-704 (1950).—*C.A.* 45, 1899*i*.

The mechanism of ion-exchange absorption by means of resins, the principles underlying equil. adsorption, and adsorption under nonequil. conditions were explained. Suitable adsorbents now available were named and suitable app. shown. Analytical sepns. by cationic displacement and by formation of complex ions were discussed and the way to study systematically possible chromatographic procedures was pointed out.

4223. Schubert, Jack and Lindenbaum, Arthur. **Complexes of calcium with citric acid and tricarballylic acids measured by ion exchange.** *Nature* 166, 913-14 (1950).—*C.A.* 45, 4165*i*.

Dissocn. consts. of the complexes of Ca with citric and tricarballylic acid were measured by the degree to which tracer levels of a Ca^{45} were taken up by a synthetic org. cation exchanger in the presence of known concns. of the complex-forming anion. The pK_c for the citric acid complex was 3.38 ± 0.04; that for the tricarballylic acid, 1.82 ± 0.03.

4224. Schubert, Jack and Richter, John W. **The use of ion exchangers for the determination of physicochemical properties of substances, particularly radiotracers, in solution. III. The radio-colloids of zirconium and niobium.** *J. Colloid Sci.* 5, 376-85 (1950).—*C.A.* 44, 10446*b*.

The distribution coeffs. of Zr^{95} or Nb^{95} between a radio-colloid soln. and a cation exchange resin were detd. under a variety of conditions. There was a marked difference between cation-exchange adsorption and radiocolloidal adsorption by the exchange resin. These phenomena may be applied to the sepn. and purification of elements (e.g., sepn. of Zr from Cb) by ion exchange.

4225. Selke, W. A. and Bliss, Harding. **Application of ion exchange. Copper-Amberlite IR-120 in fixed beds.** *Chem. Eng. Progress* 46, 509-16 (1950).—*C.A.* 45, 4*g*.

Bivalent-univalent exchanges such as Cu-H and Cu-Na on Amberlite IR-120 followed a nonlinear equil. in dil. solns. in which the exchanging ion in the exchanger approached the total exchange capacity. This was equiv. to assuming no back "pressure" until the resin was satd. Cu-Mg exchange followed an approx. linear equil. over these concn. ranges.

4226. SHIMIZU, HIROSHI. **Ion-exchange synthetic resins. XXV. Preparation of resin from *p*-phenol sulfonic acid and formaldehyde.** *Chem. High Polymers (Japan)* 7, 155-8 (1950).--*C.A.* 45, 7725*g*.

Details of prepn. were described. Capacity of cation exchange against 0.5 *N* NaOH and NaCl was about 70% of the theory.

4227. SILLEN, LARS G. **Filtration through a sorbent layer. IV. The ψ condition, a simple approach to the theory of sorption columns.** *Arkiv Kemi* 2, 477-98 (1950) (in English).--*C.A.* 45, 2270*d*.

Various types of fronts obtained on eluting a uniformly loaded sorbent with a soln. of const. compn. were described. It was shown that calcns. involved could often be simplified. The case of ion-exchange resins was considered as well as ordinary absorption columns.

4228. SMIRNOV, A. S. AND BLUVSHTEĬN, M. M. **Effect of the solubility of the sorption compounds on the sorption capacity of cationites.** *Doklady Akad. Nauk S.S.S.R.* 70, 449-51 (1950).—*C.A.* 45, 4996*i*.

The active groups in both cationites were phenolic OH groups. Dynamic expts. were reported with a rate of filtration of 3 m/hr (10 ml/min.), with 0.002 *M* solns. of $Bi(NO_3)_3.5H_2O$, $PbCl_2$, $HgCl_2$, $CaCl_2.6H_2O$, and $FeSO_47H_2O$, at pH = 2 throughout (in order to avoid hydrolysis of the Bi salt).

4229. SONDERS, L. R.; ENRIGHT, D. P., AND WEYL, W. A. **Wettability, a function of the polarizability of the surface ions.** *J. Applied Phys.* 21, 338-44 (1950).—*C.A.* 44, 6701*c*.

Base-exchange expts. were described where the H ions present in the surface layers of bentonite and of a soda-lime glass were replaced by different cations. This substitution seemed to have no particular effect on the hydrophilic and rheological properties of the carriers as long as their surfaces were kept in contact with water. After drying, however, the surfaces that contained ions of high polarizability became hydrophobic, at least temporarily. A porous clay film would no longer absorb water instantaneously after having been treated with Ni^{++}, Mn^{++}, Hg^{++}, or similar ions with incomplete outer electron shells.

4230. SPEDDING, F. H. AND DYE, J. L. **Efficient separation of dysprosium and yttrium.** *J. Am. Chem. Soc.* 72, 5350 (1950).--*C.A.* 45, 2805*c*.

Two successive ion-exchange treatments yielded pure Y and Dy from ore concentrates. A preliminary elution with 0.1% NH_4 citrate at pH 5.8-6.1 from Nalcite H.C.R. resin sepd. Y and Dy from the other rare earths, and subsequent elution of Y-Dy fractions with 5% citrate at pH 2.8 gave Y and Dy that were spectrophotometrically pure.

4231. SPEDDING, F. H.; FULMER, E. I.; BUTLER, T. A., AND POWELL, J. E. **Separation of rare earths by ion exchange. IV. Variables involved in the separation of samarium, neodymium, and praseodymium.** *J. Am. Chem. Soc.* 72, 2349-54 (1950).--*C.A.* 46, 6533*i*.

With 0.5% citrate solns. as eluent, the effects of pH, temp., resin particle size, and flow rate on the elution of pure Sm^{+++} or Nd^{+++} were detd. From these results and from expts. on the elution of equimol. mixts. of Sm_2O_3 and Nd_2O_3 at varying pH and flow rate, the best of the conditions tested for sepn. were pH 3.80 at a linear flow rate of 0.5 cm/min. Under these conditions, the recoveries 99.5% pure oxides were 96 and 95% resp.

4232. SPEDDING, F. H.; FULMER, E. I.; POWELL, J. E., AND BUTLER, T. A. **The separation of rare earths by ion exchange. V. Investigations with 0.1% citric acid-ammonium citrate solutions.** *J. Am. Chem. Soc.* 72, 2354-61 (1950).—*C.A.* 46, 6996*i*.

Variables involved in the sepn. of Sm, Nd, and Pr with 0.1% citric acid-ammonium citrate soln. and Amberlite IR-100 resin were investigated. Both the degree of sepn. and the elution time increased as the pH of the eluant decreased. Optimum yields of pure rare earths for a given operating time were obtained at pH 6.0. The slower the flow rate and the smaller the size of the resin particles the less was the observed band overlap and the better the sepn.

4233. SWIETOSLAWSKI, W. **Classification of sorbents and ion exchangers.** *Przemysl Chem.* 6, (29), 41-3 (1950).—*C.A.* 45, 9994*b*.

All sorbents and ionites which were characterized by one function only (i.e., sorbents possess adsorption capacity and ionites the ability of ion exchange) were classified as ideal. The nonideal sorbents comprised those which possess either acidic or basic groups or had them absorbed or adsorbed. In both cases the sorbents took part in the ion-exchange process. The ionites might possess the ability of adsorption or absorption of mols. from the soln. and therefore might act as ion exchangers as well as sorbents.

4234. THOMPSON, S. G.; CUNNINGHAM, B. B., AND SEABORG, G. T. **Chemical properties of berkelium.** *J. Am. Chem. Soc.* 72, 2798-801 (1950).—*C.A.* 44, 9814*g*.

By use of LaF_3 carrier, unoxidized Cm, Bk, and unoxidized fraction of Am, Y, and rare earths were sepd. from the remainder of fission products. The group of Am, Cm, and Bk was sepd. by adsorption on a cation-exchange resin (Dowex 50). Elution of the resulting chromatogram with NH_4 citrate at 87°C gave sepd. fractions of the 3 elements. The order of elution in this group was the same as for their homologs, Tb, Gd, and Eu. The differences in rates, however, between neighboring actinides were greater than for the corresponding lanthanides.

4235. VAJNA, SANDOR. **Ion-exchanging resins. I.** *Magyar Kem. Floyoirat* 56, 88-96 (1950).—*C.A.* 46, 804*b*.

The regularities of ion exchange could be calcd. on the basis of the known laws of mass action used in other chem. reactions. Certain slight correction values were worked out to obtain more exact results. Small-scale exchange expts. were carried out with 1-mm globules of polyethylene resin in glass tubes. The resin bed was satd. with $CaCl_2$ or KCl, then regenerated with KCl or HCl.

4236. WOLLISH, ERNEST G. AND SCHMALL, MORTON. **Colorimetric determination of panthenol and pantothenates.** *Anal. Chem.* 22, 1033-7 (1950).--*C.A.* 44, 10605*a*.
Pantoyl lactone, one of the products from the hydrolysis of panthenol and pantothenates, formed the hydroxamic acid with NH_2OH in alk. soln. An Amberlite column IRA-400-OH adsorbed and eliminated interfering substances.

4237. YANG, JENG-TSONG. **Radionography. Specificity of ion exchangers. Separation of lanthanum and yttrium.** *Anal. Chim. Acta* 4, 59-67 (1950).—*C.A.* 44, 6333*c*.
Two French adsorbing resins have been studied by means of radioactive tracers, and their specificity was found to be very satisfactory. The adsorbing power in g ions was inversely proportional to the valence of the adsorbed ion, though const. to the ionic concn. The elution and sepn. of La and Y have been performed ionographically.

4238. YANG, JENG-TSONG. **The separation of protactinium from tantalum by ion exchange.** *Compt. rend.* 231, 1059-61 (1950).—*C.A.* 45, 3730*h*.
By a single operation the elements were sepd. by means of Amberlite IR-4B ion-exchange resin. A citrate soln. served as the complexing agent and the eluting soln. was HF brought to a pH of 3 with concd. NH_4OH. A 10-cc. pipet served as a column.

4239. YANG, JENG-TSONG. **Separation of traces of actinium^{227} from large amounts of lanthanum by ionic exchange.** *J. chim. phys.* 47, 805-6 (1950).--*C.A.* 45, 3746*g*.
Ac^{227} (3.12 millicuries) was sepd. from 160 mg of La in a column of ion-exchange resin (Amberlite IR-100) with an eluent of 5% NH_4NO_3 (pH 5.5). In a single manipulation, a product was obtained whose activity was 5.31 millicuries per mg.

4240. YOSHINO, YUKICHI. **Determination of minute amount of selenium with an ion-exchange resin.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 71, 577-9 (1950).—*C.A.* 45, 6537*i*.
SeO_3^{--} could pass quantitatively through the column of resin at pH 0.7-5.0. Sepn. from Fe^{+++} was quant. only when the amt. of iron was less than about 10 times that of Se. The sepn. from considerable Zn was perfect. SeO_3^{--} could be quantitatively copptd. with $Zn(OH)_2$ and then sepd. from Zn with the ion-exchange resin.

4241. YOSHINO, YUKICHI AND KOJIMA, MASUO. **Separation of a small amount of titanium from iron by ion-exchange resin.** *Bull. Chem. Soc. Japan* 23, 46-7 (1950).—*C.A.* 45, 2366*a*.
Treatment of a soln. with 50% KCN or NaCN converted most of Fe to complex cyanide and copptd. the remainder with $Ti(OH)_4$. The ppt. was removed, dissolved with dil. H_2SO_4, dild. with H_2O, and passed through 5-10 g com. phenolsulfonic acid resin. Fe was eluted with 200 cc. 2 *N* KCN and the resin was washed with water. The Ti was eluted with 200 cc. 10% H_2SO_4 and detd. with H_2O_2 colorimetrically.

4242. ANDERS, HEINZ. **Removal of phenols by Wofatit from liquor obtained in low-temperature carbonization; regeneration of the filter, some results.** *Gas-u. Wasserfach* **92**, No. 17 (Gas), 238-42 (1951).—*C.A.* **46**, 332*h*.
Wofatit, an exchange resin, was successfully used for removing phenols and part of the fatty acids from the liquor resulting from low-temp. carbonization of coal. In a typical expt. the rate of flow of the liquor was 2 vols. of liquor/hr/vol. of Wofatit; the capacity was about 6 vols. of liquor/vol. of Wofatit before the effluent reached the max. permissible permanganate no.

4243. ANYAS-WEISZ, L.; SOLMS, J., AND DEUEL, H. **Determination and characterization of pectins by means of ion exchangers.** *Mitt. Lebensm. Hyg.* 42, 91-105 (1951).--*C.A.* 45, 6322*d*.
Aq. solns. of high-mol.-wt pectins and pectates were sepd. from all low-mol.-wt electrolytes by percolation through layers of cation exchangers in the H-form and anion exchangers in the OH-form. The free carboxyl and ester groups of the pectins were then detd. titrimetrically in the filtrate. Amberlite IR-120 (H-form) and IR-4B (OH-form) were used as ion exchangers. H_2O-insol. pectates, such as Ca pectate, must first be transferred into the H_2O-sol. Na salt. The pectin soln., which should not contain more than 0.5% pectin, was percolated dropwise through a continuous liquid column of 30 cc. each of cation and anion exchanger.

4244. AUSTERWEIL, G. V. **Selectivity and selective power of ion exchangers. I.** *Bull. soc. chim. France* **1951**, 528-31.—*C.A.* **46**, 3828*c*.
When an ion exchanger having a mobile cation was placed in contact with a soln. contg. 2 other cations, the *selectivity* was defined as the quotient of the equil. ionic ratio in the soln. divided by the equil. ionic ratio on the exchanger and was a function of the soly. and the polarity of the exchanger.

4245. AUSTERWEIL, GEZA V. **Selectivity of ion exchangers.** *Compt. rend.* **232**, 1481-3 (1951).—*C.A.* **45**, 8847*g*.
When a total of 1 g-equiv. of 2 cations ($x + y = 1$) was placed in contact with an exchanger having 1 g-equiv. of exchangeable ions, the selectivity S was the ratio of the quotient na/mb of the ions fixed on the exchanger and the quotient $x(1-a)/y(1-b)$ of the ions remaining in soln. m and n were mole fractions.

4246. BAFNA, S. L. AND SHAH, H. A. **Studies of a synthetic cation-exchange resin.** *Current Sci.* (India) 20, 233-4 (1951).—*C.A.* **46**, 2349*c*.
The capacity of a prepd. cation-exchange resin (in meq./g) was detd. by pH titration (2.7 at pH 7), by detn. of ash (as $BaSO_4$) in the Ba salt of the resin (2.28), by detn. of limiting exchange with $BaCl_2$ soln. (2.20), and by passing a soln. of NaCl through the column of the acid resin and detg. the H^+ content of the effluent (2.15).

4247. BHATNAGAR, M. S. **Organic adsorbents.** *Ind. Eng. Chem.* 43, 2108-12 (1951).—*C.A.* 45, 9993*i*.
The adsorption of inorg. and org. acids and bases and inorg. salts on phenol- and amine-HCHO resins was detd. An increase in adsorptive properties was experienced in the resins with an increase in the no. of OH groups in phenols and

amino groups in the amines. The acid-condensed phenolic resins adsorbed fatty acids according to Traube's order. An increase in adsorption was shown with an increase in group movement, with the polarizability of the adsorbed mol., and with the molar refraction.

4248. BONHOEFFER, K. F.; MILLER, L., AND SCHINDEWOLF, U. **Membrane-potential measurements on technical ion exchangers. I.** *Z. physik Chem.* **198**, 270-80 (1951).—*C.A.* **46**, 4883*d*.
Concns. of ions bound by the membrane were calcd. from measured potentials by means of a theoretical equation, and agreed in order of magnitude with analytical detns. From measured potentials activity coeffs. of bound K, Na, and Li were found to be 0.45, 1.2, and 2.1, resp.

4249. BONHOEFFER, K. F. AND SCHINDEWOLF, U. **Membrane-potential measurements on technical ion exchangers. II.** *Z. physik Chem.* **198**, 281-5 (1951).—*C.A.* **46**, 4883*e*.
The work was extended to a cation exchanger with strong acid groups. The agreement between calcd. and analytical data was even better, the relative uptakes of K, Na, and Li in this case agreeing quantitatively with calcns. based on membrane potentials.

4250. BRETON, E. J. JR. AND SCHLECHTEN, A. W. **Separation of copper from zinc by ion exchange.** *J. Metals* **3**, 517-21 (1951).
Ion exchange as a unit process in metallurgy would considerably extend the range of metal recovery operations. Carboxylic acid exchangers were required where sepns. must be carried at pH's greater than 5 and sulfonic acid cation exchange resins were preferred for removal of ions from acidic solns. The carboxylic acid cation exchangers may be employed for concn. of ions from very dil. solns.

4251. BRUNISHOLZ, G. AND BONNET, J. **Determination of boric acid. I. Separation of H_3BO_3 from metallic cations by ion exchange.** *Helv. Chim. Acta* **34**, 2074-5 (1951) (in French).—*C.A.* **46**, 2961*a*.
Metallic ions such as Fe^{3+}, Al^{3+}, Ni^{2+}, and Zn^{2+} as well as NH_4^+ could be removed from a pH 1-5 soln. of H_3BO_3 by passage through a sulfonic acid-type ion-exchange resin followed by 200 ml of H_2O to recover the H_3BO_3.

4252. BRUSSET, HENRY AND KIKINDAI, TIVADAR. **The positive character of the halogens.** *Compt. rend.* **232**, 1840-1 (1951).—*C.A.* **46**, 2943*h*.
An exchange of H^+ of Amberlite IR100H with I^+ of iodine nitrate and with Br^+ of bromine nitrate was noted. Solns. of iodine nitrate and bromine nitrate were prepd. in abs. EtOH, then transformed into sulfates by exchange of cations.

4253. BUSER, W. **Separation of alkali ions by ion exchange and complex formation.** *Helv. Chim. Acta* **34**, 1635-41 (1951) (in German).—*C.A.* **46**, 858*b*.
Of the alkali ions only Li^+ and Na^+ formed stable complexes with *uramil diacetic acid*. The relation between pH and extent of complex formation for Li^+ and Na^+ was shown graphically. To sep. Li^+ and Na^+ from K^+ by cation exchange, taking advantage of complex formation, the pH must be >9; to sep. Li^+ from Na^+ the pH must be 6.5-7.5 (90% Li complexed, < 10% Na complexed). Both Amberlite IR 120 and IRC 50 were useful.

4254. CONNICK, ROBERT E. AND MAYER, STANLEY W. **Ion-exchange measurements of activity coefficients and association constants of cerous salts in mixed electrolytes.** *J. Am. Chem. Soc.* **73**, 1176-9 (1951).—*C.A.* **45**, 6115*b*.
Ion-exchange equil. of Dowex 50 resin and an aq. soln. contg. a small concn. of Ce^{+++} ion and a relatively large concn. of $HClO_4$, $NaClO_4$, HCl, HNO_3, or Na_2SO_4 were measured. Relative values of activity coeffs. of the Ce^{+3} salts were calcd. from the data.

4255. COTELLO, ANA. **Preparation of synthetic cation-exchange resins from domestic raw materials.** *Industria y química* (Buenos Aires) **13**, 57-8, 61, 89-93, 103, 127-31, 142 (1951).—*C.A.* **47**, 233*g*.
Cation-exchange resins were prepd. from furfural and tannic exts. (ordinary and sulfited quebracho ext., ordinary and sulfited carob ext., and a 50:50 mixt. of ordinary and sulfited exts. from lignum vitae and *Astronium balansae*) in aq. and alc. medium. Capacity detns. were carried out with a soln. contg. $CaCl_2$ (250 p.p.m. expressed as $CaCO_3$) and NH_4Cl (96.5 p.p.m. as NH_3).

4256. D'ANS, J. AND BLASIUS, E. **Chromatography of electrolytes. II.** *Naturwissenschaften* **38**, 236 (1951).—*C.A.* **46**, 2442*b*.
A brief account of work with Dowex 2 as anion-exchange resin and Dowex 50 and Permutit RS as cation exchangers in the analysis and synthesis of various complex inorg. salts such as Co-NH_3 complexes and Cr-aquo compds.

4257. DAVIES, C. W. AND JONES, T. G. **Adsorption and swelling experiments with an amine-type ion exchanger.** *J. Chem. Soc.* **1951**, 2615-24.—*C.A.* **46**, 1840*c*.
Samples of Amberlite IR-4B were treated with Na_2CO_3 soln., washed with H_2O, and wet-sieved into several particle fractions. The exchange of the resins was studied with HCl and NaCl, and the data again cor. for the high CO_3 content (av. of 2.4 milliequiv./g). Extensive exchange with neutral salts occurred, owing to this residual CO_3 content. At all acid concns. above 0.04 *N* the H_2O adsorption was detd. almost entirely by the total concn. of the ambient soln., and was insentitive to the actual acid concn.

4258. DAVIES, C. W. AND THOMAS, G. GARROD. **Molecular adsorption on ion-exchange resins.** *J. Chem. Soc.* **1951**, 2624-7.—*C.A.* **46**, 1840*a*.
Samples of Wofatit C, Zeo-Karb 215, Amberlite IR 100, and Zeo-Karb H-1 were dry-sieved, and the adsorption of a no. of org. acids was studied. Blank detns. were run, sometimes giving considerable correction. Adsorption of org. acids on Wofatit C and Amberlite IR 100 could be represented by the Freundlich equation, and Traube's rule was followed by the mono- and dicarboxylic acids.

4259. DEUEL, H.; ANYAS-WEISZ, L., AND SOMS, J. **Contact exchange in ion exchange.** *Experientia* **7**, 294-5 (1951) (in German).—*C.A.* **46**, 1186*g*.

Regeneration of exchange resins was accomplished by contact with sol. or insol. polyelectrolytes in circulation in H_2O. With this technique it was possible to regenerate mixed-bed systems of cation and anion exchangers without sepn. of their resinous components.

4260. Deuel, H.; Solms, J.; Anyas-Weisz, L., and Huber, G. **Ion exchangers. II. Selective reactions of ion exchangers.** *Helv. Chim. Acta* **34**, 1849-53 (1951) (in German).—*C.A.* **46**, 2874*g*.
Selectivity was recognized in comparisons of the hydrolysis of low-mol,-wt esters or ethers (EtOAc, Me galacturonate, or maltose) and related high-mol.-wt compds. (polyvinyl acetate, Me polygalacturonate, or glycogen). The acidified form of the cation-exchange resin Amberlite IR-120 strongly catalyzed the hydrolysis of the low-mol.-wt compds. but had little or no catalytic effect on the high-mol.-wt compds. under identical conditions.

4261. Fitch, F. T. and Russell, D. S. **Separation of the rare earths by ion-exchange procedures.** *Can. J. Chem.* **29**, 363-71 (1951).—*C.A.* **46**, 373*i*.
The NH_4 salts of the iminodiacetic acids form complex ions with the rare-earth elements involving both one and two iminodiacetate ions. These acids were examd. as possible complexing agents in the chromatographic sepn. of the rare earths with cation-exchange resins since the stability of the rare-earth complex increases with at. no.

4262. Fronaeus, Sture. **Use of cation exchangers for the quantitative investigation of complex systems.** *Acta Chem. Scand.* **5**, 859-7 (1951) (in English).—*C.A.* **46**, 9932*a*.
The math. theory was developed for systems in which a central ion, M^{++}, and a complex ion, Ma^+, were taken up by the exchanger. Concn. changes in the resin phase of higher complexes with zero or neg. charge were neglected. If no cation complexes were formed, the calcns. were simplified. Exptl. measurements were made on cupric acetate solns. kept at const. ionic strength with $NaClO_4$.

4263. Funasaka, Wataru; Kawane, Makoto, and Hashino, Tomoyasu. **A rapid method for the determination of the sulfate radical with an ion exchanger.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **54**, 355-7 (1951).—*C.A.* **47**, 5308*a*.
Sulfate was quantitatively converted into H_2SO_4 by means of cation exchanger "Diaion K," and the resulting acid could be titrated with NaOH soln.

4264. Golovatyĭ, R. N. **Concentration of lead from aqueous solutions by ion-exchange resins.** *Gigiena i Sanit.* **1951**, No. 11, 55-6.—*C.A.* **46**, 2445*b*.
Ion-exchange resin in the acid state was used for the retention of Pb ions. A 20-cm layer of the resin in the tube was treated with a pass of 0.1 *N* $Pb(NO_3)_2$, washed with 10% HCl, then with distd. H_2O. The test specimen was then passed through (if its pH was under 3 it should be neutralized), and the retained Pb was eluted with 10% HCl after several min. residence; 2 more washings with 5% HCl completed the process.

4265. Gregor, Harry P. **Ion-pair formation in ion-exchange systems.** *J. Am. Chem. Soc.* **73**, 3537-8 (1951).—*C.A.* **46**, 1330*c*.
The calcd. and exptl. values were compared for the variation of the selectivity coeff., K_D, as a function of the fraction of the exchange capacity (X^i) taken up by an exchanging ion in the systems perchlorate-chloride and trichloroacetate-chloride plotted as log K_D vs. X^i_{Cl}.

4266. Gregor, Harry P.; Bregmen, J. I.; Gutoff, Fradelle; Broadley, Robert D.; Baldwin, David E., and Overberger, C. G. **Ion-exchange resins. Capacity of sulfonic acid cation-exchange resins.** *J. Colloid Sci.* **6**, 20-32 (1951).—*C.A.* **45**, 4112*i*.
The capacity of an ion-exchange resin was identical for 8 ions (H^+, Li^+, Na^+, K^+, NH_4^+, Me_4N^+, Me_3PhN^+). Bu_4N^+ and the bivalent ions showed somewhat divergent results. The resins were prepd. by polymerizing mixts. of styrene and divinylbenzene by the bead method at 90°C, sulfonating with H_2SO_4 at 90°C, removing unsulfonated resin by flotation, and conditioning the resin by alternate treatments with 1 *M* NaCl and 1 *M* HCl.

4267. Gregor, Harry P.; Collins, F. C., and Pope, Martin. **Ion-exchange resins. III. Diffusion of neutral molecules in a sulfonic acid cation-exchange resin.** *J. Colloid Sci.* **6**, 304-22 (1951).—*C.A.* **45**, 9994*g*.
Distribution coeffs., diffusion coeffs., and activation energies for the diffusion process were measured for aq. solns. of MeOH, EtOH, BuOH, iso-BuOH, AmOH, MeOAc, EtOAc, iso-BuOAc, and urea, by using a sulfonated polystyrene-divinylbenzene resin of uniform particle size. The equations of diffusion into a spherical particle described the diffusion process satisfactorily.

4268. Gregor, Harry P. and Bregman, J. I. **Ion-exchange resins. IV. Selectivity coefficients of various cation exchangers toward univalent cations.** *J. Colloid Sci.* **6**, 323-47 (1951).—*C.A.* **45**, 9994*h*.
The selectivity of a series of sulfonated polystyrene-divinylbenzene resins for univalent cations was examined experimentally. The selectivity was a function of: (1) ionic activity coeff. in the resin phase; (2) differences in ionic vol.; and (3) thermodynamic osmotic pressure.

4269. Gustavson, K. H. **Displacement of sulfate groups in chromium complexes by the functional groups of cation exchangers.** *Svensk Kem. Tid.* **63**, 167-70 (1951) (in English).—*C.A.* **46**, 1280*f*.
Analyses of aged dil. solns. of $Cr_2(OH)_2(SO_4)_2$ (total Cr in cationic form) by means of ion exchangers suggested that the sulfate groups were present as a bridge between 2 Cr atoms or attached to 1 Cr atom (less stable). The cationic complexes fixed by a sulfonic acid type exchanger contained 1 sulfate group on 4 Cr atoms.

4270. Gustavson, K. H. **The determination of sulfato groups in cationic chromium complexes by means of quaternary anion exchangers.** *J. Soc. Leather Trades' Chemists* **35**, 270-5 (1951).—*C.A.* **45**, 10634*h*.

In the analysis of Cr sulfates by cationic exchange resins, the compn. of the cationic Cr complexes was detd. indirectly by detn. of the Cr and SO_4 in the original and residual solns. There were some indications that the functional group of the resin (COOH or SO_3H) might penetrate the complex and displace SO_4 groups thereby giving low results for the acidity. This complication might be eliminated by use of the Cl salt of a strongly basic quaternary anion-exchange resin (Amberlite IRA-400 or Dowex 2A). The ionic SO_4 in the soln. was replaced by Cl ion and the complex-bound SO_4 was detd. directly in the residual soln. Only solns. free from noncationic Cr could be thus analyzed.

4271. Hawkins, M. B.; Garber, R. E., and Tompkins, E. R. **Remotely controlled equipment for fission-product separations by ion exchange.** *Natl. Nuclear Energy Ser.*, Div. IV, **9**, *Radiochem. Studies: The Fission Products*, Book 1, 310-17 (1951).--*C.A.* **47**, 6784*a*.

Ion-exchange app. was described to sep. 6 major fission products in concd. carrier-free solns. from pile-activated U. The product cations were alternately adsorbed and eluted from each of 3 or 4 columns ranging from 6 liter to 5 ml in series. Remote control from a central console was possible for flow rates, acidity, flow pattern, measurement of activity, and vol.

4272. Heijde, H. B. van der and Aten, A. H. W. Jr. **Adsorption curve of a rare earth in an ion-exchange column.** *J. Phys. and Colloid Chem.* **55**, 740-4 (1951).--*C.A.* **45**, 6896*d*.

The distribution curves of activated dysprosium ions on the resin (and interstitial soln.) along an exchange column after the initial adsorption and also after two different phases of elution with NH_4 citrate soln. were detd.

4273. Honda, Masatake. **The relation between pH of ion-exchange resin phase and the composition of the solution at equilibrium.** *J. Am. Chem. Soc.* **73**, 2943-4 (1951).--*C.A.* **45**, 8847*i*.

The adsorption of an acid (anion) or alkali (cation) by the resin could be considered a neutralization reaction which took place in the resin phase. When any exchange resin had adsorbed a definite amt. of an ion at equil., i.e. when the activity of the adsorbed ion was at a definite value, the pH in the resin phase should take a fixed value.

4274. Honda, Masatake. **Ion-exchange resins applied to analytical chemistry. IX.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **72**, 361-4 (1951).—*C.A.* **46**, 847*h*.

Exchange-equil. consts. of $H^+—Ca^{++}$, $H^+—Be^{++}$, $Be^{++}—Ca^{++}$, $Be_2O^{++}—Ca^{++}$, $H^+—Al^{+++}$, and $Ca^{++}—Al^{+++}$ were measured for Amberlite IR-120, and conditions for the sepn. of Be^{++} and Al^{+++} were studied.

4275. Honda, Masatake. **The ion-exchange resin applied to analytical chemistry. X. Separation of basic aluminum ion.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **72**, 555-9 (1951).—*C.A.* **46**, 3458*c*.

The Al solns. were prepd. by dissolving metallic Al in $AlCl_3$ soln. or by anion adsorption from $AlCl_3$ soln. with anion exchanger. The sepn. of cations was performed with Amberlite IR-120 and gelatinous polystyrol sulfonate. As a most stable basic cation $[(Al_2{}^{4+})]_n$ was confirmed. Other cations were shown to be mixts. of this ion and normal Al^{3+}.

4276. Honda, Masatake. **Ion-exchange resin applied to analytical chemistry. XI.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **72**, 638-41 (1951).—*C.A.* **46**, 6027*i*.

By the adsorption of a suitable pH indicator, on a feebly colored ion exchanger, such as polystyrol sulfonic acid, a stable colored column was obtained. The adsorption was studied of silica by a strong basic anion exchanger, such as Amberlite IRA-400, with the resin column adsorbed with alizarin yellow-R. HCl and CO_2 strongly affected the adsorption of silica.

4277. Huffman, E. H.; Iddings, G. M., and Lilly, R. C. **Anion exchange of zirconium, hafnium, niobium, and tantalum in hydrochloric acid solutions.** *J. Am. Chem. Soc.* **73**, 4474-5 (1951).—*C.A.* **46**, 1330*d*.

Zr^{95} and Nb^{95} in 1 cc. 6-7 *M* HCl were sepd. by passage through a Dowex-2 column 8 cm long and 3 mm inside diam. and washing with 3 cc. acid. The elutriant and wash contained the Zr. The Nb was then washed from the column with about 4 cc. of 1.5-4.0 *M* HCl.

4278. Huffman, E. H. and Lilly, R. C. **Anion exchange of complex ions of hafnium and zirconium in hydrogen chloride-hydrogen fluoride mixtures.** *J. Am. Chem. Soc.* **73**, 2902-5 (1951).—*C.A.* **45**, 7908*h*.

Studies were made with Amberlite IRA-400 to det. the dependence of elution rate upon acid concn. and Cl^- concn. In high acid concns. (1.0 *M* HCl, 0.5 *M* HF) the rate was independent of H^+ and HF concn., but depended upon the 2nd power of Cl^- concn.

4279. Hume, D. N. **Removal of zirconium and niobium from Amberlite resin adsorbent.** *Natl. Nuclear Energy Ser.* Div. IV, **9**, *Radiochem. Studies: The Fission Products*, Book 3, 1521-2 (1951).—*C.A.* **46**, 6546*c*.

HF removed Zr and Nb activities adsorbed on Amberlite resin.

4280. Janus, J. W.; Kenchington, A. W., and Ward, A. G. **Rapid method for the determination of the isoelectric point of gelatin using mixed-bed deionization.** *Research* **4**, 247-8 (1951).—*C.A.* **46**, 320*e*.

Passage of a 1-10% gelatin soln. through a 50-cm column of mixed resins (2.5 parts anion-exchange resin Amberlite 400 to 1 part cation-exchange resin Amberlite IR 120) at 40°C gave almost complete removal of foreign ions. The pH of the soln. was indistinguishable from the isoionic point. The peaks obtained in opacity-pH curves were, for all except some acid-processed materials, very sharp. The treatment sharpened the peaks over those obtained from untreated material.

4281. Jurkiewicz, Jan and Zieliński, Henryk. **Examination of adsorptivity of the ion exchanger "Escarbo."** *Prace Glownego Inst. Gornictwa, Komun.* No. **94**, 11 pp. (1951) (English summary).—*C.A.* 47, 6216*h*.

The ion exchanger showed properties of both a cationic exchanger and of a surface sorbent. Sorption from aq. solns. and nonelectrolyte followed the pattern of the Feundlich equation. Removal of H_2SO_4 resulting from the cation exchanger was important, as the residual H_2SO_4 caused swelling of the Escarbo, decreasing its ion exchange ability. Also the change of the pH inside the "sponge" could be disadvantageous. Equil. for methylene blue solns. was attained after a much longer time.

4282. Kagawa, Ikumi and Kasashi, Ryuzo. **Ion-exchange resins. III. Influence of the distribution density of electrolyte radicals on the exchange equilibrium of anion exchanger.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 177-81 (1951).—*C.A.* **47**, 1459*g*.

Ions in the resin phase were in a very different state than those in soln. The former should be in the state of so-called ion assocn. In view of this fact, a new equil. equation was derived.

4283. Kagawa, Ikumi and Kasashi, Ryuzo. **Ion-exchange resin. IV. Influence of temperature on the anion-exchange equilibrium and the heat of exchange.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **54**, 242-4 (1951).—*C.A.* **47**, 2568*e*.

Anion-exchange expts. were made for the systems NO_3-Cl, $\frac{1}{2}SO_4-Cl$, and $\frac{1}{2}SO_4-NO_3$ at 10, 37.5, and 50°C, and the exchange equil. consts. were detd. From the results, heat of anion exchange was calcd. The state of an ion in the resin phase corresponded to that in a highly concd. soln.

4284. Kakihana, Hidetake. **Inorganic analytical chemistry with ion-exchange resins. II. Separation of beryllium from aluminum.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 200-3 (1951).—*C.A.* **46**, 3449*b*.

When the soln. contg. Al, Be, and Ca ions in concn. less than 0.01 *N* passed through the phenolsulfonic acid-type exchanger satd. with Ca ion, Al was completely adsorbed, while most of the Be was found in the effluent. Beryllium adsorbed on the exchanger could be easily eluted with 0.01 *N* $CaCl_2$ soln.

4285. Kakihana, Hidetake. **Inorganic analytical chemistry with ion-exchange resins. IV. Determination of exchange-equilibrium constants of alkali-metal ions and the purification of potassium chloride.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 255-8 (1951).—*C.A.* **46**, 847*g*.

Exchange-equil. consts. of Li^+, Na^+, K^+, Rb^+, and Cs^+ with the H ion of the sulfonic acid of the cation exchanger were found to be 0.69, 1.24, 1.58, 2.30, and 2.62, resp. ($H_3O^+ = 1.00$).

4286. Ketelle, B. H. and Boyd, G. E. **The ion-exchange separation of the rare earths.** *J. Am. Chem. Soc.* **73**, 1862-3 (1951).—*C.A.* **45**, 7407*f*.

Sepn. of the Y-group rare earths from Gd, Eu, and Sm was effected with a 0.26 cm² by 97-cm 270/325-mesh Dowex-50 column at 100°C with citrate buffer at 100°C (pH 3.28) at 0.64 cm/min.

4287. Kikindaï, Tivadar. **Halogen cations.** *Bull. soc. chim. France* **1951**, 799-801.—*C.A.* **46**, 5476*h*.

Reaction of I_2 in abs. alc. with an ion-exchange resin gave $R^-H^+ + I_2 \rightleftarrows R^-I^+ + HI$. I^+ reacted with I^- to give I_2 (a reaction which can be used for analytical detn.), and with KCl and KBr to give ICl and IBr. I^+ salts hydrolyzed yielding IOH, which reacted according to $5\ IOH \rightarrow 2I_2 + HIO_3 + 2\ H_2O$. INO_3 added to cyclohexene gave $C_6H_{10}(NO_3)I$.

4288. Kikindaï, Tivadar and Cassel, Marthe. **The positive character of halogens.** *Compt. rend.* **232**, 1110-12 (1951).—*C.A.* **45**, 6456*d*.

A possibility of stabilizing the cations I^+ and Br^+ on the ion-exchange resin Amberlite I.R. 100H, and thereby proving the existence of these ions in abs. alc., was offered. A prepn. of salts contg. the pos. halogen ions was given, and the abs. exclusion of water from the alc. was emphasized.

4289. Kirshnaswamy, N. **Cation-exchange capacity of avaram resin.** *Proc. Indian Acad. Sci.* **33B**, 178-83 (1951).—*C.A.* **46**, 1840*g*.

Avaram cation exchanger, prepd. from the bark of *Cassia auriculata* (Venkataramanan, 1945) was compared with Amberlite IR 100 and Zeocarb resins in the H and Na cycle. Column and batch methods were used to study the exchange with $CaCl_2$ solns. The capacity of Avaram resin was the lowest of the 3 in the H cycle, and intermediate between the others in the Na cycle.

4290. Klyachko, V. A. **Nature of the selectivity of ionites.** *Doklady Akad. Nauk S.S.S.R.* **81**, 235-7 (1951).—*C.A.* **46**, 3827*g*.

Phenolsulfonic acid was condensed with HCHO, with the addn. of Na ethylenediaminetetraacetate which formed a sol. complex with Ca. It was preliminarily regenerated with 5% HCl, and treated with a soln. of 2 mg equiv. each of $CaCl_2 + NaCl$, actually took up 0.654 mg equiv./g, of which 0.623 mg equiv./g was Ca^{++}, i.e. 96% of the sum $Na^+ + Ca^{++}$, and gave back 98% of the Ca^{++} on regeneration with 10% HCl. Both active groups and a complex former were necessary for selective absorption. A cationite selective towards Ni was obtained by introducing dimethylglyoxime into the sulforesorcinol resin.

4291. Kraus, Kurt A. and Moore, George E. **Anion-exchange studies. I. Separation of zirconium and niobium in HCl-HF mixtures.** *J. Am. Chem. Soc.* **73**, 9-13 (1951).—*C.A.* **45**, 4524*f*.

The behavior of Zr(IV) and Nb(V) on the anion exchange resin Dowex 1 was studied in a no. of HF-HCl mixts. Sepn. of the 2 elements was excellent under a no. of conditions. Difficulties occurred only at low HCl concns. where E_{Zr} and E_{Nb} become approx. equal. Although Zr was usually eluted first, the elements could be eluted in reverse order under some conditions. In the case of Nb(V) at least three species were observed in 9 *M* HCl differing by two F^- ions each. The first two species, existing at low F^- concn., were probably oxygenated.

4292. Kraus, Kurt A. and Moore, Geo. E. **Anion-exchange studies. II. Tantalum in some HF-HCl mixtures.** *J. Am. Chem. Soc.* **73**, 13-15 (1951).—*C.A.* **45**, 4524*h*.

The anion exchange behavior of Ta (V) was studied for a no. of HCl-HF mixts. It adsorbed very strongly under most conditions, even in 9 *M* HCl. The species TaX_5F^- and $HTaX_5F_3^{-2}$ (where X was a chloride, fluoride, hydroxide, or 1/2 oxide ion) were tentatively identified.

4293. Kraus, Kurt A. and Moore, George E. **Anion-exchange studies. III. Protactinium in some hydrochloric acid-hydrofluoric acid mixtures—separation of niobium, tantalum, and protactinium.** *J. Am. Chem. Soc.* **73**, 2900-2 (1951).—*C.A.* **45**, 7845*e*.

By tracer techniques, elution studies were made on Nb, Ta, and Pa at 25°C with Dowex-1 resin.

4294. Kunin, Robert and McGarvey, Francis X. **Monobed deionization with ion-exchange resins.** *Ind. Eng. Chem.* **43**, 734-40 (1951).—*C.A.* **45**, 4524*b*.

At high regeneration levels the combination IR-120:IRA-400 exchangers gave H_2O of greater than 10,000,000 ohms per cm at a flow rate of 4 gal/ft³ min. The increased capacity of monobed operation was due to overcoming the detrimental effects of $CaSO_4$ pptn. in conventional dieonization. IRA-410 performed in a monobed at a much greater regeneration efficiency than the IRA-400 exchanger. The weak base-strong acid system, such as IR-120: IR-45 combination, possessed a high degree of regeneration efficiency and a low regeneration cost, but would not remove CO_2 or SiO_2. The strong base-weak acid system IRA-400 or IRA-410 with IRC-50 gives H_2O of reasonable quality but was rate-sensitive owing to the low rate of diffusion of electrolytes in carboxylic exchangers.

4295. Lescoeur, L. **Exchange titrimetry.** *Ann. inst. hydrol. climatol.* **22**, 51-8 (1951).—*C.A.* **46**, 10502*h*.

The total concn. of cations in an aq. soln. could be detd. by passing a portion of the soln. through a column of Zeocarb previously equilibrated with HCl and titrating the effluent with NaOH. Data on the compns. of a no. of natural waters found by this method were reported.

4296. Lindsay, F. K. and D'Amico, J. S. **Operating characteristics of a strongly basic anion exchanger.** *Ind. Eng. Chem.* **43**, 1085-7 (1951).—*C.A.* **45**, 7725*i*.

The order of decreasing affinity of Nalcite SAR (Dowex 2) for some anions was PO_4, SO_4, I, NO_3, Br, Cl, OH, HCO_3, F. The resin was insol. by all common solvents, was exceedingly resistant to phys. wear or attrition, and had a max. vol. expansion of 6% in changing completely from the Cl form to the OH form. The Cl form could be used up to 95°C, the OH form only to 50°C. The pH range of operation was 0 to 10.

4297. Lister, B. A. J. **Cation-exchange separation of zirconium and hafnium.** *J. Chem. Soc.* **1951**, 3123-8.—*C.A.* **46**, 4883*f*.

A virtually complete sepn. of Zr and Hf was obtained on a lab. scale by elution from a cation-exchange column with 1.0 *N* H_2SO_4 of the oxychlorides or oxynitrates prepd. from the mixed oxides, the over-all elution curves being measured radiochemically with 17-hr Zr^{97} and 45-day Hf^{181} tracers. The Zr was eluted first and the Hf then removed with 2 *N* H_2SO_4 and (or) 0.05 *M* $H_2C_2O_4$. Up to 95-98% Zr contg. < 0.01% Hf was recovered from a ZrO_2 contg. 1.5-2% HfO_2, and substantially complete sepn. was also obtained with a HfO_2 contg. 8% ZrO_2.

4298. Lowen, Warren K.; Stoenner, Raymond W.; Argersinger, Wm. J. Jr.; Davidson, Arthur W., and Hume, David N. **Studies of cation-exchange equilibrium on a synthetic resin.** *J. Am. Chem. Soc.* **73**, 2666-74 (1951).—*C.A.* **45**, 6879*f*.

Eight exchange systems on Dowex 50 were investigated, involving the ions Na^+, H^+, NH_4^+, Ag^+, Tl^+, Ni^{++}, and Ca^{++} in solns. of total ionic strength of approx. unity. The apparent discrepancies between the decrease in concn. of one ion in the soln. and the increase in concn. of the other probably arose from the absorption of water by the previously dried resin. In certain systems, especially those involving either silver or thallous ion, adsorption of electrolyte by the resin occurred also.

4299. MacNevin, Wm. M.; Riley, Mary G., and Sweet, Thomas R. **An ion-exchange experiment for quantitative analysis.** *J. Chem. Education* **28**, 389-90 (1951).—*C.A.* 45, 8931*i*.

An aq. soln. of a weighed sample of metal sulfates was passed through a column contg. a cation-exchange resin such as Dowex 50 which was treated with dil. HCl. The dil. H_2SO_4 resulting from the exchange was drawn off, titrated with standard NaOH, and the percentage of SO_3 calcd.

4300. Manecke, G. and Bonhoeffer, K. F. **Electrical conductivity of anion-exchange membranes.** *Z. Elektrochem.* **55**, 475-81 (1951).—*C.A.* **47**, 23*h*.

Ion-exchange membranes having various concns. of bound ions were made and their sp. conds. measured in KCl solns. of various concns. By use of exptl. values of ionic concn. and mobility, sp. cond. was calcd. and it agreed satisfactorily with the measured values.

4301. Marconi, Maria. **Titration of the anion in soluble salts, by ionic exchange.** *Chimica* (Milan) 6, 384-5 (1951).—*C.A.* **46**, 4427*a*.

The anions of some sol. org. salts could be titrated after passing the soln. through an ion-exchange column. For the titration, a mixed indicator was used of thymol blue and cresol red (3:1).

4302. Mayer, Stanley W. and Schwartz, S. David. **The association of cerous ion with iodide, bromide, and fluoride ions.** *J. Am. Chem. Soc.* **73**, 222-4 (1951).—*C.A.* **45**, 4524*e*.

The distribution of Ce^{+++} ion between cation exchange resin Dowex 50 and solns. of NaI, NaBr, NaF, and $NaClO_4$ was measured. The consts. for ion-pair formation between Ce^{3+} and the halides were calcd.

4303. McTaggart, F. K. and Newnham, I. E. **Use of radioactive tracers in the separation of hafnium and zirconium.** *Proc. Conf. Applications Isotopes Sci. Research, Univ. Melbourne* **1950**, 167-74 (1951).—*C.A.* **45**, 9389*e*.

A report was given of ion-exchange column expts. on the sepn. of these elements and of soly. studies on their hydroxides in basic soln. and on their phosphates in acid soln. Hf^{181} and Zr^{95} were used as tracers.

4304. Miller, Hoke S. and Kline, G. E. **Reactions of cesium in trace amounts with ion-exchange resins.** *J. Am. Chem. Soc.* **73**, 2741-3 (1951).—*C.A.* **45**, 6879*h*.

The distribution coeffs. for the exchange of Cs in trace amts. with both phenolsulfonic and nuclear sulfonic ion-exchange resins were detd. as a function of pH. Phenolsulfonic resin exhibited two pH ranges of strong adsorption. Cs was found to be selectively adsorbed by the phenolic groups in the presence of high concns. of sodium salts in alk. solns.

4305. Morton, F. **Properties and limitations of a cation-exchange resin. Laboratory examination of Zeo-karb 225.** *Lancet* **260**, 825-7 (1951).—*C.A.* **45**, 8321*e*.

Zeo-karb is an insol., gritty powder with a capacity of 2.5 meq. of cation/g. It is a synthetic org. resin based on polystyrene $(C_6H_5CH{:}CH_2)_n$ and contg. SO_3H groups. Zeo-karb exhibited a high relative affinity for Ca, less for K, and much less for Na. Mg trisilicate eliminated the acid produced during cation change but lowered the efficiency of Zeo-karb.

4306. Motoyama, Takuhiko and Okamura, Seizo. **Cation exchangers from polyvinyl alcohol.** *Chem. High Polymers* (Japan) **8**, 326-8 (1951).—*C.A.* **47**, 4522*i*.

Cation-exchange resins contg. sulfate groups were obtained by treating polyvinyl alc., polyvinyl acetate, or the mixt. with H_2SO_4 and oleum. The exchange capacity and the amt. of combined sulfate in the products was detd., and the results are summarized.

4307. Nagmatsu, Masatoshi. **Electrochemical studies on ion exchangers.** *J. Electrochem. Soc. Japan* **19**, 369-72 (1951).—*C.A.* **46**, 4701*c*.

The ion-exchange capacity of H-R type resin was detd. by the so-called "NaCl prepd. method" and also by the method utilizing the conductometric titration. Both methods gave practically the same results.

4308. Newnham, I. E. **Ion-exchange separation of hafnium and zirconium. I.** *J. Am. Chem. Soc.* **73**, 5899 (1951).—*C.A.* **46**, 10027*e*.

The ion-exchange sepn. of Zr and Hf was applied to a 2-g oxide mixt. contg. 20% HfO_2 yielding a fraction contg. 99.9% HfO_2.

4309. Oda, Ryohei; Shimizu, Hiroshi, and Tanabe, Takashi. **Preparation of a new anion-exchange resin.** *Bull. Inst. Chem. Research, Kyoto Univ.* **24**, 86 (1951) (in English).—*C.A.* **46**, 4701*b*.

A new kind of anion exchanger was prepd. by condensing *N,N'*-diphenylpiperazine with HCHO. The capacities of the resin were 2.38-4.57 meq. HCl per g, and 0.39-1.03 per cc., and the degrees of swelling were 1.04-2.60.

4310. Oda, Ryohei; Shimizu, Hiroshi, and Tanabe, Takashi. **Synthesis of a new anion-exchange resin.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **54**, 286 (1951).—*C.A.* **47**, 2909*d*.

The resin was prepd. by condensing 1,4-diphenylpiperazine with HCHO in the presence of HCl or H_2SO_4. The anion-exchange capacity was about 3 millimoles HCl/g. Sp. gr. was about 0.3.

4311. Pepper, K. W. **Sulfonated cross-linked polystyrene—monofunctional cation-exchange resin.** *J. Applied Chem.* (London) **1**, 124-32 (1951).—*C.A.* **45**, 6865*f*.

Styrene and divinylbenzene, as the cross-linking agent, were copolymerized in suspension with 1.5-3.0% of Promulsin as the suspension-stabilizer to form beads of cross-linked polystyrene. The particle size of the bead polymer was inversely related to the apparent viscosity of Promulsin and to the time of shaking. The beads were sulfonated by heating at 100°C with excess of H_2SO_4 in the presence of Ag_2SO_4 as the catalyst. The product was a hygroscopic gel and its cation-exchange properties were consistent with those for a monofunctional, strongly acidic material.

4312. Peremyslova, E. S. and Stashko, R. P. **Effect of temperature on the process of ion exchange on synthetic cationites.** *J. Appl. Chem. U.S.S.R.* **24**, 995-7 (1951) (Engl. translation); *Zhur. Priklad. Khim.* **24**, 877-9 (1951).—*C.A.* **47**, 4167*d*.

Solns. of $CaCl_2$ and KCl (0.01 *N*) were passed through Wofatit P (phenolsulfonic resin with—SO_3H groups mainly in the side chains) and Cationite PFSK (*p*-phenolsulfonic resin with—SO_3H groups mainly in the nucleus) at 2°, 15°, and 75°C. The apparent exchange capacity increased proportionally with temp., but the ratio of capacity for Ca to K remained const.; this indicated that the nature of the change of exchange capacity was the same for both Ca and K. The resin (1 g) was allowed to stand in 500 ml of 0.01 *N* $CaCl_2$ or NaCl at const. temp. and the acidity of the supernatant detd. at intervals. Equil. was attained faster at 75°C than at 15°C.

4313. Reichenberg, D.; Pepper, K. W., and McCauley, D. J. **Properties of ion-exchange resins in relation to their structure. II. Relative affinities.** *J. Chem. Soc.* **1951**, 493-9.—*C.A.* **45**, 6006*e*.

The relative affinity coeffs. (K_H^{Na}) were detd. at 0.1 *M* cation concn. in soln. For a resin of low cross-linking (2% divinylbenzene), K_H^{Na} was approx. unity and independent of the mole-fraction of Na ion on the resin (X_{NaR}). With resins of medium cross-linking (5 and 10% divinylbenzene), K_H^{Na} was greater than unity for all values of X_{NaR}, and showed a flat max. at a value of X_{NaR} of 0.4-0.5. For resins of high cross-linking (17 and 33% divinylbenzene), the max. disappeared and K_H^{Na} decreased sharply with increasing X_{NaR}, becoming less than unity at high values of X_{NaR}.

4314. Richardson, R. W. **Selective diffusion into ion-exchange resins. A new method for the purification of the direct cotton dyes.** *J. Chem. Soc.* **1951**, 910-14.—*C.A.* **45**, 8775*i*.

Ion-exchange resins (Deacidite B), capable of acting as molecular sieves, yielded ash-free effluents from aq. solns. of crude dyes. Dye-coupling components were sufficiently small to be completely adsorbed when present in the usual amts. expected in crude dyes. With dyes smaller than the class prepd. from benzidine, such as from naphthylamines, 1.5% of the resin may have been satd. and regeneration of the resin became troublesome because of slow outward diffusion of the dye.

4315. Saldadze, K. M. **Ultrapurification of weak electrolytes with ion-exchange resins.** *Doklady Akad. Nauk S.S.S.R.* **77**, 457-60 (1951).—*C.A.* **46**, 3367*a*.

The weak electrolyte (15-30% tech. citric or tartaric acid) was passed through a column filled with cation-exchange resins (wofatite R, SBS, or espatite K) and then through a column contg. anion-exchange resins (MG or MM-2N). The soln. was than passed in the same order through other columns at a speed of 5-10 m/hr. The ratio of column height to diam. was 10-15. AcOH, formic, and other acids were also purified.

4316. Samuelson, Olof and Gärtner, Fred. **Utilization of ion exchangers in analytical chemistry.** XVIII. *Acta Chem. Scand.* **5**, 596-602 (1951) (in English).—*C.A.* **46**, 7766*d*.

The degree of substitution of cellulose xanthate in viscose could be detd. with the aid of anion-exchange resins. Low-mol.-wt by-products from the formation of viscose were adsorbed on the resin.

4317. Samuelson, Olof and Schramm, Kerstin. **Use of ion exchangers in analytical chemistry. XXI. Determination of total salt concentration by means of anion-exchange resins.** *Svensk Kem. Tid.* **63**, 307-11 (1951) (in English).—*C.A.* **46**, 4952*d*.

A Dowex 2-resin bed (diam. 9 mm, length 140 mm, particle size 0.2-0.3 mm) was treated with 350 ml *N* NaOH and washed until free of alkali. Known amts. of KCl, Na_2SO_4, H_3PO_4+ NaOH, V_2O_5+ NaOH, H_2WO_4+ NaOH, and SO_2+ NaOH were dissolved separately, the solns. passed through a column as above (about 20 min.), and the effluents titrated (0.1 *N* HCl and methyl red).

4318. Sasaki, Tsunetaka and Inaba, Ayako. **Conductometric titration of cation-exchange resins.** *Bull. Chem. Soc. Japan* **24**, 20-4 (1951).—*C.A.* **46**, 5929*f*.

The exchange capacities and the exchange equil. consts. for Dowex 50, phenoxyacetic acid-HCHO resin, Amberlite IR-C 50, hydroquinone-HCHO, phenolsulfonic acid-HCHO, and sulfonated coal, all in the H-forms, were detd. by titrating with NaOH conductometrically. Time required to attain equil. was about 10 min., although for some resins, it was 30 min. in the final stage of the titration. Air free of CO_2 and satd. with H_2O vapor was passed through the soln. during titration. The analysis of the results of titrating a mixt. of 2 resins, each having one kind of exchange group, agreed with the results from the detn. of the sep. resins.

4319. Schubert, Jack. **Use of ion exchangers for the determination of physical-chemical properties of substances, particularly radiotracers, in solution. IV. Activity coefficients of barium nitrate in uranyl nitrate.** *J. Am. Chem. Soc.* **73**, 4488-9 (1951).—*C.A.* **46**, 6965*e*.

The activity coeffs. were measured for carrier-free $^{140}Ba^{++}$ in $UO_2(NO_3)_2$ by the use of the uranyl form of the cation-exchange resin, Amberlite IR-1. The value of $K_a = 14$ was obtained from a plot of log $K_{ex.}$ *vs.* $\sqrt{m}$ and an extrapolation to infinite diln. (K_a is the thermodynamic exchange const., $K_{ex.}$ is the concn. exchange const.).

4320. Schuler, Robert H.; Boyd, Alfred C. Jr., and Kay, Daniel J. **Experiments with ion-exchange resins.** *J. Chem. Education* **28**, 192-4 (1951).—*C.A.* **45**, 4977*a*.

Cu and Ag ions were adsorbed on Amberlite IR 100-H resin in a 50 cm column. These ions were eluted with *M* $NaNO_3$ at 4 ml/min. with the Cu being eluted first. The eluant was analyzed volumetrically for these two ions and the data are plotted as histograms.

4321. Selke, W. A. and Bliss, Harding. **Continuous countercurrent ion exchange.** *Chem. Eng. Progress* **47**, 529-33 (1951).—*C.A.* **46**, 299*c*.

A continuous ion-exchange system had been constructed in which essentially countercurrent flow was obtained in exhaustion and regeneration columns. In Cu-H exchange, a fluidized exhaustion column could be used because hydraulic classification according to the amt. of Cu on the resinous exchanger acted to maintain countercurrent action. Runs were made in which the recovery of Cu exceeded 99%.

4322. Shah, H. A. and Bafna, S. L. **Ion exchange. I. Equilibrium studies of three synthetic cation-exchange resins.** *Current Sci.* (India) **20**, 38-9 (1951).—*C.A.* **45**, 8820*a*.

The result of equil. studies of 3 synthetic exchange resins, Amberlite IR-100, Amberlite IR-105, and Amberlite IR-120, were reported. The pH titration curves for the 3 resins showed that excess of cation (here Na^+) increased the cation uptake of the resin at the same pH.

4323. Shimizu, Hiroshi. **Synthetic ion-exchange resins. XXX. Preparation of carboxylic acid-type cation-exchange resin (KH-4B).** *Chem. High Polymers* (Japan) **8**, 212-19 (1951).—*C.A.* **47**, 234*d*.

Cation-exchange resins of carbonic acid type were prepd. by treating phenoxyacetic acid with concd. H_2SO_4 to which formalin was added. The yield was 47%. The cation-exchange capacity of the resin was 98% of the theoretical value. Vitamin B_6 was completely adsorbed by the resin.

4324. Shimizu, Hiroshi; Shiba, Hidekiyo, and Oda, Ryohei. **Preparation of an anion-exchange resin from 2-amino-4-methylthiazole by condensation with formaldehyde.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **54**, 677-8 (1951).—*C.A.* **47**, 7137*a*.

In order to obtain a resin completely insol. in acid, 2-amino-4-methylthiazole, phenol, and HCHO were condensed. The ion-exchange capacity of the resin was about 4 millimoles/g.

4325. SPEDDING, F. H.; FULMER, E. I.; POWELL, J. E.; BUTLER, T. A., AND YAFFE, I. S. **The separation of rare earths by ion exchange. VI. Conditions for effecting separations with Nalcite HCR and one-tenth percent citric acid-ammonium citrate solutions.** *J. Am. Chem. Soc.* **73**, 4840-7 (1951).—*C.A.* **46**, 6997*b*.

Procedures were developed for the successful sepn. of the rare earths by using a high-capacity resin, Nalcite HCR, and 0.1% citrate soln. The high-capacity resin proved to be superior to a low-capacity resin, Amberlite IR-100, for the sepn. of the heavy rare earths. Er, Ho, and Dy were obtained in purities greater than 99%.

4326. SPIEGLER, K. S. AND CORYELL, C. D. **Electromigration in a cation-exchange resin.** *Science* **113**, 546-7 (1951).—*C.A.* **45**, 8321*f*.

The movement of ions in a resin column, followed with radiotracer technique, confirmed the hypothesis that wet resins acted like solns. of electrolytes. The electrode reactions were: anode, $4R^- + 2H_2O = 4HR + O_2(g) + 4e$; cathode, $4e + 4NaR + 4H_2O = 4Na^+ + 4R + 4OH^- + 2H_2(g)$, where R was the resin radical.

4327. STACH, H. **Evaluation of ion exchangers with particular emphasis on exchange rates.** *Angew. Chem.* **63**, 263-7 (1951).—*C.A.* **45**, 7725*h*.

Expts. were reported on the chem. constitution and reaction kinetics of 8 cation exchangers. The results were applicable to anion exchangers.

4328. STERN, HARRY. **Production of sodium hydroxide solution by ion exchange.** *Iowa State Coll. J. Sci.* **25**, 358-60 (1951).—*C.A.* **45**, 6896*e*.

When the exchange resin, Dow HCR, satd. with Na ions was brought into contact with a soln. of $Sr(OH)_2$, equil. was reached in a few min. The resulting soln. may contain as much as 3.5% NaOH. The optimum conditions were: 1.3 *N* $Sr(OH)_2$, and $Sr(OH)_2$ equiv. to 2.8 times the Na^+ on the resin. The resin could be recharged by the use of NaCl. The Sr^{++} could be sepd. from the soln. by pptn. as the basic chloride.

4329. TATUR, H. **Purification of dibutyl phthalate with mixed ion-exchange agents.** *Przemysl Chem.* **7**, 627-31 (1951).—*C.A.* **46**, 8425*e*.

Lab. expts. proved that purer dibutyl phthalate could be obtained by using mixed ion-exchange agents than with cation- and anion-exchange agents used separately.

4330. TEICHER, HARRY AND GORDON, LOUIS. **Separation of iron (III) from aluminum.** *Anal. Chem.* **23**, 930-1 (1951).—*C.A.* **45**, 7465*h*.

Fe^{+++} was converted into the red $Fe(CNS)_3$ complex which was easily removed by passing the soln. through a column contg. the anion exchanger Amberlite IRA-400A. at pH = 1. Then Al could be pptd. by NH_4OH and the ignited ppt. weighed as Al_2O_3. The recovery of 18 to 78 mg of Al to which 2 mg of Fe had been added was perfect in 11 expts.

4331. TEVEBAUGH, ARTHUR DAVID. **The properties of the citrate complexes of the rare earth ions and their adsorption on Amberlite resin.** *Iowa State Coll. J. Sci.* **25**, 367-8 (1951).—*C.A.* **45**, 6953*a*.

Absorption spectra of solns. contg. $NdCl_3$ and citric acid at different pH values indicated the existence of 4 citrate complexes. The gradual addn. of $Na_3C_6H_5O_7$ to a soln. of $LaCl_3$ or $NdCl_3$ or $SmCl_3$ produced, first, a decrease in pH and a ppt. One ppt. was $LaC_6H_5O_7 \cdot 2H_2O$. Amberlite IR-100 in the acid cycle was a moderately strong acid with a break in the titration curve at 8.58 milliequivs. of H^+ per 5 g of resin.

4332. WHEATON, R. M. AND BAUMAN, W. C. **Properties of strongly basic anion-exchange resins.** *Ind. Eng. Chem.* **43**, 1088-93 (1951).—*C.A.* **45**, 7726*f*.

Properties of Dowex 1 and Dowex 2, resins of the quaternary ammonium type cross-linked with divinylbenzene, were given. The resins were spherical particles of 20 to 50 mesh, exchange 1.2 equiv. per liter wet vol., and had a bulk d. of 45 lb ft^3 and a real d. of 1.15. The selectivity of the resins for univalent ions was about the same pattern for most anions with the exceptions that the Dowex 1 was less selective toward the OH anion than the Dowex 2. In dil. solns. the selectivity of the resins was greater for bivalent ions than univalent ions.

4333. WICKBOLD, REINHOLD. **Applications of cation exchange in chemical analysis.** *Z. anal. Chem.* **132**, 241-50 (1951).—*C.A.* **45**, 5557*i*.

The use of the resins Wofatit K and Wofatit KS were explained in detail. The purification of the com. sample, filling the column, capacity of effecting complete exchange, rate of adding the soln. and the results obtained with more than 25 different salt solns. were tabulated.

4334. WICKBOLD, REINHOLD. **Uses of cation exchange in chemical analysis. II.** *Z. anal. Chem.* **132**, 321-8 (1951).—*C.A.* **45**, 6953*g*.

A tippable column was described which permitted the removal of the adsorbed cations by running acid through the column in the opposite direction to that used in the removal of the adsorbed cations. The removal of the cations took place more readily with dil. HCl than with more concd. acid, and slow passage of the eluant in the reverse direction was more efficient.

4335. YAMABE, TAKEO AND SATO, SHUNICHI. **Ion-exchange equilibria.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **54**, 483-5 (1951).—*C.A.* **47**, 5738*e*.

The applicability range of an empirical formula for cation-exchange equilibrium had been studied with dianion K, and the results were summarized.

4336. YAMAMOTO, YUTAKA. **Anion-exchange adsorption from aqueous solutions of acids by anion-exchange resin. I. Anion-exchange equilibria.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **54**, 485-7 (1951).—*C.A.* **47**, 6217*a*.

The anion exchange adsorption equilibria by Diaion A in the aq. solns. of HCl and HOAc were expressed better by Langmuir's adsorption equation than by the Freundlich equation. The anion-exchange resin had max. exchange capacity.

4337. Yamamoto, Yutaka. **Anion-exchange adsorption from the aqueous solutions of acids by anion-exchange resin. II. Theory of anion-exchange velocity.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **54**, 569-71 (1951).--*C.A.* **47**, 6735*c*.
Possible rate-detg. factors for the anion-exchange velocity were discussed.

4338. Yamamoto, Yutaka; Maruyama, Takashi, and Shigaki, Meiten. **Anion-exchange adsorption from aqueous solutions of acids by anion-exchange resin. III. The rate-determining factor of anion-exchange process.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* **54**, 701-4 (1951).—*C.A.* **47**, 7287*g*.
In the cases of HCl and AcOH the velocity of chem. reaction was rate-detd. for the concn. 0.2-0.4N. Either the velocity of diffusion inside the particle or the velocity of chem. reaction became rate-detg. for the concn. 0.01-0.02N according to the conditions of exchange.

4339. Yoshino, Yukichi. **Separation of arsenic from iron by ion-exchange resin.** *Bull. Chem. Soc. Japan* **24**, 39-41 (1951).—*C.A.* **46**, 6031*f*.
Both $AsO_3{}^{3-}$ and $AsO_4{}^{4-}$ in dil. HCl were recovered without loss on passing through a bed of 30-mesh phenolsulfonic acid-type cation-exchange resin in the H form or Na form. $AsO_3{}^{-3}$ was quantitatively sepd. from Fe^{2+} in mixts. of varying Fe/As ratio.

4340. Young, Norton. **Method for the preparation in the laboratory of a base-exchange material (artificial zeolite) of high quality.** *Rev. colombiana quim.* **4**, No. 1, 47-9 (1951).—*C.A.* **46**, 2717*d*.
Dissolve 46 g $Na_2SO_4.Al_2(SO_4)_3$ contg. 35% water of crystn. in 2500 ml water, add 20 g NaOH in 500 ml water, cool to 4°C, and add 83 g Na_2SiO_3 contg. 35.8% SiO_2 in 500 ml water with stirring and hold at 4°C for 18 hrs. Filter and allow to stand for 72 hrs when it can be cut and molded with the hands. Freeze out the water by holding at -15°C for 16 hrs. Thaw in running water, leaving an amorphous translucent substance whose particles are retained on a 20-mesh sieve. Allow to drain 72 hrs.

4341. Argersinger, W. J. Jr. and Davidson, Arthur W. **Experimental factors and activity coefficients in ion-exchange equilibria.** *J. Phys. Chem.* **56**, 92-6 (1952).—*C.A.* **46**, 7840*f*.
Aq. ion-exchange expts. with Dowex 50 showed that the total equil. compn. of an exchange system was detd. not only by the extent of simple ion exchange, but also by absorption of water and adsorption of electrolyte by the exchanger, and by the variation in apparent molal vol. of the solute during exchange.

4342. Bafna, S. L.; Pai, M. U., and Shah, H. A. **Ion exchangers. I. Sulfonation of Indian coal.** *J. Sci. Ind. Research* (India) **11B**, 134-6 (1952).—*C.A.* **47**, 2958*g*.
Powd. semi-bituminous coal was dried at 105-10°C and sulfonated 2 hrs at 200°C with 5% H_2SO_4 or 10% fuming H_2SO_4, the mixt. cooled, and the exchanger washed free of acid. It was transferred to a column, backwashed with tap H_2O, converted to the H-form with 5% HCl, washed with distd. H_2O, and dried to const. wt at 105-10°C. The exchange capacity was detd. by equilibrating 0.5 g of dried exchanger with 50 ml of 1 *N* $BaCl_2$ and titrating an aliquot of the soln. with standard NaOH.

4343. Bafna, S. L. and Shah, H. A. **Ion exchange. II. Studies of a synthetic cation-exchange resin HP-6.** *J. Indian Chem. Soc.* **29**, 611-14 (1952).—*C.A.* **47**, 1871*f*.
The resin contg. SO_3H, COOH, and OH groups, was prepd. The capacity of the resin in milliequiv. H/g dried resin, detd. was (*a*) by titration curve in the presence of NaCl, 2.27 and 2.84 at pH 7 and 11, resp., (*b*) by ash detn. 2.28, (*c*) by limiting exchange with $BaCl_2$ 2.20, and (*d*) by dynamic system with 0.5 and 0.01 *N* NaCl 2.15. On the basis of equiv. wts of replaceable H and the method of synthesis, a structure of the resin was postulated.

4344. Barker, George E. and White, Robert R. **Rates of alcoholysis and diffusion in ion-exchange resins.** *Chem. Eng. Progress Symposium Ser.* **48**, No. 4, *Reaction Kinetics and Transfer Processes*, 75-90 (1952); *Dissertation Abstracts* **12**, 457-8 (1952).—*C.A.* **47**, 2024*h*.
The rate of the reaction of EtOH and n-Bu acetate was detd. with fixed beds of cation-exchange resin as catalyst. The chem. reaction and diffusion of the various components within the resin controlled the rate. The specific-reaction-velocity const. of the alcoholysis reaction and the diffusivities of the components as functions of temp. were evaluated.

4345. Bergsma, F. **Selective membranes consisting of ion exchangers.** *Chem. Weekblad* **48**, 361-4 (1952).—*C.A.* **46**, 7841*a*.
The reduced mobility of one ion in the system ion exchanger-water made ion-exchanger plates suitable for selective membranes. Applications were: the electrolysis of NaCl solns. without rediffusion of the Cl^-, the sepn. of K^+ and Na^+, and the removal of ions from colloidal solns. by electrodialysis.

4346. Blasius, F. and Negwer, M. **Chromatography of electrolytes. III. Separation of heavy metals by their chloro complexes at elevated temperatures.** *Naturwissenschaften* **39**, 257-8 (1952).—*C.A.* **47**, 6303*c*.
Several heavy metals could be sepd. by chromatography on an anion-exchange resin in 30% HCl soln. at room temp. or with lower HCl concn. at higher temp. A column 2.2 cm in diam. and 28 cm long was used. This column contained 55 cc. of Permutite ES or Dowex 2 and was surrounded by a thermostat. Fe^{3+} and Mn^{2+} were sepd. in 10-15% HCl in a prewashed column at 80°C and at 2.5 cc. per min. (total 7 cc.) and washed afterwards with four 50-cc. portions of HCl of the same concn. and temp. For the Fe-Al sepn., the same procedure was followed. For Co-Ni sepn. 20% HCl was used; 150 cc. of soln. was passed at 1.5 cc. per min. at 80°C.

4347. Bonner, Oscar D.; Argersinger, William J. Jr., and Davidson, Arthur W. **Factors involved in cation-exchange equilibria.** *J. Am. Chem. Soc.* **74**, 1044-7 (1952).—*C.A.* **46**, 5407*f*.

Studies of the NH_4^+-H^+ and Ag^+-H^+ exchanges on Dowex 50 at 25°C in solns. of unit ionic strength showed that the equil. compn. of solid and liquid phases was detd. by various methods. H_2O absorption was a linear function of resin compn., but electrolyte adsorption depended in a more involved fashion on both resin and soln. compn. New data for the Na^+-H^+ exchange on Dowex 50 in solns. of ionic strength 1.0 and 0.3 *M* were detd.

4348. Bonner, Oscar D.; Davidson, Arthur W., and Argersinger, William J. Jr. **Activity-coefficient ratios of nitric acid and silver nitrate, and their application to ion-exchange equilibria.** *J. Am. Chem. Soc.* **74**, 1047-50 (1952).—*C.A.* **46**, 5407*h*.

E.m.f. measurements on cells of the type: $Ag|AgCl|HCl$ (0.2 *M*)$|HNO_3, AgNO_3|Ag$ were used for the calcn. of the ratios of activity coeffs. at 25°C of HNO_3 and $AgNO_3$ in solns. of varying acid-salt ratio and total ionic strengths ranging from 0.1 to 1.0 molal. These activity-coeff. ratios were combined with ion-exchange data for the Ag^+-H^+ equil. on Dowex 50. The activity coeffs. in the mixed resins were greater than unity.

4349. Bregman, J. I. and Murata, Yoshiaki. **Phosphonous and phosphonic cation-exchange resins.** *J. Am. Chem. Soc.* **74**, 1867-8 (1952).—*C.A.* **47**, 6217*d*.

The resins were the first to show a selectivity for Na over K. Potential applications of the resins included Na depletion in physiol. applications, rare earth sepns., and use in mixed-bed and reverse demineralization units.

4350. Brown, William F. and Rieman, William III. **Separation of titanium, zirconium, and thorium by ion exchange.** *J. Am. Chem. Soc.* **74**, 1278-82 (1952).—*C.A.* **46**, 6545*i*.

The nature of the complexes between metal and citrate ions was studied and some probable complexes given. Radio-chem. work with Ti^{51} showed that the radioactive isotope was sepd. from the normal isotopes to a certain extent.

4351. Brunisholz, G. **An analytical ion-exchange column.** *Helv. Chim. Acta* **35**, 1003-4 (1952) (in French).—*C.A.* **46**, 7378*c*.

The app. consisted of an upper reservoir with a float valve that shut off when the reservoir was empty, preventing air from entering the resin bed, and an evacuation system to remove air bubbles remaining from the bed.

4352. Brusset, Henry and Kikindai, Marthe. **Ionic exchange in nonaqueous solutions.** *Chim. anal.* **34**, 192-3 (1952).—*C.A.* **46**, 10778*c*.

By means of Amberlite IR 100 it was possible to remove the I^+ ions from a soln. in EtOH. When the resin RH reacted with I^+I^- the reaction could be expressed by the equation: $RH + I^+I^- = RI + HI$ and was manifested by loss of the total I and gain of H^+.

4353. Calmon, Calvin. **Application of volume change characteristics of a sulfonated low cross-linked styrene resin.** *Anal. Chem.* **24**, 1456-8 (1952).—*C.A.* **47**, 1315*f*.

The vol. of a sulfonated styrene resin cross-linked with 1% divinylbenzene (Permutit QX) depended upon the valence of the cation in the exchange position and the concn. of the soln. in equil. with the resin. Vol. changes of a column bed or a single sphere of the resin could be measured with similar results. Vol. ratios obtained were 1.0 for univalent ions, 0.47-0.53 for bivalent ions with the exception of Zn and ferrous ions which formed gelatinous ppts. and Sr, Ba, and Pb which formed insol. sulfonates, and 0.18-0.22 for trivalent ions. Bed vol. was shown to vary directly with concn. of NaCl or HCl up to 1 *N*.

4354. Cassidy, Harold G. **Electron exchange-polymers.** *Proc. Natl. Acad. Sci. U.S.* **38**, 934-7 (1952).—*C.A.* **47**, 1973*f*.

Resins that were reversibly oxidizable and reducible, and thus could be used to conduct oxidation-reduction reactions by ion-exchange techniques, were prepd. A column prepd. with filter aid and a resin prepd. from vinylhydroquinone and α-methylstyrene was run through several oxidation-reduction cycles with I_2, I^-, and $K_2Cr_2O_7$. The column lost some capacity, possibly because the mols., after repeated oxidation and reduction with resulting changes in shape and polarity, were caused to coil up and expose fewer and fewer active groups to the reagents.

4355. Clarke, J. T.; Marinsky, J. A.; Juda, W.; Rosenberg, N. W., and Alexander, S. **Electrochemical properties of a permionic anion membrane.** *J. Phys. Chem.* **56**, 100-5 (1952).—*C.A.* **46**, 7911*h*.

Data on cond., Donnan diffusion, and Cl^- transport no. showed that the Cl^- form of Permionic ARX-44 ion-exchange membrane was a partially dissocd. salt with an ionization const. between 0.1 and 1.

4356. d'Ans, J.; Blasius, E.; Guzatis, H., and Wachtel, U. **The use of anion exchangers in analytical and preparative chemistry.** *Chem.-Ztg.* **76**, 811-14, 841-4 (1952).—*C.A.* **47**, 3169*h*, 4781*a*.

Anion exchangers could be used for detg. cations in a salt or salt soln. Carbonate-free alkalies could be prepd. by passing the alkali over a strongly anionic resin. Ion exchange was possible by using nonaq. solvents as long as sufficient ionization took place. MeOH, EtOH, Me_2CO, $CHCl_3$, pyridine, PrOH and nitrobenzene were used. Quant. results for halogen compds. were obtained with MeOH, EtOH, and nitrobenzene.

4357. Davies, C. W. and Thomas, G. Garrod. **Ion-exchange resins as catalysts in the hydrolysis of esters.** *J. Chem. Soc.* **1952**, 1607-10.—*C.A.* **46**, 8291*e*.

Two cation-exchange resins (Amberlite IR-100, 20-40 mesh; and Wofatit C, 20-40 and 40-60 mesh) were used in the H form as catalysts for the hydrolysis studies of methyl acetate, ethyl acetate, *n*-butyl acetate, *n*-amyl acetate, and benzoyl acetate through the temp. range of 15-55°C. The rate consts. were increased by using a smaller-mesh resin. The results showed that Amberlite IR-100 was about 11 times more efficient than Wofatit C, a weakly acidic resin.

4358. Dranen, J. van. **An empirical formula for ion exchange.** *Rec. trav. chim.* **71**, 1157-8 (1952) (in English).—*C.A.* **47**, 8459*c*.

The results for a no. of published ion-exchange expts. were recalcd. by use of the empirical formula secant $(\pi x/2U) = kc + 1$, where k was an empirical const., c = total no. of equivs. of added cation present in the soln. at equil., x = the total no. of equivs. exchanged, and U = capacity of the exchanger. The formula gave reasonable agreement with observed facts for a no. of exchanges of alk. earth and alkali elements.

4359. Duncan, J. F. **A theoretical treatment of cation exchangers. II. Equilibria between an ion exchanger and an aqueous solution with common cation.** *Proc. Roy. Soc.* **A214**, 344-55 (1952).—*C.A.* 46 10778*a*.

The treatment of an ion exchanger as a concd. aq. polyelectrolyte was extended for an exchanger satd. with a single cation in equil. with a soln. contg. a salt of the same cation. Activity and osmotic coeffs. were derived for mixts. of electrolytes with resinates. Resinates of the sulfonated polystyrene type were discussed.

4360. Feldman, Isaac and Havill, Jean R. **Some ion-exchange studies of the polymerization of beryllium.** *J. Am. Chem. Soc.* 74, 2337-40 (1952).—*C.A.* **46**, 8460*g*.

The ion-exchange between Be solns. and the ammonium form of Dowex 50 resin was studied to det. the exptl. conditions under which polymerization of Be began. At an ionic strength of 0.1, pH 4.5, and temp. 37°C, the polymerization of Be in perchlorate soln. began when its concn. was raised to about 10^{-5} *M*.

4361. Fisher, S. A. and Meloche, V. W. **Ion exchange of rhenium from molybdenum.** *Anal. Chem.* **24**, 1100-6 (1952).—*C.A.* 46, 11029*a*.

When 10% NaOH solns. contg. perrhenate and a 3000-fold excess of molybdate were passed through an ion-exchange column contg. Amberlite resin, IRA 400, the Mo could be eluted into the effluent with 10% NaOH and the Re retained on the resin. A recovery of 99 ± 3% of the Re from the column was then effected by eluting with 7-8 *N* HCl.

4362. Fronaeus, Sture. **Ion-exchange study of the cerous sulfate system.** *Svenk Kem. Tidskr.* **64**, 317-24 (1952) (in English).—*C.A.* 47, 5221*b*.

The ionic strength was kept const. with $NaClO_4$, and the cerous concn. was measured with a tracer, Ce^{141}. The mononuclear complexes $CeSO_4^+$, $Ce(SO_4)_2^-$, and $Ce(SO_4)_3^{3-}$ were shown to exist for sulfate ion concns. ≦200mC. The complexity consts. were calcd. for those conditions. The $CeSO_4^+$ complex had small affinity for the exchange resin as compared to the cerous ion.

4363. Fronaeus, Sture. **The equilibria between nickel and acetate ions—ion-exchange and potentiometric investigation.** *Acta Chem. Scand.* 6, 1200-11 (1952) (in English).—*C.A.* 47, 5292*b*.

The investigation indicated the existence of $NiOAc^+$ and $Ni(OAc)_2$ at AcO^- concns. ≦0.5*M*. At 20°C and an ionic strength of 1*M*, the complexity consts. were 4.7 ± 0.6 and 18 ± 3, resp.

4364. Gabrielson, Gunnar and Samuelson, Olof. **Utilization of ion exchangers in analytical chemistry. XIX. Separation of aldehydes and ketones from organic acids.** *Acta Chem. Scand.* 6, 729-37 (1952) (in English).—*C.A.* **46**, 11039*h*.

Quant. sepn. could not be obtained by Amberlite IRA-400 in the free base form; the percent recovery in the effluent was 79.4, 85.5, 88.4, 0.025, 0.015, 37.7, 0.20, 100.8, and 100.3% for HCHO, furfural, PhCHO in H_2O, salicylaldehyde in H_2O, vanillin, MeCH:CHCHO, glyoxal, Me_2CO, and MeCOEt, resp. Amberlite IRA-400 (strongly basic type) in the Cl form could be used to sep. org. acids from most aldehydes and ketones, but the solns. were contaminated with Cl ion.

4365. Gabrielson, Gunnar and Samuelson, Olof. **Utilization of ion exchangers in analytical chemistry. XX. Separation of ketones from alcohols.** *Acta Chem. Scand.* 6, 738-43 (1952) (in English).—*C.A.* 46, 11039*e*.

Ketones were sepd. quantitatively from alcs. by absorbing of the ketone on an anion-exchange resin in the bisulfite form. The ketones were eluted from the column with hot H_2O. The column was prepd. by satg. Amberlite IRA-400 (particle size 0.12-0.30 mm, resin layer 550 mm deep and 9.8 mm diam. in column) with 500 cc. *M* $NaHSO_3$ and H_2O.

4366. Gabrielson, Gunnar and Samuelson, Olof. **Utilization of ion exchangers in analytical chemistry. XXII. Separations of aldehydes from ketones.** *Svensk Kem. Tid.* **64**, 150-6 (1952) (in English).—*C.A.* **46**, 9018*i*.

$Me_2CO-C_4H_3OCHO$, $Me_2CO-AcH$, and $EtCOMe-AcH$ mixts. were adsorbed on Amberlite IRA-400 columns (9.8 by 550 mm; particle size 0.12-0.30 mm) in the bisulfite form. Water (300 ml) effected complete elution of the ketones. The aldehydes were eluted quantitatively with 300 ml *M* NaCl (2 ml/min.). Because of the lesser stability of the Me_2CO bisulfite compd., more than 99% Me_2CO was eluted before C_4H_3OCHO could be detected in the effluent. Me_2CO in distillates from sulfite waste liquor and sulfite alc. was detd. by adsorption on an ion-exchange column.

4367. Gingold, K.; Rochow, E.; Seyferth, D.; Smith, A., and West, R. **Ionization of organometallic halides.** *J. Am. Chem. Soc.* 74, 6306 (1952).—*C.A.* **47**, 11905*c*.

Organosilicon ions of the type R_3Si^+, R_2Si^{++}, and RSi^{+++} were studied from a conductometric viewpoint. $(CH_3)_2Si$ ions were retained by a cation exchange resin; by elution and metathesis, various salts were prepd., including dimethyltin tungstate, molybdate, and sulfide.

4368. Glueckauf, E. **A theoretical treatment of cation exchangers. I. The prediction of equilibrium constants from osmotic data.** *Proc. Roy. Soc.* (London) **A214**, 207-25 (1952).—*C.A.* **46**, 10777*h*.

An interpretation of ion exchange in swelling materials could be made by treating the exchanger phase as a concd. aq. electrolyte. The water uptake of polystyrene sulfonates of different cross linkings was studied for various univalent cations. Calcns. were made for the osmotic properties of an unstrained resinate. The data showed that the anions did not contribute toward the statistical entropy terms of the solns.

4369. Goodall, R. R. and Mellor, N. **Electrometric titration of chloride. An improved form of end point half-cell containing a hydrogen-silver exchange resin.** *Anal. Chim. Acta* **6**, 373-8 (1952) (in English).—*C.A.* **46**, 7472*i*.

An end point half-cell suitable for use in Cl^- titrations had been prepd. by dipping a Ag rod into an aq. suspension of a cation-exchange resin which had been partly converted to the Ag form. Dowex 50 and Zeocarb 225 were suitable resins.

4370. Goudie, Alexander J. and Rieman, William III. **Determination of phosphate by ion exchange.** *Anal. Chem.* **24**, 1067-8 (1952).—*C.A.* **46**, 9470*g*.

A re-evaluation of the ion exchange procedure for the detn. of phosphate was necessary. The carbonate error could be eliminated by standardizing the base under the same conditions of analysis or by eliminating CO_2 in both the standardization and analysis. Diammonium citrate was used as a complexing agent for Fe^{3+} previous to regeneration by HCl.

4371. Gregor, Harry P.; Taifer, Mark; Citarel, Louis, and Becker, Ernest I. **Chelate ion-exchange resins.** *Ind. Eng. Chem.* **44**, 2834-9 (1952).—*C.A.* **47**, 3493*e*.

HCHO and o-aminophenol, anthranilic acid, or $m\text{-}C_6H_4(NHCH_2CO_2H)_2$ was used as the chelate monomers. Data were reported on the absorption from buffered solns. of Mg^{++}, Fe^{++}, Co^{++}, Ni^{++}, Cu^{++}, and Zn^{++} by the last named resin at pHs varying from 1 to 8 depending upon the cation-ion concns. of from 0.001 to 0.1 *M* and ionic strengths of from 0.025 to 1.0. Since the metallic ions were absorbed to different extents at different pH levels, sepns. were effected in favorable cases.

4372. Grossman, Jack J. and Adamson, Arthur W. **The diffusion process for organolite exchangers.** *J. Phys. Chem.* **56**, 97-100 (1952).—*C.A.* **46**, 7400*a*.

Particle- and film-diffusion mechanisms were rate-controlling for the exchange systems H-Cs and Na-Cs, resp., on Dowex 50, although intermediate diffusion characteristics were observable.

4373. Grunbaum, Benjamin W.; Schöniger, Wolfgang, and Kirk, Paul L. **Preparation of very dilute standard base by ion exchange.** *Anal. Chem.* **24**, 1857-8 (1952).—*C.A.* **47**, 1006*b*.

A strong base anion-exchange resin, Amberlite XE-67, reacted with 0.0010 *N* KCl soln. to provide a 0.0010 *N* KOH soln. for the titration of microgram quantities of fatty acids.

4374. Gustavson, K. H. and Holm, Britta. **The effect of the degree of crosslinking of cation-exchanging resins on their interactions with chromium complexes.** *Svensk Kem. Tid.* **64**, 137-45 (1952) (in English).—*C.A.* **46**, 8412*h*.

Sulfonated polystyrene resins crosslinked with 5, 8, 15, and 25 % $C_6H_4(CH{=}CH_2)_2$ were reacted with various chlorides, perchlorates, and sulfates of Cr. The lightly crosslinked resins removed the cationic Cr complexes completely.

4375. Haissinsky, Moise. **Electronic and solvent transfer in aqueous solutions of bi- and trivalent chromium. Separation of two ionic species by ion exchange.** *J. chim. phys.* **49**, No. 7/8, C133-6 (1952).—*C.A.* **47**, 941*b*.

The exchange between Cr^{++} and Cr^{+++} in aq. HCl or H_2SO_4 soln. was detd. by means of Cr^{51}. The ions were sepd. in a Dowex 50 column. All operations with Cr^{++} were performed under H_2. The column was eluted with HCl, $Cr(OH)_3$ was pptd. with NH_4OH and NH_4Cl, ignited to Cr_2O_3, and counted. The half life of the exchange reaction was less than 2 min. in HCl, 3 to 5 min. in H_2SO_4.

4376. Hale, D. K.; Hawdon, A. R.; Jones, J. I., and Packham, D. I. **The carboxylation of resorcinol and the separation of beta- and gamma-resorcylic acid by ion exchange chromatography.** *J. Chem. Soc.* **1952**, 3503-3509.—*C.A.* **47**, 5917*d*.

Complete sepn. of the acid from the β-isomer was effected by adsorbing the acids on a bed of weakly basic anion exchange resin in the chloride form and eluting with solns. of hydrochloric acid in water or aq. alc. Small scale expts. indicated that strongly basic anion exchangers were similarly amenable to the sepn. procedure. A process for the partial conversion of the gamma- to the beta-isomer was also developed.

4377. Hein, Fr. and Lilie, H. **The preparation of complex acids by the ion-exchange method.** *Z. anorg. u. allgem. Chem.* **270**, 45-48 (1952).—*C.A.* **47**, 1522*a*.

The synthetic resin Wolfatite A could be conveniently used in prepg. complex acids. The cations of complex salts were readily replaced by H ions at room temp. and a contact period of 15 min. The following complex salts produced the corresponding acids: $K_4[Fe(CN)_6]$, $K_3[Cu(CN)_4]$, $NH_4[(NH_3)_2Cr(SCN)_4]$, $K_3[Cr(SCN)_6]$, $K_3[Co(CN)_6]$, $K_4[Mo(CN)_8]$, $Na[Co(NO_2)_4en]$.

4378. Hirs, C. H. W.; Moore, Standford, and Stein, William H. **Isolation of amino acids by chromatography on ion-exchange columns; use of volatile buffers.** *J. Biol. Chem.* **195**, 669-83 (1952).—*C.A.* **47**, 10599*e*.

About 100 mg of each amino acid was isolated from protein hydrolyzates. To separate the basic amino acids, a strongly acidic cation exchanger was employed; for the acidic amino acids, a weakly basic anion exchanger; and for the neutral acids, two columns of strongly acidic cation exchanger. Elution was effected with ammonium formate or acetate buffers at pH 3 to 7. The buffers were removed by sublimation, the amino acids being obtained in crystalline form. All the amino acids (methionine excepted) were obtained analytically pure.

4379. Högfeldt, Erik. **Sorption isotherms on ion exchangers by e.m.f. titrations.** *Acta Chem. Scand.* 6, 610-11 (1952) (in English).—*C.A.* 46, 10775*h*.

H^+-satd. Wofatit KS under HNO_3 at 25°C was titrated with $AgNO_3$ soln. with use of Ag/AgI electrodes. The Ag^+ concn. was detd., the capacity by satg. the resin with H^+, expelling the H^+ with KNO_3, and titrating with NaOH. The isotherms agreed with those detd. by the batch-equil. method.

4380. Högfeldt, Erik. **Ion-exchange equilibria. II. Activities of the components in ion exchangers.** *Arkiv. Kemi* 5, 147-71 (1952) (in English).—*C.A.* 47, 6215*i*.

An ion exchanger contg. 2 ionic species was treated as a binary nonideal mixt. A certain amt. of the exchanger (R^-) was in equil. with a soln. contg. 2 ions $A_1^{z_1+}$ and $A_2^{z_2+}$. The mol. wts of the components could be chosen in 2 ways, giving 2 formal treatments. Application of the derived equations to existing data of Ag-H on Wofatit KS and Dowex 50, and Ba-H on Dowex 50 showed the preference of one method as the better approach.

4381. Holm, L. W. **Sectioned ion-exchange column: determination of the state of a substance in solution.** *Research* (London) 5, 286-8 (1952).—*C.A.* 46, 7827*f*.

A sectioned ion-exchange column, consisting of alternating bands of cation- and anion-exchange resins, could be used to obtain information about the behavior of a carrier-free radioactive substance. An expt. was described with P^{32} in the form of the orthophosphate showing the presence of a small amt. of filterable impurity and also cationic complexes or positively charged colloids.

4382. Honda, Masatake. **Ion-exchange resin applied to analytical chemistry. XII. Determination of adsorption band by a high-frequency method.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 73, 529 (1952).—*C.A.* 47, 2625*f*.

The tube of a cation exchanger was inserted in the anode or grid coil of a high-frequency oscillator. Resin adsorbed with H^+, Na^+, or Ba^{++} showed different currents and by this method the portion of the resin contg. metallic ions could be detected.

4383. Honda, Masatake. **Measurement of pH in cation-exchange resin phase.** *Japan Analyst* 1, 122-5 (1952).—*C.A.* 47, 4688*d*.

Dimethyl yellow or naphthyl red was adsorbed in the almost colorless sulfonated polystyrene resin (R—H type), and its color change with the pH of soln. in various concns. (1 ~ 0.001*N*) of NaCl solns. was observed. As the concn. of NaCl increased, the pH of soln. at which color changed in the resin phase shifted to acid. Similar observation was made on a weakly acidic carboxylic resin (Amberlite IRC-50), but the color change was not sharp as in the former.

4384. Honda, Masatake; Yoshino, Yukichi, and Wariko, Tatsuki. **The solution of barium sulfate by ion-exchange resins.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 348-9 (1952).—*C.A.* 47, 2568*d*.

When a mixt. of cation and anion exchanger was added to a suspension of $BaSO_4$ and the soln. shaken, the $BaSO_4$ was dissolved completely. This phenomenon was due to the adsorption of Ba^{++} and SO_4^{--} ions present in the soln.

4385. Kakihana, Hidetake and Yashiro, Kensuke. **Rapid analysis with an ion-exchanging resin. Volumetric determination of sulfate ion in copper sulfate and of free sulfuric acid in a mixture of copper sulfate and sulfuric acid.** *Japan Analyst* 1, 85-6 (1952).—*C.A.* 47, 1007*b*.

An approx. 0.1 *N* soln. of $CuSO_4$ was passed through a 10 ml Amberlite IR 120 (H type) column, which was then washed with 50 ml H_2O. The effluent was combined and the resulting H_2SO_4 was detd. by alkalimetry.

4386. Kawabe, Hiroshi and Yanagita, Masaya. **Synthesis and utilization of ion-exchange resins. I. Cation-exchange resin from salicylic acid.** *Repts. Sci. Research Inst.* (Japan) 28, 264-74 (1952).—*C.A.* 47, 4010*i*.

$C_6H_4(OH)CO_2H$ was condensed with HCHO (1:2 moles) with HCl (or H_2SO_4) catalyst at 99 C in 1.81 times ratio (reaction/emulsifying) to a sol. polynuclear resin which was then jellified with PhOH (0.7/1 mole I) at 98°C for 1 hr, dried, and powd. to pass through a 20-40 mesh. The resin was utilized in the extn. of streptomycin and nicotine.

4387. Kindt, B. H.; Balis, E. W., and Liebhafsky, H. A. **Alkalimetric determination of phosphate after separation of calcium by ion exchange.** *Anal. Chem.* 24, 1501-2 (1952).—*C.A.* 47, 4246*g*.

$H_2PO_4^-$ could be titrated to HPO_4^{-} after the removal of Ca^{++} by Dowex 50, by using a glass electrode, by freeing all reagents of CO_2 and carrying out the analysis in air contg. no CO_2. Good results were obtained in detg. 34.9-50.5% P_2O_5 in 5 samples.

4388. King, Edward L. and Dismukes, Edward B. **The separation, identification, and spectra of chromium. III. Thiocyanate cationic complexes.** *J. Am. Chem. Soc.* 74, 1674-5 (1952).—*C.A.* 46, 6981*a*.

The species $Cr(H_2O)_6^{+++}$, $Cr(H_2O)_5(SCN)^{++}$ and $Cr(H_2O)_4(SCN)_2^{+}$ were sepd. by use of ion-exchange techniques. The complex species were identified by detn. of the (thiocyanate)/(Cr(III)) ratio.

4389. Klement, Robert. **Separation of molybdenum from heavy-metal cations with the aid of ion-exchange resins.** *Z. anal. Chem.* 136, 17-25 (1952).—*C.A.* 46, 8568*i*.

If a slightly acid soln. contg. MoO_4^{2-} was treated with sufficient citric acid, a complex anion was formed which was not removed from soln. by passage through an H form of app. contg. Wofatit F, Amberlite IR 120, or Dowex 50 resin. After washing the column, all the Mo was in the eluate where it could be pptd. with oxine and the Mo detd. by weighing the oxinate or by bromometric titration of the ppt. Pb, Cu, Cr, Ni, Fe, and V were adsorbed by the resin.

4390. Kressman, T. R. E. **Ion-exchange separations based on ionic size.** *J. Phys. Chem.* 56, 118-23 (1952).—*C.A.* 46, 7400*c*.

Ionic size affected the mechanism of cation and anion exchange reactions by affecting both the position and rate of attainment of equil.; however, with a weakly basic, highly porous exchanger, the equil. position was independent of ionic size. For Zeo-Karb 225 the equil. exchange values for the following ions increased in the order NMe_{4}^{+}, NE_{4}^{+}, Na^{+}, $PhNMe_2CH_2Ph^{+}$, whereas if the satn. capacities of the resin were the same for all ions, the order should have been Na^{+}, NMe_{4}^{+}, NEt_{4}^{+}, $PhNMe_2CH_2Ph^{+}$. The rates of absorption of acids on De-Acidite-E and De-colorite decreased with increasing size of the acid mol. and increased with increasing valence. This applied not only to HCl and H_2SO_4, but also to the large org. dyes Orange G and Orange II.

4391. Lapidus, Leon and Amundson, Neal R. **The rate-determining steps in radial adsorption analysis.** *J. Phys. Chem.* **56**, 373-83 (1952).—*C.A.* **46**, 7396*g*.

Mass-transfer equations, based on various kinetic, liquid, and solid diffusion-rate mechanisms, were derived for the satn. of an initially empty radial adsorption disk. One ion-exchange and two adsorption systems were used in expts. to test the validity and usefulness of the equations under a variety of operating conditions.

4392. Leden, Ido. **The use of an anion-exchange resin to prove the presence of anionic complexes in some cadmium and copper salts.** *Svensk Kem. Tid.* **64**, 145-9 (1952) (in English).—*C.A.* **46**, 8563*a*.

A soln. of $Cd(ClO_4)_2$ was percolated through a column of Amberlite IRA400, pretreated with $NaClO_4$. Washing the 10-g column with 35 ml H_2O removed all the Cd, hence the $Cd(ClO_4)_2$ soln. had not contained any anionic complexes. Similar results were obtained for $CdSO_4$. A column satd. with Cl ions and treated with a $CdCl_2$ soln. had to be washed with six 25-ml portions of H_2O before the effluent was free from Cd ions. When NaCl was added to the $CdCl_2$ soln., 8 washings became necessary. Further treatment of the column with a $NaClO_4$ soln. to remove the Cl ions failed to give any Cd ions in the effluent.

4393. Lescoeur, L. **Exchange titrimetry and exchange potentiometry.** *Ann. inst. hydrol. climatol.* **22**, 59-66 (1952).—*C.A.* **46**, 10502*i*.

The pH of a soln. after exchange with Zeocarb, which was related to the concns. and hydrolysis consts. of the anions present, allowed further characterization of the sample.

4394. Linnenbom, V. J. **Separation of high-specific-activity sodium^{24} from large quantities of magnesium.** *J. Chem. Phys.* **20**, 1657-8 (1952).—*C.A.* **46**, 11029*d*.

Sepn. of Na^{24} from Mg was accomplished by ion exchange of the chlorides in neutral soln. on Dowex-50 resin (100 mesh) in a glass-free (polystyrene) column. Both Mg and Na were adsorbed. Elution with 0.1 *N* HCl removed the Na and left the Mg behind. Recovery of Na activity was quant. and sepn. from Mg was complete.

4395. Lister, B.A.J. and Hutcheon, J. M. **Preparation of pure hafnium by cation exchange.** *Research* (London) **5**, 291-2 (1952).—*C.A.* **46**, 8555*g*.

Pure Hf was prepd. from a Zr-Hf mixt. by absorbing the mixt. on the top section of a cation-exchange resin and eluting with *N* H_2SO_4 to remove the Zr. The Hf was then eluted from the column with 3 *N* H_2SO_4. An expt. showed 0.3% Zr impurity in the Hf eluate.

4396. Lister, B. A. J. and McDonald, L. A. **Zirconium chemistry.** *J. Chem. Soc.* **1952**, 4315-30.—*C.A.* **47**, 3664*h*.

Zr solns. in the concn. range 0.01 to 0.05 *M* contg. a radioactive Zr isotope were used in measurements of the rate of self-diffusion of the Zr species, the migration of Zr ions in an elec. field, the rate of diffusion of Zr ions into ion-exchange resins, the ionic charge of the Zr species absorbed on the resin, the ratio of anion to cation in the species absorbed on the resin, and the presence of Zr in the anionic form.

4397. Manecke, G. **Separation of ions in ion-exchange columns by ionophoresis.** *Naturwissenschaften* **39**, 62-3 (1952).—*C.A.* **47**, 378*g*.

A horizontal ion-exchange column, 8 cm long, 1.5 cm^2 cross-section was connected on both sides to electrode vessels, 120 v. d.c., 0.005 to 0.020 amps.; water flowed by the Pt electrodes. By virtue of the difference in migration rate of different ions in such a column, the ions could be sharply sepd.

4398. Manecke, G. **Electric conductance of cation-exchange membranes.** *Z. physik. Chem.* **201**, 193-210 (1952).—*C.A.* **47**, 7290*e*.

The membranes consisted of sulfonated PhOH-HCOH condensation products, and of sulfonated $PhCH{:}CH_2$-$C_6H_4(CH{:}CH_2)_2$, mixed polymers with different degrees of cross-linkages. The mean activity coeff. of the ions in the membrane was detd. from the K-ion concn. with high ion concns. outside the membrane, and from measurements of the membrane potentials with relatively low ion concns. From these membrane potentials the equil. const. for the exchange K-Na was calcd. and found to be in good accord with the exptl. results.

4399. Marconi, Maria. **Determination of the cationic exchange capacity of resins of sulfonic type.** *Chimica* (Milan) 7, 432-3 (1952).—*C.A.* **47**, 6217*b*.

The cationic exchange capacity of these resins could be detd. not only with neutralization reactions, but with oxido-reduction reactions, e.g.: $IO_3^- + 5I^- + 6H^+ \rightarrow 3I_2 + 3H_2O$. To 1 g of resin activated with *N* HCl, washed to a neutral reaction and suspended in H_2O, add 1 g KI and 5 cc. 0.1 *M* KIO_3, shake, and after 10 min. dil. with 100 cc. H_2O; titrate with 0.1 *N* $Na_2S_2O_3$ (starch indicator).

4400. Martin, J. Robert and Hayes, John R. **Application of ion exchange to the determination of boron.** *Anal. Chem.* **24**, 182-5 (1952).—*C.A.* **46**, 3902*f*.

Dissolve the sample contg. 0.03-20.0% B in water or dil. HCl, dil. to 50 ml, pass through a cation-exchange resin, and wash the bed with 200 ml of water. Nearly neutralize the effluent with NaOH, reflux 5 min., cool, and adjust the pH to 6.90. Make 0.6 *M* with invert sugar and titrate to pH 6.90 with standard NaOH.

4401. Merriam, C. Neale Jr.; Southworth, Raymond W., and Thomas, Henry C. **Ion-exchange mechanisms and isotherms from deep-bed performance.** *J. Chem. Phys.* **20**, 1842-6 (1952).—*C.A.* **47**, 4167*a*.

Exchange expts. of NaCl contg. Na^{22} on Amberlite XE-79 showed that solid diffusion was the rate-detg. step. The diffusion const. necessary to explain the results was estd. as 1.8×10^{-7}. The Na-Cs exchange isotherm was detd. by three series of expts. The av. capacity of the Me_2CO-washed Amberlite XE-79, detd. by treating three 5-g samples with 100 ml of 0.1970 M NaCl + Na^{22}, was 3.11 milliequiv./g.

4402. Michaels, A. **Simplified method of interpreting kinetic data in fixed-bed ion exchange.** *Ind. Eng. Chem.* **44**, 1922-30 (1952).—*C.A.* **47**, 354*i*.

The treatment was applicable to those high-exchange-rate reactions in which the exchange zone, i.e., the zone where the majority of the reaction occured, descended through the resin bed at const. velocity. The results could be extrapolated for the design of large ion-exchange units. The effect of bed height and liquor velocity on the capacity and rate of exchange of Na for H ions on acid-form Nalcite HCR (Dowex 50) was studied.

4403. Minami, Eiichi; Kakihana, Hidetake, and Fuzimoto, Masatoshi. **Inorganic analytical chemistry with ion-exchange resin. V. Electrometric determination of cations in the effluent from the cation exchanger.** *J. Chem. Soc. Japan,* Pure Chem. Sect. **73**, 368-70 (1952).—*C.A.* **47**, 2642*e*.

H, Rb, and Cs found in the effluent from the cation exchanger were detd. by measuring the electric cond. By this method the elution could be followed easily.

4404. Miyamoto, Shigeru and Sasaki, Tsunetaka. **Electrolytic regeneration of ion-exchange resin.** *J. Chem. Soc. Japan,* Pure Chem. Sect. **73**, 926-8 (1952).—*C.A.* **47**, 6277*h*.

Cation-exchange resins and anion-exchange resins could be regenerated up to almost 100% by selecting electrolytic conditions. Efficiency of elec. current and regeneration were detd. by the amt. of current and not by c.d. Electricity consumed was smaller the narrower the distance between the electrodes. Electrodes other than Pt caused corrosion or soln. of the electrode.

4405. Moore, Geo. E. and Kraus, Kurt A. **Anion exchange. IV. Cobalt and nickel in hydrochloric acid solutions.** *J. Am. Chem. Soc.* **74**, 843-4 (1952).—*C.A.* **47**, 4166*g*.

The anion-exchange behavior of Ni(II) and Co(II) in 0.5-12 M HCl was studied by detg. their elution consts., $E = dA/V$, where d was the distance (cm) an adsorption band moved when V cc. of eluent had passed through a column of A cm^2. Dowex-1 was used. The difference in the adsorption behaviors of Ni and Co was sufficient to permit excellent sepn.

4406. Mori, Yutaka and Meguro, Kenjiro. **Application of ion-exchange resin for the study of the properties of colloidal solutions. I. Purification of ferric hydroxide sol.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **73**, 907-9 (1952).—*C.A.* **47**, 6217*c*.

Purification of Fe(OH)$_3$ sol. by ion-exchange resins Diaion A and B was studied. The results were compared with those of electrodialysis. Simultaneous use of cation and anion exchange resins gave a sol. of higher purity than does electrodialysis.

4407. Nagamatsu, Masatoshi. **Electrochemical studies on ion exchangers. II. Ion exchange reaction between cation-exchange resins of the sulfonic acid-type and neutral salt solutions.** *J. Electrochem. Soc. Japan* **20**, 123-8 (1952).—*C.A.* **47**, 423*c*.

Bivalent ions were exchanged to a greater extent than univalent ions and were very readily exchanged at low concns. The exchange reaction of "Daiya ion" reached equil. after about 30 min., and the exchange velocity satisfied a 1st-order or a 2nd-order rate equation at the beginning. This ion-exchange resin satisfied the mass-action equation.

4408. Nagamatsu, Masatoshi. **Electrochemical studies on ion exchangers. IV. Ion-exchange reaction between zeolite and neutral salt solutions.** *J. Electrochem. Soc. Japan* **20**, 203-6 (1952).—*C.A.* **47**, 423*f*.

The rate of the ion-exchange reaction, $Na_2(Zeolite) + CaCl_2 \rightleftarrows Ca(Zeolite) + 2NaCl$, was lower than that in sulfonic acid-ion-exchange resins. The logarithm of the equil. const. K_a of the reaction had a linear relation with m_{Na}/M, where m_{Na} was the equiv. Na ion in the liquid phase at equil. and M the capacity for replacing Ca with Na in the Ca (Zeolite).

4409. Nakanishi, Hisayoshi and Nagao, Sansei. **Application of ion-exchanging resin to routine analysis. Determination of total sulfate ion and silicofluoride ion.** *Japan Analyst.* **1**, 86-7 (1952).—*C.A.* **47**, 1007*a*.

Detn. of SO_4^{--} in Cu electrolytic refining soln. by an ion-exchanging resin (Amberlite IR 120) was in good agreement with the usual $BaSO_4$ method. The same procedure was employed to remove Sn from Sn electrolytic refining soln.

4410. Noggle, G. R. and Zill, L. P. **The quantitative analysis of sugars in plant extracts by ion-exchange chromatography.** *Arch. Biochem. Biophys.* **41**, 21-8 (1952).—*C.A.* **47**, 2090*c*.

Ion-exchange chromatography was used to sep. the sugars of plant exts. Quant. results were obtained for both plant exts. and recovery expts. Results were given for plant samples contg. sucrose, raffinose, stachyose, glucose, galactose, and fructose.

4411. Pepper, K. W.; Reichenberg, D., and Hale, D. K. **Properties of ion-exchange resins in relation to their structure. Part IV. Swelling and shrinkage of sulphonated polystyrenes of different crosslinking.** *J. Chem. Soc.* 3129-36 **(1952)**.

Two methods were described for determining the wt-swelling of ion exchange resins in bead form. It was shown from pycnometric measurements that the H–, Na–, and mixed forms of the resins obeyed the relationship: $(V_M)_H = (W_M)_H + 0.63$, where the first term was the swollen vol. and the sec the wt of water absorbed by an amt. of the M-form equivalent to 1 g of dry *H*-form. The effect on wt swelling was investigated for changes in degree of cross-linking, cationic compn., and concn. of ambient HCl solns.

4412. RADHAKRISHNA, B. P. **Separation of thorium and lanthanum by ionic exchange.** *Anal. Chim. Acta* **6**, 351-4 (1952) (in French).—*C.A.* **46**, 7453*e*.

A simple and efficient method was described for the sepn. of Th and La by ion exchange, especially by Amberlite IR 100, with a radioactive indicator. La was eluted first with citric acid, and then the Th was sepd. with H_2SO_4 as eluent. The sepn. was complete, and the method could be applied to all of the rare earth elements.

4413. RIEMAN, WILLIAM III AND LINDENBAUM, SIEGFRIED. **Analysis of mixtures of chloride and bromide by ion-exchange chromatography.** *Anal. Chem.* **24**, 1199-1200 (1952).—*C.A.* **46**, 9470*d*.

Halide mixts. were sepd. by chromatography on a strong-base anion-exchange resin column with $NaNO_3$ as the eluent. Eluent was passed through the column at a given rate, and fractions of the effluent analyzed by titration. The first set of fractions contained no halide; the second, Cl^-, and the third, Br^-. Capacity and interstitial volume of the column were detd. by treating the column with HCl, eluting all the Cl^- with $NaNO_3$. Titration of H^+ in the eluate gave interstitial volume.

4414. RYABCHIKOV, D. I. AND BUKHTIAROV, V. E. **Use of ion-exchange chromatographic method in the analysis of copper-iron ceramic alloys and bronzes.** *Zhur. Anal. Khim.* **7**, 377-83 (1952).—*C.A.* **47**, 4787*d*.

One of the cations remained unchanged while the others were transformed into complex anions. The cationite used was SBS and the rate of flow through the column was 4 ml/min. To sep. Cu and Fe, the latter was converted to $Fe_2(P_2O_7)_3$ at pH 10-11. Cu and Al were sepd. by converting Al to tartrate $Al_2(C_4H_2O_6)_3$ in an ammoniacal soln. Cu was sepd. from Al and Fe by changing Al and Fe to salicylates at pH 10. Mn was sepd. from Fe by treating their soln. with $(NH_4)_2C_2O_4$ at pH 5. This left Mn as Mn^{++} and Fe formed $Fe(C_2O_4)_3{}^{3-}$.

4415. RYABCHIKOV, D. I.; SENYAVIN, M. M. AND FILIPPOVA, K. V. **Comparative characteristics of some ion-exchanging substances.** *Zhur. Anal. Khim.* **7**, 135-44 (1952).—*C.A.* **47**, 1309*a*.

The phys. and mech. properties (vol.-wt, exchange capacity, swelling in various liquids, etc.) of 12 cationites and 11 anionites, both Soviet and foreign, were described.

4416. SAKAI, WATARU AND SEIYAMA, TETSURO. **Theory of ionic-exchange equilibria.** *Mem. Faculty Eng., Kyushu Univ.*, **13**, 95-117 (1952).—*C.A.* **47**, 21*h*.

The discussion was confined to the simple case of a uni-univalent ion exchange, and the ionic exchange reaction equation obtained was based on Bethe-Fowler's approximation. The theoretical equation was applied to exptl. results. Numerical relations between the adsorption equations of the Freundlich and Langmuir types and the chem. equil. equation were discussed.

4417. SAKAI, WATARU; SEIYAMA, TETSURO, AND NAGAMATSU, MASATOSHI. **Theory of ion-exchange equilibria. I. Derivation of equilibrium equation. II. The equilibrium equation and its application to experimental results.** *J. Electrochem. Soc. Japan* **19**, 343-5 (1951); **20**, 21-4 (1952).—*C.A.* **46**, 4318*g*.

In ion-exchange reactions, the exchanger phase caused anomaly in equil. An equation for ion-exchange equil. was derived, taking into account a lattice model for exchanging ions. Several characteristics of the equation were discussed. This equation might have been applied satisfactorily to various org. and inorg. ion exchangers.

4418. SALMON, J. E. AND TIETEZE, H. R. **The separation of quadrivalent and quinquevalent vanadium from phosphoric acid by ion-exchange resins. Some observations on the reduction of quinquevalent vanadium by ion-exchange resins.** *J. Chem. Soc.* **1952**, 2324-6.—*C.A.* **46**, 8997*h*.

Cation-exchange resins removed both V(IV) and V(V) from H_3PO_4 solns. Removal of V from K_3PO_4 solns. was influenced by the concn. of the K. Zeo-Karb 215 and 216 and Amberlite IR 120 reduced the V(V) to V(IV) as it was sepd., while Zeo-Karb 225 effected only partial reduction.

4419. SALOMON, L. L.; BURNS, J. J., AND KING, C. G. **Synthesis of L-ascorbic-1-C^{14} acid from D-sorbitol.** *J. Am. Chem. Soc.* **74**, 5161-5162 (1952).—*C.A.* **48**, 132*f*.

L-ascorbic acid was purified by treatment of the final hydrolysate with a weakly basic anion exchanger, Amberlite IR-120, in the acetate form. The ascorbic acid, adsorbed on a column of the resin, was eluted with 1 *N* hydrochloric acid. Fractions contg. no ascorbic acid, as detd. by titration, were discarded. Ascorbic acid was recovered almost quantitatively through this purification step. The use of an anion exchange column in the acetate form rather than in the free base form made unnecessary the prior use of a cation exchanger.

4420. SANSONI, BRUNO. **Use of ion-exchange resins as electron exchangers.** *Naturwissenschaften* **39**, 281(1952).—*C.A.* **47**, 6069*f*.

Oxidation-reduction ion exchangers were prepd. from strongly acid cation exchangers like Wofatite F, Amberlite IR 120, Dowex 50, and oxidation-reduction systems such as Fe^{2+}/Fe^{3+}, Sn^{2+}/Sn^{4+}, leucomethylene blue/methylene blue (LMB), or by treatment of anion exchangers like Wofatite M, Amberlite IRA 400, with hydroquinone/quinone, etc. The exchanger was reduced by $Na_2S_2O_4$ and oxidized by air or O_2.

4421. SAUNDERS, L. AND SRIVASTAVA, R. S. **Adsorption of organic bases by carboxylic acid ion-exchange resins. I. Equilibrium studies.** *J. Chem. Soc.* **1952**, 2111-18.—*C.A.* **46**, 10790*a*.

Quant. studies of the equil. distributions of NaOH, nicotine, pyridine, piperidine, ephedrine, and quinine between their aq. and alc. solns. and weak acid ion-exchange resins such as methacrylic acid resin and Amberlite IRC 50 resulted in classification into 2 groups. Weak bases follow the law (concn. of base in resin)/(concn. in equil. soln.) = const., while others mostly follow a logarithmic law.

4422. SCHUBERT, JACK. **Ion-exchange studies of complex ions as a function of temperature, ionic strength, and presence of formaldehyde.** *J. Phys. Chem.* **56**, 113-18 (1952).—*C.A.* **46**, 7400*g*.

The formation const., k_f, of the complex ion $(MA_n)^c$, where M was Sr^{++} or Ca^{++}, A was an anion, n was the no. of mols. of A relative to M, and c was the net charge of the complex, was related to the equil. ion-exchange formulation. Equilibrating Dowex 50 with the M and the listed ligands, at pH = 7.2-7.3, $\mu = 0.16$, and $t = 25°C$, and measuring the mat. of M in the resin and liquid phases showed that the M formed 1:1 complexes with the ligands. In the temp. range 3-40°C at const. μ, k_f of the Sr citrate complex was const., whereas decreasing μ increased its k_f. The presence of 10% HCHO had a great effect on the affinity of aspartic acid for the M.

4423. SCHUBERT, JACK AND LINDENBAUM, ARTHUR. **Stability of alkaline earth-organic acid complexes measured by ion exchange.** *J. Am. Chem. Soc.* **74**, 3529-32 (1952).—*C.A.* **46**, 11005*d*.

The formation constd. for the complex ions formed between Ca^{++} or Sr^{++} and a series of org. acids were detd. in barbital-buffered solns. at pH 7.2-7.3, ionic strength 0.16, and temp. 25°C by utilizing the equil. ion exchange on Dowex-50 resin of essentially carrier-free levels of radioactive cations. All complexes were of the 1:1 type. The logarithm of the formation consts. at 25°C between the org. anion from the parent acid listed and Ca^{++} and Sr^{++}, resp., were given.

4424. SEAL, KENNETH S. **The preparation of a cation-exchange resin.** *Pharm. J.* **168**, 343-4 (1952).—*C.A.* **46**, 9746*h*.

A procedure for converting Zeo-Karb 225, a synthetic resin based on polystyrene and contg. sulfonic acid groups, into the K form was outlined.

4425. SHAH, H. A. AND BAFNA, S. L. **Ion exchange. I. Three synthetic cation-exchange resins.** *J. Indian Chem. Soc.* **29**, 187-92 (1952).—*C.A.* **46**, 8787*f*.

The H forms of Amberlites IR-100, IR-105, and IR-120 were equilibrated with solns. of varying concns. of NaOH, 0.05 *N* in NaCl, and the acidity of the supernatants detd. by titration with standard acid or alkali. Plots of capacity of resin *vs.* pH of soln. showed that for Amberlites IR-100 and IR-105 the active groups were sulfonic below pH 10-10.5, and OH above. For IR-120 the sulfonic groups were active up to pH 14.

4426. SJÖSTRÖM, EERO. **Utilization of ion exchangers in analytical chemistry. XXIII. Separation of ketones.** *Svensk Kem. Tidskr.* **64**, 301-5 (1952) (in English).—*C.A.* **47**, 4248*c*.

The adsorption of ketones on Amberlite IRA-400 columns in the bisulfite form (9 by 450 mm; particle size 0.12-0.30 mm) was studied. $PhCOMe_3$ and Ph_2CO in 95% EtOH (500 mg/50 ml) were only slightly "retarded" by the resin, and were easily displaced by washing with the solvent. Camphor in EtOH was not adsorbed, but $CH_2(CH_2)_4CO$ in H_2O was taken up almost quantitatively (flow 1 ml/min.) and could be eluted with hot H_2O. Me_2:CHCOMe$_3$ and PhCH:CHCOPh in EtOH were only adsorbed quantitatively at very low flow rates (0.4 and 0.2 ml/min., resp.).

4427. SPEDDING, F. H. AND POWELL, J. E. **Quantitative calculation of the behavior of elution bands in the separation of rare earths on ion-exchange columns.** *J. Am. Chem. Soc.* **74**, 856-7 (1952).—*C.A.* **47**, 3652*f*.

A theory was given for the sepn. of rare earths on ion-exchange columns in the pH range 5.5-7.3 with 0.1% citric acid.

4428. SPEDDING, F. H. AND POWELL, J. E. **Quantitative theory of rare earth separations on ion-exchange columns.** *J. Am. Chem. Soc.* **74**, 857 (1952).—*C.A.* **47**, 3652*f*.

The method consisted essentially in adsorbing a mixt. of neutral rare earth chlorides on a high-capacity ion-exchange column and eluting them with 0.1% citric acid.

4429. SPIEGLER, K. S. AND CORYELL, C. D. **Electromigration in a cation-exchange resin. II. Detailed analysis of two-component systems.** *J. Phys. Chem.* **56**, 106-13 (1952).—*C.A.* **46**, 7840*h*.

Electromigration in a cation-exchange column flushed with deionized water was observed by tagging laminas of adsorbate with radiotracers and observing their migration in an elec. field. Cond. was ionic and the current was carried only by the cations. Broadening of the tagged band occurred as electrolysis proceeded. When Dowex-50 in the Na form was electrolyzed between Pt electrodes, the faster H ions produced at the anode penetrated the Na layer.

4430. STEINBACH, JOHN AND FREISER, HENRY. **Preparation of standard sodium hydroxide solutions by use of a strong anion-exchange resin.** *Anal. Chem.* **24**, 1027-8 (1952).—*C.A.* **46**, 8567*b*.

Standard 0.1 *N* NaOH was prepd. by passing a soln. of 2.922 g of NaCl in 50-100 ml of distd. water through 40 g of Amberlite IRA-400 in a 1.8 × 60 cm Jones reductor at a rate of 4 ml/min. into a 500-ml volumetric flask, and washing the resin with sufficient distd. water to make the soln. up to vol. The resin was regenerated with 2 liter of *N* NaOH made from 18 *N* NaOH.

4431. STRICKLAND, J. D. H. **Use of ion-exchange resins to determine the charge of an ion in aqueous solution.** *Nature* **169**, 620 (1952).—*C.A.* **46**, 6897*d*.

Application of the law of mass action to the equil. between two ions A and B whose charges were of the same sign, and an ion-exchange resin gave: $\log [k_1/(k_2 - k_1)] = (n_2 - n_1 + 1) \log C_B + \log(V/KWC)$, where k_1 and k_2 were values of some physically measurable property of ion A proportional to the no. of mols. of A, n_2 was the unknown charge of A, n_1 was the known charge of B, C_B was the concn. of B in V soln., K_c was the equil. const., W was the wt of resin, and C its capacity.. The plot of $\log k_1/(k_2 - k_1)$ *vs.* $\log C_B$ enabled n_2 to be evaluated.

4432. Sweet, Richard C.; Rieman, William III, and Beukenkamp, John. **Determination of alkali metals in insoluble silicates by ion-exchange chromatography.** *Anal. Chem.* **24**, 952-5 (1952).—*C.A.* **46**, 9465*c*.

The application of ion-exchange chromatography to the detn. of Li, Na, and K in insol. silicates was studied. The effect on the sepn. of altering the elution conditions was discussed. The procedure, with minor modifications, was also recommended for the detn. of alkali metals in other types of samples such as soap, biol. material, and salt mixts.

4433. Vermeulen, Theodore and Hiester, Nevin K. **Ion-exchange chromatography of trace components. A design theory.** *Ind. Eng. Chem.* **44**, 636-51 (1952).—*C.A.* **46**, 4860*g*.

A kinetic-diffusional theory was derived for trace sepns. by ion exchange, the appropriate *mass-transfer* coeffs. were evaluated for typical cases, and the method was applied to a proposed Ra-Ba sepn. The theory was based upon linear-equil. conditions i.e., the trace ions undergoing sepn. had soln.- and solid-phase concns. less than 10% of the carrier ion concn., the complexing agent, if used, was in substantial excess, and exchange directly between trace solutes was negligible.

4434. Vickery, R. C. **Separation of the lanthanons by ion exchange. A comparison of eluants.** *J. Chem. Soc.* **1952**, 4357-63.—*C.A.* **47**, 3169*i*.

AcOH, malic acid, tartaric acid, citric acid, glycine, nitrilotriacetic acid, and ethylenediaminetetraacetic acid, were compared as eluants for the rare earths from the NH_4 form of Dowex-50 resin. The efficiency of the sepn. at equal flow rates increased in the order given for the first four acids and then fell off. However, at a high pH and flow rates in excess of those with the first four acids, greater efficiencies were obtained with the last three compds. at equal molarities. This was attributed to the increased stability of the rare earth-eluant complex, which latter increased with eluant in the above given order.

4435. Waldock, Kenneth T. and Frizzell, Laurence D. **A study of the functional groups of cation exchangers by infrared absorption.** *J. Phys. Chem.* **56**, 654-7 (1952).—*C.A.* **46**, 8964*h*.

Infrared analysis of Zeo-Karb, Amberlite IR-1, Amberlite IR-100, Dowex-30, and Dowex-50 established the presence of sulfonic acid groups in all of them and the presence of O-H, C=C, and para groups. The O-H groups may be phenol groups. The evidence for -COOH in Zeo-Karb was also not beyond question. There was a structural similarity for Zeo-Karb, Amberlite IR-1, and Amberlite-100. Samples of the exchanger with adsorbed H^+ or other cations were prepd. as air-dried 20-40-mesh material.

4436. Westermark, Torbjörn. **Sheet ion exchangers. I. General aspects of synthetic ion exchangers in sheet form.** *Acta Chem. Scand.* **6**, 1194-9 (1952) (in English).—*C.A.* **47**, 6217*g*.

The nomenclature, prepn., properties, and applications were given for a sheet ion exchanger made by immersing plates, rods, or sheets of com. polystyrene in chlorosulfonic acid at room temp.

4437. Wheaton, R. M. and Harrington, D. F. **Preparation of cation-exchange resins of high physical stability.** *Ind. Eng. Chem.* **44**, 1796-1800 (1952).—*C.A.* **46**, 11505*b*.

Preswelling before sulfonation and slow diln. of the residual acid were important steps in the prepn. of spherical Dowex 50 (a sulfonated styrene-divinylbenzene copolymer). Maintenance of high H_2O content in the resin prior to use was also desirable. The progress of swelling was followed by observation of the polymer beads in polarized light.

4438. Wiklander, Lambert and Nilsson, Erik. **Equilibria in ion exchange. II. Influence of the mode of replacement.** *Acta Agr. Scand.* **2**, 197-209 (1952).—*C.A.* **47**, 6215*g*.

Continuous infinitesimal ion exchange, proceeding in systems where the capacity of the replacing ion per unit time was very low and the activity of the released ions in small owing to a more or less complete removal of these from the exchange system or by some sort of inactivation, was studied with Amberlite IR-100 satd. with either Li-K, Na-K, or Na-Cu, HCl being used as the replacing agent. Large replacements were compared with small successive replacements, and the equil. quotient of the mass law was related to the ratio of the percentage release of the two ions.

4439. Wilkes, J. F. **Corrosion problems in ion-exchange systems.** *Corrosion* **8**, No. 6, Topic of the Month 1-2 (1952).—*C.A.* **46**, 6577*g*.

When their exchange capacity became exhausted cation-resin beds could be reactivated by the use of 2-8% H_2SO_4 or 5-10% HCl. Anion exchangers were regenerated with soda ash, NaOH, or NH_3. Rubber-lined exchanger tanks were readily available and gave good service; multiple coats of baked phenolics were too brittle, and unlined exchanger tanks of Monel, Everdur, and stainless steel have given unsatisfactory operating experience. Larger piping may be rubber- or Saran-lined steel; the latter was available in smaller sizes.

4440. Zeegers, J. A. **Ion exchange as unit operation.** *Chem. Weekblad* **48**, 356-61 (1952).—*C.A.* **46**, 7378*b*.

Ion exchangers could be compared with rectification columns and treated by a similar graphic method of equil. curves and work lines. A well-defined stationary front moved through the exchanger during the exchanging process, which broadened during the regeneration. Operating along two different work lines during exchange and regeneration made it possible to convert equiv. quantities in both reactions.

4441. Zimmermann, M. **Rapid testing of ion exchangers.** *Angew. Chem.* **64**, 107-10 (1952).—*C.A.* **46**, 4146*a*.

Data were presented on the effect of particle size, H_2 and Na exchangers, evaluation of the shaking method and filtering test, and effect of regenerating agent and regenerating time. Many data were given.

4442. Alexander, G. B. **The preparation of monosilicic acid.** *J. Am. Chem. Soc.* **75**, 2887-8 (1953).—*C.A.* **47**, 9200*h*.

Pulverized cryst. $Na_2SiO_3.9H_2O$ was treated with an aq. slurry of "Nalcite" cation-exchange resin in the hydrogen form at 0°C. The liberated monosilicic acid was stabilized at pH 3 by a trace of H_2SO_4 in the soln. The degree of polymerization so obtained, measd. by the cryoscopic method, was 1.1.

4443. Bernhard, Sidney A. and Hammett, Louis P. **Specific effects in acid catalysis by ion-exchange resins. I. Hydrolysis of esters in 70% aqueous acetone.** *J. Am. Chem. Soc.* **75**, 1798-1800 (1953).—*C.A.* **47**, 7874*h*.

Sulfonated polystyrene-divinylbenzene cation-exchange resins, used as catalysts for the hydrolysis of carboxylic esters in 70% aq. acetone, showed slower reaction rates than did 0.44 *M* HCl. For 7 Me esters of the compn. RCO_2CH_3, the retardation observed with the resin catalyst paralleled the entropy of the gaseous compd. RH.

4444. Blasius, E. and Wachtel, U. **Detection of a polar pyridine-iodide complex by means of ion exchange.** *Z. anal. Chem.* **138**, 106-10 (1953).—*C.A.* **47**, 5837*h*.

In MeOH soln. a complex was formed which could be written $(I^+Py)I^-$. Permutite RS in the H^+ form could be used to remove it and elution could be accomplished with H_2SO_3 soln. but not with dil. HCl.

4445. Bonner, Oscar D. and Rhett, Vickers. **Equilibrium studies of the silver-sodium-hydrogen system on Dowex-50.** *J. Phys. Chem.* **57**, 254-6 (1953).—*C.A.* **47**, 5212*b*.

Equil. of the Ag-Na and Na-H exchanges on 2 samples of Dowex 50 were studied while a const. ionic strength of approx. 0.1 *M* was maintained. Comparison of these with another series of Na-H exchanges already reported showed a definite relation between the selectivity of the resin and the max. water uptake.

4446. Boyd, G. E. and Soldano, B. A. **Osmotic free energies of ion exchangers.** *Z. Elektrochem.* **57**, 162-72 (1953).—*C.A.* **47**, 9102*f*.

The thermodynamics of ion exchange electrolytes was discussed. The magnitudes of the osmotic free energies for two generally available ion-exchangers might have been estd. from v.p.-sp. vol. measurements. Free energies for ion exchange processes were developed using osmotic forces which were calcd. from vol. changes in the ion exchanger networks. Strongly basic and strongly acidic exchangers were employed.

4447. Calmon, Calvin. **Application of volume characteristics of sulfonated polystyrene resins as a tool in analytical chemistry. Determination of pH and dissociation constants of acids.** *Anal. Chem.* **25**, 490-2 (1953).—*C.A.* **47**, 6302*d*.

The effect of cross-linking of the polymer on the swelling of the dry sulfonated product in water was studied. The vol. relations of these exchangers in HCl solns. and when combined with cations of different valences were also detd. The cation exchangers contg. a divinylbenzene content of 1% or less were found to be the most sensitive to the vol. changes.

4448. Dizdar, Zdenko. **The use of ion exchangers for the separation, concentration, and determination of traces of cadmium in uranium.** *Rec. trav. inst. recherches structure matiere* (Belgrade) **2**, 85-8 (1953)(in English).—*C.A.* **47**, 6817*a*.

Solns. contg. Cd^{++} and UO_2^{++} ions (Cd:U 10^{-4} - 10^{-6}) were passed through Amberlite IR-120 columns of the following dimensions: cross-section 0.78 cm^2; length 19 cm; resin content 6.5g; and flow rate, 1 ml/cm^2/min. The U is eluted with 0.5*N* oxalic acid. After elution with *N* HCl, Cd was assayed polarographically and spectrographically. Complete sepn. was obtained.

4449. Dolar, Daro and Draganić, Zorica. **Separation of traces of rare earth elements from uranium with Amberlite IR-120 resin.** *Rec. trav. inst. recherches structure matiere* **2**, 77-83 (1953) (in English).—*C.A.* **47**, 6816*b*.

After adsorption in the column, UO_2^{++} was eluted with *N* oxalic acid. Ce, Eu, and Y could then be eluted with 5*N* HCl.

4450. Feinland, Raymond; Baldwin, David E., and Gregor, Harry P. **Sulfonated polystyrene-dichlorostyrene-divinyl benzene ion exchange resins.** *J. Polymer Sci.* **10**, 445-7 (1953).—*C.A.* **47**, 7252*c*.

The prepn. of sulfonic acid cation-exchange resins of lower exchange capacity than the fully sulfonated material by partial hydrolysis was unsuccessfully attempted by a variety of techniques. They were obtained by the sulfonation of a tripolymer. Preswelling in acetylene tetrachloride leads to smooth reaction and completion in 3 days at 90°C. The exchange capacities measured for swollen and unswollen systems and a comparison with the calcd. values for monosulfonation of all unchlorinated benzene rings showed that the capacity could be varied at will.

4451. Fronaeus, Sture. **An ion exchange and extinctiometric investigation of the nickel thiocyanate system.** *Acta Chem. Scand.* **7**, 21-31 (1953) (in English).—*C.A.* **47**, 8582*h*.

The cation-exchange method with Amberlite IR-105 and the extinctiometric method at 20°C and *M* concns. with $NaClO_4$ as supplemental salt checked each other, showing that only mononuclear complexes were formed. At pH 3, $NiSCN^+$ adsorbed on the resin was free within the resin phase and was not coordinated to structurally bound groups within the resin.

4452. Gabrielson, Gunnar. **Control of phosphating solutions.** *Metal Finishing* **51**, No. 4, 76-8 (1953).—*C.A.* **47**, 6816*a*.

An ion-exchange method for detg. phosphates and accelerators was described. For concentrates take 3-4 cc. and dil. to 100 cc.; for phosphating baths, dil. a sample with an equal vol. of H_2O. Pass 10 cc. of either soln. through a layer of sulfonic cation exchanger in the H form (height and diam. of resin layer are 150 and 9.8 mm, resp.). Wash the resin layer with about 50 cc. of H_2O. Titrate the eluate with 0.1 *N* NaOH first to a methyl orange end point and then against phenolphthalein. From the results of these titrations, the amts. of phosphate and accelerator could be calcd.

4453. Gilliland, E. R. and Baddour, R. F. **The rate of ion exchange.** *Ind. Eng. Chem.* **45**, 330-7 (1953).—*C.A.* 47, 6216*e*.

The ion pair Na-H was studied on Dowex 50 in order to evaluate factors in such exchange. The assumption that the rate of ion exchange was limited by the rate of mass transfer permitted the derivation of a no. of rate equations. The rate const. for ion exchange in a packed bed was not a function of bed height or of bed diam. (except as this affected the flow rate) so long as the column diam. was sufficiently greater than 20 times the particle diam. Both the resistance in the liquid phase and the resistance in the solid phase were important in detg. the total resistance to ion exchange in the range of concns. (0.01 to 1 *N*), particle diam. (0.022 to 0.100 cm), and flow rates (0.02 to 2.0 cm/sec) tested.

4454. Gillis, J.; Hoste, J.; Cornand, P., and Speecke, A. **Separation of niobium and tantalum by ion-exchange resins in an oxalic acid solution.** *Mededel. Vlaam. Chem. Ver.* **15**, 63-5 (1953).—*C.A.* 47, 12114*b*.

Nb and Ta were sepd. with the ion-exchange resin Dowex 2 in an oxalic acid soln. With a mixt. contg. equal wts of these two elements, it was possible in a single extn. to isolate Nb free of Ta with a 95% recovery. The recovered Ta contained about 1% Nb.

4455. Haagen, K. **Synthetic ion-exchange resins containing carboxyl and sulfonic acid groups.** *Z. Elektrochem.* **57**, 178-83 (1953).—*C.A.* 47, 8929*d*.

In this type of synthetic resin, the rate of salt formation for the carboxyl group was appreciably slower than for the sulfonic acid group. Titration curves showed the influence of swelling, resin particle, and pore size, as well as the effect of the sulfonic acid group upon the rate of salt formation of the carboxyl group.

4456. Hagerty, P. Frank II and Bliss, Harding. **Kinetics of ion exchange in the calcium cycle.** *Ind. Eng. Chem.* **45**, 1253-9 (1953).

The use of a strongly acidic cation-exchanger in the calcium cycle avoided regenerant trouble, because the regenerant was itself regenerated and its degree of utilization in any one operation was not important. The rate process was shown to be one of diffusional control, and the parameters governing the behavior were reported. Cu and Zn behaved similarly and could be essentially completely removed. Cr was not completely removed, because its rate of ionization was low. A procedure for the calculation of unit design in the Cu-Cd cycle was developed.

4457. Inoue, Yoshiyuki; Kawamura, Akira; Wada, Keizo, and Okamura, Hiroshi. **The reaction of chrome complex to the ion-exchange resin. I. The reaction between Amberlite IR-4B and oxalatochromate complex.** *Japan Analyst* **2**, 21-6 (1953).—*C.A.* 47, 6165*g*.

Ion-exchange behavior of pure $K[Cr(C_2O_4)_2(H_2O)_2]$ and $K_3[Cr(C_2O_4)_3]$ was investigated as an aid to the analysis of chrome tanning liquor. The column of regenerated *Amberlite IR-4B* was treated with NaCl, Na_2SO_4, Na_2HPO_4, NaH_2PO_4, $NaNO_3$, HCl, H_2SO_4, H_3PO_4, HNO_3, AcOH, or $(CO_2H)_2$ to form their salts. Then the soln. of either complex (0.1% as CrO_3) was passed, and the effluent was analyzed for Cr and $(CO_2H)_2$. The best result was observed on the resin treated with AcOH.

4458. Katzin, Leonard I. and Gebert, Elizabeth. **Absorption of inorganic salts from organic solvents onto anion-exchange resins.** *J. Am. Chem. Soc.* **75**, 801-3 (1953).—*C.A.* 47, 6069*h*.

Dowex A-1 was treated with HCl, NaCl, or $NaNO_3$, washed exhaustively, and air-dried to the desired degree. For $CoCl_2$, in acetone, on chloride resin the absorption decreased as the H_2O content of the resin decreased. In *tert*-butyl alc., the absorption of $CoCl_2$ was reduced. $Co(NO_3)_2$ showed similar absorption. $CoCl_2$ in acetone, on nitrate resin absorbed to a much greater extent (1.5 millimoles/g of resin) even in lower H_2O contents of resins. $Co(NO_3)_2$, in acetone, on chloride resin absorbed much less strongly.

4459. Kraus, Kurt A. and Moore, George E. **Anion-exchange studies. V. Adsorption of hydrochloric acid by a strong-base anion exchanger.** *J. Am. Chem. Soc.* **75**, 1457-60 (1953).—*C.A.* 47, 6735*d*.

The adsorption of HCl by the "strong base" anion-exchange resin Dowex-1 was detd. in the concn. range of 0.002 to 16 molal HCl for the aq. phase. The mean activity coeffs. of HCl in the resin phase were calcd. and it was found that the log of the coeff. increased linearly with the HCl molality of the resin phase.

4460. Kraus, Kurt A. and Moore, George E. **Anion-exchange studies. VI. The bivalent transition elements manganese to zinc in hydrochloric acid.** *J. Am. Chem. Soc.* **75**, 1460-2 (1953).—*C.A.* 47, 6735*e*.

The anion-exchange behavior of the bivalent transition elements Mn to Zn was studied in HCl solns. Their adsorbabilities differed sufficiently, as a function of HCl concn., to permit their sepn. The HCl concns. where noticeable adsorption occurred increased in the order Zn, Cu, Co, Fe, and Mn with no noticeable adsorption for Ni, even in concd. HCl.

4461. Mayer, Stanley W. and Freiling, E. C. **Ion exchange as a separation method. VI. Column studies of the relative efficiencies of various complexing agents for the separation of lighter rare earths.** *J. Am. Chem. Soc.* **75**, 5647-9 (1953).—*C.A.* 48, 3102*c*.

Using columns of Dowex-50 cation-exchange resin at 87°C, Sm-Eu and Eu-Tb sepn. factors were detd. for a number of complexing agents under dynamic conditions. The efficiencies of eluting conditions were detd. by comparing the purity of Eu and Sm obtained, as well as that of Y and Tb which likewise were difficult to sep. The order of selectivity was found to be: ethylenediaminetetraacetate > lactate = glycolate > malate ≧ citrate.

4462. Osborn, G. H. **Ion-exchange resins in analytical chemistry. Application of ion-exchange resins to the analysis of insoluble substances. Bibliography on the analytical exchange of ion-exchange resins.** *Analyst* **78**, 220-1; 221-52 (1953).—*C.A.* 47, 6301*g*.

These resins could be used to dissoc. many materials that were apparently insol. The column technique could not be used and the soln. must be shaken with an excess of the resin for protracted periods.

4463. Pfeiffer, P. W. **A graphical method for calculating ion-exchange columns.** *Chem. Eng. Sci.* **2**, 45-52 (1953).—*C.A.* **47**, 10394*g*.
The procedures for distn. and ion-exchange processes were compared.

4464. Reichenberg, D. **Properties of ion-exchange resins in relation to their structure. III. Kinetics of exchange.** *J. Am. Chem. Soc.* **75**, 589-97 (1953).—*C.A.* **47**, 6217*e*.
The kinetics of Na-H exchange on sulfonated cross-linked polystyrenes of 5 and 17% divinylbenzene content in bead form were investigated by an indicator method. For both resins the kinetics at high Na concn. in soln. ($>1N$) were clearly distinct from those at low concn. ($<0.05N$). At high concn. the rate was independent of the Na concn. and inversely proportional to the square of the particle radius. At low concn. the rate was proportional to the Na concn. and inversely proportional to the particle radius.

4465. Samuelson, Olof. **Use of ion exchangers in analytical chemistry. XXV.** *Z. Elektrochem.* **57**, 207-13 (1953).—*C.A.* **47**, 9205*g*.
Methods were described for the sepns. of cations, such as Fe^{3+}, VO^{2+}, CO^{2+}, Ni^{2+}, and Cu^{2+} quantitatively from solns. contg. alkali metals by means of anion exchangers in the citrate form. Anion exchangers, in the bisulfite form, could be used for the group sepn. of aldehydes, ketones, alcs., and acids.

4466. Schlögl, R. **Ionic mobility in exchangers.** *Z. Elektrochem.* **57**, 195-201 (1953).—*C.A.* **47**, 9116*d*.
Different methods for measuring ionic mobility were compared by using NaBr as the external electrolyte on both anionic- and cationic-exchange membranes. Ions of the same charge as the membrane showed a decrease in mobility with increased concn. of external electrolyte. Ions of a different charge showed an initial increase in mobility with increased concn. of electrolyte.

4467. Short, J. F.; Smith, P. G., and Twigg, G. H. **Temperature distribution in an ion exchange column.** *J. App. Chem.* **3**, 198-206 (1953).
A theoretical and experimental study on temp. distribution in an ion exchange column during exhaustion and regeneration was carried out. The theory evolved predicted that a "hot spot" moved along the column uniformly and at a const. peak temp. The predictions were verified experimentally with a strongly basic anion exchanger. Acetic acid was adsorbed on the resin and NaOH used for the regenerant liquid.

4468. Tanaka, Hiroshi and Meguro, Kenjiro. **Application of ion-exchange resin to the study of the properties of colloidal solution. II. Aging of vanadium pentoxide solution.** *J. Chem. Soc. Japan*, Pure Chem Sect. **74**, 48-50 (1953).—*C.A.* **47**, 6735*b*.
V_2O_5 was passed through anion and cation exchange resins, and the resulting change of viscosity was detd. as the measure of the progress of aging. The H^+ concn. was a decisive factor for aging as long as the VO_3^- concn. remained nearly const.

4469. Wheaton, R. M. and Bauman, W. C. **Ion exclusion.** *Ind. Eng. Chem.* **45**, 228-33 (1953).—*C.A.* **47**, 3623*c*.
By this unit operation aq. solns. of ionic and nonionic fractions could be sepd. into 2 primary components without heat or use of regenerants other than water for elution of the resin used. A sulfonated styrene-type medium cross linked (4-12%) fine-mesh resin was suggested. Sepns. described were HCl from AcOH, and NaCl from EtOH. Good sepn. was effected with low ionic concns.

II-9. Chromatography in Columns

4470. Strain, Harold H. **Petroleum-soluble fluorescent constituents of leaves.** *Nature* **137**, 947-7 (1936).—*C.A.* **30**, 6035¹.
The 1st portions of the percolate of petroleum ether exts. of dried leaf material, passed through magnesia and siliceous earth Tswett adsorption columns, contained colorless hydrocarbons recoverable in cryst. form. Other colorless substances were slightly adsorbed on the magnesia and could be recovered from subsequent portions of the percolate. Elution with petroleum ether and alc. gave strongly fluorescent crystals. The adsorbent magnesia itself was highly fluorescent and phosphorescent. Siliceous earth (Hyflo Super Cel, F.A. 501) contained small amts. of org. substances removable by washing with petroleum ether and alc.

4471. Flood, H. **Preparation and inorganic, chromatographic application of paper capable of ion exchange.** *Z. Anal. Chem.* **120**, 327-35 (1940).—*C.A.* **35**, 1341⁴.
At different places in a column of Al_2O_3 segregation of certain ions was found in definite zones, whereas some ions such as Na would pass through the column without being adsorbed. Whereas org. chromatography depended upon a stepwise adsorption of the mols. present in a soln., inorg. chromatography depended upon an exchange of ions of the soln. with the ions present as impurity in the Al_2O_3. The impregnation of a porous paper by capillarity was described and some analytical uses for tech. purposes were discussed. A simple way to impregnate the paper consisted in causing a ppt. of $Al(OH)_3$ to form in the pores of the paper; hydrated oxides of Cr and SiO_2 behaved similarly.

4472. Sellés, E. **Chromatograph and its applications.** *Anal. fís. quim. (Spain)* **36A**, 130-45 (1940).—*C.A.* **39**, 2684⁹.
Principles, technique, and app. were described. The relation between chem. structure and adsorption was discussed.

4473. Sinomiya, Tiro. **Compound formation and chromatographic adsorption of organic compounds.** *J. Chem. Soc. Japan* 61, 1221-6 (1940).—*C.A.* 37, 3990⁹.

Nitrotoluene and naphthalene substitution products dissolved in C_6H_6 were sepd. chromatographically in an activated alumina adsorption tube and with C_6H_6 or alc. + C_6H_6 as the sepg. liquid. The 2-component mol. compds. were suctioned out and dried, and the crystals were examd. for the deliquescence point and m.p. and arranged in terms of the chromatographic adsorption. The substituents of the aromatic compds. had the following order of adsorbability: CO_2H, $OH > NH_2 > NO_2 >$ Me, H.

4474. Troitskiĭ, G. V. **Separation of adsorption zones of colorless substances in chromatographic analysis by measurement of dielectric constant.** *Biokhimiya* 5, 375-80 (1940).—*C.A.* 35, 4794⁷.

Measurement of the dielec. const. gave a convenient way of detg. the adsorption zones of fat-sol. or water-sol. substances. Thus, the nonsaponifiable fraction of a bull's liver was adsorbed by a column of $Al(OH)_3$, and the boundaries of the adsorbed substances were detected by sound changes.

4475. Zechmeister, L. and Frehden, O. **Some applications of the "brush" method in chromatographic analysis.** *Bull. soc. chim. biol.* 22, 458-60 (1940).—*C.A.* 35, 3921².

An inorg. chromatogram on Al_2O_3 was prepd., the column slipped out of the tube, and tested for the various metals by applying longitudinal stripes of appropriate reagents to the column with a small brush.

4476. Bielenberg, W. and Fischer, L. **Chromatographic determination of hydroxybenzenes.** *Brennstoff-Chem.* 22, 278-80 (1941).—*C.A.* 37, 1952⁶.

The conditions under which PhOH, the crésols, *p*-xylenol, carvacrol, thymol and guaiacol coupled with diazotized *p*-$NO_2C_6H_4NH_2$, forming individual azo colors, and the conditions leading to chromatographic sepn. of the colors, were detd. The above hydroxybenzenes could be chromatographically identified in presence of one another.

4477. Cassidy, Harold G. and Wood, Scott E. **Chromatography of solutions containing a single solute.** *J. Am. Chem. Soc.* 63, 2628-30 (1941).—*C.A.* 35, 7802⁷.

The theory of chromatography proposed by Wilson was tested with data obtained from passing lauric acid in petroleum ether over carbon. The data were in reasonable agreement with the theory.

4478. Coleman, Geo. H. and Farnham, Alford G. **Azoyl derivatives of sugars and separation by chromatographic adsorption.** *Proc. Iowa Acad. Sci.* 48, 246-7 (1941).—*C.A.* 36, 3489⁹.

The chromatographic sepn. of α-d-glucose and fructose azoates was made, using silicic acid as an adsorbent. By using a mixt. of "Magnesol" and "Dicalite" as an adsorbent the following sepns. were made: lactose and galactose, sucrose and α-d-glucose, trehalose and β-d-glucose.

4479. Conner, R. T. and Straub, G. J. **Determination of thiamin by the thiochrome reaction.** *Ind. Eng. Chem., Anal. Ed.*, 13, 380-84 (1941).

The synthetic zeolite, Decalso, was used to absorb thiamin in order to separate it from substances interfering with the measurement of the fluorescence produced by the oxidation of thiamin to thiochrome with $K_3Fe(CN)_6$ in an alk. soln. Optimal conditions were given to elute the thiamin from the column by use of a hot 25% soln. of KCl or NaCl.

4480. Croatto, Ugo. **Chromatographic separation of the rare earths.** *Ricerca sci.* 12, 157 (1941).—*C.A.* 37, 2680⁴.

Chromatographic analysis was used to identify rare earths. This method possessed a no. of advantages. In particular the possibility of the chromatographic sepn. of La^{+++} and Ce^{+++} with Al_2O_3 as adsorbent was mentioned. Ce^{+++} was more strongly adsorbed than La^{+++}.

4481. Erämetsä, Olavi. **Chromatography of rare earths.** *Bull. comm. géol. Finlande* 14, 36-49 (1941).—*C.A.* 37, 3316⁵.

A mix. of rare earths was dissolved and passed through a tube filled with Al_2O_3 and the resulting chromatogram examd. spectroscopically and sometimes with *X*-rays. The adsorptive ability of Y appeared to be less than that of the real lanthanides. The addition of Rochelle salt to the solution had a remarkable effect on the adsorption.

4482. Erämetsä, Olavi; Sahama, Th. G., and Kanula, Viljo. **Chromatographic separation of the rare earths. I.** *Ann. Acad. Sci. Fennicae* **A57, No. 3,** 5-20 (1941).—*C.A.* 38, 4490⁵.

A tech. Y-Er nitrate of known compn. was passed through an Al_2O_3-filled tube at various pH values, and the rare-earth content of the various fractions was detd. The Y group was in general more strongly adsorbed than the Ce group and the adsorption was independent of the pH. Addn. of citric acid reversed the adsorption series in the La group.

4483. Pinterovic, Zvonimir. **Inorganic chromatography. I. Determination of iron.** *Kem. Vjestnik (Zagreb)* 15/16 45-51 (in German, 52) (1941-42).—*C.A.* 40, 4617⁶.

A tube 3 mm or 6 mm in diam., with funnel-shaped top, was filled with Al_2O_3 adsorbent. Solns. contg. Fe^{+++} in concns. of 2×10^{-6} to 4×10^{-3} poured into the tube gave a yellow color, which on development with $K_4Fe(CN)_6$ became blue. Curves representing height of the colored zone vs. concn. of Fe^{+++} were constructed.

4484. Trappe, Wolfgang. **Separation of biological lipides from their natural mixtures by means of adsorption columns. III. Separation of phosphorus- and nitrogen-free lipide fractions.** *Biochem. Z.* 307, 97-106 (1941).—*C.A.* 35, 4053³.

An Al_2O_3 (Brockmann) column permitted the sepn. of free fat acids with phosphatides from the total lipide ext. Frankonite KL, which gave the best results, was suspended in dil. HCl and heated on the water bath. This was washed several times with H_2O in the centrifuge, then with acetone until the acetone remained colorless. The powder was then heated with dil. NH_4OH, again washed with H_2O and finally dried at 120 °C. This very active adsorbent permitted the sepn. of hydrocarbons and cholesterol esters.

4485. Zechmeister, L.; Tóth, G.; Fürth, P., and Bársony, J. **Chromatographic separation of some β-glucosidases.** *Enzymologia* 9, 155-60 (1941) (in German).—*C.A.* 36, 790^1.

The chromatographic method was employed for the sepn. of some β-glucosidases of emulsin and *Merulius lacrimans*. The enzymes sepd. were: salicinase, cellobiase, amygdalase and gentiobiase. Al_2O_3 and bauxite were used as the adsorbents.

4486. Békésy, Nikolaus v. **A column for chromatographic adsorption that can be taken apart.** *Biochem. Z.* 312, 100-2 (1942).—*C.A.* 37, 6497^7.

The column was constructed of glass plates and cork separators, fastened with special clamps, and provided a rectangular cross section. The rectangular cross section minimized the formation of "hidden Zones." The column could be taken apart to remove the various zones after the chromatograph had been developed.

4487. Bielenberg, W. and Fischer, L. **Chromatographic determination of hydroxybenzenes. III.** *Brennstoff-Chem.* 23, 283-5 (1942).—*C.A.* 38, 531^1.

The study of the chromatographic sepn. of the azo colors of the hydroxybenzenes, formed by coupling with diazotized p-$NO_2C_6H_4NH_2$, was extended to other o-, m- and p-compds. About 400 pairs were studied. The exceptions were given in a table of 28 compds. for which positions in the Al_2O_3 column were given.

4488. Coleman, George H.; Farnham, Alford G., and Miller, Aaron. **Azoyl derivatives of sugars and separation by chromatographic adsorption.** *J. Am. Chem. Soc.* 64, 1501-2 (1942).—*C.A.* 36, 5781^4.

The following pairs of p-Phenylazobenzoyl derivs. were sepd. by chromatographic adsorption, using Magnesol (hydrous Mg silicate) as adsorbent with Dicalite as a filter aid: α-D-galactose + α-lactose, α-lactose + sucrose, and 4 other pairs; on Merck reagent silicic acid as adsorbent α-D-lactose + β-D-fructose, and 3 other pairs were sepd.

4489. Flood, H. and Smedsaas, A. **Inorganic capillarity analysis (chromatography) of metal complexes.** *Tids. Kjemi, Bergvesen Met.* 2, 17-19 (1942).—*C.A.* 37, 5334^8.

Chromatograms of $Cu(NO_3)_2$ soln. which had formed complex ions by treatment with glycine, Na tartrate and tartaric acid were shown. With glycine, the ionization of the complex was repressed by increasing the quantity of glycine added, and the quantity of Cu unadsorbed was increased at the expense of the adsorbed Cu. Good chromatograms were obtained with the glycine complexes of Ni and Co.

4490. Müller, P. B. **Standaridzation of activity of alumina for chromatography.** *Verhandl, Ver. Schweiz. Physiol.* 21, 29-31 (1942).—*C.A.* 38, 5469^4.

The heat evolved in treating Al_2O_3 with solvents (light petroleum) was reproducible and proportional to its chromatographic adsorption activity. When active and inactive products were mixed, the relation between content of active Al_2O_3 and evolution of heat was complex and dependent in a nonlinear manner on the compn. of solvent mixts.

4491. Polgar, A. and Zechmeister, L. **Isomerization of β-carotene. Isolation of a stereoisomer with increased adsorption affinity.** *J. Am. Chem. Soc.* 64, 1856-61 (1942).—*C.A.* 36, 5785^4.

The isomerization of β-carotene under the influence of a refluxing petr. ether soln., iodine catalysis, concd. HCl catalysis and melting the β-carotene was studied by means of chromatograms; a no. of pigments were indicated, 9-10 of which were stereoisomers of β-carotene. On addn. of I_2 all yielded a preponderant quantity of β-carotene and minor stereoisomers.

4492. Schwab, Georg-Maria and Issidoridis, A. **Inorganic chromatography. VI. Absorption spectra of adsorbed ions.** *Z. physik. Chem.* 53B, 1-19 (1942).—*C.A.* 37, 5653^6.

The absorption spectra of Cu, Cr (ic), Ni and UO_2 ions adsorbed on Al_2O_3 were detd. in reflected light. The position of the band and the absorption coeff. lay between those for the ion in soln. and the hydroxide and closely agreed with those for the basic salt.

4493. Smith, E. L. **Comments on the partition chromatogram of Martin and Synge.** *Biochem. J.* 36, xxii (1942)

The efficiency of the partition chromatogram of Martin & Synge was less than their theory indicated. The first factor was adsorption of organic acids by the silica. The second interfering factor was temporary neutralization of part of the acid by the alkali originally combined with the indicator. The third and most important factor was the change of partition coefficient with concn. The fatty acids from butter and margarine, resp., were distingused by the butyric acid band given by the former.

4494. Tiede, Erich and Schikore, Werner. **Chromatographic adsorption in the chemistry of phosphorescent substances.** *Ber.* 75B, 586-9 (1942).—*C.A.* 37, 3347^2.

Less than 1γ of Cu could be removed from $Zn(NO_3)_2$ by passage through Al_2O_3. Likewise Ca, Sr, Ba or Mg salts could be purified by chromatographic adsorption. The purification was improved by doubling the length of column of adsorbent or by passing the soln. through the column several times.

4495. Tiselius, Arne and Claesson, Stig. **Adsorption analysis by means of interferometric study.** *Arkiv Kemi, Mineral. Geol. Ser. B,* 15, No. 18, 1-6 (1942).—*C.A.* 38, 35^7.

The liquid was drawn through the adsorption column by air pressure, and the buret readings and index of refraction were noted at frequent intervals. From plotted values of the readings, a satisfactory detn. of the concn. of a soln. could be obtained with solns. of lauric, palmitic and myristic acids.

4496. Turba, Fritz and Richter, Margit. **The adsorption behavior of protein-degradation products. II. Chromatography of aminodicarboxylic acids on alumina.** *Ber.* 75B, 340-4 (1942).—*C.A.* 37, 3466^5.

Untreated Al_2O_3 was not sufficiently active for use in chromatography of amino acids; its activity was greatly improved by treatment with *N* HCl, but for full development it required the use of 0.05 *N* AcOH-acetate buffer at a ph of 3.3. Under these conditions aspartic and glutamic acids were quantitatively adsorbed and could be completely recovered by elution with dil. alkali, They could thus be quantitatively sepd. from glycine. alanine, leucine, serine, arginine, histidine, tryptophane, proline, cystine, and methionine.

4497. Turkevich, John. **Removal of adsorbents from chromatographic tubes.** *Ind. Eng. Chem., Anal. Ed.* 14, 792 (1942).—*C.A.* 37, 3^1.

After the development of the chromatogram, the solvent was just allowed to disappear from above the surface of the tube, the suction was stopped and the tube was placed horizontally on a paper placed on a table top. By means of a rubber stopper with gas inlet tube at the bottom of the chromatographic tube, gas pressure was introduced gently and periodically.

4498. Walker, F. T. and Mills, M. R. **Component glycerides of linseed oil—segregation by chromatography.** *J. Soc. Chem. Ind.* 61, No. 8, 125-8 (1942).—*C.A.* 36, 7332^7.

The glyceride groups were isolated by the methods of chromatographic analysis. Visual means were not available for sepg. the linseed-oil glycerides, but by cutting up the colorless chromatogram into segments and detg. the I_2 value of the adsorbed oil, the whole of the chromatogram could be explored. The fatty acids were adsorbed by Al_2O_3 in inverse order of their I_2 values, and the more satd. were retained at the top of the column, the most unsatd. passing through.

4499. Zechmeister, L. **Some new applications of chromatography.** *Math. naturw. Anz. ungar. Akad. Wiss.* 61, 36-40 (1942).—*C.A.* 39, 3759^5.

The application of the chromatographic method to the field of metal-ion detection was reviewed. Methods for the sepn. of stereoisomeric carotenoids and for the partial sepn. of certain β-glucosidases were described.

4500. Zechmeister, L. and McNeely, W. H. **Separation of *cis*- and *trans*-stilbenes by application of the chromatographic brush method.** *J. Am. Chem. Soc.* 64, 1919-21 (1942).—*C.A.* 36, 5806^8.

The application of the chromatographic brush method to stilbene and the *p*-Me and *p*-MeO derivs. was described. In each case the *trans* isomer possessed stronger adsorption affinity than the *cis* form and was located near the top of the Al_2O_3 column. After adequate development the 2 isomers were sepd. by a wide interzone. The method might also have proven useful for the study of the *cis*-*trans* shifts under the influence of light and other factors.

4501. Zechmeister, L.; McNeely, W. H. and Sólyom, G. **Chromatography of *cis*- and *trans*-benzoin and -anisoin oximes with application of the brush method.** *J. Am. Chem. Soc.* 64, 1922-4 (1942).—*C.A.* 36, 5807^2.

The chromatographic brush method, with an NH_4OH-$CuSO_4$ soln. as color reagent, was used for the detection and sepn. of *cis*- and *trans*-benzoin and -anisoin oximes on Neutrol Filtrol columns. In a mixt. composed of 2 stereoisomers, 1-2% of either form could be rapidly detected in the presence of the other.

4502. Cancino, José M. **Analytical and industrial aspects of chromatography.** *Actas y trabajos congr. peruano quím.* 2, I, 300-6 (1943).—*C.A.* 39, 3476^3.

The industrial value of chromatographic analysis was described in detail in reference to the prepn. of chlorophyll from nettles and the detn. of the presence of growth hormones.

4503. Croatto, Ugo. **Chromatographic separation of rare earths.** *Atti reale ist. veneto sci.* 102, 103-17 (1943).—*C.A.* 43, 6941*e*.

The sepn. of Ce^{4+} and La^{3+}, Ce^{4+} and Sm^{3+}, Ce^{4+} and Pr^{3+}, Ce^{4+} and Nd^{3+} nitrates by means of Al_2O_3 (which, if pptd. from $Al_2(SO_4)_3$ with NH_4OH was found to be the best adsorbent) was described. Ce^{4+} was made visible on the adsorption columns by treating the chromatograms with NH_4OH and H_2O_2. For the Ce^{4+}-La^{3+} mixt. it was found that the addn. of Fe^{3+} and Ca^{++} ions realized a more distinct chromatographic sepn. of Ce and La, which enabled a purification of the mixt. up to 95%.

4504. Currie, A. B. **Elutriation.** *Mfg. Chemist* 14, 194-7 (1943).—*C.A.* 37, 6163^5.

A review of the theory and practical application of various methods of elutriation.

4505. DeVault, Don. **The theory of chromatography.** *J. Am. Chem. Soc.* 65, 532-40 (1943).—*C.A.* 37, 3316^6.

Equations were derived for single and multiple solutes. When only one solute was present, if the adsorption isotherm was of the usual type, the front boundary of the band was sharp and tended constantly to sharpen itself in spite of diffusion, etc., whereas the rear boundary was broad and gradual. The quantitative agreement with experimental data, at least in the case of lauric acid on charcoal, was sufficiently good to justify the assumptions made. The partial differential equations for multiple solutes were given and the discontinuous solns. for multiple solute were discussed separately.

4506. Erämetsä, Olavi. **The chromatography of metals of the diphenyl thiocarbazone complex.** *Suomen Kemistilehti* 16B, 13-14 (1943).(in German).—*C.A.* 40, 4620^9.

The dithizonates of the heavy metals dissolved in CCl_4 were so strongly adsorbed on Brockmann's Al_2O_3 that only a narrow 2-mm upper band was obtained. On ordinary Al_2O_3 the metals Sb^{+++}, Sn^{++}, Ni^{++}, and Mn^{++} were completely adsorbed. Cu^{++} formed a gray-green ring at the top of the column, while Cd^{++} formed an orange ring below the Cu^{++}. Fe^{++} also formed an orange ring in this region, as did excess dithizone. Co^{++} gave a typical, rapidly wandering ring of blue-violet, while between Co^{++} and Cd^{++} nothing was adsorbed Zn^{++} formed a bright carmine-red ring below Co^{++}, while Hg^{++} and Hg^{+} formed an orange-yellow ring below the Zn^{++}.

4507. Farkas, Guillermo. **Chromatographic adsorption.** *Ph (Montevideo)* **1943**, No. 1/2, 18-22.—*C.A.* **38**, 1676^1.

App. and technique were described with a few general rules regarding the relation of structure and selective adsorption. This method was applicable in numerous org.-chem. fields, especially in the biol., e.g., in the sepn. of vitamins.

4508. Halfter. **A method for the separation of dinitro- and trinitrotoluene by chromatographic means.** *Z. ges. Schiess- u. Sprengstoffw., Nitrocellulose* **38**, 173-5 (1943).—*C.A.* **39**, 3671^1.

2,4-Dinitrotoluene (green on MgO, blue on $Ca(OH)_2$), 2,6-dinitrotoluene (weakly colored), 2,4,6-trinitrotoluene (TNT) (violet on MgO, light red on $Ca\ (OH)_2$) could be sepd. from each other by use of the chromatographic method with a column of pure MgO and $Ca(OH)_2$, 5:8, and a benzene-petr. ether solvent. The expt. was usually carried out so that the dinitro compds. passed into the filtrate. (The very strong coloration on MgO alone could serve for testing the solvent after washing.) The TNT remained adsorbed.

4509. Hamoir, G. **A new method for separation of a mixture of amino acids by chromatographic adsorption on Ag_2S.** *Compt. rend. soc. biol.* **137**, 734-5 (1943).*Biochem. J.* **39**, 485-90 (1945).—*C.A.* **39**, 3561^6; **40**, 3491^4.

Cysteine and cystine were adsorbed on pptd. Ag_2S at pH 2-3 and not eluted by dil. AcOH; methionine was adsorbed at pH 3; and glutamic and aspartic acids, histidine, tryptophan, phenylalanine, tyrosine, leucine, and arginine were adsorbed at pH 6-7 and eluted by very dil. AcOH.

4510. Karschulin, M. and Svarc, Z. **Chromatographic studies. I. Chromatographic analysis of elements of group IIb with the aid of active alumina from Lozovac (Croatia).** *Kem. Vjestnik (Arhiv Kem. i Tehnol.)* **17**, 99-105 (in German, 105) (1943).—*C.A.* **40**, 5352^9.

Active Al_2O_3, prepd. by roasting naturally occurring $Al(OH)_3$ at 600 °C, was used in the chromatographic analysis of As, Sb, and Sn. The properties of the adsorbent zone were investigated by prepg. a 5% gelatin suspension of the adsorbent plus the adsorbate, cooling and sectioning the gelatin sample longtiduinally. Addn. of Cd^{++} or Mn^{++} to the soln. contg. As, Sb, and Sn shifted the the Sn^{++} into the upper zone of the Al_2O_3 column. The chromatogram of the given element was washed with hot water and a 5% gelatin suspension poured over it. The column was cooled with water so as to solidify the gelatin adsorbed by the colored zone of the unknown, and the sample was sectioned longitudinally.

4511. Lecoq, H. **Microdetermination of lead by chromatographic analysis. Application to the analysis of water.** *Bull. soc. roy sci. Liège* **12**, 323-31 (1943).—*C.A.* **42**, 7464*g*.

Lead was detd. by adsorption on a column of Al_2O_3. The chromatograph was developed by the addn. of a 1% soln. of Na_2S. A sample of H_2O could be analyzed for Pb by this procedure by comparing the color developed in the unknown with the color produced by known concns. of Pb.

4512. Quarendon, R. **Chromatographic adsorption analyses.** *Mfg. Chemist* **14**, 201-4, 251-5 (1943).—*C.A.* **37**, 6517^3.

Although the method was developed for materials showing variable colors, it was applicable to colorless materials. Sepn. of isomers and other material of very similar properties was often possible.

4513. Schramm, Gerhard and Primosigh, Josef. **Quantitative separation of neutral amino acids by chromatography.** *Ber.* **76B**, 373-86 (1943).—*C.A.* **37**, 6516^4.

Chromatographic adsorption on activated charcoal and on Al_2O_3 in the presence of HCHO was described. Two g of the charcoal (Schering), of 28-mesh and freed from fines, formed a 4-cm column in a 12-mm adsorption tube through which 50 cc. of liquid flowed without suction in 2-3 hrs. The charcoal bed was washed with 5% AcOH to bring down its adsorptive capacity to a useful level. Glycine, alanine, serine, proline, methionine, valine, leucine, isoleucine (1-1.5 mg N in 2-5 cc. of 5% AcOH) added to the column and eluted with 5% AcOH, passed completely into the 1st 50-cc. eluate, whereas with phenylalanine, tyrosine and tryptophan no N_2 was found in the 1st eluate and only about 8.5, 4.6 and 0%, resp., in the 2nd eluate.

4514. Semtin, Halfter. **A chromatographic method for separating di- and tri- nitrotoluene.** *Z. ges. Schiess. u. Sprengstoffw. Nitrocellulose* **38**, 173-5 (1943).—*C.A.* **38**, 2902^2.

The mixt. used for adsorption contained 5 parts MgO and 8 parts $Ca(OH)_2$. MgO was colored violet by 2,4,6-trinitrotoluene, and with 2,4-dinitrotoluene gave a green color, while $Ca(OH)_2$ became bright red and blue, resp. Benzine and benzene were used as solvents.

4515. Swift, Clifton E.; Rose, W. Gordon, and Jamieson, G. S. **Preparation of purified methyl linoleate by chromatography.** *Oil & Soap* **20**, 249-50 (1943).—*C.A.* **38**, 655^4.

A column of alumina for chromatographic adsorption was prepd. by alternately pouring alumina and petr. ether (36°-60 °C) in small portions into a chromatograph tube (400 g alumina adjusted to a given activity in a tube 1-3/4 in. diam.) with a glass rod for stirring. A portion, 4 g Me esters of cottonseed oil in 150 ml of petr. ether, was introduced and the chromatogram developed with 1400 ml of petr. ether. The Me linoleate was eluted by rapidly forcing 2.5 liter more of petroleum through with pressure.

4516. VENTURELLO, GIOVANNI. **Chromatographic inorganic analysis.** *Ann. chim. applicata* **33**, 263-71 (1943).—*C.A.* **40**, 7041^{9}.

A series of chromatographic sepns. was described. The several constituents of the solns. were adsorbed on "Brockmann" Al_2O_3. A theoretical discussion was included.

4517. VENTURELLO, GIOVANNI. **Adsorption by alumina. Reply to a study of Siewert and Jungnickel.** *Atti reale accad. sci. Torino, Classe sci. fis., mat nat.* **79**, 260-2 (1943-44).—*C.A.* **41**, 4992*h*.

The adsorption was only in certain cases dependent on the sp. affinity, whereas in general it depended on the ionic charge, radius, and polarizability. The irregular position of bivalent Mn, which followed univalent Ag in the chromatographic series, was not in accord with the values of the soly. product of the carbonates, i.e., resp., $MnCO_3$ 10^{-11} and Ag_2CO_3 10^{-12}, but with the fact that the ions have the radius, resp., Mn 5.35 and Ag 6.10 A. and therefore have a different mobility.

4518. WACHTEL, JACQUES L. AND CASSIDY, HAROLD G. **Chromatography as a means of separating amino acids.** *J. Am. Chem. Soc.* **65**, 665-8 (1943).—*C.A.* **37**, 3466^{7}.

Details were given of the sepn. of glycine, dl-leucine, dl-phenylalanine and l-tyrosine. Two columns were used, 1 contg. 1.4 g of Darco G-60 charcoal and 3 g of pulped filter paper and the other 2.6 g of charcoal and 4 g of paper. The 1st column served the dual function of sepg. rapidly glycine and dl-leucine and more slowly dl-phenylalanine from l-tyrosine; after glycine and dl-leucine were washed from the 1st column, the column was developed with 5% aq. acetone until dl-phenylalanine began to appear in the percolate. The mixed glycine and dl-leucine fraction from the 1st column was concd. to about 20 cc. and applied to the 2nd column.

4519. WALL, MONROE E. AND KELLEY, EDWARD G. **Determination of pure carotene in plant tissue. Rapid chromatographic method.** *Ind. Eng. Chem., Anal. Ed.* **15**, 18-20 (1943).—*C.A.* **37**, 1102^{3}.

Ground dehydrated products were extd. with a mixt. of 30% acetone and 70% Skellysolve B and carotene was sepd. from interfering pigments by removal of most of the acetone, passage of the concentrate through a column of 3 parts Hyflo Super-Cel and 1 part of Micron Brand activated MgO, No. 2641, followed by elution with 3-5% acetone in Skellysolve B.

4520. WEIL-MALHERBE, H. **Experimental study of chromatography.** *J. Chem. Soc.* **1943**, 303-12.—*C.A.* **37**, 6516^{2}.

Quant. studies comprised the detn. of elution curves for benzopyrene, dissolved in mixts. of light petroleum fraction and benzene, on alumina and silica gel. The elution curve was a sigmoid curve, with characteristic threshold volumes; its exact form depended on the shape of the adsorbent column and on the particle size of the adsorbent. The threshold volume was studied as a function of the quantity of adsorbent, quantity of adsorbate, and the initial vol.

4521. WEISS, JOSEPH. **The theory of chromatography.** *J. Chem. Soc.* **1943**, 297-303.—*C.A.* **37**, 6516^{1}.

A general theory for the formation of a chromatogram in an adsorption column from a single substance and the process of development was derived on the basis of the Langmuir, Freundlich and linear adsorption isotherms.

4522. AUSTIN, C. R. AND SHIPTON, J. **The determination of carotene: a critical examination.** *J. Council Sci. Ind. Research* **17**, 115-26 (1944).—*C.A.* **38**, 5241^{1}.

An amt. of finely divided material contg. 100-200γ of carotene was weighed into a flask, covered with 20% aq. KOH, and brought to the boil on a hot plate. After cooling, 6 vols. of abs. alc. were added and the mixt. refluxed for 30 min. The ext. was filtered through sintered glass and the residue triturated with alc. and petr. ether until no further color was extd. The filtrate was adjusted to an alc. concn. of 55-75% and extd. twice with petr. ether. The bulked petr. ether exts. were washed 3 times with equal vols. of water and dried over Na_2SO_4. The soln. was passed through a column of activated MgO and the carotene eluted with 10% acetone in petr. ether.

4523. BAUERNFEIND, J. C.; BAUMGARTEN, W., AND BORUFF, C. S. **Adsorption phenomenon of β-carotene.** *Science* **100**, 316-17 (1944).—*C.A.* **39**, 10^{8}.

β-Carotene, dissolved in Skellysolve B, was adsorbed on activated Al_2O_3 and the chromatogram was developed with $CHCl_3$. Two pigments were formed. The top, narrow orange band "T" moved slowly and the lower, broad, β-carotene band passed rapidly down the column.

4524. BAUMGARTEN, W.; BAUERNFEIND, J. C., AND BORUFF, C. S. **Carotenoids in corn distillers' by-products.** *Ind. Eng. Chem.* **36**, 344-7 (1944).—*C.A.* **38**, 4088^{8}.

Chromatographic sepn. of the carotenoids of corn distillers' solubles, dried grains and dried grains with solubles indicated that the dried grains contained more carotene than the other by-products.

4525. BJÖRLING, CARL O. **Chromatographic assay of extractum and tinctura** *Nucis vomicae.* *Svensk Farm. Tids.* **48**, 137-9 (1944).—*C.A.* **39**, 1963^{6}.

Dissolve 0.2 g ext. (or 10g tincture) *nux vomica* in 5 cc. 70% alc. and suck it through 10 g dry Al_2O_3 in a glass tube of 1-cm bore. Elute with 4 portions hot 95% alc. To the filtrate add 20 cc. 0.01 *N* H_2SO_4, evap. off most of the alc., and titrate with 0.01 *N* borax, using methyl red and methylene blue as indicator.

4526. BJÖRLING, CARL O. **Evaluation of extracts and tinctures of** *nux vomica* **by adsorption analysis.** *Svensk Farm. Tid.* **48**, 161-5 (1944).—*C.A.* **39**, 1250^{2}.

Measured quantities of procaine-HCl or strychnine nitrate were dissolved in 5 or 10 ml EtOH and sucked through 10 g of Al_2O_3 (Merck, pure, water-free) in an adsorption column 1 cm in diam.

The column was washed 5 times with 5-ml portions of alc. The filtrate, dild. with an equal vol. of water, was titrated with $0.1\ N\ H_2SO_4$ to a green end point with bromophenol blue indicator.

4527. CHRISTENSEN, V. A. **Chromatographic analysis of alkaloids. I. Galenic preparations. 1. Analysis of tinctura** *nucis vomicae* **and extraction** *nucis vomicae*. *Dansk Tids. Farm.* **18**, 105-11 (1944).—*C.A.* **39**, 5403^3.

A mixt. of 25 g of tincture nucis vomicae and 15 g of abs. EtOH was passed through a column of 10 g Al_2O_3 in a 10-mm tube, or through 15 g of Al_2O_3 in a 13-mm tube. Fifteen cc. of EtOH was used as wash fluid. An equal vol. of H_2O was added to the alkaloid base and the mixt. titrated, bromophenol blue being used as an indicator.

4528. CHRISTIANI, A. V. AND ECK, VALERIE. **Separation of coprosterol and cholestanol with the aid of chromatographic adsorption analysis.** *Z. physiol. Chem.* **280**, 127-8 (1944).—*C.A.* **39**, 5406^3.

The isomers coprosterol and cholestanol could be sepd. by dissolving their mixt. in benzine, passing the soln. through a layer of alumina, eluting with 2:1 benzene-benzine, and evapg. each 100-cc. portion of filtrate *in vacuo* on the water bath. Since cholestanol was more strongly adsorbed on alumina than coprosterol, the eluate at first consisted principally of coprosterol, and evapn. of it yielded an oily residue.

4529. CLAESSON, STIG. **A self-registering apparatus for adsorption analysis.** *The Svedberg.* (Mem. Vol.) **1944**, 82-93.—*C.A.* **39**, 842^9.

A microinterferometric system in which the n was detd. as a function of the d. of soln. which had passed through a filter contg. a suitable adsorbent was made self-registering. Results were accurate within about 10^{-5} in n and 0.03 g in wt at max. sensitivity.

4530. CROWE, M. O'L. AND WALKER, A. **Fluorescence and absorption spectral data for pterinlike pigments synthesized by the diptheria bacillus and isolated by chromatographic analysis.** *J. Optical Soc. Am.* **34**, 135-40 (1944).—*C.A.* **38**, 2686^9.

4531. CROWELL, WM. R. AND KÖNIG, OTTO. **Improved apparatus for use in chromatography.** *Ind. Eng. Chem., Anal. Ed.* **16**, 347 (1944).—*C.A.* **38**, 3166^5.

A tube for use in chromatographic work was made from Lucite. A section along the entire length was removed and a tightly fitting piece made to close this opening. The tube could be opened for the detn. of the completeness of the adsorption and if necessary closed and the process continued.

4532. DUTTON, HERBERT J. **Adsorption analysis of colorless compounds: method and application to the resolution of stearic and oleic acids.** *J. Phys. Chem.* **48**, 179-86 (1944).—*C.A.* **38**, 5127^1.

A modification of a highly sensitive differential refractometer was described by means of which measurements of changes of n could be continuously made upon the percolate from adsorption columns during continuous flow.

4533. GORDON, A. H.; MARTIN, A. J. P., AND SYNGE, R. L. M. **Technical notes on the partition chromatography of acetamino acids with silica gel.** *Biochem. J.* **38**, 65-8 (1944).—*C.A.* **38**, 5472^5.

The extn. of Ac derivs. of amino acids on silica gel was discussed. The method of prepn. of the adsorption column and of the indicators employed were given.

4534. IIDA, TAKEO AND ISHIMOTO, KENZO. **Activation of Fushun alumina for chromatography.** *J. Pharm. Soc. Japan* **64**, 303-4 (1944).—*C.A.* **45**, 417*h*.

The $Al_2O_3 \cdot 3H_2O$ used for activation tests contained a minute amt. of alkali, and it was therefore given a pretreatment to remove the alkali. No activity was imparted by drying at 100-200 °C, but a powerful adsorption affinity was imparted by heating 1 hr at 300 °C. The product approximated Brockmann Al_2O_3 when heating was at 1000-1100 °C. The adsorptive affinity decreased with length of the heating period at equal temps., but the diffusibility increased. The adsorptive affinity of acid-washed Al_2O_3 was slightly stronger than that of water-washed Al_2O_3.

4535. LECOQ, H. **Analytical investigation of anions and cations by electrochromatography.** *Bull. soc. roy. sci, Liège* **13**, 20-6 (1944).—*C.A.* **42**, 6703*i*.

The adsorption was effected with the aid of an e.m.f. Expts. were conducted in the usual vertical glass tube contg. adsorbent with an e.m.f. of 80 v. between Pt electrodes at the top and bottom with no current, with the anode at the top, and with the cathode at the top. The most satisfactory distribution of anions was obtained with the anode at the bottom. The adhesive force between the adsorbed ions and the adsorbent was less than in ordinary chromatography. A 2nd app. consisted of two vertical tubes contg. adsorbent. In this process osmosis was assocd. with chromatography, and the ions migrated under the influence of the potential Cu, Pb, and Cd cations and CrO_4, AsO_4, and PO_4 anions were studied.

4536. LIDDELL, H. F. AND RYDON, H. N. **A new indicator for use in partition chromatography, 3, 6-disulfo- -napthalene-azo-N-phenyl- -naphthylamine.** *Biochem. J.* **38**, 68-70 (1944).—*C.A.* **38**, 5466^5.

The prepn. of the indicator was described in detail. It was recommended for use in the partition chromatographic sepn. of acetyl amino acids.

4537. LINDNER, ROLAND. **Chromatographic adsorption of radioactive atoms (radiometric adsorption analysis).** *Z. physik. Chem.* **194**, 51-65 (1944).—*C.A.* **42**, 8631*c*.

The process was applied to the sepn. of Pb and Bi in the form of their radioactive isotopes Th B and Th C. In this way a useful method of radiometric adsorption analysis was developed which could be applied to the classical radiochem. problem of the sepn. of Ra and Ba.

4538. MEUNIER, P. **Selective adsorption: chromatography.** *Chimie & industrie* **52**, 68-74 (1944).—*C.A.* **40**, 2711^1.

Two illustrative examples were given: (a) sepn. of carotenoids from paprika bark and detn. of provitamin A, and (b) detn. of tocopherol in blood serum. The practical uses to which chromatographic analysis may be put were outlined.

4539. MÜLLER, P. B. **The calorimetric standardization of the activity of adsorption agents for chromatographic analysis, with particular attention to Al_2O_3. II.** *Helv. Chim. Acta* **27**, 404-7 (1944).—*C.A.* **38**, 3921^7.

The expts. were carried out with solns. in petr. ether (of different degrees of purity), hexane, pure ethanol, and $CHCl_3$ as solvents and with 3 different samples of specially prepd. Al_2O_3. The sepn. of vitamin A ester and vitamin A alc. was studied. The results showed that there was a distinct proportionality between the heat effects and the adsorption activity. Reproducibility was accomplished only when care was taken to use the same adsorbent and solvents during the entire work.

4540. ÖHMAN, VALTER. **An example of the use of adsorption analysis in technical synthesis.** *The Svedberg* (Mem. Vol.) 1944, 413-18.—*C.A.* **39**, 1113^7.

The analytical problems arising from the direct electrochem. nitration of ethylene at an anode were solved by the methods of Tiselius and Claesson. The products were butyl nitrate, diglycol dinitrate, nitroglycol, ethyl nitrate and butyl nitrate.

4541. REED, GERALD; WISE, E. C, AND FRUNDT, R.J.L. **Quantitative separation of alcohol and ester forms of vitamin A by solvent extraction and chromatographic methods.** *Ind. Eng. Chem., Anal. Ed.* **16**, 509-10 (1944).—*C.A.* **38**, 5471^7.

Vitamin A alc. could be sepd. quantitatively from its esters by filtration of a soln. in ethylene dichloride through chromatographic columns of activated alumina. The activation and standardization of the alumina were described.

4542. SCHRAMM, GERHARD AND PRIMOSIGH, JOSEF. **Adsorption analysis of amino acids. II. Group separation of the complete mixture.** *Ber.* **77B**, 417-26 (1944).—*C.A.* **40**, 4622^3.

By a proper choice of adsorbents the mixed amino acids from proteins could be sepd. into 5 groups: (1) Aromatic amino acids; (2) basic amino acids; (3) acid amino acids; (4) those that gave stable compds. with HCHO: and (5) aliphatic neutral amino acids. A 10-cm column of silica gel was prepd. The soln. contg. the acids of groups 2 to 5 was run through the column at the rate of 4 drops per min. at atm. pressure, and the last of the soln. was transferred with a little H_2O. The acids of groups 3 to 5 were washed out quantitatively with 50 ml of H_2O. Those adsorbed were eluted with 100 ml of 20% AcOH. The anionotropic Al_2O_3 used for adsorbing group 3 was prepd. by treating Al_2O_3 (Merck) with HCl.

4543. SCHRAMM, GERHARD AND PRIMOSIGH, JOSEF. **Experiments on detecting the adsorption of amino acids with the eye.** *Ber.* **77B**, 426-7 (1944).—*C.A.* **40**, 4623^1.

Before the amino acid soln. was put on the column, it was colored with an appropriate chromatic indicator which was less strongly adsorbed. When Al_2O_3 was colored yellow with bromothymol blue, the amino acids of group 3 produced a white ring; if the Na salt of the indicator was used, it turned blue at the lower edge of the adsorption zone.

4544. SCHWAB, GEORG-MARIA; SIEWERT, G., AND JUNGNICKEL, H. **The alkaline reaction of aluminum oxides and the analysis of adsorption by aluminum oxide.** *Z. anorg. Chem.* **252**, 321-2 (1944).—*C.A.* **40**, 4275^9.

Titration by leaching alumina with a large amt. of H_2O and direct titration in the presence of H_2O and a large amt. of NaCl were compared. For some aluminas the results were comparative. The part of the Al oxide that was technically important for adsorption could not be leached with H_2O.

4545. STIMMEL, BENJAMIN F. **Method for preparing replicas of chromatograms.** *J. Chem. Education* **21**, 515 (1944).—*C.A.* **40**, 4932^7.

Crayola crayon of the desired color was extd. with benzene. The ext. was mixed with talc and centrifuged. The solid was dried and used in the column to make the replica.

4546. STRAIN, HAROLD H.; MANNING, WINSTON M., AND HARDIN, GARRETT. **Xanthophylls and carotenes of diatoms, brown algae, dinoflagellates and sea-anemones.** *Biol. Bull.* **86**, 169-91 (1944).—*C.A.* **38**, 5260^9.

The pigments were extd. with absolute MeOH contg. 0.5% $PhNMe_2$, and then transferred to petroleum ether after which the fractions were sepd. by chromatographic adsorption. Six species of diatoms each yielded the following xanthophylls: diatoxanthin, diadinoxanthin (both new), fucoxanthin, neofucoxanthin A, and neofucoxanthin B.

4547. SYNGE, R. L. M. **Analysis of a partial hydrolyzate of gramicidin by partition chromatography with starch.** *Biochem. J.* **38**, 285-94 (1944).—*C.A.* **39**, 1895^2.

Partition chromatography on silica gel gave poor quant. sepn., but the amino acids were found to travel as quite sharp bands in column chromatograms made with raw potato starch and developed with butanol satd. with water. Preliminary data were given on this technique, and behavior of known samples of dl-alanine, dl-valine and dl-leucine in such columns described. An identical sequence of bands was obtained on paper and on starch chromatograms.

4548. TUCKER, PAUL W. **New simplified chromatographic adsorption column.** *Chemist-Analyst* **33**, 65 (1944).—*C.A.* **38**, 5695^2.

A slight constriction was made in a tube of the proper size; on this was placed a Witt plate to hold the column and the tube was inserted in a rubber stopper that fitted in the neck of a suction flask.

4549. BEAUCOURT, J. H. AND MASTERS, D. L. **Chromatographic methods in inorganic microanalysis.** *Metallurgia* **32**, 181-4 (1945).—*C.A.* **39**, 5195^9.

Activated Al_2O_3 and ordinary dehydrated $Al(OH)_3$ were found to be effective absorbents and were preferable to others such as MgO, $BaSO_4$, and ZnO. Many heavy metal ions could be developed with $(NH_4)_2S$ to give black sulfide zones; Fe, Cu, and Co reacted with $K_4Fe(CN)_6$ to give blue, brown, and greenish zones, resp. With $(NH_4)_2S$ following zones were obtained: Pb^{++}, black; Ag^+, gray; Zn^{++}, white; Cd^{++}, yellow; Mn^{++}, flesh color. Certain ions could not be sepd. directly from aq. solns., since they formed mixed zones. Examples were Cr^{III}, Fe^{III}, Hg^{II}, and Co^{II}, Ni^{II}, Cd^{II}, Fe^{II}. However, if these were converted into amine or tartrate complexes, the order of adsorption could be altered and sepns. effected which were impossible with the simple ions.

4550. BERENBLUM, I. **3,4-Benzopyrene from coal tar.** *Nature* **156**, 601 (1945).—*C.A.* **40**, 1005^6.

A soln. of 10 g of the crude tar-distn. fraction in 100 cc. C_6H_6 and an excess of petr. ether was extd. after being filtered several times with concd. H_2SO_4 at 3°C. The combined H_2SO_4 exts. were dild. with H_2O, extd. with C_6H_6, the C_6H_6 ext. was washed with dil. NaOH, and dried. After diln. with twice its vol. of petr. ether, the soln. was passed through an Al_2O_3 column and eluted with C_6H_6-petr. ether (1:1).

4551. BINKLEY, W. W.; BLAIR, MARY GRACE, AND WOLFROM, M. L. **Isolation of constituents of cane juice and blackstrap molasses by chromatographic methods.** *J. Am. Chem. Soc.* **67**, 1789-93 (1945).—*C.A.* **40**, 481^7.

After fermentation with yeast and passage through Amberlite IR-100 and IR-4, 225 g of Cuban blackstrap yielded 35 g (15.6%) of a dark brown solid with a bitter taste and a raisin-like odor. This was acetylated at 95-8°C for 4 hrs. The filtrate from the dark-brown solid contained 8.9 g of glyceryl triacetate and 6.2 of a dark sirup. Most of the dark-brown solid and dark sirup was strongly adsorbed by Magnesol, a behavior indicative of a polymeric structure; this portion was not investigated. Elution of the Magnesol with 100:1 C_6H_6:EtOH gave 5.83 g of a golden-yellow sirup from which were isolated 0.215% (on basis of blackstrap) of inositol (as the hexaacetate), 0.05% of D-mannitol (as hexaacetate), and 0.07% of β-D-glucose (as pentaacetate) (details were given of the sepn.). Cane juice was found to contain 0.005% of inositol; blackstrap contained 0.134% of inositol and 0.186% of phytin inositol.

4552. BROUWER, TH. **Apparatus for chromatographic adsorption.** *Chem. Weekblad* **41**, 103-4 (1945).—*C.A.* **40**, 2039^2.

A micro column was described.

4553. CHRISTENSEN, V.A. **Alumina for chromatographic analysis (of alkaloid salts).** *Dansk Tids. Farm.* **19**, 29-48 (1945).—*C.A.* **39**, 5405^7.

To test the suitability of Al_2O_3, shake 20 cc. 1% procaine-HCl in 86% EtOH at frequent intervals for a period of 15 min. at about 20°C in a conical flask with 5 g Al_2O_3, filter, and titrate 10-cc. aliquots of the filtrate (after diln. with equal parts of H_2O) with 0.1 *N* HCl (bromophenol blue indicator). If the analysis was carried out chromatographically with so small a quantity of Al_2O_3 that not all of the acid residue was adsorbed, this was an excellent method for estg. the quality of the Al_2O_3. The adsorption was independent of the length of the column, but depended on the time of contact.

4554. CLAESSON, STIG. **Theory for frontal adsorption analysis.** *Arkiv Kemi, Mineral., Geol.* **A20**, No. 3, 14 pp. (1945) (in English); *Discussions Faraday Soc.* **1949**, No. 7, 34-8.—*C.A.* **41**, 1169*a*; **44**, 9769*g*.

The concn. of several constituents in soln. could be calcd. from frontal analysis, using Langmuir's isotherm, more simply than could be obtained by elution analysis.

4555. CLEAVER, CHARLES S.; HARDY, ROBERT A., AND CASSIDY, HAROLD G. **Chromatographic adsorption of amino acids on organic exchange-resins.** *J. Am. Chem. Soc.* **67**, 1343-52 (1945).—*C.A.* **39**, 4844^8.

The responses toward several amino acids (glycine, alanine, arginine, histidine, and glutamic acid) of a cation-exchange and an acid-binding synthetic organic resin (Amberlite IR-100 and IR-4) were reported. The influence of the following factors was investigated: type of resin, particle size, length of adsorption column, rate of flow, and concn. of amino acid and H ion in soln. The work included several binary and 2 ternary mixts., evidence regarding their separability being reported.

4556. COLEMAN, GEORGE H.; REES, DONALD E.; SUNDBERG, ROBERT L., AND MCCLOSKEY, CHESTER M. **Separation and identification of the products of hydrolysis and alcoholysis of methylated disaccharides.** *J. Am. Chem. Soc.* **67**, 381-6 (1945).—*C.A.* **39**, 1850^8.

Details were given of the chromatographic sepn. of the azoylated hydrolyzates (obtained by the 2nd method) from Me heptamethyl-β-gentioside, -β-melibioside, -β-Cellobioside, -β-lactoside, and -maltoside. The upper band formed was always the monoazoate, contaminated with a little of the diazoate band. With cellobiose it was necessary to sep. the upper band on a 2nd column.

4557. DYKYJ, J. AND CERNY, J. **A new method of quantitative chromatography of inorganic cations.** *Chem. Listy* **39**, 84-91 (1945).—*C.A.* **44**, 9868*h*.

A cationoid dye (methylene blue) adsorbed on starch was desorbed and replaced by inorg. cations. A chromatographic tube was filled with an aq. starch suspension. After sedimentation, a small amt. of methylene blue was added to the supernatant water, which, after draining formed a thin ring on the upper end of the starch column. When an inorg. cation soln. was passed through the column, it shifted the blue ring by a distance proportional to the amt. of the cation present. The method was suitable only for individual Mg, Ca, Sr, or Ba ions.

4558. GAJJAR, INDIRA M. AND REENIVASAYA, M. **Chromatographic adsorption of shark-liver oil on activated fuller's earth.** *J. Sci. Ind. Research* (India) **3**, 301-2 (1945).—*C.A.* **39**, 2895^2.

Shark-liver oil with a vitamin A activity of 10,570 I.U./g was passed through a column of activated fuller's earth. The 3 zones which were colored (top to bottom) red, orange, and yellow, were divided into 5 fractions. The eluates of the fractions had activities (top to bottom) of

211,000, 77,200, 5620, 6550, and 8170 I.U./g the activity of the filtrate was 5560 I.U./g.

4559. GLUCKAUF, E. **Chromatography of two solutes. Adsorption isotherms from chromatographic measurements.** *Nature* **156**, 205-6 748-9 (1945).—*C.A.* **39**, 4786^6.

The results obtained by Offord and Weiss (1945) were criticized.

4560. JACOBS, P. W. M. AND TOMPKINS, F. C. **Inorganic chromatography. II. Position, rate of advance, and width of adsorbate zones.** *Trans. Faraday Soc.* **41**, 395-400 (1945).—*C.A.* **39**, 5157^3.

Columns were prepd. by suspending 20 g Al_2O_3 in 50 ml water at 90°C and introducing this into tubes of 11 mm diam. under 10 cm Hg suction. The vol. of 0.1 *N* soln. of cations (Cu, Cd, Zn, Ni, Co, Mn, Mg) which traversed columns of equal length until detected in the filtrate was detd. It was found that $c_0/Q(dx/dt)_{c_0}$=const., where x was any distance from top of the column at time t, c_0 the initial concn., and Q the amt. of solute adsorbed per unit length of column in milliequiv. The rate of advance when developed with HCl and the relative positions were studied.

4561. JACOBS, P. W. M. AND TOMPKINS, F. C. **Inorganic chromatography. III. Elution curves.** *Trans. Faraday Soc.* **41**, 400-5 (1945).—*C.A.* **39**, 5157^5.

Cu bands were formed from neutral $CuSO_4$ solns. in columns (2.45 cm diam.) of Al_2O_3. The concn. distribution in soln. at the front part of the band after being advanced 3 cm was detd. and the corresponding distribution of adsorbed matter on the Al_2O_3 was calcd. from this and the isotherm. H_2SO_4 at 20 milliequiv./liter was used in the development, since the corresponding isotherm was linear up to a Cu concn. of 60 milliequiv./liter when the satd. value was attained. Al_2O_3 was unsuitable as an adsorbent in an inorg. chromatographic study.

4562. JACQUES, JEAN AND MATHIEU, JEAN PAUL. **Role of the dielectric constant in chromatography by fractional elution.** *Compt. rend.* **221**, 293-4 (1945); *Bull. soc. chim.* **1946**, 94-8.—*C.A.* **40**, 3323^9, 5977^1.

The adsorption on Al_2O_3 of benzophenone or anthracene dissolved in the following solvents was studied: hexane, benzene, Et_2O, $CHCl_3$, ethylene dichloride, 2-butanol, acetone, EtOH, and MeOH. The adsorption of binary mixts. of the solvents was also detd. The constituent of a binary or a ternary mixt. having the highest dielec. const. was most highly adsorbed. In binary mixts. that had one substance in common the adsorption of the constituent of higher dielec. const. varied as the abs. value of the difference of the dielec. consts.

4563. LAHIRI, A. **Chromatographic analysis of coal bitumen.** *Fuel* **24**, 66-73 (1945).—*C.A.* **39**, 3649^7.

The ext. was prepd. as a 10% soln. in $CHCl_3$ and the chromatogram was obtained on 115 × 3.5-cm columns of silica gel. Liquid chromatography was used and the columns were developed successively by petr. ether, petr. ether + 10% benzene, benzene, benzene + 5% EtOH, benzene + 20% MeOH, CS_2 satd. with MeOH, and a 1:1 mixt. of pyridine and CS_2 + 10% MeOH. The progress of development was observed by using a Hg discharge lamp and filter giving light at 365-400 mμ. Development yielded 20 zones and several of these were rechromatographed on magnesia or alumina columns with various solvents. The ultraviolet absorption spectra were given for 11 fractions.

4564. LAHIRI, A. AND MIKOLAJEWSKI, E. **Chromatographic separation of coal bitumens.** *Nature* **155**, 77-8 (1945).—*C.A.* **39**, 1748^1.

A high-pressure C_6H_6 ext. of coal was dissolved in C_6H_6 and chromatographed on silica gel. The chromatogram was developed by using the following 8 solvents in succeeding order: petr. ether, b. 60-80°C; petr. ether plus 10% C_6H_6; C_6H_6; C_6H_6 plus 1% EtOH; C_6H_6 plus 5% EtOH; C_6H_6 plus 20% MeOH; $CHCl_3$; and CS_2 satd. with MeOH. Fifteen different fractions were collected, sepn. being made on the basis of the color of the ultraviolet fluorescence of the percolate. Activated alumina and magnesia could also be used as adsorbents. Fuller's earth and floridin were not suitable, since they adsorbed too strongly.

4565. LEROSEN, ARTHUR L. **The characterization of silicic acid-Celite mixtures for chromatography.** *J. Am. Chem. Soc.* **67**, 1683-6 (1945).—*C.A.* **39**, 5156^8.

The terms evaluated were: S, V_c, R, and T_5, where S = length of adsorbent column contg. 1 unit vol. of solvent/length of unfilled tube required to contain the same vol. of solvent, V_c = rate of flow of the developing solvent through the column when a state of const. flow had been reached (mm/min.), R = rate of movement of the adsorbate zone (mm/min.)/rate of flow of the developing solvent (V_c), T_5 = the time in sec. required for a solvent to penetrate 50 mm into an initially dry column (9 × 75 ± 2mm) under a vacuum given by the water pump.

4566. LEVY, A. L. **A rapid and convenient method of filling chromatograph columns.** *Chemistry and Industry* **1945**, 380.—*C.A.* **40**, 1080^1.

The adsorbent and the solvent were placed in a separatory funnel equipped with a stirrer. The mixt. was allowed to flow through the top into the clean, dry column.

4567. LEW, B. W.; WOLFROM, M. L., AND GOEPP, R. MAX, JR. **Chromatography of carbohydrates and some related compounds.** *J. Am. Chem. Soc.* **67**, 1865 (1945).—*C.A.* **40**, 65^6.

Chromatography of carbohydrates and related poly-HO compds. on adsorptive clays was described; alcs., ethers, dioxane, ketones, acids, pyridine, and H_2O, alone or in admixt., were used as developers. The sepn. of D-glucose or D-mannitol and sorbitol; D-mannitol and dulcitol; 1, 4, 3, 6-dianhydrosorbitol, -D-mannitol, and -L-iditol; the detn. of the rate of lactonization of D-gluconic acid; and the isolation of ascorbic acid from lemon juice were given.

4568. MAIR, BEVERIDGE J. **Separation and determination of aromatic and mono-olefin hydrocarbons in mixtures with paraffins and naphthenes by adsorption.** *J. Research Natl. Bur. Standards* **34**, 435-51 (1945).—*C.A.* **39**, 4028^5.

The mixture was introduced into the top of a column of silica gel. When the sample was adsorbed, a desorbing liquid, such as EtOH, was added and pressure applied. This forced the hydrocarbons down the column where fractionation by adsorption occurred. The components of the sample issued from the bottom of the column in the order paraffins and naphthenes, mono-olefins, aromatics, and then desorber.

4569. McNEELY, W. H.; BINKLEY, W. W., AND WOLFROM, M. L. **Separation of sugar acetates by chromatography.** *J. Am. Chem. Soc.* **67**, 527-9 (1945).—*C.A.* **39**, 2492^4.

The chromatographic brush method of Zechmeister was applied successfully to the sepn. of well-characterized sugar acetates. Magnesol (synthetic hydrated $2MgO.5SiO_2$) was chosen as the most versatile adsorbent. The brush reagent streak on the extruded column reacted with the invisible zones at a rate characteristic of the compd. forming the zone.

4570. MEUNIER, PAUL. **Chromatography and mesomerism. The relation of the color of halochromism to (chemical) constitution in the group of carotenoids and vitamin D.** *Compt. rend.* **221**, 64-6 (1945).—*C.A.* **40**, 1715^7.

In the case of vitamin A_2 (absorption max. 639 mμ) complete rupture of the mol. was assumed, the ring being already open, when reacting with $SbCl_3$. The colors appearing in the course of ionizing adsorptions proved that all or part of the system of conjugated double bonds was free to oscillate and consequently not bound to the adsorbent.

4571. MICHAELIS, L. AND GRANICK, S. **Metachromasy of basic dyestuffs.** *J. Am. Chem. Soc.* **67**, 1212-19 (1945).—*C.A.* **39**, 3990^3.

The variability of color of an adsorbed dye was discussed as depending on the nature of the stainable substrate at which it was adsorbed. Absorption-spectra data were given for methylene blue, toluidine blue, oxonine, capri blue, crystal violet, fuchsin, malachite green, methylene blue, phenosafranine, and thionine in solvents and when adsorbed. As a model for a substrate stainable in the normal color a 3% soln. of nucleic acid at pH 4.6 was chosen; as a model for a substrate stainable in the metachromatic color a soln. or gel of agar at pH 4.6 was chosen.

4572. MITRA, B. N. AND SRINIVASAN, M. **Application of chromatography to explosives.** *J. Sci. Ind. Research* (India) **3**, 300-1 (1945).—*C.A.* **39**, 2879^2.

Impure styphnic acid was dissolved in C_6H_6 and adsorbed on talc or kaolin (which had been pretreated with dil. acid, washed, and dried). Red impurities were at the top, and (yellow) styphnic acid at the bottom. Impure T.N.T. was dissolved in toluene and adsorbed on talc. The filtrate contained T.N.T.; the adsorbate was probably D.N.T. with some T.N.T. M.N.T. was dissolved in toluene and adsorbed on anhyd. Na_2CO_3.

4573. OFFORD, A. C. AND WEISS, JOSEPH. **Chromatography of two solutes.** *Nature* **155**, 725-6; **156**, 570-1 (1945).—*C.A.* **39**, 4786^6; **40**, 1080^2.

The conclusions were in complete disagreement with the fundamental equation from which their results were derived, and were not compatible with exptl. results.

4574. REIMERS, F. **Chromatographic analysis of alkaloid salts. II.** *Dansk Tids. Farm.* **19**, 166-73 (1945).—*C.A.* **39**, 5405^9.

The chromatographic method was applied to the analysis of eucodal, nupercaine, and pantocain. Hyoscyamine-HBr and dicodid could not be analyzed chromatographically; the former because the acid residue was not bound completely in the column, the latter because the base washed out too slowly.

4575. WALKER, F. T. **The segregation of linseed-oil glycerides by chromatography.** *J. Oil Colour Chem. Assoc.* **28**, 119-34 (1945).—*C.A.* **39**, 5090^5.

A soln. of 2.5-3.0 g of linseed oil in 50 ml of *n*-hexane was passed through an absorption column (dimensions 8 in. × 1½ in.) contg. finely divided Al_2O_3, at the rate of approx. 200 ml per hr. The chromatogram was allowed to develop by percolating an addnl. 300 ml of *n*-hexane through the column at the same rate. The thin colored layer at the top was removed, the remainder of the column was divided into 1/2-in. sections and the oil removed by dissolving in a mixt. of equal parts of Et_2O and acetone.

4576. WALTER, JOHN E. **Rate-dependent chromatographic adsorption.** *J. Chem. Phys.* **13**, 332-6 (1945).—*C.A.* **39**, 4539^3.

The process of chromatographic adsorption was studied from the kinetic viewpoint, assuming a bimol. reaction between adsorbent and solute. Boundaries characteristic of equil. adsorption were obtained only if the time of passage of the soln. through the colnmn was greater than the half-life of the reaction by a factor of at least 100.

4577. WILLIAMS, T. I. **Chromatography.** *School Sci. Rev.* **26**, 154-61 (1945).—*C.A.* **39**, 3709^7.

Brief review of methods and applicable materials, with suggestions for class use.

4578. BERGDOLL, M. S. AND DOTY, D. M. **Chromatography in the separation and determination of the basic amino acids.** *Ind. Eng. Chem., Anal. Ed.* **18**, 600-3 (1946).—*C.A.* **41**, 56*a*.

A single adsorbent mixt. of 1 part of Lloyd's reagent and 2 parts of Hyflo Super Cel was used in the sepn. of lysine, histidine, and arginine. All of the amino acids were adsorbed, but all non-basic amino acids could be eluted with 0.5 *N* HCl, except cystine which must be converted into cysteine by reduction with Zn prior to the chromatographic sepn. Lysine could be eluted with 1*N* HCl, histidine with 0.125 *M* $NaHCO_3$, and arginine with pyridine.

4579. BINKLEY, W. W. AND WOLFROM, M. L. **Chromatographic isolation of cane-juice constituents.** *J. Am. Chem. Soc.* **68**, 1720-1 (1946).—*C.A.* **40**, 6855^6.

Normal La. cane-juice solids (5.8 g) were prepd. by ice sublimation and acetylated with Ac_2O and $ZnCl_2$ at -15° to -10°C for 3 hrs. The mixt. was allowed to warm to room temp. during 18 hrs; there resulted 3.2 g unreacted solids and 4 g of a viscous yellow sirup; 2 g of the sirup in 25 cc.

C_6H_6 was passed through a mixt. (170 g) of 5 parts of Magnesol and 1 part Celite; products identified were D-glucose (as pentaacetate), D-fructose (as tetraacetate), and sucrose (as octaacetate).

4580. Brockmann, Hans and Volpers, Fritz. **Method for chromatographic separation of colorless substances.** *Naturwissenschaften* **33,** 58 (1946).—*C.A.* **41,** 7200*a*.

Colorless adsorbed material was made visible by using a fluorescent adsorbent, such as Al_2O_3 with small amts. of heavy metal, or better with morine (also good for $CaCO_3$ or MgO). For SiO_2 adsorption small amts. of berberine were used. Ultraviolet light showed lighter and darker bands depending on the adsorbate.

4581. Claesson, Stig. **A study of the adsorption of normal, branched, and unsaturated fat acids and related compounds by means of adsorption analysis.** *Rec. trav. chim.* **65,** 571-5 (1946). (in English).—*C.A.* **41,** 1907*h*.

Flowing chromatography was used as an analytical technique for investigating fat acid mixts. A special silica prepd. by heating Merck's product at 800°C for 15 min. adsorbed all unbranched satd. fat acids from heptane to the same extent, regardless of mol. wt. Branched acids were adsorbed less than unbranched; unsatd. acids were adsorbed more than satd. The same rules were valid for the Me esters.

4582. Claesson, Stig. **Mathematical characteristics of adsorption isotherms in frontal analysis of several solutes.** *Arkiv Kemi, Mineral. Geol.* **A24,** No. 7, 7 pp. (1946) (in English).—*C.A.* **41,** 6834*f*.

When the equation for the isotherm was written $f_i(c_1, c_2, \ldots. c_n) = k_i c_i r(c_1, c_2, \ldots. c_n)$, where c_i was the concn. of the solute i in the presence of other solutes $1, 2, \ldots. i-1, i+1 \ldots. n$, k_1 was a const. which was characteristic for substance i, and $r(c_1, c_2 \ldots. c_n)$ was an arbitrary function, the validity of the formulas was greater than was suspected. The significance of the *displacement factor* r $(c_1, c_2 \ldots. c_n)$ was discussed.

4583. Claesson, Stig. **Studies on adsorption and adsorption analysis with special reference to homologous series.** *Arkiv. Kemi, Mineral, Geol.* **23A,** No. 1, 133 pp. (1946) (in English).—*C.A.* **40,** 3665^{6}.

The following homologous series were especially investigated, and phys. and chem. data presented in tables and graphs: fatty acids, ethyl esters of fatty acids, dibasic acids, and alcs. Frontal analysis was found to be the best method for analyzing compds. with long C chains, whereas displacement development was particularly selective for gases and vapors.

4584. Craig, Lyman C.; Golumbic, Calvin; Mighton, Harold, and Titus, Elwood. **Identification of small amounts of organic compounds by distribution studies. IV. Use of a solid phase.** *Science* **103,** 587-9 (1946).—*C.A.* **40,** 4581^{7}.

Solns. of 10 mg chrysene and 15 mg anthracene in 20 cc. cyclohexane (both pure and mixed) were shaken with Brockmann's alumina. A series of 10 tubes each contained 0.7 g alumina. The soln. was shaken 2 min. in the first tube, decanted into the second, shaken, and so on through the series. This was followed by 20 cc. cyclohexane, and the process repeated until all the tubes were filled. The data showed that a solid phase can be substituted directly for one of the liquid phases. The advantages are those common to chromatography.

4585. Cropper, F. R. **Some applications of chromatographic analysis in industry.** *Analyst* **71,** 263-5 (1946).—*C.A.* **40,** 4971^{9}.

An account of the practical use of chromatography in an industrial analytical lab.

4586. Georges, L. W.; Bower, R. S., and Wolfrom, M. L. **Chromatography of sugars and their derivatives.** *J. Am. Chem. Soc.* **68,** 2169-71 (1946).—*C.A.* **41,** 717*e*.

The suitability of a synthetic, hydrated Ca acid silicate (Silene EF) for the chromatography of sugars and their derivs. (alcs., glycosides, acetates, and Me ethers) was demonstrated. The streak (toward the alk. $KMnO_4$ indicator employed) and extrusive properties of this adsorbent were especially favorable. A table of adsorption series was given and the sepn. of mixts. of sugars and sugar alcs. illustrated.

4587. Glückauf, E. **Theory of chromatography.** *Proc. Roy. Soc.* (London) **A186,** 35-57 (1946).—*C.A.* **40,** 6932^{2}.

Chromatographic sepn. for 2 solutes, the adsorption of which followed a Langmuir isotherm, was analysed. Development of the bands, both with pure solvent and with a solvent contg. another solute, was discussed. Very simple conditions hold for both the vol. of solvent and the amt. of adsorbent required for complete sepn. of the 2 solutes. For substances difficult to sep., the min. amt. of adsorbent X_o (in g) was proportional to the quantities to be sepd. $(m_1 + m_2)$ (in mol.) and inversely to the satn. capacity of the adsorbent $(1/\beta)$ (in mol./g adsorbent) and to the square of the relative difference of the adsorption coeffs. (a_1 and a_2) of the solutes $X_o = \text{approx.}\ \beta(m_1+m_2)/[(a_2/a_1)-1]^2$.

4588. Gullstrom, D. K.; Burchfield, H. P., and Judy, J. N. **Chromatographic resolution of the quinone oximes.** *Ind. Eng. Chem., Anal. Ed.* **18,** 613-16 (1946).—*C.A.* **41,** 56*f*.

The isomeric quinone dioximes were adsorbed from acetone on columns of activated alumina in the order of their dipole moments, the *o*-isomer formed an upper orange band, the *p*-isomer a lower yellow band. The *o*-monoxime was adsorbed above the *o*-dioxime as a red band and the *p*-monoxime between the dioximes as a green band, probably as *p*-nitrophenol. Chromatographic adsorption was useful in the sepn. of *p*-monoxime from *p*-isomer and products of side reactions which took place during the nitration of phenol and oximation.

4589. Harris, Roberta and Wick, Arne N. **Preparation of silica gel for chromatography.** *Ind. Eng. Chem., Anal. Ed.* **18,** 276 (1946).—*C.A.* **40,** 3665^{5}.

A detailed procedure was given for the prepn. of silica gel suitable for partition chromatography. Material prepd. by this method was used in the isolation of pure penicillin.

4590. Korenman, I. M. and Kraĭnova, Z. V. **Micro chromatographic detection of cadmium.** *J. Applied Chem.* (U.S.S.R.) **19**, 604-(1946) (in Russian).—*C.A.* **41**, 2347*h*.

The soln. to be tested was treated with excess KCN, and passed over a column of activated silica gel; only $K_2Cd(CN)_4$ and $KAg(CN)_2$ were adsorbed among the complex cyanides which were decomposable by $(NH_4)_2S$. Elution of the column by KI soln. led to partial sepn. of the 2 salts; the development was done by $(NH_4)_2S$ soln. In the presence of Cd and Ag the color was orange, while Ag in absence of Cd gave black to gray color.

4591. Lew, B. W.; Wolfrom, M. L., and Goepp, R. Max, Jr. **Chromatography of sugar and related polyhydroxy compounds.** *J. Am. Chem. Soc.* **68**, 1449-53 (1946).—*C.A.* **40**, 7168⁸.

A chromatographic adsorption series (7 classes) of carbohydrates and some related substances were given in tabular form, the compds. being arranged in decreasing order of adsorptive strength.

4592. Lindner, R. **The separation of barium from radium by radiometric adsorption analysis.** *Naturwissenschaften* **33**, 119-21 (1946).—*C.A.* **41**, 7250*f*.

Ra and Ba could readily be sepd. by chromatographic adsorption on Al_2O_3 with radiometric detn. of activity. On elution of prepns. a few days old it was found that about 50% of the Rn remained on the alumina column. This was due to a "rebound" effect of the Rn formed from adsorbed Ra. A similar effect was found on adsorbing radioactive Pb (ThB); it could be desorbed only with great difficulty.

4593. Lindner, Roland and Peter, Otto. **Separation of radioactive yttrium earths in an adsorption column (radiometric adsorption analysis).** *Z. Naturforsch* **1**, 67-70 (1946).—*C.A.* **41**, 2349*b*.

A soln. of the yttrium earths was neutron-irradiated and adsorbed in an Al_2O_3 column. The chromatographic analysis was made by measuring the radioactivity throughout the column.

4594. Roberts, John D. and Green, Charlotte. **Separation of 2, 4-dinitrophenylhydrazones by chromatographic adsorption.** *Ind. Eng. Chem., Anal. Ed.* **18**, 335 (1946).—*C.A.* **40**, 3700⁵.

By means of Merck's silicic acid mixed with Super Cel in a 2:1 ratio, solns. of 2, 4-dinitrophenylhydrazine and its derivs. with acetaldehyde, propionaldehyde, acetone, and Me Et ketone could be sepd. satisfactorily. Each of these derivs. could be sepd. from mixts. with the others and with 2, 4-dinitrophenylhydrazine (strongly adsorbed) except for the hydrazone of acetone which could not be sepd. from that of propionaldehyde.

4595. Ruiz, Saenz Lascaño. **The analytical separation of a mixture of synthetic dyes. An application of the chromatographic method. I.** *Ind. parfum.* **1**, 187-91 (1946).—*C.A.* **42**, 5675*c*.

The chromatographic sepn. of various dyes in binary and ternary mixts. in both aq. and alc. soln. was studied on alumina. Since this was of basic character, it adsorbed best compds. with acid groups. Tartrazine O which contained 2 sulfone groups and one carboxylic group was adsorbed more strongly than the chemically related Pyrazolone Yellow J.

4596. Ruiz, Saenz, Lascaño; Chovin, P., and Moureu, H. **Relation between the structure and adsorbability of certain synthetic dyes. I.** *Bull. soc. chim.* 1946, 592-4.—*C.A.* **41**, 2901*i*.

Tartrazine O (azo deriv. of pyrazolone, contg. SO_3Na and COOH groups) was more strongly adsorbed on alumina than Flavazine L (contg. H and CH_3 in corresponding positions). Among 4 monoazo oranges, 2 sulfonated aminoazos, being less acid, were less adsorbed than 2 sulfonated hydroxyazos; the o-hydroxyazo deriv. of 2-naphthol was more adsorbed than the p-hydroxyazo deriv. of 1-naphthol.

4597. Schmah, Hans. **Preparation, alkaline properties, aging, and solubility of extremely pure aluminum hydroxide and application in chromatography.** *Z. Naturforsch* **1**, 322-3 (1946).—*C.A.* **41**, 5359*f*.

$Al(OH)_3$ gel was prepd. from Al ethylate and had an alk. surface reaction. It adsorbed KCl, $KClO_4$, or K_2SO_4 from neutral solns. to a pH of 8.5 to 9.5 depending on the method of prepn., relative amts. of adsorbent, and concn. of the adsorbate.

4598. Strain, Harold H. **Conditions affecting the sequence of organic compounds in Tswett adsorption columns.** *Ind. Eng. Chem., Anal. Ed.* **18**, 605-9 (1946).—*C.A.* **41**, 20*c*.

Variations of the adsorption sequence of 2 or more solutes were observed as a result of a change in solvents, concn. of solvents, adsorbents, temp., and H-ion concn. A mixt. of 2 chlorophylls and 2 xanthophylls yielded as many as 6 of the 24 possible sequences. The effect of the above variables on the adsorption sequence was demonstrated for mixts. of 2 to 4 solutes. Various pigments were used.

4599. Wilkes, John E. **High-speed filter for chromatographic analysis.** *Ind. Eng. Chem., Anal. Ed.* **18**, 329-30 (1946).—*C.A.* **40**, 3653³.

Considerable time was saved if Celite No. 545 was used in place of Hyflo Super Cel. Expts. with small quantities of riboflavin showed that the results of this substitution were satisfactory.

4600. Bendall, J. R.; Partridge, S. M., and Westall, R. G. **Displacement chromatography on cation-exchange materials.** *Nature* **160**, 374-5 (1947).—*C.A.* **42**, 435*b*.

Tiselius' "displacement development" modification of the chromatographic method was successfully applied to the sepn. of bases and amino acids. A mixt. of 3.0 millimols. of glycine and 3.4 millimols. of creatinine in 20 ml H_2O was adsorbed on a column of Zeo-Karb 215, and then developed with 0.043 *M* NH_4OH; glycine was displaced first, and emerged from the column before creatinine.

4601. Beyaert, M. and Cornand, P. **Extraction of the α and β acids of hops or lupulin.** *Congr. intern. inds. fermentation, Confs. et communs.* **1947**, 236-78.—*C.A.* **42**, 7927*b*.

Hops (or lupulin) were extd. with MeOH. The ext. was evapd. at reduced pressure and the residue extd. with petr. ether. The ext. was again evapd. and the residue treated with benzene. From this soln. the highly colored impurities were chromatographed on silica gel. The elutriate was evapd. and dissocd. in MeOH. Humulon (α acid) was pptd. with $Pb(OAc)_2$. The humulate was decompd. with H_2SO_4, and Humulon (α acid) extd. with petr. ether.

4602. BROCKMANN, HANS AND VOLPERS, FRITZ. **Chromatographic adsorption. II. A new process for the separation of colorless substances.** *Chem. Ber.* **80**, 77-82 (1947).—*C.A.* **41**, 3071*a*.

Pentamethoxyflavone on Al_2O_3, a fluorescent substance, did not react with the compds. to be adsorbed and was not removed in the elution process. Small amts. imparted to the Al_2O_3 a magnificent yellow fluorescence. Diphenylfluorindinesulfonic acid and salicylic acid also imparted a red and a blue fluorescence, resp., to Al_2O_3.

4603. CLAESSON, STIG. **A new method for the observation of zones of colorless substances on a chromatographic column.** *Nature* **159**, 708 (1947).—*C.A.* **41**, 5359*i*.

The zones could be detected on the column by observing the changes in *n* of the soln. in contact with the particles of the adsorbent. The tube was made by clamping 2 glass windows against a U-shaped metal plate. One window was rather thick and had polished edges. If the adsorbent was observed at the proper angle from a suitable distance (about 1 m), boundaries of the zones could be seen. The sensitivity was improved by using monochromatic light. In paper chromatography, the paper was placed under the glass.

4604. CLAESSON, STIG. **Some arrangements for adsorption analysis with large amounts of substances.** *Arkiv Kemi, Mineral. Geol* **A24**, No. 16, 9 pp. (1947).—*C.A.* **42**, 2539*b*.

It was found that the attachment of a filter with a small diam. to a larger one permitted a sharpening of the front. The shape of the front was not influenced when the vol. ratio did not exceed 5. An app. with 3 sections, each of 50 mm height and diam. of 10, 20, and 40 mm, showed a sharp front and permitted sepn. of mixts. of sucrose and raffinose or glucose, developed with 4% phenol soln. With a triple filter, and 100g of adsorbent, 2 to 10 g of pure substance can be sepd. from a mixt.

4605. COATES, J. I. AND GLÜCKAUF, E. **Theory of chromatography. III. Experimental separation of two solutes and comparison with theory.** *J. Chem. Soc.* **1947**, 1308-14.—*C.A.* **42**, 2490*d*.

Values calcd. from a chromatogram agreed with the calcns. for the Langmuir isotherm for mixts. of Cu and Mn ions on acid Zeo-Karb under the conditions: (1) the sum of the concns. of Cu and Mn be less than the H-ion concn.; (2) the total ionic concn. be less than 1 milliequiv. per cc.

4606. DUBRISAY, RENE. **Applications of chromatography to the separation of noble metals.** *Compt. rend.* **225**, 300-2 (1947).—*C.A.* **42**, 2204*a*.

If a dil. soln. contg. $AgNO_3$ or a salt of a salt of a noble metal was slowly poured through a glass tube contg. a known wt of finely powd. carbon, metallic Ag and noble metal collected in the upper part of the tube. After washing, drying, and weighing, the Ag could be dissolved in dil. HNO_3 and the noble metal by a suitable solvent. The nature and structure of suitable carbon, the most favorable temp., and the rate at which the soln. was added were discussed.

4607. GLÜCKAUF, E. **Adsorption isotherms from chromatographic measurements.** *Nature* **160**, 301 (1947).—*C.A.* **42**, 4020*a*.

A simplification was made of the method previously described for strongly colored solutes. The complete isotherm was detd. within ±1% without a single concn. measurement.

4608. GLÜCKAUF, E. **Theory of chromatography. II. Chromatograms of a single solute.** *J. Chem. Soc.* **1947**, 1302-8.—*C.A.* **42**, 2490*c*.

Equations were formulated for the development of a band for the relatively simple cases where the adsorption isotherm was concave or convex to the concn. axis, and for the sigmoid type of isotherm. The latter was calcd. from the elution curves with 0.25 *N* H_2SO_4 and $CuSO_4$ solns. on Zeo-Karb pretreated with a soln. of 0.14 *N* $CuSO_4$ and 0.11 *N* H_2SO_4. The isotherm agreed with the results from direct equil. measurements.

4609. GLÜCKAUF, E. AND COATES, J. I. **Theory of chromatography. IV. The influence on incomplete equilibrium on the front boundary of chromatograms and on the effectiveness of separation.** *J. Chem. Soc.* **1947**, 1315-21,—*C.A.* **42**, 2490*e*.

The effects of self-sharpening and of nonequil. on the final form of the front boundary were discussed and equations were derived. Curves were shown for the development of Mn and Cu bands from mixts. on Al_2O_3 by H_2SO_4 and of Cu and Co on Al_2O_3 by $MnSO_4$.

4610. GLÜCKAUF, E. **Theory of chromatography. V. Separation of two solutes following a Freundlich isotherm.** *J. Chem. Soc.* **1947**, 1321-9.—*C.A.* **42**, 2490*f*.

Equations were derived for the development of chromatograms for mixts. obeying the Freundlich adsorption isotherm and applied to available data for adsorption isotherms of succinic and oxalic acids on charcoal.

4611. GRACIAN Y TOUS, JAIME AND FIZARRO, AGUSTIN VIOQUE. **Separation of higher fatty acids by selective adsorption.** *Anales fis. y quim.* (Madrid) **42**, 109-22 (1947).—*C.A.* **41**, 5323*i*.

In chromatographic analysis of oleic and stearic acids, Al_2O_3 as adsorbent reacted chemically with the acids; this prevented adsorption and desorption. Silica gel was a satisfactory adsorbent.

4612. HOPF, PETER P. **Radial chromatography in industry.** *Ind. Eng. Chem.* **39**, 938-40 (1947).—*C.A.* **41**, 7167*a*.

Chromatographic adsorption could be accomplished by allowing the soln. to flow radially through an adsorbent. The flow could be assisted by rotating the cylinder contg. the adsorbent in a manner similar to a centrifuge.

4613. HULTIN, ESKI AND NORDSTRÖM, LENNART. **Adsorption analysis of some methylated carbohydrates.** *Svensk Kem. Tid.* 59, 19-21 (1947). (in English).—*C.A.* **41**, 3017*f*.

It was possible by frontal adsorption analysis to det. the different Me derivs. of glucose present in the hydrolyzate of methylated carbohydrates.

4614. LENNARTZ, H. J. **The solvent series for chromatographic adsorption analysis.** *Angew. Chem.* **A59**, 158-9 (1947).—*C.A.* **42**, 4020*b*.

The position of CS_2 in the series was established in expts. with other solvents as follows: petroleum ether, CS_2, CCl_4, C_2HCl_3, and benzene.

4615. LEROSEN, ARTHUR L. **Rate of movement of a chromatographic zone as a function of column position, initial concentration, and initial volume.** *J. Am. Chem. Soc.* **69**, 87-90 (1947).—*C.A.* **41**, 2304*c*.

The system silicic acid-benzene-*o*-nitroaniline was studied. The ratio *R* of the displacement of the zone of adsorbed material to the displacement of the developing solvent in the column was detd. for the leading and trailing edges of the zone. For the leading edge *R* was found to be independent of the column position and to vary with the initial concn. c_0 and to a less extent with the initial vol. v_0.

4616. LEROSEN, ARTHUR L. **Standardization of chromatographic adsorbents. Rate of flow of developing solvent.** *Anal. Chem.* **19**, 189-90 (1947).—*C.A.* **41**, 2958*i*.

In order to est. the usefulness of an adsorbent in columns of different dimensions and with a variety of solvents and pressures, a more general term was needed. A value, V_c, for a standard degree of packing, was proposed and its values for all conditions could be calcd. Results of expts. with silicic acid and lime as adsorbents and benzene and ligroin as solvents were within 10% of the calcd. values.

4617. LINDNER, ROLAND. **Radiometric adsorption analysis and its application to problems of nuclear physics.** *Z. Naturforsch.* **2a**, 333-4 (1947).—*C.A.* **42**, 2865*d*.

Chromatography on Al_2O_3 was recommended as a general sepn. method for radioactive elements. From Ba-Ra mixts., 80-90% of the Ba could be obtained free of Ra; from La-Pr mixts., 40% of the La was obtained pure.

4618. LINDNER, ROLAND. **Separation by adsorption of the cerium group of rare earths; in particular, their isotopes formed in uranium fission.** *Z. Naturforsch.* **2a**, 329-32 (1947).—*C.A.* **42**, 2865*c*.

Partial sepn. of rare earths from neutral soln. was obtained by an Al_2O_3 chromatographic column. A rare-earth activity of 13-d. half-life, from U fission, was sepd. from activities obtained by irradiation of rare earths and known to be assignable to La, Ce, Sm, and element 61. The 13-d. activity was assigned to Pr.

4619. LYANDA-GELLER, B. A. **Application of chromatographic adsorption to purification of penicillin.** *Mikro-biologiya* **16**, 61-5 (1947).—*C.A.* **42**, 9092*a*.

Chromatographic adsorption of pencillin from soln. in AmOAc on a column of silica gel (pretreated with $Ba(OH)_2$ soln.) yielded colored adsorption zones. In one the concn. of pencillin was several times larger than in the original soln. Bio-essays of successive zones showed that antibiotic activity of the eluate varied directly with N content, which was 0.51 to 2.54% in the AmOAc solns.

4620. MARTIN, A. J. P. **The principles of chromatography.** *Endeavour* **6**, 21-8 (1947).—*C.A.* **41**, 3677*f*.

Theory of chromatography was surveyed. Numerous examples were given, with colored illustrations, and partition chromatograms discussed.

4621. NEUWORTH, MARTIN B. **Chemical nature of coal hydrogenation products. I. Initial resolution by chromatography on alumina.** *J. Am. Chem. Soc.* **69**, 1653-7 (1947).—*C.A.* **41**, 6868*i*.

Ground coal was mixed with oxide catalyst and hydrogenated at 375°C and 1800 p.s.i. The volatile products distd. into a cooled trap, and were sepd. into 4 fractions by chromatography.

4622. POLSON, A.; MOSLEY, V. M., AND WYCKOFF, RALPH W. G. **The quantitative chromatography of silk hydrolyzate.** *Science* **105**, 603-4 (1947).—*C.A.* **41**, 5559*i*.

Partition chromatography based on differences of rates of flow in pairs of solvents showed the presence of eight amino acids in silk hydrolyzates. Quant. estns. were made by comparing color upon addn. of ninhydrin of standard and unknown amino acid concns.

4623. ROBINSON, G. **Some applications of inorganic chromatography.** *Metallurgia* **37**, 45-7, 107-8 (1947).—*C.A.* **42**, 2204*c*.

The method was used to det. the variation of Zn in a brazing alloy during branzing. A soln. of the alloy and standard Zn, Cu, and Ni solns. were passed through 8-hydroxyquinoline columns and banding occurred in the order, Cu (green), Ni (yellow), and Zn (yellow). Some inert material such as starch, kieselguhr, $BaSO_4$, SiO_2 gel had to be mixed with the reagent. Only the Zn complex was fluorescent in ultraviolet light. In detg. Zn loss in brazing, a chromatograph of a soln. of the original metal was compared with solns. of the brazing material during the process.

4624. SEASE, JOHN W. **Use of a fluorescent adsorbent for the chromatography of colorless compounds.** *J. Am. Chem. Soc.* **69**, 2242-4 (1947).—*C.A.* **42**, 147*a*.

By the use of a silica gel contg. a small quantity of fluorescent ZnS, the following order was found for decreasing adsorption affinity when developed with petr. ether: PhCH:CHCHO, xanthone, $p\text{-}O_2NC_6H_4CH_2Br$, $o\text{-}HOC_6H_4CHO$, azoxybenzene, $PhNO_2$, CHI_3.

4625. TISCHER, J. AND TOGEL, E. **The fluorescent chromatography of Perilla oil.** *Z. physiol. Chem.* **282**, 103-17 (1947).—*C.A.* **43**, 4031*i*.

Free fatty acids were removed from a benzene soln. of Perilla ocimoides seed oil by passage through Al_2O_3, followed by exact neutralization with alc. NaOH, followed by thorough washing.

The dried soln. was chromatographed through 7 Al_2O_3 columns. In ultraviolet light there were 6 zones. The zones blueish violet and dirty green were identified as mono- and diglycerides; yellowish bright blue, and di-and highly unsatd. triglycerides; deep blue and bright blue, triglycerides in increasing order of satn.; strongly iridescent yellowish silver grey; sterol esters; and colorless, waxes and carbohydrates.

4626. VELASCO, FERNANDO. **Methods of analysis by adsorption. Chromatography.** *Inform. quim. anal.* 1, No. 6, 125-34 (1947).—*C.A.* 43, 58*d*.
The methods were described with discussion, and the effects of the variables were discussed.

4627. AEPLI, OTTO T.; MUNTER, PAUL A., AND GALL, JOHN F. **Determination of γ-benzene hexachloride by partition chromatography.** *Anal. Chem.* 20, 610-13 (1948).—*C.A.* 42, 6981*f*.
The partition solvents were nitromethane and *n*-hexane; the supporting medium was silicic acid. Take 0.2-0.3 g of triturated sample and heat to boiling with 25 ml of mobile solvent (*n*-hexane satd. with $MeNO_2$). Stopper and shake 5 min. and decant through a Buchner funnel into a Kohlrausch flask. Repeat the extn. with 10-ml more of mobile solvent. Wash the residue and flask with five 10-ml portions of the same solvent. Make up to 100 ml in the K. flask and use 25 ml to prep. the chromatogram. Carefully run through silicic acid at the top of the column and wash down with 100 ml of the solvent and collect about 10-ml in the fraction collector at the bottom of the tube.

4628. APPLEZWEIG, NORMAN. **Ion-exchange adsorbents as laboratory tools.** *Ann. N. Y. Acad. Sci.* 49, 295-314 (1948).—*C.A.* 42, 5300*h*.
The use of ion-exchangers were reviewed, with suggestions for their application in chromatography.

4629. BASU, A. N. AND GLENN, R. A. **Chemical nature of coal hydrogenation product. II. Progress in further chromatography of primary coal hydrogenation products on silica gel.** *Fuel*, 27, No. 3, 96-9 (1948).—*C.A.* 42, 9116*a*.
The bands obtained by Neuworth using chromatographic technique upon liquid coal hydrogenation products were resolved further by re-chromatographing on silica gel. Acetylable compds. were concd. in the most strongly adsorbed fractions, whereas the O and N compds. were distributed throughout the column.

4630. BRADFIELD, A. E. AND PENNEY, M. **Catechins of green tea. II.** *J. Chem. Soc.* 1948, 2249-54.—*C.A.* 43, 3394*a*.
By rechromatographing previous fraction on a series of columns contg. silica (sepd. from a fine fraction by sedimentation in H_2O), using ether and a mixt. of AcOEt and CCl_4 as solvents, the following components were sepd: (-)-eqicatechin gallate, (±)-catechin, and (-)-gallocatechin gallate.

4631. CLAESSON, STIG. **Frontal analysis and displacement development in chromatography.** *Ann. N. Y. Acad. Sci.* 49, 183-203 (1948).—*C.A.* 42, 5300*d*.
The work of Tiselius and his coworkers was described.

4632. DEITZ, VICTOR R. **Surface Areas of some solid adsorbents of possible use in chromatography.** *Ann. N. Y. Acad. Sci.* 49, 315-23 (1948).—*C.A.* 42, 5300*e*.
The com. solid adsorbents available in the U. S. were listed with their surface areas, and densities.

4633. DERBY, JAMES V. JR. AND DEWITT, JAMES B. **Comparison of methods for the determination of carotene.** *J. Assoc. Offic. Agr. Chemists* 31, 704-8 (1948).—*C.A.* 43, 6948*d*.
The prepd. exts. of carotene were chromatographed and the optical d. of the purified pigments were measured between 400 and 500 mμ. On the basis of the ratios of various extinction coeffs. and the extinction coeff. at 450 mμ the carotene content of dehydrated alfalfa meal by the modified A.O.A.C. method was 43% higher than the Wall and Kelley procedure; 34% higher than the alc. KOH method; and 13% higher than the sapon. modification of the A.O.A.C. method.

4634. DIEMAIR, W. AND NEU, H. **Adsorption of amino acids.** *Z. anal. Chem.* 128, 566-83 (1948).—*C.A.* 43, 3746*c*.
Expts. were described of the influence of the duration of hydrolysis (of milk albumin, rape seed, beechnut, and soya) upon the products formed, the sepn. of the amino acids in the protein hydrolyzates, the chromatographic adsorption of the various products, and the detn. of tryptophan and S present in org. combination. By means of activated charcoal (Carboaraffin C) followed by Floridin XXF "extra" and Filtrol-Neutrol a good quant. sepn. could be made.

4635. DUGAN, L. R. JR.; BEADLE, B. W., AND HENICK, A. S. **A chromatographic study of autoxidized methyl linoleate.** *J. Am. Oil. Chemists' Soc.* 25, 153-7 (1948).—*C.A.* 42, 6142*e*.
A 1-in. diam. column of Na-Al silicate was used as adsorbent for esters after being wetted with iso-octane. The esters were eluted in sections from the column by using 100 ml of ethanol and then made up to definite vol. and aliquots taken for spectrophotometric studies and detns. of peroxide content. The column adsorbed the greater portion of the oxygenated substances.

4636. DUPONT, G.; DULOU, R., AND VILKAS, M. **The preparation of alumina for chromatography.** *Bull soc. chim. France* 1948, 785-6.—*C.A.* 43, 1535*b*.
Tech. Al_2O_3 hydrate was converted to γ Al_2O_3 by calcining at 500°C for 1 hr. The calcine was soaked in concd. HCl for 2-3 hrs with occasional stirring. The mixt. was washed by decantation till the supernatant liquid clarified in 2-3 min. After washing to neutrality, the product was dried at 105°C.

4637. EDMAN, PEHR. **Technique for partition chromatography on starch.** *Acta. Chem. Scand.* 2, 592-6 (1948).—*C.A.* 43, 4036*i*.
The pretreatment of the starch, the prepn. of the column, and the operational procedure were given. An automatic cut collector was described.

4638. Fischer, Werner and Kulling, Achim. **Chromatography of electrolytes on aluminum oxide.** *Naturwissenschaften* 35, 283-4 (1948).—*C.A.* 44, 2820*e*.

The adsorption of ions on alumina was studied. With Na-contg. γ-alumina, the exchange of Na against other dissolved ions took place in equiv. amts. With Na-contg. or Na-free alumina, a 2nd type of adsorption took place in which both cations and anions were adsorbed from the soln. in equiv. amts.

4639. Fuks, N. A. and Chetverikova, L. S. **Use of partition chromatography in analytical chemistry. I. Analysis of hexachlorocyclohexane.** *Zhur. Anal. Khim.* 3, 220-5 (1948).—*C.A.* 43, 8978*g*.

Nitromethane was used as mobile solvent, isooctane as mobile solvent and specially prepd. silica gel for the column. Chromatography gave, after adsorption of the γ-isomer, 1% of a new product which proved to be a new isomer of heptachlorocyclohexane. Besides this, the α-, and δ-isomers were obtained.

4640. Fulda, W. **Preparation of pure alumina from solutions of bauxite in dilute NaOH.** *Metall* **1948**, 397-9.—*C.A.* 43, 9393*i*.

Air-dried, finely crushed (5000 mesh/cm^2) bauxite was dissolved in 8-15% NaOH soln. (8 g bauxite per liter soln. in 5 hrs at 200°C and 10-15 atm.) filtered at about 100°C, and pptd. by seeding with hydrated Al_2O_3 at an initial temp. near 100°C, and with const. stirring for 12 hrs.

4641. Galinovsky, F. and Vogl, O. **Chromatographic separation of epimeric alcohols.** *Monatsh.* 79, 325-6 (1948).—*C.A.* 43, 2894*f*.

A 20-cm tube 16 mm in diam. packed with Al_2O_3 was used. Mixts. of cholestanol and epicholestanol or of cholesterol and epicholesterol dissolved in benzene were sepd. A 1:1 benzine-genzene mixt. eluted the epiforms and the solutes with not more than one recrystn. gave correct m.ps. The Al_2O_3 was treated with ether in a Soxhlet extractor to remove the other compd. of each pair.

4642. Gapon, E. N. and Gapon, T. B. **Mechanism of the formation of chromatograms.** *Doklady Akad. Nauk S.S.S.R.* 60, 817-20 (1948).—*C.A.* 42, 8572*b*.

Chromatograms were classified as molecular, exchange, and pptn. A typical mol. chromatogram was the sepn. of EtOH and MePh vapors on active charcoal. Exchange chromatography was illustrated by the sepn. of Cu and Co^{++} (upper zone Cu^{++}) on permutites, bentonite clays, Ba aluminate, ZnO, Al_2O_3.

4643. Gapon, T. B. and Gapon, E. N. **Precipitation chromatography.** *Doklady Akad. Nauk S.S.S.R.* 60, 401-4 (1948).—*C.A.* 42, 6603*e*.

The method of pptn. chromatography used columns made up of a carrier (Al_2O_3, $Al(OH)_3$, SiO_2 gel, etc.) mixed with a pptg. reagent. The column could be used either dry or wet. The following examples were discussed: Dry column of SiO_2 gel with Na_2SiO_3 as precipitant, column of Al_2O_3 with KI as precipitant, columns of Al_2O_3 with Ag_2SO_4 and Al_2O_3 with NH_4CNS (1:9) as precipitants, and a wet column of Al_2O_3 with $FeCl_3$ as precipitant. The operation could be reversed, the mixt. of salts being poured in first, the soln. of the precipitant next; the chromatogram would form at some place in the columns.

4644. Gottlieb, Sidney. **Separation of tropic and atropic acids by partition chromatography.** *J. Am. Chem. Soc.* 70, 423 (1948).—*C.A.* 42, 2246*f*.

Tropic and atropic acids could be sepd. by passage of the $CHCl_3$ soln. through a column of silicic acid. Atropic acid, being more sol. in $CHCl_3$, moved rapidly through the column; tropic was found in the upper band.

4645. Hagdahl, Lennart. **Technical improvements in adsorption analysis.** *Acta. Chem. Scand.* 2, 574-82 (1948).—*C.A.* 43, 3264*f*.

The use of constriction pieces between units of coupled filters improved the sharpness and regularity of the fronts. With the Tiselius Claesson interferometer, "layering" in the cuvette caused a blurring of the fringes and consequently inconsistent results. This was eliminated by a mixer placed between the column and cuvette.

4646. Hellstrom, Nils. **Identification and determination of polycyclic hydrocarbons by ultraviolet absorption and chromatographic adsorption.** *Acta Chem. Scan.* 2, 319-32 (1948).—*C.A.* 43, 3182*f*.

Distn. of a highly refined tar lubricating oil from fir stumps gave a principal fraction which gave evidence of contg. hydrocarbons by C_6H_6 structure. Adsorption of the distd.. fraction+ added retene on Super-Filtrol from C_7H_{16} solvent (followed by frontal analysis and use of ultraviolet spectra) showed the types of hydrocarbons present and order of adsorption to be C_6H_6, $C_{10}H_8$ phenanthrenes (including the added retene). Addn. of both retene and phenanthrene in known amts. before adsorption and analysis of fractions showed that retention vols. could not be used to calc. compns. of the oils, partly because of too great a difference in adsorption of hydrocarbons of C_6H_6 structure and retene and partly because of indistinctness of the step characterizing $C_{10}H_8$ hydrocarbons.

4647. Hiester, Nevin K. and Vermeulen, Theodore. **Elution equations for adsorption and ion exchange in flow systems.** *J. Chem. Phys.* 16, 1087-9 (1948).—*C.A.* 43, 464*i*.

General kinetic equations were derived for the elution bell for any fractional extent of previous satn. Satn. and elution equations were also derived for cases involving more than one "memory" term.

4648. Hough, L.; Jones, J. K. N., and Wadman, W. H. **Application of paper partition chromatography to the separation of the sugars and their methylated derivatives on a column of powdered cellulose.** *Nature* 162, 448 (1948).—*C.A.* 43, 2542*b*.

In a tightly packed column (12 in. high and 1 1/4 in. diam) contg. Whatman ashless filter tablets rubbed through an 80-mesh sieve, 2- and 4-component mixts. of sugars were sepd. with individual recoveries of 95-100% when the components differed widely in R_G values. Butanol satd. with water contg. 1% NH_3 was used as the mobile phase.

The time for any particular sugar to emerge was proportional to its R_G value.

4649. Jones, Francis T. and Bickoff, E. M. **Crystalline characteristics of four carotene isomers.** *J. Assoc. Offic. Agr. Chemists* **31**, 776-81 (1948).—*C.A.* **43**, 6881*g*.

The isomers were prepd. from a com. product by chromatographic adsorption. All-trans-β-carotene was platy with tendency to cluster. All-trans-α-carotene crystals were similar. Neo-β-carotene B crystals grew only in spherulitic aggregates.

4650. Kamienski, B. **Dielectric theory of selective adsorption (chromatography).** *Bull. intern. acad. polon. sci., Classe sci. math. nat., Ser. A*, **1947**, 1-4 (1948) (in English).—*C.A.* **43**, 6883*a*.

The relative powers of adsorption of various materials from various solvents on common adsorbents were interpreted qualitatively on the basis of electrostatic attraction of dipoles.

4651. Kretovich, V. L. and Bundel, A. A. **Chromatographic determination of dicarboxylic amino acids in plants.** *Doklady Akad. Nauk S.S.S.R.* **61**, 861-4 (1948).—*C.A.* **43**, 3746*e*.

The plant material was inactivated by boiling EtOH and then extd. with H_2O; the ext. was passed over Al_2O_3 in a chromatographic column, pretreated with dil. HCl; after this elution was effected with 3 *N* KOH. Neutral (except cystine) and basic amino acids were not adsorbed in the acidic column. Cystine was retained, apparently due to formation of an insol. Al salt.

4652. Labruto, G. and D'Alcontres, G. Stagno. **Behavior of several double and complex salts with regard to chromatographic adsorption. II.** *Ann. chim. applicata* **38**, 320-5 (1948).—*C.A.* **44**, 1842*f*.

Solns. of KCN and $CuSO_4$ were mixed in proper proportions to form $K_3Cu(CN)_4$, and the mixt. was passed through a 42 × 2.3 cm column of activated charcoal. The filtrate contained no Cu^{++} or K^+, and only 0.6% of the CN^- taken; it contained all of the SO_4^{--}. When KCN and $CdCl_2$ solns. were mixed to form $K_2Cd(CN)_4$ and passed through the column, the filtrate contained no K^+ or Cd^{++}, but contained 2.6% of the CN^- and all of the Cl^-. All of the constituent ions of K_2HgI_4, $K_3Fe(CN)_6$, and $K_3Co(NO_2)_6$ were adsorbed by the column.

4653. Lennartz, H. J. **Chromatographic adsorption analysis of isomorphous mixtures.** *Z. anal. Chem.* **128**, 271-9 (1948).—*C.A.* **42**, 6199*f*.

Most hydrophilic adsorption agents could be easily tested with respect to their activity for true adsorption or addn. adsorption. The following adsorption agents were arranged in the order of diminishing activity: Al_2O_3, MgO, $CaSO_4$, CaO, talc, $Ca_3(PO_4)_2$, milk sugar. Many org. compds. could be sepd. by chromatography.

4654. Ovenston, T. C. J. **Chromatographic method for the identification and estimation of mineral jelly in propellant explosives.** *Analyst* **73**, 616-17 (1948).—*C.A.* **43**, 1979*i*.

Ext. 5 g of the ground or sliced propellant with Et_2O in the usual manner and remove the ether *in vacuo*. Ext. the residue insol. in Et_2O with 4 portions of light petroleum (b. 40-50°C), reduce the vol. of the exts. to about 25 ml, and pour into a chromatographic Al_2O_3 column. Wash the unadsorbed mineral jelly through the column with light petroleum with a vol. such that all of the other constituents remain adsorbed.

4655. Peterson, Merlin H. and Johnson, Marvin J. **The estimation of fatty acids of intermediate chain length by partition chromatography.** *J. Biol. Chem.* **174**, 775-89 (1948).—*C.A.* **42**, 8240*f*.

The higher fatty acids were removed by extn. of the aq. soln. with thiophene-free benezene followed by passage through a macro-chromatogram packed with Celite 545 moistened with 33 *N* H_2SO_4, the column being developed with benzene. Capric and the higher fatty acids passed through the column whereas caprylic and the lower acids were left on the column. Capric acid was sepd. by subsequent passage through a micro-chromatogram contg. 35 *N* H_2SO_4, the capric appearing as a sep. zone in the effluent. If the chromatogram was prepd. with 30.5 *N* H_2SO_4 as the nonmobile phase, caproic and caprylic acids appeared as a sep. zone in the effluent, while butyric and lower fatty acids remained on the column.

4656. Ramsey, L. L. **Separation of butyric and isobutyric acids by partition chromatography.** *J. Assoc. Offic. Agr. Chemists* **31**, 164 (1948).—*C.A.* **42**, 3704*g*.

The sepn. was made on a silicic acid column with water as the immobile solvent and $CHCl_3$ contg. a small percentage of *n*-BuOH as the mobile solvent. The sepn. was incomplete and the bands visibly overlapped. A single passage through the column detected a min. of about 10% isobutyric acid present in butyric acid as an impurity, and about 30% butyric added to isobutyric acid.

4657. Ramsey, L. L. and Patterson, W. I. **Separation and determination of the straight-chain saturated fatty acids C_5 to C_{10} by partition chromatography.** *J. Assoc. Offic. Agr. Chemists* **31**, 139-50 (1948).—*C.A.* **42**, 3704*d*.

The acids were sepd. on a column of silicic acid, with MeOH as the immobile solvent, 2, 2,4-trimethylpentane as the mobile solvent, and bromocresol green as indicator. The identification was confirmed by adding an approx. equal amt. of an authentic sample of the suspected acid and testing of the chromatographic homogeneity of the mixt. on a fresh column.

4658. Sacconi, Luigi. **Inorganic chromatographic adsorption.** *Gazz. chim. ital* **78**, 583-91 (1948).—*C.A.* **43**, 2542*a*.

Data were given contributing to a general systematic scheme of analysis, and attempting to explain the mechanism of chromatographic adsorption on Al_2O_3.

4659. Schikore, Werner and Muller, Ernest Gerhard. **Adsorptive purification in phosphorescence chemistry I.** *Z. anorg. Chem.* **255**, 327-30 (1948).—*C.A.* **43**, 1659*e*.

Ammoniacal $ZnSO_4$ was run through a column contg. Al_2O_3 pretreated with an alc. soln. of dimethylglyoxime (Ni) or α-nitroso β-naphthol (CO) or Al_2O_3 sandwiched about a layer of the solid reagent. Removal of traces of Fe from water glass used as an adhesive in prepg. a phosphorescent screen was carried out.

4660. SCHROEDER, W. A. **Some experiments in systematic quantitative chromatography.** *Am. N. Y. Acad. Sci.* **49**, 204-17 (1948).—*C.A.* **42**, 5371*d*.
The materials analyzed were propellants and explosives. Reagent silicic acid, prewashed with anhyd. solvents to increase its activity, proved the most suitable adsorbent. It was usually mixed with Celite 535 to raise the rate of filtration. "Double zoning" occurred frequently; i.e., when a presumably homogeneous compd. was chromatographed, it produced 2 well-sepd. zones which could not be distinguished by other than chromatographic methods, and each of which, when eluted and rechromatographed, again produced 2 zones.

4661. SEASE, JOHN W. **The use of fluorescent silica gel mixtures in the chromatography of colorless compounds.** *J. Am. Chem. Soc.* **70**, 3630-2 (1948).—*C.A.* **43**, 1711*d*.
Addn. of 2.5% Zn silicate to silica gel-2.5% ZnS adsorbing media increased the ultraviolet excitation range. Sepns. of 40 binary mixts. involving 25 compds. (mostly aldehydes, ketones, esters, and aromatic amines) were described.

4662. SHEMYAKIN, F. M. AND MITSELOVSKII, E. S. **Chromatographic separation of cations with the aid of o-hydroxyquinoline, β-naphthoquinoline, and cupferron.** *Zhur. Anal. Khim.* **3**, 349-53 (1948).—*C.A.* **43**, 8973*b*.
The *o*-hydroxyquinoline was used by itself, the others were mixed with potato starch in a ratio 1:1 by vol. A soln. contg. 2 cations in concns. of 0.05 *M* each was carefully percolated through the adsorber and the widening of adsorption bands with time was observed. The pairs of cations analyzed were: Cu-Fe, Cu-Ni, Cu-Co, Co-Ni, Ni-Fe, and Co-Fe. Only Co-Ni formed 2 distinct bands.

4663. SHEMYAKIN, F. M. AND MITSELOVSKII, E. S. **Kinetics of chromatographic separation of pairs of colored ions on aluminum oxide.** *Doklady Akad. Nauk S.S.S.R.* **61**, 289-92 (1948).—*C.A.* **42**, 8572*g*.
Sharp sepn. of various pairs of salts of Fe^{+++}, Fe^{++}, Cu^{++}, Ni^{++}, and Co^{++}, Cr^{+++}, was obtained in Al_2O_3 columns 65 mm high, 7 mm in diam. Essential conditions of sharp and uniform boundaries were homogeneity of the grain size of Al_2O_3, absence of air bubbles, good wettability and slow (dropwise) addn. of the soln. The rates of the progress of the front of the band with given ion pairs followed the law $x = X\ (1 - e^{-kt})$, where x = distance swept by the front of the band during the time t, X = limiting distance reached by the front at equil.

4664. STEIN, WILLIAM H. AND MOORE, STANFORD. **Chromatography of amino acids on starch columns. Separation of phenylalanine, leucine, isoleucine, methionine, tyrosine, and valine.** *J. Biol. Chem.* **176**, 337-65 (1948).—*C.A.* **43**, 2266*g*.
The effluent from chromatographic columns of potato starch was collected in regular series of small fractions of known vol., and amino acids were detd. by a quan. photometric ninhydrin method. The fully automatic fraction-collection machine was based on the interruption of a light beam by each drop of effluent. The first 6 amino acids emerging from the column (when the sample consisted of a known mixt. of 18 amino acids) could be made to appear as distinct peaks on the effluent curves and permitted quant. detn.

4665. THOMAS, HENRY C. **Chromatography: a problem in kinetics.** *Ann. N. Y. Acad. Sci.* **49**, 161-82 (1948).—*C.A.* **42**, 5300*g*.
A kinetic theory was proposed which led to a Langmuir-type isotherm at equil. The rate was assumed to be detd. by chem. effects alone and equal to the rate of adsorption minus the rate of desorption. The former was assumed proportional to the product of the "concn. of empty holes" on the adsorbent and the concn. in soln. of the material being adsorbed; the latter was first order with respect to the concn. of adsorbed material. The adsorption of anthracene from cyclohexane soln. by com. activated alumina gave qual. agreement.

4666. VAVON, GUSTAVE AND GASTAMBIDE, BERNARD. **Chromatographic separation of cis and trans cyclone isomers. Case of borneol, isoborneol and menthol, neomenthol.** *Compt. rend.* **226**, 1201-3 (1948).—*C.A.* **42**, 8571*e*.
In the chromatographic sepn. of *cis*- and *trans*-cyclanols, e.g., menthol and neomenthol, and borneol and isoborneol, the steric effect was such that the *trans* isomer was more strongly adsorbed. The alc. mixt., dissolved in petr. ether, was completely adsorbed by a column of adsorbent alumina and eluted with: (1) petr. ether; (2) C_6H_6 or CCl_4; (3) ether; and finally $CHCl_3$ or MeOH.

4667. WEISS, D. E. **Modified activated carbon adsorbents for continuous fractional adsorption.** *Nature* **162**, 372-3 (1948); *Discussions Faraday Soc.* **1949**, No. 7, 142-51.—*C.A.* **42**, 8571*b*; **44**, 9769*d*.
Adsorbents which permitted adsorption and desorption to be controlled by pH adjustment could be prepd. by adsorption of a surface-active, or water-insol. acid (e.g. fatty acids or lecithin) as a primary adsorbate on the usual adsorbents such as alumina, activated charcoal, and carbon black. The adsorbent acquired the properties of a primary adsorbate and formed, under alk. conditions, salts with cations or bases, which could be considered as a secondary adsorbate. These could be eluted by acid, thus eliminating use of org. solvents and permitting immediate re-use of the prepd. adsorbent. Similarly cationic surface-active agents could be used as primary adsorbate to prep. adsorbents for acids or anions.

4668. WHITE, JONATHAN W. JR. AND DRYDEN, EDWIN C. **Separation of aliphatic alcohols by chromatographic adsorption of their 3,5-dinitrobenzoates.** *Anal. Chem.* **20**, 853-5 (1948).—*C.A.* **43**, 67*i*.
Forty pairs of the 3,5-dinitrobenzoates of aliphatic alcs. (C_1 to C_6) were subjected to chromatographic adsorption. Under ultraviolet radiation, bands of adsorbed nonfluorescent material

resulted in an absence or diminution of fluorescence. Silicic acid, pretreated with rhodamine 6G, was used as adsorbent, hexane as sample solvent, 5% ether in hexane for development and ether for elution. The degree of sepn. possible varied.

4669. ZECHMEISTER, L. **Sterochemistry and chromatography.** *Ann. N. Y. Acad. Sci.* 49, 220-34 (1948).—*C.A.* 42, 5300*f*.

The sepn. of optical antipodes and diastereoisomers with optically active and inactive adsorbents was reviewed, including the behavior of *cis-trans* isomers towards various adsorbents as a function of the structure of the isomers.

4670. ALEXANDER, GUY B. **The chromatographic separation of perrhenic and molybdic acids.** *J. Am. Chem. Soc.* 71, 3043-6 (1949).—*C.A.* 43, 8794*b*.

The equil. adsorption of perrhenic and molybdic acids on Norit approached the exchange isotherm behavior in the range studied. There was sufficient difference in the adsorption characteristics of perrhenic and molybdic acids to permit a quant. chromatographic sepn. of these compds. with 1.95 *N* H_2SO_4 as the solvent and developing agent and Norit as the adsorbent.

4671. BACH, RICARDO O. **Attempts at inorganic chromatography. I. Estimation of small quantities of cupric ion.** *Anales asoc. quim. argentina* 37, 55-68 (1949).—*C.A.* 43, 7859*e*.

Cu^{++} was studied by chromatographic absorption on ZnS. The sample (alloy or mineral) was treated by the usual methods; the insol. matter filtered off, and the filtrate contg. Cu^{++} was neutralized and made slightly ammoniacal. The pH was adjusted to 5 with AcOH. Ten to 25 cc. of soln. contg. 0.1 to 1.0 mg of Cu^{++} was dild. to a convenient vol. and passed through the column. Cu, when present in alloys to the extent of 0.01 to 1.0%, could be detd. by this technique. Mixts. of salts of Hg, Ag, Bi, and Cu were successfully sepd. into 4 zones.

4672. BACH, RICARDO O. **Attempts at inorganic chromatography. II. Estimation of small amounts of cadmium ion in the presence of zinc and copper ions.** *Anales asoc. quim. argentina* 37, 69-78 (1949).—*C.A.* 43, 7859*f*.

Cd^{++} could be adsorbed chromatographically on ZnS. In an ammoniacal cyanide soln. 1.0 mg of Cd could be detected in the presence of Zn and Cu. This technique was successfully applied to minerals and alloys contg. 0.01 to 1.0% Cd by first removing Fe, Mn, etc., by the usual methods.

4673. BELL, D. J. AND PALMER, ANNE. **Quantitative analysis of mixtures of 1,3,4,6-tetramethyl-, 1,3,4-trimethyl-, and 3,4-dimethylfructoses by partition chromatography.** *J. Chem. Soc.* 1949, 2522-5; *Nature* 163, 846 (1949).—*C.A.* 44, 8285*i*; 43, 6947*d*.

The sepn. was carried out on a silica-water column. An aq. soln. of the sugars was extd. with $CHCl_3$, the $CHCl_3$ replaced by toluene soln. applied to the column. The first compd. was eluted with toluene contg. 0.33% EtOH, the second with $CHCl_3$ contg. 5% BuOH, and the third with MeOH. The H_2O phase from the original extn. was evapd. and the residue dissolved in $CHCl_3$. This soln. was applied to the column. The second compd. was eluted with $CHCl_3$ contg. 0.5% BuOH.

4674. BILLE, R. **Aromatic adsorption index for chromatographic adsorbents.** *Svensk Kem. Tid.* 61, 141-5 (1949).—*C.A.* 44, 313*i*.

The index depended upon the ability of the adsorbent to adsorb selectively aromatic hydrocarbons from a hydrocarbon mixt. The test was as follows: A sample (3 g) of adsorbent, predried at 150°C for 2 hrs, was shaken with 10 ml of a 50-50 mixt. by vol. of heptane and toluene for 30 min. in an adsorption vessel. The aromatic adsorption index was the difference between the *n* of the original hydrocarbon mixt. and that of the hydrocarbon mixt. after contact with the adsorbent multiplied by 10^4.

4675. BROCKMANN, HANS. **Chromatography of colorless substances and the relation between constitution and adsorption affinity.** *Discussions Faraday Soc.* 1949, No. 7, 58-64.—*C.A.* 44, 9772*b*.

Adsorption of *p*-substituted stilbenes from CCl_4 soln. and of *p*-substituted azobenzenes from C_6H_6 soln. gave the same order of adsorption affinity with complete sepn. possible of adjacent compds. The functional groups in order of decreasing affinity were COOH, $CONH_2$, OH, NH_2, COOMe, NMe_2, NO_2, OMe, H. Variation in H_2O content yielded bentonite in 5 grades of activity, SiO_2, $CaSO_4$, and MgO in 3 grades, and $CaCO_3$ in 2 grades.

4676. BROCKMANN, HANS AND VOLPERS, FRITZ. **Chromatographic adsorption. IV. Separation of colorless substances with fluorescent adsorbents.** *Chem. Ber.* 82, 95-103 (1949).—*C.A.* 44, 900*f*.

The chromatographic adsorption of colorless compds. was made visible by the use of fluorescent adsorbents. The effect of functional groups on the adsorption affinity was examd. and a new process for the prepn. of fluorescent adsorbents described. In the first expts. an Al_2O_3 was used with certain heavy heavy metals added to produce fluorescence. The adsorbed particles were to a certain degree transparent to UV, particularly if *n* of the solvent was similar to the adsorbed particles. The outermost layer of an adsorption column then formed a more or less transparent cover through which a part of the UV could penetrate to the inner layers of the column and, vice versa, the fluorescent light originating here could penetrate outward.

4677. BURRIEL, F. AND PEREZ, F. PINO. **Application of chromatographic technique in the detection of traces of nickel.** *Anales real soc. espan. y quim.* 45B, 749-56 (1949); *Anal. Chim. Acta* 3, 468-75 (1949).—*C.A.* 44, 3837*i*, 10584*b*.

On passing unknown solns. through a small column filled with dimethylglyoxime, small amts. of Ni^{++} were detected in the presence of a large excess of disturbing ions. One hundred γ Ni^{++} in 1000, 2000, and 5000 times as much Co^{++} in neutral soln. produced, after washing, characteristic red fringes in a column 7 mm diam. × 30 mm packed with 0.2 g dimethylglyoxime + 1 g $CaCO_3$ mixt. In neutral soln. 2γ Ni^{++} alone was detected positively;

1γ, uncertainly. Two-tenths γNi^{++} in 10,000 times as much Co^{++}, in 10% ammonia soln., was clearly seen in a column 4 mm diam. × 15 mm filled with dimethylglyoxime.

4678. Cassidy, Harold G. and Nestler, F. H. Max. **Chromatography of the carboxylic acids.** *Discussions Faraday Soc.* **1949**, No. 7, 259-64.--*C.A.* 45, 1840*b*.

The principles and chief methods of application of chromatography as used in the sepn. of fatty acids were discussed. The application of elution analysis, frontal analysis, displacement analysis and partition chromatography were reviewed.

4679. Claesson, Stig. **Adsorption analysis of high-molecular substances.** *Arkiv Kemi, Mineral. Geol.* **26A**, No. 24, 29 pp. (1949) (in English).—*C.A.* 43, 6037*h*

Chromatographic adsorption analysis was made with charcoal as adsorbent. More peaks were shown on a distribution curve than ultra-centrifuge studies on the same material. The rate of adsorption and amt. adsorbed were low and the amt. adsorbed decreased with increasing mol. wt. Frontal analysis of very dil. solns. with large filters with the adsorbent and a flow rate of low was the best procedure for analytical purposes. Theoretical considerations indicated that the frontal analysis diagrams extrapolated to zero concn. gave an upside down picture of the wt-distribution function. The expts. were done with polymethyl methacrylate and nitrocellulose at various concns. in acetone and in acetone-methanol mixts.

4680. Claesson, Stig. **High-molecular-polymer separation.** *Discussions Faraday Soc.* No. 7, 321-5 (1949).—*C.A.* 44, 7620*b*.

The difficulties assocd. with chromatographic sepn. of high-mol. substances were discussed. Normally, the rate of adsorption was low, requiring an extremely low flow-rate to reach equil. Curves of very dil. solns. in Me_2CO of polymethyl methacrylate and polyvinyl acetate obtained by frontal analysis on Carboraffin-Supercel provided information about the mol.-wt distribution that agreed well with results obtained by other methods.

4681. Cook, A. H. **Chromatographic separation of natural compounds.** *Nature* **164**, 300-2 (1949).—*C.A.* 43, 8234*e*.

Chromatography did more than any other experimental advance to overcome the difficulties of isolating less abundant substances.

4682. Cuckow, F. W.; Harris, R. J. C., and Speed, F. E. **Simple fraction-collecting machine for chromatographic analysis.** *J. Soc. Chem. Ind.* (London) **68**, 208-9 (1949).—*C.A.* 43, 8756*a*.

Successive small fractions of the percolate from a chromatographic column were collected by the machine which had 60 stations. The app. was activated by a clock mechanism and solenoid arrangement and collected each sample according to a predetd. time.

4683. d'Ans, Jean and Heinrich, Gisela. **Chromatography of electrolytes.** *Naturwissenschaften* **36**, 317-18 (1949).—*C.A.* 44, 5757*c*.

Columns of Brockmann Al_2O_3 were treated with excess metal salt soln. (0.1 to 0.8 molar), the soln. removed with little water, and the ions removed with 10% HCl. Cation and anion were detd. in the eluted material. A few quant. results are given. Although two Al_2O_3 materials had practically equal Na content, a Merck product retained more ions than a Riedelde Haen product.

4684. Dunabin, J. E.; Mason, H.; Seyfang, A. P., and Woodman, F. J. **Spectrographic examination of chromatographic columns.** *Nature* **164**, 916 (1949).—*C.A.* 44, 2403*i*.

With Al_2O_3 as adsorbent, the dithizone complexes of a no. of metals were sepd. chromatographically and sections were examd. with an ultraviolet spectrograph. Quantities of Cd between 0.1 and 0.5γ could be detd. with a standard deviation of 10%. This represented concns. of 0.02 to 0.1 p.p.m. on a 5-g sample.

4685. Fisher, R. B.; Parson, D. S., and Holmes, R. **Chromatographic analysis.** *Nature* **164**, 183 (1949).—*C.A.* 43, 8298*h*.

The partition of substances between aq. and nonaq. phases affected the distribution of substances around the center of the spot. These spots were usually markedly elliptical.

4686. Gapon, E. N. **Aluminum oxide for chromatographic analysis.** *Zavodskaya Lab.* **15**, 126 (1949).—*C.A.* 43, 5328*a*.

A suspension of $Al(OH)_3$ (1 g/10 ml) in water must have pH 6-6.3 to be satisfactory for chromatography. Ignition at 900-1000°C for 4-5 min. was recommended. The product was suitable for cation analysis; for anion analysis it must be treated with *N* HNO_3 or $HClO_4$.

4687. Gapon, E. N. and Gapon, T. B. **Chromatography of ions. I. Theory of chromatometry.** *Zhur. Obshchei Khim. (J. Gen. Chem.)* **19**, 1627-34 (1949); *J. Gen. Chem. U.S.S.R.* **19**, No. 9, a49-57 (1949) (English translation).--*C.A.* 44, 1778*g*, 6230*h*.

In the case of pure cation exchange, the length of the zone of the i th ion in an ideal ion-exchange chromatogram should be proportional to the concn. of the ion and to the vol. v of soln. passed. The linear adsorption capacity Q was defined by $Q= gS/L$ (mg equiv.)/cm, L being the length of the column in cm, g its wt, S the amt. of the exchange ion (mg equiv.)/g; in terms of the diam. d of the tube (cm) and the bulk wt of the adsorbent W (g/ml), $Q=d^2WS/4$. In expts. with Al_2O_3 and 0.1 *N* solns. of $CuCl_2$ and $Co(NO_3)_2$ 1:1 vol., both the upper Cu^{++} and the lower Co^{++} zone increased in length linearly with the v.

4688. Gapon, T. B. and Gapon, E. N. **Chromatographic analysis of ions. II. Exchange cationic chromatograms of Cu^{++}-Co^{++} and Co^{++}-Ni^{++}.** *Zhur. Anal. Khim.* 4, 131-5 (1949).—*C.A.* 44, 2820*g*.

By passing a soln. contg. equal amts. of Cu^{++} and Co^{++} through an adsorption column, the relation between the length of the zone (L) occupied by a cation and the vol. of soln. (v) used was found to be $L= av+ B$, where a and B were consts. An ideal chromatogram was defined as one consisting of clearly defined zones each of which contained only one ion, and the voids were filled with soln. contg. only the ions displaced from the adsorbent. Co and Ni were effectively sepd. by using a specially prepd. adsorbent. The latter was obtained by mixing carefully prepd. 2% solns. of Na aluminate and Na silicate.

4689. GLUECKAUF, E. **Theory of chromatography. VI. Precision measurements of adsorption and exchange isotherms from column elution data.** *J. Chem. Soc.* 1949, 3280-5.—*C.A.* 44, 9771*d*.

The elution of 250-mesh Na-"Dowex 50" was studied with 0.2 *N* HCl at a flow rate of 0.00175 cm per sec. The no. of theoretical units in the column was detd. by elution of the column contg. Na^{24} with 0.2 *N* $Na^{23}Cl$. Reliable adsorption data could be obtained even with disturbance of the rear boundary by diffusion and nonequil. phenomena.

4690. GLUECKAUF, E.; BARKER, F. H., AND KITT, G. P. **Theory of chromatography. VIII. The separation of lithium isotopes by ion exchange and of neon isotopes by low-temperature adsorption columns.** *Discussions Faraday Soc.* 1949, No. 7, 199-213.—*C.A.* 44, 9771*f*.

In the sepn. of Li^7 the enrichment was less than expected. The sepn. of Li isotopes was studied with *N* AcOLi on Zeo-Karb H.I. with a diffusion coeff. of about 10^{-6} cm^2 per sec and a grain size of 0.015 mm diam. at a flow rate of 0.0004 ml per sec. The sepn. of Ne isotopes on charcoal at -196°C was also studied to test predictions by the theory. The method was not adapted to isotope sepn. in bulk when the sepn. factor was small.

4691. GOETZ-LUTHY, NYDIA. **Separation of primary, secondary, and tertiary amines by chromatographic adsorption analysis.** *J. Chem. Education* 26, 271-2 (1949).—*C.A.* 43, 6113*a*.

Mixts. (mg quantities) of 2-aminoquinoline, with the methyl and di-methyl derivatives were sepd. quantitatively with an activated alumina column.

4692. HELLSTRÖM, NILS AND BORGIEL, HENRYK. **Chromatography.** *Acta Chem. Scand.* 3, 401-7 (1949).—*C.A.* 44, 5651*c*.

An app. which recorded on a photographic paper changes in refractive power of a soln. leaving a filter vs. the amt. of soln. was discussed.

4693. HOUGH, L.; JONES, J. K. N., AND WADMAN, W. H. **Quantitative analysis of mixtures of sugars by the method of partition chromatography. IV. Separation of the sugars and their methylated derivatives on columns of powdered cellulose.** *J. Chem. Soc.* 1949, 2511-16.—*C.A.* 44, 1853*d*.

Simple sugars in admixt. were sepd. on a semimicro-scale by the use of columns of powd. cellulose. A full description was given of an automatic receiver changer. By these means the following mixts. were sepd. nearly quantitatively into their components: rhamnose, arabinose, ribose and galactose, and 2,3,4,6-tetramethyl-, 2,4,6-trimethylglucose, 2,4-dimethylxylose, and 2,4-dimethylgalactose.

4694. JENSEN, WALDEMAR. **Chromatographic analysis of tall oil.** *Finnish Paper Timber J.* 31, 225-7 (1949)(in English).—*C.A.* 43, 9442*c*.

Quant. analysis for neutral components of raw or distd. tall oil was carried out by chromatography of 1-g samples on 20-25 g of Al_2O_3 in a 20-mm-diam. tube, with dry Et_2O or petroleum ether (b. 42-52°C) as solvent. The neutral components were quantitatively eluted with 200 ml Et_2O or 600 ml petr. ether, except that in the latter case the phytosterol remained adsorbed on the column.

4695. KAJANNE, PAAVO. **Reactivation of adsorptive alumina (spent in organic chromatography).** *Acta Chem. Scand.* 3, 639-43 (1949) (in English).—*C.A.* 44, 971*b*.

Successful reactivation was obtained by allowing spent Al_2O_3 to trickle down an inclined quartz tube, heated to 700°-800°C by a thermal element, against a brisk countercurrent of O_2. Under proper conditions a first class Al_2O_3, with negligible elutable material, was obtained.

4696. KOFLER, W. **Separation and purification of organic compounds by means of sublimation through adsorptive substances.** *Monatsh.* 80, 694-701 (1949).—*C.A.* 44, 3407*b*.

An app. was described whereby impure compds. or a mixt. could be heated generally below their m.ps. and sublimed under reduced pressure and by means of a "carrier gas" were passed through a column of an adsorptive substance maintained at the same temp. The sepn. was effected as with a chromatogram.

4697. LEVI, ALFRED A. **Methods for extending the scope of partition chromatography.** *Discussions Faraday Soc.* 1949, No. 7, 124-8.—*C.A.* 47, 4167*g*.

The technique of partition chromatography could be extended to mixts. of substances with limited solubilities in H_2O: (1) by using as stationary phase a solvent immiscible or only partly miscible with the flowing phase; (2) by using as stationary phase a substance that reacts reversibly with some of the components of the mixt.; (3) by applying the technique of displacement development.

4698. MARTIN, MONIQUE; YANG, JENG-TSONG, AND DAUDEL, PASCALINE. **Application of radioactivity to the study of chromatographic analysis.** *Anal. Chim. Acta* 3, 222-5 (1949) (in French).—*C.A.* 43, 8271*d*.

The fixation of Cl^-, Br^-, and I^- ions on Al_2O_3 chromatographic columns was studied by means of radioactive elements and a Geiger counter. The masses of ions adsorbed were roughly proportional to their at. wts, and their nos. were not sensibly dependent upon their natures. Cl^- ions were much more easily washed out than Br^- ions, and the latter were a little more readily eluted than I^- ions. This order was the same as with the Amberlites.

4699. MEINHARD, JAMES E. AND HALL, NORRIS F. **Surface chromatography.** *Anal. Chem.* 21, 185-8 (1949).—*C.A.* 43, 2114*i*.

Mix 3.5 g of Celite+ 6.2 g of reagent Al_2O_3 with 18 ml of water. Heat, with stirring, on the steam bath until coagulation is complete. Allow to cool, triturate with 2.5 ml more of water, apply the creamy mixt. to some of the surface of microscope slides and spread to a depth of 2 mm.

Dry in a dust-free atm. Add the sample of soln. to the surface by means of a capillary pipet. Develop with water of suitable solvent and ripen with a gas such as NH_3, H_2S, or I_2. Ripening can also be accomplished with a dye soln.

4700. NIJKAMP, H. J. **The chromatographic determination of the short-chain volatile fatty acids.** *Chem. Weekblad* 45, 480-2 (1949).—*C.A.* 44, 977*e*.

The silica gel (400 mg) was triturated with 0.08 cc. 0.2 *N* NaOH and 0.08 cc. 0.4% bromocresol green soln. The mixt. was rinsed with several small portions CCl_4 in 6 vols. of BuOH, which had been allowed to stand in contact with water. The gel settled in the glass into a column about 3.5 cm high. Since the volatile fatty acids possessed different distribution coeffs., the mixt. formed several bands. The acid from each band was titrated with 0.01 *N* NaOH.

4701. OVENSTON, T. C. J. **Chromatography in an explosives laboratory.** *J. Soc. Chem. Ind.* 68, 54-9 (1949).—*C.A.* 43, 5593*d*.

Silica gel admixed with Celite 535 was found to be the most suitable adsorbent for the study of propellants and high explosives. Light petr. ether mixed with acetone, benzene, or ethyl ether was used for chromatogram development. Adsorption series with these solvents were given for a no. of the compds. studied. The streak tests used to locate zones of colorless compds. on the extruded column were described.

4702. OVENSTON, T. C. J. **Chromatographic examination of propellant explosives.** *Analyst* 74, 344-51 (1949).—*C.A.* 43, 8138*i*.

There were 24 ether-sol. ingredients which could be sepd. and identified by chromatography. For all except mineral jelly, a good adsorbent was a mixt. of silica gel and Celite 535. The developing solvents were usually light petroleum (b.p. 40-50°C) mixed with C_6H_6 or Et_2O.

4703. PARTRIDGE, S. M. AND WESTALL, R. G. **Displacement chromatography on synthetic ion-exchange resins. I. Separation of organic bases and amino acids using cation-exchange resins.** *Biochem. J.* 44, 418-28 (1949).—*C.A.* 43, 8806*h*.

"Zeo-Karb 215" was used in a packed column and a mixt. of amino acids resolved into a series of fractions. Each contained ampholytes of similar isoelec. point, but a difference of 0.5-1.0 pH unit was required to effect a useful sepn. between any 2 components. Fine grinding was found to be essential for the production of wide bands. Generally, resins graded between 40 and 60 mesh/inch were found satisfactory.

4704. PINTEROVIC, ZVONIMIR. **Inorganic Chromatography. II. Adsorption of tin on a column of alumina.** *Bull. soc. chim. Belges* 58, 522-7 (1949).—*C.A.* 44, 9771*i*.

A suspension of Al_2O_3 in H_2O, previously heated to remove air, was used to fill a 25-cm tube, 2.7-6.0 mm in diam. For Sn the best chromatographs were obtained by reacting Sn (excess) with HCl; this soln. was added to the tube previously impregnated with 0.375 *N* HCl; the tube was rinsed with H_2O and developed with H_2S soln. The order of adsorption was Bi^{3+}, Sb^{3+}, Sn^{4+}, Sn^{2+}, and As^{3+} for a soln. contg. 50-500 mg of these in 100 cc. of 10% tartaric acid.

4705. ROBINSON, G. **Separations of 8-hydroquinoline columns.** *Discussions Faraday Soc.* 1949, No. 7, 195-8.—*C.A.* 45, 20*d*.

Zn was sepd. from a Cu-Ni-Zn alloy by use of a 10-cm column of 60-mesh 8-hydroxyquinoline and starch and a wash soln. of 5% NaOAc. Application to steel analysis was unsatisfactory owing to interference from Fe, although Mo, Mn, Ni, and V gave characteristic bands. Further applications were hindered by difficulty of distinguishing the yellow bands of other elements.

4706. SACCONI, LUIGI. **Inorganic chromatographic adsorption. II. The buffer action of active alumina surfaces.** *Gazz. chim. ital.* 79, 141-52 (1949).—*C.A.* 43, 8293*i*.

Chromatographic adsorption of cations on alumina was hydrolytic, and depended primarily on the surface buffer action of the Al_2O_3 itself. A study of Al^{+++}, Pb^{++}, Cu^{++}, and Fe^{+++} (nitrates) ions on a column of active Al_2O_3, with NH_4 aurintricarboxylate as developing agent, showed that Al and other ions were adsorbed together at the head of the column. Al ions liberated from the Al_2O_3 were then absorbed whenever a soln. of an acid or a soln. of Pb, Cu, or Fe was passed through the column. The adsorption of cations on Al_2O_3, with deposition of basic compds., depended on a decrease in H-ion concn. by the Al_2O_3 functioning as surface buffering agent.

4707. SACCONI, LUIGI. **Inorganic chromatographic adsorption. III. Influence of ionic hydration on chromatographic adsorption. Chromatography of complex cobaltiamminic compounds.** *Gazz. chim. ital.* 79, 152-64 (1949).—*C.A.* 43, 8295*b*.

Adsorption of cobaltiammino complexes was governed chiefly by the dimensions and polarizability of their coordinated radicals; ionic hydration was a fundamental factor in the adsorption of cations on Al_2O_3. Eight complexes were prepd. Since ion adsorption on Al_2O_3 involved the preferential adsorption of H_2O mols. polarized by aquo ions, forms of Al_2O_3 having the highest adsorptive capacity had the greatest tendency to become hydrated.

4708. SACCONI, LUIGI. **Surface buffer action of alumina in inorganic chromatography.** *Nature* 164, 70-1 (1949).—*C.A.* 43, 8234*d*.

The mechanism of inorg. chromatographic adsorption on activated Al_2O_3 was discussed. Detns. of the heats of hydration on tech. and pure Al_2O_3 showed that inorg. chromatographic adsorption was based mainly on the preferential adsorption for polarized H_2O of aquo ions.

4709. SACCONI, LUIGI. **The mechanism of inorganic chromatographic adsorption on alumina.** *Discussions Faraday Soc.* 1949, No. 7, 173-9.—*C.A.* 45, 20*c*.

The adsorption of inorg. salts on alumina was regarded as a hydrolytic adsorption followed by Al^{+++}-H^+ or Na^+-H^+ ion exchange. Adsorbability was proportional to the polarizing power of the ions and the polarizability of groups coordinated to the ions. Hydrated ions were adsorbed strongly because of the orientation of the coordinated H_2O groups.

4710. SCHROEDER, W. A.; MALMBERG, EARL W.; FONG, LAURA L.; TRUEBLOOD, KENNETH N.; LANDERL, JANET D., AND HOERGER, EARL. **Chromatographic investigations of smokeless powder. Derivatives of diphenylamine formed in double-base powders during accelerated aging.** *Ind. Eng. Chem.* 41, 2818-27 (1949).—*C.A.* 44, 1707*c*.

Chromatographic and spectrophotometric analyses were used to study the reaction products formed from the stabilizer, diphenylamine, during accelerated aging (at 71°C) of a double base powder, JP204. The structure of the various compds. affected their chromatographic properties on silicic acid; the position of the nitro group affected the adsorption affinity.

4711. SCHWAB, GEORG-MARIA. **Nature and applications of inorganic alumina chromatography.** *Discussions Faraday Soc.* 1949, No. 7, 170-3.—*C.A.* 45, 60*c*.

Absorption spectra of chromatographic bands on alumina showed that the bands contained basic aluminates. Chromatography was applicable to qual. analysis in conjunction with the usual group sepns. Except Al, all members of the $(NH_4)_2S$ group were separable in one operation.

4712. SCHWAB, GEORG-MARIA AND GHOSH, AMALENDRA NARAYAN. **Chromatographic separation and x-ray identification of platinum metals.** *Z. anorg. chem.* 258, 323-31 (1949).—*C.A.* 43, 8304*d*.

The chromatographic sepn. of the Pt metals from chloride solns. upon basic Al_2O_3 columns was studied; $RuCl_3$ was unsuitable because of its hydrate isomerism and hydrolysis for chromatographic purposes, but with Ir and Rh chlorides the difficulty was overcome. The complex chlorides of Ir-Pt-Pd-Rh were adsorbed in that order. The Pt metals were sepd. easily from other metals with the exception of Fe.

4713. SEASE, JOHN W. **Location of colorless chromatographic zones with an ultraviolet-sensitive multiplier phototube.** *Anal. Chem.* 21, 1430-1 (1949).—*C.A.* 44, 2891*a*.

The position of colorless compds. in a chromatographic column was detected by illuminating the column with a narrow slit of ultraviolet light and measuring the intensity of the scattered light with a 1P28 multiplier phototube. Decreases in photo-current indicated the zones.

4714. SHEARON, WILL H. JR. AND GEE, OWEN F. **Carotene and chlorophyll. Commercial chromatographic production.** *Ind. Eng. Chem.* 41, 218-26 (1949).—*C.A.* 43, 5543*f*.

The chopped, dehydrated alfalfa was extd. with hexane in a 2 stage process, and the concd. ext. selectively adsorbed in towers filled with activated charcoal. The concentrate was pumped into the towers from the bottom; the chlorophyll, adsorbed most readily, formed the lowest band, followed by xanthophyll and carotene. When carotene first appeared in the eluate at the top, pumping of the crude was stopped, and the carotene fraction was eluted by feeding fresh hexane into the bottom of the tower. The xanthophyll was similarly eluted with hexane-iso-PrOH, but for elution of the chlorophyll, the flow of liquid was reversed and the eluant (hot C_6H_6-iso-PrOH) was pumped in at the top of the tower.

4715. SHEPARD, CHARLES C. AND TISELIUS, ARNE. **The chromatography of proteins. The effect of salt concentration and pH on the adsorption of proteins on silica gel.** *Discussions Faraday Soc.* No. 7, 275-85 (1949).—*C.A.* 44, 7619*f*.

Adsorption of proteins on silica gel was studied in batch expts. and on chromatographic columns. In the batch expts. 0.1% protein soln. was carefully shaken with weighed amts. of the gel for 30 min. avoiding denaturation, the adsorbent was centrifuged off, and the residual protein in soln. detd. by absorption at 278 mμ. For expts. at different pH, the gel was suspended in H_2O, the desired pH adjusted with HCl or NaOH, the suspension centrifuged and dried at 105°C. The effect of salt concn. on the adsorption of proteins was studied with buffer solns. The max. amt. of adsorption of albumins and globulins was about the same, but with serum albumin and ovalbumin max. adsorption was seen only with high salt concns.

4716. SHIBATA, MURAJI. **The chromatographic adsorption of metallic ions.** *Science* (Japan) 19, 570-1 (1949).—*C.A.* 45, 7845*f*.

When an aq. soln. of metallic ions was allowed to pass through a layer of Al_2O_3, chromatographic adsorption occurred in the following order: Bi^{2+}, Fe^{3+}, Hg^{2+}, Pb^{2+}, Cu^{2+}, Zn^{2+}, Co^{2+}, Cd^{2+}, Ni^{2+}, Fe^{2+}, and Mn^{2+}. It was assumed that the ions were adsorbed by the electrostatic forces on the uniformly charged surface of the Al_2O_3. When the values $-Ze^2/R$ were calcd., with the radius of hydrated ion as R, their order of magnitude agreed well with the order of the chromatographic adsorption.

4717. SRIKANTAN, B. S. AND KRISHNAN, V. **Chromatographic estimation of alloys.** *J. Indian Chem. Soc.* 26, 415-18 (1949).—*C.A.* 44, 2890*c*.

Optimum condition for the estn. of Cu in brass and bronze were exptly. detd. Freundlich's equation was modified to get an expression relating the length of the adsorbed column to the quantity of the metal ion. The equation was $C_1/C_2{}^{1/n} = h_1/h_2$, where h_1 and h_2 were the lengths of the chromatograms at concns. C_1 and C_2, resp.; n had to be detd. experimentally for each cation.

4718. STEIN, WILLIAM H. AND MOORE, STANFORD. **Amino acid composition of β-lactoglobulin and bovine serum albumin.** *J. Biol. Chem.* 178, 79-91 (1949).—*C.A.* 43, 5812*i*.

Hydrolyzates of β-lactoglobulin and bovine serum albumin were analyzed chromatographically using starch columns.

4719. STEWART, A. **The function of adsorbent activity in the chromatographic separation of certain anthraquinone compounds.** *Discussions Faraday Soc.* 1949, No. 7, 65-79.—*C.A.* 44, 10446*i*.

The mean relative movements of adsorption bands of the substituted anthraquinone compds., 1-chloro, 1-methylamino, 1-amino, 1-dimethylamino, 1-amino-

4-methyl, 2-amino, 1,4-diamino, and 1,4,5-triamino were detd. as a function of H_2O deactivation of activated Al_2O_3 and $MgCO_3$. Weakly adsorbed compds. showed a max. increase at low H_2O addns., whereas strongly adsorbed compds. showed the increase at higher H_2O addns.; these facts permitted control of the band movement. The latter was practically independent of activating temp. of $Al(OH)_3$ dehydrated from 250° to 550°C.

4720. Tanaka, Minoru; Ashizawa, Takashi, and Shibata, Muraji. **Chromatography for inorganic compounds.** *Chem. Researches* (Japan) 5, *Inorg. and Anal. Chem.*, 35-52 (1949).—*C.A.* 43, 8945*h*.

Use an Al_2O_3 column at pH 7.6, moistened with a little 48% EtOH and add the soln. to be tested. Wash with H_2O and develop by the addn. of $(NH_4)_2S$. This gave the characteristic color of ions at different layers. By combination of dithizone analysis and chromatography, the presence of Co 0.001 γ, Ni 0.001 γ, An 0.000 γ, Cu 0.05 γ was measured.

4721. Trueblood, Kenneth N. and Malmberg, Earl W. **Chromatographic properties of silicic acid-celite.** *Anal. Chem.* 21, 1055-8 (1949).—*C.A.* 43, 8945*i*.

Seven com. samples of SiO_2 were investigated by mixing 1.75 parts (based on the wt after removal of free water) with 1 part of celite. Free water was detd. by heating to 200°C and structural water by igniting. 4-nitrotriphenylamine and ethyl centralite were used to compare the relative adsorptive strengths of the samples. After prewashing with 0.2 V ml of ether, V ml of 1:1 acetone-ether, 0.8 V ml of ether, V ml of ligroin, and 0.2 V ml of the solvent used as developer (V= vol. required to wet column completely), 5 of the 7 samples had very similar adsorptive powers. Existing differences could be correlated with the content of structural water. Complete removal of structural water led to loss of adsorptive strength.

4722. Venturello, Giovanni and Saini, Guido. **Chromatographic separations of the metals in the platinum group.** *Ann. chim. applicata* 39, 375-80 (1949).—*C.A.* 45, 8398*e*.

The chromatographic sepns. were effected by adsorbent columns of alumina and the following reagents: Benzidine gave ppts. of various colors with all the elements of the Pt group. Sodium sulfide, showed the Rh. Thiourea indicated Os when Ir was present. Thiobarbituric acid showed the presence of Rh.

4723. Wolfarth, J. S. and Glenn, R. A. **Chemical nature of coal hydrogenation products. III. Further chromatographic resolution of band III-IV oil on alumina.** *Fuel* 28, 253-7 (1949).—*C.A.* 44, 305*a*.

Chromatograph on alumina of the pentane-soluble fraction resolved this material into at least 7 distinct fractions. The sequence of adsorption, in contrast to that on silica gel, was determined primarily by the total O-and N-contents of the compds. present instead of their acetylability. Investigation of the chromatographic fractions after acid and alkali extn. showed the major part of the O-recovered to be in an inert form such as an aromatic or cyclic ether and also that the major part of the N was probably in a fused pyrrole ring.

4724. Yanovskiĭ, M. I. **Theory of chromatography on nonhomogeneous surfaces. Calculation of the maxima of desorption curves from the distribution functions of surface portions over heats of adsorption.** *Doklady Akad. Nauk S.S.S.R.* 69, 655-7 (1949).—*C.A.* 45, 6457*c*.

The distribution function $p(Q) = ds/dQ$ over heats of adsorption Q on a surface s, is related to the chromatographic parameters by $p(Q) = vc/M\chi RT$ (M= wt of unit length of the sorbent column).

4725. Zechmeister, L. **Adsorption and some constitutional and steric properties.** *Discussions Faraday Soc.* 1949, No. 7 54-7.—*C.A.* 44, 9769*h*.

The orientation of mols. in the fixation of org. mols. on an adsorbent was detd. by certain groups designated as "anchoring groups." For α-carotene, β-carotene, and γ-carotene, the stereoisomer contg. a single, peripherally-located *cis* double bond was adsorbed above the corresponding all-*trans* compd., whereas both of these essentially straight types were adsorbed more strongly than the spatial forms having a centrally-located *cis* double bond.

4726. Bach, Ricardo O. **New experiments on inorganic chromatography.** *Industria y química* (Buenos Aires) 12, 283-6, 301 (1950)—*C.A.* 45, 7463*h*.

Good results were obtained with org. media, on activated Al_2O_3. $Fe(CNS)_3$ and $Co(CNS)_2$ dissolved in Et_2O could be sepd. by washing with Et_2O, the Fe zone remaining fixed, and the Co zone being slowly displaced downward. In C_6H_6 soln. the Co^{2+} compd. of *β-nitrosonaphthol* could be sepd. on an activated Al_2O_3 column from the corresponding Fe^{2+} and Cu^{2+} compds., but the 2 latter decomp. more or less rapidly, and only the Co compd. could be recovered by prolonged washing.

4727. Beroza, Morton. **Chromatographic separation employing ultraviolet absorbancy ratios.** *Anal. Chem.* 12, 1507-10 (1950).—*C.A.* 45, 2813*b*.

Impurities were detd. in chromatographic zones by subjecting a systematic collection of chromatographic fractions to a detn. of ultraviolet absorbency ratios. The method was used for the sepn. of alkaloids from a mixt.

4728. Boldingh, J. **Fatty acid analysis by partition chromatography.** *Rec. trav. chim.* 69, 247-61 (1950).—*C.A.* 44, 6348*h*.

Natural and synthetic elastomers were used as carriers for the immobile solvent in partition chromatography. With systems contg. benzene absorbed in vulcanized *Hevea* rubber and with a strong polar solvent as the mobile phase, a straight quant. micro detn. of the satd. *n*-fatty acids from C_6 to C_{18} could be made. Hydroxy fatty acids also were readily sepd. from their mixts. with *n*-fatty acids.

4729. Booth, V. H. **Apparatus for pressure and suction regulation in chromatographic columns.** *Analyst* 75, 109-11 (1950).—*C.A.* 44, 4728*d*.

The simplest expedient was to lead a gas under pressure through a stopper at the top of the chromatographic tube. A simple app. was shown of which the upper part served to apply gas pressure and the lower part for the control of suction.

4730. Brumberg, E. M.; Berezhnaya, I. N.; Dutkinskiǐ, V. P., and Manoǐlov, S. E. **The use of ultraviolet light in chromatographic analysis with the adsorption column.** *Doklady Akad. Nauk S.S.S.R.* **74**, 747-50 (1950).—*C.A.* **45**, 8391*i*.

As the eluate came off the column, it passed between an ultraviolet source and a fluorescent screen; this permitted visual or photoelec. monitoring of any solutes which absorbed the light exciting the fluorescence.

4731. Burma, D. P. and Banerjee, B. **Preparation and standardization of aluminum oxide from the locally available aluminum hydroxide for chromatographic separation.** *Science and Culture* **15**, 442-3 (1950).—*C.A.* **44**, 9770*c*.

Five grades of activated Al_2O_3 were prepd. from locally available granular aluminum hydroxide of grain size of 100-200 mesh. The effectiveness of the different grades was checked by the use of azobenzene, p-methyoxybenzene, Sudan yellow, Sudan red, p-aminoazobenzene, p-hydroxyazobenzene, and Minosa hormone. Directions were outlined.

4732. Craig, Lyman C. **Partition chromatography and counter-current distribution.** *Anal. Chem.* **22**, 1346-52 (1950).—*C.A.* **45**, 911*i*.

The design and operation of a completely automatic, 220-cell, glass distribution train was briefly described. Exptl. distribution patterns of mixtures of amino acids and of fatty acids, obtained from this app., were compared with calcd. values. The study led to a slightly different concept of a continuous fractionation process such as partition chromatography.

4733. Cruse, K. and Mittag, R. **Colorimetric determination and chromatographic separation of sym-trinitrobenzene and m-dinitrobenzene.** *Z. Anal. Chem.* **131**, 273-8 (1950).—*C.A.* **45**, 500*c*.

Sym-trinitrobenzene could be detd. accurately by the red colored complex which it formed with EtONa in benzene soln. *m*-Dinitrobenzene could likewise be detd. in ultraviolet light. When both of these compds. were present, a chromatographic sepn. could be effected by means of freshly-activated MgO in benzene.

4734. Di Giacomo, Angelo and Rispoli, Giuseppe. **Pectin as an absorbent in chromatographic analysis.** *Boll. lab. chim. provinciali* (Bologna) **1**, No. 4, 13-15 (1950).—*C.A.* **46**, 3445*g*.

Pectin extd. from lemon rinds, repptd. twice, dried, and ground was proposed as a packing material for chromatographic columns. It was used successfully for the sepn. of $Co(NO_3)_2$ and $Cu(NO_3)_2$, of Orange No. 1 from tartrazine, of Victoria Scarlet from Orange No. 1 and from tartrazine.

4735. Fuks, N. A. **Preparation and standardization of aluminum oxide for chromatographic analysis of organic substances.** *Zavodskaya Lab.* **16**, 878 (1950).—*C.A.* **45**, 971*c*.

Com. Al_2O_3 activated by gradual heating to 300-400°C for 1 hr and ground to 180-200-mesh size. Treatment with hot 0.1 *N* HCl yielded the "acid" alumina, most suitable for org. detns., after thorough washing. For standardization a soln. of azobenzene and *p*-methoxyazobenzene in isoöctane-C_6H_6 was recommended. Prepns. with lower activity were obtained by shaking with progressively larger amts. of H_2O (2-16%).

4736. Gabrielson, Gunnar and Samuelson, Olof. **Utilization of ion exchangers in analytical chemistry. XVI.** *Svensk Kem. Tid.* **62**, 214-20 (1950) (in English).—*C.A.* **45**, 4168*i*.

$NaHSO_3$ (400 ml of *M*) was passed through a column of Amberlite IRA-400 (9.8 by 140 mm) to convert it to the bisulfite form, and the column washed with H_2O. Next, 50 ml of a soln. containing 1.2 to 4.1 milliequivs. aldehyde was passed through the column (about 25 min.), followed by washing with H_2O (about 400 ml). Quant. adsorption has been obtained for CH_2O, $(CHO)_2$, AcH, MeCH:CHCHO, PhCHO, $C_6H_4(OH)CHO$, $CH_3O(OH)C_6H_3$-CHO, and C_4H_3OCHO. The adsorption of acetone and MeEtCO has also been studied. Both were adsorbed almost quantitatively, but were removed readily by washing. This observation has led to a method for quant. sepn. of aldehydes and ketones.

4737. Gapon, E. N. and Shuvaeva, G. M. **"Aluminate" aluminum oxide for chromatographic ion analysis.** *Doklady Akad. Nauk S.S.S.R.* **70**, 1007-10 (1950).—*C.A.* **44**, 7708 *f*.

Dissolve 100 g of Al in 1 1.30% NaOH and dil. to 2% concn. of $NaAlO_2$. Treat the soln. with CO_2 to ppt. $Al(OH)_3$. Filter and wash to pH 8 with hot H_2O. Dry at 100-30°C, heat 10 min. at 800°C and suspend the product for use (1 g per 6 ml H_2O), giving pH 9.4-9.6. Cations were sharply adsorbed on the product from aq. solns. and Na ions appeared in the filtrate. For anion adsorption the product was treated with *N* HNO_3, followed by washing with H_2O.

4738. Gault, Henry and Ronez, Christiane. **A device which permits rapid separation of the zones formed in the course of chromatographic adsorption.** *Bull. soc. chim. France* **1950**, 587-8.—*C.A.* **44**, 10383*g*.

An app. consisting of rigidly supported glass cylinders of different lengths and the same diam. was used as a column for chromatographic sepns.

4739. Granger, Camille and Zwilling, Jean P. **Separation and determination of several hexachlorocyclohexane compounds by adsorption on silica with the method of chromatography.** *Bull. soc. chim. France* **1950**, 873-6.—*C.A.* **45**, 2371*c*.

Fifty g of silica contg. 15-20% H_2O was mixed with 150 cc. of petr. ether and introduced into the top of the column. N_2 was passed over the silica layer (to remove the excess of solvent) so that the ether flowed at approx. 600 cc./hr. The clear liquid was added and the ether was flushed through the column and 20-cc. fractions contg. octachlorocyclohexane and heptachlorocyclohexane were recovered. From 600 to 1000 cc. petr. ether was poured through to ext. the γ-isomer. CCl_4 extd. the Δ isomer.

4740. Hansen, Robert S.; Gunnar, Keith; Jacobs, Alfred, and Simmons, C. Robert. **The adsorption**

separation of zirconium and hafnium. *J. Am. Chem. Soc.* 72, 5043-5 (1950).—*C.A.* 45, 2805*e*.

For sepn. of Zr from Hf most satisfactory results were obtained by preferential adsorption of Hf from a MeOH soln. of $ZrCl_4$ and $HfCl_4$ by silica gel. Other solvents were investigated, as well as effects of concn., flow rate, and gel properties. Hf products of 30-60% concn. could be obtained in good yields by differential stripping of the silica gel.

4741. HARVALIK, ZABOJ V. **Electronic image converter and its use in chromatography.** *Anal. Chem.* 22, 1149-51 (1950).—*C.A.* 45, 436*g*.

The image converter consisted of an objective lens system, a tube (CV-147) which converted infrared or ultraviolet light to visible light of 525 mμ, and an eyepiece. An application for the detection of zones on a chromatographic column was suggested.

4742. HASKINS, J. F. AND HOGSED, M. J. **The alkaline oxidation of cellulose. II. Chromatography of acetylated carbohydrate acids.** *J. Org. Chem.* 15, 1275-7 (1950).—*C.A.* 45, 2202*f*.

The mixt. of 120-500 mg of the carbohydrate derivs. in $CHCl_3$ was passed through a column 35 mm in diam. of a 3:1 mixt. of Mallinckrodt A.R. silicic acid and Celite and the zones were developed with C_6H_6-AcOH(30:1). The order of adsorption of various acetylated carbohydrate derivs. was detd. to be: amides > phenylhydrazides > acids > lactones > nitriles.

4743. HOLMAN, RALPH T. **Crossing over, a new technique in displacement analysis with the Tiselius-Claesson interferometer.** *Anal. Chem.* 22, 832-3 (1950).—*C.A.* 44, 8824*i*.

The Tiselius-Claesson interferometric adsorption analysis app. had the disadvantage of a limited range of concs. which could be measured in any given expt. This was overcome by introducing the effluent liquid into the comparison channel which was ordinarily filled with pure solvent at a time when the concn. of the solute of the effluent was constant. If the 2 channels were connected so that the effluent traversed one after the other after passing through a spacer with a definite vol. (2 ml) then one could det. the difference in concn. between the 2 channels.

4744. HOWARD, G. A. AND MARTIN, A. J. P. **Separation of the C_{12}-C_{18} fatty acids by reversed-phase partition chromatography.** *Biochem. J.* 46, 532-8 (1950).—*C.A.* 44, 10446*g*.

Sepn. of longer-chain fatty acids was attempted by evolving a partition chromatogram in which the less polar phase was stationary. This was accomplished by the use of kieselguhr treated with dichlorodimethylsilane vapor rendering it "unwettable" by strongly polar solvents. The most suitable systems for use with straight-chain satd. fatty acids from lauric to stearic were aq. MeOH-octane or aq. Me_2CO-medicinal paraffin, but unsatd. substituted fatty acids behaved the same.

4745. HOYER, HERBERT. **Hydrogen-bridge bonding and chromatographic separation of isomeric substances.** *Kolloid-Z.* 116, 121 (1950).—*C.A.* 44, 6230*i*.

Chromatographic sepns. of mono-, di-, tri-, and tetrahydroxyanthraquinones were made on silica gel with benzene, chlorobenzene, and methylene chloride as the solvents. All mols, with OH groups exclusively in the 1, 4, 5, and 8 positions easily permeated the columns, whereas all compds. that also carried OH groups in the remaining positions were adsorbed. 1,4,5-trihydroxyanthraquinone and 1,4,5,8-tetrahydroxyanthraquinone permeated the silica gel column easily, whereas 2-hydroxyanthraquinone was adsorbed. A similar role of H-bridge bonding in adsorption was shown for hydroxynitro and hydroxyazo compds.

4746. JØRGENSEN, P. FISCHER. **Identification of Phenylosazones by chromatography.** *Dansk Tids Farm.* 24, 1-8 (1950).—*C.A.* 44, 2893*e*.

Phenylosazones of hexoses, pentoses, methylepentoses, and tetroses with unbranched C chains were differentiated by chromatography. $CaCO_3$ was used as adsorbent and 3% EtOH(94%) in $CHCl_3$, 5% EtOH(94%) in acetone and 1 part acetone with 1 part $CHCl_3$, were used as developing fluids. All phenylosazones were used in $CHCl_3$ soln.; sepn. of sorbose, glucose, galactose, altrose, xylose, arabinose, rhamnose, fucose, and erytrulose was obtained.

4747. JØRGENSEN, P. FISCHER. **Chromatographic investigation of frangula fluidextract.** *Dansk Tids. Farm.* 24, 111-27 (1950).—*C.A.* 44, 6083*i*.

Frangula fluidext. in petr. ether was chromatographed on $CaCO_3$, particle size 3.5 μ. The following substances were adsorbed: chrysophanic acid + emodin monomethyl ether, chrysophanic acid anthrone + emodin anthrone monomethyl ether, aloe emodin. If 10 to 20% EtOH contg. $CHCl_3$ was used as solvent and the soln. chromatographed on 20 μ $CaCO_3$ particles, the following substances were sepd.: frangula emodin, 2-(hydroxymethyl)-anthraquinone frangulin and its corresponding base, difrangulin and its base, a condensation product of frangula emodin anthrone and a condensation product of partly oxidized frangula emodin anthrone.

4748. KAMIEŃSKI, B. **Potentiometric chromatography. V. Electrometric adsorption analysis in inorganic chemistry.** *Bull. intern. acad. polon. sci., Classe sci. math. et nat.*, Ser. A, **1950**, 73-7 (in English).—*C.A.* 46, 4417*h*.

An Sb electrode sealed in a glass capillary tube was used for the detection of Cu ions passed through an Al_2O_3 adsorption column. Changes in the potential were observed when the Cu ions reached the vicinity of the Sb electrode.

4749. KÜHN, KONRAD. **Enrichment of molybdenum in dilute solutions by adsorption.** *Z. anal. chem.* 130, 210-22 (1950).—*C.A.* 44, 5181*d*.

From molybdate soln. with enough free H_2SO_4 to make the pH ~ 4-6, Mo was adsorbed more readily than SO_4^{--}, Cl^-, NO_3^-, or ClO_4^- by a column of Al_2O_3. Then by washing the column with dil. NH_4OH, almost all the Mo was recovered.

4750. LEROSEN, A. L.; MONAGHAN, P. H.; RIVET, C. A.; SMITH, E. D., AND SUTER, H. A. **Streak reagents for chromatography.** *Anal. Chem.* 22, 809-11 (1950).—*C.A.* 44, 8816*f*.

Reagents were described for the detection on the chromatographic column of the following compds.: 1,3-Pentadiene, cyclohexene, $BuNH_2$, Et_2NH, Et_3N, $PhNH_2$, PhNHEt, $PhNEt_2$, $PhNMe_2$, Ph_2NH, Ph_3N, MeOH, EtOH, PhOH, $COMe_2$, PhOMe, PhCl, AcOH, BzOH, $MeNO_2$, $PhNO_2$, C_6H_6, and CS_2. The adsorbents used were Special Filtrol, silicic acid, Florisil, MgO, $CaCO_3$, $Ca(OH)_2$, and $CaHPO_4 \cdot 2H_2O$.

4751. LYNAM, C. G. AND WEIL, HERBERT. **A new plant for radial chromatography.** *Mfg. Chemist* **21**, 195-9, 205 (1950).—*C.A.* 44, 7594*c*.

A stationary radial chromatographic seperator was described with an exchangeable inner container contg. the adsorbent. The latter consisted of an assembly of 5 concentric perforated tubes covered with gauze and sealed at the top and bottom, the positions of which corresponded to the boundaries between the zones of the various constituents of a mixt. to be sepd. The soln. was fed through an inner perforated pipe and with the aid of valves. When development of the chromatogram had proceeded to the desired stage, the entire inner container was removed, a new one put in place, and the charged adsorbent from the first container removed by emptying the contents of each ring separately into a tank.

4752. LYNAM, C. G. AND WEIL, HERBERT. **Combination-columns in chromatographic technology.** *Ind. Chemist* **26**, 109-12 (1950).—*C.A.* 44, 5158*i*.

Details were given on large-scale chromatographic columns which could be mechanically disassembled into sections and separately eluted.

4753. MACMORRAN, GEO. H. **Chromatography of senna and related compounds.** *J. Pharm. and Pharmacol.* **2**, 773-82 (1950).—*C.A.* 45, 3563*h*.

Heavy $MgCO_3$ gave promising results. It dissolved readily in dil. acids, thus liberating the adsorbed substances, which may be extd. by an immiscible solvent. Acetylation of the hydroxyanthraquinone derivs. before chromatography reduced the extent to which they were adsorbed, and made elution easier.

4754. MARSHALL, LAWRENCE M. AND DACOSTA, WM. A. **Cumulative frequency distribution in manual chromatography.** *Science* **111**, 155-6 (1950).—*C.A.* 44, 8817*c*.

The vol. of effluent was plotted on arithmetic probability paper against the cumulative percentage of solute collected. A mixt. of succinic acid (normal) and fumaric acid (abnormal) was analyzed by using a 4-mm internal-diam. column contg. 0.5 g silica gel with 10% tet-AmOH in $CHCl_3$ as the mobile phase.

4755. MARVEL, C. S. AND RANDS, R. D., JR. **Separation of organic acids.** *J. Am. Chem. Soc.* **72**, 2642-6 (1950).—*C.A.* 46, 8826*a*.

Procedures were outlined for the sepn. of H_2O-sol. org. acids by using partition chromatography satisfactory for the detection and detn. of acids in mixts. The "peak effluent vols." of 36 acids had been detd. by a standard procedure. Only 5-80 mg of the mixts. was required. With an increasingly polar solvent, it was possible to sep. mixts. contg. 2-7 H_2O-sol. acids or other less polar compds. As little as 0.5 mg could be detected in an 80-mg sample. The immobile phase was H_2O-adsorbed on silicic acid. The developing liquid or eluant was made progressively more polar to develop the more H_2O-sol. acids, accomplished by adding increasing amts. of BuOH to $CHCl_3$.

4756. MEINHARD, JAMES E. AND HALL, NORRIS F. **Surface chromatograph - refinements in apparatus and technique.** *Anal. Chem.* **22**, 344-51 (1950).—*C.A.* 44, 8279*g*.

The chromatography of solns. of 0.1 *M* $NiCl_2$ in 0.6 *N* HCl and 0.4 *N* HCl and of 0.1 *M* $CuCl_2$ in 0.6 *N* HCl was studied by using specially designed pipets so that the ratio of sample vol to developer (H_2O) vol. was accurately controlled. The process was carried out on glass slides coated with a rigid adsorbent, the chromatograms were colored by application of mordant dyes, and the zone radii accurately measured by means of a specially constructed transparent scale.

4757. MILIČEVIĆ, B. **Possibility of qualitative and quantitative analysis based on the separation of ions by means of chemical exchange.** *Bull. soc. chim. Belgrade* **15**, 167-71 (1950) (English summary).—*C.A.* 46, 6038*i*.

The sepn. of I^- and Br^- was carried out on a $PbCl_2$ column and that of Ag^+ and Cu^{2+}, and Ag^+ and Pb^{2+} on a Zn dust column with the conventional chromatographic technique. In the upper part of the column a yellow zone of PbI_2 was formed, below which a $PbBr_2$ zone was visible under ultraviolet light. The length of these zones served as a basis for the detg. I^- and Br^- in their mixts. The Ag^+-Cu^{2+} and Ag^+-Pb^{2+} sepns. in the Zn dust column were less satisfactory.

4758. MONAGHAN, PATRICK H.; SUTER, HANS A., AND LEROSEN, ARTHUR L. **Characterization of some chromatographic adsorbants.** *Anal. Chem.* **22**, 811-13 (1950).—*C.A.* 44, 8816*b*.

The rate of migration of a zone of *o*-$NO_2C_6H_4NH_2$ in C_6H_6 was detd. on different grades of silicic acid, silica gel, silicates, alumina, $CaCO_3$, MgO, charcoal, ZnO, $ZnCO_3$, CaO, $CaHPO_4$, $Ca_3(PO_4)_2$. The order of decreasing adsorption affinity for *o*-$NO_2C_6H_4NH_2$ was roughly: acid silicates, silica gel, silicic acid, alk. oxides, alk. hydroxides. Mg-contg. adsorbants were stronger than the corresponding Ca compds.

4759. NEWING, M. J. **Surface properties of polar silicones.** *Trans. Faraday Soc.* **46**, 755-62 (1950).—*C.A.* 45, 1805*i*.

Silicones with terminal —OH group were sepd. by chromatography. Force-area and potential-area curves on water showed that at low pressure all silicone mols. lay flat on the water surface. Silicones as *boundary lubricants* on *steel* were discussed in relation to the possible orientation of the monolayers on the metal surface.

4760. RAMSEY, L. L. AND HESS, S. M. **Collaborative study of a chromatographic method for the volatile fatty acids.** *J. Assoc. Offic. Agr. Chemists* **33**, 848-54 (1950).—*C.A.* 45, 491*h*.

Two samples in duplicate consisting of an aq. soln. of the volatile acids were analyzed by 22 analysts in 17 labs. with a chromatographic method. The study showed that the method was sufficiently accurate for studies of decompn. in foods.

4761. Rosen, A. A.; Sundstrom, K. V. Y., and Vogel, W. F. **Separation of 2,4-dinitrophenylhydrazones of some substituted benzaldehydes by chromatographic adsorption.** *Anal. Chem.* **24,** 412-13 (1952).—*C.A.* 46, 4956*g*.

The adsorption of the 2,4-dinitrophenylhydrazones of 12 substituted benzaldehydes contg. one or more OH, MeO, or EtO groups was studied. The adsorbent selected was a uniform mixt. of silicic acid and Celite, with pure benzene used as the solvent both for adsorption and for development of the chromatogram. All binary combinations of the 14 compds. studied were tested.

4762. Rosen, J. B. and Winche, Warren E. **The admittance concept in the kinetics of chromatography.** *J. Chem. Phys.* **18,** 1587-92 (1950).—*C.A.* 45, 6007*a*.

Chromatographic processes with linear kinetics were represented by a system admittance for the case where the influent concn. varied sinusoidally. The admittance was obtained for a variety of assumed rate-controlling mechanisms. It depended strongly on the type of kinetics obeyed by the system. The results indicated exptl. techniques for detg. the kinetics of these processes. Representative results obtained with an electronic analog computer were presented for a case of non-linear kinetics.

4763. Schweitzer, George K. and Talbott, C. K. **Resolution of optically active inorganic stereoisomers by adsorption on quartz.** *J. Tenn. Acad. Sci.* **25,** 143-7 (1950).—*C.A.* 46, 11004*e*.

A column of *l*-rotatory quartz powder was used to effect the partial resolution of Cr and Co complexes. The *l*-rotatory quartz powder had a selective adsorptive power towards these racemic complexes. Multiple columns greatly enhanced a sepn.

4764. Shemyakin, F. M. **Importance of chromatographic adsorption for the formation of rhythmic structures.** *Kolloid. Zhur.* **12,** 392-5 (1950).—*C.A.* 45, 925*c*.

When periodic pptns. of RY formed during diffusion of RX into MY soln., the RY ppts. acted as chromatographic adsorbents on RX. The ions of MX were less retarded by the ppts. and diffused ahead of RY ions. This explained the discrete formation of ppts. The results of diffusion of MY into RX soln. may be different from those of diffusion of RX into MY because RY may differently adsorb MY and RX.

4765. Shemyakin, F. M. and Mitselovskiĭ, E. S. **Chromatographic determination of traces of iron in concentrated sulfuric acid.** *Zavodskaya Lab.* **16,** 748 (1950).—*C.A.* 45, 974*e*.

The acid was passed through a micro-column of silica gel, which was then treated with 0.5-1.0 ml satd. $K_4Fe(CN)_6$; a blue color indicated Fe; sensitivity was 6 γ.

4766. Sillén, Lars Gunnar. **Filtration through a sorbent layer. V. Final form fronts and broadening fronts.** *Arkiv Kemi* 2, 499-512 (1950)(in English).—*C.A.* 45, 2270*e*.

In the equil. case where solute and sorbent were in equil. at all times, two types of fronts were encountered, sharp fronts and broadening fronts. In the nonequilibrium case two types of fronts were also encountered: the front which tended toward a final form and then moved on through the column with the same speed as the equil. front would have had and secondly the broadening fronts.

4767. Srikantan, B. S. and Krishnan, V. **Possibility of separating copper and silver zones in an alloy of copper and silver by zinc chromatographically.** *J. Indian Chem. Soc.* 27, 34-6 (1950).—*C.A.* 44, 6767*b*.

The usual chromatographic order Cu-Ag-Zn with alumina as absorbent was reversed in dil. solns. to Cu-Zn-Ag. This was shown to be due to the preferential adsorption of Zn^{++} over the Ag^+ in dil. solns. The adsorption of Zn^{++} from $ZnSO_4$ solns. of different concn. was detd. as above, the Zn being detd. by titration with $K_4Fe(CN)_6$ soln. with Ph_2NH as indicator. At lower concns. there was greater adsorption of Zn^{++} per g of alumina than the Ag^+, while at higher concns. more Ag^+ was adsorbed than Zn^{++}. The method may be used in the analysis of Cu-Ag alloys.

4768. Strain, Harold H. **Distribution in adsorption columns. Separation of xanthophylls and chlorophylls.** *Ind. Eng. Chem.* **42,** 1307-10 (1950).—*C.A.* 44, 8734*c*.

Weakly adsorbed materials such as *n*-heptyl alc. on MgO adsorbent may reduce the adsorption of a pigment and also cause zone doubling. A pigment soln. contg. strongly adsorbed impurities such as hydroquinone, phloroglucinol, ethylene, glycol, resorcinal, *o*-cresol, *o*-phenylene-diamine, acetamide, glycerol, or 8-hydroxyquinoline put upon a MgO column followed by a pigment soln. free of impurity often yielded two widely sepd. pigment zones.

4769. Tanaka, Minoru and Shibata, Muraji. **Inorganic chromatography. I. Confirmation of fundamental conditions and its applications for semimicro chemical analysis.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 254-6(1950).—*C.A.* 45, 4525*a*.

Working conditions of inorg. chromatography using Al_2O_3 as adsorbent were studied. Adsorbed ions were developed by $(NH_4)_2S$ soln. and their orders of adsorption are as follows: (top) Bi^{+++}; (Hg^{++}, Fe^{+++}); (Pb^{++}, Cr^{+++}); Cu^{++}; (Ag^+, Zn^{++}); Tl^+; (Co^{++}, Cd^{++}, Ni^{++}, Fe^{++}); Mn^{++} (bottom).

4770. Tanaka, Minoru and Shibata, Muraji. **Inorganic chromatography. II. The mechanism of chromatographic adsorption.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 312-14 (1950).—*C.A.* 45, 4997*c*.

Expts. confirmed neither the older assumption that the phenomena depended on ionic exchange between the ions in the soln. and the Na ion held by the adsorbent, nor the newer theory that the cause was the different relative rates of formation of the insol. hydrous metal oxides. Filter paper used as the adsorbent gave concentric rings for the various ions, the order of which agreed with the usual chromatography.

4771. Tiselius, A. and Hagdahl, L. **Note on "carrier displacement" chromatography.** *Acta Chem. Scand.* 4, 394-5 (1950).—*C.A.* 44, 9856*d*.

Homologous alcs. (1% in 0.1 N HCl) were used for the displacement of amino acids and peptides in sharply divided segments from active charcoal and on filter paper. Examples given (solvent and carrier) were valine, tert-BuOH, and H_2O; leucine, tert-BuOH, and sec-BuOH; methionine, sec-BuOH; and tert-BuOH; leucylglycylglycine, iso-AmOH, and BuOH; phenylalanine, AmOH, and iso-AmOH; and glycyltryptophan, $PhCH_2OH$, and AmOH.

4772. Trueblood, Kenneth N. and Malmberg, Earl W. **An experimental study of chromatography on silicic acid celite. The applicability of the theory of chromatography.** *J. Am. Chem. Soc.* **72,** 4112-24 (1950).—*C.A.* 45, 1840*e*.

4-nitroaniline, N-ethyl-4-nitroaniline, 4-nitrodiphenylamine, N, N-diethyl-4-nitroaniline, 4-nitrotriphenylamine, and Et centralite, were chromatographed and a variety of developing mixts. and rates of development were investigated. Adsorption isotherms on silicic acid-celite were found to be essentially linear in the range of concns. most important in practical chromatography on this adsorbent. Rates of development in mixts. were demonstrated to be the same as those of the same compds. developed separately. A technique was developed for detg. precisely the distribution of a compd. in a zone on a column.

4773. Tunitskii, N. N. and Cherneva, E. P. **Dynamic theory of adsorption and chromatography. I. Broadening of chromatographic bands and adsorption fronts.** *Zhur. Fiz. Khim.* 24, 1350-60 (1950).—*C.A.* 45, 6896*g*.

Chromatographic processes were treated statistically. A sharp adsorption band was broadened because of the fluctuation of the lifetime of the particles in the adsorbed state. Two relations were then derived: $(x - \bar{x})^2 = 2Kt$ (1) and $(t - \bar{t})^2 = 2Bx$, which were valid both when diffusion in the liquid or the adsorption was rate-detg. and when the limiting step was the diffusion through the adsorbent particles. A linear adsorption isotherm was assumed throughout. Exptl. data obtained with a cation exchanger confirmed the theory.

4774. Ullmann, M. **Chromatography of soluble starches.** *Kolloid-Z.* **116,** 10-18 (1950).—*C.A.* 44, 6178*d*.

Starch was adsorbed selectively on an Al_2O_3 column from aq. soln. By means of I_2-KI solns. the adsorbed starch components which form colored complexes with I_2 showed visible sepn. zones of dark blue, light blue, and light violet. The adsorptive capacity of the Al_2O_3 was changed if the column was pretreated with HCl; darker shades and sharper sepn. of the colored zones were obtained. The Al_2O_3 column should be given only sufficient pretreatment with HCl to give best results with the absorbate.

4775. Vahrman, M. **Estimation of the hydrocarbons in primary tars by hot chromatography.** *Nature* **165,** 404-5 (1950).—*C.A.* 44, 9137*h*.

Hydrocarbons in samples of primary coal tar were detd. by using a steam-heated 6 × 1/2 in. column of silica gel. Before use, the silica was sized between 100 and 200 mesh and ignited at 500°C. The tar (5 g) was melted on the column and eluted with 100-120°C ligroin until the eluant was colorless (3-4 hrs). The eluant was evapd. on an oil bath under vacuum to const. wt.

4776. Weiss, D. E. **Industrial fractional adsorption techniques.** *Roy Australian Chem. Inst. J. & Proc.* 17, 141-56 (1950).—*C.A.* 44, 10383*d*.

An industrially useful continuous fractional adsorption process must: (a) be able to adsorb fractionally from aq. soln.; (b) have free countercurrent flow between adsorbent and solution; (c) permit of simple regeneration of the adsorbent. Countercurrent flow may be achieved by using an adsorbent of different sp.gr. from the solution especially by froth flotation techniques, enabling both "sink" and "float" processes to be used. Industrial application of such processes depended on the development of suitable adsorbents, and work was being done with surface modifiers of both the org. solvent and the electrolyte type.

4777. Wendel, Kurt. **Chromatographic analysis.** *Planta* 37, 604-11 (1950).—*C.A.* 44, 4306*c*.

In a study of the material to be used in the adsorption column for the detn. of leaf pigments, the sepn. of chlorophylls was more effective with starch than with powd. sugar. Decompn. of the pigments could be avoided by the use of purified peroxide-free ether and avoiding exposure to light and air.

4778. Al-Mahdi, A. K. and Wilson, Cecil L. **Chromatography of organometallic complexes.** *Mikrochemie ver. Mikrochim. Acta* **36/37,** 218-23 (1951).—*C.A.* 45, 5071*h*.

Chromatography could be used to sep. inorg. ions that form complexes with org. compds. by the use of org. reagents. Sepns. of Cu, Fe, and Ni cations could be made by means of Na diethyldithiocarbamate both qualitatively and quantitatively. The accuracy of a detn. could be increased by converting to another complex after the chromatographic sepn. had been effected.

4779. Asahara, Teruzo; Konishi, Yotaro; Kuroda, Yusuke, and Mashino, Minoru. **Chromatographic separation of fatty acids.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. **54,** 70-2 (1951).—*C.A.* 47, 1407*i*.

The sepn. of fatty acids was carried out with calcined MgO, CaO, and Al_2O_3 as adsorption medium. Each of the MgO and CaO was mixed with EtOH, and Al_2O_3 with petr. ether made into slurry and filled in cylinders. The combination of MgO and CaO gave better results than either alone.

4780. Ashizawa, Takashi. **Chromatographic analysis of metals by organic reagents.** *Repts. Balneol. Lab. Okayama Univ.* **1951,** No. 5, 1-42 (English summary).—*C.A.* **46,** 7927*h*.

Alumina, diatomaceous earth, aluminate, $MgCO_3$, $CaCO_3$, urea-formaline resin, heulandite, mordenite, desmine, chabazite, etc., were used as adsorbents. A large no. of org. reagents were tried. The detn. of Cu, Zn, Ni, and Co in rocks; Fe, Cu, Zn, Ni, and Co in plants; Cu and Zn in urine; Hg in rocks; Bi in rocks; and Cu, Zn, Ni, and Co in natural waters, were reported.

4781. BACH, RICARDO O. AND GARMENDIA, ANTONIO A. **Experiments in inorganic chromatography. IV. Separation, detection, and determination of cobalt ion.** *Anales asoc. quim. argentina* **39**, No. 191, 11-17 (1951).—*C.A.* **46**, 9016*f*.

Chromatographic sepn. of metal ions from organometallic compds. were useful in qual. or quant. analyses of small amts. of metal ions, as illustrated by the addn. compd. formed by Co and β-nitroso-α-naphthol. Alumina columns were used. The limits of identification were detd. in some detail.

4782. BAILEY, A. **Ultraviolet absorption spectra of chromatographic fractions of lignins.** *J. Am. Chem. Soc.* **73**, 2325-6 (1951).—*C.A.* **45**, 9264*i*.

Each of the chromatographic fractions of lignins could be identified by its absorption curve alone. Chem. differences between the fractions existed and fluorescence observations were valid indications of such chem. differences.

4783. BAILEY, H. C. AND KNOX, J. H. **Determination of aldehydes in combustion products.** *J. Chem. Soc.* **1951**, 2741-2.—*C.A.* **46**, 9018*g*.

A soln. (1-5 cc contg. about 0.2 millimole of aldehyde) was passed down a tube (8 mm in diam.) packed with Ag_2O to a depth of 10 cm, the sample washed through with H_2O to a total vol. of 25 cc, and the resulting soln. titrated with KSCN. The sepn. and detn. of individual aldehydes was achieved by converting the Ag salts of the soln. obtained from the Ag_2O column with NaCl to the Na salts and further to the free acids which were sepd. by chromatographic adsorption on buffered SiO_2.

4784. BROCKMANN, H. AND BEYER, E. **Chromatographic adsorption. V. The chromatographic separation of colorless compounds by means of fluorescent adsorbents.** *Angew. Chem.* **63**, 133-6 (1951).—*C.A.* **45**, 5485*d*.

Fluorescent adsorbents, illumination technique, and photographic recording of colorless zones were investigated.

4785. CRAIG, LYMAN C.; HAUSMANN, WERNER; AHRENS, EDWARD H. JR., AND HARFENIST, ELIZABETH J. **Determination of weight curves in column processes.** *Anal. Chem.* **23**, 1326-7 (1951).—*C.A.* **46**, 299*b*.

App. for the rapid evapn. of samples taken from different parts of a column was described. This made possible a rapid detn. of distribution curves in chromatography, ion exchange, and countercurrent distribution processes.

4786. DEAN, JOHN A. **Isolation and determination of cobalt as the nitroso R salt complex by chromatographic ion exchange.** *Anal. Chem.* **23**, 1096-7 (1951).—*C.A.* **45**, 10125*a*.

Application was made to steels and Cu- and Ni-base alloys. The red color complex was developed as usual. The soln. was passed through a 5-6 cm column of alumina previously washed with dil. $HClO_4$ and the red band remained at the top of the column. After washing the column with hot *M* HNO_3 (70-80 °C), the Co-complex was eluted with *M* H_2SO_4, and the color read in a photometer at 500-520 mμ. Excess dye must be present. Fe must be completely oxidized.

4787. DEAN, JOHN A. **Modified method for potassium—removal of fluoride and sulfate ions by chromatographic ion exchange.** *Anal. Chem.* **23**, 202-4 (1951).—*C.A.* **45**, 3287*e*.

The sample was dissolved in HF and $HClO_4$, extd. with water, and passed through an acid-alumina exchange-adsorption column. The column removed F^- or SO_4^{--} ions and added ClO_4^- ions to the soln.

4788. DURSO, DONALD F.; SCHALL, ELWYN D., AND WHISTLER, ROY L. **Automatic fraction collector for chromatographic separations.** *Anal. Chem.* **23**, 425-7 (1951).—*C.A.* **45**, 4971*g*.

The circuit diagram and construction details were given for an automatic app. designed to admit 4 successive developing solvents to a column and collect each effluent separately. The app. had been applied to guaran, xylan, and starch hydrolyzates.

4789. FUNAKUBO, EIICHI AND MATSUMOTO, YUTARO. **The theory and application of chromatography.. 1. Rate of displacement of the chromatographic zone in respcct to anthracene.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **72**, 402-6 (1951).—*C.A.* **46**, 850*a*.

There was a regular relation between the time of development and the rate of displacement when the benzene soln. of anthracene was developed in an alumina column. An idea of the fatigue of adsorbent was proposed to explain the exptl. results.

4790. FUNAKUBO, EIICHI; MATSUMOTO, YUTARO, AND INOUE, AKIRA. **The theory of chromatography and its applications. II. Rate of displacement of the chromatographic zone in regard to anthracene, anthraquinone, and carbazole.** *J. Chem. Soc. Japan., Pure Chem. Sect.*, **72**, 439-41 (1951).—*C.A.* **46**, 4884*b*.

The rates of displacement of the adsorption bands were studied for anthraquinone and carbazole and a mixt. consisting of these 2 compds. and anthracene in the Al_2O_3-C_6H_6 system.

4791. GORDON, B. E.; WOPAT, FRED JR.; BURNHAM, H. D., AND JONES, L. C. **Analysis of mixtures of aldehydes and ketones.** *Anal. Chem.* **23**, 1754-8 (1951).—*C.A.* **46**, 3459*c*.

A chromatographic sepn. of the 2, 4-dinitrophenylhydrazones was made in mixts. of aldehydes and ketones. A 2:1 weight ratio of silicic acid and Celite activated at 170°-200 °C for 24 hrs was used as an adsorbent. Et_2O-petr. ether mixts., concn. specified for various sepn., were used for developing and eluting. Relative strengths of adsorption were: formaldehyde > acetaldehyde > acetone > propionaldehyde > methyl ethyl ketone = N-butyraldehyde > isobutyraldehyde.

4792. GRANT, R. A. AND STITCH, S. R. **A volume-actuated fraction collector for use in chromatography.** *Chemistry & Industry* **1951**, 230.—*C.A.* **45**, 5460*b*.

The design of a pressure-actuated Hg switch and the assocd. electro-mech. system for fraction collection was presented.

4793. Grasshof, H. **A chromatographic-colorimetric method for the determination of minute amounts of acid.** *Angew. Chem.* **63**, 219-20 (1951).—*C.A.* **45**, 6539*a*.

Detailed directions were given for detg. acids by means of chromatographic adsorption of the acid soln. and a standard dye soln. (Orange GG, Casella) on alkali-free Al_2O_3 and subsequent colorimetric analysis of the elutriate obtained with NaOH soln. Data were given for AcOH, HCl, H_2SO_4, and CO_2.

4794. Hall, David A. **Simplified coupled filter system for adsorption chromatography.** *Nature* **168**, 124 (1951).—*C.A.* **46**, 10698*i*.

In place of a mixer for carrier displacement adsorption chromatography, a jet was placed at the bottom of the series of coupled filters for direct delivery into a fraction collector. The improved columns were useful in sepg. mixts. of small amts. of aromatic acids.

4795. Hesse, Gerhard. **The rate factor of adsorption processes in chromatographic columns.** *Z. Elektrochem.* **55**, 60-5 (1951).—*C.A.* **45**, 9335*c*.

Adsorptive capacities of active charcoal, silica gel, and Al_2O_3 for *o*-xylene were 35, 5.4, and 2.5%, with *T* values (time to reach one half of final pressure) of 12, 28, and 1 sec, resp. Values of *T* for the components of the mixt. (benzene, *o*-, *m*-, and *p*-xylenes, EtPh) on a silica gel were 2, 13, 9, 8, and 8 sec, resp. Since separability of constituents depended on differences in their *T* values, sepn. of all but *p*-xylene and ethylbenzene in the mixt. should be possible, and this was true exptly.

4796. Holman, Ralph T. and Hagdahl, Lennart. **Tiselius-Claesson interferometric adsorption analysis apparatus.** (Improvements in design and use.) *Anal. Chem.* **23**, 794-7 (1951).—*C.A.* **45**, 7388*e*.

Complete details were given for the construction and operation of a modified Tiselius-Claesson adsorption analysis app. The app. may be used for chromatographic displacement sepns. as well as elution, frontal, and carrier displacement sepns.

4797. Holman, Ralph T. and Williams, William T. **Displacement analysis of lipides. VI. Separation of unsaturated acids.** *J. Am. Chem. Soc.* **73**, 5285-9 (1951).—*C.A.* 46, 9325*i*.

Displacement chromatography was used for the sepn. of unsatd. fatty acids. Charcoal was the adsorbent and aq. EtOH the solvent. Satd. and unsatd. acids of the same chain length (4-18 C atoms) were sepd. Nonconjugated unsatn. decreased adsorption; carboxyl-conjugated conjugation increased adsorption. The conjugated octadecadienoic acid (not carboxyl-conjugated) was adsorbed less strongly than stearic acid, whereas conjugated octadecatrienoic acid was adsorbed more strongly than stearic acid.

4798. Hoyer, H. **Hydrogen-bridge bonding and chromatographic separation.** *Z. Elektrochem.* **54**, 413-18 (1950); *Kolloid-Z.* **121**, 121-9 (1951).—*C.A.* **45**, 6528*e*.

Adsorption of a variety of aminoanthraquinones was detd. by passing C_6H_6 solns. through columns packed with silica gel or Al_2O_3. Compds. in which a H-bridge formed passed through the column; the others were adsorbed. This provided a method for sepg. isomers, 1,2-, 1,3-, 1,6-, or 1,7-dihydroxyanthraquinones which were adsorbed while the other isomers passed through a calcite-packed column.

4799. Hoyer, H. **Hydrogen-bridge bonding and chromatographic separation of mercapto compounds.** *Kolloid-Z.* **122**, 142-3 (1951).—*C.A.* **45**, 8848*c*.

The chromatographic method using silica gel columns was used to sep. 1- and 2-mercaptoanthraquinones. The results indicated the presence of inner H-bridge bonding for the 1-mercaptoanthraquinone. Both the chromatographic and spectroscopic methods showed that the SH..O bond was weak.

4800. Ishii, Ryuichiro. **Carotene production by microorganism. II. Activation of alumina for chromatographic analysis of carotenoid pigments.** *J. Fermentation Technol.* (Japan) **29**, 313-16 (1951).—*C.A.* **47**, 2648*a*.

Alumina (0.5 kg) was added to 1.5 liter of *N* H_2SO_4 and the mixt. was heated at 60-70°C for 15 min. under const. stirring. After repeating 3 times it was washed with hot water until neutral. This alumina was similarly treated 3 times with 1.5 liter of 0.5 *N* NaOH 3 times with careful washing. After filtering the alumina was heated at 305-375°C for 2 hrs.

4801. James, T. H. and Vanselow, W. **Chromatographic investigations related to photographic theory.** *J. Am. Chem. Soc.* **73**, 5617-22 (1951).—*C.A.* **46**, 2431*f*.

Elution chromatography, with AgBr as the adsorption medium and aq. C_5H_5N solns. as the chromatographic developer, was applied to the sepn. of a series of photographic sensitizing and desensitizing dyes. The chem. sensitizer, allylthiourea, displaced all of these dyes with about equal ease and was absorbed more strongly than any of them.

4802. Kirchner, J. G.; Miller, John M., and Keller, G. J. **Separation and identification of some terpenes by a new chromatographic technique.** *Anal. Chem.* **23**, 420-5 (1951).—*C.A.* **45**, 5075*f*.

A "chromatostrip" was prepd. by coating a glass strip with a slurry of silicic acid adsorbent, starch binder, and $ZnCdS_2 + Zn$ silicate fluorescing agent. The dried strip was spotted with the terpene mixt. and a solvent of 15% EtOAc in hexane was allowed to ascend the strip in a test tube. The resolved compds. were located by ultraviolet light or by spraying with various reagents, such as fluorescein followed by Br_2 vapor for olefin double bonds.

4803. Knox, Kerro and Thomas, Henry C. **The Jones reductor: a model for the kinetics of chromatography.** *J. Chem. Phys.* **19**, 224-7 (1951).—*C.A.* **45**, 6456*f*.

The Jones reductor could be made to assume a steady state of operation in the reduction of $Fe_2(SO_4)_3$. The rate-limiting process was the diffusion of Fe^{+++} through a static film of soln. around the solid particles. This was particularly evidenced by the exponential dependence of the extent of reduction on the square root of the flow rate. The behavior of the reductor as a function of Zn-ion concn., Zn amalgam particle size, and temp. also agreed with this result.

4804. Kretovich, V. L.; Drozdova, T. V., and Petrova, I. S. **Chromatographic determination of volatile fatty acids.** *Doklady Akad. Nauk S.S.S.R.* **80**, 409-12 (1951).—*C.A.* **46**, 1923*c*.

The soln. of the acids was neutralized with 0.1 *N* NaOH, evapd. to dryness, and 2 drops of 18 *N* H_2SO_4 and 0.1 g Na_2SO_4 added. The soln. was extd. 5 times with 1% BuOH in $CHCl_3$ (total 6 ml) and then placed in a tube with prepd. silica gel (silica gel ground with aq. bromocresol green, then treated with 1 drop NH_4OH until blue, suspended in 1% BuOH-$CHCl_3$ soln., and transferred to the tube), and forced through by a pressure bulb. AcOH gave a yellow band, $PrCO_2H$ light green, and HCO_2H white with yellow edges near top of tube.

4805. LeRosen, Arthur L.; Monaghan, Patrick H.; Rivet, Charles A., and Smith, Edgar D. **Specificity of chromatographic adsorbents.** *Anal. Chem.* **23**, 730-2 (1951).—*C.A.* **45**, 7407*g*.

The factors responsible for the adsorption of a given substance on a given adsorbent were studied and a math. function relating the interactions in the chromatographic system to the movement of the adsorptive zone was constructed. Preliminary work indicated that, for the compds. studied, the adsorption could be accounted for in terms of donor-acceptor and H-bonding interactions and also that the C side chain acted to decrease adsorption.

4806. Ling, Chi-Shau. **Note on the purification of 2, 4-dinitrotoluene from toluene by the aid of chromatography.** *J. Chinese Chem. Soc.* **18**, 135-6 (1951) (in English).—*C.A.* **46**, 2965*c*.

Chromatography was suggested as a means of sepg. 2, 4-$(NO_2)_2C_6H_3$ Me, from other mono- and trinitrated toluenes. MgO was used as the absorbent and Me_2CO as solvent. TNT was strongly absorbed producing a violet zone at the top of the column, the dinitro compd. was poorly absorbed forming a green zone at the bottom; other products passed into the soln.

4807. Lynam, C. G. and Weil, H. **Radial chromatographic pilot plant.** *Can. Chem. Processing* **35**, 471-8 (1951).—*C.A.* **45**, 9309*c*.

Arrangements were shown for overcoming difficulties arising from batch character of chromatography. The plant described primarily for sepn. by chromatographic adsorption or partition could also be adapted to fractionations in which other types of chromatography were involved.

4808. Matsumoto, Yutaro and Funakubo, Eiichi. **The theory and the application of the chromatographic adsorption method. IV. Oxidation of anthracene in the course of the chromatographic procedure. V.** *J. Chem. Soc. Japan, Pure. Chem. Sect.*, **72**, 731-3, 733-6 (1951).—*C.A.* **46**, 5930*d*.

When anthracene (0.5 g) in 130 cc. C_6H_6 was filtered through a column (16 mm in diam. and 16 cm in length) of activated Al_2O_3, a very small portion of anthracene was oxidized to anthraquinone (about 0.5 g).

4809. Miller, John M. and Kirchner, J. G. **New type of chromatographic column.** *Anal. Chem.* **23**, 428-30 (1951).—*C.A.* **45**, 4971*c*.

A rigid column of adsorbent (e.g. silicic acid) in a matrix of gypsum was prepd. by mixing 32 parts silicic acid, 8 parts plaster of Paris, and 60 parts H_2O and allowing the mixt. to harden around a central glass rod in a rectangular mold. The column was activated by drying. It had several advantages over a packed glass column: the distribution of adsorbent was always perfectly uniform, it was adapted to ascending development, it could be examd. by radiation of 230-90 mμ which was absorbed by glass, extrusion was unnecessary before applying a streak reagent and the streak could be scraped off without destroying the column, it was easily shifted to different solvents successively, and zones showed uniform distribution through column cross sections.

4810. Mowery, Dwight F. Jr. **Chromatographic adsorption. I. An efficient utilization of finely powdered adsorbents.** *J. Am. Chem. Soc.* **73**, 5047-9 (1951).—*C.A.* **46**, 8461*c*.

A lab. chromatographic column operating at pressures up to 120 lb/in^2 was described. A method of air-blowing was adopted which improved flow rate and allowed complete elution of adsorbed sugars from Florex XXX. Elution curves for glucose and fructose from airblown Florex XXX, Florex-Celite, and Celite columns were obtained.

4811. Mowery, Dwight F. Jr. **Chromatographic adsorption. II. The separation of D-glucose and D-fructose.** *J. Am. Chem. Soc.* **73**, 5049-52 (1951).—*C.A.* **46**, 8461*d*.

Quant. data were obtained for the chromatographic sepn. of D-glucose and D-fructose mixts. by means of air-blown Florex XXX. Cryst. D-fructose was prepd. in good yield from sucrose, and a rough calcn. indicated that 10 lb of D-fructose could be produced per day from sucrose in a 1 × 6-ft column at 200 lb pressure.

4812. Partridge, M. W. and Chilton, J. **Reversed-phase partition chromatography.** *Nature* **167**, 79-80 (1951).—*C.A.* **45**, 5559*g*.

Glass powder "wetted" with $CHCl_3$ and then mixed with water satd. with $CHCl_3$ would pack in a column and could be used in the sepn. of *o*- and *p*-nitroaniline and *o*- and *p*-nitrophenol.

4813. Pearl, Irwin A. and Dickey, Edgar E. **Lignin and related products. IV. Separation of syringaldehyde and vanillin by chromatography.** *J. Am. Chem. Soc.* **73**, 863-4 (1951).—*C.A.* **45**, 5657*i*.

Vanillin and syringaldehyde could be sepd. by adsorption on a mixt. of Magnesol and Celite No. 535 (5:1 by wt.) (which had been washed with dil. HCl) and elution with 50:1 petr. ether (b. 65-

110 °C)-EtOH; recoveries from mixts. were 99 and 98%.

4814. RAO, N. R.; SHAH, K. H., AND VENKATARAMAN, K. **Chromatographic separation of vat dyes.** *Current Sci.* (India) **20**, 66-8 (1951).—*C.A.* 45, 8775*h*.

A procedure for the chromatographic sepn. of vat dyes using aqueous tetraethylenepentamine, $NH_2(CH_2CH_2NH)_3$, $CH_2CH_2NH_2$, and $Na_2S_2O_4$ was described.

4815. SCHÄFER, HAROLD AND NEUGEBAUER, WALTER. **Inorganic chromatography.** *Naturwissenschaften* **38**, 561 (1951).—*C.A.* 46, 10748*f*.

The reaction between $CuCl_2$ and γ-Al_2O_3 had 3 stages: (1) phys. adsorption (considerable; it could be eluted), (2) immediate pptn. of $Cu_2(OH)_3Cl$ brought about by OH groups remaining on the γ-Al_2O_3, (3) slow continued pptn. of $Cu_2(OH)_3Cl$ by rehydration of Al_2O_3.

4816. SCHNEIDER, K. W. AND OBERKOBUSCH, R. **Analysis of phenol mixtures, using rectification and chromatography.** *Brennstoff-Chem.* **32**, 110-17 (1951).—*C.A.* 45, 5573*b*.

In addn. to theoretical investigations of the migration velocity of pure substances in adsorber columns, adsorption expts. were carried out with definite binary mixts. The expts. showed that the *o*-substituted hydroxybenzenes had less adsorption affinity for Al_2O_3 than the isomeric *p*- or *m*-substituted compds.

4817. SEN GUPTA, N. C. AND GUPTA, A. **Standardization of silica for adsorption chromatography.** *Science and Culture* **17**, 265-6 (1951).—*C.A.* 46, 10049*f*.

Silica gel was activated by drying at 180°-200 °C for 6 hrs, standardized by mixts. of toluene, chlorobenzene, or nitrobenzene, and petr. ether, was tested with respt to activity. The plotted curves from the exptl. results appeared to follow Langmuir's adsorption isotherms.

4818. SMITH, EDGAR D. AND LEROSEN, ARTHUR L. **Effect of side chain on the chromatographic adsorption of some ketones.** *Anal. Chem.* **23**, 732-5 (1951).—*C.A.* 45, 7407*i*.

The effect of the side chain on the strength of chromatographic adsorption on $CaCO_3$, silicic acid, and Florisil was studied, also included were the straight-chain methyl ketones from C_3 to C_{20}. The rates of movement of the adsorbate zones down the adsorbent columns were used as a measure of adsorption strengths. Generally, the ketones appeared to be adsorbed because of interactions between carbonyl-O and the adsorbent. The heavier the side chain, the smaller was the adsorption strength, although in certain cases periodic increases in adsorption affinity were observed with increasing length of side chain.

4819. THOMAS, HENRY C. **Solid diffusion in chromatography.** *J. Chem. Phys.* **19**, 1213 (1951).—*C.A.* 46, 3366*h*.

The simple case of isotopic exchange, where a linear isotherm was to be found, was treated for a slightly idealized system. If 2 columns, differing in length and in the radii of the spheres of adsorbent, were set up, the breakthrough curve of one should be immediately deducible from that of the other.

4820. ULMANN, M. **Chromatographic studies on the decomposition of potato starch by malt amylase.** *Biochem. Z.* **321**, 377-87 (1951).—*C.A.* 45, 7810*h*.

The selective adsorption of Al_2O_3 (treated or untreated with HCl) has been utilized to study the digestive products of potato starch chromatographically. The amylase prepn. very rapidly splits the complex aggregates between amylose and amylopectin. The further hydrolysis of the latter leads to the formation of 2 dextrins which give a brown reaction with I_2 and which can be sepd. on Al_2O_3.

4821. ULMANN, M. **Changes of state (phase) in diluted starch solutions. I. Chromatographic investigations.** *Kolloid-Z.* **123**, 105-13 (1951).—*C.A.* 46, 8930*c*.

A bipartite (acid-basic) Al_2O_3 column was found best-suited for the chromatography of starch; 0.0025 *N* I-KI soln. was used to make the adsorbed starch particles visible. Depending on degree of diln. and on mech. treatment of the soln. (shaking) characteristic zone changes were obtained on the chromatographic column. Potato-starch solns. showed more complicated conditions than correspondingly concd. pudding-flour solns. Shaken solns. were more easily filtered and showed a different chromatogram.

4822. WISE, W. S. **Chromatographic estimation of aqueous solutions of acids.** *Analyst* **76**, 316-17 (1951).—*C.A.* 45, 6968*d*.

To eliminate the necessity of dissolving in a solvent before placing on the column, a little silica gel was added to the acid. The aliquot used should contain about 0.001 equiv. of total acid. A mixt. of 28.1% butyric acid, 15.6% propionic acid, 39.1% acetic acid, and 17.2% formic acid, gave the respective values 28.4, 15.1, 39.5, and 17.1%.

4823. YANOVSKII, M. I. **Chromatographic method of determination of adsorption isotherms, isobars, and isosteres.** *Zhur. Priklad. Khim.* **24**, 661-6 (1951).—*C.A.* 47, 22*b*.

The adsorption isotherm was derived from the chromatographic desorption curve by graphic integration. Isobars and isosteres were detd. from series of desorption curves at different temps.

4824. ZECHMEISTER, L. **Paper disk columns in glass chromatographic tubes.** *Science* **113**, 35-6 (1951).—*C.A.* 45, 3204*d*.

A Tswett tube could be packed with filter paper disks if the latter were cut with a precision punch and die to a diam. equal to the av. inside diam.= 0.05 cm of the tube. This app. had the advantages of the chromatopile and those of a closed system.

4825. ZHUKHOVITSKII, A. A.; ZOLOTAREVA, O. V.; SOKOLOV, V. A., AND TURKEL'TAUB, N. M. **New method of chromatographic analysis.** *Doklady Akad. Nauk S.S.S.R.* **77**, 435-8 (1951).—*C.A.* 46, 11011*b*.

A stream of diluent (air) was applied while the furnace which heats consecutive sections of the adsorbing column, and causes desorption, was moved down the column. This "chromathermographic" method permitted variation of the velocity of the air stream, the temp. of the furnace, and its velocity. The air stream distributed the components at different spots of the temp. field, and kept them sepd. by preventing either acceleration or slowing down. The method was illustrated by a plot of sepn. of 105 g of a mixt. $CH_4 + C_2H_6 + C_2H_4 + C_3H_8 + C_3H_6 + C_4H_8 + iso\text{-}C_4H_8$, in terms of the vol. of air passed for $\alpha = 40$ cc/min., $d = 1\text{-}2$ mm, $V/n = 60$ m, $T_n = 150\,°C$. The plot showed 7 distinct peaks.

4826. Alm, R. S.; Williams, R. J. P., and Tiselius, Arne. **Gradient elution analysis. I. A general treatment.** *Acta Chem. Scand.* **6**, 826-36 (1952) (in English).—*C.A.* **47**, 6301*h*.

An eluting medium was used whose compn. was continuously changed by the addn. of a solvent of high eluting power at a known rate to a known initial vol. of another solvent of lower eluting power in a mixing chamber which drained into the column.

4827. Alm, R. S. **Gradient elution analysis. II. Oligosaccharides.** *Acta Chem. Scand.* **6**, 1186-93 (1952) (in English).—*C.A.* **47**, 6301*i*.

Gradient elution analysis was used in a chromatographic analysis of α-Schardinger dextrin contg. a mixt. of mono- to hexasaccharides and dextrin. Charcoal was mixed with an equal amt. of Celite and pretreated by satn. in a column with stearic acid in 96% EtOH; the charcoal was filtered, stirred with 50% EtOH, and again filtered; the operation was repeated with 20% EtOH and 100 fractions (0.5 cc. each) obtained.

4828. Al-Mahdi, A. K. and Wilson, Cecil L. **Chromatography of organo-metallic complexes. II.** *Mikrochemie ver. Mikrochim. Acta* **40**, 138-40 (1952).—*C.A.* **47**, 2643*h*.

Pairs of inorg. cations were sepd. by means of the complexes formed with Na diethyldithiocarbamate with the solvents $CHCl_3$ or C_6H_6 and a column filled with activated Al_2O_3. All possible binary combinations of Co^{++}, Cu^{++}, Fe^{+++}, and Ni^{++} were studied. In about half the cases, a very satisfactory sepn. was possible.

4829. Boggs, L. A.; Cuendet, L. S.; Dubois, Michel, and Smith, Fred. **Simple fractionating device for chromatographic analysis. Application to the study of carbohydrates.** *Anal. Chem.* **24**, 1148-51 (1952).—*C.A.* **47**, 4660*e*.

The construction and operation of an app. of general use for collecting 200 fractions of eluates from a chromatographic column was described. By the use of phenol satd. with H_2O and a column of cellulose powder a no. of simple sugars have been sepd. By using methyl ethyl ketone-H_2O azeotrope as the solvent. mixts. of methylated sugars could be readily resolved into their components.

4830. Burstall, F. H.; Swain, Patricia; Williams, A. F., and Wood, G. A. **Inorganic chromatography on cellulose. XI. Separation of tantalum from niobium and its application to quantitative analysis.** *J. Chem. Soc.* **1952**, 1497-1504.—*C.A.* **47**, 3753*i*.

To the metals or oxides in a Pt dish, add a few drops of water, a little HNO_3, and 5-10 ml of 20 *N* HF. Evap. to dryness. To the residue add 1 g NH_4F, 6 ml of water, and 2 ml of HF. Prep. a column from a slurry of cellulose in EtCOMe. After passing through the column, the Ta and Nb were nearly completely retained. Ext. the Ta with EtCOMe satd. with water and the Nb with a soln. of 7.5 ml HF in 92.5 ml of EtCOMe.

4831. Burstall, F. H. and Williams, A. F. **Inorganic chromatography on cellulose. Determination of tantalum and niobium in high and low-grade complex minerals and ores.** *Analyst* **77**, 983-99 (1952).—*C.A.* **47**, 1537*f*.

Moisten the weighed metals or oxides in a Pt dish, add a few drops of HNO_3 and 10-20 ml of 40% HF. Finally, evap. the resulting soln. to dryness and dissolve the residue in exactly 8 ml of dild. HF. Cover, heat, and after 10 min. add 1 g of NH_4F and heat for another 10 min. in the covered dish. Ext. this soln. with a column of activated cellulose, and treat the column with 100 ml of a soln. of EtCOMe satd. with water. In all, use 250 ml of this solvent. The eluate will then contain the Ta fraction. Then by a mixt. of 7.5 ml of 40% HF to each 92.5 ml of EtCOMe, ext. the Nb.

4832. Chapon, L. **Simple apparatus for the automatic collection of fractions in microchromatography.** *Bull. soc. chim. France* **1952**, 538-9.—*C.A.* **46**, 9346*d*.

Each fraction was collected in a siphon which emptied into one of a no. of flasks on a turntable; the decrease in wt of the siphon during emptying caused the breaking of an elec. contact which made the table turn until the next flask was in position to receive the next fraction.

4833. Cheftel, Rose Irène; Munier, Roger, and Macheboeuf, Michel. **Microchromatography ou paper of nonvolatile, water-soluble aliphatic acids. II. Utilization of an alkaline solvent phase followed by an acid solvent phase for two-dimensional chromatography.** *Bull. soc. chim. biol.* **34**, 380-7 (1952).—*C.A.* **47**, 1008*i*.

The sepn. and identification of oxalic, malonic, succinic, fumaric, maleic, malic, adipic, sebacic, glycolic, lactic, citric, tartaric, and aconitic acids were studied.

4834. Danielsson, Carl Erik. **A new type of preparative chromatographic paper column.** *Arkiv Kemi* **5**, 173-6 (1952) (in English).—*C.A.* **47**, 5634*b*.

A cylinder, 30 cm high and 10 cm in diam. was made by rolling filter paper on a 1-cm rod. The interior was filled with paraffin. Rings of filter paper (8 cm outside, 3 cm inside diam.) contg. the soln. to be examd. were placed on the cylinder. A 2nd cylinder, 10 cm high with a hole on the topside, served as a cap. The solvent in the top was maintained at a const. level by being fed from an inverted flask. Zones of const. compn. of valine, alanine, and glycine were found at 35, 45, and 57 mm from the center.

4835. DiModica, G. and Rossi, P. F. **Separation by chromatography of unsaturated organic acids.** *Chim. anal.* **34**, 271-3 (1952).—*C.A.* **47**, 1543*i*.

Special attention was given to linoleic and linolenic acids. A soln. in acetone was poured on a very cold column of Al_2O_3 and the column was eluted with acetone under slight pressure of N_2. The least sol. linolenic acid was absorbed more than the more sol. linoleic acid which, in turn, was absorbed more than was the still more sol. oleic acid.

4836. Donaldson, Kenneth O.; Tulane, Victor J., and Marshall, Lawrence M. **Automatically increasing solvent polarity in chromatography.** *Anal. Chem.* **24**, 185-9 (1952).—*C.A.* **46**, 4862*b*.

An automatic device was described that permitted the delivery of solvent gradually increasing in polarity for better resolution of org. acids on silica gel columns.

4837. Drake, Birger. **Chromatography combined with automatic recording of electrolytic conductivity. I. Description of an apparatus and applications to the analysis of amino acids and peptides.** *Arkiv Kemi* **4**, 401-20 (1952) (in English).—*C.A.* **47**, 1544*f*.

An automatic continuous recording of the resistances due to concn. changes in eluates from adsorption columns was described. An "unbalanced voltage" was fed through an amplifier to a phase-discriminating circuit; the output was applied to an elec.-mech. arrangement controlling one of the bridge resistances so that balance was restored. The advantages were a linear response to concn. changes.

4838. Drake, Birger and Gardell, Sven. **Chromatography combined with automatic recording of electrolytic conductivity. II. The analysis of a mixture of glucosamine and galactosamine.** *Arkiv Kemi* **4**, 469-72 (1952) (in English).—*C.A.* **47**, 1544*h*.

The electrolytic resistance of the effluent from a chromatographic column filled with Dowex 50 was recorded automatically and continuously. The column was calibrated with known solns. and mixts. of glucosamine and galactosamine hydrochlorides. The amts. of these in the hydrolyzate of a polysaccharide from beef cornea were then detd. by this method, and colorimetrically.

4839. Drew, Frederick D.; Marshall, Lawrence M., and Friedberg, Felix. **Separation of keto acids by cellulose columns.** *J. Am. Chem. Soc.* **74**, 1852-3 (1952).—*C.A.* **47**, 5846*h*.

γ-Methiol-α-ketobutyric, α-ketobutyric, pyruvic, oxalacetic, and α-ketoglutaric acids were sepd. by adsorption on Solka-Floc BW100 and elution with BuOH-decyl alc. with gradually increasing concn. of BuOH. The acids emerged in the order given.

4840. Duin, H. van. **Partition chromatography of homologous series.** *Biochim. et Biophys. Acta* **9**, 580 (1952).—*C.A.* **47**, 2245*e*.

The concept of retention vol. was introduced to derive a relation for partition chromatography of homologs. Once the slope for a given aliphatic series had been established, it was possible to identify homologs by their retention vols. when the behavior of one member of the series on the column was known.

4841. Dustin, J. P. **Description of a chromatographic fraction collector for multiple applications.** *Ind. chim. belge* **17**, 257-60 (1952).—*C.A.* **46**, 6867*a*.

An app. was described based on the photoelectrical principle. It was possible to collect simultaneously 4 series of 180 fractions of 10 ml or corresponding amts. of larger fractions.

4842. Faucher, Joseph A. Jr.; Southworth, Raymond W., and Thomas, Henry C. **Adsorption studies on clay minerals. I. Chromatography on clays.** *J. Chem. Phys.* **20**, 157-60 (1952).—*C.A.* **46**, 6459*h*.

With the aid of chromatographic columns contg. a clay mineral dispersed on asbestos, ion-exchange processes were studied. The results of isotopic exchanges showed that the columns did not run under equil. conditions. A correction procedure was possible which served to produce isotherms for cases of true ion exchange.

4843. Fillinger, Harriett H. and Trafton, Lois Ann. **Chromatographic analysis for metal ions.** *J. Chem. Education* **29**, 285-7 (1952).—*C.A.* **46**, 7472*f*.

In the analysis of group I, of the cations, a single Al_2O_3 column and 1 reagent, K_2CrO_4, sufficed; reddish-orange (Hg), yellow (Pb), and dark rust-colored (Ag) bands were obtained in the order stated (top to bottom). For the Cu group, one Al_2O_3 column and 3 reagents were used; *p*-dimethylaminobenzylidenerhodanine in EtOH, Na_2SnO_2, and Na_2S. For the As group, 3 columns and 3 reagents were required; a hot concd. soln. of $Na_2S_2O_3$, a satd. soln. of cacotheline, and a strong soln. of $AgNO_3$. For the Zn group, 2 columns and 4 reagents were used; concd. $K_3Fe(CN)_6$ soln., diethylaniline in H_2SO_4, a fresh mixt. of $NaBiO_3$ and HNO_3, and a soln. of KCNS in Me_2CO. For the Al group, 2 columns and 4 reagents: $Pb(NO_3)_2$, $K_4Fe(CN)_6$, dimethylglyoxime, and Aluminon. For the alk. earth group, 2 columns and 2 reagents were necessary: (*p*-nitrophenylazo) resorcinol and NaOH.

4844. Gapon, E. N. and Belen'kaya, I. M. **Precipitation chromatography of ions.** *Kolloid. Zhur.* **14**, 323-37 (1952).—*C.A.* **47**, 1459*h*.

If a soln. of 2 metal nitrates was filtered through a column of a mixt. of NaI with Al_2O_3 or silica gel, 2 iodide layers formed; AgI was prepd. above (i.e. before) HgI_2 which pptd. before $BiI_3 \rightarrow PbI_2 \rightarrow Cu_2I_2$. After the completion of the filtration, the iodide zones might contract to rings, or move up the column, or form new ppts. (of Ag_2HgI_4, $AgBiI_4$, or $PbHgI_4$), or become sepd. by a coloreless zone (if HgI_2 was one of the components). HgI_2 alone might form 2 zones, namely of the yellow (below) and the red (above) modifications. Analogous zones occurred when metal nitrates were filtered through a column moistened with a Na silicate soln.; Al_2O_3 and starch could not be used instead of silica gel. The earliest ppt. was $HgSiO_3$, followed by $Fe(OH)_3$, UO_2SiO_3, $CuSiO_3$, Ag_2SiO_3, $CoSiO_3$, and $NiSiO_3$, in this order, except that Co and Ni gave a common zone.

4845. Glenn, R. A.; Wolfarth, Joy S., and Dewalt, C. W. Jr. **Refractometric adsorption analyses. Use of automatic recording differential refractometer.** *Anal. Chem.* **24**, 1138-43 (1952).—*C.A.* **46**, 9461*e*.

The battery-operated, continuous, automatic recording differential refractometer was adapted for following the progress of liquid chromatographs of colorless materials. Integration of the area under the curve in a refractogram obtained by the use of the automatic recording refractometer permitted detn. of the individual components in the percolate from an adsorption column by utilizing the additive property of the *n*. Quant. refractometric adsorption analyses according to this technique were reported for the first time. Analyses of methylcyclohexane-toluene mixts. on silica gel were presented.

4846. Heinrich, Gisela. **Temperature dependence of column chromatography of electrolyte solutions.** *Naturwissenschaften* **39**, 257 (1952).—*C.A.* **47**, 6302*c*.

Expts. on chromatography of $CuSO_4$ solns. on standard Brockmann Al_2O_3 columns at temps. ranging from 20° to 80°C indicated that the duration of the test decreased from 61 to 47 min. and that at higher temps. up to 75% increased adsorption of the ions took place. This held for different types of Al_2O_3, for Ni as well as for Cu, and at concns. varying from 0.8 to 0.1*M*.

4847. Hesse, G.; Daniel, Irmgard, and Wohlleben, G. **Aluminum oxide preparations for chromatographic analysis and experiments on their standardization.** *Angew. Chem.* **64**, 103-7 (1952).—*C.A.* **46**, 6338*i*.

A no. of chromatographic adsorbents were evaluated for filtration speed, adsorption activity, activity series for a no. of different org. compds., activity stages, exchange activities, and adsorption velocity. Three types of Al_2O_3 prepns. were developed which possess const. properties.

4848. Higuchi, Takeru; Hill, Norman C., and Corcoran, Geraldine B. **Chromatographic separation and determination of dicarboxylic acids, C_4 to C_{10}.** *Anal. Chem.* **24**, 491-3 (1952).—*C.A.* **46**, 6039*g*.

Sebacic, azelaic, suberic, pimelic, and lower straight-chain dicarboxylic acids in mixts. contg. any or all of these acids were detd. The method, a modification of that of Marvel and Rands was based on chromatographic sepn. of the acidic components on a partition column with either pH 5.40 citrate buffer (for sepn. of acids above adipic) or water (for sepn. of acids below adipic) as the internal phase.

4849. Hilliard, Leland B. and Freiser, Henry. **Chromatographic separation of metallic chelates.** *Anal. Chem.* **24**, 752-4 (1952).—*C.A.* **46**, 11041*h*.

Various metals were sepd. by adsorption chromatography of $CHCl_3$ solns. of metallic 8-hydroxyquinolinates on silicic acid columns and elution with $CHCl_3$ and $CHCl_3$-EtOH mixts. Cu(II), Ni(II), Co(II), Fe(III), Al(III), Ga(III), and In(III) were sepd. by this procedure after extn. from aq. soln. at pH 5.0 and Pb(II), Bi(III), Zn(II), and Cd(II) after estn. at pH 10.0.

4850. Huisman, T. H. J. and Krans, S. A. **A simple fractionator for column chromatography.** *Chem. Weekblad* **48**, 1007-9 (1952).—*C.A.* **47**, 5180*d*.

The collector consisted of a sheet metal top and bottom circle 65 cm diam. About 120 holes were drilled around the edge to receive glass collecting tubes. An elec. clock and relay caused the ring to move one space at predetd. intervals. It was used to sep. amino acids from urine by the use of Dowex 50.

4851. James, A. T. and Martin, A. J. P. **Gas-liquid partition chromatography. A technique of the analysis of volatile minerals.** *Analyst* **77**, 915-32 (1952).—*C.A.* **47**, 1529*e*.

A gas-liquid partition column for the sepn. of volatile acids and bases and an automatic buret for detection and detn. by titration was described. With 4-ft columns having a stationary phase consisting of a mixt. of a liquid silicone and stearic acid, all normal and iso acids from formic to undecanoic acid could be sepd., and by the use of a 11-ft column all the isomers of valeric acid could be resolved. In sepg. volatile bases, advantage was taken of their H-bonding power so that by the use of H-bonding and non-H-bonding stationary phases, many amines could be sepd. and different types of amines distinguished.

4852. Kegeles, Gerson and Sober, Herbert A. **Automatic recorder for interferometry and refractometry of streaming solutions. Applicable to chromatographic analysis.** *Anal. Chem.* **24**, 654-60 (1952).—*C.A.* **46**, 6869*c*.

An instrument which used a cell-focusing cylindrical-lens optical system together with a vertically driven photographic plate combined with an interferometer and an automatic-recording prism cell was described. The instrument could be employed as an automatic-recording prism-cell device, as a continuous-recording interferometer with monochromatic light, or as a continuous concn. gradient recorder.

4853. Kember, N. F. **Inorganic chromatography on cellulose. VII. Determination of thorium in monazite and of thorium and uranium in uranothorianite.** *Analyst* **77**, 78-85 (1952).—*C.A.* **46**, 3454*f*.

The procedure consisted in prepg. a HNO_3 soln. of monazite sand free from phosphate and allowing it to percolate through a cellulose column previously prepd. in ether contg. 12% HNO_3. $Th(NO_3)_4$ passed quantitatively into the solvent but most other inorg. compds. remained in the column. The ether was removed and the Th recovered from the eluate by pptn. as oxalate and ignition to ThO_2. The method could also be used in the analysis of uranothorianite for both U and Th.

4854. Kirkwood, John G. and Brown, Raymond A. **Diffusion-convection. A new method for the fractionation of macromolecules.** *J. Am. Chem. Soc.* **74**, 1056-8 (1952).—*C.A.* **46**, 5406*d*.

The new method proposed was based on the principles of the Clusius column. Horizontal transport of the macromol. components in a vertical convection channel was produced by thermodynamic interaction with a diffusing low-mol.-wt substance to which the channel walls were permeable.

4855. Kurtz, Floyd E. **Chromatography of methyl stearate, methyl oleate, methyl linoleate, and methyl linolenate: a concept of amplified chromatographic separations.** *J. Am. Chem. Soc.* **74**, 1902-9 (1952).—*C.A.* **47**, 6310*c*.

More effective sepn. than previously reported of C_{18} esters, judged on the basis of completeness and time involved, were obtained. More effective sepns. than otherwise obtainable were predicted by the proper use of solutes of intermediate adsorption affinities.

4856. Lapidus, Leon and Amundson, Neal R. **Mathematics of adsorption in beds. VI. The effect of longitudinal diffusion in ion-exchange and chromatographic columns.** *J. Phys. Chem.* **56,** 984-8 (1952).—*C.A.* **47,** 9065*c*.

Equations were derived for cases of local equil. and of mass transfer at particle surface in which equil. was linear. Calcd. results for local equil. showed that sharp boundaries were smoothed out for low ratios of fluid velocity to diffusion coeff.

4857. Laskowski, D. E. and Putscher, R. E. **Dielectric indicator for column chromatography.** *Anal. Chem.* **24,** 965-9 (1952).—*C.A.* **46,** 8902*g*.

The feasibility was detd. of using the oscillator section of a thermal regulator (Thermocap relay) as a dielec.-const.-sensitive device for detecting colorless components in the effluent stream of a chromatographic column.

4858. LeRosen, Arthur L.; Movarek, Richard T., and Carlton, Jack K. **Streak reagents for chromatography.** *Anal. Chem.* **24,** 1335-6 (1952).—*C.A.* **46,** 11017*i*.

A number of streak reagents were used for the detection of org. compds. on silicic acid columns.

4859. Lien, Oliver G. Jr.; Peterson, Elbert A., and Greenberg, David M. **Automatic fraction collector for column chromatography.** *Anal. Chem.* **24,** 920-1 (1952).—*C.A.* **47,** 3*d*.

Description of a device for the collection and drying of radioactive fractions directly in the counting planchets. The app. operated on the const. time-interval principle and involved a continuously rotating table and an automatically positioned delivery tip.

4860. Lister, B. A. J. **The chromatographic purification of inorganic salts on activated alumina.** *J. Applied Chem.* (London) **2,** 280-3 (1952).—*C.A.* **46,** 8555*c*.

Solns. of Zn, Cd, Mn, Mg, Ca, Sr, and Ba salts, and of Na and NH_4 tungstates were freed from trace impurities of Fe, Cu, Ag, and Pb by one pass through a column of activated alumina. In most cases the contaminant contents of the resulting solns. were <2.0 p.p.m. Fe was the least completely removed, owing to the presence of colloidal $Fe(OH)_3$.

4861. Löfgren, Nils M. **Qualitative separation of purines, pyrimidines, and nucleosides by paper chromatography.** *Acta Chem. Scand.* **6,** 1030-5 (1952) (in English).—*C.A.* **47,** 3759*b*.

On strip paper the components of any mixt. of adenine, guanine, xanthine, hypoxanthine, cytosine, uracil, thymine, adenosine, guanosine, cytidine, uridine, and thymidine could be identified in ultraviolet light.

4862. Marshall, Lawrence M.; Donaldson, Kenneth O., and Friedberg, Felix. **Chromatographic resolution of organic acids with progressively changing solvents.** *Anal. Chem.* **24,** 773-5 (1952).—*C.A.* **47,** 72*c*.

A technique was described for computing chromatographic positions and the migration of several org. acids in several solvent systems. This permitted the chromatographic procedure to be scaled upward or downward. The possibilities of this newer type of chromatography were illustrated by exptl. data.

4863. Mercer, R. A. and Williams, A. F. **Inorganic chromatography on cellulose. XIII. Determination of tantalum and niobium in low-grade phosphatic and siliceous ores.** *J. Chem. Soc.* **1952,** 3399-3403.—*C.A.* **47,** 1537*d*.

The chromatographic method was extended to ores contg. less than 0.1% $Ta_2O_5 + Nb_2O_5$. The sample was digested with $HCl + NH_4F$ and placed on a column of cellulose. Ta was extd. with EtCOMe which was satd. with water and the column was then equilibrated with EtCOMe contg. 12.5% of 40% HF by vol. In one procedure, the sample was chromatographed directly and, in the other, a preliminary acid hydrolysis treatment was given in order to get rid of most common cations. For low-grade ores, 10 g of sample were needed to get weighable quantities of $Ta_2O_5 + Nb_2O_5$ and a preliminary sepn. of these earth acids was necessary.

4864. Miller, John M. and Kirchner, J. G. **Improvements in chromatographic techniques for terpenes.** *Anal. Chem.* **24,** 1480-2 (1952).—*C.A.* **46,** 11050*e*.

Chromatostrips were used to check the effluent fractions from a silica (with 5% starch) column. Details were given for the prepn. of this adsorbent. The filling of the column with an aq. slurry was shown to give more uniform zones than dry packing.

4865. Misato, Tomomasa and Fukunage, Kazuo. **Determination of γ-BHC by chromatography.** *J. Agr. Chem. Soc. Japan* **26,** 24-7 (1952).—*C.A.* **47,** 5605*c*.

The partition chromatographic method was improved, and the amts. of reagents (hexane, nitromethane, silica gel, etc.) and the size of app. were reduced $\frac{1}{3}$-$\frac{1}{5}$. By this method γ-BHC was sepd. from the other isomers and hepta- and octachlorocyclohexane with accuracy.

4866. Monaghan, P. H.; Moseley, P. B.; Burkhalter, T. S., and Nance, O. A. **Detection of chromatographic zones by means of high-frequency oscillators.** *Anal. Chem.* **24,** 193-5 (1952).—*C.A.* **46,** 4860*b*.

An app. was described for the detection of colorless zones on chromatographic columns. Portions of the columns under test were placed between the plates of a capacitor in the tank circuit of a high radiofrequency oscillator.

4867. Mottier, M. and Potterat, M. **Study of some liposoluble dyes by chromatography with alumina disks. Fixation of chromatograms on alumina disks.** *Mitt. Lebensm. Hyg.* **43,** 118-23; 123-5 (1952) (in French).—*C.A.* **46,** 7942*f*.

The soln. to be examd. was dropped from a pipet onto the center of an alumina disk and eluated with the following solvents: pentane, CCl_4, benzine, $CHCl_3$, ether, acetone, abs. alc., and H_2O. Since the disks were very sensitive, their fixation by satg. them with melted paraffin was suggested.

4868. Ovenston, T. C. J. **Double zoning and the homogeneity test in column chromatography.** *Nature* **169**, 924-5 (1952).—*C.A.* 46, 11011*f*.

The homogeneity test was affected by double zoning which may occur when the column is treated with a weakly developing solvent following earlier treatment with a stronger one either in a prewashing step or during actual development of the chromatogram. Secondary zones may also occur when adsorbates undergo chemical change during chromatography or by the action of light or oxidation on inactive adsorbents. Confirmation of one zone should be made.

4869. Parker, C. A. **Chromatography of rubber accelerators and antioxidants on silica gel.** *Nature* **170**, 539-40 (1952).—*C.A.* 47, 2528*e*.

Silica gel (Celite) permitted chromatographic adsorption of some compds. from acetone exts. of vulcanized rubbers without the destruction of labile compds., as occurred when Al_2O_3 columns were used. Portions of the ext. corresponding to 0.2-0.4 g of rubber were chromatographed on a column 1 cm in diam. The positions of the zones were found by streaking the extruded columns with appropriate reagents.

4870. Pearl, Irwin A. and Beyer, Donald L. **Separation of vanillic and protocatechuic acids by chromatography.** *Anal. Chem.* **24**, 1366 (1952).—*C.A.* 46, 11050*h*.

The acids were sepd. on a Magnesol column (acid-washed, air-dried overnight, and moistened with benzene) and eluted with benzene-EtOH (10:1). The extruded column was streaked with $FeCl_3$ and the zones were extd. with acetone; recoveries were 97% of each acid from mixts.

4871. Roginskiĭ, S. Z. and Yanovskiĭ, M. I. **Theory of chromatography on nonhomogeneous surfaces. I. Determination of the distribution function of portions of a solid surface over heats of adsorption from the desorption curves.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1952**, 59-63.—*C.A.* 46, 6897*f*.

Given an exptl. adsorption curve $\Phi(c)$, the distribution function could be derived by graphic differentiation $\rho(Q) = (1/RT)d\Phi(c)/d \ln c$. Practically, the detn. of the adsorption isotherm in the range of small coverages may present difficulties. In such cases, use could be made of the desorption curves. With the aid of the fundamental equation of chromatography, valid for both adsorption and for desorption in a stream of pure solvent, $\rho(Q) = cV/MxRT$, where V = vol. of solvent (or diluent gas) passed, x = distance from the entrance of the column, and M = wt of one cm of the adsorption layer.

4872. Roginskiĭ, S. Z. and Yanovskiĭ, M. I. **Theory of chromatography on nonhomogeneous surfaces. III. Dynamics of the adsorption of mixtures on nonhomogeneous surfaces.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1952**, 64-73.—*C.A.* 46, 6898*c*.

The case of a mixt. of 2 adsorbable substances was detd. by the functional relation $Q_2 = \phi(Q_1)$ between the heats of adsorption Q_1 and Q_2 of the 2 components on the same portion of the surface. With a mixt. of one less adsorbable component 1 and more readily adsorbable component 2 passed in a vol. V_0 of carrier gas, two sorption waves developed, the 1st of which contained 1 at a concn. c_1^1 higher than its initial c_1^0. At const. ratio c_2^0/c_1^0, a decrease of the sum $c_1^0 + c_2^0$ caused the range occupied by component 1 to decrease gradually.

4873. Ryan, W. and Williams, A. F. **Inorganic chromatography on cellulose. VIII. The use of a "compound column" of alumina and cellulose for the determination of uranium in minerals and ores containing arsenic and molybdenum.** *Analyst* 77, 293-6 (1952).—*C.A.* 46, 7470*g*.

By adding activated Al_2O_3 to the cellulose and placing the mixt. on top of the usual cellulose column and with ether-HNO_3 as eluant the Mo and As are adsorbed while U passes into the eluate. Decomp. the sample contg. the equiv. of 100-150 mg. of U_3O_8 with $HNO_3 + HF$, remove the latter by repeated evapn. with HNO_3 and, if necessary, fuse any residue with KOH in a Ni crucible. Evap. to dryness, add 4 ml. of 25% HNO_3 and add the cool soln. to the adsorbing column.

4874. Sato, Takuya R.; Norris, William P., and Strain, Harold H. **Apparatus for continuous electrochromatography.** *Anal. Chem.* **24**, 776-8 (1952).—*C.A.* 47, 1*f*.

The construction of 12-in. and 24-in. electrochromatographic cells and their supports was described. The quant. sepn. and recovery of Ca^{45++}, $P^{32}O_4^{---}$, and Ag^+ from CrO_4^{--} were described. The high potential across the cell presented considerable hazard during its operation.

4875. Sen, Binayendra Nath. **Chromatography with calcium sulfate rods in the qualitative copper-cadium and arsenic-antimony-tin separations.** *Z. anorg. u. allgem. Chem.* **268**, 99-100 (1952).—*C.A.* 46, 6995*g*.

A $CaSO_4$ rod on which there were 1 or 2 drops of unknown soln. was placed in a test tube contg. dil. HCl so that the unknown soln. was 2-4 cm above the HCl surface. After the HCl soln. had stopped climbing, H_2S passed over the rod gave sulfide zones, the color of which indicated (a) Cd or Cu or (b) Sb, Sn, or As (the last named in each case moved the highest).

4876. Shemyakin, F. M. and Romanov, D. V. **Effect of the composition of zeolites on their chromatographic properties.** *Kolloid. Zhur.* 14, 376-8 (1952).—*C.A.* 47, 1460*b*.

The chromatographic efficiencies of 36 ppts. obtained by mixing NaOH, $Al_2(SO_4)_3$, and Na_2SiO_3 (in H_2O) in various ratios were compared. The mixts. (*a*) Na_2O 18.6, Al_2O_3 5.1, SiO_2 9.0 mol., (*b*) Na_2O 15.5, Al_2O_3 5.1, SiO_2 12.0, and (*c*) Na_2O 12.4, Al_2O_3 5.1, SiO_2 15.0 caused the best sepn. of Cu, Cr, Co, and Fe ions. The width x of a band increased with time t according to $x = x_0 (1-e^{-kt})$, where x_0 and k were const.

4877. Smith, E. D.; Mueller, William A., and Rogers, L. N. **Chromatographic determination of purity of chloroacetic acid.** *Anal. Chem.* **24**, 1117-19 (1952).—*C.A.* 46, 9471*f*.

The respective acid zones were located on the adsorbent column by use of acid-base indicator streak reagents and analyzed by cutting the zones out and then eluting and titrating each separately. The procedure provided a reasonably accurate analysis of chloroacetic acid, and, with somewhat less accuracy, detns. may also be made of AcOH and Cl_2HCCO_2H.

4878. SMITH, E. LESTER. **Pitfalls in partition chromatography.** *Nature* **169**, 60-2 (1952)

A single solute could give rise to two and sometimes three bands on kieselguhr partition chromatograms run with n-butanol. Double zoning could be caused by a water-logged film at the top of the column. A fall in temperature could produce this result. Alternatively, double zoning with vitamin B_{12b} as solute could be caused by an over-dry section at the top of the column arising from solvent under-saturated with water. Triple zoning could arise from the successive operation of both causative factors.

4879. ULMANN, M. **Starch chromatography.** *Stärke* **4**, 73-7 (1952).—*C.A.* **47**, 3593*a*.

Five ml of 0.1% starch soln. was adsorbed on 5-6 g of Al_2O_3 in an 8-mm tube and the chromatogram was developed with 0.0025 *N* iodine-KI soln. Treatment of the upper half of the column with 0.2% HCl gave an "acidic-basic" column resulting in more selective adsorption and better zone sepn. Amylopectin was adsorbed by acid-treated alumina; during development amylose moved to the basic alumina while amylopectin remained on the acidic alumina.

4880. ULMANN, M. **The amylose in potato starch; chromatographic investigations.** *Makromol. Chem.* **9**, 76-95 (1952).—*C.A.* **47**, 6688*e*.

When a starch soln. was chromatographed on an Al_2O_3 column, the upper part of which was acid (pH 4.5) and the lower basic (pH 8.2), amylopectin was held in the upper part and amylose in the border zone (pH 7) and the lower part. With I_2-KI soln., amylopectin was light violet, while amylose consisted of a central wide zone (medium blue) and narrow upper and lower zones (light blue). Amylose prepd. by adsorption to cellulose or $Al(OH)_3$ was shown to contain amylopectin.

4881. VANDENHEUVEL, F. A. AND HAYES, E. R. **Partition chromatography of aliphatic acids.** *Anal. Chem.* **24**, 960-5 (1952).—*C.A.* **46**, 9019*d*.

Details were given for packing and using a silicic acid column for the sepn. of C_2-C_{12} monocarboxylic acids and C_4-C_{10} dicarboxylic acids. Band boundaries were detected by allowing the eluate at const. flow rate to neutralize known vols. of 0.01 *N* NaOH added at timed intervals.

4882. WILLIAMS, A. F. **Inorganic chromatography on cellulose. IX. The use of alumina and cellulose adsorbents for the determination of thorium and the simultaneous determination of thorium and uranium in ores.** *Analyst* **77**, 297-306 (1952).—*C.A.* **46**, 7471*a*.

Although $Th(NO_3)_4$ could not be extd. from a cellulose adsorbent in the presence of phosphate by ether + HNO_3, an extn. could be made from an Al_2O_3 adsorbent. Then if there was a cellulose column beneath the Al_2O_3 column, $Th(NO_3)_4$ could be extd. free from other ions. The method was extended to the chromatographic detn. of U and Th in the same sample.

4883. WILLIAMS, R. J. P. **Gradient elution analysis.** *Analyst* **77**, 905-14 (1952).—*C.A.* **47**, 1530*c*.

Expts. were described on the resolution of amino acids and of peptides in cases where the standard procedures were unsatisfactory. In the gradient method described, there was also a temp. gradient along the column so that the procedure resembled a continuous fractional crystn. process.

4884. WILLIAMS, TREVOR I. AND WEIL, HERBERT. **Definition of chromatography.** *Nature* **170**, 503 (1952).—*C.A.* **47**, 3652*h*.

Chromatography was used in a different sense long before Tswett used the term. The definition proposed was: those processes that allow the resolution of mixts. by sepn. of components in concn. zones on or in phases different from those in which they were originally present, irrespective of the nature of the forces causing transfer of substances between phases.

4885. BISHOP, J. R. AND LIEBMANN, H. **Determination of aluminum and zinc after their chromatographic separation from tin-lead alloys.** *Analyst* **78**, 117-22 (1953).—*C.A.* **47**, 4240*h*.

Dissolve 2 g of alloy in 9 ml of concd. HBr + 1 ml of Br. Add 5 ml of 60% $HClO_4$ and boil until a clear colorless melt remains. Dissolve it in 70 ml of 6 *N* HCl, evap. to about 20 ml, add 20 ml of water, cool in ice, and filter off the $PbCl_2$. Evap. until fumes of $HClO_4$ cease, cool, add 10 ml of 6*N* HCl, cool in ice, and again filter. This soln. could be used for detg. Al but before detg. Zn further sepn. of $PbCl_2$ was necessary. To det. Zn, evap. to dryness, add 1 mg of Fe as $FeCl_3$ soln. and again evap. To the dry residue add a little 6*N* HCl and add 0.5 ml of *n*-BuOH. Transfer to a cellulose column and finally wash with 100 ml of eluent prepd. from 80 ml of 6*N* HCl + 1920 ml of freshly distd. BuOH. Det. the Zn polarographically and the Al similarly.

4886. DALE, JEAN C. AND KING, E. J. **Adsorption of dyes, amino acids, proteins, and metal hydroxides on quartz.** *Arch. Ind. Hyg. Occupational Med.* **7**, 484-9 (1953).—*C.A.* **47**, 12432*d*.

When powd. SiO_2 was treated with acid fuchsin, aurin, azocarmine, Biebrich scarlet, eosin, phloxine red, neutral red, acridine red, crystal violet, methyl green, Nile blue sulfate, thionine blue, and Victoria blue, only the last 7 listed, which were basic in reaction, were adsorbed. Proteins from cerebrospinal fluid, ascitic fluid, and serum may be adsorbed on SiO_2 particles, with the max. occuring near the isoelec. point.

4887. DUIN, H. VAN. **Partition chromatography of homologous series. II.** *Biochem. et Biophys. Acta* **10**, 198-9 (1953).—*C.A.* **47**, 4239*h*.

An extension of the use of partition curves for the identification of compds. of a homologous series.

4888. GUEST, R. J. **Determination of thorium in ores by the column method.** *Can. Dept. Mines* *and Tech. Surveys, Tech. Paper* No. 1, 24 pp. (1953).—*C.A.* 47, 6305*c*.

A rapid and accurate method was described for detg. 0.01-1.0% ThO_2 in ores. The column was prepd. from 50 g activated alumina, stirred to a homogeneous mass, with ether contg. 12.5% HNO_3. A procelain disk, covered by a disk of Whatman's 41 H paper, was placed in the bottom of the column. A 5-cm layer of activated cellulose was added with the aid of the ether-HNO_3 mixt. Activated alumina was added until a 6-cm layer was formed and this covered with the ether-nitric acid. The unknown soln. was transferred to the column and washed until 500 ml of effluent was obtained. If U was to be detd., or less than 1% Th was present, a second-column extn. was made. The U could be detd. as usual and the Th pptd. as oxalate from about 0.3 *N* HCl and ignited to ThO_2.

4889. Roubaud-Valette, J. **Theoretical study of chromatography.** *J. chim. phys.* **50**, 117-34 (1953).—*C.A.* 47, 6735*h*.

A detailed study of possible adsorption mechanisms led to 3 possible hypotheses; absorption in the interior of the gel and reversible or irreversible surface adsorption. Only the reversible surface adsorption could explain the exptl. results.

4890. Sen, Binayendra Nath. **Asbestos chromatography.** *Australian J. Sci.* **15**, 133 (1953).—*C.A.* 47, 4781*e*.

The technique of asbestos chromatography was extended to the following sepns.: Hg^+ from Pb^{++} (in *N* KI soln.), Hg^{++} from Pb^{++} (0.2 *N* KI), Hg^{++} from Cu^{++} (0.5 *N* KI), Pb^{++} from Cu^{++} (0.5 *N* KI), Cu^{++} from Fe^{+++} (H_2O with 15-20% PrOH), Fe^{+++} from Zn^{++} (dil. NH_4OH), Co^{++} from Ni^{++} (H_2O with 25-30% PrOH), and Mn^{++} from Zn^{++} (H_2O).

4891. Shuvaeva, G. M. and Gapon, E. N. **Secondary adsorption of ions on aluminate aluminum oxide.** *Zhur. Anal. Khim.* **8**, 50-2 (1953).—*C.A.* 47, 4687*e*.

Chromatographic tubes 0.6-1.0 cm. were filled with aluminate Al_2O_3 used as a suspension in 1 *N* HNO_3. The salt solns. used in these expts. were 1*N*. The following solns. were passed: $CuSO_4 + Cu(NO_3)_2$, $CoSO_4 + Co(NO_3)_2$, $NiSO_4 + NiCl_2$, $UO_2(NO_3)_2 + K_2SO_4$, $Cr_2(SO_4)_3 + UO_2(NO_3)_2 + K_2SO_4$, $UO_2(NO_3)_2 + K_2SO_4 + CuSO_4$, $Cr_2(SO_4)_3 + CuSO_4$, $CuSO_4 + CoSO_4$, $CuSO_4 + NiSO_4$, and $CoSO_4 + NiSO_4$. Formation of secondary-ion-exchange chromatograms on the anion exchanging Al_2O_3 corresponded to the adsorption of ions on cation-exchanging Al_2O_3.

4892. Vanselow, W. and James, T. H. **Influence of quaternary salts on photographic development and their effectiveness as chromatographic developers.** *PSA Journal* **19B**, 36-9 (1953).—*C.A.* 47, 2071*d*.

The relative effectiveness of several quaternary salts in displacing adsorbed carbocyanine and merocyanine dyes from AgBr was detd. in a chromatographic column. The effectiveness in a series of pyridinium salts increased in the order: methyl, *n*-heptyl, *n*-nonyl, *n*-decyl, *n*-undecyl, *n*-dodecyl. The effectiveness of a given quarternary ion in displacing an adsorbed merocyanine dye increased markedly when excess KBr was added to the soln.

II-10. Chromatography on Paper

4893. Flood, H. and Smedsaas, A. **The adsorption series in inorganic capillarity analysis (chromatography).** *Tids. Kjemi, Bergvesen Met.* **1**, 150-1 (1941).—*C.A.* 37, 4319³.

With the new technique and with paper impregnated with Al_2O_3 as adsorbent, the adsorption series, aside from the position of Cd between Zn and Ni-Co, of certain ions in aq. soln. agreed well with previous work. TiO^{++} was between Sb^{+++} and Bi^{+++}, VO^{++} between Pb^{++} and Cu, Sn^{++++} (hard to develop but after reduction with Fe powder detectable with cacothelin in the series near H^+), Sn^{++} before Fe^{+++} and after Sb^{+++}, and Ba^{++}, Sr^{++} and Ca^{++} after Mn^{++}.

4894. Krüger, Deodata. **The absorption of methylene blue by cellulose.** *Klepzig's Textil-Z.* **44**, 647-50 (1941).—*C.A.* 36, 5641³.

In threads and foils of regenerated cellulose the absorption of methylene blue was considered to be a typical adsorption phenomenon whose range depended on the size of the surface available to the dye mols. which formed a unimol. layer on top of this surface. In the case of oxycelluloses (superbleached cellulose) the amt. of methylene blue taken up under definite conditions was taken as an empirical measure of the formation of carboxyl groups formed from the primary alc. groups of the cellulose chain mols. under the influence of the oxidizing medium.

4895. Flood, H. and Smedsaas, A. **The influence of cations upon one another in inorganic capillarity analysis.** *Tids. Kjemi, Bergvesen Met.* **2**, 1-5 (1942).—*C.A.* 37, 4319⁵.

If $M_2{}^+$ was adsorbed less readily than $M_1{}^+$, then when $M_2{}^+$ was added to a soln. contg. $M_1{}^+$, the chromatographic zone of $M_1{}^+$ increased as the concn. of $M_2{}^+$ increased. The proportionality of the zone width with respect to the quantity of ions introduced led to the assumption of constancy in the ion distribution in the chromatograms. This view was confirmed by studies of Cu^{++} and Mn^{++} chromatograms; even through a Mn zone contg. Cu distributed through it, the Mn was almost constantly distributed through the entire zone.

4896. Goto, Hidehiro and Kakita, Yachiyo. **Fluorescence analysis. XIV. Application of the chromatographic method to fluorescence analysis by using filter paper.** *J. Chem. Soc. Japan* **63**, 120-3 (1942).—*C.A.* 41, 3010*a*.

A piece of filter paper was soaked in an aq. suspension of $Al(OH)_3$ and dried. The dried paper was dipped in a soln. contg. the cation to be detected and developed with oxine soln. The oxine compds. of Al and Cd, Zn, Mg, Ca, Zr, or Be were fluorescent.

4897. Flood, H. **Adsorption of anions in inorganic capillary analysis.** *Tids. Kjemi, Bergvesen Met.* 3, No. 2, 9-12 (1943).—*C.A.* 38, 2895^8.

Paper, impregnated with Al_2O_3, could be made suitable for capillary analysis of anions by treatment with a strong acid ($HClO_4$). The adsorption order of a series of anions was detd. Cations were partly adsorbed in the anion zones which was analogous to the secondary adsorption of anions in cation zones.

4898. Consden, R.; Gordon, A. H., and Martin, A. J. P. **Qualitative analysis of proteins: a partition chromatographic method using paper.** *Biochem. J.* 38, 224-32 (1944).—*C.A.* 39, 537^5.

The procedure for making two-dimensional chromatograms with strips of filter paper was described. Amino acids were sepd. in such chromatograms and revealed with ninhydrin. By such means most of the amino acids found in a wool hydrolyzate, or in an artificial mixt. of 22 amino acids, could be demonstrated.

4899. Iijima, Shunichiro; Sato, Tetsuko, and Kamoshita, Takeko. **Microanalysis by inorganic chromatography. I. Fundamental studies.** *Bull. Inst. Phys. Chem. Research (Tokyo) Chem. Ed.* 23, 181-6 (1944).—*C.A.* 42, 7197*i*.

A test paper was prepd. on which $Al(OH)_3$ was pptd. A definite amt. of a given soln. was allowed to be absorbed by the strips of the test paper; then the paper was developed with $K_4Fe(CN)_6$ soln. for Fe^{+++} or dimethyglyoxime for Ni^{++}. A straight-line relation between the height of the colored portion of the test paper and the concn. of the soln. was found within the limits of the expt., i.e. 1-5 mg of Ni per cc.

4900. Iijima, Shunichiro and Sato, Tetsuko. **Microanalysis by inorganic chromatography. II. Detection and determination by means of an aluminum hydroxide test paper.** *Bull. Inst. Phys. Chem. Research (Tokyo) Chem. Ed.* 23, 233-8 (1944).—*C.A.* 42, 7197*i*.

By using $Al(OH)_3$ test paper ions such as Cu, Cd, Pb, Fe, Co, and Zn, as well as mineral acids could be detd. The limit of concn. was 0.1-0.05 mg per cc. for Cu, Cd, Pb, Fe, Co, and Zn and 0.5-0.05 *N* for mineral acids.

4901. Iijima, Shurichiro and Sato, Tetsuko. **Microanalysis by inorganic chromatography. III. Detection and determination by means of chromium hydroxide test paper and silicic acid test paper.** *Bull. Inst. Phys. Chem. Research (Tokyo) Chem. Ed.* 23, 284-8 (1944).—*C.A.* 42, 7198*c*.

The $Cr(OH)_3$ test paper had certain advantages over $Al(OH)_3$ test paper in testing for certain cations. Its use was described.

4902. Burmistrov, S. I. **Qualitative reactions of primary arylamines.** *Zhur. Anal. Chim.* 1, 265-71 (1946).—*C.A.* 43, 5344*a*.

Five reactions for identifying primary arylamines were described. For these tests a soln. contg. 1-2 mg/ml of arylamine in a volatile solvent, e.g., ether, benzene, $CHCl_3$, EtOAc or Me_2CO, was applied on a strip of filter paper. After the solvent evapd., the reagent, dimethylaminobenzaldehyde, m-nitraniline, 1-naphthol, or phenol, was applied on the filter paper as benzene solns. contg. 2 mg of reagent per ml. After the paper dried, it was exposed to a gaseous reagent, such as NH_3, HCl, Br, or alkyl nitrite. The specific reactions of 58 compds. were listed.

4903. Hopf, Peter P. **Chromatographic "spot" tests.** *J. Chem. Soc.* 1946, 785-6.—*C.A.* 41, 923*d*.

Filter paper treated with an absorbent contg. a suitable developer acted like a chromatographic column towards a soln. contg. certain constituents. The colored zones were specific to the constituent, solvent, developer, and pH, and could be used for comparative analysis. A paper that was dipped in a soln. contg. peptized Al_2O_3 and formaldoxime hydrochloride gave with a neutral soln. of ferromanganese a stain of definite position and color. Paper impregnated with Al_2O_3 and 8-hydroxyquinoline gave with a soln. in dil. aqua regia a black outer zone due to Fe and a central yellow spot due to Mo.

4904. Partridge, S. M. **Application of the paper partition chromatogram to the qualitative analysis of reducing sugars.** *Nature* 158, 270-1 (1946).—*C.A.* 40, 7275^2.

A filter-paper chromatogram of five monosacharides using collidine as solvent was presented.

4905. Church, H. F. **Cationic exchange reactions of cellulose and their effect on insulation resistance.** *J. Soc. Chem. Ind.* (London) 66, 221-6 (1947).—*C.A.* 42, 755*i*.

When exchange was complete with a given cation, equal nos. of ions were attached to the cellulose, irrespective of the wt or valency of the ion. Possible mechanisms to satisfy this requirement were considered. The quantity of acid liberated by treating the fully "H-exchanged" paper with a neutral salt soln. was a correct indication of the exchange capacity, provided absorption effects were avoided. The nature of the cation used to effect exchange had a considerable effect on the elec. resistivity of cellulose when the major part of the moisture had been removed.

4906. Consden, R.; Gordon, A. H., and Martin, A. J. P. **Identification of lower peptides in complex mixtures.** *Biochem. J.* 41, 590-6 (1947).—*C.A.* 42, 3015*g*.

The identification of a large proportion of the dipeptides was based upon ionophoresis in silica jelly and subsequent partition chromatography on paper. An app. was described for the removal of salts from solns. of amino acids and peptides.

4907. Drake, Birger. **A new adsorption apparatus and the separation of aspartic and glutamic acids.** *Nature* 160, 602-3 (1947).—*C.A.* 42, 1086*c*.

A flexible canula with a capillary drop tip was connected to the effluent end of the adsorption column and placed below a rotating drum on which filter paper was fastened. The tip was lifted to the drum periodically, and a drop of eluate deposited which could later be developed colorimetrically. Aspartic and glutamic acids were sepd. in this app., contg. Amberlite IR-4 as adsorbent, by elution with 0.05% AcOH followed by *N* HCl.

4908. Fink, R. M.; Dent, C. E., and Fink, K. **Application of filter paper partition chromatography to radioactive tracer studies.** *Nature* **160**, 801-3 (1947).—*C.A.* 42, 2304*g*.

Exts. from the thyroids of rats killed 24-48 hrs after intravenous administration of I^{131} were run on a phenol-collidine 2-dimensional chromatogram. The chromatogram was placed against x-ray film to yield a radio-autograph which indicated little radioactivity in the spot of thyroxine but much in the position for diiodothyroxine and inorg. iodide and several unidentified substances. One-dimensional chromatograms, with phenol and collidine, resp., also showed sepd. bands, except that thyroxine and iodide were in the same position in the collidine chromatogram.

4909. Flood, A. E.; Hirst, E. L., and Jones, J. K. N. **Quantitative estimation of mixtures of sugars by the paper chromatogram method.** *Nature* **160**, 86-7 (1947).—*C.A.* 41, 6591*g*.

Two paper sheets were used. One was sprayed with ammoniacal $AgNO_3$ to locate the sugars. The corresponding areas on the other paper were extd. under a reflux condenser, and the sugars detd. with Somogyi's micro Cu reagent.

4910. Hawthorne, J. R. **Micro-estimation of sugars separated on the filter paper chromatogram.** *Nature* **160**, 714-15 (1947).—*C.A.* 42, 2209*a*.

A method capable of sepg. and estg. as little as 40γ of a sugar, accurate to within about 5%, was described. Two-component mixts. were sepd. by chromatography, with BuOH-AcOH-H_2O as solvent. The spots were dissolved, transferred to paraffin cups, and analyzed by hypoiodite oxidation.

4911. Keston, Albert S.; Udenfriend, Sideny, and Levy, Milton. **Paper chromatography applied to the isotopic derivative method of analysis.** *J. Am. Chem. Soc.* **69**, 3151-2 (1947).—*C.A.* 42, 2308*f*.

The *p*-iodo phenylsulfonyl (I^{131}) derivs. from 1 mg amino acids were extd. with ether, the residue was dissolved in 0.5 ml EtOH-NH_3, an aliquot equiv. to 1-7γ placed as a transverse line on Whatman No. 1 paper, and the chromatogram developed with pentanol satd. with 2 *N* NH_4OH.

4912. Lugg, J. W. H. and Overell, B. T. **Partition chromatography of organic acids on a paper sheet support.** *Nature* **160**, 87-8 (1947).—*C.A.* 41, 6591*i*.

BuOH satd. with aq. AcOH was used as the mobile phase, removed at the end by drying at 60°C. The dried sheets were sprayed with a soln. of bromophenol blue (40 mg/100 ml 95% alc.), the spots excised and extd. with H_2O, and detns. made by titration. The spots had fine tails but were well defined. The R_F values decreased slightly with decreased concns. of the acids. Mixts. of 20γ each of malic, tartaric, and citric acids were resolved with ease.

4913. Vischer, Ernst and Chargaff, Erwin. **The separation and characterization of purines in minute amounts of nucleic acid hydrolyzates.** *J. Biol. Chem.* **168**, 781-2 (1947).—*C.A.* 41, 6596*b*.

Purines in nucleic acid hydrolyzates were sepd. by unidimensional partition chromatography on paper, similar to the procedure developed for the sepn. of amino acids.

4914. Winsten, Walter A. and Spark, Arthur A. **Penicillin types produced by** *P. Chrysogenum Q*-176. *Science* **106**, 192-3 (1947).

P. chrysogenum Q-176 could produce no less than 8 penicillins when grown on the usual corn steep liquor-lactose medium. The presence of the penicillins was proven by a paper partition chromatographic method.

4915. Arden, T. V.; Burstall, F. H.; Davies, G. R.; Lewis, J. A., and Linstead, R. P. **New method for the separation, detection, and estimation of inorganic compounds.** *Nature* **162**, 691-2 (1948).—*C.A.* 43, 2888*f*.

Paper chromatography had been extended to inorg. compounds. Ca, Sr, and Ba could be sepd. as chlorides with pyridine contg. 4% KSCN as solvent. Na rhodizonate was used for the development of Ba and Sr, alizarin for Ca. Al, Ga, In, and Zn had been studied as chlorides with BuOH contg. HCl. Al and Ga were developed with Aluminon but dithizone was used for In and Zn. V could be sepd. by diethyl ether or 2-methyltetrahydrofuran contg. HNO_3 and H_2O_2.

4916. Block, Richard J. **Estimation of amino acids on paper chromatograms.** *Science* **108**, 608-9 (1948).—*C.A.* 43, 5341*h*.

Good results were obtained by first sepg. the protein hydrolyzate into dicarboxylic, basic, and neutral amino acid fractions by adsorption successively on an anion exchange and then on a cation exchange resin. The eluates from the resins were chromatographed separately on paper strips, and then revealed by spraying with ninhydrin.

4917. Boldingh, J. **Application of partition chromatography to mixtures insoluble in water.** *Experientia* 4, 270-1 (1948).—*C.A.* 42, 7599*i*.

Filter paper (S. & S. 595) was impregnated with dild. vulcanized rubber latex, dried, and rinsed with EtOH and Me_2CO. The rubber content was approx. 30% by wt. In these strips the rubber was the fixed phase, and an org. solvent acted as the mobile phase. Sepn. of several fatty acid esters from MeOH or MeOH-Me_2CO 1:1 solns. were affected on the strips. Sudan IV in 50% aq. MeOH was used to trace the ester spots.

4918. Brown, F.; Hirst, E. L.; Hough, L.; Jones, J. K. N., and Wadman, H. **Separation and identification of methylated sugars on the paper chromatogram.** *Nature* **161**, 720 (1948).—*C.A.* 42, 6274*c*.

Many methylated sugars could be identified on the paper chromatogram with the same app. and solvents as for the sepn. of the simple sugars. The chromatogram was allowed to run until the solvent had advanced about 40 cm from the starting line. The paper was then dried and sprayed with ammoniacal $AgNO_3$, and on warming, the positions of the sugars were indicated by brown spots. Tetramethyl D-glucose was used as a standard.

4919. Crammer, J. L. **Paper chromatography of flavine nucleotides.** *Nature* **161**, 349-50 (1948)

Collidine, and a butyl alcohol-acetic acid mixture (shake 4 parts butyl alcohol with 1 part glacial acetic acid and 5 parts water, and use the upper layer), were two very suitable solvents for separating various flavine compounds. As little as $0.01 \mu g$ flavine was detected on the paper.

4920. Ekman, Birger. **Paper chromatography of primary aromatic amines.** *Acta Chem. Scand.* **2**, 383-4 (1948) (In English).—*C.A.* **43**, 2263*b*.

Spots of primary aromatic amines on filter paper were developed by org. solvents and diazotized by spraying with 0.2% $NaNO_2$ in 0.1 *N* HCl. A red-violet color was then developed by spraying with 0.2% *N*-ethyl-*l*-naphthylamine-HCl in EtOH.

4921. Fisher, R. B.; Parsons, D. S., and Morrison, G. A. **Quantitative paper chromatography.** *Nature* **161**, 764 (1948).—*C.A.* **42**, 5792*b*.

Amino acids were assayed quantitatively by (a) measurement of max. extension of a spot upon a paper chromatogram and (b) by measurement of the outline of a spot with a planimeter. Log relationships of concn. to area were shown.

4922. Flood, A. E.; Hirst, E. L., and Jones, J. K. N. **Quantitative analyses of mixtures of sugars by the method of partition chromatography. I. Standardization of procedure.** *J. Chem. Soc.* **1948**, 1679-83.—*C.A.* **43**, 1290*b*.

Full details were given for spotting the sugar mixt., locating the sepd. sugars on the paper strip, leaching out the individual sugars and for their detn. Standardized controls involving the use of given amts. of known sugar solns. obviated the necessity of reagent standardizations and use of a specific sugar as the "reference compd." in each individual detn. All chromatograms were run for 45 hrs at 20°C, with BuOH (40%), EtOH (10%), and H_2O (50%).

4923. Forsyth, W. G. C. **Color reagents for the paper chromatography of sugars.** *Nature* **161**, 239-40 (1948).—*C.A.* **42**, 4087*a*.

The use of resorcinol and naphtharesorcinol in addn. to the usual ammoniacal $AgNO_3$ as a color reagent in the chromatographic detn. of sugars permitted pos. identification of reducing as well as nonreducing sugars.

4924. Haugaard, Gotfred and Kroner, Thomas D. **Partition chromatography of amino acids with applied voltage.** *J. Am. Chem. Soc.* **70**, 2135-7 (1948).—*C.A.* **43**, 137*i*.

Two-dimensional chromatography was developed to overcome the difficulty of detecting the bands of amino acids whose R_F values lie close together. Optimum conditions were the use of an impressed voltage of 100 for 16-18 hrs at a controlled temp. with paper buffered with M/15 phosphate soln. at pH 6.2. The R_F values for the amino acids were: serine 0.21, glycine 0.28, alanine 0.49, valine 0.74, leucine 0.82, proline 0.86, aspartic acid 0.16, glutamic acid 0.32, lysine 0.17, and arginine 0.32.

4925. Hird, F. J. R. and Trikojus, V. M. **Paper partition chromatography with thyroxine analogues.** *Australian J. Sci.* **10**, 185-7 (1948).—*C.A.* **42**, 8852*e*.

Thyroxine, thyroxine-O-methyl ether, and 3,5-diiodothyronine were sepd. on paper chromatograms when the stationary phase was 2 *N* NH_4OH and the mobile phase was a mixt. of equal vols. of BuOH and amyl alc. (b.p. 128-132°C). R_F values were given.

4926. Hotchkiss, Rollin D. **The quantitative separation of purines, pyrimidines, and nucleosides by paper chromatography.** *J. Biol. Chem.* **175**, 315-32 (1948).—*C.A.* **42**, 8861*g*.

Purines and pyrimidines in nucleic acid, and several related compds., could be sepd. by the movement of a boundary of BuOH along paper strips. Cytosine, uracil, adenine, and thymine could be isolated from mixts, and from hydrolyzates of nucleic acids, and under favorable circumstances guanine could be recovered.

4927. Lederer, Michael. **The chromatographic Separation of antimony.** *Anal. Chim. Acta* **2**, 261-2 (1948).—*C.A.* **43**, 61*e*.

Sb^{+++} was sepd. from all common metallic ions by adsorbing one drop of the soln., slightly acidified with HCl, on a strip of filter paper, developing with H_2O, and exposing the strip to H_2S vapors after the liquid front had traveled 10 cm. An orange patch close to the original spot indicated Sb.

4928. Lederer, Michael. **Paper chromatography of the noble metals.** *Nature* **162**, 776-7 (1948).—*C.A.* **43**, 3743*c*.

A mixt. or alloy contg. Au, Pt, Pd, Cu, and Ag was dissolved in aqua regia and dild. with as much more water. A drop of this soln. was placed on a paper cylinder and the cylinder developed by allowing it to stand for 24 hrs in a dish of butanol satd. with *N* HCl in an atm. satd. with *N* HCl and butanol. Ag (black) deposits where the drop of soln. was placed while Cu (black), Pd (orange), Pt (yellow) and Au (yellow) lie in that order above it.

4929. Longenecker, William H. **Glass trough for filter paper partition chromatography.** *Science* 107, 23, (1948).--

A trough was described to serve as a reservior into which the filter paper dips.

4930. Lugg, J. W. H. and Overell, B. T. **One- and two-dimensional partition chromatographic separations of organic acids on an inert sheet support.** *Australian J. Sci. Research* Ser. A, **1**, 98-111 (1948).—*C.A.* **43**, 6946*i*.

Procedures were developed at 20°C for "one-" and "two-dimensional" partition-chromatographic sepns., on Whatman No. 1 filter paper, of mixts. of relatively nonvolatile org. acids. Ionization, and adsorption of the acids by the paper, were suppressed by swamping both the stationary and mobile solvent phases with a volatile acid (formic or acetic). Formic acid was superior because at high concn. it permitted well-difined bands of the test acids to travel down the sheets and conferred upon the bands highly characteristic R_F values.

4931. PARTRIDGE, S. M. AND WESTALL, R. G. **Filter-paper partition chromatography of sugars. I. General description and application to the qualitative analysis of sugars in apple juice, egg white, and fetal blood of sheep. II.** *Biochem. J.* 42, 238-50, 251-3 (1948).—*C.A.* 42, 4636*c*,*e*.

A soln. of $AgNO_3$ in NH_4OH was used as a spraying reagent to reveal the position of the sugars on the filter paper chromatograph. Ionic sepn. of a salt occurring on paper chromatograph might be regarded as analogous to the process occurring in ion-exchange reagents, the cellulose apparently acting as the reagent.

4932. POLSON, A. **Quantitative partition chromatography and the composition of Escherichia coli.** *Biochim. et Biophys. Acta* 2, 575-81 (1948).—*C.A.* 43, 3875*f*.

Quant. estn. of amino acids could be made by comparison of developed chromatograms of the unknown and standard amino acid solns. In a one-dimensional analysis series, glycine, threonine, alanine, and aspartic and glutamic acids were paper chromatographed in a water-satd. *m*-cresol soln. contg. 0.3% NH_3. At the end of the run the paper was dried at 100°C, sprayed with a 0.1% ninhydrin in BuOH, and warmed at 100°C for 10 min.

4933. RUTTER, L. **Modified techinque in filter-paper chromatography.** *Nature* 161, 435-6 (1948).—*C.A.* 42, 4863*i*.

A wicklike "tail" formed in the center of an 11-cm filter paper, was immersed in the soln. under test. After a sufficient amt. had been adsorbed, the chromatogram was developed by immersing the tail in the proper soln. The various bands on the main chromatogram were cut apart and eluted separately.

4934. SMITH, E. C. BATE. **Paper chromatography of anthocyanins and related substances in petal extracts.** *Nature* 161, 835-8 (1948).—*C.A.* 42, 6893*h*.

Natural and some synthetic chlorides of anthocyanins and flavones were identified and sepd. by partition chromatography on paper, with and without treatment with NH_3 vapor, their reaction with ammoniacal $AgNO_3$, and their R_f values (relative distance moved by the solute in relation to liquid) in butanol-acetic acid-H_2O (40:10:50 by vol.).

4935. STEWARD, F. C.; STEPKA, W., AND THOMPSON, JOHN F. **Apparatus for partition chromatography on paper.** *Science*, 107, 451-2 (1948).—*C.A.* 42, 4798*g*.

The app. of Longenecker was modified for greater ease of construction and freedom from breakage by the use of troughs of sheet metal with a V-shaped cross section, with welded end plates, coated with resistant enamel. The end plates also supported two lengths of 10-mm glass rod above the edges of the trough to carry the partition paper. A third glass rod was laid down the center to hold the edge of the paper in place.

4936. VERDIER, CARL HENRIC DE AND AGREN, GUNNAR **Paper chromatographic analysis of amino acids and peptides in tissue extracts and enzyme hydrolyzed proteins.** *Acta Chem. Scand.* 2, 783-96 (1948) (in English).—*C.A.* 43, 4314*a*.

In 2 dimensional runs with a 0.1% soln. of cupron in the first direction, comparisons were made of the resolving capacity of collidine with that of pyridine-AmOH. There was little advantage in using collidine. Comparisons were made of several methods of prepg. blood filtrates for paper chromatography.

4937. WIELAND, THEODOR. **The retention analysis and its usefulness in the quantitative evaluation of paper chromatograms and paper ionopherograms of synthetic amino acid mixtures.** *Angew. Chem.* A60, 313-16 (1948).—*C.A.* 43, 2660*c*.

The procedure for a retentiometric acid detn. was described and the evaluation of paper chromatograms and ionopherograms was presented.

4938. WIELAND, THEODOR AND FISCHER, EDGAR. **Retention analysis, a quantitative ultramicromethod.** *Naturwissenschaften* 35, 29 (1948).—*C.A.* 44, 2403*e*.

Drops of glycine solns. in different concns. were placed at 1 cm from the edge of a 7 cm wide filter paper (SS 575), and immersed 3 mm in a soln. of 0.1% $Cu(OAc)_2$ in tetrahydrofuran (10% H_2O). The soln. was allowed to rise 5 cm, the strip was then air dried and "developed" by spraying with a 0.1% dithioöxalic diamide soln. in acetone contg. 10% H_2O. A sharply defined Cu salt picture appeared with V-shaped depressions at the upper edge quantitatively showing the amt. of glycine present.

4939. WILLIAMS, ROGER J. AND KIRBY, HELEN. **Paper chromatography using capillary ascent.** *Science* 107, 481-3 (1948).—*C.A.* 42, 5494*f*.

In the analysis of amino acid mixts., the solvents were allowed to ascend a filter paper cylinder by capillary action. The method and various modifications were described which approx. doubled the sensitivity of the method for amino acids. Modifications also made possible the production of two-dimensional chromatograms. A considerable no. of descending and ascending chromatograms were made under parallel conditions, and the ascending ones were in general definitely superior.

4940. WINEGARD, HERBERT M.; TOENNIES, GERRIT, AND BLOCK, RICHARD J. **Detection of sulfur-containing amino acids on paper chromatograms.** *Science* 108, 506 (1948).

A method for the detection of cystine, cysteine, and methionine on paper chromatograms was described employing K iodoplatinate. This reagent was found stable for at least two weeks at room temp. For spraying purposes, a 1:6 dilution gave the best compromise between contrast and sensitivity.

4941. WINSTEN, WALTER A. **A simplified apparatus for one-dimensional paper partition chromatography.** *Science* 107, 605 (1948).—*C.A.* 42, 5724*a*.

The centers of 2 halves of an ordinary Pyrex Petri dish, 3 1/2 in. in diam., with lips facing upward were connected by fusing them to a solid glass rod, 3/8 in. in diam. and 16 in. long. The double trough was then placed in a glass humidifying chamber. The bottom trough served to contain the aq. soln. which provided the necessary humid atm., and the upper trough contained the org. solvent used for development. The glass rod was wound with absorbent cotton and wet with the soln. used in the lower trough. The paper strip chromatograms, suitably folded to dip into the org. solvent and to hand down from the upper trough, were held in place by a thin, solid glass rod bent in a great arc. A wire guard was placed around the circumference of the upper trough to hold the paper away from the side of the trough over which they hang.

4942. WINSTEN, WALTER A. AND EIGEN, EDWARD. **Studies on the streptomycin complex using paper partition chromatography.** *J. Am. Chem. Soc.* 70, 3333-9 (1948).—*C.A.* **43**, 819*h*.

The developing agent was a mixt. of BuOH and piperidine, contg. *p*-$MeC_6H_4SO_3H$. The 2 latter could be varied within wide limits. After development of the chromatogram and removal of solvents, the dried strip was laid on the surface of nutrient agar previously seeded with sp. bacteria whose growth was inhibited by the antibiotics. The agar plate revealed zones of growth inhibition which served to characterize the various antibiotics (and their amts.) in the original mixt.

4943. WOIWOD, A. J. **Microestimation of amino nitrogen and its application to paper-partition chromatography.** *Nature* **161**, 169 (1948).—*C.A.* 42, 3287*d*.

The amino acids could be detd. on the paper chromatograms after their location on trial strips. Instead of using trial strips, it was possible to locate glycine, valine, and possibly other amino acids with ninhydrin under conditions which did not destroy the amino N appreciably.

4944. AGREN, GUNNAR AND NILSSON, TAGE. **Paper chromatographic analysis of amino acids and other ninhydrin-reacting substances in deproteinized human plasma.** *Acta Chem. Scand.* 3, 525-38 (1949).—*C.A.* 43, 8429*c*.

Combination of one- and two-dimensional chromatograms showed 21 compds. present, with 1-ml samples of deproteinized human plasma. When strict duplicate chromatograms were run simultaneously in the same chamber, differences in R_F values did not exceed 4%.

4945. ALBANESE, ANTHONY A. AND LEIN, MARILYN. **The chromatographic estimation of lysine and some applications of the method.** *Science* **110**, 163-4 (1949).—*C.A.* 43, 9126*f*.

Cu salts of amino acids were partitioned on paper strips in an aq. phenol atm. for 6 hrs by the capillary ascent method. After drying in air the strips were developed with a freshly prepd. 10% soln. of iron ferrocyanide. Relative amts. of the individual acids could be judged by the intensity of the pink color.

4946. ARDEN, T. V.; BURSTALL, F. H., AND LINSTEAD, R. P. **A new method for the detection and determination of uranium.** *J. Chem. Soc.* 1949, S311-13.—*C.A.* 44, 8820*f*.

A chromatographic method employing org. solvents in conjunction with strips or sheets of absorbant paper was described for the sepn. of U from other metals in soln. U as $UO_2(NO_3)_2$ in soln. moved with the solvent front as diffusion of the solvent in the absorbant paper proceeded. Most other metals remained stationary or moved only slowly in comparison with U. Detection was accomplished with $K_3Fe(CN)_6$.

4947. ARONOFF, S. **Separation of the ionic species of lysine by means of partition chromatography.** *Science* **110**, 590-1 (1949).—*C.A.* **44**, 3332*i*.

Paper partition chromatography of lysine in a satd. phenol-water system may result in a plurality of spots, the no. and position of these spots depending on the pH of the aq. soln. of the lysine. The relative intensities of the spots were in rough accord with the distribution of ionic species for the different pH values as calcd. from ionization consts.

4948. BACH, RICARDO O. **Experiments in inorganic chromatography. III. A variation of the Gutzeit test for arsenic.** *Anales Asoc. quím. argentina* 37, 247-8 (1949).—*C.A.* **45**, 2361*e*.

From 0.5 to 500 γ As was detd. with the conventional Gutzeit app. except that the tube contg. sensitized paper was replaced by a tube 2 mm in diam. filled with diatomaceous earth impregnated with 1-5% $HgBr_2$.

4949. BAILEY, A. **Adsorption chromatography of lignin.** *Paper Ind. and Paper World* **31**, 205-9 (1949).—*C.A.* 43, 5590*a*.

The adsorption of various lignin prepns. on cellulose (filter paper) was shown to be a general phenomenon which occurred with unrelated lignins and formed a variety of solvents. All prepns. were sepd. into zones which were chromatographically hetergeneous, the no. of such zones varying with the lignin prepn. and the solvent used. The prepns. were allowed to dry on the filter paper and the best chromatographic differentations were obtained with the following solvents: for BuOH-NaOH lignin MeOH, EtOH, $PhNH_2$, $PhCH_2OH$, BzH, quinoline, Ph cellosolve, and furfural.

4950. BENTLEY, H. R. AND WHITEHEAD, J. K. **Use of furan derivatives in paper chromatography.** *Nature* **164**, 182-3 (1949).—*C.A.* **43**, 8299*a*.

Furfuryl alc., freshly distd., and tetrahydrofurfuryl alc., contg. 10 to 30% water, gave good sepns. of amino acids on paper chromatograms. The inclusion of urea (0.5%), pyridine (8%), or furoic acid (5%) as stabilizers sharpened the outlines of the spots and reduced their size.

4951. BERRY, HELEN KIRBY AND CAIN, LOUISE. **Biochemical individuality. IV. Paper chromatographic technique for determining excretion of amino acids in the presence of interfering substances.** *Arch. Biochem.* **24**, 179-89 (1949).—*C.A.* **44**, 2062*g*.

The solvent was prepd. by mixing 100 g phenol with 20 ml of a soln. contg. 6.3% Na citrate, 3.7% KH_2PO_4, and 0.5% ascorbic acid, allowing to stand until soln. occurred, and then using the upper layer within 48-72 hrs. The chromatogram was developed by the ascending technique for 12-16 hrs, after which the solvent was removed by blowing air at 85°C over the sheets for 8-10 min. Amino acids were detected by spraying the sheets with 0.2% ninhydrin in H_2O-satd. BuOH.

4952. Block, Richard J. **Quantitative paper chromatography; a simplified procedure.** *Proc. Soc. Exptl. Biol. Med.* **72**, 337-41 (1949).—*C.A.* **44**, 2587*e*.

Some improvements were described in existing techniques of estg. amino acids by one- and two-dimensional paper chromatography.

4953. Brante, Gunnar. **Iodine as a means of development in paper chromatography.** *Nature* **163**, 651-2 (1949).—*C.A.* **43**, 5336*e*.

Iodine sublimed or sprayed in EtOH soln. on to paper aided identification of spots caused by amines, amino acids, amine alcs., quanidines, purines, and pyrimidines.

4954. Brimley, Robert C. **Quantitative paper chromatography.** *Nature* **163**, 215-16 (1949).—*C.A.* **43**, 5695*h*.

Equations developed from the theory of heat flow were applied to a theoretical consideration of the linear relationship which held between the area of the spots of test substance and the log of the concn., at which it was initially applied. Movement by diffusion was assumed.

4955. Burstall, F. H.; Davies, G. R.; Linstead, R. P., and Wells, R. A. **Inorganic chromatography on cellulose.** *Nature* **163**, 64 (1949).—*C.A.* **43**, 4595*g*.

Au, Pt, and Pd were sepd. from each other and from Ir or Rh by paper chromatography by using methyl propyl ketone contg. 30% (vol./vol.) of concd. HCl. Metals of the Cu and Sn groups were also sepd., with solns. of the chlorides and ethyl isopropyl ketone, contg. 10% (vol./vol.) of concd. HCl, for group IIa, and dry EtOAc previously shaken with 2% HCl, for group IIb. Columns of cellulose pulp have been used to sep. and est. Ni and Co in minerals and steels, and to sep. Sc from a large no. of metals, including the rare earths.

4956. Burstall, F. H.; Davies, G. R., and Wells, R. A. **Inorganic chromatography on cellulose. III. The use of columns of cellulose for the separation and determination of metals.** *Discussions Faraday Soc.* **1949**, No. 7, 179-83.—*C.A.* **45**, 60*e*.

Ni, Co, Cu, Fe, Hg, Bi, Cd (chlorides) could be sepd. by elution with appropriate org. solvents on a column of cellulose prepd. from paper pulp. The solvents used contained Me-Pr-CO, acetone, water, HCl, Me acetate, Na phosphate, Et ether, and HNO_3. The sepns. depended on the selectivity of the solvent, the partition of the salts between the org. solvent and the water in the cellulose, and the adsorbability of the metal ions.

4957. Calvin, M. and Benson, A. A. **The path of carbon in photosynthesis. IV. The identity and sequence of the intermediates in sucrose synthesis.** *Science* **109**, 140-42 (1949).

Fumarate buffer in distd. water was used since inorg. salts, especially phosphates, interfered with movement of compds. on the paper. Alc. extract of as much as 100 mm of algae was applied to the filter paper (Whatman No. 1). Development in water-satd. phenol was followed by thorough drying at room temp. The sec. solvent was freshly prepd. before use from equal vols. of 1,246 ml *n*-BuOH—84 ml water, and 620 ml propionic acid—790 ml water. Although the radioactive fixation products which were sepd. chromatographically may be eluted and their activity detd. accurately, the radiogram served as a semiquant. record of the activity fixed in each compd. The first free carbohydrate which appeared in these plants was sucrose.

4958. Cavallini, Doriano; Frontali, Nora, and Toschi, Giovanni. **Determination of keto acids by partition chromatography on filter paper.** *Nature* **163**, 568-9 (1949).—*C.A.* **43**, 5342*g*.

Only BuOH gave satisfactory results with Schleicher-Schull filter paper No. 597, in strips 2 × 50 cm. The dinitrophenylhydrazones, dissolved in 0.01 *M* phosphate buffer (pH 7.2), was placed on a mark, 7 cm from the end of the filter paper. The soln. was dried with warm air. The top of the paper was then placed in the solvent. Well-shaped and well-separated spots of the hydrazones were obtained.

4959. Chargaff, Erwin; Magasanik, Boris; Doniger, Ruth, and Vischer, Ernst. **The nucleotide composition of ribonucleic acids.** *J. Am. Chem. Soc.* **71**, 1513-14 (1949).—*C.A.* **43**, 5817*d*.

A method was developed for sepn. on filter paper and estn. by spectrophotometry of all ribonucleotides found in ribonucleic acids. The chromatograms were developed with isobutyric acid in an NH_3 atm. and the components shown by an indirect method or by direct inspection under a "Mineralight." Guanylic acid and uridylic acid had the same position on the chromatogram and were eluted together.

4960. Crumpler, H. R. and Dent, C. E. **Distinctive test for α-amino acids in paper chromatography.** *Nature* **164**, 441-2 (1949).—*C.A.* **44**, 75*d*.

The method was based on the ability of compds. which have the α-amino-carboxylic structure to form Cu complexes. The mixt. was applied to the paper for 2-dimensional chromatograms in duplicate. One paper was dusted lightly with finely powd. $[CuCO_3, Cu(OH)_2]$ in a streak along the path of the amino acids in phenol. The chromatograms were then run as usual with phenol and collidine-lutidine and were finally treated with ninhydrin. The untreated paper was for control. The Cu-dusted one showed only the substances not contg. an α-aminocarboxylic acid grouping in their mol.

4961. Datta, S. P.; Overell, B. G., and Stack-Dunne, M. **Chromatography on alumina-impregnated filter paper.** *Nature* **164**, 673-4 (1949).—*C.A.* **44**, 1778*e*.

Strips of Whatman No. 54 filter paper were dipped into aq. $Al_2(SO_4)_3$ (65g/liter, drained, and then dipped into 2 *N* NH_4OH to ppt. the $Al(OH)_3$. After being dried at about 140°C these were stored over H_2SO_4 or P_2O_5. Variations in Rf values (ratio of distance traveled by an ion to distance traveled by the liquid front) were obtained by storing over different concns. of H_2SO_4. Storing over P_2O_5 gave very strongly adsorbing papers.

4962. DOUGLASS, C. D. AND WENDER, SIMON H. **The use of multiple strips in one-dimensional paper chromatography.** *Proc. Okla. Acad. Sci.* **30**, 153-4 (1949) (Pub. 1951).—*C.A.* 46, 3445*f*.

Sixteen paper-strip chromatograms of a lemon-peel infusion, exhibiting 14 bands, when sectioned by bands, leached, and rechromatographed from a new solvent, gave enough material for identification studies.

4963. DRAPER, O. JANET AND POLLARD, ARTHUR L. **The purification of phenol for paper partition chromatography.** *Science* **109**, 448-9 (1949).—*C.A.* 43, 5758*d*.

Paper partition chromatography was used to identify amino acids in bacterial-culture filtrates, but the extraneous colors present on the developed chromatograms made the results uncertain. These colors, probably due to metal contaminants, could be eliminated by purification of the PhOH.

4964. ELBEIH, I. I. M.; MCOMIE, J. F. W., AND POLLARD, F. H. **The application to qualitative analysis of the separation of inorganic metallic compounds on filter paper by partition chromatography.** *Discussions Faraday Soc.* **1949**, No. 7, 183-90.—*C.A.* 45, 61*g*.

The sepn. of 24 cations by using aq. 1-butanol with and without complexing agents, and aq. collidine was studied. Sepns. with butanol solns. of benzoyl acetone were notable. The successive use of collidine and the butanol soln. at right angles to each other on the paper permitted sepns. which were otherwise difficult or impossible. The sepn. of As from large amts. of other ions was sensitive to 0.1γ.

4965. EVANS, R. A.; PARR, W. H., AND EVANS, W. C. **Paper partition chromatography of phenolic substances.** *Nature* **164**, 674-5 (1949).—*C.A.* 44, 2325*c*.

Phenolic acids were sepd. from their parent phenols and from each other in quantities of the order of 5γ. A one-dimensional, 15-hr development at room temp. on Whatman No. 44 filter paper gave a 30-cm solvent run, which was sufficient. The org. phase of a mixt. of one part butanol, one part pyridine, and 2 parts NaCl was the mobile liquid. Diazotized sulfanilic acid (Pauley's reagent) in 50% ethanol was the coloring agent.

4966. FINK, KAY AND FINK, R. M. **Application of filter paper partition chromatography to qualitative analysis of volatile and nonvolatile organic acids.** *Proc. Soc. Exptl. Biol. Med.* **70**, 654-6 (1949).—*C.A.* 43, 5695*i*.

The method was suitable for many org. acids with chain lengths of 1-8 C atoms. The hydroxamate derivs. obtained from about 10^{-6} mole of each of the esters were applied to the filter paper, the 2-dimensional chromatogram was developed with suitable solvents, and the paper was sprayed with dil. $FeCl_3$ to make the derivs. visible as purple spots on a yellow background. Isobutyric acid and phenol gave excellent results as solvents for 2-dimensional chromatograms of dicarboxylic acids.

4967. FLOOD, H. **Inorganic capillary analyses.** *Discussions Faraday Soc.* **1949**, No. 7, 190-5.—*C.A.* 45, 20*b*.

Thick blotting paper was impregnated with $Al(OH)_3$ by dipping in Na aluminate soln. and drying. The adsorption sequence on this paper was similar to that for Al_2O_3 columns. With cation mixt. the elongation of the chromatographic zone was a function of concn. ratios. Sepns. were effected by adding glycine as complexer.

4968. FOSDICK, L. S. AND BLACKWELL, R. Q. **Scanning instrument for quantitative one-dimensional paper partition chromatography.** *Science* **109**, 314-15 (1949).—*C.A.* 43, 4055*g*.

The paper strip developed with ninhydrin was passed between a light source and a photoelec. cell. From transmission values, R_f values and the quantity were detd. The accuracy varied from 5 to 15% depending on the amino acid.

4969. GOOD, P. M. AND JOHNSON, A. W. **Paper chromatography of pterins.** *Nature* **163**, 31 (1949).—*C.A.* 43, 3529*h*.

Individual butterfly wings were extd., and the pterins identified by paper chromatography of 0.1% solns. in 0.5 *N* NH_3, with a BuOH-AcOH solvent. After development of the chromatogram, the paper was viewed in ultraviolet light.

4970. GORDON, A. H. **Paper chromatography.** *Angew. Chem.* **61**, 367-9 (1949).—*C.A.* 44, 19*h*.

The procedures for unidimensional and two-dimensional paper chromatography were described on the basis of examples with amino acids.

4971. HAIS, I. M. AND PECÁKOVÁ, L. **Paper partition chromatography of riboflavin decomposition products.** *Nature* **163**, 768 (1949).—*C.A.* 43, 7073*f*.

The products of photolytic decompn. of riboflavin were studied by paper partition chromatography with 0.08-2.5γ riboflavin in BuOH 4, AcOH 1, and H_2O 5 parts or BuOH 3, $C_5H_5N_4$ 4 and H_2O 5 parts as the mobile phase and examg. the chromatogram in ultraviolet light. In addn. to riboflavin, lumiflavin and lumichrome, two other spots were observed at R_f 0.0 and 0.30 with BuOH, AcOH, H_2O developer.

4972. HAMER, D. AND WOODHOUSE, D. L. **Amino acid composition of salmine.** *Nature* **163**, 689-90 (1949).—*C.A.* 43, 7524*a*.

Analysis of hydrolyzed salmine by partition chromatography on paper was used. No other amino acids were detected by using one-or two-dimensional chromatograms when phenol with NH_3, collidine-lutidine mixt. 1:1 (vol./vol.), or BuOH-HOAc mixt. 4:1 (vol./vol.), were used as solvents.

4973. HANES, C. S. AND ISHERWOOD, F. A. **Separation of the phosphoric esters on the filter paper chromatogram.** *Nature* **164**, 1107-12 (1949).—*C.A.* 44, 3408*d*.

A procedure was given for the identification of phosphoric esters, based on characteristic diffusion rates in filter paper. Quant. data could be obtained by analysis of separate areas of the paper.

4974. HIRST, E. L.; HOUGH, L., AND JONES, J.K.N. **Quantitative analysis of mixtures of sugars by the method of partition chromatography. II. Separation and determination of methylated**

aldoses. *J. Chem. Soc.* **1949**, 928-33.—*C.A.* **44**, 486*c*.

With BuOH (40%), EtOH (10%), H_2O (49%), and NH_4OH (1%) as solvent the qual. chromatographic sepn. of 62 common and less common sugars and their methylated derivs. was discussed and the "R_G" values given. R_G was the ratio between the distance traveled from the starting line by a specific sugar (or its deriv.) and that traveled by the tetra-Me D-glucose. The NaIO micrometric method could be applied in the detn. of aldoses and their derivs. (after paper partition chromatographic sepn.) by H_2O extn. of the paper strips (as previously described). Satisfactory analyses of known sugar mixts. were given.

4975. Hirst, E. L. and Jones, J. K. N. **Quantitative analysis of sugars by means of partition chromatography. III. Determination of sugars by oxidation with sodium periodate.** *J. Chem. Soc.* **1949**, 1659-62.—*C.A.* **44**, 1364*i*.

The method depended on a micro-scale oxidation of sugars to HCOOH. Satisfactory recoveries of HCOOH (94-100% of theory) were obtained from ribose, arabinose, xylose, rhamnose, glucose, galactose, mannose, fructose, sorbose, galacturonic acid, glucosamine-HCl, and sucrose. In one mixt. the constituents were sepd. by paper chromatography and the sugars detd. by the above method. The results were satisfactory.

4976. Hirst, E. L. and Jones, J. K. N. **The application of partition chromatography to the separation of the sugars and their derivatives.** *Discussions Faraday Soc.* **1949**, No. 7, 268-74.—*C.A.* **45**, 1464*i*.

The method of sepn. by partitioning of γ quantities on strips of filter paper was described. R_G values (distance sugar has traveled/distance of travel of tetramethyl glucopyranose under like conditions) were given for sugars with the solvent system BuOH 50, EtOH 10, and H_2O 40 parts. Cellulose columns with solvents such as BuOH-H_2O, iso-PrOH-H_2O, acetone-H_2O, or ethanol as solvents were recommended where larger samples were required.

4977. Holiday, E. R. and Johnson, E. A. **Location of paper chromatogram spots of purine and pyrimidine derivatives in ultraviolet light.** *Nature* **163**, 216-17 (1949).—*C.A.* **43**, 5704*c*.

A low pressure Hg lamp equipped with a filter for 230-400 mμ was used to excite the fluorescence of the paper. Areas of concn. of the order of 0.5-1.0 γ/cm^2 appeared as dark patches against the background fluorescence. Either transmitted or reflected light may be used.

4978. Horrocks, R. H. **Paper partition chromatography of reducing sugars with benzidine as a spraying reagent.** *Nature* **164**, 444 (1949).—*C.A.* **44**, 185*f*.

The reagent was prepd. by combining benzidine 0.5 g, glacial AcOH 20 ml, and abs. EtOH 80 ml. When the sprayed chromatograms were heated at 100-105°C, pentoses produced a chocolate brown color in 5 min.; lactose, maltose, galactose, glucose, and levulose formed dark brown spots within 10 min.

4979. Lacourt, A.; Sommereyns, G.; Degeyndt, E.; Baruh, J., and Gillard, J. **The separatory power of organic solvents in quantitative chromatographic separations of inorganic compounds present in gamma quantities.** *Mikrochemie ver. Mikrochim. Acta* 34, 215-23 (1949).—*C.A.* 43, 6537*b*.

The tests were made with 0.01 ml of soln. applied 3.5 cm below the top of a strip of suitable paper. The process could be applied to the detn. of impurities, e.g., the content of Fe, Ti, Al, V, Ni, and Co in MeOH, EtOH, PrOH, iso-PrOH, and iso-AmOH. The inorg. cations could be sepd. from saline solns. and a soln. contg. Fe, Ti, and Al in 6 *N* HCl eluted with 6.5 *N* HCOOH could be analyzed and 10γ of each ion detd. within 2-3%.

4980. Lacourt, A.; Sommereyns, G.; Degeyndt, E.; Baruh, J., and Gillard, J. **Quantitative inorganic paper chromatography. Submicro separation and determination of aluminum, iron, and titanium.** *Metallurgia* 40, 181-2; *Nature* **163**, 999-1000 (1949).—*C.A.* 43, 7859*g*.

The soln., contg. 1-10γ of salt, was drawn directly from a horizontal capillary buret which delivered 0.01 cc. with an accuracy of ± 0.0002 cc. It was deposited 3.5 cm from the top of a strip of Whatman No. 1 filter paper. Only solvents miscible with H_2O gave satisfactory sepns. Acetone carried Fe along the liquid front. Acid salt solns. produced different chromatograms from the neutral solns., even if the soln. spot was dried before development. Chlorides were preferable to nitrates for sepns. Mixed solvents such as pyridine-acetone, pyridine-MeOH, pyridine-H_2O, in varying proportions were good developing agents for cations, giving sharp, well-defined spots in the sepn. of Fe from Ti, Al, and V.

4981. Lederer, Michael. **Separation of chloride-group anions by partition chromatography on paper.** *Science* **110**, 115-16 (1949).—*C.A.* **43**, 8972*h*.

The solvent was BuOH satd. with 1.5 *N* NH_4OH. Among the methods tried the most satisfactory procedure was first to spray with a soln. of $Fe(NO_3)_3$ and H_2O_2. This produced a red spot for CNS and a blue spot for I^-. The whole paper was then originally formed and pptd. the 4 anions. The paper was then washed twice with dil. HNO_3 to remove exceeds Ag, and then held over H_2S. Cl^- produced a brown spot (R_f 0.10-0.11) and Br^- a brown spot.

4982. Lederer, Michael. **Separation of the copper and tin groups by partition chromatography on paper.** *Anal. Chim. Acta* **3**, 476-80 (1949).—*C.A.* 44, 10579*d*.

The chromatographic sepn. on paper of elements of the Cu and Sn groups employed ascending development by BuOH satd. with *N* HCl and identification by means of H_2S. The sepn. of Cu and Cd, and and that of Sb, As, and Sn-(II) ions was recommended.

4983. Lederer, Michael. **The paper chromatography of inorganic anions.** *Australian J. Sci.* **11**, 174 (1949).—*C.A.* **43**, 6883*b*.

Paper chromatography, using butanol satd. with aq. 1.5 *N* NH_4OH, was useful for making the following sepns.: halides from most other ions; nitrite from bromate, iodate, and periodate; most univalent anions from mixts. with multivalent anions.

4984. Lederer, Michael. **Paper partition chromatography of organic anions.** *Australian J. Sci.* **11**, 208-9 (1949).—*C.A.* **44**, 976*h*.

The following acids were sepd. by paper chromatography, by using as solvent BuOH satd. with 5 *N* NH_4OH: *o*-, *m*-, and *p*-aminobenzoic acids ($R_f = 0.38$, 0.19, 0.12, resp.), *o*-, *m*-, and *p*-hydroxybenzoic acids (0.60, 0.27, 0.13), sulfanilic acid (0.13), *o*-, *m*- and *p*-nitrophenols (0.62, 0.72, 0.62), and α-, and β-naphthols (0.95, 0.97).

4985. Lederer, Michael. **Paper chromatography of some metals.** *Australian J. Sci.* **12**, 78 (1949).—*C.A.* **44**, 6332*g*.

R_f values for butanol satd. with *N* HCl, and color tests were given for the following ions: Tl^+ (0.0), Tl^{3+} (1.11), Zn^{2+} (0.77), Be^{2+} (0.33), In^{3+} (0.30), V^{4+} (0.17), Mg^{2+} (0.11), Ti^{4+}, Al^{3+}, and Cr^{3+} (0.07), Er^{3+} (0.05), Ce^{3+}, Y^{3+}, Th^{4+}, and Di (0.03). Tl^{3+} could be sepd. from all metal ions except Au and Hg.

4986. Lindberg, Olov and Hummel, J. P. **The measurement of radioactivity from chromatogram.** *Arkiv. Kemi* **1**, 17-19 (1949).—*C.A.* **43**, 4951*c*.

A method was described for the serial counting of segments of filter-paper strips. The procedure was used in an expt. which demonstrated the synthesis of adenosine triphosphate by rat kidney homogenate.

4987. Longenecker, William H. **Simplified partition chromatographic procedures—resolution of sulfonamides, sulfones, and their metabolic products from biological methods.** *Anal. Chem.* **21**, 1402-5 (1949).—*C.A.* **44**, 3065*e*.

Apply 0.003-0.01 ml aliquots of sulfonamide solns. or plasma to narrow strips of filter paper (3 mm × 34 cm). Suspend the strips from the top of 1-liter cylinder to below the surface of 100 ml of solvent (40 ml BuOH and 10 ml concd. NH_4OH dild. to 100 ml with water). For use with plasma, add 0.1 g nonaethyl-eneglycol monostearate to this soln. Hold the strips taut with attached weights. Provide a filter paper wick to carry solvent from a test tube at the top down into the cylinder to maintain a satd. atm. When the solvent, rising by capillary action, reaches the top, remove and dry the strips. Apply *p*-dimethylaminobenzaldehyde soln. (1 g in 100 ml of 3% HCl) to representative strips to locate the bands. To the other strips, add nitrite soln. (0.1 g $NaNO_2$ in 100 ml glacial HOAc + 1 drop HCl), dry, and add *N*-(1-naphthyl) ethylenediamine (0.1 g in 100 ml BuOH) to produce colored bands. Strings of plain or mercerized cotton, glass wool, or thin asbestos paper could be used.

4988. Ma, Roberta M. and Fontaine, Thomas D. **One- and two-dimensional paper-partition chromatographic apparatus.** *Science* **110**, 232-3 (1949).—*C.A.* **43**, 8747*e*.

A 1-liter graduated cylinder served as the chamber. The paper for the chromatogram was held in a stainless steel holder. A rubber stopper and adhesive cellophane tape sealed the top of the cylinder. The chromatograms were run on filter paper sheets 300-330 mm long and 230-280 mm wide.

4989. Malpress, F. H. and Morrison, A. B. **Use of pyridine in the deionization of solutions for paper chromatography.** *Nature* **164**, 963 (1949).—*C.A.* **44**, 3836*e*.

A procedure was given, based on the soly. of sugars and the insoly. of inorg. salts in pyridine, for consistent elimination of salt effects in chromatographic studies.

4990. Markham, Roy and Smith, John D. **Chromatography of nucleic acid derivatives.** *Nature* **163**, 250-1 (1949).—*C.A.* **43**, 4723*c*.

Chromatograms run in BuOH in an NH_3 atm. on filter paper were dried and pinned to a strip of Ilford Reflex Document Paper No. 50. On exposure to 2537 and 2650 A. light for 1.5 min., the absorbing substances (purine and pyrimidine derivs.) showed up as light areas on a black background. Extn. of these areas from the filter paper with H_2O was followed by spectrophotometric analysis.

4991. Markham, Roy and Smith, J. D. **Chromatographic studies of nucleic acids. I. Technique for the identification and estimation of purine and pyrimidine bases, nucleosides and related substances.** *Biochem. J.* **45**, 294-8 (1949).—*C.A.* **44**, 3066*i*.

Pyrimidines moved faster than corresponding purines (uracil faster than xanthine, or cytosine than guanine). In the presence of NH_4OH, the NH_2 derivs. moved much faster than the corresponding OH compds.; the difference was greatly decreased or actually reversed by changing to an acidic solvent. Increasing the no. of OH groups in the subst. decreased its rate of movement. Increasing methylation tended to increase the movement of the subst. in all solvents.

4992. Masuyama, Motosaburo and Takahashi, Mitsumasa. **Ionophoretic chromatography.** *Kagaku (Science)* **19**, 327 (1949).—*C.A.* **46**, 3366*i*.

Six dyes were used for testing the method. After a mixt. of 4 aq. dye solns., which was put on the lower end of vertically hung filter paper, was dried, 0.1 *N* NaCl soln. was sprayed to make the paper conducting. By use of carbon electrodes, a d.c. (0.05 ma.) was applied for 3 hrs. Application of the usual partition method with phenol, after the ionophoretic method, gave almost the same results as in 2 successive one-dimensional partition methods.

4993. Miettinen, J. K. **A new technique in descending paper chromatography.** *Abstracts Communs., 1st Intern. Congr. Biochem.* **1949**, 229.—*C.A.* **46**, 5930*f*.

The neutral amino acids could be completely sepd. from hydrolyzates in one-dimensional expts. In 2-3 weeks, leucine, isoleucine, phenylalanine, methionine, valine, tryptophan, tyrosine, and proline could be completely sepd. as individuals on a 50-cm chromatogram on Whatman No. 1 filter paper.

4994. Miettinen, Jorma K. and Virtanen, Atturi I. **A new technique in paper chromatography.** *Acta Chem. Scand.* **3**, 459-64 (1949).—*C.A.* **43**, 8298*i*.

A continuous developing technique was accomplished in descending paper chromatography by fastening a thick pad of cellulose at the foot of the filter paper and allowing solvent to be adsorbed until the fastest moving compd. nearly reached the pad. tert-AmOH showed the best resolving power; this and other alcs. were preferred, and caused less decompn. than collidine, isobutyric acid, and pytidine.

4995. MITCHELL, HERSCHEL K.; GORDON, MALCOLM, AND HASKINS, FRANCIS A. **Separation of enzymes on filter paper chromatopile.** *J. Biol. Chem.* **180**, 1071-6 (1949).—*C.A.* 44, 2592*g*.

The method was based on salting-out adsorption and adsorption displacement of enzymes on a filter paper pile. The soln. of enzymes was taken up on filter paper disks, dried, and then placed near the head of an enclosed column of filter paper disks. Sepn. of the enzymes occurred when $(NH_4)_2SO_4$ solns. of varying strengths were passed through the column.

4996. MITCHELL, HERSCHEL K. AND HASKINS, FRANCIS A. **A filter paper "Chromatopile".** *Science*, **110**, 278-9 (1949).—*C.A.* 44, 75*f*.

A pile of filter paper disks clamped tightly was used as an absorbing column. It was connected by a siphon of rubber tubing to a flask contg. the solvent and the flask adjusted so the level of the solvent was even with the top of the paper pile. In a test run on 50 mg each of adenine, tryptophan, phenylalanine, *p*-aminocinnamic acid, and anthranilic acid, the compds. sepd. on different groups of paper disks and 233 mg of the original 250 mg was recovered.

4997. MÜLLER, RALPH H. AND CLEGG, DORIS L. **Automatic paper chromatography.** *Anal. Chem.* **21**, 1123-5 (1949).—*C.A.* 43, 8776*i*.

Paraffin barriers were placed on filter paper to form 2 plane reservoirs connected by a narrow channel. With the paper vertical, the sample and an appropriate eluting liquid were placed in the lower reservoir. The progress of the elution was followed automatically by an optical arrangement. With MeOH as elutant, 1γ each of aniline orange and malachite green were sepd. in approx. 1 min.

4998. MÜLLER, RALPH H. AND CLEGG, DORIS L. **Kinetics of paper-chromatogram development.** *Anal. Chem.* **21**, 1429-30 (1949).—*C.A.* 44, 2325*e*.

The square of the radius (r) of a colored zone on a paper-disk chromatogram was proportional to the development time (t) for a given solvent or a solute. Thus $r^2 = at$, or $R_f = r_{11}/r_1 = (a_1/a_{11})^{1/2}$. The values of a_1 and a_{11} could be detd. precisely from a plot of square-law data.

4999. NICHOLSON, D. E. **Modified technique for the development of paper chromatograms.** *Nature* **163**, 954 (1949).

In the sepn. of amino acids by partition chromatography, use of the BuOH in the spray was obviated by the following procedure: carry out the two dimensional chromatography in PhOH as usual, then at right angles with a 0.1% soln. of ninhydrin in collidine or BuOH-AcOH; heat the paper; and remove the solvent in a current of air. The warming was sufficient to develop the colors of the amino acids.

5000. NORRIS, FLORA C. AND CAMPBELL, JACK J. R. **Intermediate metabolism of Pseudomonas aeruginosa. III. Application of paper chromatography to the identification of gluconic and 2-ketogluconic acids.** *Can. J. Research* **27C**, 253-61 (1949).—*C.A.* 44, 3567*c*.

The use of paper chromatography for the detection of gluconic, 2-ketogluconic, and α-ketoglutaric acids was described. The R_f values obtained were found to vary markedly with the water content of the solvent. Salts of acids or free acids were always found to give identical R_f. MeOH and EtOH, separate or in combination, were found to be suitable solvents for this work.

5001. OSBORN, G. H. AND JEWSBURY, A. **Inorganic paper chromatography; Qualitative separation of aluminum and beryllium.** *Nature*, **164**, 443-4 (1949).—*C.A.* 44, 75*c*.

Al scarcely moved from its starting point but Be moved a considerable distance down the paper. The technique of development by fluorescence was used. The chloride spots were eluted with a solvent contg. 80% by vol. *n*-butanol and 20% concd. HCl and then sprayed with an alc. soln. of 8-hydroxyquinoline.

5002. PACSU, E.; MORA, T. P., AND KENT, P. W. **General method for paper chromatographic analysis of reducing and nonreducing carbohydrates and derivatives.** *Science* **110**, 446-47 (1949).—*C.A.* 44, 2417*b*.

An improved method for the detection of carbohydrates and their derivs. after sepn. on paper chromatograms consisted in spraying the dried chromatograms with a 1% aq. soln. of $KMnO_4$ contg. 2% Na_2CO_3. Yellow zones on a purple background changed to gray zones on a brown background after drying. Elution with H_2O in place of BuOH gave some sepn. of higher sugars and trisaccharides, but with considerable widening of the bands. Streptomycin migrated readily with H_2O. R_f values detd. on Whatman No. 1 paper with downward elution with BuOH were given.

5003. PARTRIDGE, S. M. **Aniline hydrogen phthalate as a spraying reagent for chromatography of sugars.** *Nature*, **164**, 443 (1949).—*C.A.* 44, 487*a*.

This reagent was much more selective for sugars than ammoniacal $AgNO_3$ and was extremely sensitive to aldo-pentoses and aldo-hexoses. Since it may be dissolved in moist butanol, migration of the sugar spots during the spraying process could be avoided. To prep. the reagent add aniline 0.93 g and phthalic acid 1.66 g to 100 ml of water-satd. butanol. After spraying, the chromatogram was heated for 5 min. at 105°C to develop the color.

5004. PATTON, A. R. AND FOREMAN, E. M. **Glycine reagent for paper chromatograms.** *Science* **109**, 339 (1949).—*C.A.* 43, 4978*a*.

Glycine could be identified on a paper chromatogram as a Hellebore green spot, chocolate brown under radiation at 3650 A., by spraying with a soln. of *o*-phthalaldehyde. The most suitable solvent for dispersing interfering substances found in protein hydrolyzates was 77% EtOH. Use of *o*-phthalaldehyde also permitted detection of NH_4^+ (dark grey), and histidine and tryptophan (sep. spots with intense yellow fluorescence at 3650 A.).

5005. PATTON, A. R.; FOREMAN, ELSIE M., AND WILSON, PATRICIA C. **Do amino acids fluoresce on paper-grams?** *Science* **110**, 593-4 (1949).—*C.A.* 44, 3361*a*.

Spots formed by drying solns. of amino acids on filter paper fluoresce under the ultraviolet light, possibly as a result of a reaction between the amino acid and the cellulose. All amino acids produced similar results.

5006. POLLARD, F. H.; MCOMIE, J. F. W., AND ELBEIH, I. I. M. **Inorganic paper chromatography and detection of cations by fluorescence.** *Nature* **163**, 292 (1949).—*C.A.* 43, 5702*b*.

The relative R_F values were given for two solvents: (1) 50 BuOH, 10 HOAc, 5 acetoacetic ester, 35% water; and (2) 50 collidine with 50% water. The dried strips were sprayed with kojic acid, *o*-aminobenxoic acid, morin, 1-naphthylamine-8-sulfonic acid, 2-naphthylamine-1-sulfonic acid, or 8-hydroxyquinoline and examd. under ultraviolet to locate the cations.

5007. PORTER, W. L. AND FENSKE, CHARLES S. JR. **Determination of glucose, galactose, and rhamnose in mixtures.** *J. Assoc. Offic. Agr. Chemists* **32**, 714-17 (1949).—*C.A.* 44, 486*h*.

The method involved hydrolysis, identification of the sugars by paper chromatography, and detn. of reducing sugars before and after fermentation by two yeasts capable of selective destruction of glucose, and of glucose and galactose, resp. When the chromatogram indicated only rhamnose, fermentation was unnecessary.

5008. RENARD, MARCEL. **Paper chromatography of α-chlorinated acids. A new, simple, and rapid method to establish the structure of dipeptides.** *Bull. soc. chim. Belges* **58**, 301-9 (1949).—*C.A.* 44, 3409*i*.

Paper chromatography of chloroacetic acid and α-chloropropionic acid was studied. The mixt. of acids was displaced by dichloroethylene in a moist atm. and the acid zone detected with methyl orange. The ratio R (distance covered by the acid zone divided by distance covered by the solvent zone) depended on the amt. of acid present. The presence of either compd. in an unknown mixt. was detected by addn. of a known amt. of chloroacetic acid or α-chloropropionic acid. Appearance of a single acid zone indicated identity. The application of this method for detg. the structure of dipeptides was shown with alanylglycine.

5009. ROCKLAND, LOUIS B. AND DUNN, MAX S. **Capillary-ascent test-tube method for separating amino acids by filter-paper chromatography.** *Science* **109**, 539-40 (1949).—*C.A.* 43, 8777*f*.

A spot of a 0.03 *M* amino acid soln., 1.5 mm in diam. or less, was placed about 6 mm from the small end of a strip of No. 1 Whatman filter paper, 13.5 × 1.8 × 1.0 cm. This was developed in a stoppered 6-in. test tube contg. about 0.4 cc. of a water-satd. phenol soln. R_f values (the ratio of the distance traveled by an ion to that traveled by the liquid front) were detd. for 17 amino acids.

5010. ROCKLAND, LOUIS B. AND DUNN, MAX S. **Quantitative determination of amino acids on filter paper chromatograms by direct photometry.** *J. Am. Chem. Soc.* **71**, 4121-2 (1949).—*C.A.* 44, 3072*a*.

Alanine and glycine were detd. in silk fibroin by a rapid, direct photometric analysis of color intensities of filter paper chromatograms stained with ninhydrin.

5011. ROTH, LLOYD J.; LEIFER, EDGAR; HOGNESS, JOHN R., AND LANGHAM, WRIGHT H. **Metabolism of radioactive pentobarbital in mice.** *J. Biol. Chem.* **178**, 963-5 (1949).—*C.A.* 43, 6306*h*.

When Na pentobarbital, labelled with C^{14}, was injected intraperitoneally into mice, 80% of the radioactivity was recovered: 78% in the urine, 2% in the feces, and none in expired CO_2. Filter paper chromatograms of the urine indicated the presence of 5 radioactive metabolites.

5012. RUTTER, L. **Streaming potential in paper chromatography.** *Nature* **163**, 487 (1949).—*C.A.* 43, 6040*b*.

The potential developed by the resultant flow of solvent through the capillary channels of paper was studied.

5013. SLUYTERMAN, L. A. A. E. AND VEENENDAAL, H. J. **A method for the detection of amphoteric substances in paper chromatography.** *Rec. trav. chim.* **68**, 717-20 (1949).—*C.A.* 44, 4363*i*.

Amino acids with a tertiary amino group, or aminobenzoic acids which did not react with ninhydrin, were chromatographed on paper and, after drying, the paper treated with a soln. of 15 mg tropeolin 00 in 100 ml $EtOH$-Et_2O (1:2) or other suitable acid-base indicator. After drying, the paper was held in HCl vapor in such a way that all parts absorbed the same amt. of acid. Through their buffering action, the spots with amino acids held the pH higher than the surrounding unbuffered parts of the paper and thus formed yellow spots on a red background if the correct amt. of HCl was absorbed.

5014. SUNDMAN, JACOBUS; SAARNIO, JOUKO, AND GUSTAFSSON, CHARLEY. **Investigation of the carbohydrate composition of some kinds of wood by paper chromatography.** *Finnish Paper Timber J.* **31**, 467-71 (1949).—*C.A.* 45, 2199*b*.

One g powd. and dried wood sample was treated with 10 ml 72% H_2SO_4 at room temp. for 4 hrs, 320 ml H_2O added, and the soln. boiled for 6 hrs. The acid was removed by filtering through an anion exchanger, thus avoiding epimerization. The soln. was then adjusted to pH 4-5 with AcOH and evapd. to a small vol. The chromatograms were developed with a 1:1 mixt. of *N* $AgNO_3$ and 5 *N* NH_4OH applied with a brush. In some parallel expts. the hexoses were removed by fermentation before chromatographing to bring out the pentoses more clearly.

5015. TAUROG, ALVIN; CHAIKOFF, I. L., AND TONG, W. **Occurrence of monoiodotyrosine in the thyroid gland.** *J. Biol. Chem.* **178**, 997-8 (1949).—*C.A.* 43, 6714*c*.

Two-dimensional filter paper chromatograms were prepd. with aliquots of the filtered hydrolyzate with $BuOH$-$AcOH$-H_2O and collidine-H_2O as the developing agents. Two of the radioactive spots corresponded exactly to the positions taken by added diiodo-DL-tyrosine and monoiodo-DL-tyrosine.

5016. Urbach, Karl F. **Deposition and simultaneous concentration of dilute solutions in paper partition chromatography.** *Science* **109**, 259-60 (1949).—*C.A.* **43**, 4183*a*.

A device was described which allowed the concn. on a small spot on paper strips of 3-5 ml soln. instead of the customary 0.01-0.1 ml. Histamine soln. in BuOH was added to paper strips at a rate of 1 ml per hr through specially constructed capillary pipets. The strips were mounted over a hot plate in such a way that the liquid evapd. as it was applied.

5017. Wender, Simon H. and Gage, Thomas B. **Paper chromatography of flavonoid pigments.** *Science* **109**, 287-9 (1949).—*C.A.* **43**, 6285*b*.

The sepn. of mixts. contg. 4 to 6 of these pigments and the use of color developing sprays to locate and identify the pigment zones were presented. Mixts. of 4 to 6 pigments were sepd. on a one-dimensional chromatogram strip by selecting the solvent giving the greatest differences in R_F values for the particular pigments. The color of the pigment zones in ultraviolet light was an aid in identifying the respective pigments on the developed chromatogram.

5018. Wieland, Theodor and Fischer, Edgar. **Paper chromatography of α-keto acids.** *Naturwissenschaften* **36**, 219 (1949).—*C.A.* **44**, 5757*d*.

Fresh soln. of *o*-phenylenediamine (0.05%) in 10% aq. CCl_3CO_2H was sprayed on filter paper and dried for 2 min. at 100°C to a moist, yellow condition. α-Keto acids were dissolved in either of 2 solvents: PWB, 5:7: 10 vol. ratio of propionic acid, water, and butanol, or WDB, 3:4:6 ratio of water, α-(dimethylamino) isobutyronitrile, and butanol, keto acid concn, in either 1%. The R_F values obtained by chromatography of such solns. on the paper described (yellow-green fluorescence at the locations of the keto acid) were 0.29 for pyruvic acid, 0.60 for dimethylpyruvic acid, 0.75 for cinnamoylformic acid, 0.21 for α-keto-glutaric acid, and 0.16 for oxalacetic acid with PWB solns. For WDB solns. the values were 0.46, 0.78, 0.95, 0.07, and 0.04, resp.

5019. Woiwod, A. J. **A technique for examining large numbers of bacterial culture filtrates by partition chromatography.** *J. Gen. Microbiol.* **3**, 312-18 (1949).—*C.A.* **44**, 3550*g*.

A special app. was designed for making paper chromatograms. Whatman No. 4 paper (22 1/2 × 18 1/4 in.) and BuOH + AcOH mixt. were chosen as the best paper and solvent. Phenol was used for 2-dimensional chromatography.

5020. Wolfson, W. Q.; Cohn, C., and Devaney, W. A. **An improved apparatus and procedure for ascending paper chromatography on large-size filter-paper sheets.** *Science* **109**, 541-3 (1949).—*C.A.* **43**, 8806*f*.

The stainless steel chromatography tank was cylindrical, 16 in. internal diam., 24 in. high and constructed with a 3/4-in. flange at the top for sealing. The lid was fitted with an eccentrically placed 1-in. hole for pressure reduction or the addn. or removal of material. The filter sheets (Whatman No. 1, 18 in. × 23 in. or S & S No. 604, 23 in. × 23 in.) were folded back 1 in. on 3 edges, stapled, and the sheet fastened in the form of a cylinder with adhesive tape.

5021. Wynn, Victor. **Peptidelike contaminant of filter paper.** *Nature* **164**, 445 (1949).—*C.A.* **44**, 185*g*.

A contaminant in Whatman nos. 1, 2, and 4 filter papers was studied. Each paper was set up as for a chromatogram with distd. water as the solvent. The water was allowed to run off for 5 days into a receiving vessel. Each 24-hr collection was filtered and evapd. to dryness. The first two 24-hr samples contained appreciable amts. of solid material, the other 3 negligible amts. The material from the first 2 days was mixed and the 4 specimens were hydrolyzed (6 *N* HCl, 105°C, 24 hrs) and subjected to 2-dimensional chromatography.

5022. Zaffaroni, Alejandro; Burton, Robert B., and Keutmann, E. Henry. **The application of paper partition chromatography to steroid analysis. I. Ketosteroids.** *J. Biol. Chem.* **177**, 109-16 (1949).—*C.A.* **43**, 3872*f*.

Ketosteroids were transformed into water-sol. hydrazones by means of trimethylacetohydrazideammonium chloride which were sepd. on paper strips and developed with BuOH or a mixt. of BuOH and *tert*-BuOH, satd. with H_2O. After development of the chromatogram the hydrazones were made visible with K_2PtI_6 or iodobismuthate.

5023. Zocher, H. and Torok, C. **Relations between fluorescence and adsorption.** *Anais assoc. quim. Brasil* **8**, 5-19 (1949).—*C.A.* **45**, 40*i*.

A fluorescence exhibited by a drop of soln. allowed to spread on S. & S. No. 589 filter paper was studied (Hg-vapor lamp with NiO glass filter). The threshold concn. for observable fluorescence in H_2O, expressed as the neg. log of the wt fraction, was 7 for a drop of fluorescein soln., and 6 if adsorbed onto paper. For mercurochrome the values were 6.5 and 5.5, resp., but for eosin 7 and 8, the increased sensitivity on paper being due to stronger adsorption because of higher mol. wt.

5024. Acher, Roger; Fromageot, Claude, and Jutisz, Marian. **Chromatographic separation of amino acids and peptides. V. The amino acids of insulin with a note on the determination of proline.** *Biochim. et Biophys. Acta* **5**, 81-8 (1950)(in French).—*C.A.* **46**, 11288*h*.

The chromatographic sepn. method of amino acids into 4 groups (basic, acid, neutral aromatic, and neutral nonaromatic) was applied to the constituent amino acids of insulin.

5025. Anderson, J. R. A. and Lederer, M. **Quantitative paper chromatography. I. Separation and gravimetric determination of thallium.** *Anal. Chim. Acta* **4**, 513-16 (1950) (in English).—*C.A.* **45**, 3282*f*.

Tl [III] could be sepd. quantitatively from Fe, Cu, Ni, and Co by using butanol satd. with *N* HCl soln. as solvent. Strips of paper pulp 150 × 25 × 6 mm capable of adsorbing 1-2 ml of soln. on a spot 25 mm in diam were used. Up to 50 mg of metallic ion could be sepd.

5026. Aronoff, S. and Vernon, L. **$C^{14}O_2$ assimilation by soybean leaves.** *Arch. Biochem.* **27**, 239-40 (1950).—*C.A.* **44**, 10812*c*.

The primary chromatographic product of CO_2 fixation in 5 to 90 sec. exposure was glyceric acid. Next are alanine, serine, and glycine. The first free sugars were the trioses and glucose, followed by fructose, and later by sucrose, raffinose, and mannose.

5027. Atkinson, R. O.; Stuart, R. G., and Stuckey, R. E. **Colors developed in the paper chromatography of amino acids.** *Analyst* **75**, 447 (1950).—*C.A.* **44**, 10602*e*.

Many amino acids gave a reddish color after irrigation with acid solns. and a bluish color after irrigation with basic solns. Elution with a mixt. of 60% 2,4-lutidine and 40% water, or with 20% pyridine and 80% water, caused the color to change from red to blue and the blue was readily washed away. The blue color was unstable in the presence of alkali hydroxide and NH_3 and vigorous shaking with pyridine sometime peptized the filter paper giving a transparent colloidal suspension. Glycine, asparagine, tyrosine, phenylalanine, histidine, and tryptophan gave anamolous results. By irrigation with phenol in the presence of NH_4OH, drying and spraying with ninhydrin gave brown or orange spots with the 6 acids mentioned.

5028. Bailey, A. **Chromatographic behavior of lignins.** *Paper Ind.* **32**, 395-8 (1950).—*C.A.* **44**, 8106*h*.

Lignin was extd. (1 hr) from aspen, birch, white oak, white spruce, and jack pine by means of aq. BuOH (50% by vol.) at 160°C. The filtered liquors were pptd. by aq. HCl, and the washed, air-dried lignin dissolved in dioxane (4% soln.) which was applied slowly to the center of a filter paper and after adsorption, AcOBu was applied as solvent. The preferential lignin absorption was followed alternately in ultraviolet and visible light, the appearances of the various zones being noted both wet and dry.

5029. Beerstecher, Ernest, Jr. **Micromethod for estimation of potassium by paper chromatography.** *Anal. Chem.* **22**, 1200-02 (1950).—*C.A.* **45**, 495*d*.

K was sepd. from interferring substances by paper chromatography; a soln. of 80 parts of EtOH and 20 parts of 0.1 *N* HCl was used as a solvent. K was developed as a green spot at $R_f = 0.4$ upon spraying with $NaPbCo(NO_2)_6$. Planimetry of the spots measured the K present.

5030. Biserte, Gérard and Osteux, Roger. **Separation of amino acids and polypeptides as dinitrophenyl derivatives.** *Compt. rend.* **230**, 1404-5 (1950); *Bull. soc. chim. biol.* **33**, 50-63 (1951).—*C.A.* **44**, 7374*f*.

The fixation of dinitrophenyl by the action of fluorodinitrobenzene on amino groups was a precise method for detg. terminal amino groups in polypeptides. In applying this method to paper chromatography, the following solvents were used: (1) ammoniacal $PhOH$-iso-$AmOH$-H_2O, 1:1:1, (2) toluene-$ClCH_2CH_2OH$-C_5H_5N-NH_4OH, 5:3:1:3, and (3) C_5H_5N-iso-$AmOH$-dil. NH_4OH, 6:14:20. The resolution was satisfactory when there were a small no. of different (dinitrophenyl) amino acids and particularly for the identification of the terminal groups of simple polypeptides.

5031. Bland, D. E.; Ho, G., and Cohen, W. E. **Aromatic aldehydes from the oxidation of some Australian woods and their chromatographic Separation.** *Australian J. Sci. Research* **3A**, 642-8 (1950).—*C.A.* **45**, 4442*i*.

The wood (5 g sawdust) was oxidized with $PhNO_2$ (3 ml) and 2 *N* NaOH (100 ml) in a steel bomb at 150°C for 3 hrs, and the product filtered. p-OHC_6H_4CHO was isolated from certain exts. by the "chromatopile." Paper chromatograms showed it to be present in traces in all cases.

5032. Block, Richard J. **Paper chromatograms spot amino acids.** *Food Inds.* **22**, 824-7, 951-3 (1950).—*C.A.* **45**, 983*e*.

The sepn. and identification of amino acids from protein hydrolyzates by 2-dimensional chromatographic analysis were described. Identification should not rest solely on the R_f values. The position of the spot relative to other amino acids, movement in a variety of solvent mixts., and color reactions should also be used.

5033. Block, Richard J. **Estimation of amino acids and amines on paper chromatograms.** *Anal. Chem.* **22**, 1327-32 (1950); **23**, 298 (1951).—*C.A.* **45**, 8585*a*.

Quant. detn. of amino acids from protein hydrolyzates was accomplished by prepg. one- and two-dimensional chromatograms. Known mixts. were run on the same sheet with unknowns. For two-dimensional chromatograms, it was therefore necessary to cut the first chromatogram into horizontal strips, ext. the groups of amino acids, and make new chromatograms from each group.

5034. Boggs, L.; Cuendet, L. S.; Ehrenthal, I.; Koch, R., and Smith, F. **Separation and identification of sugars using paper chromatography.** *Nature* **166**, 520-1 (1950).—*C.A.* **45**, 1840*a*.

Blackening of the paper in the chromatography of sugars with a $PhOH$-H_2O mixt. and ammonical $AgNO_3$ as a developer could be avoided if the paper was extd. with Et_2O before developing. Another method was to use malonic or propionic acid together with BuOH and H_2O as solvents.

5035. Boissonnas, R. A. **Chromatographic studies. I. Rapid separation of amino acids by ascending two-dimensional paper chromatography.** *Helv. Chim. Acta* **33**, 1966-71 (1950) (in French).—*C.A.* **45**, 418*b*.

Two chromatograms were run. Leucine, isoleucine, valine, methionine, phenylalanine, tyrosine, and tryptophan were sepd. by the solvent systems *tert*-$BuOH:MeCOEt:H_2O$ (4:4:2) and *tert*-$BuOH:MeOH:H_2O$ (4:5:1), whereas all the other amino acids were sepd. on another sheet with $C_6H_5OH:H_2O$ (7:3) and $PrOH:H_2O$ (7:3). Whatman No. 1 paper was used. The solvents were removed by an air current or *in vacuo* at 60°C.

5036. Boissonnas, R. A. **Chromatographic studies. II. Punctiform color development of amino acids, polypeptides, and sugars.** *Helv. Chim. Acta* **33**, 1972-4 (1950) (in French).—*C.A.* **45**, 418*d*.

Ninhydrin (3 g) in a mixt. of 50 ml *tert*-BuOH, 40 ml glycerol, and 10 ml H_2O was applied to paper chromatograms in small points of 0.5 mm diam. at distances of 7 mm with the aid of a stamp equipped with fine metal needles. The viscosity of the reagent prevented its spreading on the paper. Exposure of the spotted paper to infrared rays for 10 sec developed the color and outlined the amino acid spots.

5037. BONINO, GIOV. BATTISTA AND CARASSITI, V. **Separation of optical antipodes of *dl*-1(2-hydroxy) naphthylbenzylamine by means of chromatography on paper.** *Atti accad. nazl. Lincei. Rend., Classe sci., fis., mat. and nat.* 9, 229-31 (1950).—*C.A.* 45, 8489*e*.

dl-2,1-$HOC_{10}H_6CH(Ph)NH_2$, was resolved by forming the *d*-tartarate and chromatographing the salt on filter paper which had been impregnated with PhOH.

5038. BOURSNELL, J. C. **A radioactivity scanning device for paper chromatograms with phosphorus^{32}.** *Nature* 165, 399 (1950).—*C.A.* 44, 8170*g*.

An app. for counting radioactive P in PO_4^{3-} esters after sepn. on filter paper chromatograms consisted of a brass plate within which an exact 1-cm square hole had been cut. A Geiger-Müller counter with a 2-in. "Dural" end window was mounted below the hole, and the filter paper was pressed against the brass by a glass plate and a Pb wt.

5039. BRADFIELD, A. E. AND SMITH, E. C. BATE. **Chromatographic behavior and chemical structure. II. The tea catechins.** *Biochim. et Biophys. Acta* 4, 441-4, (1950).—*C.A.* 44, 5677*e*.

Paper chromatography at 20°C in BuOH-AcOH-H_2O (4:1:5) was performed on the components of the "white tannin" of green tea leaves. Spots were developed by spraying with ammoniacal $AgNO_3$. Certain regularities in these results, as well as similar ones obtained from optical rotation suggested that the l-gallocatechol of tea would be more suitably designated as l-epigallocatechol.

5040. BRODA, E. AND SCHONFELD, T. **Exchange adsorption of radioactive ions on paper.** *Monatsh.* 81, 459-62 (1950).—*C.A.* 44, 8262*b*.

The pH dependence pointed to an ion-exchange mechanism. Th-B and Rb^{86} were used. On the assumption that the active centers were carboxyls, the no. of glucose units per carboxyl group in cellulose was calcd. to be 125. Adsorption capacities for 10^{-7} *M* RbCl increase in the order H-paper 3.1%, Ca-paper 7.7%, K-paper 16.1%, and Li-paper 38%.

5041. BROWN, F. AND HALL, L. P. **The separation of carboxylate ions on the paper chromatogram.** *Nature* 166, 66-7 (1950).—*C.A.* 44, 9868*c*.

Fatty acids could be sepd. and identified by paper chromatography of the Na salts with BuOH satd. with 1.5 *N* NH_4OH as solvent. Bromocresol green and bromothymol blue revealed the anions as yellow spots, the cations as blue spots. The Na ion moved separately and more slowly than its anion, its R_f increasing as the anion R_f increased. The acids tested were: formic ($R_f = 0.09$), AcOH 0.10, propionic 0.19, butyric 0.33, valeric 0.45, caproic 0.61, caprylic 0.74, benzoic 0.39, salicylic 0.50, B-phenylpropionic 0.52, lactic 0.07, oxalic 0, tartaric 0, adipic 0, and citric 0.

5042. BRUMBERG, E. M. **Apparatus for chromatography and analysis in ultraviolet (ultrachemiscope).** *Doklady Akad. Nauk S.S.S.R.* 72, 885-8 (1950).—*C.A.* 44, 9745*i*.

A strip of filter paper was placed between a glass light-filter plate transmitting only ultraviolet, mainly 253 mμ, and a fluorescent screen with 3 fluorescent layers, the outermost (facing the filter paper) excitable by wave lengths shorter than 270, the intermediate by 320-270, the innermost by 400-320 mμ, and omitting, resp., red, green, and blue fluorescence. The nature of the substances present in the filter paper, depending on their adsorption in the ultraviolet, detd. characteristic shadows on the fluorescent screen.

5043. BUCHANAN, J. G.; DEKKER, C. A., AND LONG, A. G. **Detection of glycosides and nonreducing carbohydrate derivatives in paper-partition chromatography.** *J. Chem. Soc.* 1950, 3162-7.—*C.A.* 45, 3753*g*.

Nonreducing sugar derivs. and 1,2-glycols could be detected by methods depending on their specific reactions with $NaIO_4$ or with $Pb(OAc)_4$. After oxidation, $NaIO_4$ and $NaIO_3$ were reduced by SO_2, and the aldehydes detected by Schiff's reagent. Dialdehydes thus formed gave stable blue or purple stains, monoaldehydes reacted more feebly and precautions to prevent aerial oxidation were required. The method gave pos. results with every 1,2-glycol tested (18 of which were listed) in quantities of 10γ or less.

5044. BURMA, D. P. AND BANERJEE, B. **The role of cellulose in filter-paper chromatography.** *Science and Culture* 15, 363-4 (1950).—*C.A.* 45, 3753*b*.

Cellulose may not play a completely passive role in paper chromatography. The effect of partition was precluded by using pure H_2O as a solvent for 15 α-amino acids and 7 sugars in runs employing the usual ascending and descending techniques. Const. and reproducible R_f values in the range 0.80-0.95 were obtained for all compds. tested (except tryptophan, 0.57), indicating a weak but definite adsorption.

5045. BURMISTROV, S. I. **Chromatographic analysis on paper applied to mixtures of primary arylamines.** *Zhur. Anal. Khim.* 5, 39-43 (1950).—*C.A.* 44, 4373*h*.

This method was particularly suitable for identification of arylamines obtained after reduction of azo dyes. A strip of filter paper was exposed for a predetd. time to the vapors of HCl, formic acid, AcOH, or pyridine. A little of the amine soln. in a volatile solvent was transferred onto the paper with the aid of a capillary and the identification was carried out.

5046. BURSTALL, F. H.; DAVIES, G. R.; LINSTEAD, R. P. AND WELLS, R. A. **Inorganic chromatography on cellulose. II. The separation and detection of metals and acid radicals on strips of absorbant paper.** *J. Chem. Soc.* 1950, 516-28.—*C.A.* 44, 7182*g*.

Successful sepns. of the following were achieved by chromatography on paper strips by using the indicated solvents: Pb^{2+}, Cu^{2+}, Bi^{3+}, Cd^{2+}, Hg^{2+}—BuOH satd. with 3 *N* HCl; As^{3+}, Sb^{3+}, Sn^{2+}—acetylacetone satd. with H_2O, contg. 0.5% HCl (d. = 1.18) and 25% acetone; Fe^{3+}, Al^{3+}, Cr^{3+}—glacial AcOH contg. 25% CH_3OH; Ni^{2+}, Co^{2+}, Mn^{2+}, Zn^{2+}—acetone contg. 5% H_2O and 8% HCl; Ca, Sr, Ba—pyridine contg. 20% H_2O and 1% KCNS; Li, Na, K—CH_3OH; Pt, Pd, Rh, Ir, Ru, Os, Au chlorides, or chloro salts—Me Et ketone contg. 30% HCl; Au from Pt metals—Et_2O contg. 2% dry HCl and 7.5% dry Me-(OH).

5047. Bush, I. E. **Chromatography of steroids on alumina-impregnated filter paper.** *Nature* **166**, 445-6 (1950).—*C.A.* **45**, 986*b*.

The paper was prepd. by soaking Whatman 54 paper in a soln. of ammonium alum (200 g/liter) at 60°C, hanging for 15 min. in a closed glass vessel, then adding a liberal vol. of concd. NH_4OH to the vessel and leaving overnight, removing the paper, and washing in running H_2O for 6 hrs before drying. After complete removal of traces of solvents, drying, and neutralization of acids by a short exposure to NH_3 gas, the chromatogram was dipped for a few sec in a fresh, satd. soln. of I_2 in petr. ether, b. 60-80°C, heated to 40°C on a water bath. To make the spots more permanent and clear, the chromatogram could be sprayed with concd. starch soln. after all the background I_2 had disappeared.

5048. Cacioppo, F. and Grutta, G. La. **Partition chromatography on paper of certain thiazoles.** *Boll. soc. ital. biol. sper.* **26**, 1011-12 (1950).—*C.A.* **46**, 558*a*.

By descending chromatography with BuOH satd. with water and AcOH, it was possible to show in tissue homogenates the presence of 4-methyl-5-(2-hydroxyethyl) thiazole (R_f 0.53). Equal parts of 0.066 *M* KI soln. and 0.0033 *M* chloroplatinic acid with 6 vols. doubly distd. water was used as spot test.

5049. Carter, C. E. **Paper chromatography of purine and pyrimidine derivatives of yeast ribonucleic acid.** *J. Am. Chem. Soc.* **72**, 1466-71 (1950).—*C.A.* **44**, 5953*h*.

Solvent systems for paper chromatography of purine and pyrimidine derivs. of yeast nucleic acid were described and use of the method for analysis of complex mixts. of these compds. by two-dimensional chromatography was reported. Location of compds. on the paper chromatogram was achieved by ultraviolet fluorescence.

5050. Csobán, Gyorgy. **Paper chromatography.** *Magyar Kém. Folyóirat* **56**, 449-51 (1950).—*C.A.* **46**, 1384*g*.

A relatively simple method was worked out for the sepn. of spots which were located too close to each other on one-dimensional paper chromatograms. The principle of the method was to repeat the run 2 or 3 times with the same solvent. The procedure was suitable for increasing the distance between spots having R_f values of 0 to 0.5 by about 50%.

5051. Dalgliesh, C. E. **Permanganate as a spraying reagent for amino acids on paper chromatograms.** *Nature* **166**, 1076 (1950).—*C.A.* **45**, 3753*e*.

If a paper chromatogram was lightly sprayed with a 1% soln. of $KMnO_4$ contg. 2% Na_2CO_3, methionine, tryptophan, tyrosine, and (more weakly) proline and histidine immediately appeared as yellow spots on a red background. Cysteine, which did not normally occur on a paper chromatogram, also gave a spot as does threonine, hydroxyproline, lysine, and glycine upon standing for a few min.

5052. Datta, S. P.; Dent, C. E., and Harris, H. **An apparatus for the simultaneous production of many two-dimensional paper chromatograms.** *Science* **112**, 621-3 (1950).—*C.A.* **45**, 1824*h*.

An app. was described which allowed the simultaneous running of 12 paper chromatograms on sheets of 20 cm^2.

5053. Decker, Peter and Riffart, Wolfgagn. **Paper chromatography with water-miscible solvents.** *Chem.-Ztg.* **74**, 261 (1950).—*C.A.* **45**, 6528*d*.

R_f values were given for amino acids in such solvents as 60 vol. % α-picoline, 90% MeOH, 80% iso-PrOH, water-satd. PhOH, and collidine, and a mixt. of pyridine 50, acetic acid 35, H_2O 15%.

5054. Duff, R. B. and Eastwood, D. J. **Use of the arsenomolybdate-Somogyi reagent in quantitative paper chromatography, and its application to the study of sucrose utilization by a fungus.** *Nature* **165**, 848-9 (1950).—*C.A.* **44**, 8816*e*.

A method was described for the estn. of micro quantities of sucrose by using chromatographic sepn. on paper, extn., and colorimetric assay with a modified Somogyi Cu reagent and arsenomolybdate reagent. Ten to 350 γ of sugar could be detd. accurately.

5055. Durrum, E. L. **A microelectrophoretic and microionophoretic technique.** *J. Am. Chem. Soc.* **72**, 2943-8 (1950).—*C.A.* **44**, 8737*f*.

The technique consisted in applying an elec. potential across the ends of strips of filter paper satd. with electrolyte soln. At some intermediate position of these strips, the mixt. to be sepd. was applied. The course of sepns. was followed in the case of amino acids and peptides by ninhydrin treatment; in the case of protein sepns. by coagulation and selective dyeing *in situ* and in the case of radioactive components by autoradiography.

5056. Fowden, L. and Penney, J. R. **Elimination of losses in the estimation of amino acids by paper chromatography.** *Nature* **165**, 846-7 (1950).—*C.A.* **44**, 8826*e*.

Recovery of amino acids after chromatographic sepn. on paper strips with PhOH-NH_4OH as solvent, drying at 75-100°C and colorimetric detn. with ninhydrin was usually 75-80%. Recovery with BuOH-AcOH solvent was somewhat higher. Expts. showed that drying the paper at high temp. in the presence of solvent caused the losses of amino acids. Removal of the solvent with Et_2O, drying at room temp. and subsequent color development resulted in 98 to 101% recovery of alanine, phenylalanine, and glutamic acid.

5057. FRIERSON, W. JOE AND AMMONS, MARY JO. **The separation of inorganic ions by paper partition chromatography.** *J. Chem. Education* 27, 37-8 (1950).—*C.A.* 46, 2962*c*.

A procedure for the sepn. of inorg. ions from Groups I, II, and III by paper partition chromatography was described. No. 1 Whatman filter paper was used, acidified *n*-butanol as the solvent, and H_2S as the developer.

5058. FUČÍK, K. AND PROCHÁZKA, Ž. **Simple devices for paper chromatography.** *Chem. Listy* 44, 165 (1950).—*C.A.* 45, 5460*i*.

An Erlenmeyer flask and a test tube were used for paper chromatography. The strip of paper was hung from the stopper. One phase was placed in the vessel, the other soaked in absorbent cotton or filter paper and fastened to the stopper.

5059. GAGE, THOMAS B. AND WENDER, SIMON H. **Determination of certain flavonol-3-glycosides by paper partition chromatography.** *Anal.Chem.* 22, 708-11 (1950).—*C.A.* 44, 7189*a*.

Binary mixts. of rutin, quercitrin, isoquercitrin, robinin, and xanthorhamnin and ternary mixts. of rutin, quercitrin, and isoquercitrin have been sepd. quantitatively by paper partition chromatography. The mixts., contg. 10-40 γ of each pigment, were chromatographed on filter paper with BuOH-AcOH-H_2O. Blank filter strips were carried through the chromatographic procedure.

5060. GRASSMANN, W. AND HANNIG, K. **Simple process for continuous separation of mixtures on filter paper by electrophoresis.** *Naturwissenchaften* 37, 397 (1950).—*C.A.* 45, 2363*c*.

Inside of a 22 × 26 × 7 cm glass cuvette a vertical sheet of filter paper (S & S 589g or 602h) was suspended between 2 vertical Pt electrodes. A continuous downward stream of buffer soln. was maintained through the paper (2-6 hrs flow period) and at a location in the middle of the paper slightly below the top the test soln. was continuously fed. The electrodes carried 110 v. and 20 to 30 ma. The electrophoresis would cause the components of the soln. to spread out sidewise in a downward direction and they could be collected at the bottom of the paper sheet in sep. containers.

5061. GRAY, IRVING; IKEDA, SABURO; BENSON, ANDREW A., AND KRITCHEVSKY, DAVID. **Detection of tritiated compounds in paper chromatography.** *Rev. Sci. Instruments* 21, 1022 (1950).—*C.A.* 45, 4100*i*.

Constructional details of a windowless tube which could be used to detect tritium activity on paper, glass, or Al were given. The tube was of glass with a nichrome anode and a copper sulfide-coated Cu cathode, and utilized a stream of alc.-satd. He.

5062. HARASAWA, SHIRO. **Inorganic paper chromatography. I. The chromatograms of cadmium salts obtained by means of the developers containing hydrochloric acid as active component.** *J. Chem. Soc. Japan, Pure Chem. Sec.*, 71, 636-9 (1950).—*C.A.* 45, 6456*e*.

With developers contg. HCl as active component, $Cd(NO_3)_2$, $CdSO_4$, $Cd(C_2H_3O_2)_2$, $CdCl_2$, $CdBr_2$, and CdI_2 were chromatographed.

5063. HISCOX, E. R. AND BERRIDGE, N. J. **Use of paper partition chromatography in the identification of volatile fatty acids.** *Nature* 166, 522 (1950).—*C.A.* 45, 1901*h*.

The acids were neutralized by NH_3 or $C_2H_5NH_2$ vapor; BuOH and H_2O were used as solvents, and 2% bromocresol green was used as indicator. Blue spots on a yellow background were obtained, whose area was a rough indication of the amts. of acid present.

5064. HOUGH, LESLIE. **Application of paper partition chromatography to the separation of the polyhydric alcohols.** *Nature* 165, 400 (1950).—*C.A.* 44, 8284*i*.

Trimethylene glycol, ethylene glycol, glycerol, sorbitol, dulcitol, inositol, α-methylgalactoside, α-methylmannoside, β-methylmaltoside, and sucrose gave brown spots on filter paper chromatograms when sprayed with 5% ammoniacal $AgNO_3$ and heated. The polyhydric alcs. gave no color with aniline trichloroacetate and hence could be distinguished from reducing sugars and methylglucosides.

5065. HOUGH, L.; JONES, J. K. N., AND WADMAN, W. H. **Quantitative analysis of mixtures of sugars by the method of partition chromatography. V. Improved methods for the separation and detection of their methylated derivatives on the paper chromatogram.** *J. Chem. Soc.* 1950, 1702-6.—*C.A.* 45, 70*b*.

New spray reagents served for detecting and identifying sugars and their derivs. on paper chromatograms.

5066. ISHII, SHIN'ICHI AND ANDŌ, TOSHIO. **The effect of hydrochloric acid on the paper chromatogram of amino acids.** *Science* (Japan) 20, 424-5 (1950).—*C.A.* 45, 10141*c*.

The apparent R_f values of DL-alanine, DL-valine and L-leucine were affected by the presence of HCl, when BuOH was used as the solvent. Isovaleric acid used as the solvent decreased the R_f.

5067. ISHII, SHIN-ICHI AND ANDŌ, TOSHIO. **Effects of hydrochloric acid on the paper chromatography of amino acids.** *Bull, Chem. Soc. Japan*, 23, 172-6 (1950) (in English).—*C.A.* 46, 3906*a*.

With butanol as solvent, an increase in HCl concn. increased the R_f values of amino acids. With isovaleric acid, the R_f values decreased; with phenol only those acids of low R_f values were affected.

5068. JONES, TUDOR S. G. **Paper chromatography. I. General considerations.** *Chemist & Druggist* 153, 247-9 (1950).—*C.A.* 44, 4306*b*.

5069. KAKITA, YACHIYO AND GOTŌ, HIDEHIRO. **Fluorescence analysis. XIV. Application of chromatography with filter paper.** *Science Repts. Research Insts. Tohoku Univ.* **Ser. A, 2,** 837-41 (1950).—*C.A.* 46, 4947*d*.

Filter paper prepd. with an Al_2O_3 absorbent gave chromatographic sepns. from solns. contg. ions of any 3 of the following: Pb, Cu, Cd, Zn, Ni, Co, Mn, or Fe when developed by oxine, cochineal, or Rhodamine B and observed under ultraviolet light.

5070. Kelemen, E.; Tanos, B., and Halmagyi, D. **Separation of *p*-aminobenzoic acid derivatives by paper chromatography.** *Biochem. J.* **47**, 138-9 (1950).—*C.A.* **45**, 699*g*.

2.5-20 microliters of urine were applied to paper using H_2O satd. butanol as solvent. Ehrlich's reagent (2 g *p*-dimethylaminobenzaldehyde in 100 ml 20% wt/vol. HCl) served as a color reagent, and ocher-yellow spots developed on spraying. Each compd. could be detected in 1 γ quantity.

5071. Kennedy, Richard H. **Use of the paper-column separation in the estimation of microgram quantities of uranium.** *U. S. Atomic Energy Comm., Tech. Inform. Service* **AECD-3187** (1950).—*C.A.* **46**, 2957*e*.

For detg. U (U_3O_8) at low concns. (1 p.p.m.) and in the presence of quenching ions, an accurate and rapid method was given combining paper-column chromatography with a fluorometric final detn. In the paper chromatography, the U in aq. soln. contg. free HNO_3 was adsorbed on partially nitrated cellulose packed in a glass column. The adsorbed U was then selectively extd. from the column with Et_2O contg. HNO_3.

5072. Keston, Albert S.; Udenfriend, Sidney, and Levy, Milton. **Determination of organic compounds as isotopic derivatives. II. Amino acids by paper chromatographic and indicator techniques.** *J. Am. Chem. Soc.* **72**, 748-53 (1950).—*C.A.* **45**, 1464*e*.

Paper chromatography was applied to the sepn. of the *p* iodobenzenesulfonic acid derivs. formed from the protein hydrolyzate products with a reagent contg. I^{131}. The recovery was measured by the use of indicators consisting of known *p*-iodobenzenesulfonyl derivs. contg. S^{35} which were added in known amts. immediately after forming the I^{131} derivs. of the amino acids.

5073. Koštíř, J. V. and Slavík, K. **Partition chromatography between two organic solvents. I. Separation of dinitrophenylhydrazones of the carbonyl fission products of sugars.** *Collection Czecholov. Chem. Communs.* **15**, 17-25 (1950).—*C.A.* **44**, 8817*e*.

The carrier for the stationary phase was acetylated filter paper. The stationary phase was octanol, $CHCl_3$, trichloroethylene, or $PhCH_2OH$, the mobile phase EtOH (85%) or mixts. of petr. ether-benzene or petr. ether-pyridine. The H_2O-insol. dinitrophenylhydrazones of HCHO, CH_3CHO, $COMe_2$, $AcCH_2CO_2H$, $AcCO_2H$, $HO_2C.CO.\ CH_2CO_2H$, $HO_2C.CO\text{-}(CH_2)_2CO_2H$, and the osazones of $(CHO)_2$, CH_3COCHO and $(HOCH_2)_2CO$ could be sepd. by one or two dimensional chromatograms. The spots were detected by spraying with 10% NaOH.

5074. Kowkabany, George N. and Cassidy, Harold G. **Paper-strip chromatography.** *Anal. Chem.* **22**, 817-19 (1950).—*C.A.* **44**, 8817*h*.

Twenty-two filter papers of qualitative and quant. grade from various manufacturers were examd. for their suitability in the chromatographic sepn. of amino acid mixts., with the descending method and 5 different mixed solvent systems.

5075. Kraus, Kurt A. and Smith, Gilbert W. **Electromigration on filter paper.** *J. Am. Chem. Soc.* **72**, 4329-30 (1950).—*C.A.* **45**, 2754*d*.

The filter paper electromigration method was used to det. the charge of complex ions of Hg(II). The technique consisted of moistening a strip of filter paper with the supporting electrolyte, placing a no. of 1-microliter aliquots of solns. of the unknown near the center of the paper and measuring the displacement caused by the application of a known d.c. voltage to nonpolarizable electrodes.

5076. Kressman, T. R. E. **Ion-exchange resin membranes and resin-impregnated filter paper.** *Nature* **165**, 568 (1950).—*C.A.* **44**, 9086*a*.

Ion-exchange resins were prepd. in the form of membranes, rods, tubes, and thimbles. The membranes consisted of cross-linked resin polymers identical in compn. to the granular ion-exchange resins and were insol. in all aq. and nonaq. liquids. The SO_3H and COOH resins could be converted to any cationic form by treating them with a soln. of a salt of the appropriate cation; the anion-exchange membranes could be converted by treating them with the appropriate acid or base.

5077. Lacourt, A.; Gillard, J. and Walle, M. van der. **Chromatographic separation and absorptiometric determination of nickel and cobalt present in micromilligram quantities.** *Mikrochemie ver. Mikrochim. Acta.* **35**, 262-5 (1950); *Nature* **166**, 225-6 (1950).—*C.A.* **44**, 7711*f*; **45**, 7466*f*.

Details were given for getting the Ni and Co on filter paper, developing the chromatograms with Me_2CO, eluting separately with HCl, and detg. the Ni with dimethylglyoxime on paper and the Co with nitroso-R-salt. Excellent results were obtained in the analysis of samples contg. 2-10 γ of Ni and 2-19.7 γ of Co.

5078. Lacourt, A.; Sommereyns, G.; Degeyndt, Ed.; Gillard, J., and Baruh, J. **The separating power of organic solvents in inorganic paper (adsorption) chromatography.** *Mededel. Vlaam. Chem. Ver.* **12**, 76-84 (1950).—*C.A.* **44**, 10572*i*.

The effectiveness of various org. solvents and mixts. of solvents in developing paper chromatograms of mixts. (in HCl soln.) of Fe(III), Ti, Al, and V, and of Ni and Co was components. The sepn. of Co from Ni was best accomplished by developing with acetone contg. 1.4% EtOH and 1% HCl gas.

5079. Lacourt, A.; Sommereyns, G., and Degeyndt E. **Two observations in connection with inorganic paper chromatography.** *Mededel. Vlaam, Chem, Ver.* **12**, 91-4 (1950).—*C.A.* **44**, 10572*g*.

Sometimes 1,4-dioxane developed paper chromatograms of Fe(III) very sharply; at other times the spots were very diffuse. The difference was due to H_2O_2 and AcH produced by hydrolysis and oxidation of the solvent. Chromatograms developed in sunlight with this solvent were always diffuse. The humidity of the atm. during the drying of the paper affected the positions of Fe and Al in chromatograms of HCO_2H solns. of these 2 ions.

5080. Laidlaw, R. A. and Reid, S. G. **Filter paper chromatography. Extraction of sugars from the paper at room temperature.** *Nature* **166**, 476-7 (1950).—*C.A.* **45**, 2814*d*.

The paper strip was held between two glass rods whose interior surfaces were ground flat. H_2O was introduced to the top of the paper by means of a capillary dropping tube, (capacity 10 cc., dropping rate, 1 drop/10 secs.) which rested on the top of the paper between the two support rods. One cc. H_2O was allowed to flow down until the paper was completely wet; all the sugar was then at the foot of the strip. The dropper was then filled to the top and the flow continued for 0.5 hr. collecting about 5 cc.

5081. Lederer, Michael. **Inorganic paper chromatography.** *Roy. Australian Chem. Inst. J. & Proc.* **17**, 308-26 (1950).—*C.A.* **45**, 3222*c*.

The mechanism of chromatographic sepn. and the techniques used were reviewed. Published data on solvents tried for sepg. various cation and anion mixts. in inorg. analysis were discussed.

5082. Lederer, Michael. **Paper chromatography of some acridines.** *Nature* **165**, 529-30 (1950).—*C.A.* **44**, 7489*g*.

By development with H_2O or HCl good sepn. of pairs of the chemotherapeutic dyes atebrin, acrifavine, and monacrin (9-aminoacridine-HCl) were made. In partition chromatography, as distinguished from paper chromatography, no sepns. were obtained since all the dyes traveled with the solvent front.

5083. Lederer, Michael. **Paper chromatography of pH indicators.** *Science* **112**, 504-5 (1950).—*C.A.* **45**, 2742*e*.

The R_F values of 16 of the more common indicators were detd. with iso-PrOH, BuOH, and AmOH as solvents. The general trend appeared to be that the R_F values decreased with an increase in the no. of C atoms in the alc.

5084. Lederer, Michael. **The paper chromatography of inorganic cations.** *Anal. Chim. Acta* **4**, 629-34 (1950) (in English).—*C.A.* **45**, 3282*f*.

The R_f values of a no. of cations in several solvents were given. The values were influenced by the solvent in those cases where complexes between the cation and the acid contained in the solvent were formed.

5085. Lemmon, R. M.; Tarpey, Winifred, and Scott, Kenneth G. **Paper chromatography in synthetic organic chemistry. Microgram scale syntheses of labeled monoiodotyrosine, diiodotyrosine, and thyroxine.** *J. Am. Chem. Soc.* **72**, 758-61 (1950).—*C.A.* **45**, 1457*f*.

Syntheses of I^{131}-labeled monoiodotyrosine, 3,5-diiodo-L-tyrosine (m.p. 202°C with decompn.), and thyroxine of high sp. activity were carried out on a γ scale. The products were sepd. from their reaction mixts. and identified through the use of paper chromatography.

5086. Leone, E. and Guerritore, D. **Chromatographic analysis of 3-hydroxyanthranilic acid.** *Boll. soc. ital. biol. sper.* **26**, 608-9 (1950).—*C.A.* **45**, 6971*e*.

Paper chromatography with isoamyl alc. and the descending technique for 8-14 hrs gave R_f values for anthranilic acid 0.70 and 3-hydroxyanthranilic acid 0.63. After localizing the spots by ultraviolet photography, a microdetn. could be made by clipping the spots, extg. with water or *N* HCl, and detg. with the Beckman spectrophotometer.

5087. Lindstedt, Gösta. **Constituents of pine heartwood. XX. Separation of phenolic heartwood constituents by paper-partition chromatography.** *Acta Chem. Scand.* **4**, 448-55 (1950) (in English).—*C.A.* **45**, 2482*g*.

Paper-partition chromatography was used to sep. and identify 9 phenolic constituents of pine heartwood exts. Two-dimensional chromatograms were also prepared. Best results were obtained by using standard solvent in 1 direction and $CHCl_3$-MeOH-ligroin (2:1:7 + 5 H_2O) in the other.

5088. Loeb, C. and Lichtenberger, J. **Partition chromatography on paper of several hydroxy acids.** *Bull. soc. chim. France* **1950**, 362-3.—*C.A.* **44**, 7619*d*.

Chromatography was used to study the partition of some hydroxy acids between butanol and water. Each acid was characterized by a definite measurable partition coeff. Results were reported for tartaric, citric, malic, α-hydroxyisobutyric, glycolic, and lactic acids. Com. lactic acid gave 3 distinct coeffs.; these were interpreted as indicating the presence of 3 compds.: free lactic acid, lactyllactic acid, and a polylactyllactic acid.

5089. Magasanik, Boris and Umbarger, H. Edwin. **Separation and identification of keto acids by filter paper chromatography.** *J. Am. Chem. Soc.* **72**, 2308-9 (1950).—*C.A.* **44**, 8827*d*.

Traces of keto acids were sepd. by unidimensional ascending partition chromatography on filter paper and made visible by converting to semicarbazide hydrochloride and NaOAc and viewed under ultraviolet light.

5090. Munier, Roger and Pénasse, Lucien. **Chromatographic separation on paper of the dinitrophenylamino acids.** *Compt. rend.* **230**, 1176-7 (1950).—*C.A.* **44**, 7189*c*.

The dinitrophenyl derivs. of amino acids was sepd. by adsorption on filter paper through the use of these 3 solvent mixts. (1) $CHCl_3$, iso-PrOH, and 0.05 *M* K benzoate soln. in 45:49:6 ratio, (2) C_6H_{12}, iso-PrOH and 0.05 *M* K benzoate soln. in 60:36:4 ratio, and (3) CCl_4, iso-PrOH and 0.05 *M* K benzoate soln. in 56:40:4 ratio. These solvents prevented diffusion and elongation of spots and reduced the n_f values to suitable values.

5091. Munier, Roger and Macheboeuf, Michel. **Separation of nitrogen-containing bases through microchromatography in acid media.** *Compt. rend.* **230**, 1177-9 (1950).—*C.A.* **44**, 8054*i*.

Alkaloid mixts. contg. bases whose dissocn. consts. lie between 10^{-3} and 10^{-10} formed diffused and elongated spots in paper-adsorption sepns. with neutral solvents. Small addns. to the solvent of acids whose dissocn. consts. were close to those of the bases to be sepd., round the spots. For the sepn. of scopolamine, atropine, and hyoscyamine (dissocn. const. 10^{-5}), a solvent contg. 100 ml BuOH, 14 ml AcOH, and sufficient water for satn. was used.

5092. Opieńska-Blauth, Janina; Saklawska-Szymonowa, Olga, and Kański, Marek. **Partition paper chromatography of some organic acids.** *Ann. Univ. Mariae Curie-Sklodowska, Lublin-Polonia*, Sect. D, **5**, 221-75 (1950) (English summary); *Nature* **168**, 511-12 (1951).—*C.A.* 46, 5930*a*.

Phenol satd. with water was used as a developer, and water satd. with phenol was used as stationary phase. To prevent ionization of org. acids, the atm. of the chromatographic chamber was satd. with HCOOH vapor. A 0.04% alc. soln. of bromophenol blue gave the best results as regards the stability of revealed spots, although bromothymol blue seemed to be more sensitive. Although the size and intensity of the spots seemed to be proportional to the concn. of acids present, some acids formed more intense and larger spots than would be expected from their concn.

5093. Procházka, Ž. **Potassium permanganate as a nonspecific detection reagent in paper chromatography.** *Chem. Listy* 44, 43 (1950).—*C.A.* 45, 5561*c*.

Paper chromatograms of org. compds. could be developed with 0.03-0.15 *N* $KMnO_4$ acidified with 0.06-0.3 *N* H_2SO_4. White or light yellow spots revealed the presence of org. compds.

5094. Procházka, Ž. **Treatment of paper for paper chromatography.** *Chem. Listy* 44, 158-9(1950).—*C.A.* 45, 9334*g*.

Both filter paper and ordinary writing paper gave better results and quicker movement of the front after digestion with 5-24% HCl. Et bis-(4-hydroxycoumaryl-3)-acetate and glycine were used as test substances.

5095. Quevauviller, André. **Salts of quinine: paper chromatography.** *Rev. paludisme et méd. trop.* **8**, 281-90 (1950).—*C.A.* 45, 7301*i*.

Papergrams of aq. solns. of different quinine salts failed to show any consistent correlation between phys., chem., or physiol. properties and R_f values. Strips of Durieux (fine) filter paper 10 × 300 mm were suspended from the perimeter of a 20 cm cork disk at such a height that each ended 2 mm from the bottom of a crystg. dish 50 mm high and 27 mm in diam. Each paper was dipped in 5 cc. of the desired salt soln. in the crystg. dish for 30 sec., allowed to develop 2 hrs at 16-18° C under a bell jar contg. an atmosphere satd. with H_2O, and redipped in the soln. as above. The distance of H_2O migration was measured directly, that of the quinine salt after immersing the strips in *N*/100 iodide soln. to develop a brown color with the alkaloid.

5096. Rao, N. R.; Shah, K. H., and Venkataraman, K. **Chromatographic separation of dyes.** *Current Sci.* 19, 149-50 (1950).—*C.A.* 45, 9154*g*.

Various chromatographic sepns. of mixts. of acid dyes, basic dyes, and direct dyes by means of filter paper, cellulose acetate, nylon, or vinyon fabric, with water, pyridine, or methyl cellosolve acetate as solvents were described.

5097. Reguera, Rose M. and Asimov, Isaac. **Use of silver nitrate and sodium dichromate in the detection of purines by paper partition chromatography.** *J. Am. Chem. Soc.* 72, 5781-2 (1950).—*C.A.* 45, 2814*e*.

After resolution of the purines and pyrimidines with H_2O-satd. BuOH, the dried chromatogram was treated with 2% $AgNO_3$ followed by 0.5% $Na_2Cr_2O_7$. The chromatogram was then immersed in 0.5 *N* HNO_3 to leach out Ag_2CrO_4 not bound in purine complexes. The procedure was more sensitive than the sulfide-spot technique.

5098. Renard, Marcel. **Paper chromatography of α-chlorinated acids. II. Chloracetic and α-chloropropionic acids and their mixtures.** *Bull. soc. chim. belges* 59, 34-9 (1950).—*C.A.* 44, 7186*b*.

The method previously described, with methyl orange as indicator, was sensitive to 10-30 γ/4 mm^3. By using paper treated with bromocresol green for the chromatograph, drying the paper and subjecting it to vapors from a methyl orange soln., the positions of the 2 acids were more clearly marked and smaller quantities were detected. The ratio R (distance covered by the acid zone divided by the distance covered by the solvent zone) depended on the amt. of acid present.

5099. Riley, Richard F. **Paper partition chromatography of some simple phenols.** *J. Am. Chem. Soc.* 72, 5782-3 (1950).—*C.A.* 45, 2742*f*.

Phenols were sepd. by one-dimensional descending paper chromatography. The best solvent systems were: amyl alc. satd. with H_2O; BuOH:C_6H_6:H_2O 1:9:10; BuOH:C_6H_6:H_2O 1:19:20. The last solvent resolved hydroquinone (R_f, 0.078), resorcinol 0.13, catechol 0.38, toluhydroquinone 0.23, phloroglucinol 0.00, pyrogallol 0.025. α- and β-Naphthol fell at 0.83 and 0.85, resp. The spots were developed by spraying with 2% aq. phosphomolybdic acid and exposing to NH_3 vapor.

5100. Roche, Jean; Justisz, Marian; Lissitzky, Serge, and Michel, Raymond. **Quantitative chromatographic analysis of iodinated amino acids from the thyroid globulin.** *Compt. rend.* **231**, 723-5 (1950).—*C.A.* 45, 3017*i*.

The iodinated amino acids were extd. from the hydrolyzate with butanol at pH 1. The butanol was distd. off, the residue was dissolved in NH_4ONH_2 and then poured on Whatman paper No. 1. The chromatograph was developed with a mixt. of 68% butanol, 5% AcOH, and 27% H_2O. The amino acids were revealed by a 0.2% ninhydrin soln. in 2% AcOH.

5101. Rockland, Louis B. and Dunn, Max S. **Partogrid, proportional divider for use in paper chromatography (partography).** *Science* **111**, 332-3 (1950).—*C.A.* 44, 5677*g*.

The device was prepd. by drawing double- and triple-thickness lines at 2.5- and 5-cm intervals with India ink on a 50-cm × 50 cm sheet of millimeter paper, marking the intervals in steps of 0.1 unit from 0 to 1, photographing and making prints of 3 sizes (5.5,7, and 10 in. hypotenuses). The prints were mounted on an etched, lighted glass window and swabbed with a 25% alcoholic carbowax soln. for greater transparency. By inserting a pin through the initial spot of a paper strip chromatogram and the zero point of the partogrid and rotating the strip until the solvent front coincided with 1.0, the R_f of all spots could be accurately detd.

5102. Rutter, L. **Some applications of a modified technique in paper chromatography.** *Analyst* 75, 37-42 (1950). —*C.A.* 44, 3396*c*.

New methods were described for detecting colorless adsorbates and examples given of the application of the new technique in the analysis of dyes, biol. materials, and inorg. samples. The possible importance of soly. relations as a guide in the choice of developers was discussed. The phys. factors affecting chromatographic sepns. on paper were polarity of the solvent surface tension, activation of paper, and possible elec. effects.

5103. Rutter, L. **Treatment of paper for chromatography of some colloidal electrolytes.** *Nature* 166, 273 (1950). —*C.A.* 45, 6456*h*.

Papers treated with dil. cetyltrimethylammonium bromide have a net pos. charge in contact with water permitting their use for chromatography of colloidal electrolytes such as acid dyes and anionic detergents.

5104. Sarma, Byomkes. **Separation of uranium and thorium by partition chromatography on filter paper.** *Science and Culture* 16, 165-6 (1950).—*C.A.* 45, 3682*i*.

UO_2^{++} and Th^{4+} were best sepd. by paper chromatography using BuOH satd.with 3 *N*, or 4 *N* HCl. The UO_2 spot was developed with $K_4Fe(CN)_6$. After marking with a pencil, the strip was satd. with NH_3 for 7-10 min. and then sprayed with a 1% soln. of alizarin in EtOH; Th gave a bluish violet color.

5105. Schönfeld, T. and Broda, E. **Adsorption on paper as an indication of the presence of radiocolloids.** *Montash.* 81, 1153-5 (1950).—*C.A.* 45, 2742*c*.

Adsorption due to ion exchange occurred when 10^{-15} *M* Pb soln. (thorium B) was brought into contact with paper or glass. If the soln. was satd. with H_2S, radiocolloids were formed which were adsorbed by paper by a different mechanism; whereas when ion-exchange adsorption was occurring, the addn. of electrolyte decreased the amt. adsorbed.

5106. Shibata, Shoji; Takito, Michio, and Tanaka, Osamu. **Paper chromatography of anthraquinone pigments.** *J. Am. Chem. Soc.* 72, 2789-90 (1950).—*C.A.* 44, 8286*c*.

The solvent was gasoline (b.p. 45-70 °C) satd. at 19 °C with 97% MeOH. The paper was Toyo-Filter Paper No. 2 in 2 × 40 cm strips. Acetone solns. of the pigments were spotted on the strips and the solvent was allowed to ascend 5-6 hrs at 24-5 °C. The spots were developed by spraying with 0.5% $Mg(OAc)_2$ in MeOH and heating at 90 °C for 5 min. The colors appeared to depend upon the positions of the OH groups in the 18 natural and synthetic hydroxyanthraquinones.

5107. Smith, E. C. Bate and Westall, R. G. **Chromatographic behavior and chemical structure. I. Some naturally occurring phenolic substances.** *Biochim. et. Biophys. Acta* 4, 427-40 (1950).—*C.A.* 44, 5677*a*.

R_F values (movement of band of substance/movement of the advancing front of liquid) were detd. for naturally occurring flavones, anthocyanins, and related compds., as well as for OH, MeO, and COOH derivs. of C_6H_6; BuOH-AcOH and m-cresol-AcOH mixts. were used as solvents, resp., with results reproducible to ± 0.02. When the function $\log [(1 - R_F) - 1] = R_M$ was plotted against the no. of substituent groups of any kind, a straight line was obtained in most cases. Some irregularities were observed attributable to constitutional factors.

5108. Svendsen, Anders B. **Paper chromatography as a qualitative procedure for the phytochemical analysis of organic acids.** *Pharm. Acta Helv.* 25, 230-6 (1950).—*C.A.* 45, 1724*a*.

A procedure for the detection of org. acids in the roots of *Angelica archangelica* by paper chromatograms was outlined. Fairly large amts. of oxalic, citric, malic, and aconitinic acids and smaller amts. of succinic, chlorogenic, caffeic, and quinic acids were identified.

5109. Takahashi, Kosei. **Distribution of solvents in filter-paper chromatography.** *Science* 20, 41-2 (1950).—*C.A.* 45, 10005*i*.

The quantity of the solvent soaking into the filter paper was a complex function of the distance from the surface of the solvent, Y and of the time elapsed, t. For BuOH and PhOH, a linear relation between Y^2 and t was found.

5110. Trevelyan, W. E.; Procter, D. P. and Harrison, J. S. **Detection of sugars on paper chromatograms.** *Nature* 166, 444-5 (1950).—*C.A.* 45, 986*f*.

The dried, developed paper chromatogram strip was passed rapidly through a soln. (0.1 ml satd. aq. soln. $AgNO_3$ dild. to 20 ml with acetone and H_2O added dropwise with shaking until the sepd. $AgNO_3$ redissolved). The dry paper was sprayed with a 0.5 *N* aq.-EtOH soln. of NaOH. Brown Ag_2O was immediately produced. . Reducing sugars formed dense black spots. Excess Ag_2O was dissolved by immersion of the strip in 6 *N* NH_4OH, the paper was washed for 1 hr in running H_2O and dried in an oven. Black or dark brown spots on a white background were obtained. The spots could be made jet black by momentary exposure to H_2S.

5111. Turba, F. and Enenkel, H. J. **Electrophoresis of proteins in filter paper.** *Naturwissenschaften* 37, 93 (1950).—*C.A.* 44, 8407*h*.

A strip of filter paper (Whatman No. 1 or 4, Schleicher and Schüll No. 598g, etc.) 5 × 25 cm was stretched out in a moist chamber, soaked in buffer soln. and the ends dipped in the same. In the middle 1 to 3 drops (0.03 to 0.1 cc.) of a protein soln. were deposited and 110 v. d. c. applied. The proteins sepd. electrophoretically as shown by placing the strip in a dye soln. (50% aq. MeOH, 10% AcOH, cold satd. with azocarmine) for 10 min., then 5 min. in MeOH and 5 min. in 10% AcOH. The protein spots became intensive red to deep purple.

5112. Walker, W. R. **Paper chromatography of nitrogen bases.** *Australian J. Sci.* 13, 26, 84 (1950).—*C.A.* 45, 1912*g*; 3146*d*.

Pyridine, quinoline, isoquinoline, and collidine were sepd. by ascending development with a solvent prepd. by shaking 200 ml BuOH with 200 ml 2 N HCl, discarding the aq. layer and adding 0.5 g methyl red. The presence of pyridine, 2-picoline, 2,6-lutidine, and 2,4,6-collidine was shown in "crude pyridine oil."

5113. Wallenfels, Kurt. **Detection of reducing sugars in paper chromatogram and quantitative evaluation.** *Naturwissenschaften* 37, 491-2 (1950).—*C.A.* 45, 4604*a*.

Sugar spots on a paper chromatogram could be made visible by spraying the dry paper with a fresh mixt. of aq. 2% triphenyltetrazolium chloride soln. and 1 N NaOH and exposing for 20 min. to a water-satd. atm. at 40°C. The excess was then carefully washed out with water and the paper dried at 25°C. Reducing sugars showed up as bright-red spots. Quantities down to 5 γ could be detd. by cutting out the spot, extg. with a solvent like pyridine with 10% HCl.

5114. Yanofsky, Charles; Wasserman, Elga, and Bonner, David M. **Large-scale paper chromatography.** *Science* **111**, 61-2 (1950).—*C.A.* 44, 8279*f*.

The difficulty of applying relatively large samples in straight, narrow bands for paper chromatography was overcome by the application of the soln. through a capillary onto a cylinder of heavy filter paper mounted on a rotating kymograph. Several ml of soln. could be used satisfactorily. Schleicher and Schuell paper No. 470-A was most satisfactory.

5115. Zaffaroni, Alenjandró; Burton, Robert B., and Keutmann, E. Henry. **Adrenal cortical hormones: analysis by paper partition chromatography and occurrence in the urine of normal persons.** *Science* **111**, 6-8 (1950).—*C.A.* 44, 4059*e*.

Paper partition chromatography, modified by the use of non-aq. solvent systems, was suited to the microanalysis of adrenal cortical hormones. It was necessary to impregnate the strips with the glycol or formamide prior to chromatography. The samples were then applied and chromatograms developed, papers dried, and positions of the steroids revealed with alk. $AgNO_3$.

5116. Abdel-Akher, M. and Smith, F. **Detection of carbohydrate esters and lactones after separation by paper chromatography.** *J. Am. Chem. Soc.* 73, 5859-60 (1951).—*C.A.* 46, 11041*c*.

The dried paper was sprayed with a soln. of N MeOH-$H_2NOH.HCl$ (1 vol.) and 1.1 N MeOH-KOH (1 vol.), air dried 10 min., and sprayed with 1-2% $FeCl_3$ contg. 1% HCl, yielding a blue or mauve color in areas contg. the esters, lactones, or ester lactones.

5117. Allouf, Raymond and Macheboeuf, Michel. **Principle of microfractionation by separation between two liquid phases acting simultaneously in the midst of a sheet of paper.** *Compt. rend.* **232**, 2440-2 (1951).—*C.A.* 45, 8848*e*.

The aq. phase studied was an M/15 phosphate soln. of pH 5.3; the org. phase was iso-AmOH, each phase satd. with the other. When the bottom of a piece of filter paper was dipped into both phases, one over the other, the wet line rose in the paper less rapidly than it did when the paper was dipped in either phase alone. With 2 phases, the org. phase rose first but after a time (an hr or so) a second wet line of the org. phase remained stationary, whereas that of the aq. phase continued to rise.

5118. Anderson, J. R. A. and Lederer, M. **Quantitative paper chromatography. II. Separation and gravimetric estimation of gold. III. Separation and gravimetric determination of copper.** *Anal. Chim. Acta* 5, 321-4, 396-400 (1951) (in English).—*C.A.* 46, 850*f*.

Up to 50 mg of Au could be sepd. quantitatively from Pt and Pd with ether satd. with HCl as solvent. Strips of paper pulp measuring approx. 250 mm long, 25 mm wide, and 6 mm thick, capable of absorbing 2 ml of soln. on a spot 25 mm in diam., were employed. Up to 50 mg of Cu could be sepd. from similar quantities of Ag, Au, Pt, Rh, Hg, and Bi with butanol satd. with both 2 N NH_4OH and dimethylglyoxime as solvent.

5119. Ando, Toshio and Ishii, Shin-ichi. **Identification of halogens in organic compounds by means of paper chromatography.** *Rept. Inst. Sci Technol., Univ. Tokyo* 5, 217-21 (1951).—*C.A.* 46, 6037*c*.

Paper chromatograms of NaCl, NaBr, and NaI in water or in aq. NaOH solns. of various concns. were studied with BuOH-picoline, BuOH-PrOH, and BuOH-NH_3 as a developing solvents. After developing the soln., the spots of halides were made visible by spraying 0.2 N $AgNO_3$ soln., washing out the excess $AgNO_3$ with 0.1 N HNO_3 soln., and then spraying 0.2 N soln. of Na_2S or exposing the paper to H_2S gas. Iodide was identified by the iodo-starch reaction.

5120. Asquith, R. S. **Paper chromatography of the pyrogallol tannins.** *Nature* **168**, 738-9 (1951).—*C.A.* 46, 3462*h*.

Two new solvents (phenol-acetic acid-water and phenoltrichloroacetic acid-water) were used to sep mixts. of complex phenols into well-defined spots. The R_F values of the different tannins varied considerably with temp.

5121. Bandurski, Robert S. and Axelrod, Bernard. **Chromatographic identification of some biologically important esters.** *J. Biol. Chem.* **193**, 405-10 (1951).—*C.A.* 46, 2613*h*.

A 2-dimensional chromatographic method was described for identification of some phosphate esters. An improved method of color development involving ultraviolet light permitted hydrolysis of resistant esters and minimization of background color.

5122. Bartlett, J. K.; Hough, L., and Jones, J. K. N. **The colorimetric determination of methylated sugars: an improved micromethod of end-group assay.** *Chemistry & Industry* **1951**, 76.—*C.A.* 46, 64*e*.

Beer's Law was found to be obeyed by the colors formed with a variety of methylated sugars. Scission products of methylated glycogen were sepd. on a paper chromatogram and detd. colorimetrically to within 10-15% on γ quantities.

5123. Bishop, J. R. and Liebmann, H. **Quantitative separation of small amounts of zinc from other metals by chromatography on cellulose columns.** *Nature* **167**, 524 (1951).—*C.A.* **45**, 6121g.

The possibility of sepg. Sn, Al, Ni, Pb, Mn, Bi, Co, Zn, Cu, and Fe was shown by paper chromatography with butanol-HCl as eluent. The same sequence of sepn. was found with cellulose columns. Solns. contg. approx. 500 γ of each of the metals were applied to the top of the column and were eluted with a mixt. of water-satd. butanol and concd. HCl in the vol. ratio 92 to 8. The sepn. of the Zn was very good.

5124. Blackburn, S. and Lowther, A. G. **Separation of *N*-2,4-dinitrophenyl amino acids on paper chromatograms.** *Biochem. J.* **48**, 126-8 (1951).—*C.A.* **45**, 5220f.

The *N*-2,4-dinitrophenyl (DNP) derivs. of amino acids ran successfully on paper in solvents where the mobile phase contained much H_2O, like a benzyl alc.-water system. On adding EtOH the DNP amino acids formed spots more compact in shape.

5125. Brattsten, Inger and Nilsson, Anna. **Continuous zone electrophoresis in filter paper.** *Arkiv Kemi* **3**, 337-45 (1951) (in English).—*C.A.* **46**, 373f.

An app. for small scale fractionation by continuous zone electrophoresis was described. The sepn. occurred in sheets of filter paper between glass plates which were cooled by circulating water. A mixt. of glycine, alanine, and glycylglycine in acid soln. and a mixt. of serum albumin and γ-globulin in neutral soln. were used.

5126. Bremner, J. M. and Kenten, R. H. **Paper chromatography of amines.** *Biochem. J.* **49**, 651-5 (1951).—*C.A.* **46**, 1085b.

In spite of the question as to the specificity of the ninhydrin reaction, this reagent was very effective for the detection of primary aliphatic amines. Some secondary aliphatic amino groups seemed to give the ninhydrin reaction, but none of the tertiary groups. The chances of confusing amino acids with amines seemed to depend largely upon the solvents used for chromatography.

5127. Brown, F. **Application of paper chromatography to the separation of nonvolatile carboxylic acids.** *Nature* **167**, 441 (1951).—*C.A.* **45**, 6956c.

The sepn. by paper chromatography of fatty acids contg. more than one carboxyl group was described. EtOH-NH_3 was used as the mobile phase. The R_f values became greater with increased water in the solvent so that the sepn. of acids with similar values could be improved by adding water. Chlorophenol red and ammoniacal silver nitrate soln. were used as indicators for the anions.

5128. Bryant, F. and Overell, B. T. **Paper chromatography solvent for amino acids.** *Nature* **168**, 167-8 (1951).—*C.A.* **46**, 4603a.

Values (R_f) were given for 20 amino acids sepd. by paper chromatography from a medium contg. 1 vol. each of mesityl oxide and 85% formic acid and 2 vols. H_2O. Values were spread conveniently and ranged from 0.81 for tryptophan to 0.06 for cystine.

5129. Buchanan, J. G. **Detection of deoxyribonucleosides on paper chromatograms.** *Nature* **168**, 1091 (1951).—*C.A.* **46**, 11042g.

Deoxyribonucleosides showed pink spots on the chromatogram with the reagent cysteine-HCl in H_2SO_4. Deoxyribonucleosides 10-20 γ could be detected in this way.

5130. Burma, D. P. and Banerjee, B. **The role of water contained in the solvent used in filter paper chromatography. I.** *J. Indian Chem. Soc.* **28**, 135-40 (1951).—*C.A.* **45**, 10120f.

The R_f values of amino acids with iso-PrOH-H_2O mixts. increased with increase in H_2O of the solvent. Iso-PrOH-H_2O contg. 30% H_2O was a useful 2nd solvent in 2-dimensional paper chromatography of amino acids.

5131. Burma, D. P. **Role of water contained in the solvent used in filter-paper chromatography. II.** *J. Indian Chem. Soc.* **28**, 555-60 (1951).—*C.A.* **46**, 6542h.

R_f values of amino acids with BuOH-HOAc-H_2O, amyl alc.-HOAc-H_2O, and benzyl alc.-HOAc-H_2O as the solvents were recorded. The following compns. of alc.-HOAc-H_2O were recommended for 2nd solvents in 2-dimensional chromatography: 4:1:1 for BuOH, 25:10:8.75 for amyl alc., and 25:5:6.5 for benzyl alc.

5132. Burma, D. P. **Effect of temperature on the R_f values of the amino acids during paper chromatography with solvents completely miscible with water.** *Nature* **168**, 565-6 (1951).—*C.A.* **46**, 6922h.

The change in phase-compn. of developing solvents which were not completely miscible with H_2O was responsible for observed variations in R_f values of amino acids with increasing temp. R_f values were recorded for aspartic acid, glycine, proline, and phenylalanine at 10°, 15°, 20°, 25°, and 30°C.

5133. Burma, D. P. **R_f values and the distance of the starting point from the source of solvent in filter-paper chromatography.** *J. Indian Chem. Soc.* **28**, 631-7 (1951).—*C.A.* **46**, 6548d.

In both descending and ascending paper chromatography, the R_f values of amino acids decreased gradually when the distance between the point of their application and the source of the solvent was increased. This was attributed to a change in solvent compn. owing to the adsorption of water by the cellulose of the filter paper.

5134. Burstall, F. H. and Wells, R. A. **Inorganic chromatography on cellulose. V. Use of columns of cellulose in combination with organic solvent extraction for the separation of uranium from other metals.** *Analyst* **76**, 396-410 (1951).—*C.A.* **45**, 8393e.

UO_2^{++} was sepd. from other ions by the extn. of $UO_2(NO_3)_2$ with ether contg. 5% HNO_3 by vol. in the presence of cellulose. A soln. of the sample in HNO_3 was prepd., the acid soln. was transferred to the top of a column of cellulose in a glass tube, and 10-ml portions of Et_2O were added until 150 ml of solvent eluent was obtained, to which 75 ml of water was added and the ether removed by evapn.

5135. Chakrabarti, S. and Burma, D. P. **Separation of the alkali metals as chlorides by paper chromatography.** *Science and Culture* **16**, 485-6 (1951).—*C.A.* **46**, 380*b*.

The chlorides of Li, Na, and K were sepd. by paper chromatography; abs. MeOH; EtOH:H_2O, 8:2 (vol.); and Me_2CO:H_2O, 8:2 were used in solvents.

5136. Cheftel, Rose Irene; Munier, Roger, and Macheboeuf, Michel. **Partition microchromatography on paper of nonvolatile, water-soluble aliphatic acids.** *Bull, soc. chim. biol.* **33**, 840-5 (1951).—*C.A.* **46**, 3460*a*.

Expts. were made with BuOH, iso-BuOH, *sec*-BuOH, *tert*-BuOH, iso-AmOH, $PhCH_2OH$; cyclohexanol, PrOH, iso-PrOH, eucalyptole (cineole), EtOAc, $MeOB_z$, and EtOBz as solvents. A mixt. of PrOH 50, eucalyptole 50, HCOOH 20, satd. with H_2O, gave excellent sepn. of a mixt. contg. oxalic, tartaric, citric, malic, maleic, malonic, lactic, succinic, and fumaric acids.

5137. Counsell, J. N.; Hough, L. and Wadman, W.H. **Partition chromatography at elevated temperatures.** *Research* **4**, 143-4 (1951).—*C.A.* **45**, 6007*b*.

Chromatography at high temps. in the case of sugars and amino acids showed an increased rate of flow of the mobile phase. A higher concn. of materials could be handled and with precise temp. control and care in establishing equil., the degree of sepn. was improved. Whatman No. 1 filter paper and phenol/water contg. a trace of acetic acid was used.

5138. Decker, Peter. **Preparative paper chromatography.** *Naturwissenschaften* **38**, 287-8 (1951).—*C.A.* **46**, 2442*c*.

Details were given of a method for concg. small amts. of material on chromatographic paper by transporting it with water to one end of the paper strip which had been reduced in width. Overnight, water was admitted to the wide end and evapd. at the narrow end.

5139. Decker, Peter; Riffart, Wolfgang, and Oberneder, Gertrud. **Multidimensional paper Chromatography.** *Naturwissenschaften* **38**, 288 (1951).—*C.A.* **46**, 2442*d*.

Two-dimensional chromatography used 2 solvents in two perpendicular directions. With amino acids a suggested set of 3 solvents was: *(A)* 30% liquid phenol D.A.B. 6, 70% liquid phenol, water satd. in NH_3 and HCN atm., *(B)* 70% α-picoline, 2% concd. NH_3 soln., 28% water, *(C)* 70% iso-PrOH, 20% AcOH, 10% water.

5140. DeLoach, Will S. and Drinkard, Charles. **Separation of anions by paper partition chromatography.** *J. Chem. Education* **28**, 461 (1951).—*C.A.* **46**, 5936*h*.

The 6 anions that appeared on the filter-paper strips from top to bottom were in the order: $Fe(CN)_6{}^{4-}$, $Fe(CN)_6{}^{3-}$, S^{2-}, $AsO_4{}^{3-}$, $PO_4{}^{3-}$; and I. Flow of developer (a mixt. of, 40% BuOH, 40% of 95% EtOH, and 20% H_2O by vol.) was restricted by notching the 25 x 2-cm strips 1-2 cm from one end.

5141. DeVay, James E.; Chang, Wen-Hua, and Hossfeld, Ralph L. **Identification of histidine and tyrosine by partition chromatography of their azo dyes.** *J. Am. Chem. Soc.* **73**, 4977-8 (1951).—*C.A.* **46**, 8180*d*.

The method afforded a pos. identification of histidine and tyrosine. The azo dyes from diazotized p-$O_2NC_6H_4NH_2$ and histidine could be resolved into 3 differently colored spots, while the dye from p-$O_2NC_6H_4NH_2$ and tyrosine gave a colored spot with an R_f value greater than any of the spots of histidine. The spots were developed with aq. *sec*-BuOH (1:1).

5142. De Whalley, H. C. S. **Raffinose in raw beet sugars. Further results by the chromatographic method.** *Intern. Sugar J.* **53**, 247 (1951).—*C.A.* **45**, 10629*g*.

The analyses of numerous samples of beet sugars by the chromatographic method were reported.

5143. Dubois, M.; Giles, K.; Hamilton, J. K.; Rebers, P. A., and Smith, F. **Determination of sugars.** *Nature* **168**, 167 (1951).—*C.A.* **46**, 2448*i*.

A quant. method was outlined for sugars sepd. by paper chromatography involving phenol. The potential reducing group of an aldose or ketose was necessary. The area contg. the sugar was extd. with H_2O at room temp. and the color developed with H_2SC_4

5144. Ebel, Jean Pierre and Volmar, Yves. **Paper chromatography of ortho-, pyro-, meta-, and poly-phosphates.** *Compt. rend.* **233**, 415-17 (1951).—*C.A.* **46**, 1841*d*.

Mineral phosphates could be completely sepd. by 2-dimensional paper chromatography with an acidic and a basic solvent. The following phosphates were tested: Na_2HPO_4, $(NaPO_3)_3$, $(NaPO_3)_4$, $Na_4P_2O_7$, $Na_5P_3O_{10}$, and $(NaPO_3)_6$. Whatman No. 1 and No. 4 filter papers were satisfactory but must be previously washed with dil. HCl or alc. oxine for use with basic and acidic solvents, resp. The solvents used and R_f values obtained were given.

5145. Edström, Jan Erik. **Determination of nucleic acid components by paper partition chromatography.** *Nature* **168**, 876-7 (1951).—*C.A.* **47**, 7950*g*.

Hydrolysis, sepn., optical equipment, and results were discussed. Sensitivity in γ per cm^2 was for adenine 0.35, guanine 0.55, cytosine 0.75, uracil 0.45, and thymine 0.60.

5146. Erlenmeyer, H.; Hahn, H. v., and Sorkin, E. **Paper chromatographic separation and determination of alkali and alkaline-earth ions.** *Helv. Chim. Acta* **34**, 1419-21 (1951) (in German).—*C.A.* **46**, 858*c*.

Whatman's No. 1 filter paper, 0.1 *M* solns. of acetates, and development with a solvent consisting of 80% by vol. EtOH (96%) and 20% by vol. 2 *N* AcOH to height of 30 cm (about 24 hrs) followed by color development with *violuric acid* (5-isonitrosobarbituric acid) were used. R_f values and characteristic colors of the violurates were obtained.

5147. FEWSTER, MONA E. AND HALL, DAVID A. **Application of buffered solvent systems to the detection of aromatic acids by paper partition chromatography.** *Nature* **168**, 78-9 (1951).—*C.A.* **46**, 373*d*.

Good sepns. of aromatic acids, with little or no tailing, were obtained when butanol satd. with an NH_3-$(NH_4)_2CO_3$ buffer (1.5 *N* with respect to each) was used to develop the chromatogram. The R_f values increased when EtOH was added to the system and decreased when benzene was added. The chromatograms were run with Whatman No. 4 paper at 15°C.

5148. FOWDEN, L. **Quantitative recovery and colorimetric estimation of amino acids separated by paper chromatography.** *Biochem. J.* **48**, 327-33 (1951).—*C.A.* **45**, 5073*d*.

The reagent ninhydrin was used satd. with hydrindantin, which was prepd. from ninhydrin by treatment with H_2S and recrystn. from acetone. With this slightly modified reagent 1-30 γ of α-amino N could be detd. in amino acids. Ammonia gave false values and was removed.

5149. FOWLER, H. D. **Quantitative paper chromatography.** *Nature* **168**, 1123-4 (1951).

With more than 100-250 μg of sucrose, the linear relation between spot length and logarithm of spot-content broke down. A much truer representation was the linear relation of the logarithm of spot-content to the logarithm of spot-length. Increase of temp. decreased absolute stain-length while increase in the time of running of the chromatogram had the opposite effect.

5150. FRIERSON, W. JOE AND JONES, JOHN W. **Radioactive tracers in paper partition chromatography of inorganic ions.** *Anal. Chem.* **23**, 1447-52 (1951).—*C.A.* **46**, 850*i*.

Sepns. on paper were established by autoradiography, counting techniques, and chem. tests. The solvent systems used were: for Fe and Co, a mixt. of pyridine, BuOH, and *N* HCl; for Fe, Co, Ni, Mn, and Zn, a mixt. of BuOH and pyridine contg. diphenylamine. The R_f values were Fe, 0: Co, 0.5; Mn, 0.1: Ni, 0.6: Zn, 0.8. Also BuOH-Me iso-Pr ketone (40-25) plus 30 mg Ph_2NH/ml gave the same R_f values.

5151. GAGE, THOMAS B.; DOUGLASS, CARL D., AND WENDER, SIMON H. **Identification of flavonoid compounds by filter paper chromatography.** *Anal. Chem.* **23**, 1582-5 (1951).—*C.A.* **46**, 2449*c*.

The behavior of 38 flavonoids in 11 solvents was studied. Color development was given by 8 chromogenic sprays (alc. $AlCl_3$, $ThCl_4$, $FeCl_3$, each 1%; aq. basic Pb acetate, $Pb(OAc)_2$, Na_2CO_3, each 1%; ammoniacal $AgNO_3$, and Benedict's soln.) or spots were located under ultraviolet light before spraying.

5152. GORE, D. NEVILLE. **The detection of acids on paper-partition chromatograms.** *Chemistry & Industry* **1951**, 479.—*C.A.* **46**, 3459*i*.

Org. acids could be detected on paper chromatograms by spraying with a reducing soln. (1% dextrose), then with ammoniacal $AgNO_3$. A soln. (0.002 ml) contg. 1% tartaric, citric, and lactic acids was sprayed on Whatman No. 1 paper then the solvent was evapd. The paper was then heated in air at 105°C. The white spots corresponded to the position of the acids.

5153. GRAICHEN, CHARLES. **Paper chromatography of fluorescein and the halogenated fluoresceins.** *J. Assoc. Offic. Agr. Chemists* **34**, 795-9 (1951).—*C.A.* **46**, 2875*g*.

Two solvent systems were used for the sepn. of fluorescein dyes by 2-dimensional paper chromatography: (1) NH_4OH (1+99) satd. with isoamyl alc. and (2) a mixt. of 200 ml butanol, 88 ml water, 2 ml concd. NH_4OH, and 40 ml alc. Results were most satisfactory when (1) was used for the initial development.

5154. GUSTAFSSON, CHARLEY; SUNDMAN, JACOBUS, AND LINDH, THORSTEN. **Determination of carbohydrates by means of paper partition chromatography.** *Paper and Timber* (Finland) **33**, 1-3 (1951) (in English).—*C.A.* **45**, 4175*e*.

A photometric method was developed to evaluate quantitatively the paper chromatographic sepn. of glucose, mannose, xylose, galactose, and arabinose from wood hydrolyzates. Preferably 100-500 γ of the sugar mixt. was chromatographed on Whatman's no. 1 filter paper strips accompanied by two known mixts., one above and one below the concn. of each sugar in the unknown. For detg. all 5 sugars, 2 sep. runs must be made, one for 8 days with BuOH satd. with H_2O as eluent for detn. of glucose, galactose, and xylose; the other for 16 days with the upper layer of a mixt. of H_2O 50, AmOH 40, and AcOH 10 (by vol.) for detg. mannose, arabinose, and xylose. The developer consisted of phthalic acid and aniline.

5155. HAHN, H. V.; SORKIN, E., AND ERLENMEYER, H. **Simultaneous detection of cupric and cobaltic ions by paper chromatography.** *Experientia* **7**, 358 (1951) (in German).—*C.A.* **46**, 1391*g*.

Sepn. was accomplished as acetates employing as the nonaqueous phase a mixt. of 100 cc BuOH, 50 cc AcOH, 20 cc $AcCH_2COOEt$, and 150 cc H_2O. The chromatogram was developed with violuric acid. As little as 0.3 γ could be detected.

5156. HARASAWA, SHIRO. **Paper chromatography. II. Chromatograms of cadmium salts treated with several developers. III. Separation of copper, bismuth, and cadmium salts.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **72**, 107-10, 110-13 (1951).—*C.A.* **46**, 3449*d*.

Developers contg. BuOH and HNO_3, org. acids, or pyridine were studied. Pyridine was found excellent in some cases owing to its complex-forming property. BuOH-HCl developer was suitable for the sepn. of chlorides, sulfates, and nitrates of Cu, Bi, and Cd. The most suitable compn. of developer was BuOH 100 parts, concd. HCl 20 parts, and water 30 parts by vol.

5157. HARASAWA, SHIRO. **Inorganic paper chromatography. IV. Separation and identification of the copper group. V. Separation and detection of lead and silver salts. VI. Separation and detection of the first group metals.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **72**, 236-9, 295-8, 352-6 (1951).—*C.A.* **46**, 850*c*.

Chlorides or nitrates of Cu, Cd, Bi, Hg, and Pb were sepd. from other metals in the usual way and were subjected to paper chromatography. With a mixt. of BuOH 100, pyridine 10-20, and water

20 parts by vol. as the developer, Ag advanced rapidly, its R_f value being 0.5-0.9, while Pb showed a broad band continuous from its original line, and its R_f was far less than that of Ag. Hg(I) salt remained in the original position by the treatment of pyridine-butanol developer, and produced a dark-brown band without any fixing operations.

5158. HARASAWA, SHIRO. **Studies on inorganic paper chromatography. VII. Separation of tin and antimony and the application to the analysis of metals of the tin group.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **72**, 423-6 (1951).—*C.A.* **46**, 1917*d*.

Sb^{5+} and Sn^{4+} could be completely sepd. by treating with the developer contg. 100 vols. BuOH, 4-7 vols. HCl, and 20 vols. water, while sepn. of Sb^{3+} and Sn^{2+} was incomplete. Therefore, the soln. to be analyzed should be oxidized and for that purpose 20 vols. of water in the developer was replaced with the same vol. of 3% H_2O_2 soln.

5159. HARASAWA, SHIRO. **Studies on inorganic chromatography. VIII. Separation of iron, chromium, and manganese with butanol-hydrochloric acid developers. IX. X.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **72**, 614-16, 660-3, 776-8 (1951).—*C.A.* **46**, 6033*b*.

Suitable compns. of the developer were: BuOH 100, concd. HCl 30-40, and water 0-20 vols. Fe^{3+} was fixed by $K_4Fe(CN)_6$ soln. Dil. NaOH soln. was sprayed on both Cr and Mn bands which were then oxidized with Br_2 vapor. Mn^{+2} was oxidized to H_2MnO_3 and fixed as a dark brown band. Cr^{3+} was oxidized to CrO_4^{--}. Al was first sepd. from other cations as AlO_2^- in the usual way, and then Fe, Cr, and Mn were sepd. chromatographically by the acetone-HCl developer: 100 parts acetone + 20-40 parts concd. HCl by vol. With 100 vols. of acetone and 5-6 vols. of concd. HCl, Zn advanced almost to the front line and Fe, Co, Mn, and Ni followed in this order. Zn was fixed by spraying with a CCl_4 solution of dithizone. Ni, Mn, and Co were fixed by spraying with an alc. soln. of dimethylglyoxime and exposing them to NH_3 gas.

5160. HARASAWA, SHIRO AND SAKAMOTO, TAKASHI. **Inorganic paper chromatography. XI. Behaviors of aluminum and its separation from iron.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **72**, 897-900 (1951).—*C.A.* **46**, 6460*b*.

The suitable developers were acetone-HCl and acetone-AcOEt-HCl series contg. about 10% HCl by vol. Chromatograms of Al and Fe were sprayed with an alc. soln. of hydroxyquinoline and then with a mixed soln. of AcOH and AcONa (buffer soln.). Al was fixed as a pale-yellow band and Fe as a grayish black one.

5161. HARASAWA, SHIRO AND SAKAMOTO, TAKASHI **Inorganic paper chromatography. XII. Chromatographic behavior of chromium(IV) compounds and systematic analysis of metals of third group.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **72**, 1033-6 (1951).—*C.A.* **46**, 7927*c*.

Sepn. of Cr(III) from Al or Al-Fe(III) was difficult, but detection of these elements in the mixt. was possible. R_f values of Cr(IV) compds. such as dichromate depended on the pH of the developer contg. org. solvents. Sepn. of Al, Fe(III), and Cr(IV) was complete, but during the development Cr(III) was formed by reduction and its band partly overlapped that of Al.

5162. HEFTMANN, ERICH. **Paper chromatography in the separation of 17 α-estradiol from 17 β-estradiol and of equilin from equilenin.** *J. Am. Chem. Soc.* **73**, 851-2 (1951).—*C.A.* **45**, 5707*i*.

The solvent mixt. was prepd. by equilibration of 200 cc. petr. ether (b. p. 35-60 °C), 100 cc. PhMe, 10 cc. EtOH, and 90 cc. distd. H_2O.

5163. HOSSFELD, RALPH L. **Paper partition chromatography of simple phenols.** *J. Am. Chem. Soc.* **73**, 852-4 (1951).—*C.A.* **45**, 5651*g*.

The phenols were coupled with diazotized sulfanilic acid and the Na salts developed on carbonate-treated paper with EtAc-H_2O. The sepn. of dye mixts. was observed both by superimposed spotting of the individual dyes at a single location on the paper and by spotting the mixed dye resulting from the coupling of a mixt. of phenols with $HO_3SC_6H_4N_2Cl$.

5164. HOYER, H. **Hydrogen-bridge bonding and the separation of isomers by electrochematography.** *Kolloid-Z.* **122**, 164 (1951).—*C.A.* **45**, 8848*b*.

The sepn. of 1- and 2-naphthol orange was undertaken under the following conditions: S. & S. No. 602h paper, 10.1 v./cm, 0.005 to 0.008 amp. for 1 hr.

5165. HUEBNER, CHARLES F. **Paper chromatography of pyridine derivatives.** *Nature* **167**, 119-20 (1951).—*C.A.* **45**, 4605*i*.

The solvent used for the development of these compds. was butyl alc. satd. with 1.5 *N* NH_3. After evapn. of the solvent at room temp., the dry paper was placed for 15 min. in a closed glass cylinder contg. a few crystals of CNBr. The paper was then sprayed with 0.25% soln. of benzidine in 50% EtOH. As little as 5γ could be detected.

5166. ISHERWOOD, F. A. AND JERMYN, M. A. **Relationship between the structure of the simple sugars and their behavior on the paper chromatogram.** *Biochem. J.* **48**, 515-24 (1951).—*C.A.* **45**, 10204*e*.

A definite relation between R_F value (movement of sugar on paper chromatogram) and the molar fraction of H_2O (N) in the solvent was established empirically, and the log $[(1/R_F) - 1]$ plotted against $-\log N$ was a straight line for each sugar. Members of each homomorphous series revealed a closely similar behavior.

5167. JEANES, ALLENE; WISE, C. S., AND DIMLER, R. J. **Improved techniques in paper chromatography of carbohydrates.** *Anal. Chem.* **23**, 415-20 (1951).—*C.A.* **45**, 5072*e*.

Glucose, fructose, galactose, mannose, arabinose, xylose, maltose, lactose, cellobiose, isomaltose, gentiobiose, melibiose, and a mixt. of oligosaccharides (homologous polyglucoses of up to 10 units) from the α-amylase hydrolysis of amylose could be sepd. by paper chromatography and detected with 3,5-dinitrosalicylic acid reagent. R_f values for several sugars in 16 solvents were given.

5168. JERCHEL, DIETRICH AND MÜLLER, RUTH. **Paper-chromatography of 3-indoleacetic acid.** *Naturwissenschaften* **38**, 561-2 (1951).—*C.A.* **46**, 11294*f*.

An aq. soln. (0.5 cc.) with at least 5 γ indoleacetic acid was placed on a width of 6 cm of 8 × 60 cm Whatman IV filter paper. After room drying it was treated with a mixt. of 60 PrOH, 30 concd. NH_4OH and 10 parts H_2O in the downward direction for 6 hrs. The acid traveled with R_f 0.82-0.84.

5169. KARIYONE, TATSUO AND HASHIMOTO, YOHEI. **Paper-partition chromatography of some organic bases by the method of *N*-methylation.** *Nature* **168**, 739 (1951).—*C.A.* **46**, 3460*h*.

Basic substances not reacting readily with Dragendorff's reagent were chromatographed. The paper strip was then treated with K_2CO_3 and Me_2SO_4. The positions occupied by basic substances with quaternary N atoms were revealed.

5170. KARIYONE, TATSUO; HASHIMOTO, YOHEI, AND KIMURA, MUTSUO. **Paper-partition chromatography of alcohols with the potassium xanthogenates.** *Nature* **168**, 511 (1951).—*C.A.* **46**, 3459*b*.

A method for prepg. and chromatographing K xanthogenates of alcs. was given. By this method, 0.1% of MeOH in EtOH was easily detected. The R_f value for 10 alcs. was given.

5171. KAWAMURA, ICHIJI AND HIGUCHI, TAKAAKI. **Relation between lignin and carbohydrates in wood. III. Paper chromatography of dioxane lignin.** *J. Soc. Textile Cellulose Ind.* (Japan) **7**, 39-41 (1951).—*C.A.* **46**, 6380*c*.

Dioxane lignin could be sepd. from monosaccharides (xylose, glucose, and rhamnose) by paper chromatography and the latter converted to 2-furaldehyde with 12% HCl.

5172. KAWERAU, E. **A bridge unit for filter-paper chromatography.** *Biochem. J.* **48**, 281-3 (1951).—*C.A.* **45**, 4494*d*.

An app. was described for accurate identification of urinary sugars, etc., by filter-paper chromatography.

5173. KEMBER, N. F. AND WELLS, R. A. **Inorganic chromatography on cellulose. VI. Extraction and determination of gold.** *Analyst* **76**, 579-87 (1951).—*C.A.* **46**, 376*a*.

EtOAc contg. 5% H_2O and 10% concd. HNO_3 by vol. ext. Au efficiently from the ions of many other metals. The most satisfactory solvent, however, proved to contain 3% H_2O and 2% concd. HNO_3. The Au was removed from the paper with the aid of this solvent and 1-2 γ of Au detd. with *p*-dimethylbenzylidinerhodamine. The Au could be recovered from the solvent, prepd. in nitrate-free chloride soln. by electrodeposition on Pt. Many important details were given and the results of numerous expts. shown.

5174. KENNEDY, E. P. AND BARKER, H. A. **Paper chromatography of volatile acids.** *Anal. Chem.* **23**, 1033-4 (1951).—*C.A.* **45**, 10140*i*.

Unidimensional chromatograms made by the "ascending method" at room temp. over a period of 6-8 hrs were made of various volatile acids. One-tenth ml of an aq. soln. contg. 1.5 micromoles of each acid as an NH_4 salt was applied to pre-washed Whatman No. 1 filter paper. Chromatograms were developed in solvents contg. free NH_3 such as EtOH-NH_3 soln. or aq. acetone-soln. Location of the spots after development was accomplished by spraying dried paper with bromophenol blue indicator made acid with a little citric acid.

5175. KNIGHT, C. A. **Paper chromatography of some lower peptides.** *J. Biol. Chem.* **190**, 753-6 (1951).—*C.A.* **45**, 8076*d*.

R_f values in PhOH-water and in pyridine-iso-AmOH were detd. for some common amino acids and for 34 peptides contg. 2-8 amino acids. The spread was greater with PhOH-water.

5176. KRITCHEVSKY, THEODORE K. AND TISELIUS, ARNE. **Reversed phase partition chromatography by steroids on silicone-treated paper.** *Science* **114**, 299-300 (1951).—*C.A.* **46**, 1612*c*.

Filter paper (Munktell 20, 150G) strips were drawn through a 5% soln. of Dow Corning Silicone No. 1107 in cyclohexane, blotted between sheets of absorbent paper and dried at 110 °C for 1 hr. The treated paper was hydrophobic and held the nonpolar solvent as a stationary phase. The upper layer of a mixt. of 6 vols. H_2O, 10 EtOH, and 10 $CHCl_3$ was used as the mobile phase. At the end of the run, strips were dried at 110 °C and colored spots developed with a freshly prepd. mixt. of equal vols. of 2% *m*-$(NO_2)_2C_6H_4$ in EtOH and 2.5 *N* KOH in EtOH.

5177. LACOURT, A.; SOMMEREYNS, GH., AND CLARET, M. **Chromatographic separation on paper and determination of microgram quantities of anions.** *Mikrochemie ver. Mikrochim. Acta* **38**, 444-55 (1951).—*C.A.* **46**, 2447*f*.

Si, B, and Mo was detd. in 1 hr. For developing the spots produced from Na silicate, Na borate, and Na molybdate, a mixt. of 5% by vol. of concd. HCl and acetone in an atm. which was satd. with 5% concd. HCl in 2-butanone.

5178. LACOURT, A.; SOMMEREYNS, GH., AND DEGEYNDT, E. **New chromatographic separation of microgram quantities of iron, titanium, and aluminum.** *Mikrochemie ver. Mikrochim. Acta* **36/37**, 312-21 (1951).—*C.A.* **45**, 5062*e*.

The cations (10 γ) were present as chlorides in 6 *N* HCl. For the test, 0.01 ml of soln. was dropped on Whatman no. 1 paper (1 cm × 25 cm) and the paper was then dried. Chromatograms were developed with org. solvents or with a mixt. of these. A usable chromatogram, for qual. and quant. purposes, was obtained by a mixt. of AmOH, benzene, and HCl.

5179. LACOURT, A.; SOMMEREYNS, GH.; DEGEYNDT, ED., AND JACQUET, O. **New chromatographic method for separating cations (on paper) with the aid of organic solvents.** *Mikrochemie ver. Mikrochim. Acta* **36/37**, 117-32 (1951).—*C.A.* **45**, 5057*e*.

Solns. contg. chlorides of Fe, Ti, Al, V, Ni, Co, or Cu could be chromatographed by downward development on Whatman No. 1 or 4 paper with the aid of org. solvents. The time required to establish chromatographic equil. was appreciably less for inorg. cations than for org. substances. Sepns. were obtained of Fe from Ti and from Al, Ni from Cu, Co from Cu, and Ni from Co.

5180. Lacourt, A.; Sommereyns, Gh.; Jacquet, O., and Wantier, G. **Paper chromatographic behavior of copper, nickel, and cobalt; qualitative and quantitative separations.** *Bull. soc. chim. France* **1951**, 873-80.—*C.A.* **46**, 6544*f*.

New solvents and new development techniques were tried. Ni and Cu could be detd. by depositing on paper, developing with Me_2CO contg. 10% $CHCl_3$ or dioxane with 10% AcOH, eluting with HCl, and detg. the Ni with dimethylglyoxime and the Cu with diethyldithiocarbamate.

5181. Lacourt, A.; Sommereyns, Gh., and Soete, J. **Chromatographic separation of microgram inorganic samples on paper. Aluminum, uranium, iron.** *Mikrochemie ver. Mikrochim. Acta* **38**, 348-57 (1951).—*C.A.* **46**, 2444*d*.

The sepn. of Al and Fe was studied. For development, a 5% soln. of HCl in acetone satd. with benzene proved excellent. Fifty γ of U could be detd. in 75-175 min. within 4% of the truth.

5182. Lacourt, A.; Sommereyns, Ghislaine, and Wantier, Georges. **Inorganic chromatography on paper. Separating ability of organic solvents for saturating and developing.** *Compt. rend.* **232**, 2426-8 (1951).—*C.A.* **45**, 8848c.

One org. solvent was used for satg. the enclosure contg. the chromatographic paper and another solvent for the development. Quant. sepns. of the order of micrograms were obtained for B from Si and Mo; U from Fe and Al; Ni and Cu from Co and Fe; U from Pb, Zn, and Cd; and Al, Ti, and V from Fe, Cr, and Mo.

5183. Landua, Alton J.; Fuerst, Robert, and Awapara, Jorge. **Paper chromatography of amino acids.** *Anal. Chem.* **23**, 162-8 (1951).—*C.A.* **45**, 3447*d*.

The effect of pH on various amino acids was demonstrated. The graphs showed the position of a compd. on a chromatogram at a particular pH of the applied soln., and the pH of the applied soln. for which the spot had a min. area. Phenol, 2,4-lutidine and 1-butanol were used as solvents. Buffers were not used owing to the effect of inorg. salts on chromatograms.

5184. Laskowski, Donald E. and McCrone, W. C. **Filter-paper chromatography of inorganic cations with 8-quinolinol.** *Anal. Chem.* **23**, 1579-82 (1951).—*C.A.* **46**, 2442*g*.

Paper impregnated with 8-quinolinol was used with various solvents (e.g. dioxane, pyridine, $CHCl_3$, Me_2CO, and several alcs.) in the sepn. of Al^{3+}, Sb^{3+}, Ba^{++}, Cd^{++}, Ca^{++}, Co^{++}, Cu^{++}, Fe^{3+}, Pb^{++}, Mg^{++}, and Ni^{++}. Spots were located by observation under white and ultraviolet light.

5185. Lederer, Michael. **Inorganic analysis by paper ionophoresis.** *Nature* **167**, 864-5 (1951).—*C.A.* **45**, 8321*h*.

The sepn. of the Cu-group metals occurred in the same order as for a paper chromatogram with butanol contg. HCl. Likewise, the ionophoretic sepn. of Co and Ni by the formation of the Co thiocyanate complex was analogous to that obtained in paper chromatography with butanol contg. HCNS.

5186. Lederer, Michael. **Paper chromatography of inorganic cations. II.** *Anal. Chim. Acta* **5**, 185-90 (1951) (in English).—*C.A.* **46**, 4319*f*.

The R_F values of some 40 metallic ions were measured in Et, isopropyl, Bu, and Am alcs., contg. some HCl. Specific sepns. were obtained for Tl and Zr.

5187. Lewis, J. A. and Griffiths, J. M. **Inorganic chromatography on cellulose. IV. Determination of inorganic compounds by paper-strip separation and polarography.** *Analyst* **76**, 388-95 (1951).—*C.A.* **45**, 8393*c*.

The sepns. were of 3 kinds: (1) one cation from other cations, (2) a group of ions into individual salts, and (3) a large group into smaller groups of salts. The first kind of sepn. was illustrated by the sepn. of UO_2^{++} from about 52 other cations. The second type of sepn. was illustrated with a soln. contg. chlorides of Ni, Mn, Co, Cu, and Fe.

5188. Liberman, L.A.; Zaffaroni, Alejandro, and Stotz, Elmer. **Paper chromatography of hydroxy and keto acids.** *J. Am. Chem. Soc.* **73**, 1387-8 (1951).—*C.A.* **45**, 6540*e*.

Toluene-acetic acid-water provided an excellent system for the chromatographic analysis of hydroxy and keto acids.

5189. Marchal, J. G. and Mittwer, T. **A modification of the technique of chromatography on paper; chromatography in arcs of a circle.** *Compt. rend. soc. biol.* **145**, 417-21 (1951); *Proc. Koninkl. Nederland Acad. Wetenschap.* **54C**, 391-2 (1951).—*C.A.* **46**, 318*i*, 2442*e*.

A strip of filter paper 8-10 cm wide was trimmed at one end so that a tab 2 cm wide and 4 cm long was left attached to the main portion by a section 10-15 mm long and only 2 mm wide. The mixt. to be sepd. was placed on the tab, and the paper hung vertically with the lower end of the tab dipping in the developing soln. The substances traveled up the 2-mm-wide section and spread out in the wide portion of the paper in a series of concentric semicircular arcs. The application to the sepn. of amino acids was described.

5190. Martin, E. C. **The use of thocyanic acid in paper partition chromatography. I. The R_f values of some common cations.** *Anal. Chim. Acta* **5**, 511-12 (1951) (in English).—*C.A.* **46**, 7471*f*.

The prepn. and use of HCNS in butanol-water mixts. were described. The R_f values of 12 common cations found by using this reagent were given.

5191. McFarren, Earl F. **Buffered filter paper chromatography of the amino acids.** *Anal. Chem.* **23**, 168-74 (1951).—*C.A.* **45**, 3447*e*.

By employing several solvents buffered at pH values between 1.0 and 12.0 it was possible to sep. and identify each amino acid from all the others by the use of one dimensional chromatography. Data were given on variation of R_f values of amino acids with pH of buffer using *o*-, *m*-, and *p*-cresols, phenol, collidine, benzyl alc., 2,4-lutidine, BuOH, and benzyl and butyl acl. 1 to 1, as solvents. Twenty different amino acids were studied.

5192. Michl, H. **Quantitative measurement of electrophoresis diagrams on filter paper.** *Monatsh.* **82**, 944-5 (1951); **83**, 210-20 (1952).—*C.A.* **46**, 8465*i*.

The strip of filter paper with a dyed electrophoresis diagram extending along its length was made transparent with 1-bromonaphthalene and was placed in an app. in which light was passed through the filter paper, then through a cylindrical lens and a gray wedge onto sensitized paper. The concn. of a given component in the mixt. subjected to electrophoresis was then proportional to the area of the resp. hump of the pattern appearing on the sensitized paper. The minimizing of adsorption of dye or protein on the filter paper, and a means of quickly detg. the optimum pH for electrophoresis were discussed.

5193. Miettinen, Jorma K. and Virtanen, Artturi I. **Rapid method for determination of fatty acids and ammonia in silage by means of paper chromatography.** *Ann. Acad. Sci. Fennicae*, Series A, II, No. 41, 9pp. (1951) (in English).—*C.A.* **46**, 11500*d*.

Acetic, propionic, butyric, valeric, and caproic (?) acids were found. NH_3 was detd. (±30%) by developing the paper chromatograms with BuOH satd. with 6 *N* HCl. The NH_3 spots were located with Nessler reagent.

5194. Miličevic, B. **Inorganic single-phase paper chromatography.** *Bull. soc. chim. Belgrade* **16**, 101-3 (1951) (English summary).—*C.A.* **46**, 4319*g*.

The sepn. of the following cations and anions (in groups of 3 or 4) was accomplished by use of H_2O for developing the chromatograms: (in increasing R_F order) Fe^{3+}, UO_2^{++}, Pb^{++}, Hg^{++}, Cu^{++}, Ag^+, Cd^{++}, Co^{++}, Ni^{++}, and MnO_4^-, $Cr_2O_7^{--}$, I^-, Br^-.

5195. Miller, Christina C. and Magee, Robert J. **Separations by partition chromatography on paper. (1) Strontium from barium, calcium and magnesium. (2) Potassium, rubidium, and cesium. (3) Sodium and lithium.** *J. Chem. Soc.* **1951**, 3183-7.—*C.A.* **46**, 3453*h*.

A mixt. of 5% BuOH and 95% concd. HCl (by vol.) satd. with BuCl was used to sep. $SrCl_2$ from Ba, Ca, and Mg chlorides. From 2.5 to 500 γ of Sr could be detected and estd. with Na rhodizonate. A total wt of up to 1 mg of K, Rb, and Cs as chlorides could be sepd. by a mixt. of 55% concd. HCl, 35% MeOH, 5% BuOH, and 5% iso-butyl Me ketone. Complex Pb-Co hexanitrites were used for the estn. and detection of 5 to 1000 γ of K, Rb, or Cs.

5196. Miyaki, Komei; Satake, Kazuo, and Hayashi, Makoto. **Quantitative paper chromatography.** *J. Pharm. Soc. Japan* **71**, 249-56 (1951) (in English).—*C.A.* **45**, 7909*i*.

A known vol. of sample taken in a capillary pipet was placed at the end of a filter paper cut into 7 mm × 40 cm pieces. A set of these strips contg. unknown and various known concns. were chromatographed. Exptl. data on histamine, antibiotics, lower peptides, and amino acids from protein hydrolysis were given.

5197. Momose, Tsutomu and Yamada, Atsushi. **Organic qualitative analysis. II. Qualitative analysis of alcohols by paper-partition chromatography.** *J. Pharm. Soc. Japan* **71**, 980-1 (1951).—*C.A.* **46**, 1921*e*.

Dissolve 0.1-1 g of sample in 0.1-0.2 ml of dry pyridine, add 3,6-$(NO_2)_2C_6H_2(CO)_2O$ in excess, heat at 50°C (lower alcs.) or at 100°C (higher or polyhydric alcs.), decomp. the excess 3,6-$(NO_2)_2C_6H_2(CO)_2O$ by adding 1 drop water, add 2-3 ml ether, remove pyridine by extg. with 2-3 ml 5% HCl, take the residue from ether in BuOH. A drop of BuOH soln. was placed on a filter paper developed by BuOH-AcOH, sprayed with 1 *N* NaOH and $AcCH_2CO_2Et$ to get an orange-red spot.

5198. Moynihan, P. and O'Colla, Proinsias. **Application of paper chromatography to the analysis of chlorinated organic insecticides.** *Chemistry & Industry* **1951**, 407.—*C.A.* **45**, 10205*b*.

The isomers in crude hexachloro- and heptachlorocyclohexane might have been sepd. on paper impregnated with Ac_2O.

5199. Müller, Ralph H. and Clegg, Doris L. **Paper chromatography. Instruments and techniques. Physical and geometric factors.** *Anal. Chem.* **23**, 396-403, 403-8 (1951).—*C.A.* **45**, 4997*e*.

The app. and techniques used in a study of the fundamental factors involved in paper chromatography were described. Flow rates depended on the dimensions of the paper at the solvent surface and above the solvent, and variations in dimensions could be used to speed up chromatographic sepns.

5200. Müller, Ralph H. and Clegg, Doris L. **Automatic paper chromatography.** *Ann. N.Y. Acad. Sci.* **53**, 1108-18 (1951).—*C.A.* **46**, 3807*g*.

App. was described for automatic scanning of paper chromatograms during and after their development.

5201. Müller, Ralph H. and Wise, Edward N. **Use of β-ray densitometry in paper chromatography.** *Anal. Chem.* **23**, 207-8 (1951).—*C.A.* **45**, 3753*d*.

Equipment was described for the rapid analysis of paper chromatograms of substances contg. tracers. This technique was used to study metabolic products resulting from the administration of C^{14} labeled compds. The chromatogram was drawn across a fine lead slit in front of an ionization chamber at a uniform rate and in exact conformity to chart motion of a recorder.

5202. Nakano, Shoichi. **Separation and detection of twenty-four common ions by means of paper chromatography. Practical applications to the analysis of alloys. I.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **72**, 962-7 (1951).—*C.A.* **46**, 6996*f*.

Paper chromatography of the following 24 ions were studied: Ag, Pb, Hg(I), Hg(II), Cd, Bi, Cu, Sn(IV), Sb(III), Sb(IV), As(III), As(V), Zn, Fe(III), Cr(III), Al, Mn(II), Co, Ni, Mg, Ca, Sr, Ba, K. Nitrate and chloride were used with the addn. of HNO_3 and HCl, resp. The solvents used were HCl, AcOH, BuOH, iso-AmOH, acetone, ether, and their mixts.

5203. NEHER, R. AND WETTSTEIN, A. **Steroids. CVII. Color reactions with steroids, especially corticosteroids in a paper chromatogram.** *Helv. Chim. Acta* 34, 2278-85 (1951) (in German).—*C.A.* 46, 3110*d*.

The finished and dried chromatogram was drawn quickly through a 15% soln. of H_3PO_4, heated to 90°C for 20 min. and observed under the ultraviolet lamp. Characteristic fluorescent spots were seen. The fluorescence persisted for several hrs, then faded away. H_3PO_3 gave a similar but less sensitive reaction.

5204. NICHOLAS, RACHEL E. H. AND RIMINGTON, C. **Paper chromatography of porphyrins: some hitherto unrecognized porphyrins and further notes on the method.** *Biochem. J.* 48, 306-9 (1951).—*C.A.* 45, 5221*e*.

A lutidine-water system (lutidine is a mixt. of 2,4- and 2,5-dimethylpyridines which becomes completely miscible with H_2O at temps. of 17°C or below) was employed for the sepn. of porphyrins by paper chromatography. The R_f values of free porphyrins were inversely proportional to the no. of -COOH groups in the mol.

5205. OHARA, MASAMI AND SUZUKI, YUKIMASA. **The behavior of lactic acid in paper chromatography.** *Science (Japan)* 21, 362-3 (1951).—*C.A.* 45, 10286*h*.

In the paper partition chromatography of nonvolatile org. acids, lactic acid often gave 2 spots, one of which corresponded to lactyllactic acid produced by the dehydration of lactic acid. The R_f value of lactyllactic acid resembled closely that of levulinic acid.

5206. OKA, YOSHINAGA AND MURATA, AKIRA. **Inorganic chromatography. I. Chromatography on filter paper impregnated with aluminum hydroxide.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 72, 657-60 (1951); *Sci. Repts. Research Inst. Tohoku Univ.* 3A, No. 1, 82-90 (1951) (in English).—*C.A.* 46, 6030*b*; 47, 66*g*.

With strips of paper impregnated with $Al(OH)_3$, fundamental studies were made on the detn. of H_2SO_4 and sulfates of Mn, Co, Ni, Cu, Cd, and Zn. The width of absorption zone, or sensitivity, depended upon the amt. of $Al(OH)_3$. Decreasing order of adsorption on the paper were H > Cu > Zn > Cd > Ni, Co > Mn.

5207. OKA, YOSHINAGA AND MURATA, AKIRA. **Inorganic chromatography. II. Determination of copper in zinc.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 73, 494-6 (1951); *Science Repts. Research Inst. Tohoku Univ.*, **Ser. A, 3,** 707-10 (1951).—*C.A.* 47, 2631*f*, 4242*d*.

Dissolve Zn contg. Cu in HNO_3 and develop on filter paper impregnated with $Al(CH)_3$. Measure the width of the Cu band fixed with H_2S and det. its amt.; 1 part of Cu in 50 parts of Zn could be detd.

5208. OKA, YOSHINAGA AND MURATA, AKIRA. **Inorganic chromatography. III. Determination of zinc in cadmium.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 73, 496-8 (1951); *Science Repts. Research Inst. Tohoku Univ.*, **Ser. A, 3,** 711-15 (1951).—*C.A.* 47, 2631*f*, 4242*d*.

Sepn. of Cd from Zn on filter paper impregnated with $Al(OH)_3$ was possible with the addn. of KI to the soln. of their nitrates. KI soln. was used as the developer.

5209. PAPASTAMATIS, S. C. AND WILKINSON, J. F. **Paper chromatography of proteins.** *Nature* **167,** 724-5 (1951).—*C.A.* 45, 9102*c*.

One-dimensional ascending chromatography was carried out at 5°C. Buffers and salt solns. were used as developing solns. The filter strip was dried in air and sprayed with the indicator (0.1% soln. of the Na salt). The dye gave a blue-violet color throughout, the area occupied by the proteins being just discernible. The strip was air-dried and passed smoothly through 0.2 *N* AcOH, becoming a pale yellow color except in the spot occupied by the protein which persisted violet-blue, or green with very small quantities.

5210. PARDEE, ARTHUR B. **Calculations on paper chromatography of peptides.** *J. Biol. Chem.* **190,** 757-62 (1951).—*C.A.* 45, 8076*e*.

A relation between the R_F values on paper chromatograms of peptides and the amino acids of which they were composed was established. From the R_F values of the amino acids and 2 general, experimentally detd. consts., the R_F value of any desired peptide could be calcd. with an av. accuracy of ±0.05.

5211. POLLARD, F. H.; MCOMIE, J. F. W., AND ELBEIH, I. I. M. **Analysis of inorganic compounds by paper chromatography. I. Movement of cations with complex-forming solvent mixtures.** *J. Chem. Soc.* **1951,** 466-70.—*C.A.* 45, 5559*c*.

The chromatographic behavior of Ag, Hg^+, Pb, Hg^{2+}, Bi, Cu, Cd, As, Sb, Sn^{2+}, Sn^{4+}, Al, Cr, Fe^{3+}, Zn, Mn, Co, Ni, Ca, Sr, Ba, Mg, K, Na in a number of different solvent mixts., alone and with complex-forming reagents, was studied and the R_f values detd.

5212. POLLARD, F. H.; MCOMIE, J. F. W., AND ELBEIH, I. I. M. **Analysis of inorganic compounds by paper chromatography. II. Analysis of cations and anions.** *J. Chem. Soc.* **1951,** 470-4.—*C.A.* 45, 5559*d*.

The qual. analysis of mixts. of cations by paper chromatography with various combinations of 3 solvent mixts. was outlined for the sepn. of Cd and Zn; Th and U; K, Ti, V, Mo, and Fe were also reported. The R_f values for the movement of anions in butanol-pyridine-ammonia were recorded for chloride, bromide, iodide, chlorate, bromate, iodate, nitrite, nitrate, arsenite, arsenate, carbonate, phosphate, chromate, thiocyanate, and sulfate.

5213. POLLARD, F. H.; MCOMIE, J. F. W., AND STEVENS, H. M. **Analysis of inorganic compounds by paper chromatography. III. A scheme for the qualitative analyses of an unknown mixture of cations. IV. An extended scheme for the qualitative analyses of an unknown mixture of cations.** *J. Chem. Soc.* **1951,** 771-4, 1863-5.—*C.A.* 45, 5559*f*, 10120*e*.

A procedure was described for the qual. analysis of unknown mixts. of the following cations, on a series of paper chromatograms prepd. with butanol-benzoylacetone as the mobile phase: Pb, Ag, Hg, As, Sb, Cr, Mn, Cu, Co, Ni, Bi, Fe, Sn, Sr, Ba, Cd, Zn, Al, Mg, Ca, Na, K. The scheme of analysis included Ce, Li, Mo, Tl, Ti, U, V, and W.

5214. Polson, A.; Van Rooy, P. J., and Marais, E. J. **A photometric method for quantitative paper-partition chromatography of amino acids.** *Onderstepoort J. Vet. Research* **25**, 31-8 (1951).—*C.A.* 46, 3905*g*.

The concn. of the unknown must lie within the limits of the known. Close control of the temp. of the chromatographic tank was important. To insure an even application of the ninhydrin the strip of paper was drawn through a tray of the reagent. Reagent stains were removed by washing the paper in the chromatographic tank overnight in pure BuOH before the ninhydrin treatment.

5215. Porath, J. and Flodin, P. **New method for detecting amino acids, peptides, proteins, and other buffering substances on paper.** *Nature* **168**, 202-3 (1951).—*C.A.* 46, 3460*g*.

A chromatogram of several amino acid spots was sprayed with dil. acid. Hydrolysis of the cellulose occurred only in regions not occupied by the spots. After drying, the paper was treated with orcinol and the spots appeared white against a red-violet background. The method was suitable for detg. amino acids.

5216. Porter, W. L. **Multiple-paper chromatogram.** *Anal. Chem.* **23**, 412-13 (1951).—*C.A.* 45, 4971*e*.

The "chromatopack," devised to separate mg amts. of material, consisted of 100 to 200 strips (2 × 18 in.) of filter paper compressed between 2 stainless steel plates. Each strip was spotted separately with 0.05 ml of soln. and dried. The assembled strips were then placed in a closed cylinder and the solvent was allowed to ascend nearly to the top. Strips removed from the middle and ends of the pack were sprayed to locate the zones and served as guides for cutting and eluting the rest of the strips.

5217. Reeves, Wilson A. and Crumpler, Thomas B. **Paper-partition chromatography of cations.** *Anal. Chem.* **23**, 1576-8 (1951).—*C.A.* 46, 2442*i*.

BuOH contg. 20% of 12 *N* HCl was used as a solvent to resolve the 8-quinolinolates of Al^{3+}, Bi^{3+}, Cd^{2+}, Co^{2+}, Cu^{2+}, Fe^{3+}, Hg^{2+}, Ni^{2+}, and Zn^{2+}. This solvent decompd. the org. complexes and the metals moved as chloro complexes. Spots were visualized by spraying with 8-quinolinol, diphenylcarbazone.

5218. Reid, R. L. and Lederer, M. **Separation and estimation of saturated C_2-C_7 fatty acids by paper-partition chromatography.** *Biochem. J.* **50**, 60-7 (1951).—*C.A.* 46, 1923*a*.

The ascending development was for 20-24 hrs and used BuOH satd. with aq. 1.5 *N* NH_4OH as solvent; the fatty acids were used as their NH_4 salts; after air-drying the paper was sprayed with a soln. of bromocresol purple in EtOH contg. HCHO. The latter promoted the formation of well-defined yellow spots on a purple background.

5219. Rice, Randall G.; Keller, George J., and Kirchner, Justus G. **Separation and identification of 2,4-dinitrophenylhydrazones of aldehydes and ketones, and 3,5-dinitrobenzoates of alcohol by filter-paper chromatography.** *Anal. Chem.* **23**, 194-5 (1951).—*C.A.* 45, 3295*d*.

The filter paper, capillary ascent test tube method for sepg. γ quantities of amino acids was used. $CHCl_3$ was a more suitable solvent and no drying was necessary. For 3,5-dinitrobenzoates, the procedure used a 0.5% soln. of 1-naphthylamine in EtOH as the chromatogenic agent. In many cases the colored spot produced could be intensified by spraying with 10% KOH soln.

5220. Rockland, Louis B.; Blatt, Jeremiah L., and Dunn, Max S. **Small-scale filter-paper chromatography.** *Anal. Chem.* **23**, 1142-6 (1951).—*C.A.* 45, 10001*a*.

Ratings were given for 13 types of filter paper on the basis of characteristics important in chromatography. The R_f values for 18 amino acids with phenol as a solvent were given; they showed some variation (greatest for the acidic and basic amino acids) but in general the resolution sequence was the same for all papers. The effect on R_f of the H_2O content of 8 H_2O-miscible solvents was shown for the papers.

5221. Rose, Irwin A. and Schweigert, B. S. **Use of borate in the paper chromatography of ribosides.** *J. Am. Chem. Soc.* **73**, 5903 (1951).—*C.A.* 46, 11049*c*.

A mixt. of nucleic acid constituents was resolved by chromatography in aq. BuOH and the strip dried. When the paper was rerun in BuOH-borate the ribosides did not migrate and the area occupied by them was freed of contaminants.

5222. Roux, D. G. **Color reagents for the paper chromatography of di- and trihydroxyphenols.** *Nature* **168**, 1041-2 (1951).—*C.A.* 46, 5488*c*.

A new spray reagent was described for the identification of di- and trihydroxyphenols in paper chromatography. The reagent, prepd. by shaking 2.0 g of sucrose with 10 ml HCl and 90 ml abs. alc., was lightly sprayed on the paper chromatogram which was then heated for 40-60 sec. at 85°-95°C to give various colors under both visible and ultra-violet light.

5223. Sakaguchi, Takeichi and Yasuda, Hitoshi. **Inorganic paper chromatography. I. Paper chromatographic analysis of Group V and its mechanism.** *J. Pharm. Soc. Japan* **71**, 1469-74 (1951).—*C.A.* 46, 3452*i*.

Paper-partition chromatography of inorg. cations was carried out with chlorides of K, Na, NH_4^+, Mg, and Li in neutral solns. of PrOH contg. 10% by vol. of MeOH. After evapn. of the solvent the strip was sprayed with 5% $AgNO_3$, exposed to diffused light, and washed with water. A good sepn. of all 5 metals was always obtained.

5224. Sarma, Byomkes. **Inorganic separation by paper chromatography. II. Separation of uranium, thorium, and rare earth by partition chromatography on filter paper.** *Science and Culture* **17**, 139-41 (1951).—*C.A.* 47, 6217*i*.

Difficulties in sepg. U, Th, and the rare earths by one-dimensional chromatography led to an investigation of solvent mixts. that would bring about sepn. of the constituents into distinct zones. Five of the successful mixts., and the R_f values obtained, were discussed.

5225. Schneider, F. and Erlemann, G. A. **Developing reagents for sugars in paper chromatography. The rearrangement of fructose and glucose.** The

problem of glucose. *Zucker-Beihefte* No. 3, 40-1; 41-3 (1951).—*C.A.* 46, 381*d*.

Müller's alk. Cu reagent identified reducing sugars in paper chromatography. The ZnCl$_2$ double salt of *p*-aminodimethylaniline (0.3% alc. soln.) could be used as a general reagent for sugars. Different shades were obtained with aldose and ketose sugars, but a clearer distinction could be made with hypoiodate soln. On heating fructose or glucose solns. at pH 7.5 and 90°C for a long time, 3 outstanding chromatograms were obtained in each case.

5226. SCHÖNFELD, T. AND BRODA, E. **Adsorption of ions on paper and glass surfaces.** *Mikrochemie ver. Mikrochim. Acta* **36/37**, 537-52 (1951).—*C.A.* 45, 5070*c*.

The taking up of cations by surfaces of paper and of glass was studied with the aid of radioactive traces (Pb and Rb). The adsorption appeared to be caused by ion exchange. Carboxyl groups were responsible in the case of paper and silicic acid in the case of glass. Anions (PO$_4^{---}$) were not adsorbed. The adsorption of Pb and Rb by paper was reversible but equil. was not obtained in the adsorption or desorption of Pb on glass. Adsorption on paper and glass has not always been taken into consideration in microchem. work.

5227. SHIBATA, MURAJI AND UEMURA, TAKU. **Inorganic paper chromatography. IV.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 72, 541-4 (1951).—*C.A.* 46, 3458*d*.

Sepn. of Hg^{2+}, Cd^{2+}, Bi^{3+}, and Cu^{2+} was achieved by using BuOH satd. with 3-4 *N* HCl. Acetone contg. HCl in 6-8 vol. % could be recommended for the sepn. of Zn^{2+}, Co^{2+}, Mn^{2+}, and Ni^{2+}. Paper strips on which ZnS was deposited could be successfully applied to the detection of Cu in Al, Cr, Fe, Mn, Cd, Co, Ni, Zn, and alk.-earth and alkali metals.

5228. SHIBATA, MURAJI AND UEMURA, TAKU. **Inorganic chromatography. V.** *J. Chem. Soc. Japan.* Pure Chem. Sect., 72, 757-8 (1951).—*C.A.* 46, 6030*b*.

The sepn. of noble metals, Au, Pt, Pd, and Rh, was studied by means of the paper chromatography. MeOH, EtOH, PrOH, BuOH, AmOH, ether, acetone, or methyl ethyl ketone mixed with HCl were used as solvents. Ether, mixts. of BuOH or AmOH, and HCl showed the best results for the sepn. Au was at the top with solvent, followed by Pt, Pd, and then Rh.

5229. SHIBATANI, ATUHIRO AND FUKUDA, MICHIO. **Importance of controlling the water content of solvents for paper chromatography.** *J. Biochem. (Japan)* 38, 181-98 (1951).—*C.A.* 45, 8933*e*.

The influences of the developing solvents upon R_f values of 23 amino acids was studied with solvents varying in water contents. On a filter paper 10-30 γ of amino acid were placed, developed by ascending chromatography, dried at room temp., colored by ninhydrin, and the R_f values measured. With increased water, the R_f was generally increased. Solvents in a homologous series gave similar patterns of R_f values which were decreased with increase of mol. wt as well as b.p.: e.g. pyridine > picoline > lutidine.

5230. SHIBATANI, ATUHIRO AND FUKUDA, MICHIO. **The effect of water content in the solvent for paper chromatography.** *Science (Japan)* 21, 468 (1951).—*C.A.* 46, 54*h*.

The relation between the R_f values and the H$_2$O content of the solvent was discussed for several org. substances.

5231. SINGER, ARNOLD J. AND KENNER, LEONARD. **Versatile paper partition chromatographic apparatus.** *Anal. Chem.* 23, 387-8 (1951).—*C.A.* 45, 4100*h*.

Details were given for the construction of an app. for ascending strip chromatography which contained sufficient vapor space to minimize effects of temp. fluctuations and which provided rigid support at both ends for 50 strips.

5232. SINGH, M. M. AND GUPTA, J. **Inorganic partition chromatography by complexing elution.** *J. Sci. Ind. Research* (India) **10B**, 289-90 (1951).—*C.A.* 46, 5477*d*.

Bi was sepd. from Cu and Pb by chromatography on filter paper, with acetone, contg. 5% v./v. HNO$_3$, as eluant and diallyldithiocarbamidohydrazine as complexing reagent. The order of sepn was Pb→Cu→Bi. The orange-yellow Bi complex sepd. almost at the solvent front. Pb and Cu were developed by spraying solns. of KI and rubeanic acid, resp.

5233. SMELLIE, R. M. S. AND DAVIDSON, J. N. **The separation of nucleosides by ionophoresis.** *Proc. Biochem. Soc.* 49, XV (1951).

Paper as the transport media was proved more satisfactory than agar gel. The nucleosides sepd. in the order uridylic acid, guanylic acid, adenylic acid and cytidylic acid in decreasing order of mobility, and their positions after sepn. could easily be located in ultraviolet light.

5234. SOBUE, HIROSHI AND HATANO, AKIRA. **Chromatographic studies. I. Chromatographic determination of saccharides in pulp.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 460-2 (1951).—*C.A.* 47, 6133*f*.

Various sugars obtained on hydrolysis of pulp were sepd. by means of partition paper chromatography, and the R_f value of each sugar was detd. The detectable amts. of aldohexose and aldopentose were about 10 γ.

5235. STARK, J. B.; GOODBAN, A. E., AND OWENS, H. S. **Paper chromatography of organic acids.** *Anal. Chem.* 23, 413-15 (1951).—*C.A.* 45, 5072*h*.

Solvents were found for the ascending chromatographic sepn. of citric, glycolic, lactic, malic, oxalic, pyrrolidone-carboxylic, succinic, aconitic, adipic, fumaric, glutaric, levulinic, maleic, malonic, methylenebis-*N*-pyrrolidone-carboxylic, syringic, tricarballyic, and trihydroxyglutaric acids. The occurrence of the first 7 in *sugar-beet processing liquor* was confirmed.

5236. STEEL, ALAN E. **Identification of sulfonamides on paper chromatograms.** *Nature* **168**, 877 (1951).—*C.A.* 47, 7951*f*.

BuOH-AcOH solvent was found the most satisfactory of many solvents tested (BuOH, AcOH, and water 50-15-35 by vol.). Nitrous acid soln. was sprayed on the dried paper, followed after 1 min.

by a 1% soln. of dimethyl-α-naphthylamine. The sulfonamides showed as red or pink spots of the azo color; one γ was easily detected.

5237. Strain, Harold H. and Sullivan, James C. **Analysis by electromigration plus chromotography.** *Anal. Chem.* **23**, 816-23 (1951).—*C.A.* **45**, 8391*e*.

A cell, which combined electromigration and paper chromatography, could be used for a discontinuous sepn. of ions or for the continuous collection of effluent fractions. One to several sheets of paper (up to 60 cm^2) were compressed between glass plates having 2 Pt wire electrodes in grooves along opposite sides. The top edge was fitted with a wick for addn. of solvent. The bottom edge was provided with a series of wicks for collecting effluent.

5238. Suzuki, Sakaru. **Paper chromatographic resolution of basic amino acids.** *Igaku to Seibutsugaku* (*Med. and Biol.*) **20**, 64-5 (1951).—*C.A.* **45**, 10290*i*.

A soln. of a basic amino acid was spotted on the paper as in the usual way, and 1 cm beneath it a soln. of 10% cholestenonesulfonic acid in EtOH was spotted in a line of suitable length in the rectangular direction of the development. After drying, the paper was developed in the usual ascending method; a mixt. of BuOH and EtOH (or MeOH or Me_2CO might have been used) contg. 35% H_2O was used as the solvent. The color was developed with ninhydrin, and 2 spots were found to be sepd. on the paper. No further resolution of these spots was obtained in the 2-dimensional chromatography.

5239. Svendsen, Anders Baerheim. **Paper chromatography in phytochemical analyses. II. Occurrence of chlorogenic and caffeic acids in the Umbelliferae.** *Pharm. Acta Helv.* **26**, 253-8 · (1951).—*C.A.* **46**, 1220*a*.

The tests and procedures for extg. the plant and chromatographing the exts. were described.

5240. Taira, Tomotsune; Yamatodani, Saburo, and Fujii, Shigehiro. **Paper chromatography with salt solution and its application.** *J. Agr. Chem. Soc. Japan* **25**, 121-3 (1951-52).—*C.A.* **47**, 6302*e*.

Amino acids, pigments, and vitamins were chromatographed on filter paper with 3% NaCl soln. as the developing agent. R_f values of most amino acids were about 0.9, and it was difficult to identify an individual amino acid by this method.

5241. Takeda, Sumi and Shibatani, Atuhiro. **The significance of water content in the solvent for paper chromatography.** *Science* (Japan) **21**, 92 (1951).—*C.A.* **46**, 54*f*.

The R_f values of amino acids often fluctuate when rutidine or collidine was used as the developing solvent. This was due to the difficulty with which these solvents were obtained in a pure state. A mixt. of rutidine-collidine contg. 35 vol. % of H_2O was shown to give satisfactory results. A mixt. of BuOH-AcOH-H_2O giving good results contained also 35% of H_2O.

5242. Takeda, Sumi and Shibatani, Atuhiro. **An attempt to apply paper chromatography to quantitative reaction.** *Science* (*Japan*) **21**, 136-7 (1951).—*C.A.* **46**, 54*g*.

Solns. of pure amino acids of varying concns. were chromatographed in 1 or 2 dimensions, with PhOH (contg. 0.1% NH_3 and 5% H_2O), and rutidine-collidine (contg. 35% H_2O), and detected with ninhydrin. The sample contg. various amino acids was chromatographed in the same manner.

5243. Tennent, David M.; Whitla, John B, and Florey, Klaus. **Two techniques in paper chromatography [application to ketosteroids].** *Anal. Chem.* **23**, 1748-9 (1951).—*C.A.* **46**, 2952*i*.

The different zones of constituents that absorbed either visible or ultraviolet light was detd. by means of an adapter for paper chromatograms to be used in the Beckman spectrophotometer, model DU. Another procedure for ascending chromatography utilized long lengths of glass tubing as supports for the paper chromatograms.

5244. Thompson, Adrienne R. **Separation of saturated monohydroxamic acids by partition chromatography on paper.** *Australian J. Sci. Research* **B4**, 180-6 (1951).—*C.A.* **46**, 427*f*.

Simple satd. hydroxamic acids with 1-9 C atoms were sepd. by paper chromatography by an ascending technique. The ranges of useful sepn. with various mobile phases were: BuOH or AmOH, 1-5 C atoms; octanol, 2-6; C_6H_6-HOAc, 3-9; benzene-HCO_2H, 4-9 and sometimes 10; C_6H_6-octanol-HCO_2H, 2-7. Acids were added to the solvents to suppress ionization of the hydroxamic acids and prevent "tailing." Efficient humidification of the system was essential when C_6H_6 was used.

5245. Toennies, Gerrit and Kolb, Joseph J. **Techniques and reagents for paper chromatography.** *Anal. Chem.* **23**, 823-6, 1095 (1951).—*C.A.* **45**, 8392*i*.

Emphasis was put on the importance of conditioning, i.e., allowing the attainment of equil. between the paper and the atm. within the vessel before beginning a run. HCOOH (50 or 100%) as a solvent for amino acids gave compact spots initially and after running. SS589 Green Ribbon was satisfactory. Color-developing reagents were applied by dipping (e.g. 0.25%, ninhydrin in anhyd. Me_2CO) with the consequent advantage of more intense and stable color. Sulfhydryl groups were detected by dipping in ammoniacal methanolic $Na_2(NO)Fe(CN)_5$.

5246. Udenfriend, Sidney and Velick, Sidney F. **The isotope derivative method of protein amino end-group analysis.** *J. Biol. Chem.* **190**, 733-40 (1951).—*C.A.* **45**, 8066*f*.

With the aid of S^{35}-labeled indicator derivs. and paper chromatography the derivs. of the terminal amino acids could be identified and detd.

5247. Ukai, Teiji and Ohashi, Tsutomu. **Paper chromatography of the salts of organic bases. II.** *Pharm. Soc. Japan* **71**, 1393-3 (1951).—*C.A.* **46**, 3896*h*.

Paper chromatograms of HI salts of org. bases obtained by developing with BuOH with those of the quarternary ammonium iodides. On the latter either a spot of iodine could be observed which coincided with the spot of the base colored by Dragendorff's reagent, or 2 spots of iodine, one of which coincided with that of the base while the spot of iodine of the former did not coincide at all.

5248. Wachtmeister, Carl Axel. **Paper chromatography on borate-impregnated paper.** *Acta Chem. Scand.* 5, 976-8 (1951) (in English).—*C.A.* 46, 8565*a*.

Parallel chromatograms were run with borate-impregnated paper and phosphate-treated paper. When phenols and phenolic aldehydes contained 2 adjacent OH groups R_f values on the former were far lower than the corresponding values on the latter. However, compds. with nonvicinal OH groups (or *o*-hydroxy aldehydes) moved, resp., at approx. the same rates on both.

5249. Walker, W. R. and Lederer, M. **Paper chromatography of inorganic cations. III.** *Anal. Chim. Acta* 5, 191-4 (1951) (in English).—*C.A.* 46, 4319*f*.

Mixts. of aliphatic alcs., contg. HCl were examd. as solvents in the paper chromatography of cations. A mixt. of 2 solvents gave lower R_F values than the mean of the 2 components. However, a mixt. of Et and isopropyl alcs. gave lower R_F values than did either component.

5250. Weil, H. and Williams, Trevor I. **Autoradiochromatography.** *Angew. Chem.* 63, 457-60 (1951).—*C.A.* 46, 804*d*.

The use of radioactive tracers in conjunction with paper chromatography permitted photographic recording. The technique and some results were described.

5251. Weiting, G. C. **Paper chromatography of flax fiber polyuronide hemicellulose.** *Nature* 168, 833-4 (1951).—*C.A.* 46, 3284*d*.

Purified flax fiber was freed of pectic substances by $(NH_4)_2C_2O_4$ extn. and the resulting polyuronide hemicellulose was dissolved in 4% NaOH and pptd. with EtCH. A H_2SO_4 hydrolyzate contained galactose, glucose, arabinose, mannose, xylose, rhamnose, an unknown uronic acid, and traces of 2 other sugar-like compds.

5252. Weller, G. Lewis Jr. **Vector-like patterns in chromatography with parallel rows of adsorbent on filter paper.** *Chromatography Bull.* 1, No. 4, 13-16 (1951).—*C.A.* 46, 373*b*.

Rows of adsorbent (talc, sulfur, and alumina), 2-3 mm wide, were spread on a strip of filter paper 2 × 15 cm, 2-3 cm apart, and parallel to the strip length. This was supported between two strips of glass. A crystal of Giemsa stain was placed at one end of the strip and developed with a 1:1 mixt. of xylene and MeOH. A definite pattern was formed for each color component in the stain.

5253. Westman, A. E. R. and Scott, A. E. **Chromatographic evidence for the tetraphosphate ion.** *Nature* 168, 740 (1951).—*C.A.* 46, 3365*f*.

The alk. hydrolyzate of Na tetrametaphosphate was chromatographed with other pure phosphate anions. A strong spot, which by colorimetric analysis accounted for 60% of the hydrolyzate, appeared in a position where the tetraphosphate might logically be expected. A sepn. of orthophosphate, pyrophosphate, and triphosphate anions was obtained.

5254. Wieland, Th. and Wirth, Liselotte. **Retention analysis. IV. Determination of amino acids with improved retention technique.** *Angew. Chem.* 63, 171-2 (1951).—*C.A.* 45, 6126*g*.

The accuracy of the retentiometric detn. could be improved by using stripwise deposition of the test substance, prior to the paper-chromatography and ionophoresis.

5255. Wieland, Theodor and Feld, Ursula. **Retention analysis. V. Paper chromatography and ionophoresis of hydroxycarboxylic acids and their determination.** *Angew. Chem.* 63, 258-9 (1951).—*C.A.* 45, 7909*c*.

Hydroxyacids forming complexes with Cu^{++} could be detd. by the Cu acetate-tetrahydrofuran method. Data were given for tartaric, citric, malic, and citramalic acids.

5256. Winteringham, F. P. W.; Harrison, A., and Bridges, R. G. **Radioactive tracer-paper chromatography techniques.** *Analyst* 77, 19-28 (1951).—*C.A.* 46, 2443*b*.

The uses and potentialities of combined radiochem. and paper chromatography techniques were discussed. One or more radioactive isotopes were assocd. with 1 or more substances on a paper chromatogram. Labelled substances could then be located and estd.

5257. Wollish, E. G.; Schmall, Morton, and Shafer, E. G. E. **Determination of small quantities of niacin in presence of niacinamide. Separation by paper partition chromatography.** *Anal. Chem.* 23, 768-71 (1951).—*C.A.* 45, 8409*b*.

Niacin was sepd. from niacinamide by paper partition chromatography, by means of EtOAc satd. with H_2O as the carrier.

5258. Zahn, H. **Paper chromatography of dyes.** *Textil-Praxis* 6, 127-30 (1951).—*C.A.* 45, 8251c; 47, 4085*g*.

The sepn. of mixts. of dyes by paper chromatography was described. For the sepn. of wool dyes, 80% isobutyric acid, 80% glycol, 80% EtOH, and an isobutanol-glycol-HOAc-H_2O mixt. were found to be suitable. Mixts. of Cellitone dyes were sepd. with 60% glycol. Developed chromatograms were shown, and R_f values were tabulated.

5259. Zahn, H. and Wolf H. **Analysis of polyamides and polyurethan by papyrography [paper chromatography].** *Melliand Textilber.* 32, 317-21 (1951).—*C.A.* 45, 6847*i*.

The analysis for polyamides, such as Perlon L, Nylon 66 and Nylon 610, or polyurethan (Perlon U) could be carried out by chromatographic sepn. of the amino and dicarboxylic acid components in the HCl hydrolyzate of the fibers. For the ϵ-aminocaproic acid and hexamethylenediamine a mixt. of 75 parts *sec*-BuOH, 15 parts HCOOH (88%), and 10 parts H_2O was suitable. ϵ-aminocaproic acid migrated 4 times as far as hexamethylenediamine.

5260. Zimmermann, G. and Nehring, K. **Ring paper chromatography by the drop method. I.** *Angew. Chem.* 63, 556 (1951).—*C.A.* 46, 2952*i*.

The prepn. of circular chromatograms on filter paper was described.

5261. AIRAN, A. W. **Application of circular chromatography to inorganic analysis.** *Science & Culture* (India) **18**, 89-90 (1952).—*C.A.* 47, 2625*g*.

Butanol-acetic acid-water was used to irrigate the chromatogram; and after developing, the paper was sprayed with 0.1% rubeanic acid in 75% alc. Cu, Co, and Ni were sepd. from a soln. of mixed chlorides (up to 0.03% of each).

5262. AMES, BRUCE N. AND MITCHELL, H. K. **Paper chromatography of imidazoles.** *J. Am. Chem. Soc.* 74, 252 (1952).—*C.A.* 47, 1546*d*.

Air-dried chromatograms were sprayed lightly with diazosulfanilic acid reagent, and the color was developed with a light spray of 5% Na_2CO_3. R_f values were given for 3:1 PrOH-0.2 *N* NH_3 and 3:1 PrOH-*N* AcOH.

5263. ANDERSON, J. R. A. AND LEDERER, M. **Quantitative analysis by electrochromatography on paper. I. Separation and gravimetric determination of copper.** *Anal. Chim. Acta* 6, 472-5 (1952)(in English).—*C.A*, 46, 7926*h*.

Up to 20 mg of Cu could be quantitatively sepd. from small quantities of Au, Pt, and Pd by ionophoresis on strips of paper pulp 6 mm thick by 25 mm wide by 250 mm long.

5264. ANT-WUORINEN, OLLI AND VISAPÄÄ, ASKO. **The effect of the cation-exchange capacity of glass material on the carboxyl-group titration values of cellulose.** *Valtion Tek. Tutkimuslaitos Rept.* **107**, 5-9 (1952) (in English).—*C.A.* 47, 3557*h*.

The surface of the glass funnel in which exchange occurred between the carboxyl H and Na^+ could also exchange with Na^+ and release H^+. Blanks should be run without cellulose to det. the total exchange capacity of the glass. The specific exchange capacity of Pyrex and Jena Geräte was equiv. to 0.035 ml of 0.001 *N* NaOH/cm².

5265. BAUDET, JEANNINE. **Paper chromatography of copper complexes of picolines and lutidines.** *Compt. rend.* **234**, 2454-6 (1952).—*C.A.* 46, 9473*f*.

Filter paper after immersion in a mixt. of 5 g of $CuCl_2$, 20 cc. of glycerol, and 100 cc. of H_2O was pressed free of liquid and dried in air. Mixts. were chromatographed with Et_2O in an atm. satd. with Et_2O and the components identified by color as follows: Picolines: α, green; β, orange; γ, blue. Lutidines: 2-6, mauve; 2-3, yellowish; 2-4, very pale blue which became violet in air; 2-5, pale blue.

5266. BERLINGOZZI, S. AND SERCHI, G. **Distribution chromatography on the disk. Some modification of the method.** *Sperimentale, Sez. chim. biol.* 3, 1-5 (1952).—*C.A.* 46, 10039*f*.

A filter-paper disk was placed over a Petri dish, touching the center of the tip of a cone of filter paper, with the open side resting in a smaller dish in the center of the Petri dish contg. the soln. to be chromatographed. The whole was covered with a watch glass with a perforated center, through which a pipet passed that ended above the point of contact of both filter papers. It served to drop solvent on the paper.

5267. BERNSTEIN, S. AND MCGILVERY, R. W. **The enzymatic conjugation of *m*-aminophenol.** *J. Biol. Chem.* **198**, 195-203 (1952).—*C.A.* 47, 650*a*.

Products of the enzymatic conjugation of *m*-aminophenol were sepd. and identified by a combination of ion exchange and paper chromatography. Using the analytical grade of a weakly basic anion exchange resin, conditions were developed for the sepn. of known samples of *m*-aminophenylsulfuric acid from samples of the glucuronide and the free phenol. The column, after washing with hydrochloric acid followed by distd. water, ammonium hydroxide, and distd. water again, was regenerated with sodium hydroxide.

5268. BERSIN, TH. AND MÜLLER, A. **Circular paper chromatography of sugars.** *Helv. Chim. Acta* **35**, 475-8 (1952) (in German).—*C.A.* 46, 6549*h*.

Place 3 drops of the sugar soln. in the center of a circular Whatman 1 paper and chromatograph in a BuOH-AcOH-H_2O (4:1:5) mixt. at room temp. Air and solvent-satd. atm. gave identical results. The R_f values parallel the R_f values in one-dimensional chromatograms. By using selective developers and different sections of the paper, compds. with the same or very similar R_f values could be identified.

5269. BEVENUE, ARTHUR AND WILLIAMS, KENNETH T. **Color reaction of certain aldehydes with orcinol.** *Chemist Analyst* **41**, 5-7 (1952).—*C.A.* 46, 9018*f*.

By dissolving 0.5 g of orcinol and 15 g of CCl_3COOH in 100 ml of water-satd. 1-butanol, a reagent was obtained which gave characteristic colors with vanillin and at least 13 other common aldehydes on paper chromatograms.

5270. BONNIN, ANDRÉ AND SÜE, PIERRE. **Separation of phosphates, phosphites, and hypophosphites by paper chromatography.** *Compt. rend.* **234**, 960-1 (1952).—*C.A.* 46, 6038*c*.

A paper chromatogram prepd. with a solvent contg. equal vols. of BuOH, dioxane, and *N* NH_3 gave bands of phosphate, phosphite, and hypophosphite (in order of increasing distance from the soln.-paper boundary) which could be identified by molybdate-H_2S method.

5271. BOSE, R. K. AND BURMA, D. P. **Paper chromatography in the study of sugar constituents of jute hemicellulose.** *Science and Culture* (India) **18**, 39-40 (1952).—*C.A.* 47, 3557*c*.

A pyridine ext. of polyuronide hemicellulose was used for chromatography. One-way descending chromatography was carried out with phenol-H_2O, BuOH-AcOH-H_2O, and $PhCH_2OH$-AcOH-H_2O. Aniline hydrogen phthalate and benzidine were used as spraying agents.

5272. BUCH, M. L.; MONTGOMERY, REX, AND PORTER, W. L. **Identification of organic acids on paper chromatograms.** *Anal. Chem.* **24**, 489-91 (1952).—*C.A.* 46, 6039*f*.

The identification of acids of similar mobilities was assisted by the use of $AgNO_3$-NH_4OH, Ac_2O-pyridine, $(NH_4)VO_3$, and ceric ammonium nitrate as spray materials to produce color reactions that permitted the differentiation of certain groups of these acids. This procedure, in conjunction with the R value, aided in the identification of individual org. acids.

5273. Burma, D. P. **Chromatographic separation of a mixture of the hydroxides of lithium, sodium, and potassium.** *Analyst* 77, 382-3 (1952).—*C.A.* 46, 9469*g*.

From a column filled with ashless filter paper powder, different portions of the eluate were tested with phenol red or bromothymol blue. The top band in the column contained LiOH, the middle one KOH, and the lowest NaOH. With paper chromatography continuous development was used by the descending method with EtOH contg. 15% water. For indication, the dried paper was sprayed with phenolphthalein, phenol red, or bromothymol blue. After 24-hr.development, the alkali hydroxides were barely sepd. LiOH moved a little, KOH a little more, and NaOH the most.

5274. Campani, M.; Arezio, G., and Cameroni, R. **Chromatographic identification of acetylglucosamine.** *Atti soc. lombarda sci. med. e biol.* 7, 113-15 (1952).—*C.A.* 47, 5310*h*.

A 0.5 *N* Na_2CO_3 soln. was used as a solvent for paper chromatography with Whatman paper No. 1 or 4. The paper was dried at 105 to 110°C and the acetylglucosamine was identified by the violet color developed by spraying with *p*-dimethylaminobenzaldehyde.

5275. Cassidy, Harold G. **Investigation of paper chromatography.** *Anal. Chem.* 24, 1415-21 (1952).—*C.A.* 47, 4689*c*.

Important properties of the paper were porosity, chem. nature, impurities, and uniformity of these three. Properties of the fluid were type of flow, inertia, and chem. structure in terms of d., viscosity, and surface tension.

5276. Consden, R. and Stanier, Winifred M. **Ionophoresis of sugars on paper and some applications to the analysis of protein polysaccharide complexes.** *Nature* 169, 783-5 (1952).—*C.A.* 47, 664*h*.

In buffers contg. borate, sugars moved toward the anode when a voltage was applied. This ionophoresis was carried out on Whatman No. 1 paper satd. with buffer laid in a dish. The ends of the paper extended over the edge of the dish into troughs contg. buffer soln. and the electrodes. The sugars were placed on the paper 12 cm from the cathode, the dish was filled with chlorobenzene to cover the paper, and a potential of about 310 v. was applied for about 2 hrs.

5277. Consden, R. and Stanier, Winifred M. **Paper electrophoresis apparatus.** *Nature* 170, 1069-70 (1952).—*C.A.* 47, 3626*h*.

Basically, the app. was composed of 2 end trays each contg. 1 electrode plus electrolyte and a center tray bearing an org. liquid and glass-rod frame. The paper extended from the 1st to the 3rd tray, and subsequent chromatography after sepn. was possible by adjustments.

5278. Dalgliesh, C. E. **Optical resolution of aromatic amino acids on paper chromatograms.** *J. Chem. Soc.* 1952, 3940-2.—*C.A.* 47, 2013*b*.

Chromatograms run with an org. phase of BuOH-AcOH-H_2O on Whatman No. 4 paper permitted the resolution of 2,3-$(HO)_2C_6H_3CH_2CH(NH_2)CO_2H$ [not of the 3,4-isomer or its 5-Me deriv.], the 2,5-dihydroxy isomer and 2,3,4-Me$(HO)_2C_6H_2CH_2CH(NH_2)$-CO_2H; the ratio of the R_F value of the 2 optical isomers were about 0.9, which suggested that a common mechanism was operative in all cases.

5279. Das, D. B.; Choudhury, P. K. Roy, and Wareham, J. F. **The constitution of jute [as determined] by paper chromatography.** *Science and Culture* (India) 18, 197 (1952).—*C.A.* 47, 2980*b*.

Jute chlorite holocellulose was hydrolyzed with 90-95% HCOOH, the hydrolyzate (free of HCOOH) spotted on Whatman No. 1 filter paper and the following sugars were found: glucuronic acid, xylose, arabinose, and rhamnose. The developing systems used were phenol-H_2O, and *n*-BuOH-H_2O; the spray reagent was aniline oxalate.

5280. Das, D. B.; Mitra, M. K., and Wareham, J. F. **Association of xylan with α-cellulose in jute by partition chromatography.** *Science and Culture* 18, 249-50 (1952).—*C.A.* 47, 2980*d*.

α-Cellulose of jute prepd. by the chlorite method was shown by the formic acid method invariably to contain considerable amts. of xylan. The unknown sugar traveled much faster than xylose in moist phenol and BuOH and developed a brown color when sprayed with aniline oxalate.

5281. Diller, H. and Rex, O. **Chromatographic detection of thallium on paper in toxicological analysis.** *Z. anal. Chem.* 137, 241-4 (1952).—*C.A.* 47, 1537*h*.

KI was an excellent reagent for detecting Tl. As little as 0.03 γ could be detected at a diln. of 1:330,000 by the formation of yellow TlI. Thionalide, thioglycolic 2-aminonaphthalide, also gave an insol. yellow complex compd. which would serve to detect 0.5 γ of Tl.

5282. Durant, J. A. **A one-dimensional paper chromatographic technique for the separation of phenols, phenolic acids, and their derivatives.** *Nature* 169, 1062-3 (1952).—*C.A.* 46, 9473*d*.

Phenols, phenolic acids, and their derivs. have been sepd. by paper chromatography with Whatman No. 4 filter paper buffered at pH 8.0, BuOH satd. with aq. satd. $NaHCO_3$ as the solvent, and Millon's reagent as the developer.

5283. Ebel, Jean Pierre. **Application of paper chromatography to the study of some meta- and polyphosphates of disputed existence and constitution.** *Compt. rend.* 234, 621-3 (1952).—*C.A.* 46, 5486*g*.

Of the various metaphosphates previously reported, only the tri- and tetrametaphosphate ions could be characterized by paper chromatography; if mono- and di-metaphosphate ions existed in soln., they were too unstable to be isolated by this method.

5284. Ebel, Jean P. **Chromatographic and potentiometric study of the acid derived from Graham's salt.** *Compt. rend.* 234, 732-3 (1952).—*C.A.* 46, 4884*c*.

A freshly prepd. soln. of Graham's salt, the acid obtained by passage through Amberlite IR-100 H, the same acid, 24 hrs later, and the acid prepd. by treating the Pb salt with H_2S were examined by paper chromatography.

5285. EDWARD, J. T. AND WALDRON, DEIRDRE M. **Detection of deoxy sugars, glycals, and methyl pentoses in paper partition chromatography.** *J. Chem. Soc.* **1952**, 3631-4.—*C.A.* 47, 1009*h*.
Methylpentoses, deoxy sugars, and glycals on paper, sprayed lightly with aq. $NaIO_4$ and, after 10 min. with 1 vol. Na nitroprusside, 3 vols. H_2O, and 20 vols. EtOH satd. with piperazine gave blue zones in 5-10 min. (piperidine and Et_2NH could be used in place of piperazine). Deoxy sugars and glycals could be distinguished from methyl pentoses by the deep yellow zone which they gave when the chromatogram was sprayed with an acidic soln. of p-$O_2NC_6H_4NH_2$ after $NaIO_4$ oxidation.

5286. FREEMAN, J. H. **Separation and identification of polymethylol phenols by paper chromatography.** *Anal. Chem.* **24**, 955-9 (1952).—*C.A.* 46, 9017*h*.
Descending chromatography with BuOH and concd. NH_4OH (4:1 by vol.) sepd. the products formed in the initial reaction of PhOH and HCHO. The indicator reagent was 1% *p*-nitrobenzene-diazonium fluoroborate in Me_2CO.

5287. FREEMAN, J. H. **Determination of methylolphenols by paper chromatography.** *Anal. Chem.* **24**, 2001-2 (1952).—*C.A.* 47, 3187*a*.
Mono- and polymethylolphenols were detd. quantitatively by cutting out the spots on a paper chromatogram and weighing them. A straight line curve was obtained by plotting spot wt *vs.* the log of concn. To avoid errors due to variations in temp., time, distance traveled, and paper compn., the curve must be established for each chromatogram.

5288. FUJITA, HIROSHI. **The distribution of liquid ascending in a filter paper.** *J. Phys. Chem.* **56**, 625-9 (1952).—*C.A.* 46, 8461*a*.
Exptl. data indicated that the distribution of liquid ascending or descending in a filter paper was not always uniform. An equation was developed for the amt. of liquid contained in a unit area of filter paper in terms of the satn. values of the amts. of liquids contained as capillary flow and as surface flow per unit area of filter paper.

5289. GIRI, K. V.; KRISHNAMURTHY, K., AND VENKATASUBRAMANIAN, T. A. **Determination of amino acids separated by circular paper chromatography.** *Current Sci.* (India) **21**, 44-5 (1952).—*C.A.* 46, 10051*d*.
A simple quant. paper chromatographic procedure for detg. amino acids was described. It consisted in extg. the color of nindhydrin stained spots with 75% alc. and photometrically comparing the color of the exts. with those obtained from known amino acids chromatographed at the same time.

5290. GIRI, K. V. AND RAO, N. A. N. **Circular paper chromatography. I. A technique for the separation and identification of amino acids.** *J. Indian Inst. Sci.* **34**, 95-105 (1952); *Nature* **169**, 923-4 (1952).—*C.A.* 46, 9019*f*, 11290*b*.

5291. GORBACH, G. **A capillary colorimeter which is particularly suited for quantitative paper chromatography.** *Mikrochemi ver. Mikrochim. Acta* **39**, 204-8 (1952).—*C.A.* 46, 6438*g*.
After causing traces of material to be deposited on paper, the desired substance could be obtained by elution and a suitable colorimetric test applied. Expts. in detg. 0.2 mg of valine, alanine, leucine, phenylalanine, tyrosine, tryptophan, lycine, asparaginic acid, etc., alone and in mixts. with one another, showed that the percentage error may be 5%.

5292. HARASAWA, SHIRO. **Inorganic paper chromatography. XIII. Detection and separation of titanium, zirconium, iron, and chromium and the application to the systematic analysis.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 59-63 (1952).—*C.A.* 46, 8570*d*.
Developers composed of a mixt. of BuOH and Me_2CO as the main component and HCl as an active component were excellent for Ti. For example, to 100 parts of BuOH-Me_2CO mixt. (1:1), 60 parts of HCl was added. Fe salts advanced near to the front line and Ti moved almost half way from the original line. Cr followed Ti and Zr moved scarcely from the original line.

5293. HARASAWA, SHIRO. **Inorganic paper chromatography. XIV. Separation and detection of calcium, strontium, and barium.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 207-10 (1952).—*C.A.* 46, 11012*f*.
For the sepn. of Sr and Ba 20-30% NH_4CNS soln. was found most suitable and alcs. such as MeOH or EtOH were most useful as the main component of the developer. The bands of Sr and Ba were fixed by spraying solns. of sodium rhodizonate and dil. AcOH. The color of the former band was reddish orange and that of the latter was violet-pink.

5294. HARASAWA, SHIRO. **Inorganic paper chromatography. XV. Separation of alkaline earth metals and the application to systematic analysis.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 73, 210-14 (1952).—*C.A.* 46, 11012*g*.
Ca, Sr. and Ba were sepd. by the developer contg. NH_4CNS and alcs. by the descending method with good results. The compns. of the suitable developer were EtOH 100 + 30% NH_4SCN soln. 10, BuOH 100 + 30% NH_4SCN 25, and BuOH 100 + pyridine 10 + 30% NH_4SCN 30 parts.

5295. HARASAWA, SHIRO AND SAKAMOTO, TAKASHI. **Inorganic paper chromatography. XVI. Behavior of mercury and iron in oxidized and reduced forms.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 73, 240-3 (1952).—*C.A.* 46, 11012*h*.
Hg^{+}-Hg^{2+} and Fe^{2+}-Fe^{3+} could be sepd. by paper chromatography. Although expts. were carried out in an atm. of coal gas from which CO_2 and O_2 were removed, partial oxidation or reduction during the analysis occurred. For Hg the mixt. of EtOH and EtOEt (1:1) contg. HCl and for Fe, BuOH or a mixt. of BuOH and AcOEt (1:1) contg. HCl were found suitable.

5296. HARASAWA, SHIRO AND SAKAMOTO, TAKASHI. **Inorganic paper chromatography. XVII. Chromatographic behavior of copper salts in oxidized and reduced states.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 300-3 (1952).—*C.A.* 47, 2621*a*.
CuCl and $CuCl_2$ could be sepd. by the following developers: acetone-HCl, acetone-AcOH, MeOH, EtOH, BuOH, BuOH satd. with NH_4CNS with or without addn. of HCl. Cuprous and cupric salts were fixed by solns. $K_3Fe(CN)_6$ and $K_4Fe(CN)_6$, resp.

5297. Harasawa, Shiro and Sakamoto, Takashi. **Inorganic paper chromatography. XVIII. Separation of arsenic in oxidized and reduced forms. XIX. Separation of potassium, sodium, magnesium, and lithium.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 73, 611-14, 614-18 (1952).—*C.A.* 47, 3752*e*.

Sepn. of H_3AsO_3 and H_3AsO_4 was possible by MeOH or AcOH. Developers consisting of Me_2CO, or MeOH with AcOH or HCl, or $Me_2CO.H_3PO_4$, Me_2CO-EtOAc-H_3PO_4 gave good results. The position of the Na band on filter paper was recognized by gently heating it on the elec. heater (carbonization method). Developers contg. mixts. of BuOH, EtOH, MeOH, and 10% of AcOH caused good sepn. of these metals.

5298. Hashimoto, Yohei and Mori, Itsuhiko. **High-frequency papyrography, an apparatus for detecting substances on a filter paper by means of high-frequency oscillators.** *J. Pharm. Soc. Japan* 72, 1532 (1952).—*C.A.* 47, 1434*e*.

The finished paper obtained by chromatography or electrophoresis was passed through the guide of a high-frequency oscillator, consisting of 2 metal plates held closely, and the variations in grid current produced by the sample substances on the filter paper were plotted, or recorded by an automatic recorder. In this way R_f values were calcd. readily for semiquant. purposes.

5299. Hashimoto, Yohei and Mori, Itsuhiko. **Ultraviolet papyrography: an automatic analytical apparatus using filter paper without a color reagent.** *Nature* 170, 1024-5 (1952).—*C.A.* 47, 3049*d*.

The app. used light in 4 methods: (1) densitometry of finished filter papers prepd. by paper chromatography or electromigration; (2) automatic paper chromatography; (3) automatic paper electromigration; (4) automatic paper electrochromatography.

5300. Horner, Leopold; Emrich, Walter, and Kirschner, Adolf. **Experimental contribution to the mechanism of paper chromatography.** *Z. Elektrochem.* 56, 987-95 (1952).—*C.A.* 47, 5837*i*.

The interaction of cellulose with solvents was examd. by detg. refractometrically the compn. of the solvent after percolation through a paper strip. Water was preferentially taken up from 9.3%, 80.7%, and 90% aq. BuOH, 75.8% aq. PhOH, 15-60% aq. α-picoline, and 25-80% aq. iso-PrOH. From 8.1% aq. PhOH, PhOH was preferentially taken up. Oven-dried papers imbibed more H_2O than air-dried ones. The addn. of amino acids or KI increased the binding of H_2O. When a PhOH-H_2O equil. mixt. was allowed to rise in a paper strip, the PhOH content, detd. iodometrically after cutting the paper into segments, increased toward the top.

5301. Jaenicke, L. **Paper electrophoresis of sugars and sugar derivatives.** *Naturwissenschaften* 39, 86 (1952).—*C.A.* 47, 941*h*.

Sugar mixts. in electrophoresis arranged themselves from start to anode in the order maltose, xylose, ribose, glucose with fructose, arabinose, and galactose. A strip of S and S 2043b filter paper, 30 cm long, 2 to 5 cm wide was laid over a glass support, both ends hanging in electrolyte dishes; voltage 220; vacuum. The test material was added on top and 0.1 *M* borate buffer sprayed over the strip, pH 9.2. Electrophoresis was continued for 6 to 9 hrs.

5302. Jones, J. K. N. and Wise, Louis E. **The hemicelluloses present in aspen wood** *(Populus tremuloides)*. **II.** *J. Chem. Soc.* **1952**, 3389-93.—*C.A.* 47, 306*i*.

4-Methyl-*D*-glucuronic acid, galacturonic acid, and 2-α-(4-methyl-*D*-glucuronosyl)-α-*D*-xylose were identified definitely, and paper chromatographic sepns. indicated that at least 5 other (unidentified) acids of higher mol. wt were also present. The acids were sepd. first on charcoal columns and then by elution from cellulose columns. Various R_g values of the sugars and their derivs. were given with a series of solvents; these showed the relative positions of sugars on chromatograms.

5303. Kickhöfen, Botho and Westphal, Otto. **A simple combination of paper electrophoresis and paper chromatography.** *Z. Naturforsch.* **7b**, 659-60 (1952).—*C.A.* 47, 5761*c*.

Paper electrophoresis followed by paper chromatography on the same sheet of Whatman No. 1 paper was accomplished by cutting the filter paper in cross form with the lateral part approx. 1/5 or less of the diam. of the main beam. The electrophoresis of amino acids proceeded along the lateral part for 200 min. using 2800 v. (70 v./cm), the rest of the paper being rolled in. After electrophoresis the side flaps were cut off and the chromatography proceeded along the main beam.

5304. Kingsbury, G. W. J. and Temple, R. B. F. **Inorganic chromatography on cellulose. X. Spectrographic determination of micro quantities of thorium separated by chromatography from minerals and ores.** *Analyst* 77, 307-12 (1952).—*C.A.* 46, 7471*d*.

A simple spectrochem. procedure was described for detg. traces of Th that had been sepd. by chromatographic methods. In the ext., Th was copptd. with La which formed the matrix and acted as internal standard in the spectrographic analysis.

5305. Kowkabany, George N. and Cassedy, Harold G. **Investigation of paper chromatography. Factors that may affect R_F values in paper chromatography.** *Anal. Chem.* 24, 643-9 (1952).--*C.A.* 46, 11012*a*.

R_F values in ascending paper chromatography were detd. with amino acids as solutes. The increase of the amt. of amino acid slightly decreased the R_F value, and it was not affected by rate of flow of developer. Greater reproducibility of the R_F value was obtained, the further the distance the solvent moved.

5306. Krishnamurthy, K.; Venkatasubramanian, T. A., and Giri, K. V. **Preservation of paper chromatograms.** *Current Sci.* (India) **21**, 252 (1952).—*C.A.* 47, 2013*a*.

Paper chromatograms of amino acids, stained with ninhydrin, were kept in a vacuum desiccator for 2 months without fading. Preservation in dry N_2 or at low temp. in a closed container was effective.

5307. Lacourt, A.; Sommereyns, Gh., and Wantier, G. **Inorganic chromatography on paper. Power of separating and developing of organic solvents.** *Mikrochemie ver. Mikrochim. Acta* 39, 396-403 (1952).—*C.A.* 46, 11012*i*.

An org. developing soln. different from that of the satn. media was used. It was tested on solns. contg. Ni, Co, Cu, Fe, Al, Ti, Pb, U, Cd, Si, B, Mo, W, and Cr. In 17 tests with solns. contg. 10γ each of B in the presence of Mo and Si the quant. results averaged within 2.5% of the truth and in 12 tests with solns. contg. $50\ \gamma$ of U the results averaged within 4% of the truth in the presence of Fe and Al.

5308. Lacourt, A.; Sommereyns, Gh., and Wantier, G. **Quantitative inorganic paper chromatography.** *Analyst* 77, 943-54 (1952).—*C.A.* 47, 1529*h*.

Although a quant. chromatographic sepn. of Al was accomplished, the Fe and Ti spots were not completely resolved. Al was detd. with aluminon, Ti and Fe with Tiron. About 9.5γ of each ion was deposited on a paper strip, dried, and the chromatogram developed in an air-tight vessel. The soln. was then eluted from the spot. Al was removed with 0.2% aluminon and 1 ml of NH_4OAc soln. of pH 4 with the absorption measured at 5600 A.

5309. Lederer, Michael. **Electrochromatography inside filter paper. II. Diffusion and its effect on electrophoretic separations.** *Anal. Chim. Acta* 6, 521-5 (1952) (in English).—*C.A.* 46, 7927*a*.

The increase in the areas of spots of solns. on moistened filter paper was measured, and the results were used to calc. the feasibility of sepns. by paper electrophoresis.

5310. Lederer, Michael. **Paper chromatography of inorganic ions. IV.** *Anal. Chim. Acta* 7, 458-61 (1952) (in English).—*C.A.* 47, 4792*d*.

Filter paper impregnated with salts (KNO_3, NH_4NO_3, $NaNO_3$, NaCl) had been used for paper chromatography of many inorg. cations (Ag^+, Pb^{2+}, Hg^{2+}, Cu^{2+}, Cd^{2+}, Bi^{3+}, Sb^{3+}, Fe^{3+}, Co^{2+}, Ni^{2+}, Mn^{2+}, $MoO_4{}^{2-}$, Ti^{4+}, V^{5+}, $UO_2{}^{2+}$, Ba^{2+}, Rh^{3+}, Pd^{2+}, Pt^{4+}, Ru^{6+}, Au^{3+}). The R_f values of a no. of cations on such paper differed considerably from those on untreated paper, and in some cases better sepns. were possible.

5311. Lederer, M. and Ward, F. L. **Paper electrochromatography of inorganic substances.** *Anal. Chim. Acta* 6, 355-62 (1952) (in English).—*C.A.* 46, 7452*i*.

Electro-migration on filter paper was influenced by the movement of the solvent on the paper, adsorption on the paper, and the potential applied. Details of the sepn. of the Cu group, and Fe, Ni and Co, were described. The Cu group could be sepd. in 15 min. by the application of high potentials.

5312. Leech, John G. **Acetolysis products of slash pine α-cellulose studied by chromatographic methods.** *Tappi* 35, 249-53 (1952).—*C.A.* 47, 306*b*.

No uronic acid or arabinose and only very slight traces of xylose could be found in the hydrolyzate of α-cellulose by paper partition chromatography. A soln. of the acetalyzated product was stabilized by filtration through Magnesol. A portion was chromatographed on Magnesol (5 parts)-Celite (1 part), and the chromatogram developed with benzene-EtOH.

5313. Lüderitz, Otto and Westphal, Otto. **Chromatography with circular filter paper.** *Z. Naturforsch.* 7b, 136-8 (1952).—*C.A.* 46, 6542*i*.

Discrete spots in a circle about the center were used rather than as a single spot at the origin. This permitted a variety of substances to be compared on one sheet.

5314. Makisumi, Satoru. **Paper chromatography of guanidine compounds.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 737-9 (1952).—*C.A.* 47, 5848*d*.

By using BuOH:AcOH:C_5H_5N:H_2O (4:1:1:2) and BuOH:$6N$ HCl (7:3) as the solvent on Toyo filter paper 5 B and Sakaguchi's reaction, $Na_2Fe(CN)_5NO$ + $K_3Fe(CN)_6$, and Jaffe's reaction as detecting agents, R_f values of guanidine compds. were measured by a one-dimensional descending method.

5315. McFarren, Earl F. and Mills, James A. **Determination of amino acids on filter paper chromatograms by direct photometry.** *Anal. Chem.* 24, 650-3 (1952).—*C.A.* 46, 11039*h*.

Before chromatographic sepn., tryptophan was hydrolyzed with 14% $Ba(OH)_2$, cystine with a 1:1 mixt. of 6 N HCl and 90% formic acid, and all the other amino acids with 6 N HCl. The amino acid compn. of β-lactoglobulin was detd. by this procedure.

5316. Meigh, D. F. **Separation of the 3,5-dinitrobenzoates of volatile alcohols by paper chromatography.** *Nature* 169, 706-7 (1952).—*C.A.* 46, 9017*f*.

The paper-chromatographic sepn. of the 3,5-dinitrobenzoates of volatile aliphatic alcs. was carried out with MeOH and heptane as the solvents and Whatman No. 1 paper, previously soaked in a MeOH soln. of Rhodamine, 20 mg/liter, and dried at 100°C to give a yellow fluorescent background for the dark benzoate spots under ultraviolet light.

5317. Micheel, Fritz and Kamp, Franz Peter van de. **Separation of sugar mixtures by combined electrophoresis and paper chromatography.** *Angew. Chem.* 64, 607-8 (1952).—*C.A.* 47, 1545*h*.

The mixts. were used as H_3BO_3 complexes. Electrophoresis was carried out during the downflow of the soln. in filter paper. Fractions were collected and then chromatographed separately.

5318. Mills, J. S. and Werner, A. E. A. **Paper chromatography of natural resins.** *Nature* 169, 1064 (1952).—*C.A.* 46, 10639*e*.

Natural resins were sepd. by the application of paper partition chromatography, with Whatman No. 1 as the paper support, aq. isopropanol satd. with odorless kerosine (b. 180-200°C) as the solvent system, and 50% (wt/vol.) phenol in CCl_4 with exposure to Br_2 vapor as the developing agent. The procedure was applied to the following resins, dammar, mastic, sandarac, rosin, elemi, and copal.

5319. Miyaki, Komei; Momiyama, Hamako, and Hayashi, Makoto. **Quantitative paper chromatography. II. Determination of thiamine by paper chromatography.** *J. Pharm. Soc. Japan* **72**, 688-92 (1952).—*C.A.* **46**, 9147*d*.

A paper strip 8 mm wide and 40 cm long and a developing soln. consisting of 10% KCl and 95% EtOH (3:2) was used. Thiamine solns. contg. 50, 100, 250, 500, and 1000 γ/ml were submitted to chromatographic detn. The relation was found: log (spot length) = α log (amt.) + β, where α and β were const.

5320. Miyaki, Komei and Hayashi, Makoto. **Quantitative paper chromatography. III. Determination of *p*-aminosalicylic acid by paper chromatography.** *J. Pharm. Soc. Japan* **72**, 842-3 (1952) (in English).—*C.A.* **47**, 6815*e*.

The estn. of $2,4\text{-}HO(H_2N)C_6H_3CO_2H$ was given.

5321. Moura Goncalves, J. and Hasson, Aida. **Chromatographic analysis of the products evolved from glucose in an alkaline solution.** *Anais acad. brasil. cienc.* **24**, 221-3 (1952).—*C.A.* **47**, 2647*h*.

When an alk. soln. of glucose was heated in the absence of air, 8 spots (pink and white) appeared in a paper chromatogram developed with Tillman reagent with BuOH-AcOH as solvent. Besides reductone (R_f 0.63), 2 other dienols (R_f 0.34 and 0.90) were present. Two acid spots were congruent with pyruvic and lactic acids.

5322. Mukherjee, S. and Srivastava, H. C. **A spray reagent for the detection of sugars.** *Nature* **169**, 330 (1952).—*C.A.* **46**, 7000*d*.

Sugars on paper chromatograms were detected by spraying with the filtrate from a mixt. of 0.5 g $p\text{-}MeOC_6H_4NH_2$ and 2 ml 90% H_3PO_4 in 50 ml alc. soln The following colors developed after heating at 95°C for 3-5 min.: aldopentoses—dark brown, rhamnose—pinkish brown, fructose—lemon yellow, sucrose—brown yellow, aldohexases—light brown, lactose—dull yellow, maltose—faint brownish yellow, glucuronic acid—pink.

5323. Müller, Doris Clegg. **Instrumental approaches to paper chromatography.** *Analyst* **77**, 933-42 (1952).—*C.A.* **47**, 1529*g*.

An improved optical scanner for examg. chromatograms proved satisfactory for indicating the shape of a band and for evaluating R_F values more closely. Practical chromatographic sepns. depend on the distribution of solutes between 2 solvents or on selective adsorption on paper fibers, which was controlled by the compn. of the binary solvent.

5324. Nakano, Shoichi. **Analysis of cations by electrochromatography.** *J. Chem. Soc. Japan,* Pure Chem. Sect. **73**, 912-15 (1952).—*C.A.* **47**, 6308*h*.

Pt electrodes were placed at the ends of a filter-paper strip held between 2 glass plates, with one end of the paper dipping in the soln. tested. As solvent, 5*N* NH_4OH with or without citric acid, and mixts. of BuOH and AcOH were used. Uni-, bi-, and trivalent metal ions were studied with less satisfactory results than by ordinary paper chromatography.

5325. Nayar, M. R. and Rao, V. K. Mohan. **Papyrography of inorganic cations.** *J. Sci. Ind. Research* (India) **11B**, 78-9 (1952).—*C.A.* **47**, 6217*h*.

R_f values were reported for Ag, Hg, Pb, Cu, Cd and Bi in H_2SO_4, HOAc, HCl, and NH_3 solns. The sepn. of these ions by paper chromatography were discussed.

5326. Novellie, L. **A simple application technique for paper chromatography.** *Nature* **169**, 672 (1952).—*C.A.* **46**, 11011*i*.

To quickly and simply apply relatively large quantities of material to paper for use in paper chromatography, draw a line parallel to and 2 in. from the edge of the sheet of filter paper, fold the paper along the line, and dip the edge of the fold into the soln. to be chromatographed.

5327. Ohara, Eiichi and Nagai, Hideo. **Analysis of inorganic cations by simplified electropaper chromatography.** *J. Chem. Soc. Japan,* Pure Chem. Sect. **73**, 924-5 (1952).—*C.A.* **47**, 6308*i*.

A filter paper of fanlike shape was used. The soln. of the sample was put on the rivet, and electrodes were set on both sides of the fan. Results of application of Ag + Pb + Hg, Cu + Cd + Pb + Bi + Hg, As + Sb + Sn, Al + Fe + Ni + Co, Sr + Ba, etc. were given.

5328. Ohtsu, Takawo and Mizuno, Den'ichi. **Quanitative paper chromatographic estimation of various amino acids.. A modification of Fisher's method.** *Japan J. Med. Sci. and Biol.* **5**, 37-44 (1953).—*C.A.* **46**, 10051*c*.

A linear relationship was found between the area plotted on a linear scale and the quantity of the amino acid plotted on a logarithmic scale for 0.2-5.0 γ aspartic and glutamic acids chromatographed with phenol as solvent, and 0.6-5.0 γ glycine and alanine with *n*-BuOH. The error was ± 10%.

5329. Okáč, Arnošt and Černeý, Pavel. **Application of capillary chromatography in separation and determination of some metals.** *Chem. Listy* **46**, 14-15 (1952).—*C.A.* **46**, 3896*i*.

Impregnate filter paper with a soln. contg. Bi^{3+}, Sb^{3+}, and Sn^{2+} ions, treat with $(NH_4)_2S$ and then $(NH_4)_2S_2$. The thio salts formed concentric rings: black Bi_2S_3, barely visible SnS_2, and orange Sb_2S_3. The SnS_2 ring was developed, after drying, with a soln. of $K_2Hg(CNS)_4$ with which it formed a black ppt. of Hg. To detect Cd in the presence of Cu, treat the soln. to be tested with alkali and excess KCN and add to filter paper impregnated with $(NH_4)_2S$. A yellow spot of CdS was formed.

5330. Onoe, Keigo. **The separation and identification of aliphatic aldehyde 2,4-dinitrophenylhydrazones by the chromatostrip method.** *J. Chem. Soc. Japan,* Pure Chem. Sect. **73**, 337-9 (1952).—*C.A.* **47**, 3757*e*.

The prep. strips: triturate silica gel (23 g, 200 mesh) and 30 cc. 2.5% polyvinyl alc. to a homogeneous paste with addn. of a few drops of alc. to prevent foaming, spread over a strip of glass (1.5 × 25 cm) to a thickness of 0.6 mm, air-dry, and finally dry 1 hr at 60°C. C_6H_6 satd. with H_2O was the best solvent. The R_f value was very sensitive to variation in the water content of the strip; therefore, the extent of desiccation of the strip must be carefully controlled. The R_f value of CH_2O 2,4-dinitrophenylhydrazone was steady and could be used for the identification of the phenylhydrazones.

5331. Overell, B. T. **Quantitative and two-dimensional paper chromatography of organic acids.** *Australian J. Sci.* **15**, 28-9 (1952).—*C.A.* 46, 10039*h*.

Citric, malic, malonic, succinic, and oxalic acids, when present singly in concns. 2-10 mg/ml, were estd. (±4%) by measuring the lengths of the trails or comets on chromatograms. Careful control of pH and temp. (preferably below 10°C) were necessary and the use of const. development time and const. initial spot size. With mixts. of acids, interference was avoided by selecting solvents and pH so that 1 or 2 acids migrated while the others remained stationary.

5332. Paladini, Alejandro C. and Leloir, Luis F. **Detection of ultraviolet-absorbing substances on paper chromatograms.** *Anal. Chem.* **24**, 1024-5 (1952).—*C.A.* 46, 9011*a*.

After chromatography the paper was impregnated with paraffin oil to overcome any difficulty due to opaqueness of the paper. After spectrometric readings the paraffin oil could be removed with ether and the paper used for other chem. tests.

5333. Pollard, F. H.; McOmie, J. F. W., and Stevens, H. M. **The analysis of inorganic compounds by paper chromatography. V. The separation and detection of certain lanthanons.** *J. Chem. Soc.* **1952**, 4730-4.—*C.A.* 47, 5293*i*.

The chromatographic behavior of Y, La, Ce, Pr, Nd, Er, and Yb in a complex-forming solvent mixt. was investigated. Both filter-paper and cellulose columns were used and the solvent was BuOH-AcOH contg. 8-quinolinol.

5334. Rachinskiĭ, V. V. and Knyazyatova, E. I. **Sugar analysis by paper-partition chromatography.** *Doklady Akad. Nauk. S.S.S.R.* **85**, 1119-22 (1952).—*C.A.* 47, 448*c*.

For sensitivity about 20γ, the ammoniacal $AgNO_3$ reagent was satisfactory (1:1 mixt. of 0.1 N $AgNO_3$ and 5 N NH_4OH) for development of reducing sugars followed by drying at 105°C; the location of sugars was shown by dark-brown spots on a light-brown field. The 1:1 soln. of 1% alc. resorcinol and 0.2 N HCl gave various colors and sensitivities. EtOH soln. of 1:10 mixt. of 15% EtOH soln. of 1-$C_{10}H_7OH$ with 0.01 N H_2SO_4 served as a developer by giving violet spots for raffinose, sucrose, and fructose, with sensitivity about 10γ; other sugars showed very little sensitivity (500γ).

5335. Rachinskiĭ, V. V.; Knyazyatova, E. I. and Kravtsova, B. E. **Preparation and qualitative analysis of filter paper chromatograms of sugars.** *Biokhimiya* **17**, 551-6 (1952).—*C.A.* 47, 3758*f*.

Russian filter papers were employed. The best mobile solvent was C_6H_5OH satd. with H_2O. A mixt. of butanol, butyric acid, and water was used in the sepn. of glucose, fructose, and sucrose. The best developer for reducing sugars was an NH_4OH soln. of $AgNO_3$. Resorcinol was an effective developer for both reducing and nonreducing sugars; it was the universal developer for sugars.

5336. Redfield, Robert R. and Guzman Barron, R.S. **Quantitative determination of amino acids in protein hydrolyzates by paper chromatography.** *Arch. Biochem. Biophys.* **35**, 443-61 (1952).—*C.A.* 46, 5656*c*.

Complete sepn. of amino acids in simple protein hydrolyzates was achieved by one-dimensional paper chromatography with a no. of alcs. Direct photometric scanning of the chromatograms subjected to a modification of the ninhydrin reaction (or isatin for proline) was the basis of the assay.

5337. Rockland, Louis B.; Lieberman, José and Dunn, Max S. **Automatic determination of radioactivity on filter paper chromatograms.** *Anal. Chem.* **24**, 778-82 (1952).—*C.A.* 47, 3*b*.

An automatic sample changer utilized two types of recording counters and other standard app. for the detn. of radioactivity. Examples were given of radioactive counts made of glycine-2-C^{14} spotted at five concns. on Whatman No. 1 filter paper and of a typical phenol-developed test tube chromatogram of glycine-2-C^{14}. The av. recovery of radioactivity in glycine-2-C^{14} spotted at the origin was 85 ± 6%.

5338. Sattler, Louis and Zerban, F. W. **New spray reagents for paper chromatography of reducing sugars.** *Anal. Chem.* **24**,1862 (1952).—*C.A.* 47, 1543*d*.

Common hexoses and pentoses gave orange spots on a light background when the chromatogram was sprayed with a 0.3% alc. soln. of *p*-aminohippuric acid and heated to 140°C for 8 min. A spray reagent contg. 3% phthalic acid revealed 0.25 γ of glucose and 1 γ of fructose under ultraviolet light; 4 or 5 times these amts. of sugar gave orange-red spots visible in ordinary light.

5339. Schönfeld, T. and Reinharz, M. **Ion exchange capacity and dielectric strength of paper.** *Monatsh.* **83**, 753-7 (1952).—*C.A.* 46, 11013*h*.

Lignin-free cellulose was ground and washed, part was treated with 0.001 N HCl, another with 0.05 N NaCl, a 3rd with 0.05 N $CaCl_2$, and a 4th with distd. water. The dielec. strength was detd. After correcting for the thickness and d. of the sheet, it was found by statistical test that the breakdown voltage varied with the samples. The ion-exchange capacity of paper was attributed to the presence of about one COOH group per 100 glucose residues.

5340. Seiler, H.; Sorkin, E., and Erlemeyer, H. **Detection and determination of metallic ions separated by paper chromatography.** *Helv. Chim.*

Acta **35**, 120-8 (1952) (in German).—*C.A.* **46**, 8327*c*.

Tap water, mineral waters and solns. of plant ash (tobacco) were tested for Li, Zn, Mg, Cu, Ca, Na, K, and Fe with violuric acid. The solns. tested were not stronger than 0.05*N* and were first passed through a column contg. Amberlite 410 to change the chlorides, sulfates, etc., to acetates. The soln. was then evapd. to dryness in a vacuum, taken up in as little H_2O, as possible and made into a chromatogram on Whatman paper, with violuric acid. For the detns., blue, white, and red light was used to define the edges of the stains and the areas then detd. by a planimeter.

5341. SHIBATA, MURAJI AND UEMURA, TAKU. **Inorganic chromatography. VI. Mechanism of paper chromatographic separation.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **73**, 176-9 (1952).—*C.A.* **46**, 11012*d*.

The mechanism of paper chromatographic sepn. was studied by the countercurrent method. Water was used as the stationary phase and BuOH satd. with dil. HCl as the mobile phase. The mechanism of chromatographic sepns., was explained by the partition mechanism which depended upon the nature of the paper cellulose.

5342. SOBUE, HIROSHI; MATSUZAKI, KEI; HATANO, AKIRA, AND ARISAWA, YUKIO. **Chromatography. III. Pentosan in wood cellulose and some high-grade rayon pulps for the cellulose ester.** *J. Soc. Textile Cellulose Ind.* (Japan) **8**, 79-81 (1952) (English summary).—*C.A.* 46, 8851*h*.

Red-pine and beechwood pulps were hydrolyzed with 4 *N* HCl, and the insol. residue at each stage of hydrolysis was further hydrolyzed with dil. H_2SO_4 to det. the polysaccharide content. Chromatographically compared, Japanese high-grade rayon pulps contained slightly more pentosan than did U. S. Rayacetal.

5343. SOLOWAY, SIDNEY; RENNIE, FRANK J., AND STETTEN, DEWITT, JR. **Automatic scanner for paper radio chromatograms.** *Nucleonics* **10**, No. 4, 52-3 (1952).—*C.A.* **46**, 9435*h*.

The paper strip moved continously under a thin-mica-window Geiger counter shielded with 2 in. of Pb. By means of an electronic circuit, an elec. pulse was produced once each min., the strength of the pulse being proportional to the no. of counts picked up by the counter.

5344. SPITERI, JOSEPH AND NUNEZ, GIACOMO. **Partition chromatography of fat-soluble substances.** *Compt. rend.* **234**, 2603-4 (1952).—*C.A.* **47**, 941*f*.

Sepn. of higher fatty acids, chlorophylls, carotenes, vitamins, sterols, terpenes, higher alcs. hydrocarbons, etc., was done by impregnating filter paper with triglycerides and using as a carrier MeOH, EtOH, or PrOH; the latter was found to be the one of choice. The position of the different components was revealed by treating the paper with ammoniacal Ag soln.; the fixed Ag was transformed into AgCl and finally into black stains of Ag_2S.

5345. STOLL, A. AND RÜEGGER, A. **Separation and estimation of sugars by paper chromatography of their *p*-nitrophenylhydrazones.** *Helv. Physiol. et Pharmacol. Acta* **10**, 385-94 (1952) (in German).—*C.A.* **47**, 448*f*.

After conversion of the sugars to the hydrazones the mixt. could be transferred directly to the filter-paper strip, dried, and developed with an ester or one of the higher alcs. R_f values for 11 sugars with 9 different org. solvents were detd.

5346. STRAIN, HAROLD H. **Qualitative separations by two-way and three-way electrochromatography.** *Anal. Chem.* **24**, 356-60 (1952).—*C.A.* **46**, 4947*e*.

Differential elec. migration in paper moistened with one solvent followed by transverse electromigration after variation of the solvent was tested as a qual. analytical method for sepn. of the cations of the common qual. groups. This method, employed with various solvents and absorptive phases, served for the sepn. of very small quantities of the mixts.

5347. TAMURA, ZENZO. **Inorganic paper chromatography. II. Total analysis of cations by paper chromatography.** *Japan Analyst* **1**, 117-22 (1952). (1952).—*C.A.* **47**, 4792*g*.

The soln. to be tested (in dil. HNO_3 or HCl) was developed on filter paper by the descending method with the following developing solvents: Hg(0.85), Sn, Sb, Bi, As, Zn, and Cd(0.3) (in decreasing R_f value order) were sepd. by BuOH satd. with a mixt. of 2.5*N* HNO_3 and 1.5*N* HCl, other cations were fixed near the original point. Fe (1.0), Cu (0.85), Co, Pb, Mn, Cr, and Ni (0.06) were sepd. by the mixt. of 10 vols. Me_2CO and 1 vol. 35% HCl; alkali and alk. earths were fixed and Hg Sn, Sb, Bi, As, Zn, and Cd moved beyond R_f 0.9. Li (0.83), Al, Mg, NH_4, Ca (0.38), Na, Sr, K, and Ba (0.05) were sepd. by a mixt. of 10 vols. MeOH and 3 vols. 35% HCl, others moved beyond R_f 0.5.

5348. THIES, H.; SOUCI, S. W., AND KALLINICH, G. **Colorimetric determination of ketohexoses.** *Z. Lebensm.-Untersuch. u. -Forsch.* **94**, 240-5 (1952).—*C.A.* 46, 7475*h*.

The colored materials formed in the color test for fructose as well as fructose-contg. carbohydrates and diphenylamine were studied by solvent and chromatographic sepns. and spectral analysis of fractions. Four colored reaction products were sepd.

5349. TISELIUS, ARNE. **Some recent advances in chromatography.** *Endeavor* **11**, 5-16 (1952).—*C.A.* **46**, 11011*a*.

Underlying principles were discussed, especially methods for developing chromatograms. The techniques of chromatographic columns, of partition and paper chromatography and of ion-exchange chromatography were compared.

5350. ULTÉE, A. J., JR. **Chromatography, limiting the area of solution spots.** *Chem. Weekblad* **48**, 821 (1952).—*C.A.* **47**, 4239*i*.

In 2-dimensional paper chromatography results were improved by limiting the area of the spot. Best results were obtained by the use of 52.5%

$CCl_3.CCl_3$ and 47.5% $C_{10}H_8$ to produce a limiting ring. The mixt. was applied with the fire-polished end of a glass tube of 1 cm diam.

5351. VANYARKHO, L. G. AND GARANINA, V. A. **Preparation and use of chromatographic paper in chemical analysis.** *Aptechnoe Delo* **1952**, No. 3, 22-5.—*C.A.* **47**, 439*h*.

Filter paper treated with hydroxides of Al, Cr, Si, etc., was useful for adsorption analysis. The $Al(OH)_3$ paper treated with 8-quinolinol showed clear ring zones on drop tests with cation mixts. Use of 5% oxine and 10% AcOH gave very clear demarcation. Sepns. of Fe-Cu, Co-Mo, Cu-Co, Fe-Mo, Cu-Mo-Ni, Cr-Mn-Mo, and Cr-Mn-Cu could be readily made.

5352. VAVRUCH, IVAN. **Chromatographic study on beet seeds and sugar beet. I. Sugars and amino acids.** *Chem. Listy* **46**, 453-7 (1952).—*C.A.* **46**, 11728*d*.

Paper chromatography was used to study the content and movement of sugars, amino acids, and their amides in various parts of beets during various periods of their life. During germination the sugar content in seeds decreased and the amino acids and their amides increased, whereas the order was reversed during vegetation.

5353. VENTURELLO, G. AND GHE, A. M. **Qualitative and quantitative paper chromatography of inorganic ions.** *Anal. Chim. Acta* **7**, 261-7, 268-73 (1952).—*C.A.* **47**, 4792*e*.

The detection and detns. of one or more inorg. ions (Cu^{2+}, Fe^{2+}, Fe^{3+}, Ni^{2+}, Zn^{2+}, and Pb^{2+}) when present together in mixts. was made by means of filter-paper chromatography; standard diagrams obtained from titrated solns. were used. The same method was also employed with the addn. of Mn^{2+}, in Al alloys.

5354. VOLMAR, YVES; EBEL, JEAN PIERRE, AND YACOUB, FAWZI BASSILI. **Paper chromatography of the oxyacids and phosphorus and arsenic.** *Compt. rend.* **235**, 372-3 (1952).—*C.A.* **47**, 2568*f*.

The sepn. of the following salts was studied by 2-dimensional paper chromatography with Whatman No. 4 paper washed with dil. HCl and 8-hydroxyquinoline: NaH_2PO_2, NaH_2PO_3, $Na_2H_2P_2O_5$, $Na_2H_2P_2O_6$, Na_2HPO_4, and $Na_2P_2O_7$, and Na arsenate, and Na arsenite. The solvents used and the R_f values obtained for the compds. in the above order were: acidic solvent (iso-PrOH 75 cc., CCl_3COOH, 5 g, H_2O 25 cc., and concd. NH_4OH 0.3 cc.), 0.84, 0.86, 0.86, 0.48, 0.82, 0.61, 0.68, and 0.83; basic solvent (EtOH 30 cc., iso-BuOH 30 cc., H_2O 39 cc., concd. NH_4OH 1 cc), 0.75, 0.49, 0.66, 0.21, 0.39, 0.28, 0.40-0.49, 0.40.

5355. WANKMÜLLER, ARMIN. **Paper chromatography of aromatic amines.** *Naturwissenschaften* **39**, 133-4 (1952).—*C.A.* **47**, 1335*c*.

For sepn. of sulfonamides a mixt. of 32 parts MeOH, 8 H_2O, 15 AmOH, and 45 C_6H_6 was used, on S. and S.2043b filter paper, with rising chromatography in fiber direction. The strips were sprayed with 0.1 *N* HCl contg. 0.1% $NaNO_2$ and a second time with aq. Na 2-naphtholate. A max. of 150 γ should be used for good sepn., a difference of 0.05 to 0.07 in R_f value was adequate for sepn.

5356. WHITTAKER, V. P. AND WIJESUNDERA, S. **Separation of esters by filter-paper chromatography.** *Biochem. J.* **51**, 348-57 (1952).—*C.A.* **46**, 7940*g*.

Choline esters could be sepd. by paper chromatography by using alcs. freely sol. in H_2O as solvents. Propanol- and butanol-water mixts. (with or without benzyl alc. or HCOOH as a third component) gave the best sepn.

5357. WIELAND, THEODOR AND BERG, A. **Chromatography on carboxyl paper.** *Angew. Chem.* **64**, 418-19 (1952).—*C.A.* **46**, 10039*e*.

Paper with a carboxyl content of 1 to 4% gave promising results with amino acids, amines, and inorg. ions. Some data were given.

5358. YODA, ATSUNOBU. **A paper chromatographic method for the detection of nonreducing sugars and polyhydric alcohols.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **73**, 18-19 (1952).—*C.A.* **47**, 3185*c*.

Chromatograms were run with BuOH, EtOH, and water (4:1:5) 20 hrs at 20°C, dried at room temp., and sprayed with 0.5% KIO_4 and then after 1 to 5 min. with a mixt. of equal amts. of 15% aq. $MnSO_4$ and a satd. soln. of $(p\text{-}Me_2NC_6H_4)_2CH_2$ in 2 *N* AcOH. White spots on a blue background indicated locations of α-glycols.

5359. AIRAN, J. W.; JOSHI, J. V.; BARNABAS, J., AND MASTER, R. W. P. **Identification of organic acids by circular paper chromatography.** *Anal. Chem.* **25**, 659-60 (1953).—*C.A.* **47**, 6309*f*.

Tartaric, citric, malic, malonic, and citric acids were sepd. on Whatman's No. 1 paper with 1-pentanol and 5*M* aq. HCOOH. The chromatograms were sprayed with bromophenol blue or a 0.1% soln. of Mercurochrome in neutral alc. and examd. under ultraviolet light.

5360. BURMA, D. P. **Partition mechanism of paper chromatography.** *Anal. Chem.* **25**, 549-53 (1953).—*C.A.* **47**, 6735*f*.

Exptl. evidence was advanced which indicated that adsorption of the solute by the cellulose played a minor role in sepns.

5361. CAMPBELL, H. AND SIMPSON, J.A. **Spectrophotometric attachment for use in paper chromatography.** *Chemistry & Industry* **1953**, 342-3.—*C.A.* **47**, 6706*g*.

After a substance had been sepd. by chromatography or electrophoresis, the quantity present could be detd. by measuring the amt. of light absorbed by the substance. No sepn. or removal from the filter paper was necessary. As small as 10^{-6} g of colored compd. could be detd.

5362. CASTIGLIONI, ANGELO AND NIVOLI, MARIA. **Paper chromatographic separation of piperazine with hexamethylenetetramine.** *Z. Anal. Chem.* **138**, 187-8 (1953).—*C.A.* **47**, 5848*a*.

With Whatman Paper no. 1 excellent sepns. could be obtained with a (5:4:1) mixt. of water, BuOH, and AcOH as solvent or a 50% mixt. of BuOH and water. In some cases KCN was added in the stationary phase and in other cases HCl and AcOH. The migration speed of the amino acids was retarded by adding AcOH. The chromatograms were developed with I_2 vapors which gave with piperazine a brownish red spot and with urotropine a brownish yellow one.

5363. Giri, K. V.; Murthy, D. V. Krishna and Rao, P. L. Narasimha. **Circular paper chromatography. IV. Separation of organic acids.** *J. Indian Inst. Sci.* **35A**, 93-8 (1953).—*C.A.* **47**, 4248*i*.

Of 6 solvents tested, an *n*-butanol-formic acid water mixt. (15:10:15 vol./vol.) was found to be optimum for detn. of R_f values of oxalic, tartaric, citric, malic, malonic, succinic, and adipic acids in a mixt.

5364. Jones, A. Russell; Dowling, E. J., and Skraba, W. J. **Identification of some organic acids by paper chromatography.** *Anal. Chem.* **25**, 394-6 (1953).—*C.A.* **47**, 6309*g*.

To assist in the study of acidic products formed by the action of γ-rays from Co^{60} in aq. AcOH soln., the R_f values for a no. of common acids were detd. in several solvent combinations. A new acidic solvent combination for resolving nonvolatile acids and a new basic solvent combination for increasing the sensitivity of the paper chromatographic method for volatile acids were developed.

5365. Lacourt, A.; Sommereyns, Gh.; Stadler-Denis, A., and Wantier, G. **Paper chromatography of molybdates. Direct titration of chromatographic molybdenum spots and separation of chromium and of vanadium.** *Mikrochemie ver. Mikrochim. Acta* **40**, 268-84 (1953).—*C.A.* **47**, 5307*h*.

Under prescribed conditions Mo could be chromatographed on Whatman paper no. 4 and detd. within about 1% by absorption or the test spot could be cut out, the Mo dissolved, and titrated with $Pb(NO_3)_2$. After all the Mo had been converted into $PbMoO_4$ the next drop of the titrant gave a red color with diphenylcarbazide which was added as an indicator.

5366. Lindqvist, Börje and Storgårds, Torsten. **Paper chromatographic separation of volatile fatty acids. A study of a number of factors involved.** *Acta Chem. Scand.* 7, 87-96 (1953) (in English).—*C.A.* **47**, 5627*i*.

$EtNH_2$ soln. (33% $EtNH_2$ dild. to 0.025 *N* with BuOH-satd. H_2O) was placed in the bottom of the tank to a depth of 2 cm, the lid replaced, the papers were cut and lined (Whatman No. 1 for *B* and Munktell OB for *A*), a pad of filter paper (5 times the wt of the chromatogram) attached to the lower edge of the sheet and folded together tightly, and approx. 3 microliters of the sample was spotted on the paper and the position marked, the 2 outer positions being used for 0.050 and 0.025 *N* standard solns. The paper was hung in the trough, the H_2O-satd. BuOH run in, the paper removed after 16-32 hrs, the pad sepd., the paper allowed to dry in the air for 1 hr and sprayed evenly with indicator soln. prepd. from 2.5 g bromocresol green in 500 cc. EtOH and 500 cc. BuOH, the acid spots were marked, and the paper was sprayed with fresh Ag reagent, prepd. from 50 cc. 0.1 *N* $AgNO_3$ and 50 cc. 5 *N* NH_4OH, the paper heated 1-2 hrs at 100-25°C, the indicator and excess Ag reagent were removed by washing with distd. H_2O, and the paper was dried as usual.

5367. Nakano, Shoichi. **Analysis of anions by paper chromatography.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **74**, 56-8 (1953).—*C.A.* **47**, 6821*b*.

Developers contg., ammonia such as ammonia 4 + acetone 13 + BuOH 3 parts were suitable for anions. R_f values of anions in the increasing order were MnO_4^-, CrO_4^{--}, SO_4^{--}, $S_2O_3^{--}$, CO_3^{--}, CN^-, Cl^-, Br^-, I^-, CNS^-. In most cases anions were fixed by spraying with $AgNO_3$ or $Pb(NO_3)_2$ solns.

5368. Ogawa, Shuntaro. **Fluoresent reaction of vitamin C. III. Its application to filter-paper chromatography. 1. IV. Its application to filter-paper chromatography. 2.** *J. Pharm. Soc. Japan* **73**, 59-63, 94-9 (1953).—*C.A.* **47**, 4042*c*, 4042*d*.

The specificity and sensitivity of the fluoresence reactions that occurred between dehydroasorbic acid, oxidation-type reductone, or α-keto acid, with o-$C_6H_4(NH_2)_2$ were utilized for detection in paper chromatography. Chromatograms of asorbic acid, its allied compds., and of α-keto acid were prepd. and their R_f values detd. Paper chromatograms of various pH were prepd. to obtain characteristic developed images.

5369. Roberts, E. A. H. and Wood, D. J. **Separation of polyphenols on paper chromatograms.** *Biochem. J.* **53**, 332-6 (1953).—*C.A.* **47**, 3757*g*.

Paper chromatograms were prepd. with H_2O as the mobile solvent. By this procedure sepn. of optical antipodes of cathecol, epicathecol, gallocathecol, and epigallocatechol had been apparently achieved. A list of the spots corresponding to the various polyphenols was given.

5370. Sato, Takuya R.; Kisieleski, Walter E.; Norris, William P., and Strain, Harold H. **Electrochromatographic separations of calcium and phosphate ions. Factors influencing separations.** *Anal. Chem.* **25**, 438-46 (1953).—*C.A.* **47**, 6303*h*.

This investigation was concerned with procedures for detection, sepn., purification, and estn. of Ca^{2+} and PO_4^{3-}, particularly radioactive prepns. employed as tracers and radioactive species encountered in neutron activation analyses. Differential elec. migration from a narrow zone of the mixt. in an electrolytic soln. supported in paper was found to have many desirable features. The sepns. were affected by the dimensions of the paper, the electrolytic soln., its concn., the vol. and concn. of the mixt. to be resolved, the presence of salts and of mineral acids in this mixt., the elec. potential, the electrode reactions, and the distance of migration.

5371. Schlögl, K. and Siegel, A. **Paper chromatographic separation and identification of monatomic phenols as aryl hydroxyacetic acids.** *Mikrochemie ver. Mikrochim. Acta* **40**, 202-11 (1953).—*C.A.* **47**, 5309*g*.

Advantage was taken of the pH dependence of the fluorescence of an umbelliferone soln. whereby the acids appeared in the ultraviolet region as black flecks on a light green luminous background.

5372. SCHUTE, J. B. **The mechanism of paper chromatography.** *Mededel. Vlaam. Chem. Ver.* **15**, 1-12 (1953) (in English).—*C.A.* **47**, 6218*a*.

R_f values of greater magnitude were found if the paper was not thoroughly equilibrated with H_2O. With water-miscible solvents, a sepn. may take place by a partition between water of the solvent and water imbibed by the cellulose. Concn., ionization, and assocn. of the solute may cause aberration. Ion exchange may take place between the cations held by the paper and bound to carboxyl groups and silicates and the H^+ of an acid being chromatographed. The H^+ was bound irreversibly by the paper, and the salt of the acid was sepd. from the acid spot. If the paper first was washed with HCl and then H_2O, the cations would be replaced by H^+. On such H^+-paper ion exchange was impossible and acids may be chromatographed.

5373. SCHWARZ, V. **The "Chromatocoil." A space-saving device for paper chromatograms.** *Chemistry & Industry* **1953**, 102.—*C.A.* **47**, 4660*g*.

A compact device 10 cm × 10 cm which could be used for paper chromatograms 1 cm wide and up to 70 cm long at any temp. was described in detail. Quant. chromatography of adreno-cortical steroids gave reproducible R_f values.

5374. SJÖQUIST, JOHN. **Paper-strip identification of phenyl thiohydantoins.** *Acta Chem. Scand.* **7**, 447-8 (1953) (in English).—*C.A.* **47**, 6822*c*.

A no. of naturally occurring amino acids were identified as the phenyl thiohydantoins by paper chromatography. Whatman No. 1 filter paper was soaked in a 0.5% soln. of starch (extd. with 2.5% 8-quinolinol in EtOH and then with EtOH) and dried 1 hr at 40-50°C. Three solvents were used. The paper was brought into equil. with a satd. atm. of the solvent. After the descending chromatograms were run, the paper was dried 5-10 min. at 90-100°C and sprayed with a reagent made up of equal vols. of an iodine soln. (0.01 *M* I_2 and 0.5 *M* KI in H_2O) and an azide soln. (0.5 *M* NaN_3 in H_2O).

5375. SMITH, IVOR. **Color reactions on paper chromatograms by a dipping technique.** *Nature* **171**, 43-4 (1953).—*C.A.* **47**, 3751*f*.

Instead of the usual spraying for color development, the dried paper chromatogram was dipped or drawn through a 0.2% isatin or ninhydrin in Me_2CO or 1% *p*-dimethylaminobenzaldehyde in Me_2CO: concd. HCl (9:1).

5376. SURAK, JOHN G.; LEFFLER, NORMAN, AND MARTINOVICH, ROBERT. **Inorganic paper chromatography. II. Separation of groups III, IV, and V.** *J. Chem. Educ.* **30**, 20-1 (1953).—*C.A.* **47**, 4781*c*.

Brush the soln. onto a strip of filter paper and dry. After the development of the chromatogram with the proper solvents and subsequent drying, locate the bands by treating the paper with the individual identifying reagents required. These were given for groups IIIa, IIIb, IV and V.

5377. TISELIUS, ARNE. **Zone electrophoresis in filter paper and other media.** *Discussions Faraday Soc.* **1953**, No. 13, 29-33.—*C.A.* **47**, 6218*e*.

The use of zone electrophoresis in immobilized media (filter paper strips or powder, glass beads, starch, gels) as a sepn. method was surveyed and compared with free electrophoresis. Application was made to the analysis of human serum.

II-11. Organic Solids With Various Solutions

5378. HEDGES, J. J. **The absorption of water by colloidal fibers.** *Trans. Faraday Soc.* **22**, 179-93 (1926).—*C.A.* **21**, 1389.

The heat of complete wetting of the dried material was detd. Extreme care was used in the washing and weighing of the wool. After wetting a dried sample in a calorimeter, reading the increase of temp. and time, a current was passed through a heating unit in the stirrer of the calorimeter, so that a similar increase in temp. took place in about the same time. The moisture contents at different relative humidities, and for temps. from 17°-29°C were detd. by careful weighening of dried samples of wool in closed bottles containing H_2SO_4 at various concns.

5379. HEDGES, J. J. **Moisture relations of colloidal fibers.** *J. Textile Inst.* **18**, 350-9T (1927).—*C.A.* **22**, 2062.

Curves for the variation of moisture content of chemically pure wool with atm. R. H. were of the usual sigmoid character given by other hygroscopic colloids. The heat of wetting of dry wool was considerable, being 24.1 g-cal/g. Wool and its absorbed water might be considered as a two-phase system in which a little water was adsorbed by the colloid particles, while the bulk was held in a system of pores.

5380. CHAMPETIER, GEORGES AND VIALLARD, RODOLPHE. **Penetration of water into the cellulose lattice. Interchange of H and D between cellulose and heavy water.** *Compt. rend.* **205**, 1387-8 (1937).—*C.A.* **32**, 1543^4.

Dry cellulose was placed in 99% D_2O, and the progress of the interchange H→D followed by detn. of the d. of the mixed H_2O and D_2O collected by evapn. The interchange was at the rate of 3D per glucose group. The results indicated that absorption of H_2O by cellulose occurred uniformly throughout the whole mass, and was not confined to a surface layer.

5381. MAASS, O, AND CAMPBELL, W. BOYD. **Studies in cellulose—moisture phenomena.** *Pulp Paper Mag. Can.* **40**, 108-14 (1939).—*C.A.* **33**, 4017^1.

The cryst. nature of cellulose lay in the regular spacing of the C_6 groups rather than in the arrangement of the long mols., though some degree of regularity in the arrangement of the chains must follow. Results of expts. on the sorption of water and org. liquids by cellulose, heat of wetting, d. or specific vol., dielec. const. and specific heat of cellulose, were discussed.

5382. Porai-Koshits, A. E.; Veller, E. A., and Sokolova, N. V. **The theory of the dyeing process. XI. The dyeing of animal fibers by acid anthraquinone dyes and other acid dyes.** *J. Applied Chem.* (U.S.S.R.) **12**, 1191-9 (in German) (1939).—*C.A.* **34**, 4913^1.

With respect to wool all dyes were classified as: (1) those having a normal limit of the satn. of wool equal to 0.80-0.83 mg equiv./g of wool and (2) those having an "anomalous" limit, equal to 0.60-0.67 mg equiv./g of wool. The main process in dyeing of wool or silk fibers with dyes followed the stoichiometric reaction between basic groups of fiber and acid of the dye, with salt formation. Adsorption and coagulation processes very probably accompanied the process of salt formation.

5383. Bresler, S. **Adsorption of acetylene on selective adsorbents.** *Acta Physicochim. U.R.S.S.* **12**, 783-5 (1940).—*C.A.* **35**, 949^2.

Highly disperse amphoteric methylpentadecyl ketone and cycloheptadecanone adsorbents were prepd. by addn. of H_2O to an alc. soln., coagulation with acid or alkali, and drying in vacuo. Around 600 mm and room temp. C_2H_4 was strongly adsorbed on the ketone, but equil. was attained only after 10 hrs. Acetylene was adsorbed by the enol form, and the rate of the enol-ketone isomerization was given by the change in the adsorptive capacity.

5384. Jong, H. G. B. de and Bank, O. **Mechanisms of dye absorption. II. Storage, polar linkage, and extractability of dyes.** *Protoplasma* **34**, 1-21 (1940).—*C.A.* **37**, 1146^1.

Small spheres of agar and gelatin were suspended in solutions to study adsorption of dyes on colloids. Basic dyes were adsorbed on agar more strongly the higher the pH and the lower the salt concentration. Exceptions were Rhodamine B, Prune Pure, and Congo Rubin which did not stain agar. Of the acid dyes tested, only eosin and erythrosin stained agar. Gelatin was stained by acid but not by basic dyes at pH 3; at higher pH values this relation was reversed. The failure of a dye to stain a given structure was not necessarily due to an impermeability of the cells for the dye; the cells were incapable of effecting a certain ionic exchange.

5385. Kleinert, Theodor. **The adsorption of phenol by wood tissues and their chief constituents.** *Cellulosechem.* **18**, 115-18 (1940).—*C.A.* **35**, 6441^1.

Samples of spruce-wood meal, coniferous lignins and coniferous cellulose (filter paper) were satd. with aq. phenol of various concns. at room temp. The absorption was only slightly affected by temp. The absorption process obeyed the equation of Freundlich up to an absorption of about 353 millimoles of phenol per 100 g H_2O-free lignin.

5386. Kline, G. M.; Martin, A. R., and Crouse, W. A. **Sorption of water by plastics.** *Modern Plastics* **18**, No. 2, 119-23, 152, 154 (1940).—*C.A.* **35**, 534^5.

Part of the results of an exploratory investigation of the water absorption and desorption characteristics of 17 plastics were given.

5387. Kurbatov, V. Ya, and Moiseev, A. S. **The dependence of the adsorption of dyes by wool and cotton on pH.** *Trudy Leningrad. Krasnoznamen. Khim.-Tekhnol Inst. im. Leningrad. Soveta* **9**, 88-112 (1940).—*C.A.* **37**, 3607^8.

Expts. with acid, basic and substantive dyes showed that for dyes contg. strong ionogen groups (SO_3) the max. of adsorption lay at very low pH values; dyes with many cation groups showed a max. at intermediate pH values, and this latter max. became more and more marked with increasing numbers of cations. Dyes contg. anion groups other than SO_3 reached their max. adsorption at intermediate pH values, and this max. became greater the stronger the anion groups and the greater the number of these groups in the dye.

5388. Rao, K. S. **Elasticity of organo-gells in relation to hysteresis in sorption.** *Current Sci.* **9**, 19-21 (1940).—*C.A.* **34**, 2680^2.

The prepn. of Ca arabate was described. This material was taken through 4 cycles of sorption and desorption of water. On a weight-of-water vs. pressure diagram, a hysteresis occurred, which decreased and eventually disappeared on the fourth cycle. The cavities in the Ca arabate had rigid walls which "trapped" and retained water during desorption. With repeated cycles the gum swelled and the walls of the cavities became more elastic. After sufficient use they no longer "trapped" water, and the hysteresis effect disappeared. Similar results were obtained with rice and with the grain of *Cajanus indicus*.

5389. Smirnov, L. V. **The effect of impurities on crystal habit during crystallization from solution.** *Acta Univ. Voronegiensis* (U.S.S.R.) **5-6**, 38-44 (1940); *Khim. Referat. Zhur.* **4**, No. **4**, 13 (1941).—*C.A.* **37**, 4508^1.

The crystn. of herapathite (quinine iodosulfate) from solns. in various alcs. and in their mixts. was studied. The characteristics of crystals obtained from solns. in MeOH, EtOH, iso-BuOH and iso-AmOH and of crystals obtained from solns. in the mixts. MeOH-EtOH, EtOH-AmOH and EtOH-H_2O were studied. The largest crystals were obtained from EtOH-H_2O.

5390. Sponsler, O. L.; Bath, Jean D., and Ellis, J. W. **Water bound to gelatin as shown by molecular-structure studies.** *J. Phys. Chem.* **44**, 996-1006 (1940).—*C.A.* **35**, 2053^2.

Gelatin hydration was discussed from different points of view. Agreement was shown between the possible no. of H_2O mols. bound to the protein in a water-gelatin mixt. contg. 35% H_2O and the amt. calcd. to be present. Infrared absorption studies make it plausible that the water was bound to the gelatin by means of H-bridges.

5391. Steinhardt, Jacinto and Harris, Milton. **Combination of wool protein with acid and base: hydrochloric acid and potassium hydroxide.** *J. Research Natl. Bur. Standards* **24**, 335-67 (1940).—*C.A.* **34**, 3153^1.

The titration curve of wool protein with HCl and KOH at 0° and 25°C, and the effect on the curve of the maintenance of a wide range of constant ionic strengths by addns. of KCl were reported in detail. The max. acid-binding capacity (independent of ionic strength) was about 0.82 millimols./g; the max. base-binding capacity was greater than 0.78 millimols/g. In the absence of salt, no appreciable binding of acid or base occurred in the pH interval 5 to 10, but the amt. bound increased sharply as these limits were exceeded. With salt present, the course of combination was more gradual; over the 200-fold range of ionic strengths between 0.005 and 1.0, the point of zero combination was sharply defined and was near pH 6.4.

5392. VEITH, HANS. **The absorption of water by technical rubber products.** *Wiss. Veroffent. Siemens-Werken* **1940**, 318-33.—*C.A.* **38**, 1910^{6}.

Expts. on the water absorption of rubber products which are described in the literature and which are of importance in the manuf. of rubber-insulated wire and cables are reviewed, and new expts. in the same field are described. The extraordinarily long time required to reach the satn. value of water absorption, which may extend to decades (sq. root law by storage in air of 100% humidity), as a characteristic of this process.

5393. WEIDINGER, A. AND PELSER, H. **The mechanism of water adsorption in gelatin gel.** *Rec. trav. chim.* **59**, 64-72 (1940).—*C.A.* **34**, 2233^{2}.

The different colors of gelatin gels contg. $CoCl_2$ were observed. The colors were typical of different amts. of adsorbed water and allowed a distinction to be made between bound (intramicellar) and free (intermicellar) water. Small amts. of $CoCl_2$ did not interfere with intramicellar adsorption of water, but with high salt content the salt seemed to intrude into the micelles.

5394. BIKERMAN, J. J. **Measuring contact angles.** *Ind. Eng. Chem., Anal. Ed.* **13**, 443-4 (1941).—*C.A.* **35**, 5010^{4}.

An equation was suggested for detg. the contact angle (between air, liquid and solid) based upon measuring the vol. and diam. Calcns. might be made accurate to ± 0.2°.

5395. CALVET, E. AND IZAC, H. **Calorimetric study of the adsorption of acetone by the nitrocelluloses.** *Compt. rend.* **212**, 542-4 (1941).—*C.A.* **36**, 6073^{4}.

The curve for the heat evolved as function of time for the adsorption of acetone on dry 14%-N nitrocellulose was similar to that obtained for the adsorption of H_2O on urea. The amt. of acetone adsorbed reached 3.7 moles acetone per C_6 group (2.95 NO_2 groups) after 150 hrs; the relation of the heat evolved to the amt. of acetone adsorbed was a straight line without any irregularities at the equiv. ratio points. The heat of adsorption was 67.5 cal/g or 3,900 cal/mole of acetone adsorbed.

5396. CALVET, EDOUARD. **Thermal effects produced during the adsorption of acetone by nitrocelluloses.** *Compt. rend.* **213**, 126-28 (1941).—*C.A.* **36**, 6073^{6}.

The quantity of heat given off was proportional to the amt. of adsorbed acetone. The thermal effect was 3900 g cal/g mol. adsorbed acetone. The expts. had to be interrupted after the adsorption of 3.27 g mol. acetone per C_6 chain owing to the fact that the adsorption had become too slow for a convenient estn. of the heat produced.

5397. GIACANELLI, EUGENIO. **The adsorption power of gluten as a measure of the baking quality.** *Ann. chim. applicata* **31**, 449-53 (1941).—*C.A.* **37**, 3315^{1}.

The amount of water absorbed was 64-69% of the moist gluten. The baking quality improved with increased water content. Values of 68-71% water in the gluten were obtained by this method, and they might be used for judging the baking quality.

5398. IRANY, ERNEST P. **Water absorption of resins.** *Ind. Eng. Chem.* **33**, 1551-4 (1941).—*C.A.* **36**, 1109^{9}.

The rate of penetration and the max. absorption for infinite exposure are characteristic of the material and must be known in order to describe its absorption behavior completely. Exptl. absorption curves for polyvinyl acetate and polyvinyl acetal corresponded closely with the theory. For polyvinyl alc., however, no fixed value for the max. absorption was found and the absorption per unit area increased almost linearly until the resin disintegrated.

5399. KRÜGER, D. **The sorption of basic dyes by cellulose.** *Melliand Textilber.* **22**, 428-31 (1941).—*C.A.* **37**, 2579^{9}.

Comparison of the absorption spectra of basic dyes in aqueous solution and dyed onto cellulose films showed that the absorption maxima in the dyed films were shifted toward the longer wave lengths. Significant differences in the shapes of the absorption curves were also noted. The dye existed in the cellulose film as a polymeric rather than as a simple ion.

5400. KRÜGER, DEODATA AND OBERLIES, FRIDEL. **Catalytic oxidations at the surface of cellulose fibers.** *Ber.* **74B**, 663-70 (1941).—*C.A.* **35**, 6244^{2}.

The acid groups (lignosulfonic and carboxylic) in cellulose materials could, by virtue of the H ions which they produced, exert certain catalytic effects, as in sulfite digestion and in the acetylation of purified cellulose materials. These acid groups gave rise to a reaction which was not specific for lignosulfonic and carboxylic acid groups but also occurred in the presence of other absorbents with acid complexes, such as silicate complexes.

5401. MARTIN, H. AND KUHN, W. **A multiplication process for separating racemates.** *Z. Elektrochem.* **47**, 216-20 (1941).—*C.A.* **35**, 5102^{9}.

If an optically active insol. adsorption medium was distributed throughout a liquid racemic system, unequal adsorption of the optical isomers would be accompanied by different heats of adsorption and different temp. coeffs. of adsorbability for the resp. isomers. Using wool as the insol. optically active adsorbent (in the form of an endless belt) and a soln. of inactive mandelic acid as the racemate and maintaining one surface of the system at 100°C while a parallel surface was kept at room temp., for 2 different speeds of motion of the wool strip at the end of 2 days $[\alpha]_D$ of -0.25° and -0.35° were obtained at one end of the app. and +0.00° and +1.00°, resp., at the other end.

5402. NEALE, S. M. AND STRINGFELLOW, W. A. **The primary sorption of water by cotton.** *Trans. Faraday Soc.* **37**, 525-32 (1941).—*C.A.* **36**, 1228^1.

The expts. covered sorptions up to 1.5 mg H_2O/g cotton. The adsorption by the glass walls was corrected. The plot of log p vs. 1/T was linear and from the slope the differential heat of sorption was 15.7 kg-cal/g mol. This value was accounted for by each H_2O mol. directly linking in this stage of primary adsorption to a pair of suitably placed cellulose OH groups.

5403. NISHI, TETSUNOSUKE. **Permeability of membranes to dyes. VI. The dependence of the velocity of the dialysis of the dyes on temperature. VII. The relation between the dialysis constant and particle size.** *J. Soc. Chem. Ind., Japan* **44**, Suppl. binding 233-8 (1941).—*C.A.* **44**, 8198*e*.

Values for the velocity of dialysis k of Orange GG, acid Ponceau E, double Brilliant Scarlet 3R, and Scarlet 4R were detd. at 50°, 60°, and 70°C. The concns. of the solns. were detd. from the extinction coeff. In general, k increased linearly with temp., following the empirical relation of Arrhenius.

5404. RAO, KITTUR SUBBA. **Hysteresis in sorption. VI. Disappearance of the hysteresis loop. The role of elasticity of organic gels in hysteresis in sorption. Sorption of water on some cereals.** *J. Phys. Chem.*, **45**, 531-9 (1941).—*C.A.* **35**, 3138^8.

Sorption of H_2O on activated rice and dal grains exhibited a unique disappearance of a hysteresis loop initially present. The disappearance was explained on a basis of the elasticity of org. gels which swelled on the imbibition of H_2O. On rice, CCl_4 exhibited a reproducible and permanent hysteresis; the adsorption of CCl_4 was only one-twentieth as great as that of H_2O.

5405. SCHRAMEK, W. **Swelling in water and in alkalies of cellulose fibers regenerated from viscose.** *Monatschr. Textil-Ind.* **56**, 101-9 (1941); *Chimie & industrie* **47**, 239-40 (1942).—*C.A.* **40**, 7610^4.

Measurements were made of the mean length and diam. of the unswollen fibers and of fibers swollen in various media, so as to obtain the swelling both parallel and perpendicular to the fiber axis. By considering both the greatest and least diam. of a transverse section, the area of the latter was calcd. by means of the equation for the ellipse, and from the difference in fiber length before and after swelling the vol. of the swollen fiber was calcd.

5406. SEMBA, TAKESHI; YASUNAGA, EIJI, AND YAMADA, TEIKICHI. **Sorption of sulfuric acid dissolved in glacial acetic acid by cellulose.** *J. Soc. Chem. Ind. Japan* **44**, 748-9 (1941).—*C.A.* **42**, 2425*f*.

Cotton linters were dipped in glacial AcOH contg. 0.5-4.0% H_2SO_4 at 15°-55°C, and the amt. of H_2SO_4 absorbed by the cellulose in each case was detd. from the decrease in concn. of H_2SO_4 in the soln. As the duration of dipping increased, the amt. of H_2SO_4 absorbed per g of cellulose, x/m, reached a max. and then decreased gradually to an equil. value. The value of x/m decreased linearly as the temp. was raised $x/m = kC^n$, where C was the concn. of H_2SO_4.

5407. SOLLNER, KARL; ABRAMS, IRVING, AND CARR, CHARLES W. **Structure of the collodion membrane and its electrical behavior. II. The activated collodion membrane.** *J. Gen. Physiol.* **25**, 7-27 (1941).—*C.A.* **36**, 5695^6.

Acidic impurities detd. the possible charge d. of the collodion; this charge d. was probably identical with the base-exchange capacity of the interfaces. Crude collodion, because of its impurities, showed considerable electrochem. activity. Inactive com. collodion prepns., either as membranes or in bulk, could be activated by oxidation whereby the no. of carboxyl groups was increased.

5408. VIEWEG, R. AND SCHNEIDER, W. G. **The water sorption and swelling of synthetic resins.** *Kunststoffe* **31**, 417-21 (1941).—*C.A.* **37**, 4156^4.

The swelling phenomena were observed by viewing the transparent cast phenolic resin in polarized light. Test disks 30 mm diam. by 3 mm thick were first oven-dried 5 hrs at varying temps., then immersed in distd. water at room temp. Curing took place for a given time in a relatively narrow temp. range and resulted in greatly reduced water absorption capacity.

5409. ARAKI, TSUNAO. **XVI. Ion interchange of the cellulose sulfoacetate.** *J. Soc. Chem. Ind. Japan* **45**, 416-18 (1942).—*C.A.* **43**, 2432*f*.

The relation between the interchange velocity and the interchange conditions in the water washing or in the treatment with salts soln. was tabulated. The ion interchange was carried out under almost the same condition as that of other materials having the ion-interchange property.

5410. BOUTARIC, AUGUSTIN AND FABRY, SIMONE. **Capillary activity of starch-I_2 complex on filter paper.** *Bull. Soc. chim. biol.* **24**, 108-16 (1942); *Chem. Zentr.* **1943, II**, 2290.—*C.A.* **38**, 5708^9.

The starch-I_2 complex behaved like a colored colloidal substance and was adsorbed in filter paper and glass. The significance of this fact and the formation of the complex under various exptl. conditions were discussed.

5411. BOUTARIC, AUGUSTIN AND FABRY, SIMONE. **Studies on the adsorption of iodine on cellulose by a capillary rise method.** *Bull. soc. chim.* **9**, 835-40 (1942).—*C.A.* **38**, 3125^1.

Capillary rise measurements were made with ashless filter paper strips which permitted the study of I_2 sorption by cellulose. There was a rapid rise of the colorless solvent to height H and a slower rise of the I_2 to height h as shown by the formation of a reproducible blue zone. H and h were measured at various time intervals and H/h remained nearly const. The Freundlich adsorption isotherm was approximated in all cases.

5412. FRÖMEL, W. **Humus and humic acids. A comparative method based on adsorption studies and measurements of light absorption.** *Landw. Jahrb.* **92**, 94-154 (1942).—*C.A.* **38**, 4494^9.

The adsorption curves with humic acid, methylene blue and methyl violet followed the Freundlich equation in the medium concn. range. Light absorption of humic acid in the range of 5000 to about 2300 A. demonstrated the validity of Beer's law.

5413. HENK, HANS. J. **The change in textiles and dyes caused by higher air temperatures.** *Spinner u. Weber* **60**, No. 11, 22-3 (1942); *Chem. Zentr.* **1943, II**, 1685.—*C.A.* **38**, 3132^8.

Cotton withstands temps. up to 300°C for short periods of time, but it chars completely at 120°C after several months. At 80°C there is a decrease in elasticity and dye absorption; at 180°C the elasticity has dropped 50% and the dye absorption becomes nearly zero. Water absorption and fluorescence change similarly with heating. Wool is damaged by brief heating to 150°C and by prolonged heating to 50°C.

5414. HOLLAND, H. C. **The absorption of water by sole leather.** *J. Intern. Soc. Leather Trades' Chem.* **26**, 124-30 (1942).—*C.A.* **36**, 7348^2.

A method was described for differentiating the H_2O absorbed by leather at satn. into "free space" H_2O (i.e., the H_2O which just filled the capillary voids), and combined H_2O. A sample of leather, conditioned to const. wt at 60% relative humidity and 18°C, was immersed in kerosene for 1 hr. Dividing the percentage wt of kerosene absorbed by its sp gr. gave the percentage wt of capillary H_2O. Kerosene rapidly penetrated even heavily rolled leather. There was no combination, removal of H_2O-sol. matter or vol. change.

5415. HUBERT, E.; MATTHES, A., AND WEISBROD, K. **Gel structure of synthetic fibers from regenerated cellulose. I.** *Kolloid-Z.* **98**, 173-80 (1942).—*C.A.* **36**, 6793^5.

Detn. of the structure of synthetic fibers and regenerated cellulose was made with the aid of the centrifuge method, and various phenomena on swelling and shrinkage were investigated. The fiber (0.5g) was centrifuged to const. wt (800 X gravity). The swelling value q was detd. from the difference in wt between the centrifuged and abs. dry fiber, and $q = 100$ when the centrifuged fiber retained water equal to its own wt.

5416. JENSEN, JENS. **The dye adsorption in direct dyeing with several dyes.** *Kem Maanedsblad* **23**, 105-9 (1942).—*C.A.* **38**, 3132^6.

Expts. were described on the dyeing of cotton with mixts. of a slowly dyeing dye with great affinity for cellulose (Chicago Blue B) and a rapidly dyeing dye of low affinity (Chrysophenin G). At all concns. there was found a decrease in the amt. of Chicago Blue adsorbed on the addn. of Chrysophenin.

5417. LEHRMAN, LEO. **Nature of the fatty acids associated with starch. The adsorption of palmitic acid by potato and defatted corn and rice starches.** *J. Am. Chem. Soc.* **64**, 2144-6 (1942).—*C.A.* **36**, 6836^1.

Palmitic acid in MeOH was adsorbed by the starches by a typical Freundlich isotherm. Potato starch adsorbed only a very small amt. of palmitic acid compared with the defatted starches. Defatted rice starch, which in its original condition had a higher percentage of "fat by hydrolysis" than corn starch, adsorbed more palmitic acid than defatted corn starch.

5418. LENOIR, JACQUES. **A chromatographic adsorption method (on textile fibers) of dyes.** *Bull. soc. chim.* **9**, 475-83 (1942).—*C.A.* **37**, 3943^4.

A stack of 150-200 cotton fabric disks was boiled in 5% $Na_2SO_4 \cdot 10H_2O$ soln., and lowered into its adsorption tube, which was kept at 80-5°C by a water jacket. The dye soln. was run through, while the receptacle was changed regularly. The pile was then washed successively with 5%, 2% and 0.2-0.5% $Na_2SO_4 \cdot 10H_2O$ soln., and finally with H_2O; in each washing, 0.02% Na_2CO_3 might be added to prevent hydrolysis of the fixed dye. Viscose rayon and mercerized cotton act similarly to cotton, but wool in many cases held dyes too tenaciously to be useful in chromatography.

5419. MATTSON, SANTE. **Laws of ion exchange.** *Lantbruks Högskolans Ann.* **10**, 56-73 (1942).—*C.A.* **38**, 4855^1.

Demonstration expts. are described in which pieces of sponge are moistened with an electrolytic soln. ($CaCl_2$, NaCl), washed and then extd. with a soln. of another electrolyte or methylene blue. The ions first adsorbed on the surface of the sponge are exchanged for others and are found in the soln. after extn. The laws of this ion exchange are described in terms of the Debye-Huckel theory.

5420. NARASINGA, C. AND VENKATARAMANAYYA, S. **Absorption of mineral matter by sugar canes.** *Indian Sugar* **5**, 395-6 (1942).—*C.A.* **37**, 3626^3.

During the growth period selective absorption was evident. Co. 243 absorbed more sulfate and K_2O for the same amount of sugar produced; cultivation of this variety would result in rapid depletion of soil potash. Co. 313 was notably low in P_2O_5; Co. 419 contained the least amts. of CaO, MgO, SiO_2, Fe_2O_3 and Al_2O_3 and showed a good absorption of P_2O_5.

5421. NICKERSON, R. F. **Hydrolysis and catalytic oxidation of cellulosic materials. Hydrolysis of mercerized cotton.** *Ind. Eng. Chem.* **34**, 85-8 (1942).—*C.A.* **36**, 1186^4.

The rate of hydrolysis was detd. by re-fluxing 2-g samples with 150 cc. of HCl-$FeCl_3$ (2.45 *M* HCl and 0.6 *M* $FeCl_3$) and detg. the CO_2 evolved. The data indicated a parallelism between the entrance of H_2O vapor and hydrolytic liquid into the fiber and might have meant that hydrolytic attack involved mainly the surfaces and capillaries where moisture was adsorbed.

5422. PASYNSKII, A. G. AND ZOLOTAREVA, Z. **Investigations on electrochemistry of proteins. IX. Exchange adsorption of neutral salts on gelatin.** *J. Phys. Chem.* (U.S.S.R.) **16**, 27-37 (1942).—*C.A.* **37**, 2638^1.

By means of analytical and potentiometric methods, the exchange adsorption of Ag_2SO_4, $AgNO_3$, and $BaCl_2$ on gelatin was investigated. By superposition of the values for adsorption of the salt and the pH shift of the medium, it was shown that the apparent molecular adsorption of the salt in many cases represented the superimposition of exchange adsorption of the salt on the molecular adsorption of the acid.

5423. PASYNSKII, A. G.; ZOLOTAREVA, Z., AND MUKHINA, A. **Exchange adsorption of neutral**

salts on proteins. *Acta Physichochim. U.R.S.S.* **16**, 236-56 (1942).(in German).—*C.A.* **37**, 2393^4.

The adsorption of Ag_2SO_4, $AgNO_3$, and $BaCl_2$ on gelatin, of Ag_2SO_4, $BaCl_2$, and NH_4SCN on egg albumin, and of $CaCl_2$ on casein were detd. in dil. solns. The adsorption caused a change in pH of the solution, and the amount of acid or base which had to be added to the pure protein solution to cause the same change was compared with the amount of metal or CNS ion adsorbed. The ratio, α, represented the degree to which exchange adsorption occurred; α was unity for Ag solutions below 0.001 N, falling somewhat at higher concentrations; for the other solutions it ranged from 0.6 to 0.1.

5424. SCHRAMEK, W. **The swelling and dissolving of cellulose fibers.** *Deut. Textilwirt.* **9**, No. 1, 2-3 (1942).—*C.A.* **37**, 4243^5.

The typical swelling phenomena of wood fibers, ramie and cotton were discussed.

5425. SMIT, P. **A new adsorption medium and its possibilities.** *Chem. Weekblad* **39**, 375-7 (1942).—*C.A.* **38**, 2239^3.

Artificial resins could be used as purifying agents. A typical resin, called Asmit, was used for purifying molasses, fats and oils, or for adsorptive removal of alkaloids and vitamins from soln. The adsorptive power could be restored by filtering and washing the material.

5426. ABRAMS, IRVING AND SOLLNER, KARL. **The structure of the collodion membrane and its electrical behavior. VI. The protamine-collodion membrane, a new electropositive membrane.** *J. Gen. Physiol.* **26**, 369-79 (1943).—*C.A.* **37**, 2636^6.

By adsorbing salmine, a protamine, on porous collodion membranes strongly electropos. membranes were obtained that did not alter their charge for a long time. Between pH 1 and 10 these membranes were distinctly electropos.

5427. BAXTER, S. **Electrical conduction of textiles.** *Trans. Faraday Soc.* **39**, 207-14 (1943).—*C.A.* **38**, 646^6.

The elec. cond. of wool fibers was given with and without adsorbed water. The temp. coeff. at const. regain was detd. over a wide range of regains and was found independent of regain for values greater than 5%. Below 5% regain, polarization was shown, but this disappeared for higher regains and Ohm's law was obeyed. The cond. of wool with adsorbed MeOH, and for glass fibers with adsorbed water vapor, was found to be similar to the wool-water system.

5428. DAVIDSON, G. F. **The rate of change in the properties of cotton cellulose under the prolonged action of acids.** *J. Textile Inst.* **34**, T87-96 (1943).—*C.A.* **38**, 3123^6.

Purified cotton linters were steeped in solns. of HCl and H_2SO_4 for various times under conditions that did not lead to soln. The change from fibrous material to powder was gradual, but loss of tensile strength was practically complete when a fluidity of 44 was attained. The powders were observed under the microscope to be fragments of cotton fiber. The affinity for moisture of the various hydrocelluloses was expressed by the ratio of the amt. of moisture absorbed by the hydrocelluloses to that absorbed by the unmodified cotton under the same conditions of relative humidity and temp.

5429. DAYNES, H. A. **Absorption of water by soft rubber as affected by vulcanization in open steam.** *J. Rubber Research* **12**, 93-4 (1943).—*C.A.* **38**, 509^9.

The relatively great hygroscopicity of hard rubber vulcanized in open steam led to a study of soft rubber. Water-absorption tests were made by the standard method of exposing comminuted samples to humidities of 84.8 and 97.2% (relative). The difference in water absorption were not so great as with hard rubber, either because of the shorter time of vulcanization or low % S.

5430. DOUGLAS, H. W. **Electrophoretic behavior of certain hydrocarbons and the influence of temperature thereon.** *Trans. Faraday Soc.* **39**, 305-11 (1943).—*C.A.* **38**, 1159^5.

Detns. were made on emulsions of dodecane, paraffin wax and Δ^{1-2} - octadecene in aq. media in the presence of 0.01 N Na^+. The variations in the mobility of composite droplets contg. increasing mole fractions of each of the substances hexane, benzene, cyclohexane and decalin were detd. at pH 9 and 25°C using dodecane as the carrier. The affinity for OH^- of a hydrocarbon/water interface varied for different types of hydrocarbons.

5431. DYKYJ, JAROSLAV AND BENA, JAN. **The electrochemistry of starch particles. I. Cation exchange on potato-starch particles.** *Kolloid-Z.* **104**, 106-12 (1943).—*C.A.* **38**, 4494^2.

Potato starch contg. Ca was suspended in solns. 0.1 equiv. of $FeCl_3$, $CaCl_2$ or mixts. thereof and the exchange of ions detd. from analysis of the ash. Agreement was found for ion exchange on starch between exptl. values and values calcd. by the law of mass action in which activity coeffs. were used. Starch with $NH_4{}^+$ readily exchanged this ion for others, but Ca, Ba, or Fe^{III} ions were replaced by $NH_4{}^+$ with some difficulty.

5432. GOLOSOV, V. A. AND SMIRENSKIĬ, A. P. **Adsorption by vegetable fibers, dyed with sulfur dyes with dyes other than sulfur dyes.** *Tekstil. Prom.* **3**, No. 10, 11-14 (1943).—*C.A.* **38**, 3133^8.

In wool fabrics contg. cotton thread, the cotton was dyed with S dyes, then the fabric was dyed by methods used for wool with acid or with Cr dyes. The double dyeing produced an uneven color that was not fast to rubbing. This was attributed to absorption of the acid dyes by the previously dyed cotton as well as by the wool. Bleached cotton fabrics were dyed first with S dyes then washed and dried and treated with various acid, Cr and direct dyes.

5433. LIVITON, ABRAHAM. **Adsorption of riboflavin by lactose. Influence of concentration.** *Ind. Eng. Chem.* **35**, 589-93 (1943).—*C.A.* **37**, 4199^9.

In crystg. from concd. whey, lactose adsorbed riboflavin selectively. The phenomenon relating to this adsorption had been extensively investigated, and as a result the production of potent prepns. contg. pure adsorbed riboflavin had been placed on a practical basis. The relation between degree of adsorption and initial riboflavin concn. under conditions of complete crystn. was linear.

5434. Mason, Charles M. and Silcox, Herbert E. **Water adsorption by animal glue.** *Ind. Eng. Chem.* **35**, 726-9 (1943).—*C.A.* **37**, 3990^8.
Both adsorption and equil. moisture content were studied. The former obeys Freundlich's law and the latter was found to be greater than represented by the moisture adsorbed on the surface.

5435. McBain, James W. and Lee, Will Win. **Sorption of water vapor by soap curd.** *Ind. Eng. Chem.* **35**, 784-7 (1943).—*C.A.* **37**, 4920^6.
Anhyd. soap (pure or com.) took up 1 or 2% of H_2O according to a sorption mechanism of phys. type. Except for Na oleate, the curd or supercurd then suddenly formed a hemihydrate which again took up H_2O more rapidly, up to 10 or 12%, according to a sorption law until another phase formed. At low temps. these phases were higher hydrates.

5436. Neale, S. M. and Stringfellow, W. A. **The adsorption by cellulose of mixtures of direct cotton dyes.** *J. Soc. Dyers Colourists* **59**, 241-5 (1943).—*C.A.* **38**, 491^1.
Direct cotton dyes interact in aq. soln. When mixts. were used to dye cotton, the absorption of one component as compared to its absorption when dyed singly, was reduced markedly below the value to be anticipated merely from the competition of the 2 dyes for the available surface. The interference of 1 dye with the absorption of a 2nd dye increased as the temp. was lowered.

5437. Parks, L. R. and Barnes, C. R. **Some notes on the sorption of commercial tannic acid by hide powder and charcoal.** *J. Am. Leather Chem. Assoc.* **38**, 332-42 (1943).—*C.A.* **38**, 1903^3.
Neutral hide powder was prepd. by suspending com. hide powder in dil. NaOH soln. for 24 hrs., then passing CO_2 through for 15 min., filtering, washing, and drying at room temp. Com. hide powder showed min. adsorption at pH 4.69. Neutral hide powder and com. hide powder showed no min. point, and gave similar adsorptions. Deaminated neutral hide powder showed a min. at pH 3.55, deaminated com. hide powder at pH 3.96. Each adsorbed less tannic acid than com. hide powder.

5438. Poraĭ-Koshite, A. E.; Valler, E. A., and Sokolova, N. V. **Theory of dyeing. XII. The absorption by wool of acid dyes with different numbers of sulfo groups.** *J. Applied Chem.* (U.S.S.R.) **16**, 28-35 (1943) (English summary).—*C.A.* **38**, 3131^9.
Three dyestuffs (Acid Red Zh, Acid Red S, and Acid Orange Lightstable) were studied in respect to absorption on wool. Dyed in presence of H_2SO_4 at pH 2-2.5, the same satn. limit of 0.8 mg. equivs. per g. was found as the max. amt. of acid dyes chemically absorbable by wool. At pH 1.5, or less, a slight increase of absorption was found which may be due to partial hydrolysis of wool keratins.

5439. Powrie, A. and Speakman, J. B. **The adsorption of water by jute.** *J. Textile Inst.* **34**, T77-86 (1943).—*C.A.* **38**, 2826^9.
Adsorption and desorption isotherms were detd. at 25°C on powd. jute prepd. from the middle portions of six of the samples, selected so as to include 2 samples each of white jute of high and low quality, one sample of red jute, and a sample of Hibiscus cannabinus, a jute substitute. The samples for obtaining absorption data were dried for two weeks in vacuo over P_2O_5 at 25 ± 1°C. The adsorption isotherms were all sigmoid in shape, and there was considerable hysteresis between adsorption and desorption isotherms. The different kinds of jute differ considerably in their affinity for water.

5440. Aickin, R. G. **The adsorption of Na alkyl sulfates by wool and other fibers.** *J. Soc. Dyers Colourists* **60**, 60-5, 286-7 (1944).—*C.A.* **38**, 2498^8; **39**, 420^3.
The single long-chain alkyl sulfate ion reacted with the basic groups of wool and behaved as a colorless dye, in that the adsorbed ions could not be removed by a simple washing process. Under neutral conditions, up to 2.5% (on the wt of the fiber) on the Na alkyl sulfates were adsorbed. The extent of the adsorption increased with increasing pH, and the concn. of the Na alkyl sulfate was reduced to practically zero if there was less present initially than corresponded to the acid-combining capacity of the wool.

5441. Assaf, A. G.; Haas, R. H., and Purves, C. B. **Amorphous portion of dry, swollen cellulose by an improved thallous ethylate method.** *J. Am. Chem. Soc.* **66**, 59-65 (1944).—*C.A.* **38**, 1105^4.
Cotton linters, highly swollen in NaOH and dried through MeOH and benzene, were immersed in a large excess of 0.1 N thallous ethylate. The thallium cellulosate so formed was methylated with excess MeI in benzene. The methods were described in detail and could be used successfully only by avoiding many manipulative errors. The MeO content of the product was accepted as proportional to the percentage of the cellulose wetted by the particular liquid in which the thallous ethylate was dissolved.

5442. Assaf, A. G.; Haas, R. H., and Purves, C. B. **New interpretation of the cellulose-water adsorption isotherm and data concerning the effect of swelling and drying on the colloidal surface of cellulose.** *J. Am. Chem. Soc.* **66**, 66-73 (1944).—*C.A.* **38**, 1105^8.
Three highly swollen samples of cotton linters were immersed in solns. of thallous ethylate in normal ethers of different mol. vols. Methylation of the resulting thallium cellulosates gave products whose MeO contents were accepted as proportional to the penetration of the ether into the celluloses. The H_2O adsorption isotherms at 20° or 25°C of the same swollen samples were detd. The moisture content of the 1st region of inflection in the isotherm, occurring at a relative humidity of about 10%, was approx. 30% of the value at the 2nd inflection. The flat, intermediate portion of the isotherm represented the H_2O less strongly H-bonded to the sec. alc. groups, but its shape was influenced at the higher humidities by the effects of swelling and by capillary condensation.

5443. Assonov, V. A. **Adsorbent briquets for liquid-oxygen explosives.** *Kislorod* 1944, No. 3, 28-38.—*C.A.* **40**, 3605^6.
Premature explosions of liquid oxygen on adsorbents were attributed to small dust particles.

As the charge was dropped into the bore, small particles became detached from the adsorbent. These particles were carried upward by the O_2 vapors and became charged by friction. Potentials of the order of 15,000-20,000 v. were measured on these particles. A discharge of such potentials sufficed to set off the charge. Dust could be prevented by moistening the adsorbent with 20-25% of H_2O or by providing special capsules for the explosive.

5444. Austerweil, G. **Can rubber be transformed into an ion exchanger?** *Rev. gén. caoutchouc* **21**, 122-4 (1944).—*C.A.* **40**, 5944^6.

Four methods were tried: (1) introduction of a phenylamino group by the known reation of a reactive Me group and an NO group; (2) by a synesis reaction with N derivs., whereby double bonds were opened in both rubber and the N compd.; (3) fixation of an aromatic group from a NO_2 compd., with simultaneous reduction to NH_2; and (4) reaction with a quinoneimine, according to the method of Fisher. Only method (4), in modified form, gave promising results.

5445. Bersin, Th. and Meyer, Hans Georg. **Exchange adsorptions in nonaqueous solutions.** *Die Chemie* **57**, 117-18 (1944).—*C.A.* **40**, 4581^4.

Data were presented for lipoid-sol. compds., alkaloid bases, steroid hormones, oil-sol. vitamins, colchicine, piperine, acetanilide, and some aliphatic and aromatic amines. The exchange reaction was followed by means of displacement of p-dimethylaminoazobenzene on bolus adsorbate and carotene on vitellin adsorbate.

5446. Cassie, A. B. D. and Baxter, S. **Wettability of porous surfaces.** *Trans. Faraday Soc.* **40**, 546-51 (1944).—*C.A.* **39**, 2444^4.

Formulas were derived relating the apparent contact angles to the total areas of solid-liquid interface and of liquid-air interface. Exptl. confirmation was obtained when the formulas were applied to data obtained with a wire grating, the wires of which were coated with a thin film of paraffin wax. Water rolls off a duck's back owing to the structure of the feathers rather than to any exceptional proofing agent.

5447. Dykyj, J. **Electrochemistry of starch grain. I. Adsorption of dyes.** *Chem. Listy* **38**, 219-26 (1944).—*C.A.* **45**, 10630*g*.

Potato starch adsorbs cations. In the presence of a basic dye (fuchsin) in aq. suspension of the starch, the dye is adsorbed so that the soln. becomes more acidic. In the presence of a salt the adsorption of the dye is weaker. The cations decrease the sorption ability of the starch in the order: H < Na < K < NH < Rb < Cs << Ca < Sr < Ba.

5448. Gilbert, G. A. **The combination of fibrous proteins with acids. II. The adsorption of dye anions.** *Proc. Roy. Soc.* (London) **A183**, 167-81 (1944).—*C.A.* **39**, 1294^9.

Equations developed previously for the titration of fibrous proteins with acids were shown to accord with exptl. data for the adsorption of dyes in the presence of salt. Data were reported for 30 benzene dyes. Dyes of the same valency were equally affected by changes in the nonspecific force due to the fiber charge. Temp. coeffs. were detd. for a dye by use of adsorption on mohair and on human hair.

5449. Giles, C. H. **The determination of the absorption of members of the Brenthol or Naphthol AS series on cellulosic fibers.** *J. Soc. Dyers Colourists* **60**, 280-6 (1944).—*C.A.* **39**, 195^1.

Viscose rayon and cuprammonium rayon had almost identical affinity for the respective Brenthols, while mercerized cotton had lower affinity than viscose rayon but higher than linen or unmercerized cotton. Bleaching had very little effect on the affinity of either linen or cotton. Substantivity varied widely between different members of the Brenthol range and decreased with rise in temp.

5450. Holland, H. C. **The absorption of water by sole leather. II.** *J. Intern. Soc. Leather Trades' Chem.* **28**, 205-11 (1944).—*C.A.* **39**, 1560^6.

Pieces of limed hide were tanned with various vegetable tanning materials and the H_2O absorption of the resulting leathers detd. The H_2O absorption of leather was mainly influenced by the amt. of free spaces (detd. by Holland's kerosene method) and by the resistance to wetting. The free spaces decreased with increasing degree of tannage. Myrobalans leather was more resistant to H_2O than that of other vegetable tannins because of its high degree of tannage.

5451. Leviton, Abraham. **Adsorption of riboflavin by lactose. Influence of temperature.** *Ind. Eng. Chem.* **36**, 744-7 (1944).—*C.A.* **38**, 5447^3.

To obtain a higher concn. of riboflavin adsorbed on lactose crystals than was realized in the com. prepn. of lactose from whey, a two-stage crystn. was used. Conditions as to concn. of lactose and temp. were so controlled as to yield a min. of riboflavin in the first crystn. and a max. of riboflavin from the risidual liquor. The crit. concn. of riboflavin below which adsorption would not occur was a function of both concn. of lactose and temp.

5452. Liesegang, Raphael E. **Capillary phenomena with acid fuchsin.** *Kolloid-Z.* **109**, 16-18 (1944).—*C.A.* **41**, 2958*d*.

Since acid fuchsin (fuchsin S) did not combine with the cellulose fiber and thus traveled along the paper (ash-free filter paper) with the water by capillarity, it was possible to form a banded or rhythmic structure by the periodic addn. of drops of the dye. This was produced previously only by simultaneous chem. reaction.

5453. Liesegang, Raphael E. **Pseudo optics of capillary phenomena. III.** *Kolloid-Z.* **107**, 128-9 (1944).—*C.A.* **39**, 11^4.

The capillary action in blotting paper was discussed in which various dyes (malachite green, fuchsin S, trypan red and trypan blue) were used.

5454. Mitton, R. G. **The absorption of water by a vegetable-tanned sole leather.** *J. Intern. Soc. Leather Trades' Chem.* **28**, 201-5 (1944).—*C.A.* **39**, 1560^4.

Comparative expts. were described on the blotting and the whirling, methods of removing surplus H_2O from leather samples in detg. H_2O absorption.

The blotting method gave the most consistent results. Air trapped within the leather had only a slight influence on the wt of H_2O absorbed.

5455. PANKHURST, K. G. A. AND SMITH, R. C. M. **Adsorption of paraffin-chain salts to proteins. I. Some factors influencing the formation and separation of complexes between gelatin and dodecyl sodium sulfate.** *Trans. Faraday Soc.* **40**, 565-71 (1944).—*C.A.* **39**, 2442[9].

The adsorption of $C_{12}H_{25}SO_4Na$ on a high-grade com. hide gelatin in aq. solns. was studied as a function of concn. of NH_4NO_3 (0.35 to 4.0 N in 0.5% gelatin at pH 5.3 and 35°C), pH (in 1.0 N NH_4NO_3 at 35°C), concn. of gelatin (0.01% to 2.5% in the presence of 1.0 N NH_4NO_3 at pH 5.3 and 35°C), and temp. (35°, 50°, 65°C). The adsorption was continuous until a unimol. layer of the ions was formed. Further addn. of the $C_{12}H_{25}SO_4Na$ was considered to result in the formation of a reverse layer with polar groups outermost.

5456. SAIR, L. AND FETZER, W. R. **Water sorption by starches.** *Ind. Eng. Chem.* **36**, 205-8 (1944).—*C.A.* **38**, 6590[4].

Sorption isotherms were obtained for 7 com. varieties of starch. They fell into 3 groupings: tubers (white potato) > pitch or root starches (sago, arrowroot and sweet potato) > cereal starches (wheat, corn, rice). Up to 25-30% relative humidity the starches took up the same quantity of H_2O, which might be related to the quantity theoretically required to form a monohydrate.

5457. SAIR, L. AND FETZER, W. R. **Water sorption by cornstarch and commercial modifications of starch.** *Ind. Eng. Chem.* **36**, 316-19 (1944).—*C.A.* **38**, 3507[3].

Sorption isotherms of cornstarch and 10 of its com. modifications were detd. The sorption isotherm of a starch product was shown to be a sensitive method of measuring rearrangements occurring within the intact granule.

5458. SCHOCH, THOMAS J. AND WILLIAMS, CARL B. **Adsorption of fatty acid by the linear component of corn starch.** *J. Am. Chem. Soc.* **66**, 1232-3 (1944).—*C.A.* **38**, 4490[8].

Com. corn starch (contg. 0.65% natural fatty material) adsorbed 4.1-4.4% I_2; removal of the fatty acid with 81% aq. dioxane raised the value to 5.3%. A sample of recrystd. BuOH-pptd. fraction from com. corn starch adsorbed 18.7% I_2; addn. of 2, 5 and 10% palmitic acid reduced the value to 12.4, 3.5 and 0%, resp. The higher fatty acids likewise acted as selective precipitants for the linear-chain components of com. corn starch. Cereal starches must be exhaustively defatted before potentiometric evaluation of iodine affinity.

5459. SHEPPARD, S. E. **Amphipathic character of gelatin shown in its adsorption of polar surfaces.** *Science* **100**, 545 (1944).—*C.A.* **39**, 875[9].

Recent expts. on the retention of gelatin to AgBr, in which techniques developed in connection with the study of dye adsorption were used, have confirmed the hypothesis that a unimol. layer was actually present and that a secondary layer was attached to this by weaker forces. Whether molecularly stratified systems of still higher order could be built up on protein lamellae was discussed.

5460. WHEWELL, C. S. AND SELIM, A. **The action of halogens on Wool. I. Factors influencing the amount of halogen adsorbed from solutions in CCl_4.** *J. Soc. Chem. Ind.* **63**, 121-3 (1944).—*C.A.* **38**, 5413[3].

The adsorption of Cl_2 by wool from solns. of the dry gas in dry CCl_4 was affected by the duration of treatment, concn., temp., moisture content of fiber, the ratio of wool to soln., the type of wool and previous chem. treatment of the fiber.

5461. CASSIE, A. B. D. **Adsorption of water by wool.** *Trans. Faraday Soc.* **41**, 458-64 (1945).—*C.A.* **40**, 786[5].

An isotherm reduced to a common hydrostatic pressure showed excellent agreement with the theory of multimol. adsorption. There were 1.12 mols. of low-energy sites per 100 g of wool. This was close to the value (1.11 mol.) for the no. of CO groups per 100 g of wool, and it was suggested that the CO groups were primarily the water-attracting groups in wool. The heat of adsorption of water to these sites was 3500 cal per mol.

5462. KOLLMANN, F. **Sorption and swelling of wood.** *Naturwissenschaften* **32**, 121-38 (1945).—*C.A.* **40**, 2297[5].

Chemisorption of H_2O by wood was attributed to reactive OH groups of the cellulose chain and accounted for up to about 8% of the H_2O content. Additional H_2O was held by adsorption on interior surfaces and finally by condensation in capillaries. The H_2O content of wood in equil. with an atm. satd. with H_2O vapor varied from 24 to 35%. Sorption hysteresis, sorption energy, and swelling pressure were discussed, as well as the effect of different salt solns. on the swelling and means for the prevention of swelling.

5463. MONTGOMERY, E. A. V. AND WHITE, J. **Water relations of the yeast cell. II. Increase and decrease in the moisture content of the yeast cell by chemical means. Adsorption of albumin and peptone by yeast.** *J. Inst. Brewing* **51**, 285-9 (1945).—*C.A.* **40**, 3851[6].

The change in water content of the yeast cells was detd. by weighing the yeast cake obtained by a standard vacuum filtration method. Treatment with weak NH_4OH increased the yeast wt to a max. of 4.6% at pH 8.7. The yeast cells were destroyed rapidly at pH values lower than 1.8. Adsorption of albumin commenced at pH 4.85 and increased rapidly to a max. at pH 1.8; thereafter it decreased. Adsorption of peptone commenced at pH 4.4, increased to a max. at pH 2.1, then decreased to nil at pH 1.5.

5464. NATADZE, G. M. AND PEKHTEREVA, S. I. **A method for adsorbing resinous substances from conifer needles.** *Gigiena i Sanit.* **10**, No. 9, 53-4 (1945).—*C.A.* **41**, 2210c.

The conifer-needle exts. were important sources of vitamin C in Russia. Gumbrin, askanite, and gelatinized askanite were examd. as tar adsorbents. Askanite gave a turbid, green filtrate tasting almost like the untreated ext. Gelatinized askanite and gumbrin gave clear, transparent, and yellowish green filtrates, almost free from bitter flavor. Vitamin C activity of all the filtrates was 20-25% lower than that of the untreated ext.

5465. PALLMANN, H. AND DEUEL, H. **The water permeability of hydrogels.** *Experientia* **1**, 325-6 (1945) (in German).—*C.A.* **40**, 3670^5.

The permeability of different gels was detd. in terms of the permeability coefficient k of Darcy. Gels of gelatin and agar had very low k values. Water-glass gels varied markedly in k with the type and concn. of coagulant, temp., and when mixed with coarse sand. Ca silicate gels showed considerable reversibility in k when treated with $CaCl_2$ and eluted with H_2O..

5466. PAULING, LINUS. **The adsorption of water by proteins.** *J. Am. Chem. Soc.* **67**, 555-7 (1945).—*C.A.* **39**, 2240^9.

The initial process is the attachment of one water mol. to each polar amino acid side chain. Water is bound by carbonyl groups that are not coupled by H bonds with imido groups. In salmin, in which most of the amino-acid residues are polar, these polar residues cooperate to attach one water mol. jointly to 2 polar groups in the initial process of hydration.

5467. SKINNER, B. B. AND VICKERSTAFF, T. **The absorption of acid dyes by wool, silk, casein fiber, and nylon.** *J. Soc. Dyers Colourists* **61**, 193-201 (1945).—*C.A.* **39**, 4757^8.

Isotherms for the absorption of 3 acid dyes of different types on wool, silk, casein fiber, and nylon were detd. at several pH values. The results fitted the Langmuir adsorption equation at high concns. At high acidities, hydrolysis of wool occurred during dyeing, leading to increased dye absorption. The absorption isotherms of wool and casein fiber were almost identical. The observed differences in rate of dyeing and wet fastness must be attributed to differences in phys. structure. The dyeing mechanism with nylon appeared to be similar to that of wool.

5468. SOLLNER, KARL. **The physical chemistry of membranes with particular reference to the electrical behavior of membranes of porous character. I. The nature of physicochemical membranes-membranes as physicochemical machines; preparation and properties of membranes of highly pronounced electrical properties.** *J. Phys. Chem.* **49**, 47-67 (1945).—*C.A.* **39**, 3191^7.

Membranes with abs. permeability 3 to 4 times greater than that of previously described membranes of high ionic selectivity were made by improvements upon known methods. Such membranes were termed "megapermselective." The electroneg. membranes of this type were made by oxidation of collodion with NaOH and the electropos. by the adsorption of protamine on collodion.

5469. SOLLNER, KARL. **The physical chemistry of membranes with particular reference to the electrical behavior of membranes of porous character. II. The nature of the "dried" collodion membrane. Some current membrane theories and their limitation.** *J. Phys. Chem.* **49**, 171-9 (1945).—*C.A.* **39**, 3716^9.

With inorg. electrolytes and weakly-adsorbable org. compds., dried collodion membranes that were wet with water behaved as rigid nonswelling structures. The base-exchange capacity of collodion membranes was high for prepns. of great electrochem. activity, but might be medium to low for either active or inactive prepns. The high-base-exchange capacities observed were due to a more open structure.

5470. SOLLNER, KARL. **The physical chemistry of membranes with particular reference to the electrical behavior of membranes of porous character. III. The geometrical and electrical structure of membranes of porous character; some examples of the machine action of membranes.** *J. Phys. Chem.* **49**, 265-80 (1945).—*C.A.* **39**, 5153^2.

Membranes of porous character must be assumed in general to be heteroporous. It was postulated that the pore system consisted of a sequence of narrow channels and wider cavities that, interconnected at random, traverse the membrane. The penetration of the membrane by ions depended on the size of the pores and the elec. repelling forces resulting from like-charged ions fixed on the pore walls.

5471. STEIGMANN, A. **Experiments with a cationic wetting agent.** *J. Soc. Chem. Ind.* **64**, 88 (1945).—*C.A.* **39**, 3491^8.

Trimethyl-β-oleamidoethylammonium sulfate pptd. anionic colloid electrolytes, acid dyes, salts of org. acids or org. compds. with acidic groups. (SH, NO_2), polysulfides and polyiodides, nitroprussides, ferrocyanides, and thiocyanates. Techniques for impregnating filter papers for use in spot tests were described.

5472. VAN HOOK, ANDREW. **Kinetics of sucrose crystallization. Mechanism of reaction.** *Ind. Eng. Chem.* **37**, 782-5 (1945).—*C.A.* **39**, 4279^2.

Evidence was presented favoring the interpretation of the velocity of crystn. of sucrose from pure, and probably from impure solns. as an interfacial (homogeneous) rather than an interboundary (heterogeneous) reaction. Values of E, the activation energy, were calcd. for temps. from 10 to 80 °C from existing data on the crystn., diffusion, and viscosity of sucrose solns. at a const. super-satn. of 1.05 and other const. supersatns. The E values calcd. from the crystn. data were much higher than those calcd. from the diffusion and viscosity data.

5473. WIKLANDER, LAMBERT. **Partition of uni- and bivalent cations by adsorption on organolites.** *Svensk Kem. Tid.* **57**, 54-7 (1945).—*C.A.* **40**, 2711^4.

The relative adsorption from a soln. of NH_4Cl and KCl passing through an organolite did not differ much with diln., but when the ions were different in valence, it became very much different since they followed the Donnan equil. and differed by square roots. The adsorptions of NH_4Cl and KCl in N solns. passed over an organolite were 43.7 and 56.3%, a ratio of 0.74 which also held for 0.0001 N solns.

5474. BALAREV, D. **Periodic precipitation in gelatin.** *Annuaire univ. Sofia, Faculté phys. mat.* **43**, *Livre* 2, 115-17 (1946-1947).—*C.A.* **43**, 8237*e*.

The ppts. of $Ag_2Cr_2O_7$, $PbCrO_4$, and $Mg(OH)_2$ first adsorb $Cr_2O_7^{--}$, CrO_4^{--}, and OH^- until the ring becomes electronegatively charged and then adsorb Ag^+, Pb^{++}, and Mg^{++}. The outside of the ring is electroneg., the inside electropos., and the whole neutral. The adsorbed ions are firmly a part of the conglomerate of sol particles formed by coagulation.

5475. Darling, Robert C. and Belding, Harwood S. **Moisture adsorption of textile yarns at low temperatures.** *Ind. Eng. Chem.* **38**, 524-9 (1946).—*C.A.* **40**, 4220².

The moisture adsorption of wool, cotton, cellulose acetate, and viscose rayon yarns were measured at 40°, 0°, and -20°F and at several relative humidities above 50%. The equil. values obtained indicated that at const. relative humidity relative to satn. over liquid water there was a high point between 0° and 40°F. The equil. moisture content was nearly the same at 40° and 0°F, but somewhat lower at -20°F. The heat of adsorption on cotton yarn at a const. moisture content fell as the temp. fell, somewhat more rapidly than did the heat of condensation of water, until it equaled or fell below the latter at about 40°F. At a const. temp. the heat of adsorption on the yarn fell as the amt. of adsorbed water increased.

5476. Ewart, R. H.; Roe, C. P.; Debye, P., and McCartney, J. R. **The determination of polymeric molecular weights by light scattering in solvent-precipitant systems.** *J. Chem. Phys.* **14**, 687-95 (1946).—*C.A.* **41**, 1528*e*.

It was predicted by this theory and verified by expt. that correct values of mol. wt were obtained by the usual interpretation of turbidity measurements only if the solvent and precipitant had the same *n*. If the solvent and precipitant had different *n*s, scattering measurements gave information about the extent of selective absorption of solvent by the polymer.

5477. Lloyd, Dorothy J.; Dempsey, Mary, and Garrod, Marjorie. **Swelling of protein fibers in organic solvents.** *Trans. Faraday Soc.* **42B**, 228-44 (1946).—*C.A.* **42**, 6618*b*.

When all of the cross-bonds are of one type, a solvent opening this bond will dissolve the fiber; when the cross-bonds are of two or more types, a solvent that opens one type but leaves the others intact will lead to freeing of sections of the long backbone; but a solvent opening all types of links will lead to a soln. of the fiber.

5478. Neale, S. M. **Electrical double layer, the electro-kinetic potential, and the streaming current.** *Trans. Faraday Soc.* **42**, 473-8 (1946).—*C.A.* **40**, 6933⁴.

Equations were deduced that described the structure of the ionic atm. of an electrically charged surface in a uni-univalent electrolyte and that det. the potential at the surface. An equation was given for the streaming current carried by the stream through a cylindrical plug of charged fibers.

5479. Neale, S. M. and Peters, R. H. **Electrokinetic measurements with textile fibers and aqueous solutions.** *Trans. Faraday Soc.* **42**, 478-87 (1946).—*C.A.* **40**, 6933⁶.

An exptl. technique is proposed to det. the streaming current from which the surface potential (ψ_0) of fibrous nonconductors in aq. solns. is derived. Below pH = 6, ψ_0 for silk, wool, and nylon is a linear function of pH and changes sign at about pH 3. The adsorption of ions with specific affinity for the fibers causes marked changes in ψ_0 for wool and cotton.

5480. Sarkar, P. B.; Chatterjee, H.; Mazumdar, A. K., and Pal, K. B. **The relation between the acid values of jute fiber and its adsorption of methylene blue.** *Science and Culture* **12**, 108-10 (1946).—*C.A.* **41**, 2248*e*.

The affinity for basic dyes resulted from the presence of carboxyl groups in the halocellulose fraction of the jute. Acid values for raw, defatted, alkali-treated, and lignin-free jute as well as chlorite cellulose and α-cellulose were found to correspond fairly well with the dye-absorption values for carefully purified methylene blue at pH 7. Jute had been made substantially cation-free by treatment with 0.1 N HCl for 30 min. at room temp. As a result of this treatment, the color improved, but the dye-absorption and acid value were practically unchanged.

5481. Tai, An-Pang and Chu, Chi-Ming. **Calcium tartrate gels. II. Effect of salts on the time of set.** *J. Chinese Chem. Soc.* **14**, 1-6 (1946).—*C.A.* **43**, 6889*a*.

Ca tartrate dissolved in aq. NaOH through formation of a sol. complex, which subsequently gelled. Salts whose anions form insol. compds. with Ca exerted a much greater effect than those whose anions formed sol. salts. The order of effectiveness of anions for increasing the set time was $CO_3 > PO_4 >$ tartrate $>$ oxalate $> CrO_4 > SO_4 > Cl > NO_3 > OAc$. The relation of the concn. of each anion to the setting time could be expressed by an equation similar in form to the Langmuir adsorption isotherm.

5482. Van Hook, Andrew. **Kinetics of sucrose crystallization; sucrose-nonsucrose solutions.** *Ind. Eng. Chem.* **38**, 50-3 (1946).—*C.A.* **40**, 1053⁶.

The effects of both electrolytes and nonelectrolytes (especially those found in natural cane and beet juices; e.g., K_2SO_4, amino acid salts, aconitates, invert sugar, betaine, raffinose, pectins, etc.) on the crystn. velocity of sucrose from soln. were investigated refractometrically. Combinations of these contaminants depressed the normal crystn. value.

5483. Bhatnagar, Mahendra Swarup. **Organic adsorbents. I. Methods of preparation and activation, and the relative adsorptive powers of resins.** *J. Sci. Ind. Research* **6**, No. 1, B, 12-15 (1947).—*C.A.* **41**, 4952*i*.

Resins were prepd. from HCHO and phenol, resorcinol, catechol, and pyrogallol. Amino resins were prepd. from HCHO and *m*-phenylenediamine or aniline. Urea resins and protein resins from globulin were also made. Tests with aq. solns. of formic, acetic, and butyric acids showed that with HCl-condensed phenolic resins adsorption increased with increase in length of the hydrocarbon chain. The reverse held for NH_3-condensed phenolic resins, amino resins and if a less polar solvent was used, HCl-condensed resorcinol resins.

5484. BORDA, E. **Adsorption isotherm of a photographic emulsion for uranyl and lead ions.** *Nature* **160**, 231-2 (1947).—*C.A.* **41**, 7199*h*.

The adsorption isotherm of UO_2^{++} and of the Pb isotope, Th, B, dild. with inactive Pb^{++} on Ilford Concentrated Half-Tone Plates was detd. by counting the tracks formed in the emulsion after a definite length of time. The results fitted the Freundlich equation.

5485. BOSCOTT, R. J. **Solvent-treated cellulose acetate as the stationary phase in partition chromatography.** *Nature* **159**, 342 (1947).—*C.A.* **41**, 4999*d*.

Solvent-treated cellulose acetate was found to be a satisfactory stationary org. solvent phase for chromatography. The adsorbent was tested with an aq. soln. of cresol, BzH, and NaCl.

5486. CRANK, T. **An absorption isotherm for direct dyes.** *J. Soc. Dyers Colourists* **63**, 293-6 (1947).—*C.A.* **41**, 7755*f*.

Dyeing is an absorption process, on the surface and throughout the less-ordered regions of the cellulose. Cellulose is considered as a 3-dimensional network of more or less parallel mol. chains. When the structure is swollen by immersion in water, the mol. chains in the amorphous region move apart, forming capillaries or pores along which the dye mols. diffuse as dyeing proceeds.

5487. DE LOLLIS, NICHOLAS J. **Industrial adhesives.** *Product Eng.* **18**, No. 11, 117-22; No. 12, 137-42 (1947).—*C.A.* **42**, 4793*a*.

The effect of bond strength, of preparatory surface treatments, modulus of elasticity, coeff. of expansion, and new techniques such as high-frequency heating are discussed. Properties and uses of thermosetting resin adhesives, applications in wood, metal-to-wood, metal-to-metal, metal-to-glass, plastic and rubber bonding are renewed.

5488. GUTHRIE, J. D. **Introduction of amino groups into cotton fabric by use of 2-aminoethyl-sulfuric acid.** *Textile Research J.* **17**, 11 (1947)

Amino groups were introduced into the cellulose molecule in order to prepare a fabric that could be dyed with acid dyes, an acid-adsorbing property not possessed by ordinary cotton fabric. The aminized fabric also dyed well with chrome dye, showed increased affinity for direct cotton dyes, and behaved toward hydrochloric and phosphoric acid as an anion exchange resin.

5489. KING, G. **Electric polarization in keratin-water and keratin-methyl alcohol systems.** *Trans. Faraday Soc.* **43**, 601-11 (1947).—*C.A.* **42**, 2827*a*.

The increase in dielec. const. is unlikely to be a function of the absorbate alone. A comparison is drawn between the dielec. dispersion and the elastic properties of keratin-water systems. In both cases the bound water fraction breaks H bonds between the polypeptide chains, allowing increased freedom of rotation of polar groups in these chains.

5490. KING, G. AND MEDLEY, J. A. **Effect of polar vapors on the direct-current conductance of keratin and nylon.** *Nature* **160**, 438 (1947).—*C.A.* **42**, 1108*d*.

The d.-c. conds. of nylon-H_2O and of nylon-HCOOH were measured as a function of absorbate concn. The initially linear rate of increase fell away at an absorbate concn. of about 0.3 mol./100g. A similar turning point for wool-H_2O occurred at about 1.0 mol./100 g.

5491. MASON, S. G. **Specific surface and electrokinetic potentials of cellulose fibers.** *Pulp & Paper Mag. Can.* **48**, No. 10, 76-80 (1947).—*C.A.* **41**, 7747*h*.

Of the existing methods for measuring surface area, the permeability method is considered the most promising. Many of the phenomena involved in fiber flocculation, size pptn., filler retention, pitch control, etc., are often explained on the basis of changes in the zeta-potential.

5492. MELLON, EDWARD F.; KORN, ALFRED H., AND HOOVER, SAM R. **Water absorption of proteins. I. Effect of free amino groups in casein.** *J. Am. Chem. Soc.* **69**, 827-31 (1947).—*C.A.* **41**, 5364*b*.

The first step in the binding of water by the NH_2 groups was a sharing of one mol. of water between 2 NH_2 groups of relative humidities below 6%. However, treatment of the data by the B.E.T. theory of adsorption indicated a monolayer of one water mol. per NH_2 group. The 2nd step was a linear increase in absorbed water with increase in relative humidity. The 3rd step was a rapidly increasing amt. of absorption with increase of relative humidity and appeared to be a condensation of water on water mols. already attached to the NH_2 groups. Depending on the relative humidity, from 24-33% of the water absorbed was absorbed by the NH_2 groups.

5493. MONGAR, J. L. AND WASSERMANN, A. **Ionic exchange and fiber contractions.** *Nature* **159**, 746 (1947).—*C.A.* **41**, 6109*c*.

Ca alginate fibers when washed with Na_2CO_3 solns. first contracted and then elongated. The max. contraction (13%) occurred when 29% of the Ca had been converted to $CaCO_3$ with the simultaneous formation of Na alginate. This action was attributed to the formation of gel segments in the 3-dimensional network of Ca alginate.

5494. ODA, RYOHEI AND SHIMIZU, HIROSHI. **Cation-exchange resin from natural rubber. I. Preliminary experiments. II. Concentration of quantity of sulfuric acid for the preparation of cation exchangers. III. Temperature of resin formation. IV. Conditions of sulfonation. V. Conditions of resins drying.** *Chem. High Polymers* (Japan) **4**, 23-4; 24-6; 26-7; 27-8; 28-30 (1947).—*C.A.* **45**, 2706*c*.

A resin having cation-exchange capacity was obtained by the reaction of rubber with concd. H_2SO_4. The concn. of H_2SO_4 for resin formation must be above 95%, and 10 times as much H_2SO_4 as pale crepe must be used. The optimum temp. for resin formation was 140°C. The amt. of 60% oleum was 3 parts to 1 part dried resin, and the optimum reaction temp. was 40°C. The water content of resin after sulfonation was 33%. By heating first at a high temp. and then drying at a lower temp. after washing the liberation of acid could be avoided.

5495. PETITPAS, GENEVIEVE. **Absorption of Congo red by cellulose.** *Mem. services chim. etat* **33,** 83-9 (1947).—*C.A.* **43,** 4848*f*.

Dyeing of cotton linters, refined in a lab. beater for periods up to 27 hrs, in a bath contg. 6g Congo red, 2 g NaCl, and 10 g linters, in liter for 1 hr at 75°C showed a rapid and then a slower increase in the amount of Congo red absorbed, equil. finally being reached. The effect of washing was greater with beaten linters than with unbeaten. The treatment of 0.5 g of unbeaten linters, beaten linters, ramie, or spruce pulp in 10 cc. dist. H_2O (or MeOH contg. 0.5-2.0 g Congo red until equil. was reached at 20°C) showed little difference.

5496. RAO, G. N. SUBBA; RAO, E. SANJIVA, AND RAO, K. SUBBA. **Hysteresis in sorption. XV. Hysteresis in the sorption of water on casein, egg albumin, and gelatin.** *Proc. Indian Acad. Sci.* **25A,** 221-8 (1947).—*C.A.* **41,** 5359*b*.

Sorption-desorption cycles for H_2O at 30°C after degassing to 0.001 mm pressure showed that the hysteresis loop was diminished in the 2nd cycle and disappeared in the 3rd cycle for casein, denatured casein, and albumin. Denatured egg albumin and gelatin showed no hysteresis loop even on the first cycle. The disappearance of the hysteresis loop was related to the swelling property and solvation.

5497. SARKAR, P. B.; CHATTERJEE, H.; MAZUMDAR, A. K., AND PAL, K. B. **The acid number of vegetable fibers in relation to basic dye absorption.** *J. Soc. Dyers Colourists* **63,** 229-31, (1947).—*C.A.* **41,** 6052*d*.

Twelve vegetable fibers were analyzed for their lignin, CO_2, furfural, holocellulose, and other contents. Acid values and absorption of methylene blue were measured and showed a close relationship between them. Adsorption of basic dyes by these lignocelluloses was due to the presence of acidic constituents of the hemicelluloses, rather than the lignin.

5498. SCHRAMEK, W. AND STENZEL, ANNELIES. **The swelling and solution mechanism of xanthated sodium cellulose fiber.** *Melliand Textilber.* **28,** 420-7 (1947).—*C.A.* **43,** 9437*c*.

The breakdown of the aggregates in the native, cellulose structure and the recombination and orientation of these forms in the regenerated fiber were discussed.

5499. SHAH, NARHARI H. **Penetration means less depth of shade.** *Indian Textile J.* **57,** 458, 460 (1947).—*C.A.* **41,** 4312*i*.

Color penetrated cotton fiber better before mercerization. The increase in depth of shade of rayon over unmercerized cotton was due to a combination of 3 factors: (1) addnl. color absorbed, (2) differences in reflectance between cotton and rayon, and (3) difference in penetration.

5500. SIMPSON, J. E. AND HOWORTH, RUTH M. **A dynamic absorption method for determining water repellency.** *Textile Research J.* **17,** 497-503 (1947).—*C.A.* **41,** 7761*d*.

The method was claimed the most precise developed for: (a) detg. the max. hydrophobic level which any particular water-repellent was capable of producing on a fabric, (b) detg. the true degree of hydrophobicity of a fabric at any time, (c) ascertaining the efficiency of application of a repellent finish, and (d) quickly indicating the protective qualities of a finish during any given period until the repellency might become changed by wear.

5501. SUBRAHAMANYA, R. S.; DOSS, K. S. G., AND SANJIVA RAO, B. **Rubin numbers.** *Proc. Indian Acad. Sci.* **26A,** 197-202 (1947).—*C.A.* **42,** 2156*b*.

The rubin no. was defined as the no. of mg of the colloid that (when present in 10 cc. of a 0.002% Congo rubin soln. of pH 5.2 and electrolyte concn. of 0.02*N*) produced 26.5% blue color on the addn. of 10% NaCl soln. The rubin nos. of starch, gelatin, albumin, and casein were found to be 34.0, 3.5, 2.5, and 0.66, resp.

5502. SYSKOV, K. I. AND KUKHARENKO, T. A. **Sorption method of determination of constituent groups in coals and their components.** *Zavodskaya Lab.* **13,** 25-8 (1947).—*C.A.* **41,** 5702*d*.

The sum of phenolic OH and of COOH groups was detd. by the amt. of chemisorbed $Ba(OH)_2$. In many cases it was sufficient to derive the equil. E_1 from just one detn. with $Ba(OH)_2$ 0.03 N and only to check with a 0.06 N soln. The method was applicable to humic acids, lignins and residual coals. The COOH content was detd. in a similar way by the amt. E_2 of $Ca(AcO)_2$ chemisorbed in 4 days from 0.3 N and 0.4 N solns. Results were reliable when the two detns. did not differ by more than 0.2 mg equiv./g. The content of phenolic OH was found by the difference E_2-E_1.

5503. TAVERNIER, J. **Two curious cases of the formation of metallic sulfides.** *Bull. soc. Sci. Bretagne* **22,** 53-6 (1947).—*C.A.* **43,** 924*d*.

The brown color developed on exposure of white wool fabric to light and air was attributed to the reaction of S in the wool with Cu and Fe, probably introduced from a glycerinated bath used in finishing. A white creme de menthe occasionally developed an amber color after several months in bottles. This was due to the fact that at the end of each week, the sirup from incompletely purified sucrose (used in preg. the liqueur) remained in Cu containers from Saturday until Monday.

5504. TRAPEZNIKOV, A. A. AND LIPETS, M. E. **Conductometric study of the exchange adsorption of electrolytes on fatty acid crystals. III.** *J. Phys. Chem.* (U.S.S.R.) **21,** 109-18 (1947).—*C.A.* **41,** 6107*c*.

The elec. cond. κ of a $Ba(OH)_2$ soln. (0.036 M was used) was slightly lowered by palmitic acid crystals in the soln. as long as the temp. remained below 45°C. The κ of $Th(NO_3)_4$ solns. was slightly lowered by palmitic acid below 45°C and much raised between 45° and 59°C because of liberation of HNO_3; at 59°C (in 0.134 M $Th(NO_3)_4$) 0.5 g palmitic acid was quantitatively transformed into $Th(C_{16}H_{31}O_2)_4$.

5505. Zentner, Rene D. **Heat guard for the McBain-Bakr sorption balance.** *J. Phys. & Colloid Chem.* **51**, 972-4 (1947).—*C.A.* **41**, 6441*e*.

Heat radiation during the sealing and glass-blowing of the McBain-Bakr balance adversely affected the stability of certain substances such as dehydrated milk or Al soaps. This effect was prevented by shielding the sample or sorbent from radiation with a heat guard consisting of a no. of Cu disks sealed within an evacuated glass bulb.

5506. Angelescu, E. and Damian, D. **Comparative study of the adsorption on cellulose and on viscose rayon from cellulose. I. Adsorption of iodine.** *Bul. Inst. Natl. Cercetări Technol.* 3, 149-58 (1948) (in French).—*C.A.* **43**, 9438*g*.

Adsorption of I_2 from soln. in KI followed the relation $x/m = Kc^p$, x/m was mg I_2 adsorbed per g of adsorbent, c the equil. I_2 concn., and K and P consts. The adsorption on both cellulose and rayon was very weak compared with that on corn starch, and followed Henry's law $(p = 1)$, showing soln. of the I_2 rather than chem. combination as in the case of starch $(p = 0.166)$. No correlation was found between the development of blue color and adsorptive power for I_2.

5507. Berezin, B. I. and Deryagin, B. V. **Methods for the measurement of the absorptive capacity of paper. A new method for the measurement of the absorptive capacity of paper.** *Poligraf. Proizvodstvo* Sept., **1948**, 23-5; Oct., **1948**, 22-6.—*C.A.* **46**, 7767*a*.

The new method depended upon the measurement of the vol. of air displaced when the paper was satd. with paraffin oil or another liquid. Measurements could be made at normal pressure, reduced pressure or *in vacuo*. Equations were given for the calcn. of the specific pore surface and the specific paper surface from the results of the measurements described.

5508. Bréguet, André; Viatte, Robert, and Perra, H. **Absorption and fixation of sodium hydroxide by native cellulose.** *Compt. rend.* **226**, 1987-9 (1948).—*C.A.* **42**, 7524*a*.

Samples of linters (98-0% α-cellulose) were swollen at 20°C in aq..NaOH of various concns., then analyzed for percentage of NaOH and H_2O absorbed. The 1st part of the NaOH absorption curve, between 0 and 10.33% NaOH, was convex and represented swelling of amorphous cellulose, and was reversible. The 2nd part (up to 17.23% NaOH) was concave and represented transformation of cryst. areas, and was not reversible. The 3rd part (up to 27% NaOH) was a straight line and represented swelling of the converted cryst. areas and was reversible.

5509. Enders, C.; Tschapek, M., and Glawe, R. **Some colloidal properties of natural humic acids and synthetic melanoids.** *Kolloid-Z.* **110**, 240-4 (1948).—*C.A.* **43**, 5255*e*.

Comparative tests on the colloidal properties of humic acids and melanoids (formed by heating glucose with amino acids) showed similarities as well as some discrepancies between them. The hydrophilic properties of the humic acids and melanoids were similar; however, coalification of the melanoid, by heating to 300°C, reduced its hydrophilic capacity. The melanoids had less base-exchange capacity than the natural humic acids.

5510. Carbuzov, A. I. **Effect of electrolyte mixtures on the formation of periodic precipitates of calcium phosphate in agar gels.** *Kolloid. Zhur.* **10**, 265-7 (1948).—*C.A.* **43**, 7788*h*.

A 0.4 N Na_2HPO_4 soln. placed on a gel contg. 0.7% agar and 0.02 N $CaCl_2$ gave rise to 5-6 periodic ppts. Weaker solns. of citrate and tartrate had less effect, and K_2SO_4 lowered the no. of ppts. to 3 in a concn. as high as 0.3 M KSCN and KI, taken in excess (e.g. in M soln.), counteracted the action of citrate and tartrate.

5511. Geake, A. **Absorption of the two vat dyes Caledon Red BN and Caledon Jade Green by cotton.** *J. Textile Inst.* **40**, T57-T87 (1948).—*C.A.* **43**, 2776*g*.

Concn. of the dyes in the dyed cotton was detd. by extg. with pyridine and spectrophotmetric comparison with standards. Initial absorption was rapid but equil. was not reached within several days. Concn. of dye and of neutral electrolyte in solns. of const. concn. in NaOH were the chief variables considered.

5512. Haller, R. **Absorption of copper salts by vegetable and various artificial silk fibers.** *Melliland Textilber,* **19**, 168-9 (1948).—*C.A.* **44**, 8115*a*.

Absorption of Cu salts by cotton, viscose, Bemberg, and acetate rayon is described. Treatment with Fehling solution at 60-70°C results in absorption of the colloidal complex salt. of probable formula $Cu(OCH\text{-}CO_2K)_2$(?); on boiling, the complex salt is reduced to red Cu_2O by the hydro- or oxycelluloses present in the fibers. Treatment in presence of various oxidizing agents leads to absorption of various colored complex Cu salts.

5513. Harris, J. C. **Adsorption of surface-active agents by fibers.** *Textile Research J.* **18**, 669-78 (1948).—*C.A.* **43**, 1193*f*.

Cotton did not appear to preferentially absorb anionic or nonionic agents, the amts. adsorbed representing less than the quantities required for a regular closely packed monomol. film. Cationic agents were rapidly and tenaceously held, and com. practice and usage would indicate that cotton selectively adsorbed these agents. Adsorption by wool of anionic and cationic agents proceeded over a considerable period of time and in amts. exceeding those adsorbed by cotton. Cotton exhibited low adsorption of anionics because it did not possess the chemically reactive character of wool.

5514. Jurgens, J. F. **Phosphorylated Cotton Cellulose as a Cation-Exchange Material.** *Textile Research J.*, **18**, 1 (1948)

Phosphorylated cotton cellulose, made by the phosphoric acid-urea method, was investigated as a cation exchange material. Cotton linters and cotton fabric were tested for cation exchange capacity.

5515. Karnik, M. G. and Devadatta, S. C. **Swelling of cellulose.** *J. Univ. Bombay* **17A**, No. 24, 40-7 (1948).—*C.A.* **43**, 7679*i*.

The swelling and shrinkage of cellophane and of 2-fold yarn of 28s count of bleached Sakillaridis cotton were detd. in 21-71% H_2SO_4 and in 52-90% H_3PO_4 at 40°C. In H_2SO_4 the swelling and shrinkage increased to a max. and then decreased with increased acid concn.; the time to max. swelling and shrinkage decreased with increased acid concn. In H_3PO_4 the swelling and shrinkage increased with increase in concn. of acid up to 82.8% and then decreased; the time to max. swelling and shrinkage decreased with increased acid concn.

5516. KEYVAR, C. **The colloidal aspects of the theories of dyeing.** *Textile J. Australia* **22,** 872-4 (1948).—*C.A.* **43,** 6827*d*.

Dyeing theories as applicable to colloidal dye solns. were discussed. It was concluded that no single theory sufficed to explain all the phenomena which occurred in dyeing.

5517. KOSTRIKIN, YU. M. **Variants of use of chemisorbents for analytical purposes. I.** *Zavodskaya Lab.* **14,** 173-5 (1948).—*C.A.* **43,** 57*i*.

In using organolites for analytical purposes the soln. to be analyzed should be filtered through a layer of the sorbent in order to obtain complete absorption.

5518. LLARENA CHAVE, JOSE LUIS. **The adsorption of color on textile fibers.** *Afinidad* **25,** 498-503 (1948).—*C.A.* **43,** 2777*b*.

The Freundlich adsorption isotherm could be applied to exptl. data for the adsorption of Durazol Blue 3R-200 (an azo dye) on viscose rayon. A comparison of the effects of NaCl and Na_2CO_3 in the dyebath showed Na_2CO_3 to have the stronger flocculating action.

5519. LUR'E, YU YU. **Variants of use of chemisorbents for analytical purposes. II.** *Zavadskaya Lab.* **14,** 176-8 (1948).—*C.A.* **43,** 57*i*.

Mixing of the soln. with the organolite followed by extn. is preferred to filtration through a layer of sorbent followed by extn. for the following reasons: (1) In dealing with small concns. of material in soln., for which this method is intended, an extn. of 98-99% is quite satisfactory. (2) Time required for analysis is considerably shortened. (3) Smaller amts. of sorbent for adsorption and acid for extn. are required. (4) The pH required for specific adsorption can be easily maintained.

5520. McINTIRE, FLOYD C. AND SCHENCK, JAY R. **Polysaccharide acid esters as cation-exchange media.** *J. Am. Chem. Soc.* **70,** 1193-4 (1948).—*C.A.* **42,** 6968*c*.

Cotton was partially esterified with glutaric, maleic, phthalic, and succinic acids, and wood cellulose and starch with succinic acid. Shaking with excess 0.05 M Na_2CO_3 soln. showed Na-ion binding capacities in the range 0.8-4.9 milliequivs. per g at 4.8-52% esterification. The products did not gel in org. solvents or water and largely retained the original structure.

5521. MELLON, EDWARD F.; KORN, ALFRED H., AND HOOVER, SAM R. **Water absorption of proteins. II. Lack of dependence of hysteresis in casein on free amino groups.** *J. Am. Chem. Soc.* **70,** 1144-6 (1948).—*C.A.* **42,** 4818*g*.

In a series of benzoylated casein samples contg. different amts. of free amino groups, it was shown that the amino groups were responsible for the absorption of about 0.25 of the total amt. of water absorbed by casein, at all relative humidities (R.H.). The desorption expts. were all made at 30° ± 0.1°C and 51, 75, 84, and 93% R.H. by lowering the R.H. from the highest to the next lower level. Equil. was reached in 18 days, 3 times as long as required for absorption. A definite hysteresis in the sorption phenomena of about one half the absorption values at 6% R.H. and about one fifth at 50% R.H. was observed.

5522. NEUHAUS, A. **Partially isomorphous systems. X. Oriented separations on cane sugar.** *Z. Elektrochem.* **52,** 178-82 (1948).—*C.A.* **43,** 8238*f*.

The sepns. or growths of the following compds. on cane sugar as the "lattice carrier" were studied: anthraquinone, alizarin, 1-hydroxyanthracene, purpurin, and other naphthalene derivs.; C_6Cl_6, C_6Cl_5OH, p-benzoquinone, p-$O_2NC_6H_4OH$, and other benzene derivs.; β-succinic acid, isatin, and fluorescein.

5523. NORTH, F. **Some variables in the coloring of paper.** *Proc. Tech. Sect., Paper Makers' Assoc. Gt. Brit. & Ireland* **29,** 127-53, discussion 154-7 (1948).—*C.A.* **45,** 349*d*.

The dyeing of paper is believed to consist essentially of 2 stages: (1) adsorption of the dye from soln. by the cellulose before addn. of sizing agents; this adsorption is negligible with most acid dyes, small with basic dyes, and extensive with direct dyes; (2) after the addn. of sizing agents, a complex ppt. is produced and the retention of this ppt. by the fibers completes the dyeing process. From a practical viewpoint, the most important single variable in paper dyeing is that of pH.

5524. OOIWA, MASAYOSHI. **The capillary absorption of wood. III. Absorption of alcoholic solutions of phenolformaldehyde resin.** *J. chem. Soc. Japan, Ind. Chem. Sect.* **51,** 37-8 (1948).—*C.A.* **44,** 9215*a*.

After the pieces of beech wood were dipped into solns. of PhOH-HCHO resin (7.92, 17.88, and 38.61%) in 92% alc., both resin and absorbed soln. were detd. against time. Alc. was absorbed more quickly than resin, expecially at first.

5525. PETERS, R. H. AND VICKERSTAFF, T. **The adsorption of direct dyes on cellulose.** *Proc. Roy. Soc.* (London) **A192,** 292-308 (1948).—*C.A.* **43,** 8234*a*.

It was shown for Chlorazol Sky Blue FF on cotton and Chrysophenine G on cellophane that the concn. in the fiber of electrolytes other than the dye might not be neglected, and when this factor was taken into account, theory and expt. agreed well. Adsorption isotherms of a no. of direct dyes on viscose rayon were measured and relative affinities calcd. These affinities were found to vary somewhat with dye concn., but much more from dye to dye, and depended greatly on the salt concn. in the dye bath.

5526. PETITPAS, GEVEVIEVE AND PETITPAS, THERESE. **The role of water during the absorption of**

sodium hydroxide by cellulose. *Compt. rend.* **226,** 672-3 (1948).—*C.A.* **42,** 4744*a*.

In the absorption of aq. NaOH soln. by cellulose, the quantity of NaOH retained by the cellulose increased as the concn. of the aq. NaOH soln. increased, whereas the quantity of H_2O retained passed through a max. at a concn. of about 4 N (14%). When H_2O was replaced by MeOH, the retention was very small and only showed a slight indication of a max. When H_2O was added to the mixt. of NaOH-MeOH, the retention was larger and increased more rapidly in proportion to the concn.

5527. ROYER, G. L.; ZIMMERMAN, C. L.; WALTER, H. J., AND ROBINSON, R. D. **Dyeing studies at elevated temperatures—use of temperatures between 200 °F and 300 °F.** *Textile Research J.* **18,** 598-614 (1948).—*C.A.* **43,** 411*c*.

An app. was illustrated that was designed for dyeing textiles in the range of 200-300 °F. Fundamental dyeing data were obtained by using a wide variety of textile fibers. High-temp. technique was applicable in the dyeing of fibers requiring a long time for the diffusion of the dye into the individual fibers under normal dyeing conditions. A disadvantage of continuous dyeing at high temps. was the elevated temps. over a period of several hrs. The amt. of thermal decompn. of many acid and direct dyes in 0.5% concns. was detd.

5528. SARKAR, P. B. AND CHATTERJEE, H. **Studies on the absorption of methylene blue by jute fiber.** *J. Soc. Dyers Colourists* **64,** 218-21 (1948).—*C.A.* **42,** 6540*d*.

The dye absorption depends largely on the pH of the dye bath, but is practically independent of time, temp., and concn. The max. absorption agrees fairly well with the acid values of the fiber, both raw and treated. Cationic exchanges take place, apparently between polyuronic acids of the fiber and methylene blue.

5529. SCHOFIELD, R. K. AND TALIB-UDDEEN, O. **Measurement of internal surface by negative adsorption.** *Discussions Faraday Soc.* **1948,** No. 3, 51-6.—*C.A.* **43,** 1240*i*.

Measurements were made at pH 6 and pH 1.3 of the small increase in concn. occurring when samples of jute were shaken in chloride solns. from *N* to 0.0078*N*. At pH 1.3, the vol. of water taken by 100 g of dry jute was close to 11 cc. for concns. below 0.1*N*. This water was presumably taken into the fiber substance where chloride ions could not enter.

5530. SOKOLOVA, N. V. **Theory of dyeing. XIII. Effect of pH of the dye-bath on binding of acid and substantive dyes by wool keratin.** *J. Applied Chem.* (U.S.S.R.),**21,** 966-75 (1948).—*C.A.* **46,** 2806*g*.

Acid and substantive dyes are bound by wool at all pH values from 1 to 8, the amt. of dye fixed (mg.-equivs. per 100 g. of wool) increasing with diminishing pH; a satn. value of 80 is reached in 2-3 hrs. at pH 3-4 in the case of molecularly dispersed dyes, but not for colloidal dyes, which cannot penetrate into the interior of the fibers.

5531. TACHIBANA, TARO. **Surface chemical structures on biocolloids. I. Lubricating action of biocolloidal solution.** *J. Chem. Soc. Japan, Pure Chem. Sec.* **69,** 103-4 (1948).—*C.A.* **44,** 9212*b*.

The lubricating action of biocolloidal solns., such as those of sugar, gelatin, or albumin, between 2 solid surfaces was demonstrated experimentally. Comparisons were made of this action with the pptn. vol. in a soln. and the protective action of colloids, which were also manifestations of adsorption phenomena.

5532. THOMEN, E. W. **Dyeing wool with chromatable dyes in the presence of chromium salts.** *Textil-Rundschau* **3,** 367-76 (1948).—*C.A.* **43,** 2775*i*.

Differences of shades of wool tips and roots dyed with chrome dyes in neutral Cr salt solns. depended on the state of soln. of the dye-Cr salt complex preceding formation of the Cr lake. Wool tips, damaged by photochem. action of light rays, were in a loosened condition; wool roots were not damaged and more compact. Erio-chromal mordant TP was developed as a new assistant to neutral chrome dyeings, being capable of dispersing better the colloidal complexes so that the roots were penetrated as well as the tips.

5533. VIATTE, ROBERT AND PERRA, H. **Absorption and fixation of sodium hydroxide from solution by regenerated (viscose) cellulose.** *Compt. rend.* **227,** 204-6 (1948).—*C.A.* **42,** 7524*c*.

Regenerated cellulose swelled faster and absorbed more NaOH than native cellulose. The H_2O absorption reached a sharp max. at 9.3% NaOH. The curve of NaOH absorption had a 1st max. at 9.3%, a min. at 13.97%, and a 2nd max. at 21.9% NaOH.

5534. WEIR, C. E.; CARTER, J; NEWMAN, S. B., AND KANAGY, J. R. **Penetration of leather by water under dynamic conditions.** *J. Am. Leather Chemists' Assoc.* **43,** 69-95 (1948).—*C.A.* **42,** 2462*h*.

An app. was described for the detn. of the no. of flexes required for the penetration of water under essentially zero pressure through a leather specimen flexed through 60 cycles per min. during the test. Results were given for a large no. of com. leathers with and without various waterproofing treatments.

5535. ALBRINK, WILHELM S. AND FUOSS, RAYMOND M. **Electrical-properties of synthetic membranes.** *J. Gen. Physiol.* **32,** 453-60 (1949).—*C.A.* **43,** 4892*e*.

Strong water-insol. polyelectrolytes can be prepd. by addn. of butyl bromide to a 1:19 copolymer of 4-vinylpyridine. With a hydrocarbon plasticizer, flexible films can be made in which the Br are freely movable while the larger polycations are immobilized.

5536. ALEXANDER, P.; CARTER, D., AND EARLAND, C. **The application of organosilicon polymers to wool.** *J. Soc. Dyers Colourists* **65,** 107-15 (1949).—*C.A.* **43,** 4017*a*.

Organosilicon polymers are initially anchored to wool fibers, via -Si -NH—linkages. To obtain nonfelability with a deposit of less than 5%, the polymer must be produced from a monomer contg. a reactive grouping such as Si-Cl, and the polymer must be a hard solid.

5537. Arkhipov, M. I. and Kharitonova, V. P. **Effect of ammonia on the adsorption of copper by cellulose and its solubility in cuproammoniacal solutions.** *Zhur. Priklad, Khim. (J. Applied Chem.)* 22, 1030-6 (1949).—*C.A.* 44, 2233*e*.

The max. amt. of Cu absorbed by cellulose not only increased with the concn. of Cu but, at const. Cu content, varied strongly with the concn. of NH_3. In solns. incapable of dissolving the cellulose (Cu 6.28-36.2 millimoles/liter), absorption of Cu first decreased with increasing NH_3, passed through a min., and then increased with further increase in NH_3; with increasing Cu content, the min. shifted to increasingly higher NH_3 concn. Soln. of cellulose took place in 2 steps, absorption of Cu and solvation of the Cu-cellulose complex formed. NH_3 not only promoted absorption of Cu by cellulose but also was an effective solvating agent for the Cu-cellulose complex.

5538. Bellamy, L. J. and Watt, C. H. **Effect of rubber, polythene, and polyvinyl chloride tubing on penicillin.** *Chemistry & Industry* **1949**, 19-21.—*C.A.* 43, 4428*d*.

Rubber mixes, vulcanized without accelerator, when placed in contact with penicillin for 24 hrs. caused losses in potency up to 20%. Mixes vulcanized with accelerator deactivated up to 90% of pencillin on contact. The destructive activity was related to the quantity of accelerator in the vulcanized mixt. Polythene and polyvinyl chloride tubing had no effect on pencillin.

5539. Bréguet, André; Viatte, Robert, and Chareyron, Colette. **Absorption and fixation of sodium hydroxide by mercerized cellulose.** *Compt. rend.* **228**, 1499-1501 (1949).—*C.A.* 43, 7233*g*.

The swelling of mercerized cellulose in NaOH soln. plotted against the concn. of NaOH did not give a curve of 3 zones as was the case with native cellulose. Mercerized cellulose swelled in 0-35% NaOH by vol., then pressed, washed, neutralized, rewashed, and dried, swelled again in a weaker NaOH soln. as if it had not undergone the previous treatment.

5540. Bromberg, A. V. **Diffusion of pigments in gelatin gels. I. Measurement of diffusion by a microphotometric method.** *Kolloid. Zhur.* **11**, 211-20 (1949).—*C.A.* 44, 22*f*.

Dye soln. was placed on top of a gelatin gel., removed when less than 1 mm of the gel was tinted, and replaced by a gelatin soln. which at once solidified. Then the spread of the dye in both directions from the colored layer was detd. with a Se photocell. The 2 values of diffusion coeff. were almost identical for Direct Pink C, Benzopurpurin 4 B, and Chicago Blue B, but were in a ratio of 2 or 3 approx. for Saphrol and Thiocarmin R.

5541. Cassidy, Harold G. **Electron-exchange polymers.** I *J. Am. Chem. Soc.* 71, 402-6 (1949).—*C.A.* 43, 5263*c*.

The polymerized vinylhydroquinone was dissolved in glacial AcOH, buffered and suspended in the presence of albumin, and titrated under N with ceric sulfate; a bright Pt electrode referred to a satd. calomel electrode was used to measure the potentials. During the oxidation of the polymer, whether in soln. or in a dispersed solid form, a pink color developed which was interpreted to indicate the accumulation of semiquinoid residues.

5542. Cegarra, José. **Adsorption phenomena in the textile industry.** *Anales invest. textil.* (Barcelona) 1, 29-40, 99-100 (1949).—*C.A.* 44, 2247*e*.

The fixation of dye from a soln. contg. 25×10^{-5} g Dark Green BN/ml by cotton at 80 °C reached an equil. in 1 hr, but 4 hrs were required with Chlorantine Orange 2GL. Equil. (i.e., 1 hr) fixation of Dark Green BN, as g dye fixed/kg cotton, were detd. The dye fixation curve obtained at 60 °C with addn. of electrolyte followed the Freundlich adsorption equation closely. All the dye was taken up by a flock of silk from a soln. contg. 66×10^{-8} g of Brilliant Green/ml at 20 °C.

5543. Dickinson, H. O. **Use of dyes to determine the isoelectric point of gelatin.** *Nature* **163**, 485-6 (1949).—*C.A.* 43, 6884*d*.

Certain carbocyanide dyes showed a narrow and intense absorption band in the red region of the spectrum in dil. gelatin solns. if the pH was above the isoelec. point. Below this the absorption was similar to that of the aq. dye soln.

5544. Donovan, R. and Larose P. **The sorption of acids by wool.** *Can. J. Research* **27B**, 879-89 (1949).—*C.A.* 44, 4259*b*.

The effect of sodium sulfate on the sorption process was studied. Four solns. of H_2SO_4 ranging in strength from 0.0505 to 0.0101 *N* were used, but no significant effect of the salt was found. The adsorption isotherms were of the Langmuir type.

5545. Fischer, Roland; Seidenberg, S., and Weis, U. P. **Affinity of water-soluble substances to wool and their antibacterial activity.** *Helv. Chim. Acta.* 32, 8-17 (1949).—*C.A.* 43, 4017*e*.

Strips of plain wool (1 g.) were wet with warm water and placed for 1 min. at about 75 °C in 10 cc. of a soln. of gram stain (about 0.05 g gentian violet in 20 cc. of water), then throughly washed, and rinsed. The affinity for wool of wetting, detergent, mothproofing, and disinfecting agents was detd. from the increase in weight of wool strips (10 g ± 0.01) dyed in the presence of 2 g of the test substance in 500 cc. of water at 90 °C for 10 min., both neutral and acid soln.

5546. Fuoss, Raymond M. and Sadek, Hussein. **Mutual interaction of polyelectrolytes.** *Science* **110**, 552-4 (1949).—*C.A.* 44, 2824*c*.

Turbidimetric titrations of polyvinylbutylpyridonium bromide with Na polyacrylate were made with a Phoenix light-scattering photometer. Up to the equivalence point the turbidity increased linearly with the amt. of polyacrylate added, increased sharply to a ratio of 1.5, and decreased slowly upon further addn. of polyacrylate. Na polystyrene sulfonate and polypyridonium bromide were used in a second expt.

5547. Gardner, K. W. and Smith L. B. **The adsorptive capacity of cotton for sodium oleate.** *J. Am. Oil Chemists' Soc.* 26, 194-6 (1949).—*C.A.* 43, 4496*i*.

The adsorbate was shown to be an acid soap. The addn. of free NaOH repressed hydrolysis and reduced the adsorption. The acid soap could be removed from the fabric by repeated boiling distd. H_2O rinses, or the adsorptive capacity for fresh acid soap could be restored by converting the adsorbed material to lime soap by rinsing in hard H_2O.

5548. GRIGOROV, O. N. AND PRIKHID'KO, N. E. **Transference numbers of calcium ions (moving) through collodion membranes of various structures.** *Kolloid. Zhur.* **11**, 141-2 (1949).—*C.A.* **43**, 7290*g*.

Membranes of graded pore radius *r* were prepd. When *r* was 60 or 3 mμ, the transference no. *n* of Cl^- in 0.01 N KCl was 0.471 or 0.295. When *r* was 39 or 3 mμ, *n* in 0.01 N $CaCl_2$ was 0.559 or 0.506. The small relative accelration of Ca^{++} by neg. membranes was due to the great radius of Ca^{++}.

5549. GUASTALLA, LINA AND GUASTALLA, JEAN. **Physics of surfaces. Adhesion tension and bond energy.** *Compt. rend.* **228**, 1575-7 (1949).—*C.A.* **43**, 7777*b*.

Adhesion tention Γ was detd. by plunging a paraffined foil vertically into 0.001 N HCl soln. covered with a film of oleic acid or myristic acid and measuring the vertical force. As a first approxn. $W = \Gamma + A - p$, where W = energy liberated by the fixation of the fat acid film per cm² of paraffin surface, A = surface tension of pure water, and p = the film pressure.

5550. JAYME, GEORG AND MOHRBERG, WILHELM. **Swelling measurement with holocelluloses retaining lignin.** *Das Papier* **3**, 153-9 (1949).—*C.A.* **43**, 6407*e*.

Spruce holocelluloses and retaining, resp., 1.64% and 1.43% "Halse lignin" were extd. with varying concns. of aq. NaOH (ranging from 0.2% to 20%). Untreated samples retained their woody structures tenaciously and individual fibers could be obtained only by mild alk. or mech. treatments. As de-lignification increased, the H_2O-swelling capacity also increased (prior to any alk. treatments). When higher concns. of NaOH were used, the swelling capacity decreased because of the extn. of the hemicelluloses which were active swelling agents. A min. was reached after extn. with 6-8% aq. NaOH.

5551. KACSER, H. AND UBBELOHDE, A. R. **Thermodynamic conditions for the retention of solvents by crystals: the system brucine-benzene.** *Nature* **164**, 445-6 (1949).—*C.A.* **44**, 27*d*.

Brucine crystallized from C_6H_6 solns. with 1 mol of C_6H_6 per mol. of brucine. The C_6H_6 was held very tightly by the brucine, coming off only after a temp. of 140 °C was reached at ordinary pressure. The evolution of the C_6H_6 vapor could be almost explosive.

5552. KING, G. AND MEDLEY, J. A. **Direct-current conduction in swollen polar polymers. I. Electrolysis of the keratin-water system.** *J. Colloid Sci.* **4**, 1-7 (1949).—*C.A.* **43**, 3689*a*.

When a direct current was passed through a keratin film contg. at least 15% H_2O, the amt. of H_2 evolved was equiv., to the amt. predicted from the no. of coulombs passed. This indicated that d.-c. conduction in the keratin-H_2O system took place by ionic migration.

5553. KING, G. AND MEDLEY, J. A. **II. The influence of temperature and adsorbed salts on the direct-current conductivity of polar polymer-adsorbate systems.** *J. Colloid Sci.* **4**, 9-18 (1949).—*C.A.* **43**, 3689*b*.

Conds. at 25° and 40 °C were detd. as a function of H_2O sorption for keratin (undialyzed, dialyzed, or with 2% KCl or $MgSO_4$, added), dialyzed nylon, and dialyzed gelatin, and as a function of HCOOH sorption for dialyzed nylon and dialyzed keratin. Similar results were obtained with all systems. HCOOH was more effective than H_2O in increasing the cond. KCl increased the cond. of keratin markedly, whereas $MgSO_4$ had less effect.

5554. KITTELBERGER, W. W. **The diffusion of electrolytes through organic membranes. I. An equation for calculating diffusion rates. II. Experimental verification of calculated rates.** *J. Phys. & Colloid Chem.* **53**, 392-409 (1949).—*C.A.* **43**, 6489*i*.

The rates of diffusion were detd. of HCl, NaCl, and $CaCl_2$ through polyvinylbutyral resin films pigmented with SiO_2. The observed and computed rates were in agreement for HCl through membranes with 55 and 62% by vol. of SiO_2, for NaCl through membranes with 40, 55, and 62% SiO_2, and for $CaCl_2$ with 55% SiO_2 and 30% chrome yellow. Films with 70% SiO_2 were brittle and difficult to handle.

5555. KLEINERT, TH. **Adsorption process on lignin substances. III. The adsorption of sulfurous acid.** *Monatsh.* **80**, 135-9 (1949).—*C.A.* **43**, 5254*h*.

The adsorption of H_2SO_3 in dil. aq. soln. on sawdust (pine) and 2 lignins was measured at ordinary temp. One lignin was obtained from the digestion of pine shavings with dil. H_2SO_4 at elevated temp. and the other from treatment with concd. HCl at ordinary pressures. The adsorption followed the Freundlich isotherm.

5556. KLEINERT, TH. **Adsorption process on lignin substances. IV. The adsorption of aldehydes.** *Monatsh.* **80**, 140-3 (1949).—*C.A.* **43**, 5254*h*.

The adsorption of formaldehyde on the 2 types of lignin approximated Henry's law, while that of furfural followed the Freundlich adsorption isotherm.

5557. LIPETS, M. E. AND TRAPEZNIKOV, A. A. **Study of exchange adsorption of barium hydroxide by fatty acid crystals.** *Zhur. Fiz. Khim.* **23**, 981-92 (1949).—*C.A.* **44**, 19*a*.

The rate of decrease of elec. cond. of 6.3 g/liter $Ba(OH)_2$ on adding palmitic acid increased with temp. The apparent activation energy was 4300 cal/mole below 47 °C, 16,000 between 47° and 59 °C, and 227,000 between 59 and 60 °C. Two samples of stearic acids showed sudden changes of the rate of reaction with $Ba(OH)_2$ at 35°, 48°, and 60-65 °C.

5558. LISTER, G. H. **An investigation into the practical aspects of the adsorption of acid and chrome dyes by wool.** *J. Soc. Dyers Colourists* **65**, 97-106 (1949).—*C.A.* **43**, 4015*e*.

Under practical conditions of dye-bath concns. and materials the adsorption of acid and chrome dyes by wool agreed with the $\sqrt{t}$ for most of the dyeing period. To reach com. exhaustion of a dye bath 40-50% of the dye must be on the fiber in 5 min. The rate of dyeing was very sensitive to pH changes above the 50% exhaustion in 5 min.

5559. MACARTHUR, I.; MONGAR, L., AND WASSERMANN, A. **Ion exchange and fiber contraction.** *Nature* **164**, 110-11 (1949).—*C.A.* **43**, 8237*g*.

If fully swollen Ca alginate fibers of 0.4 mm were treated with a N soln. of Na_2CO_3 or Cl, the wt. of the axially contracted fibers increased up to 40%. In a test with NaCl soln. the contraction was relatively small (5-10%, depending on fiber diam.), but the vol. and length of the shortened fibers remained const. many hrs. Fully swollen fibers rinsed with 3 M dextrose or glycerol showed neither radial nor axial contraction; when treated with 5 N $CaCl_2$ the only changes were increase in stiffness, and linear coeff. of expansion (α) appeared small and pos.

5560. MACEWAN, D. M. C. AND TALIB-UDDEEN, O. II. **Artificial adsorbents.** *Bull. soc. chim. France* **1949**, D40-2.—*C.A.* **43**, 5255*i*.

The adsorption of water and 13 org. liquids, including alcs. and nitriles, on a complex of α-$Zn(OH)_2$ and Na 2,4-dinitro-1-naphthol-7-sulfonate were reported.

5561. MATSUNAGA, YOSHIAKI. **Adsorptive power of various fibers for aerosols.** *Bull. Nagoya Inst. Technol.* **1**, 260-70 (1949).—*C.A.* **44**, 8734*h*.

The adsorption on single fibers of silk, glass, and bamboo was measured for aerosols of benzidine, NH_4Cl, liquid paraffin, Boyle's oil, stearic acid, D-mannitol, and lanolin.

5562. MELLON, EDWARD F.; KORN, ALFRED H., AND HOOVER, SAM R. **Water absorption of proteins. IV. Effect of physical structure.** *J. Am. Chem. Soc.* **71**, 2761-4 (1949).—*C.A.* **43**, 7787*h*.

Sorption isotherms were measured on a series of wool, silk fibroin, and ovalbumin fibers treated to alter the internal phys. structure. Wool was dissolved in alk. thioglycolate and pptd. from soln. The product had essentially the same H_2O absorption as the control sample. Native ovalbumin was brought into a state of lateral order by denaturation, and the ordered regions were oriented by stretching the fibers. A slight but significant decrease in the absorption curve was produced by the increase in order, but this effect was much smaller on the succeeding desorption cycle.

5563. MONGAR, J. L. AND WASSERMANN, A. **Fully swollen alginate gels as "permutites"; kinetics of calcium sodium ion exchange.** *Discussion Faraday Soc.* **1949**, No. 7, 118-23.—*C.A.* **45**, 18*i*.

Fully swollen Ca-alginate fibers (diam. 0.24 to 1.2 mm) were suspended and rinsed with H_2O and then with NaCl soln. at the same temp. After known time intervals the flow of the NaCl soln. was interrupted and the fibers were again washed and analyzed for Ca^{++} and Cl . The diffusion of NaCl from the outside soln. into the gel was fast, compared with the rate of formation of $CaCl_2$ and the diffusion of $CaCl_2$ from the gel to the outside soln. was fast, compared with the rate of the reverse reaction.

5564. NEGISHI, MICHIHARU; FUKUDA, KAYOKO; MORI, HIDEKO; INAGAWA, KUNIKO, AND ARAI, YASUCHIKA. **Elasticity, tensile properties, and the mechanism of deformation of fiber. III. Tensile properties at natural cotton fibers in organic liquids.** *J. Soc. Textile Cellulose Ind.* **5**, 222-4 (1949).—*C.A.* **46**, 3756*h*.

The tensile strength and elongation of cotton fibers in satd. monohydric alcs., their esters, dioxane, C_6H_6, PhMe, and C_6H_{14} were similar to those alcs. and with a decrease of swelling.

5565. NEGISHI, MICHIHARU; FUKUDA, KAYOKO, AND MORI, HIDEKO. **Elasticity, tensile properties, and the mechanism of deformation of fibers. IV. Tensile properties of natural, hydrated, and water cellulose cotton fibers in water and caustic alkali solutions.** *J. Soc. Textile Cellulose Ind.* **5**, 266-8 (1949).—*C.A.* **46**, 3756*i*.

The tensile strength of natural cotton fibers in NaOH decreased with the concn. within the intermicellar swelling, but was const. with the value close to the dry strength within the intramicellar swelling. Hydrate and water cellulose fibers showed the same strength in water.

5566. NIKOLAEVA, M. A. AND PREIS, E. M. **Aggregative stability of metal organosols. II. Autocoagulation of organosols of some metals.** *Kolloid. Zhur.* **11**, 184-6 (1949).—*C.A.* **43**, 7292*a*.

The light absorption at 580 mμ of a slowly coagulating Zn sol in AcOEt (prepd. according to Svedberg) was detd. The coagulation was accelerated by KSCN. The dependence of the absorption on the wave length was measured for Zn in AcOEt and Au, Ag, and MnO_2 in H_2O.

5567. PERTI, S. L.; RANGANATHAN, S. K.; SUBRAMANIAN, T. S., AND SUD, L. R. **Metallic oxides as barrier treatments for prevention of attack by light on cellulose.** *Nature* **163**, 877-8 (1949).—*C.A.* **43**, 8133*i*.

Oxides of Cr, Cu, Fe, Mn, Sn, Ti, and Al were deposited by a double-bath process on Dosootie and Indian tenting fabric, in approx. 0.05, 0.5, and 1% concns. of the metal by wt of the fabric used. The treated fabrics and untreated congrol samples were exposed to sunshine at Kanpur for a total period of 2400 hrs, samples being withdrawn at periods of 400 hrs and tested for bursting strength. The results showed that Mn (0.56 and 1.3%) retarded actinic degradation markedly; Fe and Al showed some protective action but not to any useful extent.

5568. PETERS, L. AND SPEAKMAN, J. B. **The combination of wool with acids—a quantitative interpretation in terms of the Donnan theory of membrane equilibrium.** *J. Soc. Dyers Colourists* **65**, 63-71 (1949).—*C.A.* **43**, 3203*c*.

A quant. interpretation of the combination of HCl, H_2SO_4, and HCl in the presence of different concns. of KCl were given in terms of the Donnan theory of membrane equil. The course of combination was detd. by the pH inside the fiber, which could be calcd.

5569. Rosstovtzev, V. E. and Plaskin, S. A. **Sorption of sulfur dyes.** *Tekstil. Prom.* **9**, No. 1, 23-5 (1949).—*C.A.* **47**, 1936*c*.

Continuous dyeing with S dyes was improved on the lab. scale by quickly drawing the dye liquor through the fabric (with the help of a vacuum).

5570. Schwimmer, Sigmund and Balls, A. K. **Starches and their derivatives as adsorbents for malt α-amylase.** *J. Biol. Chem.* **180**, 883-94 (1949).—*C.A.* **43**, 9504*f*.

Adsorption was performed at 0°C in 40% EtOH and 0.5% CaCl$_2$ in a vol. of 20 cc. for a period of 2 min. In this system 5.1 g of wheat starch adsorbed half the α-amylase; the efficiencies of other adsorbents were compared with wheat starch. The following starches were tested: canna, potato, banana, smooth pea, wrinkled pea, corn, cassava, bean, waxy maize, sweet potato, oats, amylodextrin granules from wheat, rice and dasheen. Adsorption ranged from 0.2 (canna) to 8.0 (wrinkled pea), in general, in inverse order to the granule size which ranged from 85μ (canna) to 3μ (dasheen).

5571. Standing, G. H. A. and Warwicker, J. O. **Effect of the carboxy groups in viscose sheet on the equillibrium absorption of Chrysophenine** *J. Textile Inst.* **40**, T175-88 (1949).—*C.A.* **43**, 4015*h*.

Equil. absorption was found to depend on the ratio of the mass of sheet to the vol. of dye bath, especially if the concn. of NaCl in the bath was low, the effect being due to the presence of acidic carboxy groups in the viscose sheet which lowered the pH of the bath. In baths in which dye concn. and total cation concn. of inorg. electrolytes was kept const., the equil absorption increased with decrease of pH, and became fairly const. at pH 3 to pH 2.

5572. Subramanya, R. and Rao, M. R. Aswathanarayana. **The effect of electric field on the degree of depolarization of light scattering in colloidal solutions.** *Proc. Indian Acad. Sci.* **29A**, 442-57 (1949).—*C.A.* **44**, 2328*f*.

Light scattered by hydrosols of graphite, stearic acid, V$_2$O$_5$, and benzopurpurin was examd. while the sample was subjected to an elec. field. The depolarization factors were each detd. with the field in each of 3 orientations as follows: perpendicular to both the incident beam and the direction of observation (position A), perpendicular to the incident beam but parallel to the direction of observation (B), and parallel to the incident beam but perpendicular to the direction of observation.

5573. Willson, E.A.; Miller, J.R., and Rowe, E.H. **Adsorption areas in the soap titration of latex for particle-size measurement.** *J. Phys. and Colloid Chem.* **53**, 357-74 (1949).—*C.A.* **43**, 6041*g*.

By comparing soap adsorption values with electron microscope data on a series of copolymer latex particles, the adsorption area of an oleate mol. was calcd. to be 47 A.^{2}, and that of a myristate mol. 59 A^2. Correlations of the relative diams. from electron microscope measurements, adsorption data, and growth calcns. were shown.

5574. Wyk, A. J. A. van der and Studer, M. **The acidity of cellulose.** *Helv. Chim. Acta.* **32**, 1698-1712 (1949) (in French).—*C.A.* **43**, 9434*i*.

Cellulose suspended in 0.6 N NaCl soln. could be titrated as a sol. acid. Analysis of the titration curves obtained with native, purified, and regenerated (cuproammonium) celluloses provided dissocn. consts. having values of 10^{-7} to 10^{-6} for all samples studied. From the alkali consumed to attain the equivalence point the no. of glucose residues per equiv. was calcd. to be 690-770 for non-repptd.and 3100 for repptd. cellulose.

5575. Yarnold, G. D. and Mason, B. J. **The angle of contact between water and wax.** *Proc. Phys. Soc.* (London) **62B**, 125-8 (1949).—*C.A.* **44**, 901*g*.

The effects (a) of the velocity of the liquid surface, and (b) of the time of immersion, on the angle of contact between clean surfaces of $_2$O and wax were investigated by a dynamic method. Expts. with H$_2$O and a paraffin-wax coated steel sphere were described. A definite value could be assigned to the angle of contact of a liquid only if the exact conditions of observation were also specified.

5576. Zhukov, I. I. and Fridrikhsberg, D. A. **Changes of the transference numbers of ions in porous membranes.** *Kolloid. Zhur* **11**, 395-409 (1949).—*C.A.* **44**, 3338*d*.

The difference between the transference no. of cation in bulk (*n*) and in the membrane was detd.

5577. Zhuravleva, E. I. **The uptake of moisture by cornstarch from sugar solutions.** *Kolloid. Zhur.* **II**, 232-6 (1949).—*C.A.* **44**, 359*d*.

The amt. of H$_2$O adsorbed by 1 g of starch (0.21% ash) from sugar solns. was calcd. on the basis of the assumption that no sugar was adsorbed. It was greater when the sugar concn. *c* was less and was greater for sucrose than for fructose and glucose. Sugars could not be used for detg. the "solvation" of starch. The water adsorbed was detd. by the equil. between the osmotic pressure inside the starch grain and the osmotic pressure outside plus the elastic forces of the grain membrane.

5578. Zwolinski, Bruno J. ; Eyring, Henry, and Reese, Cecil E. **Diffusion and membrane permeability** *J. Phys. & Colloid Chem.* **53**, 1426-53 (1949).—*C.A.* **44**, 3333*i*.

Diffusion in membranes and their permeabilities were treated on the theory that mol. migration consists of a series of mol. jumps from one equil. position to another. The theory was applicable to the diffusion of electrolytes or nonelectrolytes in homogeneous or heterogeneous membranes and was applied to permeability data of H$_2$O, alcs., ethers, and amides through various animal and plant cells.

5579. Alexander, P.; Carter, D., and Earland, C. **Reaction of oxidizing agents with wool. II. The sorption of hydrogen peroxide.** *Biochem. J.* **47**, 251-4 (1950).—*C.A.* **45**, 864*i*.

H_2O_2 oxidized crystine in wool to cysteic acid and to cystine disulfoxide. Wool, silk, or nylon (*not* cotton) sorbed H_2O_2 from soln. The amt. sorbed was detd. directly on the treated fabric by titration with $KMnO_4$. The sorption within pH 2.5-9.0 was independent of pH, but decreased outside that range.

5580. ALEXANDER, P. AND KITCHENER, J. A. **The role of the electric double layer in the sorption of acids and dyes by wool.** *Textile Research J.* **20**, 203-14 (1950).—*C.A.* **44**, 5595*b*.

Dyes were taken up either as gegenions to the charged groupings within the fiber or as leading ions bound by non-coulombic forces and carrying inorg. gegenions with them into the fiber. The effect of salts and acids on dyeing equil. could be formulated by means of the law of mass action used in conjunction with the appropriate adsorption isotherm.

5581. ALEXANDER, P. AND HUDSON, R. F. **The kinetics of wool dyeing. I. Simple acid dyes.** *Textile Research J.* **20**, 481-91 (1950).—*C.A.* **44**, 8663*i*.

The rate controlling mechanism of dyeing wool with Acid Orange II could be diffusion through an unstirred film of liquid. At low concns., the diffusion of dye through an unstirred film of liquid was the slower of the two processes, whatever the degree of agitation. At higher concns. of dye, the rate-controlling step changed from diffusion through liquid film to diffusion through solid when the stirring of the liquid film was increased beyond the point at which the reaction became stirring-independent. At high concn. of dye, the diffusion of dye proceded from a satd. concn. on the fiber surface.

5582. ALEXANDER, P. AND CHARMAN, D. A. **The kinetics of wool dyeing. II. The adsorption of surface-active dyes by wool and other fibers.** *Textile Research J.* **20**, 761-70 (1950).—*C.A.* **45**, 864*e*.

The kinetic curves for the adsorption on textile fibers of a dye having a long hydrocarbon chain (Carbolan Crimson BS) indicated that there was an initial, rapid, but limited reaction, which was followed by a much slower reaction. The influence of electrolytes, dye concn., and temp. were studied and the magnitude of the initial adsorption was correlated with the surface activity of the soln. The dye taken up was on the fiber surface. The surface acitivity of the dye contributed substantially to its high anion affinity.

5583. BALAREV, D. **The structure of gels.** *Annuaire univ. Sofia, II, Fac. sci.*, Livre **2**, 153-8 (1950).—*C.A.* **46**, 10785*a*.

Pptn. of $Ag_2Cr_2O_7$ in gelatin gels forms 2 kinds of rings: primary or fine and secondary or coarse. Polar impurities are adsorbed on $Ag_2Cr_2O_7$ according to Paneth-Fajan's rule. Preaging of the gels coarsens the rings, while prestirring develops radial clear streaks through them.

5584. BENSON, BARBARA AND LAROSE, P. **The effect of sodium sulfate on the absorption of acid dyes by wool.** *Can. J. Research* **28F**, 238-56 (1950).—*C.A.* **44**, 10324*g*.

The sorption of Orange I on wool samples previously used in detg. the sorption of acids by wool was measured at the boil in the presence of salt (Na_2SO_4 or NaCl) and acid (H_2SO_4 or HCl). An empirical relation having the form of an adsorption isotherm expressed the results observed at any given acid and salt concn.

5585. BIGET, ANNE M. **A chemically inert gel.** *Ann. chim.* [12], **5**, 66-105 (1950).—*C.A.* **44**, 5186*a*.

Cellulose acetate gels, contg. as little as 2% of the acetate, could be obtained by use of strong $Mg(ClO_4)_2$ solns. These gels lose water progressively as the temp. exceeded 30°C, completely at 120°C. Strong solns. of lactic acid, phenol, acetamide, or pure alc., etc. caused dehydration, hardening, plasticizing, etc. Resorcinol and related compds. were especially destructive of the gel structure by virtue of their strong dehydrating power.

5586. BROMBERG, A. V. AND MAL'TSEVA, O. S. **Diffusion of dyes in gelatin gels. II. Effect of sorption on the rate of diffusion in gels.** *Kolloid. Zhur.* **12**, 9-16 (1950).—*C.A.* **44**, 3770*i*.

The diffusion in gel was slower than in H_2O not only because of mech. obstruction but also because the solute mols. might be for a time immobilized by adsorption on the "active centers" of the gel. The adsorption of Direct Pink by gelatin and its diffusion coeff. D were detd. in 7% gelatin gels. When pH increased from 3 to 8, the max. absorbed amt. decreased from 0.59 to 0.24 millimol./g.

5587. BROOKS, MARVIN C. AND BADGER, RICHARD M. **An adsorption system for the fractionation of nitrocellulose with respect to molecular weight.** *J. Am. Chem. Soc.* **72**, 4384-8 (1950).—*C.A.* **45**, 3682*g*.

The adsorption of nitrocellulose on starch from solns. of $(Me)_2CO$ admixted with several co-solvents was studied. The extent of adsorption increased with mol. wt, decreased with degree of nitration of the nitrocellulose, and decreased as the H-bonding character of the solvent mixt. was increased.

5588. BURTE, HARRIS, M. **A nondestructive mechanical test for animal fibers.** *J. Applied Phys.* **21**, 494-9 (1950).—*C.A.* **44**, 8114*d*.

The slope of the force-extension curve in the Hooke's law region could be measured nondestructively, for animal fibers, at 3- to 15-min. intervals. Data were presented on the interaction between concd. neutral salt solns. and wool fibers and indicated that 2 processes occurred: (a) relatively rapid hydration of the fiber until equil. with the activity of water in the salt soln. was attained; (b) relatively slow absorption of salt ions by the fiber.

5589. CARROLL, B. **Long range forces in solution.** *J. Am. Chem. Soc.* **72**, 2763-4 (1950).—*C.A.* **44**, 8734*i*.

Adsorption of 2×10^{-5} M Orange I on bovine, serum albumin (2 p.p.m. in 0.01 M HCl) proceeded in 2 steps: a rapid adsorption of 100-130 dye anions/protein mol. in 1 min., followed by a slower process requiring several weeks for the formation of an approx. unimol. layer (250 anions/mol.). An albumin mol. coated with fewer than 100 dye anions was easily attacked by pepsin.

5590. CHATTERJEE, H. **Role of the cationic ash of jute fiber in its acid-value determination.** *J. Textile Inst.* **41**, T243-8 (1950).—*C.A.* **44**, 9679*f*.

About 70% of the ash or raw jute was cationic and appeared to be mainly a salt or polyuronic acids, the remainder being mostly sol. SiO_2. HCl (0.1 N) removed almost all of the cationic ash derived from polyuronic acids. Blocking the —COOH groups of a fiber with a metallic radical could be done better by first blocking with Na and then replacing Na by double decompn.

5591. COULOMBRE, JANE AND MOORE, WALTER J. **The adsorption of sulfanilamide on silk fibroin.** *J. Phys. & Colloid Chem.* **54**, 661-4 (1950).—*C.A.* **44**, 7618*d*.

The adsorption of sulfanilamide on silk fibroin was measured in unbuffered solns. at pH = 6.0 and at 0.1, 16.3, and 34.4°C. The calcd. differential heat of adsorption remained practically const. at 4500 cal./mol. until an adsorption of 0.0058 mole of sulfanilamide per 100 g of protein was reached; thereafter it decreased rapidly. The arginine and lysine side chains in fibroin amounted to 0.0061 mole per 100 g of protein.

5592. COUPE, R. R. AND BANKS, W. H. **Adsorption of cobalt naphthenate by cellulose fibers.** *Research* (London) **3**, 528-30 (1950).—*C.A.* **45**, 2685*g*.

Co naphthenate was irreversibly adsorbed on acidified (HCl and H_2SO_4) filter paper from olive oil and linseed oil solns. and from olive oil solns. on nonacidified paper. The adsorption from linseed oil inhibited drying of the oil.

5593. DAVIDSON, G. F. **Acidic properties of cotton cellulose and derived oxycelluloses. VII. Ion-exchange reactions with basic dyes.** *J. Textile Inst.* **41**, T361-80 (1950).—*C.A.* **45**, 856*i*.

The affinity of the cations of a no. of basic dyes for the carbonyl group of acidic oxycelluloses was compared by measurements of absorption in competition with Na^+ or with another species of dye cation and by chromatographic investigation of the displacement of dye cations from oxycellulose by Na^+. The dyes varied widely but even the most weakly bound has a much greater affinity than Na^+. The xanthene dye Rhodamine B differed from the other basic dyes in its behavior. The adsorption showed a max. at pH 3.6.

5594. DOSS, K. S. G. AND GHOSH, S. K. **Kinetics of sucrose crystallization.** *Proc. Sugar Technol. Assoc. India* **19**, II, 183-91 (1950).—*C.A.* **46**, 7801*c*.

The rate of growth of a crystal of sucrose (between two parallel [100] faces), suspended and rotated in sirup of const. supersatn. at 35°C and at 75.5°C, was measured (with a screw gage). The addn. to the sirup of sufficient carboxymethylcellulose to increase the viscosity (η) ten-fold hardly affected the rate of growth, but caramel sufficient to increase η by 10% decreased the rate by 20%; impurities thus retarded growth far more effectively than a high η.

5595. EVANS, EVAN F. AND SPURLIN, HAROLD M. **Bound metal in ethycellulose effect on dilute-solution properties.** *J. Am. Chem. Soc.* **72**, 4750-6 (1950).—*C.A.* **45**, 3686*e*.

Neutralization of free carboxyls with metal ions caused an increase in the viscosity of solns. at finite concns. This increase was greatest in nonpolar solvents and least in solvents contg. appreciable H_2O or EtOH. Bound Ba^{++} decreased the slope of the reduced osmotic pressure-concn. curve. For polymers contg. bound metal ions it was recommended that solvents contg. H_2O, EtOH, or HOAc be used for the detn. of viscosity or osmotic pressure and that the values at infinite diln. be obtained by the extrapolation of exptly. detd. values.

5596. FOX, H. W. AND ZISMAN, W. A. **The spreading of liquids on low-energy surfaces. I. Polytetrafluoroethylene.** *J. Colloid Sci.* **5**, 514-31 (1950).—*C.A.* **45**, 4109*c*.

The contact angle (θ) on polytetrafluoroethylene was measured for a large no. of org. liquids. The cos θ was a linear function of the surface tension of the liquid for each homologous series. For each series there was a crit. surface tension, whose value varied from 17.5 to 20.5 dynes/cm, below which spreading coeffs. were neg. for most of the liquids studied.

5597. FRÖHLICH, H. G. **The behavior of protein fibers and of polyamides toward acids and bases. I. The absorption of hydrochloric acid.** *Deut. Textilgewerbe* **52**, 397-8 (1950).—*C.A.* **46**, 11691*f*.

The absorption of HCl by *Ardil*, *zein*, and *casein* fibers was investigated. The curves obtained for these fibers had the same form as those for silk and wool. Between pH 1.3 and 0.8 there was a region of const. acid fixation. Below pH 0.8 a rise in the absorption occurred, the steepness of which varied with the kind of fiber. The ability of the polypeptide groups to attract and bind protons with the formation of a salt was reduced with increasing HCHO content. The behavior of the polyamides toward HCl was analogous to that of the proteins. In this case, also, the absorption of HCl increased with decreasing pH and reached a satn. value at pH 2.2-2.6.

5598. HALLER, R. **Starch and metal salts.** *Melliand Textilber.* **31**, 49-50 (1950).—*C.A.* **47**, 898*e*.

Combinations of starch with metal salts are considered to be adsorption compds. rather than chem. compds. The effect of adsorbed metal oxides is discussed, expecially with respect to enzyme action.

5599. HEUSER, EMIL. **Factors which influence the kinetics of cellulose reactions.** *Textile Research J.* **20**, 828-37 (1950).—*C.A.* **45**, 2201*c*.

Either one or the other of 2 factors predominates, i.e., the phys. accessibility of the —OH groups, as dependent upon the cryst.-to-amorphous ratio, or their intrinsic chem. activity, as dependent upon the position of the —OH groups in the anhydroglucose units. Cellulose reactions could be grouped into 4 main "possibilities."

5600. Hirai, Nishio. **Solvation. I. Swelling velocity of starch and lyophilic property.** *Bull. Inst. Chem. Research, Kyoto Univ.* 23, 73-4 (1950) (in English).—*C.A.* 47, 2569*a*.

In swelling or soln. of raw starch, water mols. diffuse into the micelles, the micelle crystals grow loose, and chain mols. of starch begin to expand randomly. The substances capable of entering the helix and forming a complex with starch by their hydrophobic properties make easy the formation of the α form, the intermediate step of soln., and decrease the activation energy of swelling E by the energy of complex formation E_{xs}.

5601. Hoffpauir, Carroll L. and Guthrie, John D. **Ion-exchange characteristics of chemically modified cotton fabrics.** *Textile Research J.* 20, 617-20 (1950).—*C.A.* 44, 11104*a*.

Chemically modified fabrics exhibiting ion-exchange properties are produced by the introduction of a substituent group with basic or acidic properties into the cellulose mol. under such conditions that the fabric structure is retained. Phosphorylated cotton fabric behaves like a dibasic acid, with acid strength comparable to that of the first and second hydrogens of H_3PO_4. Partially sulfethoxylated cellulose is a strong-acid cation-exchanger.

5602. Inaba, Ayako. **Wettability of solid surfaces. IV. Wettability of palmitic acid surface by aqueous salt solutions.** *Bull. Chem. Soc. Japan* 23, 146-9 (1950).—*C.A.* 45, 6897*h*.

Minute impurities in the distd. water apparently controlled the wetting. The wetting of purified paraffin, crude paraffin, palmitic acid, and hexadecyl alc. by water and aq. solns. of KNO_3, $Ca(NO_3)_2$, $Al_2(SO_4)_3$, and $Th(NO_3)_4$ was detd. The effect of metallic soaps on the wettability was offered as an explanation of the results.

5603. Katz, Sidney M.; Kubu, Edward T., and Wakelin, James,H. **The chemical attack on polymeric materials as modified by diffusion.** *Textile Research J.* 20, 754-60 (1950).—*C.A.* 45, 897*e*.

The reaction of polymeric media with a chem. reagent generally involves the preliminary diffusion of the reagent through the polymer. The effect of a relatively rapid diffusion of a chem. reagent into a cylindrical fiber on the over-all rate of reaction and to the decay of stress therefore is derived.

5604. Kleinert, Theodor and Wincor, Wilhelm. **Bound calcium in rayon pulps and its behavior in the viscose process. I.** *Svensk Papperstidn.* 53, 638-43 (1950).(in German).—*C.A.* 45, 6839*b*.

The combining of Ca with cellulose from dil. aq. soln. of Ca salts was an ionic reaction involving carboxyl groups. Most of the Ca was bound to hemicelluloses in the pulps and, therefore, would diffuse out in the mercerizing process. The Ca remained combined with the hemicelluloses in the steeping liquor and was retained with the org. component in the dialysis process for purifying the liquor.

5605. Lambert, Joseph M. **Cationic adsorption and exchange as shown by radio-calcium tracer studies.** *Ind. Eng. Chem.* 42, 1394-8 (1950).—*C.A.* 44, 9210*c*.

The accessibility and acidic characteristics of cotton appeared to be of particular importance. The role of adsorption as an important factor in detergency was illustrated by exptl. adsorption data of surface-active agents on cotton. Radioisotope tracer methods were described for measuring the adsorption and exchange of Ca on cotton as it occurred in lab. wash test stimulating hard-water laundering. Data were obtained with several cotton detergents in multicycle wash test.

5606. Lindberg, Joel. **Rate of acid sorption by wool fibers.** *Textile Research J.* 20, 381-4 (1950).—*C.A.* 44, 8115*c*.

A method for measuring the diffusion rate of mineral acids in wool fibers consists mainly in dispersing short fibers in acid solns. and measuring the decrease in the concn. by means of a cond. cell. The diffusion const. is obtained by solving the diffusion equation for the conditions specified. Exptl. curves agree well with the theoretical ones. The importance of the epicuticle for the diffusion phenomena in wool fibers is proven.

5607. Manegold, E. **Capillaries, capillary systems, and capillarity XXII. 5. Significance of the Donnan-membrane barrier for corrosion protection by means of polar layers and for substantive dyeing.** *Kolloid-Z.* 116, 135-46 (1950).—*C.A.* 44, 9212*i*.

Covering layers may be anion-permeable, cation-permeable, or amphoteric (the type of ion passing through the layer depending on the isoelec. point and the pH), and unipolar, bipolar, or nonpolar. Presence of H_2O was necessary for corrosion and the ions available det. the type of corrosion. Substantive dyes entered pores of cellulose fibers when electrolytes supplied proper ions and in their absence remained within the fibers.

5608. Manegold, Erich and Hartel, Martin. **Capillaries, capillarity and capillary systems. XXV. 2. Forms of contraction in gelled cover- and bond-layers and the strength of the joint in three-layer bonds.** *Kolloid-Z.* 116, 80-8 (1950)

Phenomena of drying and shrinking in covering and bonding layers were described in relation to the nature of the surfaces of materials to which these layers were attached. Tensile strengths of bonding agents were listed.

5609. McGrew, Frank C. and Schneider, Allen K. **The sorption of acid dyes on nylon.** *J. Am. Chem. Soc.* 72, 2547-52 (1950).—*C.A.* 44, 8663*c*.

Evidence was presented to confirm the attachment of acid dyes to nylon at moderate pH levels by a salt-type linkage between the basic amine ends of the polymer chain and the sulfonic acid groups of the dye. The quant. measurement of affinity of dye was detd. The procedure was modified to permit its application to dyes with high affinity.

5610. McLaren, K. **The relation between detergency and adsorption by the fiber.** *J. Soc. Dyers Colourists* 66, 521-9 (1950).—*C.A.* 45, 362*d*.

A detailed study was made of the effect of temp., detergent, acid, and salt concn. on the wool-detergent properties of a specific nonionic surface-active compd. Increasing the temp. from the normal wool detergency temp. of 50 °C to 80-90 °C caused an increase in detergent efficiency. Adding acid to the detergent soln. increased its detergency, but at high temps., when a certain acid concn. was exceeded, the detergent efficiency was reduced. Both effects were accompanied by an increase in the adsorption by the substrate as acidity increased. NaCl improved the detergent efficiency up to a concn. where pptn. occurred; this concn. was lower, the higher the temp.

5611. MERRILL, REYNOLD C. AND SPENCER, ROBERT W. **Sorption of sodium silicate and silica sols by cellulose-fibers.** *Ind. Eng. Chem.* **42,** 744-7 (1950).—*C.A.* **44,** 6123*e*.

Sorption of both Na and SiO_2 from $Na_2O.3.37$ SiO_2, N-Sol A, and a H_2SO_4-treated SiO_2 sol were measured at 25 °C for bleached sulfite, soda, kraft, and mech. pulps. Similar data on NaOH were given for comparison. Both Na and SiO_2 were sorbed by the cellulose fibers but the quantity of the former sorbed was usually much greater than that of the latter.

5612. PARTRIDGE, S. M. AND SWAIN, T. **A reversed-phase partition chromatogram using chlorinated rubber.** *Nature* **166,** 272-3 (1950).—*C.A.* **45,** 6456*i*.

N-2,4-dinitrophenyl derivs. of various amino acids were sepd. by partition chromatography with 0.2 M citrate-phosphate buffer as the flowing solvent on columns prepd. by filtering a slurry of 10 g chlorinated rubber (Alloprene) in 4 cc. of a suspension of BuOH in buffer satd. with BuOH. Rates of movement depended on pH.

5613. REESE, CECIL E. AND EYRING, HENRY. **Mechanical properties and the structure of hair.** *Textile Research J.* **20,** 743-53 (1950).—*C.A.* **45,** 864*g*.

A simple quant. method for detg. the amt. of mech. strength contributed by the various types of bonds in hair fibers was developed. The effect of acids, bases, and oxidizing or reducing agents and hair fibers was first-order with respect to the bonds to be broken. Based on the theory of abs. reaction rates, the heats and entropies of activation for the reaction were calcd.

5614. REEVES, RICHARD E.; MAZZENO, LAURENCE W. JR., AND HOFFPAUIR, CARROLL L. **The heterogeneous methanolysis of native and mercerized cotton cellulose.** *J. Am. Chem. Soc.* **72,** 4773-7 (1950).—*C.A.* **45,** 2200*f*.

Methanolysis of native cotton cellulose and mercerized cellulose introduced acid-labile MeO groups into the insol. phase (representing cleavage of glucose-glucose bonds) and dissolved a portion of either cellulose. The methanolysis rate decreased in the region where 0.1-0.5% glucose unit had reacted. The data were explained in terms of reaction with an initially large cryst. surface, diminishing strongly as the surface was reduced by the coalescence of cryst. areas when internal tensions relax because of reaction within the fiber.

5615. REMINGTON, W. R. AND GLADDING, E. K. **Equilibria in the dyeing of nylon with acid dyes.** *J. Am. Chem. Soc.* **72,** 2553-9 (1950).—*C.A.* **44,** 8663*f*.

The dye absorption data yield a precise value for the amine-end content of the fiber, which was the practical upper limit for dyeing with acid dyes. The absorption of dye from solns. of low pH was accompanied by the hydrolytic rupture of principally nonterminal amide groups with the consequent production of addnl. dyeing sites. These phenomena were observed at pH's within the range of normal dyeing practice.

5616. RODMAN, CHARLES A. AND PANSEY, ALVIN W. **Use of a microscopic technique in studying the filtration characteristics of wool and cotton fibers.** *Textile Research J.* **20,** 873-9 (1950).—*C.A.* **45,** 2217*e*.

A microscopic technique was used to study the sorption mechanism of org. colloidal matter.

5617. SAMUELSON, OLOF; GÄRTNER, FRED, AND JOHANSSON, GEORG. **Ion exchange in alkali cellulose.** *Svensk Kem. Tid.* **62,** 211-14 (1950) (in English).—*C.A.* **45,** 4443*d*.

Any difference in reaction velocity between those Na ions which were bound in the amorphous parts of the cellulose and those bound in the crystallites was too small to be detected. In the expts. (covering both sulfite pulp and cotton), 0.5 g. native cellulose was treated with 50 ml NaOH of either 18 or 35% concn., and carrying about 1 mc. of Na^{24}, added as Na_2CO_3. The expts. showed that the ion exchange was complete after 3 washing periods of 10 sec. each in case of the 18% NaOH expts., and after 4 washings in case of the 35% NaOH.

5618. SCHWERTASSEK, K. **Explanation of dyeing defects in cellulose fibers by measurements of iodine sorption. II. Relation of iodine sorption and crystallinity of cellulose fibers.** *Melliand Textilber.* **31,** 764-9 (1950).—*C.A.* **45,** 5931*e*.

I_2 sorption was a measure of the colloidal surface of the fiber and therefore also of the proportion of amorphous to crystalline material but was independent of form or size of the pores. Various causes for dyeing defects and their relation to I_2 sorption were discussed.

5619. STAMM, ALFRED J. AND TARKOW, HAROLD. **Penetration of cellulose fibers.** *J. Phys. & Colloid Chem.* **54,** 745-53 (1950).—*C.A.* **44,** 9145*i*.

Fibers of pure cellulose and lignocellulosic materials such as wood can be directly penetrated only by polar liquids. These liquids, except for a small correction for adsorption compression, add their vol. to the vol. of the cell walls. Although solns. may penetrate the fibers much more slowly than the solvent in a no. of cases, they eventually swell wood more than does either component alone. This enhanced swelling can be explained on the basis of an equil. between sorption, soln. pressure, and structural resistance.

5620. SWANSTON, KATHLEEN AND PALMER, R. C. **The sorption of anionic detergents by wool.** *J. Soc. Dyers Colourists* **66,** 632-8 (1950).—*C.A.* **45,** 2217*b*.

Expts. were made on the rate of sorption of Na hexadecyl sulfate by wool at 50°C under varying conditions of salt concn. and pH. When the soln. was thoroughly stirred sorption took place rapidly at first and then more slowly. When neutral wool contg. some detergent was stirred in an alk. soln., the detergent initially in the wool came into the soln.; after about 6 min. the detergent started to go back into the wool, and continued to do so until the wool contained more than its initial amt.

5621. TROMMER, CHARLES R. **Measuring penetration and wetting.** *Am. Dyestuff Reptr.* **39**, No. 24, *Proc. Am. Assoc. Textile Chem. Colorists*, P811-12, P 830 (1950).—*C.A.* **45**, 2217*i*.
The new method involved measuring the rate of penetration of wetting agents through varying layers of fabrics without complete immersion of the samples. An elec. circuit and the subsequent lighting of an elec. light bulb marked the end point of the test by means of 2 Cu electrodes. A typical nonionic surfactant was used in the tests. An error of ± 1.5 sec. or less was considered to represent a high degree of reproducibility.

5622. VEIL, SUZANNE. **Abnormal rhythmic distribution due to chemical sorption.** *Compt. rend.* **230**, 1769-71 (1950).—*C.A.* **44**, 9775*f*.
A drop of a cupric salt soln. on gelatin impregnated with $Na_4P_2O_7$ resulted in a series of rings whose spacings decreased with increase in radius from the drop. Liesegang rings formed by the reaction of $AgNO_3$ with gelatin impregnated with dichromate showed a similar effect. Chem. sorption was postulated.

5623. WEATHERBURN, A. S.; ROSE, G. R. F., AND BAYLEY, C. H. **Sorption of soap by textile fibers.** *Can. J. Research* **28F**, 51-61 (1950).—*C.A.* **44**, 5598*c*.
Data were obtained on the sorption of Na soaps of lauric, myristic, palmitic, stearic, and oleic acids by cotton, bright and delustered viscose rayon, acetate rayon, and nylon, and wool. Sorption of fatty acid and alkali were detd. by analysis of remaining liquor after immersing a 6-g sample in 150 ml of 0.1% soap soln. for 30 min. at 70°C. Hydrolysis of the soaps played a significant part in sorption, since much sorption was of free fatty acid and of hydrolytic alkali, with a minor role played by neutral soap sorption.

5624. WILLIAMS, G. C. **Chemical composition and adsorptive properties of clear films.** *Official Digest Federation Paint & Varnish Production Clubs* No. **311**, 1020-32; *Am. Paint J.* **35**, No. 8-B (Convention Daily) 26-7, 28-9, 30 (1950).—*C.A.* **45**, 1781*g*.
The subjects discussed include: the ultimate analysis of clear films, the extn. of clear films to det. the sol. phase, and adsorptive properties of films for org. liquids.

5625. ABRAMOV, S. A. **Dyeing of caprone hosiery with direct dyes.** *Legkaya Prom.* **11**, No. 6, 26-8 (1951).—*C.A.* **46**, 741*c*.
Absorption of direct dyes followed in some respects cellulose fibers and in others animal fibers. Rate of absorption from acid solns. was close to that of cellulose fibers from neutral solns. In acid solns., absorption increased with decreasing pH.

5626. ABRIBAT, MARCEL AND POURADIER, JACQUES. **Effect of the spreading solvent on the unimolecular surface films of cellulose acetate.** *Compt. rend.* **233**, 1606-8 (1951).—*C.A.* **46**, 7402*a*.
Formation of surface films of cellulose acetate was studied in relation to the solvent used. These solns., when spread under a pressure lower than 0.1 dyne/cm produced stable surface films whose compressions and expansions were reversible, and whose characteristics varied only slightly with the compn. of the solvent.

5627. ANTZENBERGER, PAULETTE. **Study of the penetration of resins into impregnated woods by tracing the adsorption and desorption isotherms.** *Recherche aéronaut.* (Paris) No. **21**, 41-7 (1951).—*C.A.* **46**, 736*f*.
Spice-wood samples, which were either untreated, delignified, or impregnated with melamine-HCHO resin, were placed in atms. of different humidities, and the equil. moisture content of the wood was detd. Both untreated and delignified samples showed a rapid increase in water adsorption as the relative humidity was increased above about 50%, whereas the adsorption curve for the impregnated wood remained nearly linear.

5628. BAYLEY, S. T. **Dielectric properties of various solid crystalline proteins, amino acids, and peptides.** *Trans. Faraday Soc.* **47**, 509-17 (1951).—*C.A.* **45**, 9953*e*.
Insulin, chymotrypsinogen, salmine sulfate, and bovine serum albumin, the peptides glycylglycine and diglycylglycine, and the amino acids glycine and glutamic acid were studied over the range 300 to 4×10^9 cycles/sec, between −100° and 0°C. Adsorbed water increased both dielec. const. and power factor towards low (audio) frequencies, the effect being attributed chiefly to inhomogeneities and ionic conduction in the materials.

5629. BEHRANA, J. S. AND NARWANI, C. S. **Influence of chemical constitution on the adsorption of dyes by the insoluble part of heat-dehydrated gum arabic.** *J. Indian Chem. Soc.* **28**, 252-6 (1951).—*C.A.* **46**, 4799*b*.
Gum arabic heated to 165-70°C in a dry state gives the insol. metagummic acid. The H_2O-insol. acid adsorbs only basic dyes irreversibly, exchanging Ca ions for basic dye ions. Only malachite green follows Freundlich's isotherm; it is least adsorbed owing to partial dissocn. of the dye at the diln. used. Acid dyes, with the exception of Congo red in dil. soln., are not adsorbed at all. NaCl prevents the adsorption of basic dyes owing to preferential adsorption of Na^+ to the cations of the dye.

5630. BHATNAGAR, M. S. AND NIGAM, P. C. **Organic adsorbents from Indian tannins. II. Adsorption of acids, bases, and salts.** *J. Applied Chem.* **1**, 520-2 (1951).—*C.A.* **46**, 2874*a*.
Adsorption of katha and cutch for benzoic, phthalic, formic, acetic, propionic, oxalic, malonic, and succinic acids decreased with mol. wt. This reversal of Traube's rule was attributed to

orientation of mols. at the resin-water interface according to the theory of Langmuir and Harkins. The order of adsorption of Ba, Si, and Ca and the effect of substituted OH groups was explained by the polar concept.

5631. Christensen, G. N. **Diffusion in wood. II. Temperature coefficient of diffusion through wood.** *Australian J. Applied Sci.* **2**, 430-9 (1951).—*C.A.* 46, 5245*a*.

The diffusion rate depended on the cross-sectional area and the av. path length of the capillary through the lamina. The diffusion paths in both transverse directions were composed of capillary elements of similar diam.

5632. Christensen, G. N. **Diffusion in wood. III. Ion selection and its effect on the diffusion of electrolytes.** *Australian J. Applied Sci.* **2**, 440-53 (1951).—*C.A.* 46, 5245*c*.

The wood functioned as a negatively charged semipermeable selective medium in its behavior towards diffusing electrolytes and this behavior varied with the type of wood and the direction of the diffusion relative to the grain. The membrane potentials for KCl and K_2SO_4 on tangential samples were calcd.

5633. Cutler, Melvin and Kimball, George E. **Effect of adsorption on measurements of viscosities of very dilute polymer solutions.** *J. Polymer Sci.* **7**, 445-7 (1951).—*C.A.* 46, 808*g*.

The systems used were: polyvinyl alc. in water, polyethylene oxide in water, polystyrene in C_6H_6, polyvinyl acetate in C_6H_6, and polyacrylic acid solns. of various degrees of neutralization in water, in the presence of NaCl in various concns. A plot of the reduced viscosity against concn. showed a definite decrease at very low concns. At these very low concns., a straight line obeying the equation $\eta_{sp} = A(c - b)$ was obtained. The shift from the ideal straight line through the origin suggested the hypothesis that some of the polymer had been adsorbed on the viscometer.

5634. Davankov, A. B.; Perepelkin, V. P., and Sokolova, E. A. **Coloring polymerized resins in the finely dispersed state and the selective adsorption of dyes by synthetic resins.** *Zhur. Priklad. Khim.* **24**, 95-101 (1951).—*C.A.* 46, 8891*g*.

Polymers were made by emulsion polymerization of methyl methacrylate or styrene or copolymerization of methyl methacrylate and vinyl acetate, with $(NH_4)_2S_2O_8$ as a catalyst. The polymers were colored in the form of aq. dispersions by addn. of basic dyes (crystal violet, fuchsin, or methylene blue) to the dispersions. The coloring process might result from chem. interaction between the basic dye and the acidic polymer.

5635. Elöd, E. and Fröhlich, H. G. **The absorption of strong and weak acids by casein and zein fibers.** *Melliand Textilber.* **32**, 40-3 (1951).—*C.A.* 45, 8251*h*.

Acetylated and CH_2C-treated casein and zein fibers were treated with HCl, $ClCH_2COOH$, HCOOH, and AcOH of various concns. The water absorption rose only slightly with increased acidity for all fibers tested. The amt. of bound HCl acidity increased with falling pH values; the increase was largest at pH under 1, and always larger for casein than for zein.

5636. Finn, S. R. and Lewis, G. J. **The diffusion of water through an enamel based on a phenol-formaldehyde resin.** *J. Oil & Colour Chemists' Assocn.* **34**, 266-78 (1951).—*C.A.* 46, 7785*b*.

A technique has been developed in which the passage of H_2C through a "test tube" of enamel was estd. by periodic weighing. The passage of H_2O through the film was relatively rapid, but not sufficient to account for the blistering of the enamels on metal when immersed in boiling H_2O.

5637. Finn, S. R. and Lewis, G. J. **The absorption of water by enamels based on a phenol-formaldehyde resin.** *J. Oil and Colour Chemists' Assocn.* **34**, 279-94 (1951).—*C.A.* 46, 7785*c*.

These PhOH-HCHO resin enamels were capable of absorbing appreciable amts. of H_2O, as were the clear, unpigmented films of the resin. The H_2O absorption was rapid at first, became slower, and finally reached a constant value. The amt. absorbed was directly proportional to the thickness of the film.

5638. Hudson, R. F. and Schmeidler, G. A. **Kinetics of anion exchange on wool fibers.** *J. Phys. & Colloid Chem.* **55**, 1120-30 (1951).—*C.A.* 46, 11692*i*.

The kinetics of exchange of the bisulfite ion by a series of anions were followed and activation energies detd. Calcd. diffusion coeffs. decreased and activation energies increased in the order NO_3^-, Cl^-, SO_4^{--}, $C_6H_5SO_3^-$, $H_2PO_4^-$, which thus represented the ease of diffusion of these ions into the fiber. The rate of desorption of bisulfite ion from fibers in alk. soln. was much greater than that at neutrality, at pH 7.4 $D_f = 0.77$ sq. cm./sec. and at pH 13 $D_f = 3.24$ sq. cm./sec. both at 18°C.

5639. Landsberg, Rolf. **Potentials associated with the formation of precipitation membranes.** *Z. physik. Chem.* **197**, 256-64 (1951).—*C.A.* 46, 7850*g*.

The difference in potential of 2 Ag-AgCl electrodes connected by salt bridges with solns. of $K_4Fe(CN)_6$ and $CuSO_4$ or $Cu(NO_3)_2$ was followed as these solns. diffused into each other in a gelatin block. The membrane was assumed to be permeable to K^+ alone. Impermeability of the membrane to Cl^- and SO_4^{--} was confirmed by chem. tests and by the fact that the max. potential was independent of whether $CuSO_4$ or $Cu(NO_3)_2$ was used.

5640. Mann, H. B. and Richardson, R. W. **The absorption of a direct cotton dye anion associated with various cations.** *J. Soc. Dyers Colourists* **67**, 148 (1951).—*C.A.* 45, 5411*b*.

Expts. were made in which the pure acid dye was neutralized with a series of org. and inorg. bases to give the corresponding dye salts. The equil. dye absorption for purified Sky Blue FF anion assocd. with different cations in the presence of the corresponding chloride at pH 7 ± 0.5 indicated a definite variation in equil. absorption for the various cations.

5641. McGrew, F. C. and Sharkey, W. H. **Sorption of acid dyes by nylon under nonequivalent conditions.** *Textile Research J.* 21, 875-9 (1951). *C.A.* 46, 1767*i*.

Nylon filament yarn colored with acid dyes frequently shows unevenness in appearance. In others, changes in the no. of amine end-groups in the polymer cause the effect. Unevenness can be minimized, and with some colors eliminated, by dyeing in a bath so dil. in dye as to appear colorless to the eye, equalization of acid dyes can be obtained by using conditions unfavorable for attainment of equil.

5642. Neuman, W. F.; Mulryan, B. J.; Boyd, E. S., and DiStefano V. **The surface chemistry of bone. III. The role of phosphatase. IV. Further data on recrystallization. V. The ion-binding properties of cartilage.** *J. Biol. Chem.* 193, 227-35; 237-41; 243-51 (1951).—*C.A.* 46, 2159*i*.

α-Glycerophosphate was strongly adsorbed by bone ash. The presence of the adsorbed ester inhibited the accretion of addnl. mineral. A study of the interaction between powd. bone and radiophosphate buffer showed that the slow incorporation of labeled phosphate by the bone mineral required the presence of an aq. phase. This slow reaction was primarily the result of a recrystn. process rather than a simple diffusion of the phosphate through the crystal lattice. Phosphate was taken up from soln. only by cartilage contg. appreciable amts. of Ca.

5643. Nishida, Kenzo. **Donnan membrane equilibrium and direct dyeing of Cellophane. I. II.** *J. Soc. Textile Cellulose Ind.* (Japan) 7, 539-41; 541-4 (1951).—*C.A.* 46, 6389*c*.

The amts. of Diamine Blue 3B absorbed by Cellophane from a bath at 90°C contg. 0.5 of the dye and 1-35 g/liter NaCl agreed with the values derived from Donnan equil., provided that the H_2O, which adsorbed on Cellophane and served as the solvent, was assumed to be 22/100 g (of Cellophane), the amt. actually adsorbed on Neale's cotton. With Diamine Blue 2B, the actual amt. of H_2O adsorbed on Cellophane, i.e. 93/100 g, used.

5644. Olofsson, Bertil. **Combination of wool with acids in presence of salts.** *J. Soc. Dyers Colourists* 67, 57-66 (1951).—*C.A.* 45, 4049*a*.

Titrations of wool with HCl in the presence of NaCl, Na_2SO_4, KCl, K_2SO_4, and $BaCl_2$, and with H_2SO_4 in the presence of NaCl and Na_2SO_4 were made. The absorption of H, chloride, and sulfate ions were detd. Chloride and sulfate ions did not seem to be dispersed at random in the fiber phase but are somewhat localized at positive sites. The chloride ions had a greater affinity for the wool fiber than the sulfate ions.

5645. Salvinien, Jean. **Two new methods for the measurement of diffusion coefficients in gels.** *J. chim. phys.* 48, 465-70 (1951).—*C.A.* 46, 4326*i*.

Two exptl. methods were described to detn. cylindrical diffusion through a gel. Both were performed by first placing a drop of a soln. of the salt being investigated on the surface of a thin film of a gel such as gelatin. By one method, after a given diffusion time the gel film was immersed in a soln. of a material capable of forming a ppt. with the diffusing salt. From the dimensions of the resulting spot and the concn. of salt at the boundary, which could be detd. from the optical d. of the spot, the coeff. of diffusion could be calcd. The other method depended on the presence of a pptg. agent in the gel so that the advancing boundary was visible continuously.

5646. Salvinien, J.; Marignan, R., and Cordier, S. **Absolute measurement of diffusion coefficients in gels by means of radioactive indicators.** *J. chim. phys.* 48, 471-3 (1951).—*C.A.* 46, 4327*d*.

The gel was cast in a plastic tube that could be sliced into thin sections with the gel. The soln. of electrolyte contg. radioactive tracer was placed on the gel in the tube and held at const. temp. with agitation for several days. The soln. was then withdrawn, and the gel cylinder (and the plastic mold) was cut into thin equal slices, each a known distance from the gel-soln. interface. Each slice was separately dissolved in water and the radioactivity of an aliquot detd.

5647. Schmid, Gerhard. **Electrochemistry of fine-pore capillary systems. II. Electroösmosis.** *Z. Elektrochem.* 55, 229-37 (1951). *C.A.* 46, 797*i*.

The derivations of equations for electroösmosis in fine-pore capillary systems were given. The equation applied when the elec. double layer had a thickness comparable with the pore radius. Points of deviation which were explained included a decrease in electroösmotic permeability with decreasing pore radius, the constancy of the ratio of osmotic permeability to water permeability, the independence of electroösmotic pressure from the pore radius, and the decrease of electroösmotic efficiency of current with increasing c.d. Theory was compared with expt. for the elec. cond. of collodion membranes of graduated porosity in dil. KCl solns. The cond. of soln. in the pores with respect to that of soln. external to the pores increased very sharply with decreasing KCl concn. At a given KCl concn. the cond. of the pore liquid was greater for membranes treated with NaOH than for untreated membranes.

5648. Schmid, Gerhard and Schwarz, Hans. **Electrochemistry of fine-pore capillary systems. IV. Dialysis potentials.** *Z. Elektrochem.* 55, 684-9 (1951).—*C.A.* 46, 10972*g*.

An app. is described in which are measured the dialysis potentials of a series of colloidal membranes in dil. KCl solns. of varying concns. Values for the dialysis potential can be calcd. from cond. data, but are always about 3 mv. higher than the measured values.

5649. Schwertassek, K. **Iodine sorption of viscose fibers and the viscose process. III. The relation of iodine sorption and the degree of crystallization of cellulose fibers.** *Melliand Textilber.* 32, 460-5 (1951).—*C.A.* 45, 10579*d*.

I_2 sorption was related indirectly to the degree of crystallinity. A relation was found between the degree of crystallinity and degree of polymerization (D.P.). Lower D.P. gave higher I_2 sorption.

5650. Sollner, K. and Gregor, H. P. **The electrochemistry of permselective membranes. III. The electrical resistance of permselective collodion membranes in solutions of various electrolytes.** *J. Colloid Sci.* 6, 557-70 (1951).

The measurement of the electrical resistance of collodion permselective membranes in solns. of KCl, K_2SO_4, LiCl, $MgCl_2$, and HCl was described. Three types of permselective membranes were used. Equil. was attained more rapidly with membranes of higher porosity. Marked increases in resistance were found for divalent cations.

5651. Tachibana, Taro; Fukuda, Kiyoshige, and Hamaguchi, Kozo. **Adsorption of proteins from aqueous solution on films of stearate and lipides.** *Bull. Chem. Soc. Japan* 24, 155-6 (1951) (in English).—*C.A.* 46, 8930*a*.

Adsorption of egg albumin on Ba stearate film (rendered hydrophilic by Th nitrate treatment) was complete in 5 min. at a max. thickness of 50 A. and was irreversible. The adsorbed layer of protein was decreased in thickness by immersion in 8 molal urea soln. Serum albumin was adsorbed on a hydrophilic surface only, whereas serum globulin was equally adsorbed from saline soln. on both hydrophilic and hydrophobic surfaces.

5652. Tanaka, Ryukichi and Shinohara, Teruo. **Dyeing of cellulose acetate. IV. Dyeing with indigo.** *J. Soc. Textile Cellulose Ind.* (Japan) 7, 510-12 (1951).—*C.A.* 46, 6389*b*.

In the dye-bath of indigo, into which AcOH was added in increasing amts. while raising the temp., cellulose acetate fibers were dyed darker than viscose fibers at 50°C when 50% or more of the total NaOH in the bath was neutralized by the AcOH.

5653. Tattersfield, C. P. **Dyeing of blends containing regenerated protein fibers.** *Brit. Rayon & Silk J.* 28, No. 330, 64-5; No. 331, 53-4 (1951).—*C.A.* 46, 2806*h*.

Traces of formalin in the fibers will alter the shades produced from Xylene 2R, Yellow 2G, Kiton Fast Red G, and Solvay Blue PFN. All premetallized azo dyes (Neolan) are readily taken up by regenerated protein fibers. There is greater exhaustion than with wool.

5654. Wall, W. T. and Drenan, J. W. **Gelation of polyacrylic acid by bivalent cations.** *J. Polymer Sci.* 7, 83-8 (1951).—*C.A.* 45, 7850*i*.

Polyacrylic acid (av. mol. wt. 205,000) was treated with alk. earth hydroxides to bring about gelation. The gel point was recognized by a sharp increase in turbidity resulting from the pptn. of clusters in which some polyelectrolyte ions were linked by 2 or more of the bivalent cations. It required approx. half as many equivs. of $Ba(OH)_2$ as $Sr(OH)_2$ to cause gelation. $Ca(OH)_2$ was less effective on an equiv. basis.

5655. Yamamoto, Daijiro and Iwaki, Ryojiro. **Relations between dye phosphors and hydrogen bonds of rigid media or surface of adsorbents.** *J. Chem. Phys.* 19, 662 (1951).—*C.A.* 45, 7882*e*.

The dye trypaflavin phosphoresced well when adsorbed on high-mol. substances such as various celluloses, starch, dextrin, agar-agar, and various solid proteins. Nitrocelluloses were not phosphorescent adsorbents.

5656. Bartell, F. E. and Ray, B. Roger. **Wetting characteristics of cellulose derivatives. I. contact angles formed by water and by organic liquids.** *J. Am. Chem. Soc.* 74, 778-83 (1952).—*C.A.* 46, 5834*f*.

The advancing and receding contact angles of H_2O were detd. by the verticalrod, tilting plate, or controlled-drop-vol. methods in expts. at 25°C on cellulose derivs. Fibers, rods, foils, films, and coatings of the derivs. were used. A regular and systematic increase in the hydrophobic nature of the fatty acid esters was found to occur with increase in length of the hydrocarbon chain. Qualitatively, the increase in hydrophobicity with substituent groups was in the order: hydroxyl, formyl, acetyl, H phthalate, ethoxy, nitro, propionyl, and benzoyl.

5657. Beamesderfer, J. W.; Thode, E. F.; Chase, A. J., and Hubbard, R. L., Jr. **Dye adsorption on wood pulp. I. Adsorption of direct dye on unbeaten sulfite pulp.** *Tappi* 35, 374-9 (1952).—*C.A.* 47, 313*f*.

The adsorption of Benzo Fast Scarlet 4BSA on unbeaten, bleached sulfite wood pulp was studied. Langmuir-type isotherms were obtained when the specific adsorption in mg dye/g dry pulp was plotted against final dye concn. in g/liter. Parameters were obtained for time of adsorption and for KCl concn. in the dye bath. When the dye was adsorbed on carbon black of a known surface area, the area covered by a dye mol. was calcd. to be 149 A^2. This agreed quite well with an area of 141 A^2. calcd. from the structural formula.

5658. Bhat, G. N. and Rao, M. R. A. **Chrome-mordanting of wool.** *J. Sci. Ind. Research* (India) 11B, No. 2, 67-75 (1952).—*C.A.* 46, 9313*b*.

The chrome-mordanting of wool with dichromate is discussed as regards the effects of wool quality, methods of scouring, temp., wetting agents, wool porosity, and the type of acids used, their adsorption by the wool, and their effect on the dichromate adsorption. Anionic and cationic wetting agents added to the mordanting bath of previously scoured and rinsed wool adversely affect the dichromate ion adsorption.

5659. Blaker, R. H. and Laucius, J. F. **The copper method for dyeing Orlon acrylic fiber.** *Am. Dyestuff Reptr.* 41, *Proc. Am. Assoc. Textile Chem. Colorists* P39-43 (1952).—*C.A.* 46, 4800*c*.

The mechanism of the dyeing involves the formation of a cuprous salt of an acid or direct dye contg. at least one, but not over one sulfonic acid or carboxyl group in the mol. Cuprous ion is first adsorbed by the Orlon acrylic fiber, forming coordinate bonds with selected nitrile groups, after which the formation of a salt between the dye anion and the weakly bound cuprous ion takes place.

5660. BRYANT, F. **Chromatographic studies of the silk fiber. I. The amino acid composition of two sericin fractions. II. Fractionation of a fibroin hydrolyzate.** *Textile Research J.* **22**, 523-5; 525-8 (1952).—*C.A.* **46**, 9313*g*.

Sericin isolated from raw silk was readily separable into H_2O-sol. and H_2O-insol. fractions. These were qualitatively analyzed from amino content by paper chromatography. An acid hydrolyzate of silk fibroin was adsorbed on a column of a cation-exchange resin.

5661. CATES, D. M.; CAMPBELL, K. S., AND RUTHERFORD, HENRY A. **Relation between certain defects in dyed fabrics and mechanical damage in wet processing.** *Textile Research J.* **22**, 623-30 (1952).—*C.A.* **47**, 321*f*.

The mech. damage by abrasion on the surface of cotton, viscose, Fortisan, and acetate fibers results in an increase in the initial rate of dyeing at the damaged area. An abraded area appears darker than the undamaged background up to the point where the amt of dye actually adsorbed is approx. the same in both areas.

5662. CHÊNE, M. AND MANTELET, P. **Capillary properties of pulps and papers.** *Ann. inst. polytech., Grenoble* **1952**, 55-66.—*C.A.* **46**, 9305*g*.

Five sulfite pulps, relatively high in α-cellulose (91.5-95.0), were examd. Detns. were made on the time in sec. required for a 10-cm capillary rise of H_2O on the pulp strip; the time required for a 3-cm rise of 18% NaOH; "swelling" noted in *N* NaOH after 1200 sec.; the specific surface (cm^2/g); the sp. vol. (cc./g); and the av. fiber length.

5663. DICKINSON, HAROLD O. **Adsorption of carbocyanines by gelatin.** *Colloque sensibilité phot., Paris, 1951, Science et inds. phot.* **23A**, 103-10 (1952).—*C.A.* **47**, 4773*e*.

Study of the absorption spectra of a series of carbocyanines of similar structures, dissolved in dil. solns. of gelatin, indicated that the mode and degree of adsorption of dye by gelatin depended on at least 3 factors: dye structure, concn. of gelatin, and pH. Some simple carbocyanines derived from benzothiazole did not appear to to be adsorbed in the aggregate state.

5664. DRIJVERS, L. **Dyeing of textile fibers at high temperatures: above 100°C.** *Teintex* **17**, 294, 297, 299-300, 303, 305, 307, 309, 311, 313 (1952).—*C.A.* **46**, 7333*d*.

Three years of experience with high-temp. dyeing of cellulosics, wool, nylon, Orlon, and mixed fibers indicated satisfactory results.

5665. FLETT, LAWRENCE H.; HOYT, L. F., AND WALTER, J. **Quantitative data on the adsorption of a detergent by cotton sheeting under textile processing conditions.** *Am. Dyestuff Reptr.* **41**, *Proc. Am. Assoc. Textile Chem. Colorists* P139-43 (1952).—*C.A.* **46**, 5324*i*.

Minute quantities of anionic detergents that were adsorbed from soln. could be detd. by improved analytical procedures. Adsorption increased rapidly with the increasing concns. up to 0.2% of the pure org. basis. Salt-free types of detergents showed much less adsorption at equal concns. of pure org. sulfonate; the Na_2SO_4 used as a builder increased adsorption and effectiveness. In general, synthetic detergents behaved like fugitive dyes in regard to adsorption, time, temp., and washing properties.

5666. FRISHMAN, D. AND HARRIS, M. **Stripping dyes from wool.** *Dyer* **108**, 465-7 (1952).—*C.A.* **47**, 871*b*.

The mech. properties of wool fibers were harmed by the process of dye-stripping, but the harm was minimized if the stripping was carried out in the presence of a cross-linking agent. Stripping was particularly difficult in the case of wool dyed with chrome dyes.

5667. FUJITA, HIROSHI. **A numerical solution of the differential equation for adsorption-controlled diffusion in a solid. Correction to "A numerical solution of the differential equation for adsorption-controlled diffusion in a solid."** *Textile Research J.* **22**, 281-6; 556 (1952).—*C.A.* **46**, 4877*g*; 9372*g*.

An attempt was made to evaluate a numerical soln. of a set of equations, the math. difficulties of which have not been resolved either analytically or numerically.

5668. FUJITA, HIROSHI AND KISHIMOTO, AKIRA. **Diffusion with adsorption to apply to the dyeing theory of fibers.** *J. Soc. Textile Cellulose Ind.* (Japan) **8**, 244-9 (1952) (English summary).—*C.A.* **46**, 9311*h*.

The relation between the concn. of a dye in a bath and the amt. adsorbed by a fiber (considered as a porous solid cylinder) dipped in the bath while the dye diffused into the swollen fiber was theoretically expressed. From the soln. the effect of adsorption on the general sorption-time curve was numerically discussed.

5669. GAMBLE, EDWARD H. **The continuous dyeing of new synthetic fibers.** *Am. Dyestuff Rptr.* **41**, *Proc. Am. Assoc. Textile Chem. Colorists* P223-41 (1952).—*C.A.* **46**, 7333*f*.

Practical continuous processes were being developed for the dyeing of Dacron, Dynel, Orlon, and Acrilan synthetic fibers. The development of a method for the continuous application of cuprous ions to acrylic fibers was described and it was found that the treated fibers could be dyed by batch-dyeing processes with leuco esters as well as with acid dyes. A surface-stripping treatment served both to det. the extent of dye penetration and to produce dyeings of vat dyes free from crocking.

5670. GUASTALLÁ, LINA. **Adsorption of myristic and palmitic acids on paraffin.** *Compt. rend.* **234**, 2051-3 (1952).—*C.A.* **46**, 9931*g*.

When palmitic acid was adsorbed on solid paraffin from the surface of a 0.01 *N* HCl soln., a change in state occurred. This was not found for myristic acid. Comparison of the superficial area of the paraffin with the concn. of the fatty acid taken up in passing through the film gave an indication of change of state upon adsorption.

5671. GUASTALLÁ, LINA P. **Extension of the Traube-Duclaux law: the adsorption of saturated fatty acids on paraffin.** *Compt. rend.* **235**, 941-3 (1952).—*C.A.* **47**, 4165*g*.

The coeff. of the Traube-Duclaux rule, which is practically equal to 3 for the adsorption of fatty acids on the free surface of their aq. solns., becomes 3.85 for the adsorption of these materials on the surface of solid paraffin.

5672. GUTHRIE, JOHN D. **Attachment of dyes to cotton by ether linkage.** *Am. Dyestuff Reptr.* **41,** *Proc. Am. Assoc. Textile Chem. Colorists* P13-14 (1952).—*C.A.* **46,** 5319*f*.

Cotton could be colored by attaching certain azo dyes to the cellulose by ether linkage in a single operation, the dye itself acting as the etherifying agent. Ether linkage of these dyes to cellulose when applied by curing with strong NaOH was demonstrated by decolorizing the fabrics with $Na_2S_2O_3.2H_2O$, diazotizing the decolorized fabrics with HNO_2, and coupling with a phenolic substance either to restore the original color or to impart a different color.

5673. GUTHRIE, JOHN D. **Ion-exchange cottons.** *Ind. Eng. Chem.* **44,** 2187-9 (1952).—*C.A.* **46,** 11693*g*.

The exchange capacities of 9 ion-exchange cottons were detd. by using NaCl and found to be below the capacities of com. granular resins. An aminized-iminized cotton was prepd. by treating aminized cotton with ethyleneimine vapor.

5674. HARRISON, W. **The combination of wool with acids.** *J. Soc. Dyers Colourists* **68,** 176-8 (1952).—*C.A.* **46,** 8379*d*.

Exptl. evidence shows that the laws of mass action are applicable to the adsorption of acids by wool, once the conditions have been exactly defined. Calcns. from given formulas were made for different pH values for HCl with and without the addn. of KCl, and the results plotted.

5675. HEARLE, J. W. S. **Peirce's two-phase theory of absorption of water by cellulose.** *J. Textile Inst.* **43,** T354 (1952).—*C.A.* **46,** 8460*a*.

The theory is modified to take account of the division of cellulose into cryst. and amorphous regions, which allows it to be applied to cellulosic materials of β values other than 3.

5676. HINOWARA, TADAO. **Rate of sorption of sodium hydroxide on a heterogeneous solid in a solution.** *Kagaku* (Science) **22,** 38-9 (1952).—*C.A.* **46,** 2372*i*.

Rate dx/dt of sorption of NaOH by powd. wood was measured in solns. 0.05 N at 100°C and 0.1 N at 20°, 35°, 50°, and 100°C. The equation $dx/dt = K(a-x)x^n$, where a = the final amt. sorbed and n = a const., was applied to obtain the rate const. $K = 0.031$ and $n = 1$ at 0.1 N and 35°C.

5677. HIRSCH, P. **Behavior of membranes between electrolyte solutions. II. Membrane potentials at oxidized Cellophane.** *Rec. trav. chim.* **71,** 354-60 (1952) (in English).—*C.A.* **46,** 5940*b*.

Oxidation of Cellophane membranes by Br_2 in NaOH soln. increases Δ at all pH values (2.5 to 10.0); this indicates that more —COOH groups are formed by oxidation. The quantity Δ is the membrane potential minus the liquid junction potential between 2 solns. of the same electrolyte (NaCl or KCl), both adjusted to the same pH and measured between the same two concns. c_1 and c_2.

5678. HIYAMA, HACHIRO; IKEGAMI, HISASHI, AND MANABE, OSAMU. **Sulfur dyes. XXX. Sodium sulfide needed in dyeing.** *Sci. Ind.* **27,** 6-7 (1952).—*C.A.* **47,** 4612*d*.

In exptl. dyeing of fibers with Immedial Indone R ($C_{26}H_{16}O_4N_4S_5.H_2O$) the amt. of Na_2S needed was 21.7 for completely reducing the dye to its leuco base, 10 for replenishing the loss of Na_2S in the bath by oxidation by O_2 in air, and 41.7% (of the dye) for the adsorption of dye on the fibers (here Na_2S could be largely replaced by NaOH or Na_2CO_3 provided the pH was kept at 10.6).

5679. INABA, AYAKO. **Wettability of solid surfaces. V. The effect of metallic cations on wettability of stearic acid.** *Bull. Chem. Soc. Japan* **25,** 174-9 (1952) (in English).—*C.A.* **47,** 6736*d*.

The wettability of stearic acid surfaces prepd. by coating a glass rod in molten stearic acid and solidifying in air was detd. Na, K, and Rb had no effect on the wettability as a function of pH, although an increase in the salt concn. lowered the pH at which the wettability increased. Al, Th, Fe(III), Cr(III), Co, Cu, Zn, Cd, Mn, and Ag showed enhanced wettability in a pH region characteristic for each salt. Ba, Sr, Ca, Li, and possibly Hg(II), Ni, and Pb reduced wettability in the pH region above 10.

5680. JACKSON, J. H. E. AND TURNER, H. A. **The desorption of a direct cotton dye from cellulosic fibers.** *J. Soc. Dyers Colourists* **68,** 345-52 (1952).—*C.A.* **46,** 11689*h*.

A study is reported of the desorption of purified Chlorazol Sky Blue FF from dyed bleached cotton and from dyed viscose rayon into water and into NaCl solns. With cotton a dyeing hysteresis is found. Unexpected features of the desorption into very dil. solns. of NaCl are explained by assuming the presence of a small proportion of basic groups in the cotton.

5681. JENSEN, JENS. **The importance of the oil content of wool for dyeing.** *Tids. Textiltek.* **10,** 1-4 (1952).—*C.A.* **46,** 7333*a*.

The influence of the oil content of a wool on the dyeability of the latter was detd. The exptl. data of the oil content and absorbed dye showed that the presence of elain impaired the dyeing process less than anticipated and that the impairing was more perceptible with strong colorations than with weak.

5682. JOHNSON, P. **Properties of lyophilic colloids.** *Chemistry & Industry* **1952,** 206-10.—*C.A.* **46,** 5401*c*.

Lyophilic colloids, contrasted with lyophobic colloids, were quite insensitive to electrolyte concn. and showed spontaneous dispersion on addn. of much dispersion medium. Colloidal electrolytes when dissolved in water evolved heat. at first by interaction of the polar groups with water, and at higher concns. by aggregation to reduce the hydrocarbon-water interfacial energy. Water added to an aq. cellulose soln. entered the amorphous portion producing only limited swelling.

For sol. and corpuscular proteins and polypeptide chain was folded regularly on itself and stabilized by electrostatic and nonpolar linkages.

5683. Jones, W. Mervyn. **Mobility in a sorbed layer. II. Surface flow through pores of molecular dimensions.** *Trans. Faraday Soc.* 48, 562-7 (1952).—*C.A.* 46, 10776*e*.

Flow may be wholly surface flow when the ratio of the perimeter of the pores to the cross-sectional area of the pores is large (as for long thin slits) and the resistance of surface flow is, as a result, very much less than the resistance to vapor flow. It appears that, if it be possible for surface diffusion alone to contribute to the the flow of gases and vapors through certain membranes, many of the co-ordinates governing such flow would be similar to those governing flow by vacancy diffusion and flow by place exchange.

5684. Juda, W.; Rosenberg, N. W.; Marinsky, J. A., and Kasper, A. A. **Electrochemical properties of ion-exchange resins. I. Donnan equilibria, membrane potentials, and conductivities.** *J. Am. Chem. Soc.* 74, 3736-8 (1952).—*C.A.* 46, 10777*f*.

Systems involving the Na salts of 2 chemically different cross-linked polyphenol-sulfonic acids, Permionic CR-41 and CR-51, in equil. with NaCl solns. were used for transport, conductance, and Donnan studies. The data were consistent with the assumption that the Na salt of the Cr-51 material was strongly ionized, whereas the Cr-41 material might be partially assocd. into ion pairs.

5685. Kamrisch, B. **Dyeing the modern synthetic fibers.** *Dyer* 108, 709-13 (1952).—*C.A.* 47, 1395*d*.

Existing dyes, especially acetate and wool dyes, are suitable for dyeing the newer fibers, provided modified techniques are used. Ardil and Vicara require wool dyes. Dynel has much lower shrinkage at 90-100°C than do the related Fibravyl and Thermovyl fibers and can therefore be dyed with acetate dyes at the boil.

5686. Katsurai, Tominosuke. **Behavior of particles of capillary-active substances in the phase microscope.** *Kolloid-Z.* 128, 32 (1952).—*C.A.* 47, 22*i*.

If a speck of surface-active substance, such as camphor, were brought together with a drop of water in the field of the phase microscope, a rotation of the particle was observed.

5687. Kleinert, Theodor. **Bound calcium in rayon pulps and its behavior in the viscose process. II. Effect on viscose filtration.** *Textile-Rundschau* 7, 98-102 (1952).—*C.A.* 46, 9302*e*.

In the tech. filtration of viscose, the removal of the Ca from the filter cloths by acid treatment is not sufficient to permit reuse of the cloths. It is also necessary to remove the hemi-cellulose colloid formed from the Ca salts of the hemicellulose carboxylic acids.

5688. Kohlitz, Werner. **The determination of gel particles in colloid solutions, particularly viscose.** *Rayon, Zellwolle u. Chemiefasern* 30, 343-6 (1952).—*C.A.* 46, 8935*d*.

When viscose soln. was allowed to flow through a 1-mm glass capillary into streaming water, the gels became visible and could be readily counted. This test was improved by utilizing a glass ring nozzle with 0.7-mm slits. For TiO_2-filled viscose, a ring nozzle of V2A with 0.3 mm slit width gave greater accuracy.

5689. Kopaczewski, Wladislas. **Passage of hydrosols across lipide layers and the nature of the support.** *Compt. rend.* 235, 102-4 (1952).—*C.A.* 46, 10784*e*.

The passage of aq. solns. through a lipide barrier was studied for supports of different chem. natures: cellulose, wool, silk, raw silk, and cellulose impregnated with dild. horse serum. The supports were washed with alkyl arylsulfonate, rinsed in distd. H_2O, air-dried, and their ends were immersed in colored hydrosols which were either electroneg., electropos., or neutral, and in distd. H_2O. The height the color moved up the supports was measured. The penetration of colored hydrosols varied with the nature of the support and the chem. and phys. characteristics of the liquids.

5690. Kruger, Joan; Donovan, R., and Larose, P. **Sorption of Orange II by wool.** *Can. J. Technol.* 30, 215-21 (1952).—*C.A.* 47, 4614*a*.

The sorption of Orange II on wool at 100°C was detd. in the presence of AcOH and H_3PO_4 and compared with previous data with H_2SO_4 and HCl. The sorption of the dye was affected not only by pH, but also by the type of acid used and the absorption of acid by wool. The competition between the sorption of the anion and the dye depended on the concn. of the acid and its affinity for the wool. The type of the sorption isotherm was the same for all acids.

5691. Landsberg, Rolf. **Potentials in the formation of precipitated membranes. II.** *Z. physik. Chem.* 199, 280-2 (1952).—*C.A.* 46, 8936*b*.

In the formation of Cu ferrocyanide ppts. in gelatin a max. p.d. was reached with $Cu(NO_3)_2$ or $CuSO_4$. With $CuCl_2$, however, a smaller p.d. was obtained, a longer time was needed, and the zone of pptn. was more diffuse. A p.d. was observed when a plug of gelatin contg. $CuSO_4$ was dipped into a $K_4Fe(CN)_6$ soln.

5692. Laxer, G. and Whewell, C. S. **The measurement of damage produced by treatment of wool with solutions of hydrogen peroxide.** *J. Soc. Dyers Colourists* 68, 256-7 (1952).—*C.A.* 46, 8379*f*.

The percentage reduction in work to stretch the fibers 30% (% R.W.) was considered an estimate of damage. In a study, calibrated fibers of various diams. were immersed in H_2O_2 solns. maintained at const. temp. for various lengths of time. The % R.W. was very dependent upon the fiber diams., coarse fibers being less easily attacked than finer ones.

5693. Malm, C. J.; Barkey, K. T.; May, D. C., and Lefferts, E. B. **Treatment of cellulose prior to acetylation.** *Ind. Eng. Chem.* 44, 2904-9 (1952).—*C.A.* 47, 2977*e*.

High reactivity of cellulose toward acetylation was obtained when there was rapid and uniform sorption of H_2SO_4 catalyst. The amt. of sorbed H_2SO_4 was not as important as the uniformity of its distribution in the cellulose. The principal function of the catalyst treatment was the reduction of the cellulose chain length prior to acetylation.

5694. MARTIN, G. R. **Note on use of volatile filter beds.** *Chemistry & Industry* **1952**, 131.—*C.A.* 46, 5894*g*.

A suspension of finely divided naphthalene crystals, was poured into a straight-sided microfunnel fitted with a glass nail, and the excess liquid removed by suction to give a filter bed of 3-mm thickness which could be volatilized after use. The bed retentivity was 99.99% when 20 mg of I^- was converted to AgI and filtered.

5695. MEADER, ARTHUR L. JR. AND FRIES, BERNARD A. **Adsorption in the detergent process.** *Ind. Eng. Chem.* 44, 1636-48 (1952).—*C.A.* 46, 10647*c*.

The radio-active-tracer method measured directly the rate and extent of adsorption and desorption on cotton and woolen cloth of Na alkyl benzene sulfonate (A) labeled with S^{35} and Na palmitate labeled with C^{14} in the carboxyl group. Adsorption curves were plotted up to 0.01 *M* in distd. water and synthetic hard water (300 p.p.m.) at 21°, 45°, 60°, and 75°C for many of the possible combinations. Successive addn. of Na_2SO_4 progressively raised the level of the whole adsorption curve. The adsorption of miscelles was postulated and appeared consistent with the data.

5696. MONGARD, J. L. AND WASSERMANN, ALBERT. **Adsorption of electrolyte by alginate gels without and with cation exchange.** *J. Chem. Soc.* **1952**, 492-7.—*C.A.* 46, 4319*b*.

Gels of fully swollen fibrous alginates (polymeric D-mannuronic acid derivs.) undergo cation exchange with many typical ionic reagents. Alginates also are shown to adsorb significant amts. of these reagents in a manner not assocd. with cation exchange.

5697. MONGAR, J. L. AND WASSERMANN, A. **Influence of ion exchange on optical properties, shape, and elasticity of fully-swollen alginate fibers.** *J. Chem. Soc.* **1952**, 500-10.—*C.A.* 46, 4319*a*.

Fully-swollen, stretched, and optically anisotropic Ca alginate fibers undergo cation-exchange reactions with an increase of vol. and transparency of the gel, loss of birefringence, axial contraction, and increase of elasticity.

5698. MOULD, D. L. AND SYNGE, R. L. M. **Electrokinetic ultrafiltration analysis of polysaccharides. A new approach to the chromatography of large molecules.** *Analyst* 77, 964-70 (1952).—*C.A.* 47, 1546*a*.

Much of the difficulty in the chromatographic sepn. of members of a polymeric series was caused by the inability of the larger mols. to enter the porous materials by chromatography. Electrokinetic ultrafiltration was recommended to overcome this difficulty. A preliminary account was given to expts. with collodion membranes.

5699. MÜLLER, LUDWIG W. **Dyeing Perlon and nylon, alone and in mixtures with other fibers; various important characteristics of polyamide fibers.** *SVF Fachorgan Textilveredlung* 7, 20-5, 65-70, 108-12 (1952).—*C.A.* 47, 322*e*.

Dyeing methods and the suitable com. dyes for polyamide fibers were reviewed.

5700. MURAMATSU, MITSUO AND SASAKI, TSUNETAKA. **The nature of built-up films. I. Adsorption of ions on built-up films of stearic acid.** *Bull. Chem. Soc. Japan* 25, 21-5 (1952) (in English).—*C.A.* 47, 2013*g*.

The adsorption of metallic ions on built-up films of stearic acid monolayers was studied. Films were prepd. by (1) transference from H_2O and (2) conversions from Ba stearate multilayers by HCl. Various metallic ions produced a max. apparent thickness at a characteristic pH. Similar max. were obtained at a pH characteristic for each element. Cu and Hg showed small max. at pH 6.3 and 9, resp.

5701. NAGAMATSU, MASATOSHI AND SEIYAMA, TETSURO. **Electrochemical studies on ion exchangers. III. Ion-exchange reaction between solid alginic acid and neutral salt solution.** *J. Electrochem. Soc. Japan* **20**, 170-2 (1952).—*C.A.* 47, 423*e*.

The exchange reaction of solid alginic acid reached equil. only after 2 hrs. The ion-exchange power of the --COOH group was smaller than that of the --SO_3H group in a cation-exchange resin. Solid alginic acid satisfied an exptl. linear relationship between log K_a and the exchange percentage.

5702. NEALE, S. M. AND STANDING, P. T. **The measurement of Donnan potentials with cellulose and aqueous solutions.** *Proc. Roy. Soc.* (London) **A213**, 530-45 (1952).—*C.A.* 46,10786*c*.

Exptl. results show that the membrane can be regarded as an aq. region of uniform potential that depends on a Donnan distribution of the mobile ions. The degree of dissocn. of the nondiffusible ionogenic groups depends on the concn. of neutral electrolyte soln. in contact with the membrane. The dissocn. const. in the carboxylic acid groups in cellophane is derived.

5703. NISHIDA, KENZO. **Direct dyeing of cellulose. I. Construction of a photoelectric color meter and direct dyeing.** *J. Soc. Textile Cellulose Ind.* (Japan) **8**, 347-50 (1952) (English summary).—*C.A.* 46, 9851*c*.

With a photoelec. colorimeter specially constructed with a gas-filled Se cell the absorption isotherms of 0.01-0.05 g/liter Diamine Blue 2B by Cellophane and oxycellulose were detd. With NaCl added up to 5 g/liter as mordant the curves were typically parabolic or hyperbolic, but became S-shaped with higher NaCl concns.

5704. NISHIDA, KENZO. **Direct dyeing of cellulose. II. Dyeing properties of Aizen Direct Blue BBH, Diamine Blue 3B, and Nippon Sky Blue.** *J. Soc. Textile Cellulose Ind.* (Japan) **8**, 463-6 (1952) (English summary).—*C.A.* 47, 321*h*.

Finished cotton was dyed progressively better as detd. with a photoelec. colorimeter in the absorbed dye extd. with 25% pyridine, with Aizen Direct Blue BBH, Diamine Blue 3B, and Nippon Sky

Blue (Na salts of H acid coupled into disazo dyes with dianiline, ditoluidine, and dianisidine, resp.) in order in a bath at 90°C contg. 0.05-0.1 × 10^{-3} dye and 0.5-4.5 mole NaCl/kg H_2O.

5705. Nishida, Kenzo. **Effects of metallic salts in dyeing silk. I. Absorption affected in direct dyeing.** *J. Soc. Textile Cellulose Ind.* (Japan) **8**, 404-6 (1952) (English summary).—*C.A.* 47, 321*i*.

Silk cloth absorbed more Nippon Fast Yellow 3C, Nippon Brilliant Rose BD, and Nippon Violet LN when higher concns. of $FeCl_3$ or $CuSO_4$ were added (up to 20 × 10^{-4} mole/liter) to the scouring and H_2O bath.

5706. Pearl, Wesley L. **The sorption and rate of sorption of the amylose fraction of starch by papermaking fibers.** *Tappi* **35**, 41-8 (1952).—*C.A.* 46, 6830*c*.

The sorption of the amylose fraction of starch on cotton linters and wood pulp was shown to be irreversible, the rate depending upon the concn. of the soln. Sorption capacities as high as 34 g amylose/100 g pulp were noted. High pH (10.4) decreased the amt. of amylose sorbed; increased severity of beating increased the sorption.

5707. Rånby, Bengt G. **Physicochemical investigations on bacterial cellulose.** *Arkiv. Kemi* **4**, 249-55 (1952) (in English).—*C.A.* 46,8365*c*.

Electron micrographs of a sample of bacterial cellulose from *Acetobacter xylinum* showed a string diam. of 100 A. rather than 250 A. Analysis of the phase transition of cellulose I to II (mercerization by NaOH) with x-ray diffraction and water sorption had shown that bacterial cellulose had transition properties very similar to those of cotton cellulose but different from those of animal cellulose.

5708. Rastogi, M. C. **Liesegang-ring formation of the sparingly soluble salts of rarer elements in agar-agar and starch gel.** *J. Indian Chem. Soc.* **29**, 206-8 (1952).—*C.A.* 47, 25*g*.

Liesegang rings of various rarer elements (Zr, Ce, Be, U, tungstates, vanadates, etc.) were obtained in agar and starch media. Rings of some salts (i.e. Th phosphate, sulfate, and peroxide; $Zr(OH)_4$, $CaWO_4$) were not obtained at the concns. used. Rings were well defined and sepd. by clear spaces (type I), or else consisted of alternate colored bands in the otherwise continuous deposit (type II).

5709. Rigamonti, Rolando and Riccio, Virginio. **Property of ion exchange of the cellulose esters of dicarboxylic acid.** *Ann. chim.* (Rome) **42**, 580-5 (1952).—*C.A.* 47, 3080*i*.

The cellulose esters of phthalic, maleic, succinic, and adipic acids have good ion-exchange power. That of the succinate is exceptionally high when it is prepd. by boiling the cellulose impregnated with fused succinic anhydride.

5710. Ripley-Duggan, B. A. **Adsorption by wood from aqueous solutions. I. Adsorption of barium chloride, sodium chloride, and water.** *New Zealand J. Sci. Technol.* **34B**, 1-12 (1952).—*C.A.* 47, 3080*g*.

H_2O is rapidly adsorbed and equil. attained in a few min. at 15° and 25°C. Solutes were adsorbed more slowly, equil. being reached in a few hrs. The adsorption of Ba^{++} was a linear function of Ba^{++} concn. NaCl showed an apparent neg. adsorption (H_2O was adsorbed relatively more easily than is NaCl).

5711. Roy, Alexander P. **New developments in the dyeing of synthetic fibers.** *Am. Dyestuff Reptr.* **41**, *Proc. Am. Assoc. Textile Chem. Colorists* P35-8 (1952).—*C.A.* 46, 4799*d*.

The new synthetic fibers, superior to the natural fibers in many properties, are at the present time special-purpose, rather than general-purpose fibers. Improvements in the processing, dyeing, and finishing of synthetic fibers are discussed and illustrative formulas are given.

5712. Saroff, H. A. and Dillard, G. H. L. **A continuous-membrane diffusion column.** *Arch Biochem. Biophys.* **37**, 340-52 (1952).—*C.A.* 47, 356*f*.

The column allows the suspension of large areas of Cellophane in a zig-zag fashion so that thin films of solns. flow continuously on both sides of the membrane. Data are presented on the dialyzing efficiency of the app. and on the concn. contours of solns. processed. Thickness of the solns., mixing, and time of travel on the column give conditions such that the diffusion coeffs. of the solutes rather than pore size of the Cellophane can be made the controlling factor in the operation of the app.

5713. Schmid, Gerhard. **Electrochemistry of fine-pore capillary systems. VI. Convection conductivity (theoretical consideration).** *Z. Electrochem.* 56, 181-93 (1952).—*C.A.* 47, 981*i*.

The term surface cond. introduced by Smoluchowski for that part of the total cond. due to convection currents in the Helmholtz double layer is replaced by the term convection cond. Convection currents and convection cond. may occur, although a Helmholtz double layer can no longer be assumed because the pores are too narrow. The correct formulas which include the effect of convection cond. for the previously idealized fine-pore system are derived. The convection cond. can be regarded as the cond. contribution of the fixed ions in the pores. Because ion-exchange resins have high fixed-ion concns. in their pores, convection cond. can no longer be neglected, especially for resins which have high water permeability.

5714. Schöberl, A. **Green hairs, and the problem of metal deposits in wool.** *Melliand Textilber.* 33, 4-14 (1952).—*C.A.* 46, 5323*a*.

Metal deposits can be formed in wool by heating 1 g wool in 125 cc. H_2O at 90°C for several days in the presence of 1-7 g Hg, Pb, Cd, Zn, Fe, W, or Cu in the metallic form. Flocks of colored wool are obtained contg. 1-12% metal and having a pH in the range 5-8. Cu is taken up in the greatest amts. It forms brown deposits having the Cu_2S pattern. Cu-treated wool on storage, especially in light, turns green owing to oxidation of Cu_2S to form cupric compds. This is a lab. method for forming "green hairs" that correspond exactly to those that have been found to occur naturally on humans under special circumstances (e.g., Cu miners).

5715. SCHULMAN, FRED AND ZISMAN, W. A. **Surface chemical properties of solids coated with a monolayer of perfluorodecanoic acid.** *J. Chem. Soc.* 74, 2123-4 (1952).—*C.A.* 47, 6726*a*.

Compds. such as perfluorodecanoic acid are examples of a new class of surface-active compds. with CF_3 groups and 1 or more adsorbable polar groups at opposite portions of the mol. These possess both highly hydrophobic and organophobic properties, and when close packing of CF_3 groups can occur, they will have even more unusual resistance to chem. attack by bulk liquids.

5716. STANDING, H. A. **Equilibrium adsorption of direct dyes by cellulose materials.** *Chemistry & Industry* **1952**, 527-30.—*C.A.* **46**, 8857*i*.

A review of the effect of temp., dye and salt concn., and dyebath pH on the equil. adsorption of a dye by cellulose, and theories of direct dyeing since 1935.

5717. STORY, L. F. **Use of copper sulfate in dipping sheep and its effect on the subsequent processing of the wool.** *New Zealand J. Sci. Technol.* **34A**, 287-93 (1952).—*C.A.* 47, 5687*b*.

Since many chrome dyes are affected by Cu, small quantities of Cu retained on sheep wool as a result of treatment of the sheep with $CuSO_4$ can lead to faulty dyeing. General discoloration can occur because of the formation of CuS. Also, Cu has a marked catalytic effect on peroxide bleaching. Ethylene-diaminetetraacetic acid can remove 0.005% of evenly distributed Cu from wool but is less effective against a local high concn.

5718. SWILLENS, P. **The influence of temperature on dyeing and the use of dyeing temperatures exceeding 100°C.** *Rayonne et fibres synthet.* **8**, No. 4, 43-9 (1952).—*C.A.* 46, 6838*i*.

The advantageous effect of high temps. in dyeing is considered in the light of the damage done to some dyes by the reducing action of viscose in alk. solns. and of the unevenness produced by increased dye uptake.

5719. TANAKA, RYUKICHI; SEKO, KAZUMITSU, AND MURAYAMA, TETSURO. **Dyeing of cellulose acetate fibers. V. Dyeing with indigo. VI. Dyeing with indigo (dispersion).** *J. Soc. Textile Cellulose Ind.* (Japan) 8, 124-6 (1952) (English summary).—*C.A.* 46, 8858*g*.

Cellulose acetate fibers left in an indigo bath at 30°C at 0.5-32 hrs., unlike viscose rayon being dyed max. in 30 min., were dyed more deeply with longer times by progressive dissoln. of indigo in the fibers. The dispersion of indigo in 0.2 g/150 cc. soln. by adding AcOH in varying amts., as estd. from its diffusion through 5% gelatin gel, was less with more AcOH added, the indigo forming larger particles.

5720. TANAKA, RYUKICHI AND MURAYAMA, TETSURO. **Dyeing of cellulose acetate fibers. VII. Dyeing with indigo (mechanism).** *J. Soc. Textile Cellulose Ind.* 8, 194-6 (1952).—*C.A.* 46, 8858*i*.

The indigo soln. neutralized with AcOH was shaken with AcOEt at room temp. (11°-14°C) for 10-160 min. The amt. of indigo dissolved in AcOEt increased linearly with the amt. of AcOH added, and the soly. line became more horizontal with longer shaking. Since the expt. simulated the dyeing of cellulose acetate fibers with indigo, the affinity of indigo to the acetate fibers could be explained by the solid-soln. theory.

5721. THODE, E. F.; BEAMESDERFER, J. W., AND CHASE, A. J. **Dye adsorption on wood pulp. II. Relation of dye adsorption to physical properties of beater sulfite pulp.** *Tappi* 35, 379-84 (1952).—*C.A.* 47, 313*h*.

Specific dye adsorption on beaten sulfite wood pulp was detd. The specific dye adsorption for beaten sulfite pulp varied from 0.15 to 0.5 mg. dye/g. dry pulp. This value correlated well with surface areas obtained by silvering and permeability techniques, and gave straight lines, on a semilogarithmic scale, with strength values on handsheets from the pulp.

5722. TURNBULL, S. G., JR. **The dyeing of nylon, Orlon acrylic fiber, and Dacron polyester fiber.** *Am. Dyestuff Reptr.* **41**, *Proc. Am. Assoc. Textile Chem. Colorists* P75-8, P82 (1952).—*C.A.* 46, 4799*i*.

Nylon is characterized as the most dyeable of the 3 fibers; it can be effectively dyed with acetate, acid, chrome, basic, naphthol, and Capracyl dyes.

5723. VUCCINO, S. **The preparation and investigation of some thin films of high polymers used in nuclear physics.** *J. phys. radium* **13**, 543-9 (1952).—*C.A.* 47, 5717*c*.

Thin films to be used as supports for radioactive sources or as counter windows were prepd. from polyvinyl chloride, formvar, and polystyrene. Some films had a thickness of only 1 γ/cm^2. The films could be removed from the H_2O surface by adding EtOH to lower surface tension and lifting the film on a brass ring. The films were more difficult to remove from glass.

5724. WALL, FREDERICK T. AND SWOBODA, THOMAS J. **Electrolytic interaction of nylon with aqueous solutions of sodium hydroxide.** *J. Phys. Chem.* 56, 50-6 (1952).—*C.A.* 46, 7847*g*.

The theory for the interaction of charge-bearing fibers with acids and bases was generalized to cover the 6 possibilities of titration with either acid or base of nylon with $A > B$, $A = B$, $A < B$ (A = total CO_2H groups; B = total NH_2 groups). Good agreement was observed between theory and expt., and the results were used to calc. equil. consts. for ion-absorption and neutralization processes.

5725. WEATHERBURN, A. S. AND BAYLEY, C. H. **The sorption of synthetic surface-active compounds by textile fibers.** *Textile Research J.* 22, 797-804 (1952).—*C.A.* 47, 1396*i*.

Sorption decreases in the order cationic compds., anionic compds., nonionic compds. The addn. of Na_2SO_4 increases the sorption of Na alkyl sulfates. The sorption of nonionic di-Bu cresol-ethylene compds. decreases slightly with increasing length of the polyethylene oxide chain over the range studied.

5726. Weber, Rudolf. **Chemical identification of wool damage.** *SVF Fachorgan Textilveredl.* 7, 15-20, 55-9 (1952).—*C.A.* 46, 5323*d*.

Damaged wool will absorb more Cu from an ammoniated Cu_2SO_4 soln. than undamaged wool. Two g wool are digested with 100 cc. of a $[Cu(NH_3)_4]SO_4$ soln. contg. 76.5 mg Cu for 15 min. at room temp. Then the wool is removed and the residual Cu is titrated with $Na_2S_2O_3$ in a H_2SO_4-KI soln. The wool sample will show a green color after Cl or oxidation damage, gray after alk., and violet after acid damage.

5727. Bernanose, André; Comte, Marcel, and Vouaux, Paul. **A new method of emission of light by certain organic compounds.** *J. chim. phys.* 50, 64-8 (1953).—*C.A.* 47, 6258*e*.

The dyes Gonacrine and Acridine Brilliant Orange E when adsorbed upon a sheet of Cellophane and the sheet placed in a sufficiently strong alternating elec. field gave rise to rather strong light emission.

5728. Bugher, John C. **Characteristics of collodion membranes for ultrafiltration.** *J. Gen. Physiol.* 36, 431-48 (1953).—*C.A.* 47, 3047*d*.

An app. was described for securing collodion membranes of different porosity. The pore diam. was regulated by varying the amt. of PrOH soln.

5729. Deile, O.; Krämer, H. and Klaus, W. **The adsorptive retention of methylcellulose on polystyrene from the index of refraction of polystyrene sols with added methylcellulose.** *Kolloid-Z.* 130, 105-10 (1953).—*C.A.* 47, 6221*i*.

The flocculation of polystyrene sols by medium-viscosity methylcellulose was at a max. when the concn. ratio was 20:1. This was detd. by measuring n and considering a min. value of n to be indicative of max. flocculation. The adsorption of methylcellulose was believed to result from the formation of counter-ions between the sulfonate ions peptizing the Styofon and the pos.-charged O atoms of methylcellulose.

5730. Goto, Rempei; Sugano, Takeo, and Hayama, Naomi. **Protective power of surfactants for dyes.** *Bull. Inst. Chem. Research, Kyoto Univ.* 31, 133-4 (1953).—*C.A.* 47, 6663*b*.

The rubine nos. of various surfactants were examd. Nonionic and catonic surfactants showed remarkable protective power for Congo Rubine, an anionic dye, while anionic surfactants did not, and cationics induced distinct coagulation of the dye without change of color; the ppt. of the dye by KCl accompanied a distinct color change.

5731. Larose, P. **The sorption of hydrogen chloride by wool.** *Textile Research J.* 23, 91-8 (1953).—*C.A.* 47, 3571*a*.

The sorption of acids by wool from aq. solns. is generally regarded as a back-titration of the free —COOH groups present in the protein. Expts. described form part of an attempt to learn more of the interaction between wool and acids. The large amt. of HCl sorbed under certain conditions indicates that the peptide bond must be responsible for a large part of the gas sorbed.

5732. Laxer, G. and Whewell, C. S. **Adsorption of metal ions by naturally pigmented keratin fibers.** *J. Soc. Dyers Colourists* 69, 83-4 (1953).—*C.A.* 47, 5122*b*.

The amts. of Fe and Cu adsorbed by pigmented keratin fibers are much greater than those taken up by the white keratin fibers. There is an approx. linear relation between the degree of coloration of the fiber and the amt. of metal adsorbed.

5733. Rae, John. **Absorption of dyes by gels.** *Pharm. J.* 170, 30 (1953).—*C.A.* 47, 4165*h*.

Gels consisting of gelatin, agar agar, pectin, isinglass, in H_2O, and polyvinyl alc. in a buffer soln. were prepd., and the penetration of the dye was measured 24 hrs. after it was poured on the solidified gel. The dyes used were acriflavine, Congo red, Mercurochrome, Bordeaux B, trypan blue, tartrazine, and methylene blue.

5734. Ray, B. Roger and Bartell, F. E. **Hysteresis of contact angle of water on paraffin. Effect of surface roughness and of purity of paraffin.** *J. Colloid Sci.* 8, 214-23 (1953).—*C.A.* 47, 6219*c*.

The contact angle of H_2O on very thin films of purified paraffin formed on smooth glass surfaces by vacuum sublimation was 112°C, without significant hysteresis between advancing and receding angles. Hysteresis effects in the range of 5°-35°C were observed for rougher or thicker films.

5735. Smith, Denton L. and Schoonover, I. C. **Direct-filling resins: dimensional changes resulting from polymerization shrinkage and water sorption.** *J. Am. Dental Assoc.* 46, 540-4 (1953).—*C.A.* 47, 6693*e*.

Direct-filling resins shrink approx. 6-8% in vol. during polymerization; this shrinkage occurs in local areas rather than uniformly in all directions. In the absence of strain, these resins expand equally in all directions as the result of water sorption, approx. 1-1.5% by vol.

5736. Wall, Frederick T. and Saxton, Patricia M. **Electrolytic interaction of nylon with sodium hydroxide solutions at different temperatures.** *J. Phys. Chem.* 57, 370-5 (1953).—*C.A.* 47, 6146*f*.

Polyhexamethyleneadipamide (nylon 66) was studied. The adsorption of NaOH by nylon fibers was studied at 25°, 36.4°, and 49.7°C. Equil. consts. were detd. for the adsorption, which occurred in 2 stages. Equations were developed to relate the heat of adsorption with the change in OH^- concn. necessary to keep const. the amt. of adsorbed base at different temps.

Chapter III. THERMAL EFFECTS IN ADSORPTION PROCESSES

III-1. Heats of Adsorption

5737. Calvet, Édouard. **Thermal effects produced during adsorption of acetone by nitrocelluloses.** *Ann faculté sci. Marseille* **15**, 13-26 (1941).—*C.A.* **40**, 6964^3.

App. for detg. the heat of adsorption of acetone by nitrocellulose, and for measuring the total heat of soln. of nitroramie in acetone, resp. was described. Results of 15 expts. using 1 g of nitroramie contg. 14.0% N, and 23 expts. using 1 g of nitroramie with 11.47% N, were given.

5738. Calvet, Édouard. **Gelatinization of nitrocellulose. Heat of adsorption of acetone by fibers and films of nitrocellulose.** *Compt. rend.* **214**, 716-18 (1942).—*C.A.* **38**, 3888^4.

Tests with nitrocellulose films of 14% and 11.5% N gave results similar to those previously obtained with nitrated ramie fibers. Curves showed a max. evolution of heat with adsorption of 6 mols. of acetone per C_6; 24,700 cal/g for 11.5% N and 18,600 cal/g for 14% N. Beyond this concn. the curves dropped sharply for fibers of both degrees of nitration.

5739. Fricke, R. **Active substances. LVIII. Calculation of surface energy of nonpolar solids from the heat of sublimation.** *Z. physik. Chem.* **B52**, 284-94 (1942).—*C.A.* **37**, 5308^8.

The temp. dependence of the total and free surface energy of metal surfaces were calcd. for the range in which the Dulong-Petit law was valid. Both the total energy and the entropy were const. The free energy decreased linearly with increasing temp.

5740. Fricke, R. and Pfau, H. H. **Active substances. IV. Physical inhomogeneity of active solids.** *Kolloid-Z.* **100**, 153-8 (1942).—*C.A.* **38**, 1678^7.

Prepns. of active ZnO and Fe_2O_3 were caused to undergo a partial reaction (ZnO with aq. KOH, Fe_2O_3 with aq. HF, and with H_2O to give FeOOH), during which the most active portions would be expected to react preferentially. Detns. of the heat of soln. of the specimens before and after reaction showed the activity of the original specimen to be greater than that of the residue in each case.

5741. Gregg, S. John. **Heat of adsorption of ethylchloride and of sulfur dioxide on sugar charcoal.** *J. Chem. Soc.* **1943**, 351-5.—*C.A.* **37**, 6536^2.

The heats of differential adsorption on charcoal were measured in an ice calorimeter for very low pressures up to 1 atm. for SO_2, and up to satd. vapor for EtCl. From these measurements adsorption isotherms were detd. A sharp fall from 11,500 cals per mol. to 6000 cals per mol. was found for EtCl for pressures less than one quarter of the satn. pressure. This was attributed to the formation of films more than 1 mol. thick above that point.

5742. Harkins, W. D. and Jura, Geo. **The extension of the attractive energy of a solid into an adjacent liquid or film and the decrease of energy with distance.** *J. Chem. Phys.* **11**, 560-1 (1943).—*C.A.* **38**, 904^8.

The energy of adsorption or desorption of water on TiO_2 at 25°C decreased nearly exponentially from 6550 cal per mole for the 1st layer to 30 cal per mole for the 6th and successive layers. Deviations from the exponential suggest an orientation effect in some layers. N_2 at -195.8°C and H_2O at 25°C on various nonporous solids gave films 7-10 monolayers thick before satn. was attained.

5743. Haul, R. **Energy and state of order of atoms in the surface of liquids and solids.** *Z. physik. Chem.* **B53**, 331-61 (1943).—*C.A.* **38**, 1408^2.

With He, Ne, A, Hg, Na, Pb, Ag, Au as examples of simple liquids, conclusions were drawn regarding the arrangement of atoms at the surface. From crystallographic considerations, the total surface energy was obtained from the internal heat of sublimation and this was done for various temps. and crystal surfaces. A method was given for estg. the temp. coeff. of the free surface energy for solids. The surface entropy so obtained made it possible to get the free surface energy from the total surface energy.

5744. Jura, George and Harkins, W. D. **Relationship between the energy of adsorption of a vapor on a solid and of immersion of the solid in a liquid.** *J. Chem. Phys.* **11**, 561-2 (1943).—*C.A.* **38**, 904^9.

The equation, developed for calculating the heat of adsorption, was valid for either nonporous or porous solids at all relative pressures. When a solid was removed from the liquid into the vapor of the liquid, the correct film thickness was detd. by the equil. pressure.

5745. Lauer, K.; Doderlein, R.; Jackel, C., and Wilde, O. **Cellulose fibers. I. The system fiber-water.** *J. makro-mol. Chem.* **1**, 76-96 (1943).—*C.A.* **38**, 1354^8.

The heat of adsorption was detd. for a no. of pulps (including spruce, pine, cereal straws and other plants), viscose rayon and staple fibers from various woods, straws, etc. and ramie, cotton and filter paper. Cotton and filter paper, including certain pulps, gave an av. value of 1.69 (± 5%) kcal/mole $C_6H_{10}O_5$, wood pulps gave a value of 2.11 (± 10%) and rayon and staple fibers gave 3.41 (± 8%). The heat of adsorption ("heat of solvation") for regenerated cellulose was twice that of native cellulose. Calcd. for 1 mole of H_2O, the heat of adsorption was 3.40 kg-cal for both types of fibers. The heat of adsorption of mercerized cellulose increased with the time of mercerization with 20% NaOH at 20°C (the degree of polymerization was practically unchanged).

5746. Sakai, Wataru; Kurimura, Rokuro, and Okuno, Toshiro. **Catalytic powers of manganese oxides IV-V. V. Heat of adsorption and adsorption velocity of oxygen by manganese oxides.** *J. Soc. Chem. Ind. Japan* 46, 1011-18 (1943).—*C.A.* 43, 1624*b*.

The differential heat of adsorption q at the adsorption quantity a was calcd. by integrating $(d \log p/dT)_a = 2/RT^2$, between p_1 and p_2, the equil. pressures, at T_1 and T_2, resp. Adsorption of O_2 by Mn oxides was endothermic. Some samples of Mn oxides showed a secondary slower adsorption above 50°C. The velocity of this secondary adsorption was measured at 50°C by keeping the vol. of the adsorption chamber const. and recording the change in p with time. The secondary adsorption was due to the diffusion of gaseous atoms into the adsorbent.

5747. Wilhelm, R. H.; Johnson, W. C., and Acton, F. S. **Conduction, convection and heat release in catalytic converters.** *Ind. Eng. Chem.* 35, 562-75 (1943).—*C.A.* 37, 4614².

The rate of heat generation in cylindrical and slab-shaped catalyst beds and the rate of heat removal by conduction through the catalyst and gas in a direction perpendicular to the gas stream were studied. Point temps. in any catalyst cross section, the integral mean temp. of the section, and the rate of heat transfer through the periphery of the bed were related to the diam. or thickness of bed, outer bed temp., gas temp., catalyst activity, temp. coeff. of heat generation, thermal cond. of catalyst, and convection coeff.

5748. Beggerow, Gertrud and Harteck, P. **The relation between strength of adsorption and heat of adsorption for hydrocarbons.** *Z. physik. Chem.* 193, 265-73 (1944).—*C.A.* 41, 1524*e*.

The heats of adsorption on silica gel (75 g) were detd. (kcal/mole): pentane (5g) 8.8; hexane (5 g) 10.8; heptane (5 g) 11.9; octane (5 g) 14.2; 2,2,4-trimethylpentane (5 g) 12.3; benzene (5 g) 13.0; toluene (5 g) 14.4; o-xylene (5 g) 16.6; p-xylene (5 g) 16.6; cyclohexane (5 g) 10.2; methyl alc. (5 g) 15.2; ethyl alc. (5 g) 17.3; propyl alc. (5 g) 19.0_5; water (1 g) 15.5; acetone (5 g) 17.5; ether (5 g) 17.2; chlorobenzene (5 g) 17.0_5; CCl_4 (5 g) 10.8; ether (1.25, 250, 3.75, 5.00, 6.25, 7.50 g, resp.) 19.9, 18.4_5, 17.6_1, 17.2, 16.4_1, 15.5_5; benzene (1.25, 2.50, 5.00, 7.50 g, resp.) 15.3_9, 14.9_8, 13.0, 11.7_7. The heats of adsorption on different samples of silica gel and on active charcoal were the same within limits, other things being equal.

5749. Lobrowsky, A. **Heat of adsorption on ferric hydroxide sol coagulated by heating.** *Kolloid-Z.* 106, 46-50 (1944).—*C.A.* 38, 3529⁴.

A $Fe(OH)_3$ sol was coagulated by heating, and the heat of adsorption of $K_2C_2O_4$ on the resulting gel was detd. The heat of adsorption on the gel obtained by heating was greater than the heat of coagulation of the original sol. The heat of adsorption was increased by partial coagulation.

5750. Jura, George and Harkins, W. D. **Surfaces of solids. XI. Determination of the decrease (π) of free surface energy of a solid by an adsorbed film.** *J. Am. Chem. Soc.* 66, 1356-62 (1944).—*C.A.* 38, 5125⁵.

The film pressure, π, was given by the equation $\pi = \gamma S - \gamma S_f = \gamma o - \gamma$ in which γS was the free surface energy of the clean surface of a solid, and S_f was the same quantity when the surface was covered by a film. In order to obtain π or the free surface energy (γS) of the surface of a solid caused by the presence of a film adsorbed from a vapor, it was necessary to obtain exptl. data that gave the pressure of the vapor and the amt. of vapor adsorbed when the temp. was const. A method was described to detn. the pressure to 0.002 mm with a Hg manometer. Data were given for the lowering of the free surface energy of TiO_2 (anatase) by N_2 at -195.6°C, water at 25.0°C, n-heptane at 25.0°C and n-butane at 0.0°C as a function of the relative pressure of the adsorbed vapors. The spreading coeff., free energy of emersion, and work of adhesion of N_2, H_2O, n-butane and n-heptane on TiO_2 (anatase) were detd.

5751. Wicke, E. **Adsorption calorimeter for catalytic surfaces.** *Z. physik. Chem.* 193, 417-28 (1944).—*C.A.* 41, 5346*g*.

An adiabatic calorimeter was described which could be used between -80 and 150°C. The catalyst was activated at 300°C in the calorimeter itself. Heats of adsorption were obtained for iso-PrOH, water, propane, and propylene on bauxite.

5752. Kiselev, A. V. **The work and heat of adsorption.** *Acta Physicochim. U.R.S.S.* 20, 947-68 (1945).—*C.A.* 40, 3677⁶.

New expressions were obtained for the integral and differential values of the work and heat of adsorption of gases, vapors, pure liquids, and solns. Formulas were derived for the work and heat of adsorption, either involving or free from the values of surface tension, which were applicable to liquid and solid interfaces. The work (and heat) of adsorption from soln. was equal to the sum of the work (heat) of wetting of adsorbent by pure solvent, the work (heat) of adsorption from soln. of the solute and displacement of the solvent by the latter, and the work (heat) of the diln. of the soln. The differential heats of adsorption of pure substances could be expressed in terms of the isosteric or isopycnic and isothermal coeffs. of surface activity.

5753. Kiselev, A. V.; Dreving, V. P., and Runov, A. D. **The sorption and the heats of sorption of vapors and the structure of activated charcoals.** *Doklady Akad. Nauk S.S.S.R.* 46, 310-13 (1945); *Compt. rend. acad. sci. U.R.S.S.* 46, 283-6 (1945) (in English).—*C.A.* 39, 5151³.

The heat evolved by sorption of MeOH vapor on various samples of charcoal was studied. Three distinct regions of sorption were observed: (1) a region of high heats, about 18,000-20,000 cal/mole and, for some specimens, even up to 25,000-30,000; (2) a region of nearly const. heat evolution, about 14,000-12,000 cal/mole; and (3) a region where the heat declined rapidly to the value for normal condensation. The vol. of the micropores of the charcoals was estd. by measuring the vol. of MeOH vapor condensed under the influence of the adsorption field before capillary condensation began. The 2nd region of heat evolution was responsible for most of the heat of wetting.

5754. Roginskiĭ, S. Z. and Todes, O. **Statistical theory of the adsorption of gas mixtures. II.** *Acta Physicochim. U.R.S.S.* **20**, 695-712 (1945).—*C.A.* **40**, 6931^4.

The adsorption isotherms of the individual components of a binary mixt. and of the mixt. as a whole were derived by the method of the detg. band in cases where the heats of adsorption vary in opposite sense and when they are unrelated. In all cases explicit expressions were obtained for the adsorption isotherm of mixts. in terms of the adsorption isotherm of the pure components, and the laws and conditions governing mutual displacement of the components were established.

5755. Gregg, S. J. **An electrical sorption balance and calorimeter.** *J. Chem. Soc.* **1946**, 563-7.—*C.A.* **40**, 6302^4.

With a suitable sample container which was provided with a thermocouple, the sorption balance could be used to det. the differential heat of adsorption simultaneously with adsorption measurements. Residual pressure in excess of 1 mm Hg was required. A procedure for calibrating the calorimeter and calcg. the differential heat was described in detail. The performance was tested by detg. adsorption of water vapor on alumina.

5756. Miller, A. R. **The variation of the dipole moment of adsorbed particles with the fraction of the surface covered.** *Proc. Cambridge Phil. Soc.* **42**, 292-303 (1946).—*C.A.* **41**, 1511*c*.

The variation of the heat of adsorption of NH_3 on a nonconducting surface was detd. The contributions to the heat of adsorption due to the van der Waals and to the electrostatic forces were of the same order of magnitude and of opposite signs. The mutual depolarizing action of the mols. reduced the magnitude of the total variation in the heat of adsorption by a considerable amt. The heat curve, which was calcd. from the equations given by the statistical analysis, was compared with that obtained upon the assumption that the particles formed a random distribution over the surface. The effect of the clustering of the adsorbed particles on the surface on the variation of the heat of adsorption was detd.

5757. Sato, Kazuo. **Differential heat of sorption of vapor on active charcoal. II. Result of measurement.** *Rev. Phys. Chem. Japan, Shinkichi Horiba Commem. Vol.* **1946**, 1-5.—*C.A.* **44**, 4323*a*.

The heat of sorption of EtOH and benzene was measured at 25°C on Norit and on H_3PO_4- and Na_2SO_4- activated charcoal. When the charcoal was freshly outgassed, the sorption-desorption processes were irreproducible but became reproducible after several repetitions. In the reproducible isotherm, near satn., hysteresis loops were observed for both adsorption equil. and the differential heats of sorption-desorption. On bare charcoal, the differential heat of adsorption was 20 kcal/mole. A pore radius of about 20 A. was calcd. for the 3 charcoals investigated.

5758. Tamaru, Setsuro and Sato, Kazuo. **Differential heat of sorption of vapor active charcoal. I. Apparatus and method of measurement.** *Rev. Phys. Chem. Japan, Shinkichi Horiba Commem. Vol.* **1946**, 1-5.—*C.A.* **44**, 4322*h*.

An adiabatic room-temp. calorimeter was described for measuring differential heats of adsorption or desorption. The calorimeter had an oil-filled inner box of Ag contg. a quartz bulb filled with the sorbent, a large outer box filled with water surrounded by an air chamber that was automatically kept at the same temp. as the water box. By means of stirrers and heaters the temp. difference between the inner and the outer box was kept at or below 0.0027°C; this permitted measuring of the temp. of the inner box with an error below 0.001°C.

5759. Ward, A. F. H. and Tordai, L. **Standard entropy of adsorption.** *Nature* **158**, 416 (1946).—*C.A.* **41**, 1524*d*.

Equations were derived for the standard entropy of adsorption ΔS°. Values of ΔG° in kcal/mole, ΔS° in cal/degree mole, and ΔH° in kcal-mole were calcd.: EtCOOH, -1.63, -14.4, -5.9; PrCOOH, -2.45, -6.2, -4.3; BuCOOH, -3.18, +1.1, -1.8; AmCOOH, -3.72, +6.6, -1.7; $C_6H_{14}COOH$, -4.52, +7.2, -2.4.

5760. Beebe, R. A.; Biscoe, J.; Smith, W. R., and Wendell, C. B. **Heats of adsorption on carbon black. I.** *J. Am. Chem. Soc.* **69**, 95-101 (1947).—*C.A.* **41**, 1922*h*.

The differential heats of adsorption of N_2 and O_2 on carbon blacks, Spheron Grade 6 (MPC), Spheron Grade 6 "devol.", Graphon, Sterling-S (SRF), and Sterling-L (HMF) at -195°C were detd. The results were roughly consistent with the predictions of the B. E. T. theory in that the differential heats of adsorption of the monolayers were greatly in excess of the heats of vaporization, but rapidly approached the heat of vaporization in the second and successive layers. Partial "graphitization" greatly reduced the activity of the more active sites on the surface.

5761. Beebe, R. A.; Polley, M. H.; Wendell, C. B., and Smith, W. R. **Heats of adsorption on carbon black. II.** *J. Am. Chem. Soc.* **69**, 2294-9 (1947).—*C.A.* **42**, 1113*a*.

The differential heats of adsorption of *n*-butane, 1-butene, *cis*-2-butene, *trans*-2-butene, *n*-pentane, 1-pentene, 2-pentene, trimethylethylene, and butadiene were detd. on one or more of the following carbon blacks: Spheron Grade 6 (MPC), Sterling-S (SRF), Sterling-L (HMF), Spheron Grade 6 heated to 927°C, and Spheron Grade 6 heated to 2800-3300°C (called Graphon). The adsorption of both satd. and unsatd. hydrocarbons was essentially of the van der Waals type. There was no marked difference in the differential heats of adsorption for the satd. and corresponding unsatd. adsorbates.

5762. MILLER, A. R. **The heat of adsorption of diatomic molecules.** *Proc. Cambridge Phil. Soc.* **43**, 232-9 (1947).—*C.A.* **41**, 4701*c*.

The heat of adsorption of particles that occupy 2 adjacent sites on a surface was investigated statistically. A sigmoid-shaped curve was obtained for the heat of adsorption of a mobile film (expressed as a function of the fraction of the surface covered); an approx. linear curve was obtained for an immobile film. Reasonably good agreement with the equation for an immobile film was obtained with the exptl. values of the heat of adsorption of H_2 on a W surface.

5763. PERREU, JEAN. **Measurement of the heat of adsorption of gas and vapor by activated carbon.** *Compt. rend.* **224**, 1157-8 (1947).—*C.A.* **41**, 4701*b*.

An app. was described utilizing the Bunsen ice calorimeter in which the adsorption isotherm, and the integral and differential heats of adsorption could be obtained in the immediate neighborhood of 0°C. The abs. calorimetric error was less than 0.03 cal/g.

5764. PRETTRE, MARCEL AND GOEPFERT, OLIVIER. **Influence of temperature on adsorption by a heterogeneous surface.** *Compt. rend.* **225**, 737-8 (1947).—*C.A.* **42**, 1783*f*.

Three different adsorbing regions were assumed to be present in a Ni-kieselguhr catalyst and assigned values for the heat of adsorption of H_2. By using the previously assumed Langmuir consts. for each region at 438°K, the corresponding values at 456°K were calcd. by the van't Hoff isochore.

5765. SCHRENK, W. G.; ANDREWS, A. C., AND KING, H. H. **Calorimetric measurements of heats of hydration of starches.** *Ind. Eng. Chem.* **39**, 113-16 (1947).—*C.A.* **41**, 1922*g*.

The heat of hydration of several varieties of starch was found to range from 23.0 to 29.8 cal/g. Defatted starch released its heat at a slower rate than untreated starch, but the hydration energy per g. was the same.

5766. WARD, T. **Heat of adsorption of gases on manganous chromic oxide at room temperature.** *J. Chem. Soc.* **1947**, 1244-6.—*C.A.* **42**, 1113*d*.

Measurements were made of the heats of adsorption of CO, CO_2 and O_2 on the fully oxidized, reduced, and partially reduced surfaces of manganous chromic oxide. The reactions were carried out in a calorimeter at reduced pres. For most of the work the oxide was reduced with CO at 400°C. CO was irreversibly adsorbed, giving CO_2 on rise of temp. The partly reduced surface gave lower values for the heat of adsorption than either the fully oxidized or fully reduced surface.

5767. BASFORD, PAUL R.; JURA, GEORGE, AND HARKINS, WILLIAM D. **Surfaces of solids. XVIII. The heats of emersion and desorption of water from graphite at 25°C.** *J. Am. Chem. Soc.* **70**, 1444-50 (1948).—*C.A.* **42**, 5302*i*.

The heat of emersion from water of a graphite of specific area = 4.22 m^2g^{-1} and of ash content less than 0.004% (presumably free from any O-complex) was detd. as a function of the quantity of water adsorbed on the surface. For clean graphite the heat was 167 ergs cm^{-2}, decreasing to -132 ergs cm^{-2} when 1.80×10^{14} mols. of water were adsorbed per cm^2. From 2.47×10^{14} to 12.60×10^{14} mols. per cm^2 the heat of emersion increased from -32 to 49 ergs cm^{-2}. From 13.59 to 29.63×10^{14} mols. adsorbed per cm^2, the value, within a large exptl. error, was const. at -84 ergs cm^{-2}. Two finite discontinuities coincided with two discontinuities in the deriv. of the vol. with respect to the presence of the isotherm. The area of the graphite was 4.4 ± 0.6 m^2g^{-1}. The film of water on graphite attained a min. thickness of 10 A. at a relative pres. very close to satn. The extrapolation of the isotherm to unit relative pres. indicated a min. thickness of 16 A. The integral and differential heats of adsorption of water on graphite were detd. from the heats of emersion.

5768. JOYNER, L. G. AND EMMETT, P. H. **Differential heats of adsorption of nitrogen on carbon black.** *J. Am. Chem. Soc.* **70**, 2353-9 (1948).—*C.A.* **42**, 8574*e*.

Adsorption isotherms for N_2 on a sample of Grade 6 carbon black and on a sample of Graphon were detd. at -205°, -195°, and -183°C; the adsorption data were used to calc. isosterically the heat of adsorption of N_2 on the two carbon blacks. The heats were in excellent agreement with calorimetric values. ΔF and ΔS values for the process liquid N_2 going to adsorbed N_2 were calcd. as a function of the fraction of the surface covered.

5769. JOYNER, L. G. AND EMMETT, P. H. **Differential heats of adsorption and desorption of nitrogen on porous glass.** *J. Am. Chem. Soc.* **70**, 2359-61 (1948).—*C.A.* **42**, 8574*g*.

Adsorption and desorption isotherm for N_2 were measured on a sample of porous glass at -204.8° and -194.6°C. The differential heat of desorption from these data was shown to exceed the differential heat of adsorption over the hysteresis region by about 250 cals/mole.

5770. PERREU, JEAN. **The heats of adsorption of hydrogen and oxygen on active carbon.** *Compt. rend.* **226**, 907-8 (1948).—*C.A.* **42**, 4441*i*.

The heats of adsorption were measured at 0°C over a period of 30-80 min. on coconut charcoal. The integral heat of adsorption (Q_c) of H_2 decreased from 1630 to 1290 cal/mole when the adsorbed gas increased from 2.4×10^{-5} to 14.45×10^{-5} moles. The differential heat of adsorption (Q_c) decreased from 1650 to 700 cal/mole. Q_c for O_2 decreased from 78,870 to 12,530 cal/mole as the amt. of gas adsorbed increased from 0.71×10^{-5} to 43.40×10^{-5} moles.

5771. PERREU, JEAN. **Heats of adsorption of nitrogen by activated charcoal.** *Compt. rend.* **226**, 492-3 (1948).—*C.A.* **42**, 5752*d*.

The differential and integral heats of adsorption at 0°C for N_2 on activated coconut charcoal were detd. Two to 5 g of charcoal were used in measuring the integral heats of adsorption and 15 to 20 g in measuring the differential heats. The integral heats for concns. (C) > 5×10^{-5} mols./g may be expressed by the empirical formula: $Q_c = 4660 \times c^{1.001}$.

5772. Perreu, J. **Heats of adsorption of sulfur dioxide and carbon dioxide on active charcoal.** *Compt. rend.* 226, 2138-40 (1948).—*C.A.* 45, 6036*i*.

The heats of adsorption of SO_2 and CO_2 on activated coconut charcoal were detd. at 0°C. The integral heat Q_c was given by the empirical relation $Q_c = 2460c^{0.8}$ for concn. $c(2\text{-}6) \times 10^{-4}$, whence the differential heat $q_c = dQ_c/dc$ was given by $1968c^{-0.2}$. At very low c, q_c was about 11 kcal per mol. for SO_2 and about 7 kcal per mol. for CO_2.

5773. Pierce, Conway and Smith, R. Nelson. **Heats of adsorption. I.** *J. Phys. & Colloid Chem.* 52, 1111-15 (1948).—*C.A.* 43, 1638*h*.

Adsorption isotherms for EtCl were measured on graphite at -78°C and 0°C and used to calc. the isosteric heats by the Clausius-Clapeyron equation. The calcd. heat of adsorption exceeded the heat of liquefaction by about 25, 5, 2, and 1% at 1, 2, 4, and 10 statistical layers, resp.

5774. Pierce, Conway and Smith, R. Nelson. **Heats of adsorption. II.** *J. Phys. & Colloid Chem.* 52, 1115-28 (1948).—*C.A.* 43, 1638*h*.

Exptl. adsorption isotherms were measured for H_2O, NH_3 and EtCl on a sample of graphite, the B. E. T. surface area of which was 4 m^2/g. A four-const. isotherm equation was proposed and shown to be applicable to isotherms recently reported, over a relative pressure range extending from 0.05 or lower to about 0.9, $V = [ax/(1+bx)] + [\alpha x/(1-\beta x)]$, V was the vol. of gas adsorbed, x was the relative pressure and a, b, α and β, were consts. The calcd. net heat of adsorption for all layers beyond the first was found for NH_3 and EtCl on graphite and for butane on glass spheres to be given by the equation $E - E_L = K(1 - x)$.

5775. Wicke, E. **Hydrogen-exchange catalysis by oxygenic contact.** *Z. Elektrochem.* 52, 86-96 (1948).—*C.A.* 43, 6497*f*.

The heats of adsorption from -80° to 150°C of iso-PrOH, H_2O, C_3H_6, and C_3H_8 were detd. on Fe-contg. bauxite. Several adsorption isotherms for C_3H_6 and C_3H_8 were measd. These indicated that 3 types of adsorption took place for iso-PrOH and H_2O: (a) limited adsorption on 25% of the total surface with heat of adsorption of approx. 30 cal/mol.; (b) unlimited adsorption decreasing linearly with increasing surface d.; (c) multilayer adsorption.

5776. Zettlemoyer, Albert C. and Walker, Wm. C. **Active magnesia. IV. Application of dual-surface theory.** *J. Phys. & Colloid Chem.* 52, 58-64 (1948).—*C.A.* 42, 2488*i*.

The observed adsorption isotherm for N_2 at -195°C on active magnesia 2642 was best explained by assuming that 75% of the surface had a high heat of adsorption (C = 130) and 25% had a low heat of adsorption (C = 1.35).

5777. Garner, W. E.; Gray, T. J., and Stone, F.S. **The oxidation of copper and the reactions of hydrogen and carbon monoxide with copper oxide.** *Proc. Roy. Soc.* (London) **A197**, 294-314 (1949).—*C.A.* 44, 2355*h*.

The heats of adsorption of CO and O_2, the heat liberated during the catalytic reaction of CO and O_2 on a Cu_2O film formed on metallic Cu, the kinetics of the reactions, the elec. cond. of thin films of oxides during the reduction with H_2, the process of embrittlement whereby the surface was activated, and the effect of the adsorption of gases on the concn. of the Cu_2O-CuO surface were all studied. O_2 enhanced the cond., and CO and H_2 depressed it. O_2 was reversibly chemisorbed on a Cu_2O-CuO surface in a form that was specially active chemically. In this state it would combine with CO to give CO_2 at room temp. This mobile form of O was assocd. with a conductance electron, and its adsorption increased the cond. of the oxide film. At 200°C the rate of evapn. of chemisorbed-O was appreciable, but it did not appear to be entirely removed from the active areas even in a high vacuum.

5778. Guthrie, J. C. **Integral and differential heats of sorption of water by cellulose.** *J. Textile Inst.* 40, T489-504 (1949).—*C.A.* 43, 9433*i*.

The integral and differential heats of sorption of most cellulosic fibers were reported. The differential heat at zero-moisture regain was approx. equal for all such fibers, the av. value being 297 cal/g of H_2O absorbed. When the integral heat was plotted against the moisture regain on reduced coordinates, the values all fell near a single curve.

5779. Gyani, B. P. **Isosteric heats of adsorption. I. Alcohols on silica gel.** *J. Indian Chem. Soc.* 26, 345-52 (1949).—*C.A.* 44, 3344*i*.

A tensimeter was described for measuring the heats of adsorption of MeOH, EtOH, PrOH, sec-PrOH, and BuOH at different fixed concns. The heat of adsorption at comparable concns. increased as the mol. wt increased; for one substance there was a tendency for the heat of adsorption to decrease and the adsorption increased. The results were roughly the same as those calcd. by other investigators on the same vapors on charcoal by calorimetric methods.

5780. Houwink, R. **Interaction between polymers and fillers.** *J. Polymer Sci.* 4, 763-5 (1949).—*C.A.* 44, 4277*c*.

Since the initial heat of adsorption between carbon black and C_4 hydrocarbons was of the order of magnitude of 15 kcal/mole and decreased sharply until about 40% of a monolayer was formed, this indicated that 40% of the carbon black surface was covered with sites of high adsorptive capacity. Between 40 and 100% of monolayer formation, the surface was uniform with regard to adsorptive capacity; at the monolayer the values again decreased and approached the heat of liquefaction, *EL*, of the adsorbate. The heat of adsorption per CH_2 group to the carbon black was about 4 kcal/mole. Parts of these sites were of a relatively high energy content (15 kcal) leading to strong bonds.

5781. Kiselev, A. V.; Kiselev, V. F.; Mikos, N. N.; Muttik, G. G.; Runov, A. D., and Shcherbakova, K. D. **Adiabatic calorimeter with**

contant heat exchange for measuring the heats of adsorption of gases and liquids. *Zhur. Fiz. Khim.* **23**, 577-94, (1949).—*C.A.* **43**, 6871*d*.

A calorimeter was surrounded by a bath, whose temp. was kept lower than that of the calorimeter so as to remove the heat evolved by the stirrer and the elec. resistance thermometer. It could measure the heat of adsorption of gases to 0.00005-0.0002 cal, and the heat of wetting to 0.0005-0.002 cal per g adsorbent.

5782. PERREU, JEAN. **Heats of adsorption of gases and liquids by activated charcoal.** *Bull. soc. chim. France* **1949**, 919-23.—*C.A.* **44**, 3781*g*.

Integral and differential heats of adsorption were reported for NO. The adsorption of NO and H_2S was in part chem. in nature.

5783. PERREU, JEAN. **Measurement of the heat of adsorption of gases and vapors on active carbon.** *Bull. soc. chim. France* **1949**, 43-9.—*C.A.* **43**, 6903*g*.

The heats of adsorption of N_2, H_2, O_2, SO_2, and CO_2 were detd. on activated coconut charcoal by means of a Bunsen calorimeter. Results within 1% were attained with all gases except H_2. The integral heat of adsorption increased with the final concn. and the differential heat of adsorption varied inversely with the final concn. In the case of O_2, where adsorption was accompanied by chem. reaction, the variation of thermal effects was large and very rapid at low concn.

5784. PERREU, JEAN. **Heats of adsorption of acetylene and hydrogen sulfide on active carbon.** *Compt. rend.* **228**, 1427-9 (1949).—*C.A.* **43**, 7317*c*.

Values for concns. of 0.93 to 17.31 and 0.86 to 13.93×10^{-4} mol./g, resp., were tabulated. Acetylene was not polymerized at 0°C on active charcoal.

5785. PERREU, JEAN. **The heats of adsorption of ammonia gas and of ethylene gas on active charcoal.** *Compt. rend.* **228**, 833-4 (1949).—*C.A.* **43**, 4939*d*.

The differential heat of adsorption (q_c) of NH_3 on coconut charcoal at 0°C increased from 6830 cal/mole at 14×10^{-4} mole/g to a limiting value of 14,600 cal/mole at zero concn. For C_2H_4 the variation was from 6750 cal/mole at 6×10^{-4} mole/g to a limiting value of 11,800. For both gases the function $(q_c) = f(c)$ was similar to that reported for other gases except O_2.

5786. PERREU, JEAN. **The heat of adsorption of nitric oxide on active carbon.** *Compt. rend.* **229**, 590-2 (1949).—*C.A.* **44**, 1320*c*.

The integral heats of adsorption were detd. over a range of concns. and the differential heats calcd. The integral heats increased with concn. and the differential heats decreased. The ratio, q_c/L, in which q_c was the differential heat in a dil. medium and L the mol. heat of condensation, was 4.34. It was greater than for C_2H_4, H_2S, and NH_3, and varied inversely with the b. p. of the gas.

5787. RUNOV, A. D.; KISELEV, A. V.; KISELEV, V. F., AND ALEKSEEV, S. N. **Heat of adsorption from solutions at different temperatures.** *Zhur. Fiz. Khim.* **23**, 1005-17 (1949).—*C.A.* **44**, 922*i*.

The heat Q, of wetting fruit-stone charcoal by PrOH-H_2O mixts. was detd. in a calorimeter immersed in a thermostat or in a calorimeter having const. heat exchange. Q was identical at 25° and 50°C; it was 10 for H_2O, and 16, 22, 29, and 30 when the concn. c of PrOH was 1, 4, 8, and 12.4 mol./liter, resp. The apparent adsorption x of PrOH by charcoal had a max. near $c = 2$.

5788. SCHÄFER, KLAUS. **Problems concerning thermal conductivity in gases at low pressures and the transfer of energy on solid surfaces.** *Fortschr. chem. Forsch.* **1**, 61-118 (1949).—*C.A.* **44**, 8184*d*.

In gaseous adsorption on solid surfaces, quant. measurement of the transfer of energy could be made by means of a thermal accommodation coeff. The exptl. app. was designed so that this and the sp. heat of the gas could be simultaneously measd. either at low or high pres. Recent values were given for monatomic gases (He, Ne, A on W and He, A, Hg, Kr, and Xe on Pt), for diatomic gases (H_2, para-H_2, CO, O_2, N_2, and air on Pt, H_2 on W, and H_2 and air on glass), and for polyatomic gases, i. e. CS_2 and COS on Pt.

5789. SMITH, WALTER R. AND BEEBE, RALPH A. **Heats of adsorption and relative adsorbability of some gaseous hydrocarbons. Silica gel and carbon black adsorbents.** *Ind. Eng. Chem.* **41**, 1431-5 (1949).—*C.A.* **43**, 8254*h*.

The heats of adsorption of propene, 1-butene, and butane on silica gel at 0°C were detd. calorimetrically. Butane and propene had essentially the same differential heats of adsorption, but that of 1-butene was approx. 3 kcal per mole higher for the monolayer. The heats of adsorption of 1-butene and butane were essentially the same on carbon black. Butane and 1-butene could be sepd. by selective adsorption of the 1-butene on silica gel.

5790. TROESCH, ANDRE. **Kinetic laws of adsorption of methane by Fischer catalysts containing nickel.** *Compt. rend.* **228**, 1126-8 (1949).—*C.A.* **43**, 6064*b*.

Published results were analyzed kinetically and the heat of adsorption of CH_4 on a Fischer Ni catalyst approximated 17 kcal/mol.

5791. ARIFOV, U. AND LOVTSOV, V. M. **Oscillographic determination of the heats of adsorption of ions and atoms of alkali metals with the aid of functional sweep.** *Doklady Akad. Nauk S.S.S.R.* **75**, 365-6 (1950).—*C.A.* **45**, 3703*b*.

The const. a in the formula for the ionic current intensity I from an incandescent metal, $I = I_0 e^{-at}$ (where $a = Ae^{-\lambda_0/kT} + Be^{-\lambda_+/kT}$ = sum of the probabilities of evapn. of atoms and ions per sec., and λ_0 and λ_+ = heats of evapn. of atoms and ions, resp.) was detd. Measurements on K on incandescent W gave $\lambda_+ = 2.41$ e.v., The magnitude τ was the "life-time" of the adsorbed atoms, i.e. the time necessary for the ionic current I to fall to $1/e$ times I_0. For K on W, τ increased from 5.2×10^{-4} to 4.1×10^{-3} sec. with the temp. varying from 1250 to 1150°K.

5792. BASTICK, JACK. **The heats of adsorption of ammonia, arsine, and phosphine on activated carbon.** *Compt. rend.* 230, 1163-5 (1950).—*C.A.* 44, 7137*c*.

The heats of adsorption of NH_3, AsH_3, and PH_3 on a coconut charcoal were measd. in a Bunsen glass calorimeter with 2%. The adsorption at 0°C and 600 mm equil. pres. was 240 cc./g for NH_3, 132 cc./g for PH_3 and 165 cc./g for AsH_3. The differential heat of adsorption at 0°C for NH_3 (concns. greater than 6×10^{-4} mol./g) $= 1900c^{-0.216}$ for a degassing temp. of 550°C, $1344c^{-0.279}$ for a degassing temp. of 800°C and $1387c^{-0.279}$ for a degassing temp. of 1000°C; for PH_3 (concns. greater than 3×10^{-4}) $= 2446c^{-0.171}$ for a degassing temp. of 800°C; for AsH_3 (concns. greater than 2.5×10^{-4}) $= 3057c^{-0.153}$ for a degassing temp. of 800°C, where $c =$ concn. The true heat of adsorption was pos. for all 3 gases. The strong chemisorption of AsH_3 on charcoal was shown by the fact that its initial differential heat of adsorption was of the same order of magnitude as its heat of decompn.

5793. BEEBE, R. A.; KINGTON, G. L.; POLLEY, M. H., AND SMITH, W. R. **Heats of adsorption and molecular configuration. The pentanes on carbon black.** *J. Am. Chem. Soc.* 72, 40-2 (1950).—*C.A.* 44, 4747*i*.

The isotherms and calorimetric heats of adsorption were detd. at 0°C for n-C_4H_{10}, n-C_5H_{12}, neopentane, and cyclopentane on a sample of carbon black that had been extensively used for previous adsorption studies. At 0.05 coverage of the surface, the contribution per CH_2 group of the normal hydrocarbons was approx. 3 kcal per mole. In neopentane and cyclopentane, the contribution per CH_2 or CH_3 group was less than the 3 kcal encountered with normal hydrocarbons.

5794. BEECK, O.; COLE, W. A., AND WHEELER, A. **Determination of heats of adsorption using metal films.** *Discussions Faraday Soc.* **1950**, No. 8, 314-21.—*C.A.* 45, 9990*h*.

A calorimeter was described for heats of adsorption of H_2 as a function of fraction of surface covered for Ni and Fe films at room and liquid-air temps. A criterion for mobility of adsorbed layers was presented.

5795. EVERETT, DOUGLAS H. **Thermodynamics of adsorption. I. General considerations.** *Trans. Faraday Soc.* 46, 453-9 (1950).—*C.A.* 44, 9768*b*.

Four heats of adsorption were defined that were equally fundamental. That which involved principally a consideration of the decrease of potential energy of mols. on adsorption was a more useful quantity to study both experimentally and theoretically.

5796. GYANI, B. P. **Adsorption of organic bases on silica gel, and heats of adsorption. II.** *J. Chem. Soc.* **1950**, 1521-4.—*C.A.* 45, 416*h*.

The adsorptions of diethylamine, triethylamine, pyridine, α-picoline, and piperidine on silica gel were measured at 35°C. The simplest isotherm, type I, was given by diethylamine; piperidine and α-picoline isotherms were sigmoid, type IV. The isosteric heats of adsorption were obtained by a tensimetric method. The av. heats for pyridine, α-picoline, and diethylamine was practically equal to $-Q$ values from 11,270 to 12,010 cals/mole.

5797. HANSEN, ROBERT S. **Calculation of heats of adsorption from adsorption isosteres.** *J. Phys. & Colloid Chem.* 54, 411-15 (1950).—C.*A.* 44, 4768*c*.

A thermodynamic derivation of the Clapeyron equation as applied to the calcn. of heats of adsorption from adsorption isosteres led to the conclusion that the deriv. should be evaluated at a const. no. of adsorbed mols per unit surface area of the solid.

5798. HARTECK, PAUL AND MELKONIAN, G. A. **The tunnel effect in ad- and desorption of the hydrogen isotope.** *Naturwissenschaften* 37, 450 (1950).—*C.A.* 45, 4994*i*.

The heat of adsorption of heavy H_2 was only about 3% more at 80°K than that of light H_2; however, the detg. factor in the desorption was the diffusion of the gas mols. to the surface, not the evapn. For this diffusion the probability was $f \exp[-a(2mV)^{½}/h]$ as compared with the classical $f \exp(-Q/RT)$. In the former, m, the mass, entered as well as V, the height of the potential wall, not the temp., hence light H_2 would reach the surface faster and would evap. faster. In the present case the tunnel effect predominated over the Boltzmann factor. In one set of expts. with 37.8 cc. of a H_2-D_2 mixt. on 1 g of gel, final pres. 0.2 mm, 51% of D_2 was adsorbed, 0.7% desorbed, sepn. factor about 140.

5799. KEMBALL, CHARLES AND SCHREINER, G. D. L. **The determination of heats of adsorption by the Brunauer-Emmett-Teller single isotherm method.** *J. Am. Chem. Soc.* 72, 5605-7 (1950).—*C.A.* 45, 9992*i*.

The B. E. T. equation for the "phys." adsorption of gases on solid surfaces contained a const. c that included the term (a_1b_2/a_2b_1). By introducing the entropy of adsorption (a_1b_2/a_2b_1) was unity only when the differential entropy of adsorption to a standard state on the surface defined by $s_0 = s_1$ (the bare fraction of the surface being equal to the fraction covered by one layer of mols.) was equal to the entropy of liquefaction of the adsorbate. The value of (a_1b_2/a_2b_1) may range at least from 10^{-5} to 10, and the single-isotherm method of detg. heats of adsorption could be used only if the entropy of adsorption was known.

5800. KINGTON, G. L.; BEEBE, R. A.; POLLEY, M. H., AND SMITH, W. R. **The entropy of adsorbed molecules.** *J. Am. Chem. Soc.* 72, 1775-81 (1950).—*C.A.* 44, 6228*c*.

The differential heats of adsorption of N_2 and O_2 on TiO_2 were detd. calorimetrically at 78.5°K. The TiO_2 used in both cases was a sample of anatase with a B.E.T. surface of 13.9 m² per g. The magnitude of the heat in both cases indicated that the adsorption was van der Waals in nature. The initial increments of N_2 showed a heat of adsorption approx. 1 kcal per mole higher than the initial O_2 values. The partial molal entropy of the adsorbed gas was detd. from exptl. data for both N_2 and O_2 adsorbed on carbon black and TiO_2 (anatase) at 78.5°K.

5801. Laporte, Francois. **Experimental and theoretical study of the immersion of a powdery solid in a pure liquid. Construction of a microcalorimeter.** *Ann. phys.* (12) 5, 5-79 (1950).—*C.A.* 44, 7642*i*.

A microcalorimeter, kept at equil. with a stable thermal environment (cellar), was used. Measurements were made on graphite, ZnO, glass, reagent-grade TiO_2, and anatase TiO_2 immersed in distd. H_2O. The effect of degassing the specimens, as well as of the surface area of the anatase TiO_2, was also studied. Enthalpies of immersion were as follows (in joules/g): graphite 0.206, ZnO 0.462, reagent TiO_2 0.185, anatase TiO_2 0.51, glass 0.25.

5802. Mastrangelo, S. V. R. **The lambda-temperature in multimolecular helium films.** *J. Chem. Phys.* 18, 896-7 (1950).—*C.A.* 44, 7108*f*.

The 1st layer of adsorbed He was immobile and behaved like a solid under high pressure. The λ-point for 5-6 layers was 1.85°K and moved to higher temps. as the no. of layers increased. A λ-point of 1.85°K corresponded to a pressure of approx. 25 atm. The absence of a λ-point for a layer 3-4 mols. thick indicated that such a layer was "solid".

5803. Miyazaki, Shozo. **Catalytic decomposition of ammonia gas. VIII. Decomposition on molybdenum.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, 71, 483-5 (1950).—*C.A.* 45, 6473*b*.

The thermal decompn. of NH_3 gas in the presence of Mo was observed in the pressure range of 3-15 mm Hg at 700-760°C. The relations between the observed reaction rates and the gas pressures were represented by the theoretical equation. The activation energy and heat of adsorption of NH_3 gas on Mo were calcd. to be 45.7 kcal $mol.^{-1}$ and 22.8 kcal $mol.^{-1}$, resp.

5804. Morrison, J. A. and Los, J. M. **The measurement of the thermal properties of gases and vapors adsorbed on solid surfaces.** *Discussions Faraday Soc.* **1950**, No. 8, 321-6.—*C.A.* 45, 9990*i*.

A low-temp. adiabatic calorimeter was described suitable for precision measurements of the heat capacity and the heat of adsorption of gases and vapors on solid surfaces.

5805. Perreu, Jean. **Heats of adsorption of nitrous oxide on active charcoal.** *Compt. rend.* 230, 642-4 (1950).—*C.A.* 44, 4768*e*.

The integral heats of adsorption of N_2O were measured at 0°C in a Bunsen ice calorimeter on active coconut charcoal. Results were expressed by $Q_c = 3046c^{0.871}$. Calcd. differential heats q_c varied from 10,700 to 6500 cal. from which the true heats of adsorption $\lambda = q_c - L$ can be calcd., where L, the heat of condensation, equals 1760 cal. At the same pressure, N_2O was adsorbed less than C_2H_2 and H_2S but more so than other gases studied.

5806. Pierce, Conway and Smith, R. Nelson. **Heats of adsorption. III. Methanol on carbon.** *J. Phys. & Colloid Chem.* 54, 354-64 (1950).—*C.A.* 44, 4768*d*.

Isosteric heats of adsorption for CH_3OH on graphite were computed from exptl. isotherms at 0° and 28.9°C. Values for these heats of adsorption exceeded the heat of liquefaction by about 3 kcal. when only 5% of a monolayer was formed, 0.6 kcal. for 0.5 to 1 layer, and 0.2 kcal. for 1.6 to 4 layers. Values for the heat of adsorption were discussed critically for systems yielding type III adsorption isotherms.

5807. Pierce, Conway and Smith, R. Nelson. **Heats of adsorption. IV. Entropy changes in adsorption.** *J. Phys. & Colloid Chem.* 54, 795-803 (1950).—*C.A.* 44, 9767*h*.

From isotherms (from 78°and 0°C) the differential entropy and heats of adsorption of EtCl by Carbolac I were calcd. From isotherms at 0° and 28.6°C similar calcns. were made for water vapor on Graphon. The differential entropy change for the transfer of a mole of adsorbate from the liquid to the adsorbed state was neg. for the EtCl adsorption and pos. for the water adsorption over most of the measured relative pressure range.

5808. Schaeffer, W. D.; Polley, M. H., and Smith, W. R. **Nature of carbon black surfaces as revealed by adsorption studies.** *J. Phys. & Colloid Chem.* 54, 227-39 (1950).—*C.A.* 44, 6700*c*.

Surface areas were evaluated from low-temp. N_2 adsorption isotherms, by assuming 16.2 $A.^2$ as the cross-sectional area of N_2. The interaction between fully reinforcing black, Spheron 6, and decane and dihydromyrcene at 100°C were given. Only the external surface, which was measured by the microscope technique, was active in adsorption of rubber. The initial heat of adsorption of dihydromyrcene was about 20 kcal $mole^{-1}$ higher than that of the satd. hydrocarbons.

5809. Schellinger, A. Kenneth. **Calorimetric method for the determination of the surface energy of a brittle crystalline solid.** *Science* 111, 693-4 (1950).—*C.A.* 44, 9239*g*.

The calorimeter consisted of a brass chamber (3 in. in diam.) suspended inside a stainless steel water jacket. A Beckmann thermometer was inserted into the bath. The brass chamber was filled with 200 g of cryst. solid and 3 kg chilled steel shot. Revolution of the whole assembly caused tumbling of the charge mass and comminution of the brittle solid. The entire assembly was placed inside a wooden box the air temp. of which was kept at 20.5°C ± 0.1°C. When quartz was added, the energy output was 10-20% lower than energy input. This remained on the solid as surface energy.

5810. Tompkins, F. C. **Adsorption isotherms for nonuniform surfaces.** *Trans. Faraday Soc.* 46, 580-6 (1950).—*C.A.* 45, 18*d*.

With certain restrictions regarding the magnitude of certain entropy changes, 4 well-known isotherms were deduced from variation of heat of adsorption with coverage. If the variation of net heat of adsorption with coverage was known either from theoretical calcns. or exptly. from calorimetric measurements, the isotherm could be reasonably well characterized. If the concept of nonuniformity of surfaces was accepted, interpretation of transformations of state on adsorbed films on solids must be reconsidered.

5811. Treffner, W. **Calorimetry of activated magnesia from natural magnesite.** *Radex-Rundschau* **1950**, 125-31.—*C.A.* 44, 7698*b*.

The heat of hydration of activated MgO was studied by thermochem. measurements in a recording adiabatic calorimeter. This special calorimeter permitted the use of samples up to 180 g and temp. changes up to 55°C. Hydration took place in four distinct steps: (1) a very rapid reaction in the first 10-20 min.; (2) a reduced rate going to a min., the length of this period being detd. by the activity of the sample; (3) a gradual acceleration of the reaction to a max. before 2/3 of the reaction time was elapsed; (4) a rate finally decreasing to zero.

5812. Aston, J. G.; Szasz, G. J, and Kington, G.L. **The zero-point entropy of nitrogen adsorbed on titanium dioxide.** *J. Am. Chem. Soc.* 73, 1937-8 (1951).—*C.A.* 45, 7424*e*.

The heat capacities of approx. a half layer of N_2 on TiO_2 were measured from 19 to 88°K. These data along with the heat capacity of a full layer and the data for differential heat of adsorption were used to obtain information on the difference in zero-point entropy between a full layer and 0.6 of a layer. The result was compared with the zero-point entropy required by a distribution of mols. on sites.

5813. Avgul, N. N. Mikos; Dzhigit, O. M.; Isirikyan, A. A.; Kiselev, A. V., and Scherbakova, K. D. **Variation of the heat of adsorption of methyl alcohol vapor on quartz and silica gel with the surface coverage.** *Doklady Akad. Nauk S.S.S.R.* 77, 625-8 (1951).—*C.A.* 45, 6037*a*.

Differential heats of adsorption Q_a were detd. in a calorimeter with const. heat exchange, as a function of the amt. adsorbed a(micromole/g), on ground quartz, a uniformly coarse-pore silica gel "K", and a uniformly fine-pore silical gel "A". The plots of Q_a as a function of a had the same appearance for the 3 samples, with Q_a first falling with increasing a, then leveling off, but the 3 plots did not coincide. If, however, Q_a was plotted as a function of a/s (micromole/m^2), where s = sp. surface area (known from previous detns.), all 3 samples fell on the same curve.

5814. Babbitt, J. D. **The diffusion of adsorbed gases through solids.** *Can. J. Phys.* 29, 437-46 (1951).—*C.A.* 46, 8930*f*.

The equations for the diffusion of an adsorbed gas through a solid were developed on the assumption that the resistive force was directly proportional to the no. of mols. adsorbed. A better assumption was that the resistive force per mol. was inversely proportional to the no. of mols. adsorbed. Heats of adsorption decreased as the amt. of adsorbed gas increased.

5815. Boer, J. H. de. **Adsorption and molecular bonding in catalysis.** *Chem. Weekblad* 47, 416-27 (1951).—*C.A.* 46, 1339*d*.

Measured heats of adsorption of N_2 and H_2 on an Fe catalyst indicated that in the NH_3 synthesis the surface was 99.99996% covered with N_2. Aside from the possible reaction of H_2 from the gas phase, 3 alternative explanations were advanced to account for the occurrence of the reaction in spite of the apparent lack of room for H_2 on the surface: (1) adsorption of N_2 and H_2 on different crystallographic sites; (2) soln. of H_2 in the metal; and (3) a decrease in the heats of adsorption with increasing coverage of the surface in such a way as to bring the values for N_2 and H_2 closer together.

5816. Calvet, Édouard. **Thermokinetics of adsorption.** *J. chim. phys.* 48, 579-81 (1951).—*C.A.* 46, 4317*b*.

If a liquid and a solid were placed in a microcalorimeter cell, the total heat effect gave directly the heat of adsorption or absorption. With both insol. substances (TiO_2 or Al_2O_3 in H_2O) and sol. substances (urea in H_2O), there was a discontinuity at the point where a monolayer had been completed, detns. of surface area of insol. solids by this method gave results within 5% of those obtained by other methods. Urea adsorbed 10% H_2O without forming a liquid phase. The heat produced in the urea-H_2O system was independent of the amt. already adsorbed, until soln. began, when it dropped. In the nitrocellulose-acetone system, there was a plateau and then a slow decrease, without discontinuity.

5817. Dobay, Donald G.; Fu, Ying, and Bartell, F. E. **Energetics of the adsorption of aliphatic amines by silica gel.** *J. Am. Chem. Soc.* 73, 308-14 (1951).—*C.A.* 45, 4523*b*.

Isosteric heats of adsorption of Et_2NH, $BuNH_2$, and Bu_2NH by silica gel were detd. by means of adsorption isotherms obtained at 25° and 40°C. The change in the heat content $\overline{\Delta H}$, the free energy $\overline{\Delta F}$ and the entropy $\overline{\Delta S}$ per mole of adsorbate were detd. The isosteric heats and $-\overline{\Delta S}$ obtained for the initial stages of adsorption were so high as to indicate that adsorption in this range was not strictly phys. From energy and entropy considerations it appeared that at high relative pressures (i.e., over the range represented by the hysteresis portions of the isotherms) condensation of vapor occurred within the capillaries.

5818. Dresel, E. M. and Pritchard, E. **Differential heats of adsorption of ethylenediamine on coal.** *Research* (London) 4, 578-9 (1951).—*C.A.* 46, 4194*i*.

The net differential heats at 2% adsorption were 16 kcal/mole for ethylenediamine and 6 kcal/mole for MeOH and their ratio was very nearly equal to the ratio of the respective total heats of wetting. The differential heats of adsorption from the vapor phase were calcd. to be 27 kcal/mole and 15 kcal/mole, resp. The considerable difference between these 2 figures was discussed.

5819. Dryden, I. G. C. **Differential heats of adsorption of ethylenediamine on coal.** *Research* (London) 4, 579 (1951).—*C.A.* 46, 4195*a*.

The difference between the heats of adsorption of ethylenediamine and MeOH on coal was a result of chem. interaction in 1 case and phys. interaction in the other.

5820. Hüttig, G. F.; Kahler, F., and Meyenburg, G. **Kinetics of aging of active magnesium oxide.** *Kolloid-Z*, **124**, 160-3 (1951).—*C.A.* 46, 5942*b*.

Active MgO was produced by heating $MgCO_3$ at low temp.; aging was effected by heating the MgO at high const. temp. The measure of the aging was a decrease of energy, detd. by reaction of the aged MgO with 11% HCl soln. in an alc. expansion calorimeter. Up to 480 °C there was no appreciable change in aging; between 480 and 600 °C only the surface was involved; at 650°C a uniform aging of the crystal lattice occurred which decreased exponentially.

5821. Kington, G. L. and Aston, J. G. **The heat of adsorption of nitrogen on titanium dioxide (rutile) at 77.3°K.** *J. Am. Chem. Soc.* **73**, 1929-34 (1951).—*C.A.* 45, 7423*i*.

The relation between the adiabatic differential heat of adsorption and the heat of compression was deduced, and the isothermal and adiabatic heats of compression were related. The relation between the calorimetric heat and isosteric heat was obtained. It was independent of any assumption of a 2-dimensional surface pressure. Data for differential heat of adsorption for the system N_2 on TiO_2 (rutile) at 77.32°K were obtained in a precision adiabatic calorimeter. Heat data were obtained for the same system by the Clausius-Clapeyron relation.

5822. Morrison, J. A.; Los, J. M., and Drain, L.E. **Heat capacity, integral heat of adsorption, and entropy of argon adsorbed on titanium dioxide.** *Trans. Faraday Soc.* 46, 1023-30 (1951).—*C.A.* 47, 2896*f*.

Direct measurements of the heat capacity of A adsorbed at 3 low concns. on TiO_2 (rutile) were made between 14° and 105°K. Argon was admitted to the calorimeter in increments (50 to 200 ml at S. T. P.) to give a temp. rise of 0.5° to 2°. At higher temps. (up to 130°K) the heat capacity of the adsorbed A was detd. from the temp. coeff. of the integral heat of adsorption. Between 14° and 25°K the heat capacity appeared to be that of a 3-dimensional oscillator. At the higher temps. the heat capacity rose to values much larger than could be accounted for on the basis of any simple model of the adsorbed phase.

5823. Polley, M. H.; Schaeffer, W. D., and Smith, W. R. **Heats of adsorption on carbon black. III.** *J. Am. Chem. Soc.* 73, 2161-5 (1951).—*C.A.* 45, 6918*h*.

The heats of adsorption of n-$C_{10}H_{22}$ and dihydromyrcene were measured at 100 °C on a series of furnace and channel carbon blacks. The adsorption appeared to be phys. in nature, and initial values between 2 and 3 kcal per CH_2 group in the adsorbate were obtained for the heat of adsorption. Dihydromyrcene appeared to undergo some degree of reaction with the chemisorbed O-complex present on the surface of channel blacks.

5824. Ashpole, D. K. **Correlation between Young's modulus and differential heat of sorption at zero regain for cellulosic fibers.** *Nature* **169**, 37-8 (1952).—*C.A.* 46, 5313*h*.

A statistical analysis of the heat of wetting and moisture regain data showed that the small differences in the regain among different cellulosic fibers were significant. For viscose and cuprammonium rayons, cellulose acetate, cotton, mercerized cotton, and flax, a good correlation (0.928 correlation coeff.) was noted between the regain and the initial Young's modulus of the fiber (g/denier). The high value of regain was associated with the high modulus with high H bonding energy in the amorphous zone.

5825. Bastick, Jack. **The heat of adsorption of ammonia, phosphine, and arsine on silica gel.** *Compt. rend.* **234**, 1279-81 (1952).—*C.A.* 46, 6921*b*.

The heat of adsorption was measured in an ice calorimeter as a function of the amt. of gas adsorbed and the temp. of degassing used originally on the silica gel. The AsH_3 and PH_3 were apparently physically adsorbed, the heat of adsorption falling steadily with an increase in the amt. of adsorption. In contrast to these two gases, NH_3 gave indications of being chemically adsorbed on the gel that had been degassed at 200 °C. Until the NH_3 equiv. to about one third of a monolayer was added, the differential heat of adsorption remained approx. const. at 13 to 15 kcal/mol.; it then dropped steadily toward the heat of liquefaction.

5826. Boer, J. H. de and Steenis, J. van. **The behavior of hydrogen atoms on surfaces. II. The heat of adsorption of hydrogen atoms on glass and the desorption curve.** *Proc. Koninkl. Ned. Akad. Wetenschap.* **55B**, 578-86 (1952).—*C.A.* 47, 5759*h*.

The heat of adsorption of H atoms on glass and the energy of activation was estd. from a desorption curve at room temp. and application of abs. rate theory.

5827. Boer, J. H. de and Steenis, J. van. **The behavior of hydrogen atoms on surfaces. III. A semiquantitative treatment of the phenomena on glass and on inorganic salt surfaces.** *Proc. Koninkl. Ned. Akad. Wetenschap.* **55B**, 587-95 (1952).—*C.A.* 47, 5759*h*.

A heat of adsorption of 47.5 kcal/mol. was given for H atoms on lead glass. A value of about 60 kcal/mol. was estd. for the heat of adsorption on CaF_2.

5828. Cabrera, N. **The structure of surfaces and their adsorption, considered as a coöperative problem.** *Z. Elektrochem.* 56, 294-6 (1952) (in French) (English summary).—*C.A.* 46, 8461*e*.

"Surface melting" occurred in crystals in contact with their vapor just below the m.p., but this temp. T_c was considerably lower for a crystal immersed in a liquid or covered with an adsorbed layer. At T_c there should be a min. in heat of adsorption, and a marked change in surface tension.

5829. HÜTTIG, G. F. AND THEIMER, O. **Gas adsorption and surface structure.** *Z. Elektrochem.* 56, 490-6 (1952).—*C.A.* 47, 378*a*.

Heat of adsorption, forms of adsorption isotherm, relation of adsorption isotherm to temp., and desorption rates for the following substances were reviewed: H_2, NH_3, CO_2, N_2, and CH_4 and C_2H_6 on wood charcoal; C_2H_5Cl; N_2 on KCl; and CO on glass.

5830. KISELEV, V. F. AND KRASIL'NIKOV, K. G. **Investigation of the adsorption and of heats of adsorption of phenol from its aqueous solutions on nonporous carbon black.** *Doklady Akad. Nauk S.S.S.R.* 86, 111-13 (1952).—*C.A.* 47, 1459*c*.

Spheron Grade 6 lampblack was heated 7 hrs. at 900°C under 0.1-0.2 mm Hg. Adsorption of PhOH from its aq. soln. and heats of adsorption (in an isothermal calorimeter) were measured up to satn. The adsorption and the heat-of-adsorption isotherms had the same S-shape. In the low-concn. range, where the adsorption curve was made up of distinct steps, the heat of adsorption curve had a series of deep minima, the positions of which corresponded to those of the steps.

5831. MOONEY, R. W.; KEENAN, A. G., AND WOOD, L.A. **Adsorption of water vapor by montmorillonite. I. Heat of desorption and application of B.E.T. theory.** *J. Am. Chem. Soc.* 74, 1367-71 (1952).—*C.A.* 46, 6459*i*.

Repeated adsorption-desorption measurements of H_2O on montmorillonite showed that the desorption isotherm was reproducible whereas the adsorption isotherm depended on the initial H_2O content. Heats of desorption were calcd. from the Clausius-Clapeyron equation and give evidence of discrete layer formation.

5832. QUARTERMAN, L. AND PRIMAK, W. **The heat of reaction of graphite and potassium.** *J. Am. Chem. Soc.* 74, 806-9 (1952).—*C.A.* 46, 5419*g*.

The heat of reaction of graphite with an excess of K was redetd. calorimetrically. Detns. at several temps. in the range 66-95°C gave a mean value of 81 ± 2 cal/g of high-d. Acheson graphite. Heats of reaction of K with pitch-bonded natural graphite, pitch-bonded lampblack, pitch-bonded petroleum coke, and natural Ceylon graphite were detd. also. All of the results were in the range 72-90 cal/g.

5833. ANTROPOFF, A. V. AND LIETZ, G. **Investigations of the adsorption of gases from very small to high pressures. V. The heat of adsorption of argon on activated charcoal.** *Kolloid-Z.* 133, 76-9 (1953).—*C.A.* 48, 5595*a*.

Adsorption of A was detd. at 0°C on a Bayer charcoal (AKTII), the rise of temp. being measured with a Pt resistance thermometer in 2 types of vessels. Mean, integral, and differential heats of adsorption were calcd. for pressures from 8 to 604 mm. Mean and differential heats fell rapidly as pressure increased, reaching an approx. const. value of 1500 cal at 220 mm.

5834. BEEBE, R. A.; MILLARD, B., AND CYNARSKI, J. **Heats of adsorption of nitrogen and argon on porous and nonporous carbon adsorbents at -195°C.** *J. Am. Chem. Soc.* 75, 839-45 (1953).—*C.A.* 47, 6241*f*.

Heats of adsorption were detd. by means of an isothermal calorimeter for N_2 and A on Spheron and Graphon, on 2 samples of Saran charcoal, and on carbon wear dust prepd. by Savage. Anomalies both in the isotherm and the heat-coverage curve were found for the system A-Graphon. The magnitude of the heats obtained with the porous Saran charcoal was related to pore diams. The carbon wear dust presented a less homogeneous surface than expected.

5835. CALVET, ÉDOUARD. **Adaptation of a microcalorimeter of four elements to the thermogravimetry of adsorption.** *Compt. rend.* 236, 486-8 (1953).—*C.A.* 47, 5178*d*.

A microcalorimeter having 4 thermally sensitive elements was described. Each contained a liquid-containing silver cell isolated thermally from the thermostatted 100 kg copper block in which they were mounted. The exptl. zero was stable to 0.00001°C for periods of several days when the app. was operated in a const.-temp., const.-humidity room controlled to 1/20°C. A liquid-vapor heat exchanger was made of thin silver foil, formed in the shape of a star around a thin glass tube having an inside diam. of 5 mm. The lower end of this glass tube was approx. 5 mm above the sealed base of the surrounding star-shaped foil cylinder. This exchanger was submerged in the liquid in the measuring cell to within 5 mm of the top of the foil. When the liquid was vaporized, the vapor was forced from top to bottom through the space between the inner surface of the silver foil and the glass tube. The vapor passed from the cell through the glass tube which was secured to the neck of the cell by a stopper.

5836. CALVET, ÉDOUARD. **Thermogravimetry of adsorption by the exclusive use of a microcalorimeter with four elements.** *Compt. rend.* 236, 377-9 (1953).—*C.A.* 47, 4723*c*.

The microcalorimeter consisted of 2 identical systems, each consisted of 2 cells, which were connected with thermoelements. A liquid was distd. from one cell (of each system) onto an adsorbent in the other one. The special circuit contg. the 4 thermoelements allowed continuous measurement of the following quantities: (1) dq/dt, the rate of change in the heat of the calorimeter due to the slow adsorption of the vaporizing liquid. (2) dp/dt, the change of the weight p of the liquid due to its vaporization. The combination of both curves gave the differential heat of adsorption dq/dp as a function of p. Changes in heat of the order of 1/1000 cal/hr could be registered.

5837. PIERCE, CONWAY AND SMITH, R. NELSON. **Heats of adsorption. V. Adsorption on a homogeneous surface.** *J. Am. Chem. Soc.* 75, 846-8 (1953).—*C.A.* 47, 7287*e*.

The adsorption isotherm of EtCl on a sample of new Graphon was concave with respect to the pressure axis up to 0.001 relative pressure and 3% of a monolayer, convex between 3% and 100% of a monolayer, concave between 1 and 1.3 monolayers, and convex at still higher coverage. The results were interpreted as indicating strong lateral interaction with the max. in the heat of adsorption vs. coverage curve at approx. a monolayer.

III-2. Heats of Wetting–Specific Heat–Wetting Phenomena

5838. ANDRIANOV, P. I. **Sorption potential and hydrophile property of soils.** *Colloid J.* (U.S.S.R.) **6**, 695-700 (1940).—*C.A.* **35**, 7613^5.

The sorption potential and vapor pres. characterized the hydrophile property of soils just as well as the ratio of heat of wetting with water to that of wetting with C_6H_6(the Rebinder method). The amts. of particles with diam. less than 0.001 mm, detd. by mechanical analysis, might not have characterized the sorption properties of soil, especially in the case of soil of the region of permanent cold.

5839. ANDRIANOV, P. I. **New methods for designating the moisture content and hydrophilic properties of soils.** *Pedology* (U.S.S.R.) **1941**, No. 1, 40-9; **Chem. Zentr. 1941, I**, 3430.—*C.A.* **38**, 2150^9.

The moisture content of soils, up to the field capacity, could be calcd. from the heat of wetting or the hygroscopic moisture. The method for characterizing the soil-moisture status by means of pF values was discussed.

5840. BOYD, GEORGE E. AND HARKINS, W. D. **The energy of immersion of crystalline powders in water and organic liquids. I.** *J. Am. Chem. Soc.* **64**, 1190-4(1942).—*C.A.* **36**, 4002^8.

Data were given for the heat of immersion (h_i) of TiO_2, ZrO_2, SiO_2, SnO_2, ZnS, $BaSO_4$, $ZrSiO_4$ and graphite in one or several of the following liquids at 25°C: water, EtOH, BuOH, ethyl acetate, butyric acid, nitrobenzene, CCl_4, C_6H_6 and isooctane. The heats of immersion varied from 0.3 to 1.8 cal/g in water with smaller values for org. liquids. The ratio $h_i/(h_i)_{H_2O}$ depended almost wholly upon the nature of the liquid for which h_i was detd., and not upon the solid immersed, provided polar liquids only were investigated. For TiO_2 (anatase) the values of the ratio were: water, 1.00; butyric acid, 0.77; ethyl acetate, 0.69; BuOH, 0.67; nitrobenzene, 0.55; CCl_4, 0.46; benzene, 0.28; isooctane, 0.20. The ratios were almost the same for other O-contg. solids.

5841. GUNDERMANN, J. **Effect of very fine grinding on the heat of solution or heat of wetting of sugar and cellulose.** *Kolloid-Z.* **99**, 142-7 (1942).—*C.A.* **37**, 4297^1.

The structure of the crystal lattice of sucrose was destroyed to a great degree by intensive grinding. This was made evident by the pos. values obtained for the heat of soln. The heat of soln. could serve as a criterion for the efficiency of the mill used for fine grinding. The destruction of the lattice structure of finely ground cellulose could be detected from changes in the heat of wetting. Similar detns. were made also with finely ground coke.

5842. KIMURA, OSAMU. **A method for measuring the surface energy of solids.** *Bull. Chem. Soc., Japan* **17**, 61-3 (1942).—*C.A.* **41**, 4348*b*.

A float pycnometer method was used to measure the surface energy of solids. The surface energy of $CaSO_4.2H_2O$ was found to be 3.9 × 10^2 dynes/cm.

5843. MULLER, P. B. **The calorimetric standardization of the activity of adsorbents for chromatographic analysis with specific consideration of alumina.** *Helv. Chim. Acta* **26**, 1945-65 (1943) (in German).—*C.A.* **39**, 10^9.

The activity of an adsorbent was detd. by measuring the heat effect produced when 50 g of the absorbent and 65 ml of the solvent were mixed in a specially designed calorimeter. Four Al_2O_3 prepns. were used. Solvents used were petr. ether (b. 90-110°C) unpurified and purified in several ways, mixts. of the several grades of petr. ether with ethyl ether, ethanol, chloroform and hexane. Various combinations of the oxides with the solvents were measured. The correlation of the heat effect and the activity of the oxides was good.

5844. CANNON, C. G.; GRIFFITH, M., AND HIRST, W. **The carbonization of coals.** *Proc. Conf. Ultra-fine Structure of Coals and Cokes, Brit. Coal Utilisation Research Assoc.* **1944**, 131-46.—*C.A.* **39**, 1274^2.

Heats of wetting by MeOH of carbonized residues from coals of different ranks were detd. as a function of the max. carbonizing temp., carbonization being in N_2. In general, coals of low coking rank showed highest heats of wetting and this was also true of the coked residues. There usually were 2 maxima in heat of wetting vs. carbonization temp. curves, one in the range 300° to 500°C and the other 500° to 700°C. Heat of wetting over the lower ranges was suppressed by carbonization in a closed bomb.

5845. EICHBORN, JOHANN-LUDWIG v. **Mutual adhesion of substances not miscible spatially. I. Problems of the contact angle theory, especially of liquids on solid surfaces.** *Kolloid-Z.* **107**, 107-28(1944).—*C.A.* **39**, **11**^{5}.

A theoretical discussion was presented. An appendix was included dealing with the distinctions and ambiguities in phys.-chem. terms, such as "tension," "stress" or "strain."

5846. GRIFFITH, M. AND HIRST, W. **The heat of wetting of coals in organix liquids.** *Proc. Conf. Ultra-fine Structure of Coals and Cokes, Brit. Coal Utilisation Research Assoc.* **1944**, 80-94.—*C.A.* **39**, 1267^5.

Measurements in an ice calorimeter (min. rate of liberation of heat of 1 cal/hr) showed that MeOH liberated 94% of the heat of wetting within 10 min. and 99% within 25 min. Optimum conditions for the coal sample were: through 72 B.S.S. mesh, dried for 1/2 hr at 105°C in air, and final evacuation at 10^{-5} mm Hg. Heat of wetting due to ash constituents under 5% and up to 4% water in MeOH was negligible. Heat of wetting values of the coals by MeOH, expressed as cal/g of dry, ash-free coal, showed a decrease with increasing volatile from 6 to 20%. Between 20 and 30% volatile the heat of wetting is a min. Beyond 30% volatile the heat of wetting shows a marked and abrupt spread covering 3-24 cal/g.

5847. Deryagin, B. **Thickness of the liquid film adhering to the walls of a vessel after emptying.** *Acta Physicochim. U.R.S.S.* 20, 349-52 (1945).—*C.A.* 40, 774^4.

For the case of the thick liquid films adhering to a vessel being emptied (or to a plate being drawn from the liquid), the thickness of the liquid layer was independent of surface tension. The av. film thickness $\bar{h} = 2h_o/3$ and $h_o = (nU/pg \sin \alpha)^{1/2}$, where n was the viscosity and p the d. of the liquid, g was the gravitational const., h_o was the film thickness just above the "water-line," which made an angle α with the wall and receded with velocity U parallel to the wall.

5848. Deryagin, B. and Titievskaya, A. **Experimental determination of the thickness of the liquid layer left on a solid wall behind the receding meniscus.** *Doklady Akad. Nauk S.S.S.R.* 50, 307-10 (1945).—*C.A.* 43, 2059*b*.

Exptl. tests were made with 11 various oils and solns. of rosin in oil of different n. The thickness of the residual layer of liquors was detd. by weighing a glass cylinder of 3.5 cm diam., wall thickness 0.15 cm immersed in the liquid and either raised vertically at the rate U or kept stationary, with the surrounding liquid being siphoned off at that rate. The "end effect" i.e. the effect of the liquid adhering to the bottom end of the cylinder, was eliminated.

5849. Dimo, V. N. **Heat of wetting of soils, minerals, and rocks in relation to their surface properties.** *Pedology* (U.S.S.R.) 1946, 301-8.—*C.A.* 41, 825_g.

The heat of wetting was accompanied by adsorption and hydration; max. hygroscopicity was assocd. with adsorption, hydration, and capillary condensation. Since the latter was conditioned by the size of the ultrapores, a value for ultraporosity could be obtained from the ratio of heat of wetting to max. hygroscopicity. There seemed to be no proportional relation or constancy of the values of max. hygroscopicity, heat of wetting, and specific surface.

5850. Herbst, Heinrich H. **Heat of wetting of metal surfaces by oils.** *Petroleum Refiner* 25, No. 3, 133-7 (1946).

The quantity adsorbed on a smooth metallic bearing was not related to the quantity adsorbed by the powder (of the same metal) in the same ratio as bearing surface area to powder surface area. Capillary structure and "ultraporosity" exerted considerable influence on these phenomena. For instance, various adsorbates of variable large molecular sizes would tend to give different surface area relationships with one and the same powder. The heat-of-wetting of metals by oils must be carried out directly on the smooth metal or bearing-metal itself. An apparatus was described.

5851. Onusaǐtis, V.A. and Yur'evskaya, N.P. **Investigation of the process of coke structure formation. II. Electrical conductivity, heat of wetting, and sorption properties of cokes.** *Bull. acad. sci. U.R.S.S., Classe sci. tech.* **1946**, 1635-47(in Russian).—*C.A.* 41, 3278*f*.

Heats of wetting Q with MeOH were detd. calorimetrically on 2 granularly different grades of coke (0.104-0.208 and 0.043-0.061 mm grain size) for 600 and 850°C cokes. Irrespective of coal sort and grain size, higher coking temp. always resulted in lower Q. Distinctly different Q values were found with cokes made from 3 portions of a given coal sorted out by petrographic types, glossy, half-glossy, and half-dull. Sorption expts. were made at 20°C on powd. cokes evacuated at 400°C for 6-8 hrs. Water vapor was adsorbed at all pressures up to that of satd. vapor with the exception of 1200°C glossy-coal coke where no sorption occurred at any pressure; sorption of C_6H_6 was very slight and ended at 4-5 mm. Max. sorption values for the coarse-grain total-coal cokes, 800, 1000, 1200°C, were H_2O 41.5, 13.1, 3.84 mg/g; C_6H_6 9.0, 6.6, 2.07 mg/g; for glossy-coal coke, H_2O 26.5, 6.2, 0; C_6H_6 2.48, 7.28, 2.65; half-glossy, H_2O 41.5, 22.1, 6.9; C_6H_6 4.55, 10.3, 4.4 mg/g.

5852. Skuratov, S. M. and Shkitov, M. S. **Specific heat of water bound by high polymeric substances.** *Compt. rend. acad. sci. U. R. S. S.* **53**, 627-9 (1946) (in English).—*C. A.* 41, 2633*b*.

The calorimeter consisted of a thin-walled cylindrical Ag ampoule fitting tightly in a Ag container. A bifilar coil of manganin wire served as heater. The sp. heat of gelatin, H_2O content ranging from 16.7 to 0.46%, gave a value coinciding within 1% with that computed from addn. equations. The sp. heat of both types of starches also yielded very close values, deviating but slightly from the computed ones. The departure from the straight line somewhat increased with the H_2O content.

5853. Baticle, Robert L. **The rate of wetting of a pulverulent solid by a liquid.** *Compt. rend.* 224, 339-40 (1947).—*C. A.* 41, 3677*i*.

The wetting of a pulverulent solid by a liquid was usually characterized by the two static quantities adhesive tension and heat of wetting. A dynamic quantity, the rate of wetting, had also been used. For a given liquid-solid couple, the movement of liquid in a compressed powder was given by the equation: $t = Kl^2$, where K was a const. depending on the packing of the powder, and l the depth of bed of the solid. The rate of wetting of powders was detd. experimentally in an app. consisting of a brass cylinder for holding the compressed powder fitted with a vertical glass tube for observing the fall of the liquid level with time. For TiO_2 powder, the curve was rigorously parabolic for a no. of the usual liquids.

5854. Dumanskiĭ, A. V.; Mezhennyĭ, Ya. F., and Nekryach, E. F. **Lyophilism of disperse systems. I. Heat of wetting.** *Kolloid, Zhur.* 9, 355-66 (1947).—*C.A.* 43, 6042_c.

Heats of wetting Q with H_2O were detd. calorimetrically for potato starch of different moisture contents m. At 20°C, $m = 0.00$, 0.55, 5.12, 10.26, 16.02, 18.58, 22.02, 28.24, $Q = 28.06$ cal/g sample (28.06 cal/g dry starch), 26.24 (26.38), 16.29 (17.16), 10.36 (11.42), 4.21 (5.01), 2.10 (2.58), 1.09 (1.395), 0.48 (0.67). Log Q was very nearly a linear function of m; its extrapolation gave $Q = 0$ at $m = 25.7\%$. The surface area was $S_0' = 0.7 \times 10^{-7}$ cm^2/cc. For powdered gelatin, at 20°C, $m = 0.00$, 4.73, 9.47, 15.40, 26.16, $Q = 32.50$, 23.58.

15.45, 8.26, 1.13 cal/g dry gelatin, and for powd. agar, $m = 0.00$, 7.56, 10.48, 14.73, 20.92, 29.18, $Q = 44.85$, 28.10, 22.45, 11.25, 6.99, 3.24 cal/g dry agar; the linearity between log Q and m held in both cases.

5855. HORMATS, SAUL; ZEFFERT, B. M., AND DOLIAN, F. E. **Heat of wetting of charcoal and its retentivity for ethyl chloride.** *J. Colloid Sci.* **2,** 307-14 (1947).—*C. A.* **41,** 6454*c*.

Retentivity was defined as the wt of adsorbed gas or vapor per unit vol. of adsorbent in equil. in air with a concn. of the gas or vapor just below that of physiological significance. There was a ten-fold variation in the retentivity of com. activated charcoals for EtCl. Changing the size and shape of the charcoal container, the vol. of charcoal, or the flow rate of desorbing air within practical limits did not affect retentivity. There was no correlation between the heats of wetting of a charcoal in C_6H_6 and its retentivity for EtCl. This was thought due to (1) small heat effect and (2) small extent of surface concerned with retentivity as compared to total surface contributing to heat of wetting by the benzene.

5856. HUTCHINSON, E. **III. Heats of wetting and adsorption on ionic crystals.** *Trans. Faraday Soc.* **43,** 443-7 (1947).—*C. A.* **42,** 1477*i*.

The heats of wetting and adsorption on NaF of a no. of liquids were measured. The response to small temp. changes was less than one sec. The heats of wetting on NaF per g powder (cal) and per g-mol. of liquid (kcal.) were, resp: CCl_4, 0.96, 24.7; chlorobenzene, 0.48, 12.3; petr. ether, 0.31, 8.1; benzene, 0.54, 14.0; octyl alc., 0.42, 10.0; nitrobenzene 0.84, 21.7; amyl acetate, 0.92, 23.7; acetone, 0.33, 8.6; acetophenone, 0.33, 8.6; benzaldehyde, 0.64, 16.6; oleic acid, 0.92, 23.3; caprylic acid, 0.94, 24.3. These heats were greater for highly polar than for nonpolar liquids.

5857. IL'IN, B.V. **The van der Waals forces at the edges of crystals. The work of the electrostatic forces in the wetting of the alkaline earth sulfates.** *Doklady Akad. Nauk S.S.S.R.* **56,** 269-71(1947).—*C.A.* **44.** 8191*h*.

When crystals of $CaSO_4$, $SrSO_4$, and $BaSO_4$ were wet with water, EtOH, or other alcs., van der Waals forces developed between the mols. of the liquid and those of the solid material. These consisted of adsorptive forces of 3 components: electrostatic, dispersive, and repulsive forces. The dispersive component amounted to only 1-2% of the experimentally obtained energy of adsorption. Neglecting this component, the electrostatic work of wetting was calcd. for the above salts and compared with the experimentally detd. heat of wetting. The agreement was only in order of magnitude.

5858. KING, G. **The effect of strongly hydrogen-bonding agents on some polar polymers.** *J. Colloid Sci.* **2,** 551-62 (1947).—*C.A.* **42,** 2826*h*.

The dielec. const., relative rigidity, swelling, heat of wetting, and sorption were detd. for the systems: nylon-H_2O vapor, keratin-H_2O vapor, nylon-HCOOH vapor, and keratin-HCOOH vapor. The effect of temp. over the range 20-140°C on the relative rigidity of nylon and of sorbed H_2O on the relative rigidity of silk were also detd. Both H_2O and HCOOH decrease the dielec. const. of the polymers over and above their effect as absorbates. Calcns. were made to det. the approx. no. of mols. of bound H_2O and low energy sites per unit wt. of keratin, nylon, and silk.

5859. PESEZ, MAURICE AND BERRET, RENÉ. **Method of measuring the heat of wetting of decolorizing carbons.** *Chimie & industrie* **58,** 28-30 (1947).—*C.A.* **42,** 425*c*.

The adsorbing power of carbons was proportional to the heat of wetting in benzene. The construction and operation were described of a special calorimeter, in which the heat of wetting was compared with the amt. of heat given off by an elec. resistance through which passed a known current.

5860. ADAM, N. K. **Principles of penetration of liquids into solids.** *Discussions Faraday Soc.* **1948,** No. 3, 5-11.—*C.A.* **43,** 1239*f*.

The min. contact angle obtainable was zero, not uncommon for "receding" angles; the max. possible advancing angle on a "smooth" surface, important for waterproofing problems, was probably between 110° and 120°. For rough surfaces, apparent contact angles as high as 160° were found. The water-repellence of duck feathers was due to well-designed structure and not to any water-repellent wax. Simple geometrical considerations showed that the penetration pressure may become neg. in the presence of constritions in a pore. An attempt was made to confirm this experimentally in a tube with zigzag walls.

5861. CASSIE, A.B.D. **Contact angles.** *Discussions Faraday Soc.* **1948** No. 3, 11-16.—*C.A.* **43,** 1239*d*.

The difficulty of reproducing a "smooth" surface doubtless is the cause for so many published values of contact angles. Despite this, the abs. values of these angles give a useful relation between measurable roughness and angle and this treatment may be extended to hetergeneous surfaces. Advancing contact angles only appear to give agreement between theory and expt. and probably no phenomenon in textiles that involves receding contact angles has been explained satisfactorily. The multimol. sorption theory indicates that the advancing angle will be unique whereas the receding one will generally be less than the advancing angle and need not have a unique value.

5862. DRESEL, EVA H.; GRIFFITH, M., AND HIRST, W. **The free and total energies of interaction of coals with methyl alcohol.** *Trans. Faraday Soc.* 44, 992-1001 (1948).—*C.A.* 43, 8835*i*.

The heat of wetting (ΔH_L) of coal by MeOH was detd. from adsorption measurements. The isotherms were measd. by a volumetric method on 3 kinds of coal. Hysteresis was observed, and only the desorption isotherm was suitable for the detn. of the free-energy lowering (ΔG_T) for the adsorption of MeOH vapor at two different pressures. In detg. the temp. coeff. of ΔG_T it was necessary to make measurements at the higher temp. first. There was no evidence from these results that heat was liberated slowly in the calorimetric measurements. The differential heats of adsorption were also calcd. Even after subtracting the latent heat of condensation of MeOH, all of the differential heats were considerably greater than zero. The behaviors of the 3 kinds of coal were interpreted in terms of a model of coal structure.

5863. Dumanskiĭ, A. V.; Mezhenniĭ, Ya. P., and Nekryach, E. F. **The lyophilism of disperse systems. II. Heat of wetting of starch, gelatin, agar, and silica with water and alcohol.** *Kolloid. Zhur.* **10**, 103-11 (1948).—*C.A.* 7781*f*.

Q of sol. starch in H_2O and in EtOH was 24.5 and 1.3 cal/g and of silica gel 22.7 and 25.2 cal/g. Agar and gelatin gave $Q = 0.62$ and 0.08 in EtOH. Potato starch had 1.68 in EtOH and 27.5 in *M* aq. sucrose soln. The percentage *A* of H_2O that lowered *Q* to zero was calcd. to be 37 and 30% for starch and silica gel, resp. The ratio of *Q* for dry powder to *A* was almost const. (0.67-0.81); this showed that the heat of adsorption of 1 g of water was const. (approx. 75 cal). Increases of the concn. of sucrose on mixing its solns. with starch yielded for "bound" H_2O 31-34%, in agreement with the *A* calcd. from *Q*. The real heat of wetting was greater than *Q*, because *Q* included the neg. heat of swelling and soln.

5864. Gapon, E. N. **Work of wetting and heat of wetting of soils.** *Kolloid Zhur.* **10**, 259-64 (1948).—*C.A.* 43, 7619*e*.

The thermodynamic relations between the differential heat Q_d, integral heat Q_i, differential work A_d and integral work A_i of wetting were derived. For soils, A_i decreased in the series Mg> Ca> H> Na. Q_d was always greater than A_d, but the difference was small at low humidities.

5865. Gapon, E. N. and Zuev, L. A. **Heat of wetting of soils.** *Kolloid. Zhur.* **10**, 83-93 (1948).—*C.A.* 43, 7619*c*.

Chernozem, the satn. capacity of which was 31 milliequiv./100 g, was transformed into the Mg, Ca, Na and H forms. These were dried at 107°C in a high vacuum, and 20-g samples were immersed in 500 g H_2O either dry or after having adsorbed *s* g H_2O per 100 g soil. The heat of wetting *q* of dry samples in cal (±0.05) per g soil was 5.71, 5.48, 4.42, and 5.22 for the above forms, resp., at 15°C. Between about $s = 0.2$ and 3, *q* decreased linearly when *s* increased. The series Mg > Ca > H > Na agreed with that valid for adsorption of H_2O at low vapor pressures.

5866. Gregg, S.J. **Hysteresis of the contact angle.** *J. Chem. Phys.* **16**, 549-50 (1948).—*C.A.* **42**, 5302*b*.

The angle of contact θ of a liquid against a solid was profoundly affected by the presence of an adsorbed film on the unimmersed portion of the solid. In the "adsorption increasing" run of a vapor-adsorption expt. there was an advancing contact angle θ_a; in the "adsorption decreasing" run there was a receding contact angle θ_r. Adsorption hysteresis was aggravated in some cases by air—an impurity almost inevitably present during measurements of the contact angle. Phase transformations were frequent causes of adsorption hysteresis. Perhaps adsorption hysteresis, and therefore, hysteresis of the contact angle might in principle be eliminated by allowing sufficient time to elapse before measuring θ; under conditions attainable in practice, there would be a residue of cases in which hysteresis of the contact angle would persist despite the most careful precautions.

5867. Guastalla, Lina P. and Guastalla Jean. **Direct measure of adhesive tension. Modes of wetting.** *Mém. services chim. état* (Paris) 34, 373-9(1948).—*C.A.* 44, 5679*b*.

Adhesive tension was measured directly by a sensitive torsion balance and a galvanometer. The exptl. results were shown graphically as the force per unit length of perimeter as a function of depth of the sheet in the liquid. There was a hysteresis on introducing and withdrawing the sheet. Paraffin and a pure water gave a mean value of -27 dynes/cm, mica and pure water about +55 dynes/cm. A monolayer of oleic acid on the paraffin resulted in a mean value of +12 dynes/cm. Results were also given for some vegetable waxes.

5868. Inaba, Ayako. **Wettability of solid surface. I. Wettability of paraffin surface.** *Mem. Faculty Sci. Kyūsyū Univ.*, Ser. C., Chem. **1**, 1-17 (1948).—*C.A.* 46, 2374*f*.

The advancing contact angle of water on crude paraffin (117°) was almost equal to that of purified paraffin (116°), whereas the receding contact angle of the former (103°) was smaller than that of the latter (108°). The wettability of crude paraffin increased with time of contact with water, reaching after 10 hrs const. values of 93° for the advancing angle and 75° for the receding angle. Purified paraffin showed only a slight increase in wettability after several hrs contact with water.

5869. Plaksin, I. N. and Bessonov, S. V. **Change of the wettability of metals and sulfides under the action of gases.** *Doklady Akad. Nauk S.S.S.R.* 61, 865-8 (1948).—*C.A.* 43, 2485*h*.

Contact angles θ between the solid surface and a drop of H_2O were measured as a function of time in O_2, N_2, and CO_2. Only O_2 proved to have an effect in the direction of increased hydrophobization of the surface. Thus, under O_2, for Au, θ increased from 61 to 78° in 60 min., for Ag from 52 to 68° in 30 min., remaining practically const. after about 60 min. For pyrite and sphalerite, θ passed through a max. (after about 50 and 34 min., resp.), then decreased and, eventually, fell below the initial value.

5870. Rees, W. Howard. **Heat of absorption of water by cellulose.** *J. Textile Inst.* **39**, T 351-67 (1948).—*C.A.* 43, 1180*h*.

Heat-of-wetting measurements were made on various cottons by the method of mixts. with 2 cylindrical Dewar flasks of internal diam. 2.5 in. and 540 cc. capacity. Distd. H_2O (200 cc.) was placed in each flask so that, before the container was lifted, the specimen was completely below H_2O level but isolated from it. Heats of absorption were derived from exptl. data of heats of wetting and also from moisture-absorption data, and the value for cellulose at zero-moisture regain was found to be 283 cal/g of liquid H_2O (15.6 kcal per mole H_2O vapor).

5871. Wahba, Maurice. **Moisture relationships of cellulose. I. The heat of wetting in water and in certain organic liquids.** *J. Phys. & Colloid Chem.* 52, 1197-1208 (1948).—*C.A.* 43, 1638*f*.

The heats of wetting of dried, outgassed samples of raw cotton, medicated cotton, standard cellulose, and viscose in water were measured calorimetrically and found to be 12.3, 10.0, 10.7, and 20.3 cal per g, resp. Similarly, heats of wetting in MeOH, acetone, and benzene were 13.5, 2.6, and 1.3 for viscose, and 7.6, 1.5, and 0.8 for cellulose. The heats of wetting of cellulose in the different liquids changed in the same order as the adsorption values from the vapors of the liquid.

5872. Weil, Louis. **Calorimeter for measuring heats of wetting.** *Compt. rend.* 226, 2130-2 (1948).—*C.A.* 46, 2351*b*.

A Dewar vessel, suitably enclosed, was used as an adiabatic calorimeter for measuring the heat of wetting of bentonite by benzene.

5873. Andrianov, P. I. **Heat capacity of bound water.** *Doklady Akad. Nauk S.S.S.R.* 66, 219-22 (1949).—*C.A.* 43, 6069*e*.

By calorimetric measurements, the sp heats of starch with 22.98 and 10.84% moisture were found to be 0.402 ± 0.006 and 0.322 ± 0.003 cal/g, resp.; hence the sp heat of the hydrophylically bound H_2O is 0.91 ± 0.03 and 0.76 ± 0.03 cal/g, resp., i.e. considerably lower than the sp heat of free H_2O, and decreasing with the relative H_2O content of the starch.

5874. Aron, Ya. B. and Frenkel, Ya. I. **Behavior of liquid drops (and bubbles) on the surface of a solid. II. Experimental verification of the formulas for the critical sliding angle and the minimum mass of the drops (bubbles).** *Zhur. Eksptl. Teoret. Fiz.* 19, 807-13(1949).—*C.A.* 46, 10780*c*.

The formula for the limiting slope α at which a drop or a bubble began to roll down an inclined plane solid surface, $\sin\alpha = 2r\Delta\sigma/mg$ (where $2r$ = diam. of the wetting area, $\Delta\sigma$ = adhesion energy, m = mass of the bubble) was verified for drops of H_2O on paraffin and muscovite and of Hg on sphalerite, talc., calcite, and glass. The min. mass m_m at which the drop would roll down at all was $m_m = 2r\Delta\sigma/g$. Drops of H_2O of m up to 0.0350 g. did not roll down on paraffin at any inclination, which was somewhat below $m_m = 0.0400$ g. The exptl. m, below which the drops did not roll, was slightly less than $2r\Delta\sigma/g$, and only in the case of Hg on glass was it exactly equal to $m_m = 0.0081$ g.

5875. Bernard, René, and Hirtz, Jean. **Effect of adsorbed films on the energy of solid-liquid adhesion. Influence of thin adsorbed layers on the energy of adhesion of liquids to solids.** *Compt. rend.* 228, 1859-61 (1949); *J. chim. phys.* 47, 95-8 (1950).—*C.A.* 43, 8234*e*.

The contact angles of small drops of tritolyl phosphate were measd. on calcite, Cu and quartz surfaces, and found to drop steadily. Equil. was reached at 25°C only after 3 weeks. The progressive increase in adsorption energy was due to replacement of a film of water, initially present, by tritolyl phosphate.

5876. Bond, R. L. and Maggs, F. A. P. **A new basis for measurement of specific surface of carbonaceous powders.** *Fuel* 28, No. 8, 169-71 (1949).—*C.A.* 43, 7207*i*.

A rapid and accurate, though comparative, assessment of specific surface was provided by the heat-of-wetting measurement. Abs. values were obtained only if the heat liberation on wetting unit area was known. It was approx. 400 ergs/cm^2 for several types of carbonaceous surface.

5877. Dresel, Eva M. and Griffith, Margery. **The significance of the heats of wetting of coal powders ground to various degrees of fineness.** *Fuel* 28, 193-9 (1949).—*C.A.* 44, 6099*f*.

The effects of fine grinding on coal powders were detd. by combining heat of wetting measurements with vapor adsorption detns. Drastic grinding in a ball mill considerably increased the sorptive power of coals, and the effect was ascribed to the production of fresh internal as well as external surface. There was a limit to the increase in total surface which might have been effected by fine grinding. The heat of wetting by MeOH detd. on 240 B. S. S. coal was a more characteristic property than the value obtained on 72 B. S. S. powders.

5878. Dumanskii, A. V. **Heats of wetting and swelling.** *Doklady Akad. Nauk. S.S.S.R.* 64, 537-40 (1949).—*C.A.* 43, 4553*d*.

The heat of wetting, Q, by H_2O was detd. as the sum of the heats of dissocn. of $(H_2O)_n$ mols. into H_2O, of the reverse assocn., of sorption of H_2O and of the loss, q, of kinetic energy of the H_2O mols. undergoing sorption; since the sum of the 1st 3 terms = 0, $Q = q$. If the kinetic energy of a H_2O mol. = 5/2 kT, $Q = q = 10 \times 10^{-14}$ erg, in very good agreement with that calcd. from the heat of wetting of dry starch (1512 cal/mole H_2O adsorbed). The heat of wetting could not have been due to H-bonding which would have required about 5000 cal/mole. Similar considerations for the swelling process involved dissocn. of $(H_2O)_n$, decompn. of micelles into macromols. and decompn. of the latter, sorption of H_2O mols., and the corresponding reverse assocns.

5879. Enright, D. P.; Sonders, L. R., and Weyl, W. A. **Surface polarization and wettability of inorganic substances by water.** *J. Applied Phys.* 20, 1011-12 (1949).—*C.A.* 44, 409*f*.

The incomplete wettability of sol. inorg. substances by water was the result of weak forces emanating from the strongly polarized surface ions; in contact with water, the liquid had a contrapolarized effect.

5880. Inaba, Ayako. **Wettability of solid surfaces. III. Relation between aggregative states in phase diagrams and wettability for palmitic acid-paraffin systems.** *Mem. Faculty Sci., Kyūsyū Univ.* 1, 63-7 (1949).—*C.A.*46, 3842*i*.

The wetting by water of solid surfaces of mixts. composed of palmitic acid and paraffin increased with time of contact. The rate of increase of wetting depended on the proportion of the 2 components, and it changed in a complex manner with the concn. of palmitic acid. Correlations were drawn between the rate of increase of wetting with time and the phase diagram.

5881. MAFFEI, FRANCISCO J. AND HOFFMAN, FRIDA A.M. **Heat of hydration of national cements.** *Anais assoc. quim. Brasil* **8**, 178-87 (1949).—*C.A.* 44, 6095*f*.

Seven com. samples of Brazilian cements were examd. according to the A.S.T.M. method. The averages of 2 detns. expressed in cal/g referred to calcined material ranged for the heat of soln. from 570 to 634, after 3 days 535-581, 7 days 520-581, 7 days 520-562, 28 days 501-530, and for the heat of hydration after 3 days from 33 to 84, 7 days 31-85, 28 days 68-104.

5882. MAJUMDAR, K. K. **Contact angle of natural graphite** *J. Sci. Ind. Research* (India) **8B**, No. 12, 232-4 (1949).—*C.A.* 44, 5765*d*.

The water-air-solid contact angle of graphite was measured by the spheroidal segment method. The shape of small bubbles of air held against the solid under water was observed. The formula $\tan[(180-\theta)/2] = 2h/b$, was used where θ = contact angle, h = height of bubble, and b = base of bubble. Values found ranged from 17° 49′ to 25° 28′, increasing reqularly with decrease in ash content (range of ash content 3.6 to 0.87% by wt).

5883. PERREU, JEAN. **The heats of adsorption of methyl oxide and the heats of wetting of different liquids on activated charcoal.** *Compt. rend.* **229**, 195-7 (1949).—*C.A.* 43, 8835*e*.

The integral and differential heats of adsorption of $(CH_3)_2O$ on activated charcoal were given as a function of concn. of $(CH_3)_2O$ in the gas phase. The resulting curves resembled those for other gases except O_2 and were most similar to those for NH_3. The heats of wetting of activated charcoal at 15-16°C were given for H_2O, $n\text{-}C_7H_{16}$, CCl_4, C_6H_6, $C_6H_5CH_3$, $o\text{-}C_6H_4\text{-}(CH_3)_2$, $C_6H_5NH_2$, MeOH, EtOH, PrOH, BuOH, AmOH, glycol, glycerol, cyclohexanol, HCOOH, AcOH, AcOEt, and AcOAm. The values ranged from 25 to 34 cals with the exception of H_2O, glycerol, and cylohexanol, which had lower values.

5884. ZOCHER, H. AND GOLDSTEIN, D. **The wetting of vanadium pentoxide tactosol.** *Anais Assoc. quim. Brasil* **8**, 20-4(1949).—*C.A.* 45, 22*c*.

The prepn. and sepn. by gravity of V_2O_5 sol into a dil. optically isotropic fraction and a denser anisotropic fraction contg. oriented particles was described. The latter or "tactosol" phase showed irregular orientation on glass slides and very little if any on mica. Air bubbles orient the particles parallel to the interface, and metal fragments conc. the particles.

5885. ARON, YA. B. AND FRENKEL, YA. I. **Limitations of the validity of Neumann's rule for contact wetting angles.** *Zhur. Eksptl. Teoret. Fiz.* **20**, 453—7(1950).—*C.A.* 45, 8849*d*.

Exptl. measurements on H_2O on mica, H_2O on calcite, and Hg on glass showed a dependence of θ on the inclination α of the solid surface. With increasing α, at const. wt m of the liquid drop, θ increased at the top and decreased at the bottom of the drop, and the divergence increases with α. Even on a horizontal surface ($\alpha = 0°$), θ increased with m (for Hg on mica).

5886. BIDLOT, R. AND LEDENT, P. **Study of the wetting of coal dusts by aqueous solutions of wetting agents.** *Ann. mines* **139**, No. 4, 29-32 (1950).—*C.A.* 44, 10296*f*.

The time required to wet coal dust contg. 25% volatile matter was detd. for 0.02 to 2.0% aq. solns of the 5 com. wetting agents. The curve of surface tension vs. concn. of the addnl. agent was found to be similar to those previously detd. Lowering of the surface tension to approx. 35 dynes/cm appeared to be a necessary condition for complete wetting of the particles. A wetting speed of 12 mg/sec or greater was attained at 0.2% for one agent, at 0.5% for one, and at 2.0% for 3, while 2 agents showed speeds of only 3.0 and 3.5 mg/sec at 2.0%.

5887. DUMANSKIĬ, A. V. **Heats of wetting and hydrophily of disperse systems.** *Kolloid. Zhur.* **12**, 319-25 (1950).—*C.A.* 45, 927*e*.

The amt. A of "bound" H_2O could be calcd. from the heat of wetting (Q), from n, cryoscopy, dielec. const., and by freezing out; e.g., for H_2O "bound" by starch these methods gave $A = 0.31\text{-}0.36$ g/g. The ratio Q/A was independent of sorbent, being 73-80 cal/g for agar, starch, silica gel, clay, kaolin, Na stearate, and the insol. fraction of gelatin. The area of sorbent covered by 1 g of "bound" H_2O was $Q/116A$ cm^2 if Q was measured in ergs; 116 ergs was the total surface energy of 1 cm^2 H_2O.

5888. DUMANSKIĬ, A. V. AND OVCHARENKO, F. D. **Heats of wetting of Glukhovets kaolin and Chasov-Yar clay.** *Kolloid. Zhur.* **12**, 331-7 (1950).—*C.A.* 45, 1315*c*.

Kaolin and clay, when raw, had lower heats of wetting (Q) than when satd. with K^+. For K-kaolin and K-clay after drying at 110°C, Q was 1 and 6 cal, resp. If the thickness of the adsorbed H_2O layer was 3.5 A., the amt. (A) of H_2O "bound" by K-kaolin and K-clay was 1.3% and 7.8%, resp. From the neg. adsorption of sugar, A was 2 and 7%, resp. The specific surface of K-kaolin and K-clay, calcd. from Q, was 35 and 210 mm^2.

5889. HASEDA, TAIICHIRÔ; ÔTSUBO, AKIO, AND KANDA, EIZÔ. **Specific heat of amorphous state.** *Science Repts. Research Insts. Tôhoku Univ.* **Ser. A, 2**, 16-21(1950).—*C.A.* 45, 10029*d*.

A general model for supercooled liquids was proposed which involved the "ideal supercooled liquid," crystal nuclei, microcrystallites, and crystals. Inhomogeneities which appeared in the supercooled liquid were attributed to these nuclei and microcrystallites. In the amorphous state it was assumed that heat energy was absorbed in two ways, one by the kinetic portion and the other by the configurational portion. The former absorbed heat energy instantaneously, while the latter absorbed through a mol. relaxing process.

5890. HOWARD, FRANK L. AND CULBERTSON, J. L. **Some heats of wetting of unit surfaces.** *J. Am. Chem. Soc.* **72**, 1185-7(1950).—*C.A.* 44, 5202*e*.

Heats of wetting at 25°C were measured for the systems involving H_2O, CCl_4, or heptane as the wetting liquid and sphalerite, galena, fluorite, or quartz as the wetted solid, also for the systems sylvite-CCl_4 and sylvite-heptane. These heats of wetting were reduced to a unit-surface basis by means of the B.E.T. surface areas of the solid. The relative and abs. magnitudes of these heats of wetting showed evidence of chem. reaction rather than mere dipole interaction at some wetted surfaces.

5891. Il'in, B. V.; Kiselev, A. V.; Kiselev, V. F.; Likhacheva, O. A., and Shcherbakova, K. D. **Absolute heats of wetting of barium sulfate by water and by alcohols.** *Doklady Akad. Nauk. S. S. S. R.* **75**, 827-30 (1950).—*C.A.* **45**, 3232*i*.

Calorimetric detns. were made on 2 samples of $BaSO_4$, one of surface area 7 m^2/g, the other 9.7 m^2/g, outgassed at 400 and 300°C, resp. The exptl. values, at 20°C, were, on the smaller surface, H_2O 0.75 ± 0.02, MeOH 0.58_6 ± 0.005, BuOH 0.56 ± 0.03 cal/g; on the larger surface, H_2O 1.07 ± 0.03, MeOH 0.81_5 ± 0.005, EtOH 0.80 ± 0.01, PrOH 0.08 ± 0.01, BuOH 0.79 ± 0.02, $C_6H_{13}OH$ (at 50°C) 0.81_5 ± 0.01, $C_8H_{17}OH$ (at 50°C) 0.79 ± 0.01. The values for all the alcs. were practically identical. The data recalcd. for equal surface area were H_2O 455, alcs. 335-350 $ergs/cm^2$.

5892. Miller, John G.; Heinemann, Heinz, and McCarter, W.S.W. **Heat of wetting of activated bauxite and Attapulgus clay.** *Ind. Eng. Chem.* **42**, 151-3(1950).—*C.A.* **44**, 2821*d*.

The heats of wetting were detd. of bauxite and fuller's earth (Attapulgus clay) by water, motor gasoline, benzene, and alc. The natural clay was dried raw, dried below 450°F, at 450°C, 550°C, and 900°C, and extruded clay at 450° and 900°C. Arkansas bauxite was dried at 700° and 1200°C; South American bauxite was dried raw, at 700° and 1200°C. The sp heats of wetting of Arkansas bauxite, Attapulgus clay, charcoal, and silica gel were detd. with methyl, ethyl, Pr, Bu, isobutyl, and tert-Bu alcs. Data were also obtained for bauxite and clay with acetone, propinaldehyde, propionic acid, EtOAc, bromobenzene, aniline, $PhNO_2$, benezene, furan, cumene, butane, C_8 gasoline fraction, pyridine, thiophene, and Bu mercaptan. Change of activation of the clay had a marked effect on the surface area.

5893. Moser, Frank. **Approximating the attractive forces of adhesion for glass and other surfaces.** *ASTM Bull.* No. **169**, 62-6(1950).—*C.A.* **45**, 419*g*.

Contact-angle measurements were used to predict polarity and adhesion. Compatibility between an adhesive and a surface was assumed if approx. the same angles were obtained for the adhesive-coated surface as for a clean surface. Compatibility and subsequent adhesion of materials could be obtained by using a heterogeneous adhesive contg. both polar and nonpolar functional groups which were compatible with the dissimilar materials.

5894. Neudert, W. **A spreading test for drops for characterizing wetting.** *Kolloid-Z.* **118**, 113-14(1950).—*C.A.* **45**, 1406*a*.

Since wetting angles were greatly affected by uncontrollable factors, the calcn. of spreading potentials from such angles and surface tension was not reliable. However, wettability could be characterized by the consts. *A*, *B*, *C* in the equation $R = Av^B — Cv$, where *R* was the measured radius of drops of known vol., *v*, on a solid surface.

5895. Quarterman, Lloyd A. and Primak, Wm. L. **The capillary rise, contact angle, and surface tension of potassium.** *J. Am. Chem. Soc.* **72**, 3035-7(1950).—*C.A.* **44**, 8720*f*.

A sample of pure K was prepd. and distd. into a Pyrex glass surface-tension app. that was baked out in high vacuum and K vapor. The K wetted the glass with a small contact angle and exhibited a capillary rise that would have required a surface tension of 86 dynes/cm if the contact angle were 0°. On standing the glass surface altered, causing the contact angle to increase. Contact angles were measured by two methods.

5896. Schwarz, F. **The heat of wetting of clays and fuller's earths.** *Sprechsaal* **82**, 24-5 (1950).—*C.A.* **44**, 9650*g*.

The heats of wetting of 5 different clays, fuller's earths, and kaolins, dried at temps. between room temp. and 530°C, were detd. Large differences were found between kaolins and fuller's earths and also between lightly and strongly heated materials. Loss and pickup of H_2O when heated to several temps. between 110° and 950° C were given.

5897. Tachikawa, Shoichiro and Hosho, Hideo. **The wettability of coal.** *J. Fuel Soc. Japan* **29**, 2-7(1950).—*C.A.* **46**, 3236*e*.

In order to clarify the wettability of various coals (38 samples) and cokes (5 samples), two series of expts. for calcg. the work of wetting with H_2O and C_6H_6 were carried out. The wettability increased with the ash content and brown coals or anthracites were more wettable than bituminous coals which gave indefinite values. The calorimeter method was used to det. the relationship between the heat of wetting and the time of drying as well as the ash content of coal and coke. The heat of wetting was proportional to some powers of drying time.

5898. Wahba, Maurice. **Moisture relations of cellulose to heats of wetting of partially saturated viscose rayon and standard cellulose in water.** *J. Phys. & Colloid Chem.* **54**, 1148-60 (1950).—*C.A.* **45**, 3591*c*.

The heats of wetting of partially satd. samples of standard cellulose and viscose rayon (regenerated cellulose) were detd. in water in the absence of air at 30°C. Adsorption isotherms at 30°C with H_2O vapor were also measured on these 2 adsorbents. The ratio of the values for adsorption, heats of wetting, and heats of adsorption for the 2 cellulose samples were not const. when compared at const. relative humidities. The differential entropy for the transformation of the liquid into the adsorbed phase was neg. throughout the entire range of relative pressures used in the adsorption measurements.

5899. Wahba, Maurice and Nashed, Shawky. **Change with temperature of the heat of wetting of dry cellulose in water, and its bearing on the specific heat of the adsorbed water and of the swollen cellulose.** *Nature* **166**, 998(1950).—*C.A.* **45**, 5401*e*.

The exptl. results showed a linear decrease in the heat of wetting of dry cellulose between 0 and

40°C equal to about 0.042 cal/degree/g cellulose. The heat of wetting represented the decrease in the heat content of the system ($-\Delta H$), and the change of this with temp. represented the difference between the heat capacity of the system before and after wetting ($d(\Delta H)/dT = \Delta C_p$). The heat capacity of the system was thus shown to be increased by wetting.

5900. Wolf, F. and Sauerwald, F. **Surface-tension measurements. VI. Experiments utilizing the bubble-pressure method in the case of poor-wetting.** *Kolloid-Z.* **118**, 1-10(1950).—*C.A.* **45**, 409*h*.

Even with capillaries that were not well wet with a liquid, correct surface-tension values were obtained by the max.-bubble-pressure method if allowance was made for the effective diam. of the orifice from which the bubble parted. Observations were made with water in paraffin-, ceresin-, and silicone-coated capillaries (the silicone being dichlorodimethyl-silane) and with silicone oil in an ice capillary for poor wetting combinations. Combinations with good wetting were CH_3OH, $CHBr_3$, $C_2H_2Br_4$, $BaHgI_4$ soln., and Tl formate-malonate soln. in glass and silicone-coated glass capillaries.

5901. Benedicks, Carl. **The relation of the surface tension of a liquid to the wetting effect.** *Compt. rend.* **232**, 2435-7(1951).—*C.A.* **45**, 8849*b*.

The wetting effect was an alternation of the resistance of a solid to rupture when a liquid wets it; the effect was neg. (decreased resistance) for most liquids but pos. for some. Solids studied included hardened steel, plate glass, marble, and sugar; liquids included hydrocarbons, Et_2O, glycerol, glycol, EtOH, CCl_4, H_2O, and aq. NaOH. The neg. wetting effect on a given solid was a linear function of the surface tension of normal liquids.

5902. Berkowitz, N. and Schein, H.G. **Heats of wetting and the spontaneous ignition of coal.** *Fuel* **30**, 94-6(1951).—*C.A.* **45**, 4426*c*.

Some coals (especially certain lignites) had heats of wetting sufficient to raise the temp. of coal up to a max. of 36°C after thorough wetting of previously dry coal; this greatly increased the rate of oxidation of the coal and sometimes caused a rise to dangerous temps., even though the S content of the coal was low. Ignition may occur even in medium and small piles if they were first partially dried by exposure to dry weather and subsequently rapidly wetted. Fires have occurred when dry coal was dumped on water-logged ground, or on relatively wet coal.

5903. Chatterji, A.C. and Srivastava, R. D. **Heat of wetting of animal charcoal by different solvents.** *J. Indian Chem. Soc.* **28**, 547-50(1951).—*C.A.* **46**, 5398*g*.

The heats of wetting were detd. of MeOH, EtOH, PrOH, BuOH, acetone, AcOH, C_6H_6, $C_6H_5CH_3$, C_6H_6Cl, C_6H_{14}, $CHCl_3$, and CCl_4, of 1-5% solns. of $C_{10}H_8$, and adsorption of C_6H_5COOH, *o*-nitrobenzoic acid, phthalic acid, $C_{10}H_8$, and acenaphthene from 0.2 *M* solns. on animal charcoal, —60 mesh, free of Cl and PO_4. The adsorption of acids decreased as the heat of wetting by the solvent increased. The adsorption of $C_{10}H_8$ and acenaphthene was proportional to the heat of wetting.

5904. Dumanskiĭ, A. V. and Nekryach, E. F. **Heats of wetting and the hydrophily of flour.** *Kolloid. Zhur.* **13**, 20-6(1951).—*C.A.* **45**, 3702*i*.

Flour was kept over *x*% H_2SO_4 until equil.; then the water content *y* of the flour was 28-33%, 12-14%, 11-13%, and 4.6-5.0% at $x = 5$, 20, 60, and 90%. The differences between *y* of wheat flour (3 sorts), rye (2 sorts), barley, and oat flour were insignificant. The heat of wetting decreased when *y* increased; it was 22-28, 7.5-9.9, 4.9-5.2, and 0.4-0.7 cal/g at $y = 0$, 10, 14, and 30%.

5905. Gruntfest, I. J. **The mechanism of the wetting of textiles.** *Textile Research J.* **21**, 861-6 (1951).—*C.A.* **46**, 1771^f.

The wetting process applied to textiles could be resolved into two independent elements, often competitive with one another. One, the escape of occluded gases, was essentially mech., and the other rate of advance of the liquid phase into the mass to be wet was a physicochem. problem. The rates of surface-tension lowering appeared to correlate well with wetting-agent performance.

5906. Leadbeater, C. J. **The surface energies of metals and alloys.** *Selected Govt. Research Repts.* (London) (Powder Metallurgy) **9**, 1-21 (1951).—*C.A.* **46**, 7838*d*.

Five different methods of detg. surface energy were used. The max.-bubble-pressure method appeared to be the most reliable, but no purpose was served in making too fine a comparison between this and other methods, since differences up to 10% for Sb was found in the results of 3 investigators who used the bubble method. A table was given of the surface energies of Bi, Zn, Cd, Sb, Sn, Pb, Cu, Ag, Au, Hg, and Al. The problem of the theoretical derivation of surface energies was considered on the basis of the binding energy and electronic theory of metals.

5907. Morrison, J. A. and Drain, L. E. **Heat capacity of multimolecular layers of adsorbed argon.** *J. Chem. Phys.* **19**, 1063(1951).—*C.A.* **46**, 1839*d*.

Heat-capacity detns. of A adsorbed on TiO_2 were extended to the multimol. region in which the properties of the adsorbate approached those of the bulk substance. The heat capacity was a continuous function of the temp. with a max. a little below the normal m.p. The max. was at a lower temp. and was less pronounced, the smaller was the amt. of substance adsorbed. The maxima indicated rearrangement in the adsorbed film equiv. to fusion in the bulk substance. The onset of bulk properties accured at concns. between 1.6 and 2.9 V_m ($V_m = 755$ cc. at standard conditions). The partial molar heat capacities of adsorbed A were also evaluated for various concns.

5908. Plaksin, I. N. and Vladimirov, S. I. **Change in the wetting of platinum under the influence of various gases.** *Doklady Akad. Nauk. S.S.S.R.* **78**, 933-6(1951).—*C.A.* **47**, 23*d*.

The measurement of the contact angle at the tri-phase boundary in the system water-air-metal was used. Interaction of the gas with the Pt surface was continued for a period of 3 hrs; the contact angle was measured every 15 min. In the case of the action of O_2 a considerable increase of the hydrophobicity was noted. Nitrogen, A, and CO_2 gave identical curves of wettability. The activity of O_2 dissolved in water was also tested. The aq. medium contg. dissolved O_2 had a greater effect on the Pt surface than did gaseous O_2. The effect of H_2 on Pt surfaces was tested and found negligible.

5909. ROBERT, LOUIS. **Relation between the heat of wetting and the adsorability of liquid organic compounds on solid surfaces.** *Compt. rend.* **233**, 1103-4(1951).—*C.A.* **46**, 3366*f*.

A series of 15 org. compds. arranged in order of increasing heats of wetting on silica gel or Al_2O_3 gel was the same as that of degree of adsorbability. The heats were detd. by heating the powd. solid *in vacuo* at 110°C for 1 hr, sealing it in a glass ampule, breaking the ampule in the liquid, and measuring the temp. rise. For C_6H_6 and hexane, the heats of wetting were of the same order of magniture on silica or Al_2O_3 gel, but for EtOH the value was 2½ times that on Al_2O_3 and for H_2O 3 times.

5910. SCHEIN, H. G. **The spontaneous heating of coals.** *Brennstoff-Chem.* **32**, 298-301(1951).—*C.A.* **46**, 706*a*.

The initial heating of coal was due to the heat of wetting with water, rather than to the adsorption of O_2. Data were presented for the heat of wetting at 25°C and 40°C of a variety of coals. However, heating due to the initial heat of wetting may raise the temp. sufficiently so that the rate of oxidation of the coal was very greatly increased, so that further heating occurred, leading to ignition of the coal.

5911. SCHULTZE, K. **Hysteresis of contact lines and angles.** *Kolloid-Z.* **122**, 43-50(1951).—*C.A.* 45, 8322*d*.

The advantages of the B-no. method over that of contact angles in the choice of drop size for the detn. of contact angles were pointed out. The angle for a supposedly nonwetting system, paraffin, was only about 108°C. The B-no. method on the other hand gave a whole scale of degrees of wetting, approaching tne limit. Since the B-nos. indicated that paraffins were slightly wetted by H_2O, treatment was caused by a roughening of the surface and a consequently increased no. of accessible sensitive regions. This was demonstrated also for glass.

5912. SCHULTZE, K. **Wettability and methods for its measurement.** *Kolloid-Z.* **121**, 57-65 (1951).—*C.A.* **45**, 6897*e*.

All methods were based on the gradual transfer of a drop of water, the size of which was reproducible, to the surface to be measured. The no. of contacts required was a measure of the wettability of the surface and was designated as the B no. The wt of the water transferred at each contact was another measure of the wettability. A third measure of wettability was the force, expressed in mg, required to lift the Pt ring from the surface. Differences of paraffin surfaces treated in various ways were given.

5913. TAKAGI, SHUNSUKE. **Thermodynamics of liquids in small drops and in a meniscus. Heats of wetting and dilution.** *Rept. Inst. Sci. Technol., Univ. Tokyo* **5**, 245-52(1951).—*C.A.* **46**, 5920*c*.

Thermodynamic properties of liquids in small drops were computed by considering the surface area as one of the independent variables. The heat of vaporization from the meniscus in a capillary was also derived as a function of the capillary. The Clausius-Clapeyron formula was extended to the case where surface energy had to be taken into consideration. Heats of wetting and diln. were $-RT \log (p_0/p)$, where p_0 was the vapor pressure of pure water at temp. T, and p that of the sample to be considered.

5914. AZAROV, K. P. **Wetting of solids by silicate melts.** *Doklady Akad. Nauk. S.S.S.R.* **82**, 79-82 (1952).—*C.A.* **47**, 4169*c*.

Cylindrical shapes pressed from a powd. glass with and without various admixts., were heated to 950°C on different solid supports in a furnace, cooled rapidly, and outer angle of wetting projected magnified on a screen. Wetting of CaO, Al_2O_3, TiO_2, and quartz by the glass melt, without admixts., improved with an increase in the electronegativity of the cations of the solid. Wetting of acid solids (SiO_2, TiO_2, Fe_2O_3, Cr_2O_3) by the glass melt contg. oxides or carbonates of the metals of groups I and II were much better than wetting of basic solids (CaO and Al_2O_3). In general, as the acidity of the solid increased, wetting improved; as basicity increased, wetting decreased. With an increase in ion radius and a decrease in electronegativity of cations of group I, wetting of acid solids decreased and that of basic solids improved; for cations of group II the results were the reverse.

5915. BERKOWITZ, N. AND SCHEIN, H. G. **Inner surface of coal.** *Fuel* **31**, 130-2 (1952).—*C.A.* **46**, 1733*e*.

It was not valid to compare adsorption expts. on coal at 25°C with those made at—190°C as there was reason to think that at the latter temp. the pore surface would be much less accessible. While the high values of the heat of wetting derived from MeOH adsorption isotherms were almost certainly affected by swelling of the coal, the internal evidence of the data suggested that the available surface was not very much smaller.

5916. BERKOWITZ, N. AND SCHEIN, H. G. **Some aspects of the ultrafine structure of lignites.** *Fuel* **31**, 19-32 (1952).—*C.A.* **46**, 1734*i*.

Heat of wetting measurements with a series of Southern Hemisphere lignites, not previously systematically investigated, indicated that lignites might possess surface areas ranging up to about 380 m^2 per g (dry, ash-free). The individual measurements of the heat of wetting were in excellent agreement with results obtained from concurrent adsorption studies. Swelling of the coal substance in MeOH during adsorption or in the course of a heat of wetting detn. was not regarded as invalidating this conclusion.

5917. Good, Robert J. **A thermodynamic derivation of Wenzel's modification of Young's equation for contact angles; together with a theory of hysteresis.** *J. Am. Chem. Soc.* **74**, 5041-2 (1952).—*C.A.* **47**, 1460*g*.

A theory was presented for the hysteresis of contact angles. The driving force toward the attainment of an equil. contact angle was equal to the surface tension of the liquid times the deviation of the cosine of the contact angle from its equil. value. It was shown that this may be equated to the "contortional energy" F_c that the drop must have in order for its edge to surmount a ridge.

5918. Il'in, B. V. and Kiselev, V. F. **Absolute heats of wetting of strontium, lead, and barium sulfates, with water and with alcohols.** *Doklady Akad. Nauk S.S.S.R.* **82**, 85-7 (1952).—*C.A.* **46**, 4901*e*.

The heats of wetting Q were detd. by calorimetry on $SrSO_4$ and $PbSO_4$ preliminarily heated to a temp. low enough (200°C) to guarantee against sintering. B.E.T. surface areas were: $SrSO_4$ 4.5, $PbSO_4$ 2.3 m²/g, comparing with 5.3 and 2.4 by electron-microscope photography. The mean values of Q, with H_2O, MeOH, and $C_8H_{17}OH$, were, for $SrSO_4$, 0.34 ±0.01, 0.22 ± 0.005, and 0.23 ± 0.02, and for $PbSO_4$, 0.28 ± 0.01, 0.17 ± 0.01, and 0.17 ±0.02 cal/g. The abs. values of Q, per unit surface area, were for $SrSO_4$, 315, 200, and 215, and for $PbSO_4$, 490, 320, and 310 ergs/cm².

5919. Jura, Geo. and Hill, Terrell L. **Thermodynamic functions of adsorbed molecules from heats of immersion.** *J. Am. Chem. Soc.* **74**, 1598 (1952).—*C.A.* **47**, 5241*e*.

5920. Kiselev, A. V.; Krasil'nikov, K. G.; Pokrovskiĭ, N. L.; Avgul, N. N. Mikos; Dzhigit, O. M., and Shcherbakova, K. D. **Variation of the heat of wetting of silica gel by water with surface coverage.** *Zhur. Fiz. Khim.* **26**, 986-97 (1952).—*C.A.* **47**, 5786*d*.

The heat of adsorption of water on a silica gel with homogeneous pore-size distribution (40 A.), a surface area of 420 m²/g, and pore vol. equal to 0.90 ml/g, prepd. by hydrolysis of $SiCl_4$, was measured calorimetrically. An adsorption isotherm at 25°C was also taken. The differential heat curve dropped steeply at first from an initial value of about 15 kcal/mole, then more slowly and linearly until capillary condensation set in, at which stage the curve sloped down still more slowly. The abs. heat of wetting is 215 ergs/cm².

5921. Landt, E. and Gettmann, H. **Heat of wetting as characteristic value of powders.** *Naturwissenschaften* **39**, 279-80 (1952).—*C.A.* **47**, 6241*d*.

The heat of wetting of a pulverized material was detd. first with the material *in vacuo* before it was brought into contact with the completely wetting fluid, then with the material in equil. with increasing vapor pressure p of the fluid prior to contact with liquid phase. Thus, an isotherm of B, heat of wetting, vs. p was obtained. Exptl. values for the system of active charcoal and C_6H_6 were given.

5922. Mongar, J. L. and Wassermann, A. **Heat effects accompanying the absorption of simple electrolytes by fully-swollen alginate and cellulose gels.** *J. Chem. Soc.* **1952**, 510-13.—*C.A.* **46**, 4349*g*.

A *microcalorimeter* was described that enabled a detn. of small heat effects accompanying the reaction of fully-swollen gels with solns. of electrolytes. The heats of swelling of gels in H_2O and in $CaCl_2$ and NaCl solns. were detd. For $CaCl_2$, the heat of swelling was neg.; for NaCl it was pos.

5923. Neudert, W. **Mechanics of deformation at interfaces (spreading experiments).** *Kolloid-Z.* **126**, 104-8 (1952).—*C.A.* **46**, 9934*c*.

Data were given for the drop radius r of liquids on polished glass (in one case on a liquid) surface *vs.* the wt of the drop g. A parameter K was detd. which was a direct measure of the wetting power of the liquid. The equation was $r = R(1 - e^{-g/\Gamma}) - Kg$ in which K, R, and Γ were consts. for a given combination of spreading liquid and supporting surface. With increasing concn. of a wetting agent (BHF VII) on a glass plate K varied thus: 5.6 at 0.0%; 7.1 at 0.1%; 19.9 at 1.0%; and 15.9 at 10.0%.

5924. Neudert, Walter; Röpke, H., and Reitstötter, J. **Effect of surface properties of solid materials on the formation of the angle at the solid/liquid boundary (wetting number and working number).** *Kolloid-Z.* **125**, 35-40 (1952).—*C.A.* **47**, 5762*h*.

Angles of wetting (θ) were detd. with a microscope for drops of triolein and sesame oil on unworked and polished glass; stainless steel in unfinished, heat-treated, and polished states; Cu; and Ag-coated Cu. The observed angles increased with time, 15 min. being usually sufficient for reaching a steady state, and varied with the roughness of the surfaces. The concept of wetting no. (Z) was introduced; $Z = 1000(1 - \cos\theta)$, varying from 0 for complete wetting to 2000 for complete nonwetting ($\cos\theta = -1$).

5925. Puri, Balwant Rai; Lakhanpal, M. L., and Varma, Balvir. **Adsorption of vapors by charcoal.** *J. Indian Chem. Soc.* **29**, 841-5 (1952).—*C.A.* **47**, 7285*d*.

The adsorptions and relative wetting powers of H_2O, MeOH, EtOH, acetone, and C_6H_6 vapors on 5 types of charcoal were detd. at 20°C. The approx. equal vols. adsorbed at different relative vapor pressures, which correspond to the same capillary size, support the capillary condensation hypothesis. Minor variations in the vols. adsorbed are attributed to differences in the relative wetting powers of the compds.

5926. Röpke, H.; Neudert, Walter, and Reitstötter, J. **Effect of surface treatment of solids on the solid-liquid contact angle.** *Z. Elektrochem.* **56**, 639-43 (1952).—*C.A.* **47**, 3653*c*.

The contact angles of triolein and sesame oil on glass, stainless steel, and Cu were measured by means of a microscope for different conditions of surface prepn. (etched, polished, fired, etc.).

Differences were observed that suggest the definition of empirical indexes characterizing the spreading tendency of a liquid on a solid and also the degree of surface roughness. The latter improved wetting.

5927. STOWE, VERNON M. **Activated alumina. Heat of wetting by water. Heat of wetting by hydrocarbons.** *J. Phys. Chem.* 56, 484-6; 487-9 (1952).—*C.A.* 46, 7866*c*.

The heat of wetting on adsorption of a monolayer of H_2O on com. activated Al_2O_3 was measd. by a differential method. The value was in the range 150-190 cal/g H_2O and did not vary greatly with different grades of Al_2O_3. Measurements were extended to wetting by n-C_7H_{16}, Me_3CCHMe_2, toluene, and methylcyclohexane. The heat evolution was least for the paraffins and greatest for the naphthalene. Activated Al_2O_3 showed preferential adsorption for H_2O but no preferential adsorption for any specific type of hydrocarbon.

5928. WOLLENBERG, H. G. **The heats of wetting of hide substance between 0° and 60°C.** *J. Soc. Leather Trades' Chemists* 36, 172-81 (1952).—*C.A.* 47, 1416*i*.

Heats of wetting were detd. calorimetrically for limed, isoelectric, degreased collagen; green, and salted green, degreased pelts in the normal and shrunken states; and powd. gelatin at 0°, 20°, 40°, and 60°C. The results varied from 49 cal per g at 0° to 16.5 cal per g at 60°C for normal pelt, and from 38 cal per g at 0° to 16 cal per g at 60°C for shrunken pelt. The lower values for shrunken pelt resulted from the folding of polypeptide chains upon themselves during the shrinking process, causing a reduction in active sorption sites.

5929. YAGISHITA, HIDEHARU. **Coking IV. Structural analysis of coal by heat of wetting.** *Misc. Repts. Research Inst. Nat. Resources No.* 27, 69-79 (1952).—*C.A.* 47, 2960*a*.

Heats of wetting were more varied and lower in coals of low coalification, such as lignite, than in high coking coals with more regular structure; exceptionally high and varied in anthracite. Coal seemed to be carbonized as follows: at 400°C the mols. developed into cryst. macromols. in the amorphous region by accelerated micro-Brownian movement, which slide against one another in unit segments, as the coal melted. Low polymers then began to decomp., decreasing the cryst. region which increased about 600°C with the aromatic condensation.

5930. BANERJI, B. K. **The theory of contact angles.** *Mining Mag.* 88, 23-5 (1953).—*C.A.* 47, 3652*i*.

The total energy of the system was attributed mainly to the mutual van der Waals forces of attraction of the normal hydrocarbon chains and the fact that more dipoles were enabled to come in direct contact with the solid surface; any forces of repulsion present were considered negligible. After a collector was adsorbed, the polar parts did not contribute much to the intermol. forces, and the van der Waals forces between the hydrocarbon chains increased with chain length. From $(1+\cos\theta)/(1-\cos\theta)=C/f$ (where C was a const., f was the attractive force, and θ was the angle at a point of triple contact measured through the liquid phase between the solid surface and the tangent to the air-liquid interface) f was calcd. for each hydrocarbon chain of the satd. homologous series, by the successive addns. of 0.1159 C for each CH_2 group, and from these values the corresponding contact angles were calcd. There was very close agreement in a no. of cases with exptl. values.

5931. CALVET, ÉDOUARD; BOIVINET, PIERRE; NOËL, MICHELINE; THIBON, HONORÉ; MAILLARD, ALBERT, AND TERTIAN, ROBERT. **Alumina gels.** *Bull. soc. chim. France* 1953, 99-108.—*C.A.* 47, 3655*h*.

Gels prepd. at pH less than 6 were amorphous. At pH 9 the gels were α-boehmite. The amts. of SO_4^{--}, Cl^-, and NO_3^- adsorbed by the gel when the corresponding acids were added to Na aluminate were detd. In microcalorimetric measurements, it was found that the temp. at which the gel was dried, the adsorbed anion content, and the degree of crystallinity affected the heat of wetting of the gel in 4 N NaOH. The temp. effect was attributed to the irreversible dehydration of the gel, and confirmed by infrared-spectrum studies of three amorphous gels dried at 50°C. Only OH^- was detected in these gels, H_2O being absent.

5932. DENNIS, KENT S.; PACE, E. L., AND BAUGHMAN, CHARLES S. **Heat capacities of multimolecular layers of methane adsorbed on rutile.** *J. Am. Chem. Soc.* 75, 3269-70 (1953).—*C.A.* 48, 423*d*.

The multilayer heat capacities were investigated of CH_4 adsorbed on rutile in 1.0 to 5.8 monolayers over a temp. range of 72-116°K; 0.03106 mole constituted a monolayer. Above 1 monolayer, the adsorbed gas exhibited bulk properties. The max. in the curves of heat capacity vs. abs. temp. were interpreted as indicating a rearrangement in the adsorbed film which correspond to melting in the bulk phase. For A, bulk properties began between 1.6 and 2.9 monolayers; for CH_4 they began between about 3 and 4 monolayers.

5933. FOWKES, FREDERICK M. **Role of surface-active agents in wetting.** *J. Phys. Chem.* 57, 98-103 (1953).—*C.A.* 47, 4691*e*.

The relation between sinking time and wetting agent depended on the extent of adsorption during penetration. For strongly adsorbed substances such as Triton X-100 and Nonic 218, the rate of wetting was affected by the extent of diffusion of agent from the bulk soln. to the surface. Sinking times were related to surface tension by log $t_s=A+B\gamma$ (where t_s was the sinking time and γ was the surface tension which was concn. dependent and was related to the contact angle). Wetting properties could be correlated with the mol. structure of the wetting agent by a knowledge of the crit. concn. needed for micelle formation.

Chapter IV. THEORIES OF ADSORPTION

The literature on this phase of the subject has been grouped into four sections: chemisorption from the gaseous phase, physical adsorption of gases, capillary condensation of gases and other empirical theories, and adsorption from solutions. The first two sections are the primary categories of adsorption processes and these contain much of the basic work which has been published. About 60 percent of the literature for 1943–53 in Chapter IV is in these two sections.

The names of many scientists, who have been active in the field of adsorption phenomena, are associated with isotherm equations. Among these are the relationships of Gibbs, Langmuir, Freundlich, Polanyi, Brunauer, Emmett, Teller, Harkins, Jura, and Halsey. With the exception of the Gibbs equation, the development of these expressions have involved special models of adsorption which have been very useful in guiding new researches. It was not practical, however, to arrange the investigations according to these names. The Subject Index can be used to locate a number of papers specifically concerned with these isotherm equations.

One of the important developments in the physical adsorption of gases during the last decade had been the evaluation of surface area. The success has been due largely to the development of the Brunauer, Emmett and Teller[4] theory of multimolecular adsorption and to the constructive critical work which followed. The isotherm equations developed from this model are usually valid for surface coverages in the neighborhood of about a monolayer. They are not valid, in general, for coverages corresponding to equilibra at lower or at higher pressures. Nevertheless, the surface area determined from a selected part of the isotherm has been so helpful that it warrants the use of the familiar abbreviation B. E. T. area.

The present day requisites of a theory of adsorption are far more exacting than formerly. It was once sufficient to develop merely an algebraic equation relating the extent of adsorption to some parameter such as pressure, temperature, or volume. In present day investigations it is necessary, in addition, to calculate the heat, entropy, and free-energy quantities and, furthermore, to relate these to the fundamental constants associated with intermolecular forces.

The literature on chemisorption is extensive, varied, and puzzling. Dealing with primary valence forces as it does, it may be expected that the phenomena would have all the complications of chemical reactions. In addition, there are complications in that the behavior of the surface is influenced strongly by sample preparation, the presence of large steric factors, and a critical dependence on diffusion processes.

Theories of adsorption from solutions have generally evolved from an empirical point of view. The solid itself has usually been considered to be the adsorbent, but it is more realistic to associate the adsorption with the interface between solid and solution rather than with just one of the components of the system. Although no simple relationship can be expected between adsorbability and the chemical and physical properties of molecules, it appears possible to design the experimental procedures so as to expedite the test of various concepts and theories. In this connection Tiselius and his coworkers have been able to introduce arrangements for chromatographic analysis which have greatly aided theoretical interpretations.

The fundamental theory of ion exchange in the batch test has not progressed very far. Several investigators have pointed out that the exchange resin phase is essentially a concentrated electrolyte solution. The laws governing the distribution of ions between the solution and the ion exchanger cannot, therefore, be expected to develop further than has the general theory of concentrated electrolytic solutions. In the column technique of ion exchange definite progress has been made. The general behavior of an ion-exchange packing is similar to a chromatographic column, and theory has been developed of value to the interpretation of break-through curves, elution curves, and exchange-capacity determinations. It is a fact, however, that the empirical applications are far in front of theoretical interpretations.

---

IV-1. Chemisorption From the Gaseous Phase

5934. Calvet, Édouard and Izac, Henri. **Calorimetric study of the adsorption of acetone by the nitrocelluloses.** *Compt. rend. trav. faculté sci. Marseille* **1**, 4-6 (1941).

The nitrocellulose contained 14% N. The heat liberated was proportional to the wt of acetone adsorbed and was 3900 g cal per mole of acetone. The thermal effect was the same for the first adsorbed layers which satd. the exterior of the cotton as for the last which penetrated into the structure.

5935. Goldfeld, Yu. M. and Kobozev, N. I. **Experimental study of the role of the action of forces in the adsorption process. I. Adsorption equilibrium.** *J. Phys. Chem.* (U.S.S.R.) **15**, 257-74 (1941).—*C.A.* **38**, 4481⁶.

Adsorption isotherms were detd. for CO, H_2, C_2H_4 and C_3H_6 on Cu, and NH_3 on Fe. With increased satn. of the surface a systematic departure from the Langmuir equation appeared. The adsorption of CO on Cu was affected by poisoning with CN. The deviations in question were strengthened by the poisoning. Recrystn. of the Cu effected a marked decrease in adsorptive capacity, but led to no greater deviations from the Langmuir isotherm and likewise had little effect on the adsorption coeff. The observed behavior was discussed on the assumption of intermol. repulsive forces. In the region of small surface concns. the energy of the adsorptive binding was a linear function of conc.

5936. Roginskiĭ, S. Z. **Theory of preparation of catalysts. The role of the free energy of the processes of preparation.** *J. Phys. Chem.* (U.S.S.R.) **15**, 708-30 (1941).—*C.A.* **37**, 821⁴.

The active "points" were considered as points of "supersatn." with respect to free energy. Four types of such "points" were considered: a definitely distinct phase, local or general structural variations of a given phase, anomalous chem. compn. of a phase and, finally, the degree of dispersion of a phase. The free energy of such active centers and of the formation of such centers was discussed essentially according to Gibbs' technique.

5937. Taradoire, F. **The role of moisture in the reaction of solid substances.** *Chimie & industrie* **45**, 334-7 (1941).—*C.A.* **38**, 6168⁸.

Sorbed H_2O created a surface film which adhered to other matter in contact and caused double decompn. Presence of H_2O vapor and stirring may lead to many solid reactions even at room temp. Corrosion, or the formation of unstable or dangerous products, often resulted.

5938. Antropoff, A. v. **The adsorption of gases at pressures varying from very low up to very high values. I. Mathematical analysis of the equations for ideal absolute and differential adsorption.** *Kolloid-Z.* **98**, 249-57 (1942).—*C.A.* **37**, 4949⁸.

A distinction was made between abs. and differential adsorption. The first referred to the total mass of gas adsorbed in a space with dimensions detd. by the range of operative mol. forces. The second one referred to the excess over the amt. normally present in this vol.

5939. Frank-Kamenetskiĭ, D. A. **Activation in heterogeneous reactions.** *Depovidi Akad. Nauk U.R.S.R., Physico-Chem. and Math. Sci. Sect.* **1942**, No. 1-2, 55-9 (in Russian, 59, in English, 60).—*C.A.* **38**, 677².

If the reaction started at the moment when the gas mols. hit the solid surface, the activation took place in the gas phase. The energy of activation did not depend in this case on the specific properties of the surface, or on its energy and kinetic characteristics. On the other hand, if adsorbed mols. participated in the reaction the activation took place on the surface. In this case the surface energy may participate in the activation even though the mechanism was not clear, and the kinetics of the reaction depended on the nonuniformity of the surface. The theories and discussion presented were illustrated with the reaction of CO_2 with carbon.

5940. Hashiguchi, Ryukichi. **Relation between activation energy of recrystallization and that of self-diffusion in a metal.** *Proc. Phys. Math. Soc. Japan* **24**, 270 (1942).—*C.A.* **41**, 6099*f*.

Activation energy of recrystn. of pure Cu was plotted against the degree of cold-working, the former being calcd. from the data of Karnop and Sachs. The activation energy of recrystn. tends to that of self-diffusion at the zero of cold-working degree.

5941. Havinga, E. **Chemical reactions in unimolecular films.** *Chem. Weekblad* **39**, 266-71 (1942).—*C.A.* **37**, 4950⁸.

A survey of methods of investigation and of results.

5942. Kantarovich, B. V. **Heterogeneous process in a burning layer of carbon particles.** *J. Tech. Phys.* (U.S.S.R.) **12**, 640-6 (1942).—*C.A.* **37**, 4225⁸.

The curves for the distribution of oxygen in a burning layer of carbon particles for different periods were constructed math.

5943. Karve, D. D. **Reaction velocity in heterogeneous liquid-liquid systems.** *J. Univ. Bombay* **10**, Pt. 5, 159-66 (1942).—*C.A.* **37**, 562⁹.

Neither the chemical nor the diffusion process was the sole determining factor of the velocity of heterogeneous reactions.

5944. Miller, A. R. **The number of configurations of a coöperative assembly.** *Proc. Cambridge Phil. Soc.* **38**, 109-24 (1942); 42, 303-10 (1946).—*C.A.* **36**, 1827²; **41**, 1521*e*.

Formulas were derived for the no. of configurations of particles on a two-dimensional and three-dimensional lattice when each particle (a) occupied two closest neighboring sites and (b) consisted of 3 groups that occupied 3 sites on the lattice in such a way that adjacent groups in the mol. occupied closest neighboring sites on the lattice. Bethe's method was used to det. the equil. conditions of the corresponding order-disorder problem and the no. of configurations detd. from these equil. conditions. The no. of configurations of mixts. of dimer and single mols., of trimer and single mols., and of trimer and dimer mols. was examd. by using the Bethe technique when there might be some vacant sites.

5945. DAMKÖHLER, GERHARD AND EDSE, RUDOLF. **State of motion of adsorbed molecules when the Langmuir isotherm is valid.** *Z. physik. Chem.* **B53**, 117-23 (1943).—*C.A.* **37**, 6186[4].

As the adsorption force increased, the value of b_0 in the Langmuir adsorption isotherm decreased. The value of 10^{-7} for b_0 found with CO in the catalytic oxidation of CO on CuO by Schwab and Drikos indicated a high mobility in the adsorbed phase with 2 to 3 translational degrees of freedom and practically free rotation.

5946. WAGNER, CARL. **The interaction of streaming diffusion and chemical reaction on heterogeneous catalysts.** *Z. physik. Chem.* **193**, 1-15, (1943).—*C.A.* **39**, 2689[1].

The concn. distribution of reactants within a catalyst grain was calcd. in a stationary state and for the exchange in a given synthesis which was a special case.

5947. GUGGENHEIM, E. A. **Number of configurations of molecules occupying several sites.** *Nature* **153**, 406-7 (1944).—*C.A.* **38**, 5701[6].

A general formula was given for the no. of configurations of mols. in which the no. of pairs of sites occupied was specified. The formula given could be used to drive the thermodynamic properties of mixts. with non-zero energies of mixing, whereas the previous formula given could be used only with zero energies of mixing.

5948. LANDAU, L. **Theory of slow combustion.** *J. Exptl. Theoret. Phys.* (U.S.S.R.) 14, 240-5; *Acta Physicochim. U.R.S.S.* **19**, 77-85 (1944).—*C.A.* **39**, 2023[2].

5949. TRAVERS, A. **"Physical" adsorption and "chemical" adsorption.** *Chimie & industrie* **52**, 35-43 (1944).—*C.A.* **40**, 2371[5].

Phys. adsorption brought into action orienting forces due to permanent or induced dipoles. Chem. adsorption corresponded to binding forces of the covalence type, and consequently involved much greater energies. The 2 types of adsorption could be superposed; or phys. adsorption could be followed by adsorption or soln. in the mass of adsorbent and/or by capillary condensation.

5950. FRENKEL, YA. I. **Surface motion of particles in crystals and natural roughness of crystalline faces.** *J. Phys.* (U.S.S.R.) **9**, 392-8 (1945).—*C.A.* **40**, 3321[5].

Vicinal faces, with a slightly higher value of surface tension, must arise as a result of thermal fluctuations. These vicinal faces could be treated as terraces formed on the main faces, which thus acquired a natural roughness increasing with temp. The boundaries of such terraces were not fixed. Variations in shape and size of a crystal proceeded by transition of atoms from the surface of a terrace through the one-dimensional edge phase into the 2-dimensional adsorbed-gas phase, and vice versa. The "active" points in heterogeneous catalysis were identified with the terrace edges.

5951. GUGGENHEIM, E. A. **The number of arrangements on a lattice of molecules each occupying several sites.** *Trans. Faraday Soc.* **41**, 107-15 (1945).—*C.A.* **39**, 3715[3].

The statistical treatment by Chang of mols. each occupying 2 sites (dimers) in a lattice and that by Miller for mols. each occupying 3 sites (trimers) was simplified and extended to a mixt. of dimers and trimers and to rigid straight-chain mols. each occupying four sites (tetramers). The simplification in procedure was restricted to assemblies with zero energy of interaction between the mols.

5952. GYANI, B. P. **Distribution law, adsorption, and chemical reaction.** *J. Phys. Chem.* **49**, 442-53 (1945).—*C.A.* **40**, 2371[3].

Adsorption was examd. on the assumption that not only the planar surface of the adsorbent was important in the process, but the entire bulk of the solid and patches, active lines, and points on the surface came into operation, either individually or in superposition with one another. A simple interpretation of the classical adsorption equation was indicated on this basis and a few applications of the hypothesis to some general facts of adsorption, chem. reaction and surface catalysis were discussed.

5953. ROGINSKIĬ, S. Z. **Statistical theory of adsorption rates.** *Acta Physicochim. U.R.S.S.* **20**, 227-46 (1945).—*C.A.* **40**,11[8].

In adsorption processes requiring the overcoming of activation barriers, the laws of kinetics were affected by the inhomogeneity of the surface. The time t was substituted for the pressure p, and distribution functions of activation energies were calcd. from exptl. equations. When there was no relation between energy of activation E and heat of adsorption Q at.const. p, the kinetics followed a unimol. law and redistribution on the surface did not occur. When E and Q varied in the same sense there was redistribution of adsorbed mols. to areas with max. Q and the process had const. velocity.

5954. ROGINSKIĬ, S. Z. **Statistical theory of velocities of activated adsorption on nonuniform surfaces.** *Bull. acad. sci. U.R. S.S., Classe sci. chim.* **1945**, No. 1, 14-28 (in English 28-9).—*C.A.* **39**, 5150[3].

Three main types of kinetics of adsorption on nonuniform surfaces were discussed on the bias of the theory of activation barriers in adsorption processes. If the heat of activation was independent of the heat of adsorption, the process was of the first or second order with a const. activation energy. When activation energy dropped with an increase of adsorption heat, which was the case in an adsorption without redistribution of mols. on the surface through diffusion, the kinetics were represented by the Freundlich formula.

5955. TODES, O. M. **The dynamics of the sorption of mixtures.** *Acta Physicochim.* (U.R.S.S.) **20**, 859-86 (1945).—*C.A.* **40**, 3663[3].

The concns. for low velocities of the air current carrying the sorbate gases through the solid sorbent were detd. from static adsorption isotherms of the mixt. The sorbent was traversed by a series of successive sorption waves of the individual components, each of which entailed the partial desorption of the remaining components. The velocities of the individual waves formed a series whose terms were inversely proportional to the relative sorptivity of the respective components. For adsorption of Langmuir type and concns. not closely approaching satn., the first wave was followed by a second and accompanied by partial desorption of the first component. Addn. of a second substance to the sorbate, which caused its partial desorption from the surface of the sorbent, accelerated propagation of the principal component, regardless of which component was adsorbed better, and hence propagated with a correspondingly smaller velocity.

5956. TREJO, ALFONSO. **The modern theory of catalysis. Catalysis by activated adsorption.** *Quimica* (Mex.) 3, 65-8 (1945).—*C.A.* 39, 3997².

5957. BALANDIN, A. A. **Theory of catalyst selection.** *J. Gen. Chem.* (U.S.S.R.) 16, 793-804 (1946).—*C.A.* 41, 1920*b*.

On the basis of the multiplet theory, there must exist an energy correspondence, analogous to structural correspondence, between the catalyst and the reacting mol. The catalytic activity was max. when the adsorption potential of the catalyst was approx. equal to 0.5 the sum of energies of the reactants.

5958. BRADBURN, MARY. **Graphite crystals and crystallites. I. Binding energies in small crystal layers.** *Proc. Roy. Soc. Edinburgh* 62A, 336-49 (1946-48).—*C.A.* 43, 2484*b*.

The resonance energy, bond, order, and bond length were calcd. in a series of graphitic layers of varying size. The C—C bond lengths appeared to vary little in size with increasing no. of C atoms, in agreement with expt. However, variations in resonance energy were significant, and indicated clearly that resonance, by itself favored an approx. square, rather than oblong, shape; but in the case of such layers in equil. in the presence of H_2, the most stable layer contg. a given no. of C atoms was of the long, thin polyphenyl type.

5959. KLOTZ, IRVING M. **The adsorption wave.** *Chem. Rev.* 39, 241-68 (1946).—*C.A.* 41, 234*e*.

The adsorption wave was studied in connection with the nature of the steps involved in the removal of a toxic gas from air by a granular adsorbent. Where the rate-controlling process was a single one of these steps, it was possible to develop a complete analytical expression for the adsorption wave. Where 2 steps contributed to the rate of removal, a complete theory was still lacking, but it was possible to develop criteria for the evaluation of the relative importances of diffusion in air and reactions in the granule in the removal process.

5960. MORRISON, J. L. **The interpretation of pressure dependence of accommodation coefficients.** *J. Chem. Phys.* 14, 466 (1946).—*C.A.* 40, 5316².

Amdur interpreted the pressure dependence of the accommodation coeffs. of several gases on Pt as a simple Langmuir adsorption of the same gas as the one for which the coeff. was measured. This interpretation was found correct for H_2, D_2, N_2, CO, and O_2: impurities in He, Ne, A, Kr, and Xe invalidated this interpretation for these gases.

5961. VERWEY, E. J. W. AND ASSCHER, J. E. **Lattice structure of the free surface of the alkali halide crystals.** *Rec. trav. chim.* 65, 521-8 (1946) (in English).—*C.A.* 41, 1522*e*.

Calcns. of lattice deformation at the free surface of the cube face of alkali halide crystals were made on the basis of Born's lattice theory. The difference in displacement of the pos. and neg. ions in the nonsym. surface field was considered. With neg. ions pointing away from the crystal, and pos. ions in the surface layer being shifted toward the crystal, a lattice distortion resulted, leading to an ionic double layer of appreciable strength. Dipole moments were calcd. for surface ions of alk. halides.

5962. VIALLARD, RODOLPHE. **The evolution of heterogeneous solid-gas systems.** *Compt. rend.* 222, 1233-5 (1946).—*C.A.* 40, 6327⁹.

Solid-gas reactions of the type $A + B \rightarrow C$, in which A and C were solids and B was a gas, followed either of two courses. In one, the speed of the reaction was greater than the rate of diffusion of gas, and in the other the converse was true. There was a third type of reaction, for example, the reaction of H_2 with Gd, which followed an S-shaped curve. A mechanism for this reaction was proposed, in which the mols. first penetrated the metal; later mols. penetrated the expanded reaction product, in which they sep. into atoms, which penetrated farther and reacted.

5963. BREGER, A. KH. AND ZHUKHOVITSKIĬ, A. A. **A possible mechanism of interaction between adsorbed atoms.** *J. Phys. Chem.* (U.S.S.R.) 21, 423-30 (1947) (in Russian).—*C.A.* 41, 6791*e*.

An adsorbed atom repeled another adsorbed atom because of the same forces that caused the orienting effect of one substituent in the C_6H_6 ring on the following substituents. These forces could be calcd. semiquantitatively (a) by treating the electrons in the adsorbent as a Sommerfeld electron gas or (b) according to the theory of Hückel assuming that the electron of the adsorbent atom at which adsorption took place was excluded from the resonance.

5964. CREMER, E. **The meaning of the exponent in the Freundlich adsorption equation.** *Monatsh.* 77, 126-33 (1947).—*C.A.* 42, 5297*i*.

By assuming a heterogeneous surface on which the activities of the adsorption centers followed an exponential distribution law, it was shown that the equation $a = kC^n$ representing the variation of adsorption, *a*, with concn. of adsorbate, *C*, could be derived from a Langmuir equation. A plot of log *n* against *T* for a no. of gas-solid systems passed through the origin. The slope of this plot times the crit. temp. of the adsorbate was a const. for the adsorption of A, Kr, Xe, and C_2H_2 on activated carbon. The proportionality const. in the Freundlich adsorption equation was shown to be equal to KV^n, where *K* for the above adsorbates was approx. 10^4 for all temps. studied and *V* was the molal liquid vol. of the adsorbate.

5965. FORESTIER, HUBERT AND HAASSER, CHARLES. **Effect of physical state on the rate of reaction between metal oxides in the presence of water vapor.** *Compt. rend.* 225, 240-1 (1947).—*C.A.* **44**, 3774*d*.

The effect of H_2O on reactions between solids was greater for those solids having greater affinity for H_2O, either by adsorption or by hydrate formation.

5966. KEIER, N. P. AND ROGINSKIĬ, S. Z. **Statistics of the surface of activated charcoal deduced from the kinetics of activated adsorption** *Acta Physicochim. U.R.S.S.* 22, 61-80 (1947) (in English).—*C.A.* **41**, 7199*e*.

The behavior of active charcoals in the activated adsorption of different gases agreed with the conception that the surface of the adsorbent was inhomogenous with respect to the activation energy. Langmuir's redistribution scheme seemed to be invalid in all cases. The expts. were performed with: activated birchwood charcoal, activated sugar charcoal, anthracite recuperation charcoal, charcoal + K_2SO_3, charcoal + KNO_3; charcoal + K_2SO_4, charcoal + Cu acetate, charcoal + Pt, + O_2, + H_2, and + CO.

5967. TAYLOR, HUGH S. AND LIANG, SHOU-CHU. **The heterogeneity of catalyst surfaces for chemisorption. I. Zinc oxide.** *J. Am. Chem. Soc.* 69, 1306-12 (1947).—*C.A.* **41**, 5772*d*.

A new technique for detg. adsorption isobars of H_2 by ZnO between 77-600 °K showed desórption of chemisorbed H_2 on raising the temp. through certain temp. ranges, followed by readsorption at still higher temp. The data indicated a marked heterogeneity of the ZnO surface for the adsorption of H_2.

5968. TAYLOR, HUGH S. AND LIANG, SHOU-CHU. **The heterogeneity of catalyst surfaces. II. Zinc oxide-chromic oxide, manganous oxide-chromic oxide, chromic oxide gel.** *J. Am. Chem. Soc.* 69, 2989-91 (1947).—*C.A.* **42**, 1793*b*.

These substances revealed heterogeneity of surface. $MnO-Cr_2O_3$ catalysts did not show desorption-readsorption phenomena on raising the temp. The isobar on decreasing temp. was consequently horizontal over a considerable temp. range. The surface, nevertheless, exhibited a partial heterogeneity.

5969. VOL'KENSHTEĬN, F. F. **Interaction of adsorbed molecules and the theory of adsorption on inhomogeneous surfaces.** *J. Phys. Chem.* (U.S.S.R.) 21, 163-78 (1947).—*C.A.* **41**, 6105*d*.

If the adsorbent surface was plane and uniform, the adsorption layer unimol., and the deviations from Langmuir's elementary theory were due to interaction of adsorbed mols. only, then the laws of this interaction could be derived from the empirical adsorption isotherm. Freundlich's isotherm was obtained when the adsorbed mols. repelled one another with a force that was a linear function of the log of their mutual distance. There existed a definite correlation between the laws of mol. interaction and the distribution of inhomogeneities. This correlation was calcd. for several instances.

5970. VOL'KENSHTEĬN, F. F. **The electron levels of atoms adsorbed on a crystal surface. I.** *J. Phys. Chem.* (U.S.S.R.) 21, 1317-34 (1947) (in Russian).—*C.A.* **42**, 5340*i*.

The adsorbed atom and the lattic of the adsorbent were treated as one quantum-mech. system. The electron levels and the corresponding wave functions of this system were calcd. The difference between "phys." and "chem." adsorption were formulated mathematically.

5971. WELLER, SOL. **Chemisorption of gases.** *J. Chem. Phys.* 15, 336 (1947).—*C.A.* **41**, 4991*h*.

The appropriateness of including the amt. of chemisorbed gas (for which the heat of adsorption was comparable with the heats of chem. reactions) in applying the B.E.T. theory to an adsorption isotherm was discussed. When both phys. adsorption and chemisorption occurred, the total adsorption was correct, whether or not the chemisorption was reversible.

5972. BALANDIN, A. A. **Thermodynamic properties of adsorption complexes in heterogeneous catalysis.** *Doklady Akad. Nauk S.S.S.R.* 63, 33-6 (1948).—*C.A.* **43**, 1634*i*.

The abs. and the relative adsorption coeffs., a_r and z_r of a substance *r* (z_r relative to substance *I*), had the meanings, resp., of an adsorption equil. const. for *r* and of a displacement const. of *r* by *I* from the adsorbed layer: $a_r = [A_rS]/[S]\,[A_r]$ and $z_r = [A_IS]\,[A_r]/[A_rS]\,[A_I]$, where *S*, A_IS, and A_rS represented, resp., the surface concns. of unoccupied active centers and of adsorption complexes of *S* with *I* or *r*. This permitted formulation of the standard thermodynamic functions $\Delta F°$, $\Delta H°$, $\Delta S°$ for adsorption of *r* and displacement of *r* by *I*, by the known expressions in terms of a_r and z_r. Examples were given for dehydrogenation of cyclohexanes by Pd, Pt and Ni, dehydrogenation of alcs. on Cu at 240-275 °C, and dehydrogenation of butylene to butadiene on Cr_2O_3 at 560 °C.

5973. BONHOEFFER, K. F. **Periodic chemical reactions. I.** *Z. Elektrochem.* 52, 24-9 (1948).—*C.A.* **43**, 7791*i*.

The form which the functions $dx/dt = f\,(x,\ y)$ and $dy/dt = \phi\,(x,\ y)$ must have to give periodic changes in *x* and *y* were investigated. An autocatalytic process greatly facilitated periodicity. An important requirement was that the concn. of the initial reactants be nearly const. during a series of periods. This was automatically true at a phase boundary where *x* and *y* represented amts. of 2 surface films. This and other requirements were so exacting that periods were never observed in homogeneous systems.

5974. Booth, F. **Theory of surface diffusion reactions.** *Trans. Faraday Soc.* 44, 796-801 (1948).—*C.A.* 43, 3694*d*.

An exact solution was derived for the rate of the reaction between a solid and a gas or liquid, in which the reaction proceeded by the diffusion of the reactants through a layer of the product formed on the surface of the solid. The rate of growth of the product was inversely proportional to its thickness as in simple diffusion theory, but the const. of proportionality depended on the d. of the reactants in the product and the d. of the product.

5975. Eley, D. C. **Absolute rate of conversion of parahydrogen by metallic catalysts.** *Trans. Faraday Soc.* 44, 216-26 (1948).—*C.A.* 43, 26*g*.

The general concept as an interaction between a van der Waals layer and a chemisorbed layer seemed satisfactory, The "temp.-independent" factor was calcd. for the exchange of atoms between H_2 in a dil. van der Waals layer and a H atom in an adjacent position in the underlying stable chemisorbed layer on the metal. The results so obtained agreed within a factor of about 3 with data for the catalysts W, Ni, Pt, and Pd. The coulombic potential of the pos. cores might have a general effect in lowering energy barriers.

5976. Komarewsky, V. I. and Coley, J. R. **Vanadium oxides, hydrogenation catalysts. II.** *J. Am. Chem. Soc.* 70, 4163-4 (1948).—*C.A.* 43, 2853*c*.

The formation of the V-olefin complex in the chemisorption of olefins on V_2O_5 may be effected with very little distortion of the valence angle. The reaction temp. at which V_2O_5 gave max. activity as a hydrogenation catalyst corresponded closely with the reduction temp. of V_2O_5 to V_2O_3.

5977. Kunze, F. **The relation of the activation heat and the reaction constant for heterogeneous reactions.** *Monatsh.* 79, 267-71 (1948).—*C.A.* 43, 2850*i*.

The current theories were extended in scope.

5978. Levin, V. I. **Analysis of processes on nonhomogeneous surfaces.** *Doklady Akad. Nauk S.S.S.R.* 59, 269-72 (1948).—*C.A.* 43, 3264*a*.

The distribution function ρ of activation energies E in activated adsorption was calcd. from the known kinetic function $\psi(t)$ of the change of the free fraction of the surface with time t. A general solution was given in the form of a series $\rho(x) = \sum_{1}^{\infty} a_m (-1)^m \gamma^{(m)} (x - \ln k_0)$, where $x = E/RT$, $\gamma(y) = \psi(e^y)$, $y = \ln t$, $k_0 =$ rate const. of the adsorption $k_0 = k_0 p^{a}$, where k_0' was pressure independent. Instead of ψ, one could use the amt. q of adsorbed substance, $q = S(1-\psi)/s_0$, where $S =$ surface area, $s_0 =$ area per adsorbed mol.

5979. Miller, A. R. **Monolayers adsorbed on metal surfaces.** *J. Chem. Phys.* 16, 841-2 (1948).—*C.A.* 43, 3263*g*.

Halsey and Taylor concluded from a study of Frankenburg's data for the adsorption of H_2 on powd. W that a theory of interactions on a surface in which all the sites involved the same energy of adsorption could not account for these exptl. results. This conclusion was not well founded.

5980. Sips, Robert. **Structure of a catalyst surface.** *J. Chem. Phys.* 16, 490-5 (1948).—*C.A.* 42, 4824*h*.

The distribution of the adsorption energies of the sites of a catalyst surface was calcd. when the adsorption isotherms were known, if the adsorption was localized and there were no interactions. This method was applied to Freundlich isotherm and also to a new theoretical isotherm that reduced to the Freundlich type for small pressures but showed satn. for large pressures. This isotherm corresponded to a distribution function that differed very little from a Gaussian one.

5981. Todes, O. M. and Bondareva, A. K. **Theory of adsorption equilibria on non-homogeneous surfaces.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 21, 693-707 (1948).—*C.A.* 44, 402*d*.

Integral equations were established for the distribution function $n(b)$, where $n =$ relative fraction of portions of the surface with values of the sorption coeff. h between 0 and b, the latter defined by the application of Langmuir's equation to a single portion of the surface, considered homogeneous. $\Phi_b(p) = (p + b)$, where $p =$ partial pressure of the adsorbable substance, and $b = b_{oe}^{-Q/RT}$, with $Q =$ heat of adsorption on the given portion. An expression was then obtained for the total surface coverage as a function of p. Solution of these integral equations might be sought by choosing an empirical function $\psi(b)$ which agreed best with exptl. pairs of values Φ, p, equating $\psi(p) \approx \Phi(p)$, and then finding the exact solution analytically. Very complete exptl. data, extending up to surface coverages close to unity, permitted the use of developments by Laguerre and Hermite polynomials.

5982. Vol'kenshtein, F. F. **Electron theory of promoting and poisoning ionic catalysts.** *J. Phys. Chem.* (U.S.S.R.) 22, 311-30 (1948).—*C.A.* 42, 6628*e*.

The dissocn. of the adsorbed mols. A_2 and B_2 was an essential stage in the heterogeneous reaction $A_2 + B_2 = 2AB$ on the surface of an ionic crystal. This surface was treated as a semiconductor in which the adsorbed mols. were admixts. The dissocn. was a result of interaction between the mols. and the electrons and holes of the crystal lattice. The rate of chem. reaction depended on the numbers of the electrons and the holes, and these numbers depended on the surface concn. of the promoters of poisons present. Hence small amts. of a foreign substance often increased, and larger amts. reduced, the catalytic activity.

5983. Bosworth, R. C. L. **The mechanisms of diffusional processes.** *Roy. Australian Chem. Inst. J. & Proc.* 16, 460-82 (1949).—*C.A.* 44, 10383*i*.

Chem. diffusion might occur by moving molecules, by molar aggregates (eddies or hydrodynamic streams), or sometimes by ions or atoms. Mol. diffusion might be "ordinary" in which the carrier moved continuously (gases and liquids), or "activated" in which it remained at equil. pts. for definite periods of time between successive "jumps" (solid surfaces). When the apparent diffusion coeff. exceeded the product of the carrier velocity and the mean free path, as in electrolytic conduction in aq. solns., "shortcut" diffusion was said to occur. The migration of mols. on solid surfaces, which was important in solid-fluid systems as in adsorption and catalysis, was a case of activated diffusion.

5984. CASSEL, HANS M. **Condensation coefficient and adsorption.** *J. Chem. Phys.* 17, 1000-1 (1949).—*C.A.* 44, 2323*g*.

The condensation coeff. α, the ratio of the observed rate of evapn. to the computed excess of mols. striking the surface of the condensed phase, was calcd. by use of the Langmuir adsorption isotherm. $\alpha = A/(1/\tau + A + \beta bp)(1 + \tau\beta bp_o)$, where τ was the av. period of time that mols. remained on the surface, b was $(2\pi mkT)^{1/2}$, p was the vapor pressure, and β and A were consts.

5985. CREMER, E. **The absolute calculation of the velocity of heterogeneous reactions.** *Z. Elektrochem.* 53, 269-74 (1949).—*C.A.* 44, 2344*g*.

The kinetics of a variety of heterogeneous reactions were discussed in terms of the relation $\log A = (q/a) + \text{const.}$, where A and q were quantities in the Arrhenius equation, $k = A \exp. (-q/RT)$. The reactions included the decompn. of EtOH, PrOH, and BuOH on group III and rare earth oxides; C_2H_5Cl on $BaCl_2$; N_2O on CuO; and the formation of vinyl chloride on $HgCl_2$ and Hg_2Cl_2. The implications of the relation between $\log A$ and q were discussed in terms of the assumption of a Boltzmann distribution of "active centers" and the assumption that the rate-detg. step was the leakage of electrons through a potential barrier.

5986. GLAUBERMAN, A. E. **Theory of the surface energy of heteropolar crystals.** *Zhur. Fiz. Khim.* 23, 124-30 (1949).—*C.A.* 43, 5653*b*.

The lattice energy of an ionic crystal of the NaCl type was calcd. The distance d between 2 nearest ionic planes was 0.8% less at the surface than that far from the surface.

5987. GYANI, B. P. **Distribution law, adsorption, and chemical reaction. II.** *J. Phys. & Colloid Chem.* 53, 1091-1101 (1949).—*C.A.* 44, 3766*h*.

The adsorption of dissolved substances and vapors on liquid surfaces was examd. Systems were chosen so as to have ideally homogeneous adsorbing surfaces, thus removing some disturbing factors that might otherwise interfere with a rigorous test. The translatory motion of the adsorbed mols. could be confined rigidly to a plane. In some other cases the motion became gradually restricted to one dimension as the crowding on the surface increased. Assocn. among some adsorbed mols. was indicated in the adsorption of some polar mols. on Hg.

5988. HALSEY, G. D. JR. **Catalysis on nonuniform surfaces.** *J. Chem. Phys.* 17, 758-61 (1949).—*C.A.* 44, 1313*i*.

With NH_3 decompn. as an example, the kinetics of a heterogeneous reaction were discussed. On a continuously nonuniform surface, no single reaction step was the limiting one; on the optimum sites 2 reaction steps were equally slow. The expression for over-all velocity was developed, and solved exactly for the case of an exponential distribution of activation energies. If the distribution was broad, its exact shape was unimportant, but that a factor r, connected with the amt. of adsorption energy available for catalytic work, was important. Because the position of the optimum depended on pressure, it could not be assumed that the surface was "effectively uniform."

5989. HEDVALL, J. ARVID. **The development and application of the reaction theory of the solid state.** *Z. anorg. Chem.* 258, 180-7 (1949).—*C.A.* 44, 25*i*.

The important developments in the present state of knowledge of reactions in the solid state were discussed.

5990. HUANG, K. AND WYLLIE, G. **The surface free energy of certain metals.** *Proc. Phys. Soc.* (London) 62A, 180-91 (1949).—*C.A.* 44, 894*h*.

The valence electrons were treated according to a simple Sommerfeld model, and the pos. charge of the ions was distributed uniformly through the metal. The surface energy and the strength of the double layer were calcd. The surface double layers for the metals considered lie in the range 0.1-0.5 e.v. The contribution to the surface energy from the electrostatic energy in the double layer was very small. Calcns. were reported for Cu, Ag, Au, Li, Na, K, Rb, and Cs.

5991. LAIDLER, KEITH J. **The kinetic laws of adsorption in the particular case of surface penetration.** *Bull. soc. chim. France* 1949, D171-6.—*C.A.* 43, 6489*a*.

The sorption of a gas by a solid, in the case of surface penetration, was controlled by 2 processes, either of which may be the rate-controlling step. At sufficiently low pressures the rate of sorption was controlled by activated adsorption, but at higher pressures the rate was controlled by diffusion. If the rate of sorption was directly proportional to the gas pressure, the mols. adsorbed were not dissocd. in the solid. When the rate varied with the sq. root of the pressure, it was certain that atoms or radicals were diffusing. The theory was applied to the sorption by org. polymers and by metals and to the sorption of H_2 and O_2.

5992. LEVIN, V. I. AND ROGINSKIĬ, S. Z. **Kinetics of contact reactions. I. Processes on homogeneous surfaces.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1949, 134-43.—*C.A.* 44, 2352*i*.

Provided each adsorbed particle occupied one active center only, γ (unoccupied fraction of the surface) $= [1 + \Sigma c_j/b_j]^{-1}$, where the reciprocal adsorption coeff. $b = b_o e^{-Q/RT}$, with $Q =$ heat of adsorption of the jth substance. If the adsorption was not in equil. with the space phase, in particular in the case of slow desorption of the certain substances, γ was a function of the ratio of the rate of formation and of desorption. If the desorption of the products could be disregarded, and other substances were not adsorbed, and the concns. of the initial reactants were const., $-d\gamma/dt = mf(c)e^{-E/RT}\gamma s$, where $f(c) = k_o \Pi c_i^{\nu}$.

5993. MARBOE, EVELYN C. AND WEYL, W. A. **A method for studying the forces between metals and ionic substances.** *J. Applied Phys.* 20, 124 (1949).—*C.A.* 43, 2485*f*.

When changing from atomic to cryst. aggregate, adsorbed Au went through a highly colored red or purple stage. The rate at which this surface diffusion occurred was a measure of the forces acting between Au and a carrier surface. The substance to be examd. was treated with a dil. soln. of $AuCl_3$ in water (4×10^{-3} g/ml). The gold ions were adsorbed at the surface, and by heating in H_2 at 150°C for a few min. water and HCl were removed and Au atoms were formed. Upon heating for about an hr at 200° to 800°C, the faint pink color deepened, changed to purple, and gradually faded as the crystals become larger.

5994. MAXTED, E. B. **The nature of chemisorptive bonds. I. Some observed regularities.** *J. Chem. Soc. 1949,* 1987-91.—*C.A.* 44, 3777*h*.

Catalytic activity seemed to be detd. by the structure of the *d*-band of the metal; the disappearance of catalytic properties with disappearing fractional electron deficiencies in this band suggested that these deficiencies played a crit. part in hydrogenation catalysis and adsorption. The poisoning process might consist of, or include, the elimination of the *d*-band deficiency. Three types of strongly-held adsorbates were discussed as to toxicity: (a) nonmetals of groups Vb and BIb: S, P, or N compds.; (b) metallic ions; (c) compds. with unsatd. bonds. Participation of the metal in a resonance system of the bond multiplicity (CO, C_2H_4) appeared more likely than formation of some type of covalent bond.

5995. MOLIFRE, K.; RATHJE, W., AND STRANSKI, I. N. **Surface structures of ionic crystals.** *Discussions Faraday Soc.* **1949**, No. 5, 21-32.—*C.A.* 44, 2320*g*.

Calcns. were made to det. the effect on surface structures of the ionic polarizability in the case of the NaCl-type lattice. No tendency towards tangential contraction existed in the case of low polarizability in the surface. Only a decrease in the distance between the two uppermost lattice faces was to be expected. With more highly polarizable ions, tangentially deformed surface structures were favored from the standpoint of energy.

5996. STARODUBTSEV, S. V. **Investigation of adsorption phenomena by the method of modulated molecular beams.** *Zhur. Eksptl. Teoret. Fiz.* **19**, 215-24 (1949).—*C.A.* 44, 6699*b*.

An at. or mol. beam produced by evapn. and collimated through slits was aimed at an incandescent filament, and was interrupted periodically by a mech. device, producing a periodically modulated beam. Modulation of the beam gave rise to a modulation of the current due to ionization of the particles adsorbed on the filaments. Exptl. detns. were made with beams of K and of Na on a W filament.

5997. VAN DER MERWE, J. H. AND FRANK, F. C. **Misfitting monolayers.** *Proc. Phys. Soc.* (London) **62A**, 315-16 (1949).—*C.A.* 44, 399*b*.

Surface dislocations due to at. misfits in monolayer were treated as analogous to crystal dislocations. Up to a crit. amt. of natural misfit, the state with no dislocation (a monolayer fitting the substrate) was the one of lowest energy. The theory was applied to the mechanism of oriented overgrowth.

5998. VOL'KENSHTEIN, F. F. **Characteristics of adsorption due to "thermal disorder" on crystal surfaces.** *Zhur. Fiz. Khim.* **23**, 917-30 (1949).—*C.A.* **44**, 18*c*.

If gas mols. were adsorbed by identical spots of lattice defects on the surface and these defects were in equil. with other defects that had no adsorbent capacity, then adsorption that inactivated the spots shifted the equil. so that addnl. active spots formed from the inactive defects. If active spots were one of two dissocn. products of inactive spots, the adsorption isotherm would be $N = kp^{0.5}$, $N =$ adsorbed amt., $p =$ gas pressure. If formation of active from inactive defects was assocd. with energy changes, the exptl. heat of adsorption changed with N although the net heat of adsorption (of a mol. by an active spot) was independent of N. Temp. increase might augment the no. of active spots and thus simulate "activated adsorption".

5999. WERT, CHARLES A. AND ZENER, C. **Interstitial atomic diffusion coefficients.** *Phys. Rev.* **76**, 1169-75 (1949).—*C.A.* 44, 14*i*.

When cognizance was taken of an addnl. strain in the lattice surrounding a solute atom as it passed over a potential-energy divide, and of the increase in entropy assocd. with an increase in lattice strain energy, it was possible to est. a "theoretical" range within which these entropy factors should lie. All past observations, except for C and N in α-Fe, were consistent with this theoretical range. The assocd. entropy factors were consistent with the theoretical range.

6000. ZIMMERMAN, JUNE F. **Diffusion and activation control in heterogeneous reactions.** *J. Phys. & Colloid Chem.* **53**, 562-9 (1949).—*C.A.* 44, 2833*h*.

The characteristics of reaction-and diffusion-controlled heterogeneous reactions were reviewed. Criteria for the recognition of a heterogeneous reaction under joint activation and diffusion control were set up. A general equation was introduced to show the variation in observed velocity of activation.

6001. BABBITT, J. D. **Differential equations of diffusion.** *Can. J. Research* **28A**, 449-74 (1950).—*C.A.* 44, 10384*b*.

The pressure rather than the concn. was the quantity to be used in the differential equations for diffusion. The relation between p and c was generally not linear when the diffusion was through solids. Starting from fundamentals the equations for the interdiffusion of two gases, for the diffusion of vapors, and for the diffusion of gases and vapors through solids were derived.

6002. COULSON, C. A. AND BALDOCK, G. R. **Conditions for the existence of surface states.** *Discussions Faraday Soc.* **1950**, No. 8, 27-33.—*C.A.* 45, 9985*e*.

The mol. modification of Bloch wave functions were used to study the existence or nonexistence of surface states on the boundary of a univalent metal for simple cubic models in 1, 2, and 3 dimensions. Surface states may be induced by the perturbation caused by the approach of a polar, or ionic group. These states were more easily produced close together than separately. In certain noncubic systems, e.g. graphite, surface states existed even without any necessary changes in their Coulombic terms or resonance integrals on the boundary.

6003. Dowden, D. A. **Heterogeneous catalysis, I. Theoretical basis.** *J. Chem. Soc.* **1950**, 242-65.—*C.A.* **44**, 7634*h*.

The rate of reaction was controlled by the formation of a chemisorbed complex which may be bound to the solid surface by ionic or covalent bonds. If the rate was limited by the formation of a pos. ion at a metal surface, the process was most favored and fastest when both the ionization potential of the metal atom and the metal work function were large, and when the gradient of electron-level d. with electron energy at the Fermi surface was large and pos. Formation of neg. ions was optimum with small metal ionization potentials and work functions but with an electron-level d. gradient that was large and neg.

6004. Eley, D. D. **A calculation of heats of chemisorption.** *Discussions Faraday Soc.* **1950**, No. 8, 34-8.—*C.A.* **45**, 9985*f*.

Heats calcd. by Pauling's equation for covalent bonds were in good agreement with expt. for H_2 on W, Cu, and Ni. For O_2 on W the calcns. indicated that the film was not at. For C_2H_4 on Ni the values were for associative chemisorption.

6005. Eucken, A. **The existence of active centers in chemical adsorption and contact catalysis.** *Discussions Faraday Soc.* **1950**, No. 8, 128-34.—*C.A.* **45**, 9987*a*.

The supposed effect of active defects in a catalytic surface was rejected in favor of the theory that the essential factor was the active intermediate states of the adsorbed reactant.

6006. Eyring, Henry; Colburn, Charles B., and Zwolinski, Bruno J. **The activated complex in chemisorption and catalysis.** *Discussions Faraday Soc.* **1950**, No. 8, 39-46.—*C.A.* **45**, 9985*g*.

A general treatment of chemisorption and catalysis was given in terms of the activated complex theory of chem. kinetics. The mechanism proposed for hydrogenation of C_2H_4 was that both C_2H_4 and H_2 were adsorbed on the surface, but C_2H_4, being much more tightly held, tended to displace H_2. The activated complex was an ethane just desorbed from its two positions on the surface.

6007. Hill, Terrell L. **Generalizations of the quasichemical equilibrium approximation in statistical mechanics.** *J. Chem. Phys.* **18**, 988-9 (1950).—*C.A.* **44**, 7627*i*.

The work of Li on a generalization (from pairs of sites to larger groups of sites) of the quasichem. approximation was developed for adsorption.

6008. Huang, K. and Wyllie, G. **Theories of adsorption and properties of surface layers. Behavior of a molecule near a metal surface.** *Discussions Faraday Soc.* **1950**, No. 8, 18-27.—*C.A.* **45**, 9985*c*.

The energy changes assocd. with electron transfer to or from a mol. at distances from the metal surface may be such that the quantum-mech. tunnel effect could be neglected. The distribution of charge on a large adsorbed mol. was found by a self-consistent treatment of the image field. A representation of electronic conditions at the catalytic metal surface was proposed as giving a reasonable phys. approximation to the real situation.

6009. Kington, G. L. and Morrison, J. A. **Comment on "Thermodynamic properties of the surface of magnesium oxide."** *J. Chem. Phys.* **18**, 759 (1950).—*C.A.* **44**, 6714*i*.

6010. Laidler, Keith J. **The activated complex in heterogeneous catalysis.** *Discussions Faraday Soc.* **1950**, No. 8, 47-54.—*C.A.* **45**, 9985*h*.

General rate expressions were developed for reaction between two mols., of which *A* was more strongly adsorbed. assuming alternative mechanisms of interaction: (1) adsorbed *A* and adsorbed *B*, (2) adsorbed *A* and gaseous *B*, (3) adsorbed *B* and gaseous *A*. The rate expressions for these mechanisms were compared to the reaction between C_2H_4 and H_2. The low-frequency factor ($\sim 10^{-6}$) was due to the loss of translational and rotational freedom in forming the activated complex.

6011. Levin, V. I. and Roginskiĭ, S. Z. **Kinetics of contact reactions. II. Processes on heterogeneous surfaces.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1950**, 137-51.—*C.A.* **44**, 9783*f*.

Only the concept of the heterogeneity of the surface in adsorption and heterogeneous catalysis was capable of accounting for a variety of phenomena, particularly at very low coverages where interaction between adsorbed mols. could be invoked. A surface may be homogeneous either with respect to the heats of adsorption Q, or the activation energies E; Q and E could vary symbatically or antibatically, or could stand in no functional relation to each other.

6012. Maxted, E. B.; Moon, K. L., and Overgage, E. **The relationship between sensitivity to poisoning and catalytic surface.** *Discussions Faraday Soc.* **8**, 135-40 (1950).

The expected inverse variation of sensitivity to catalyst poisoning with the surface area of a catalyst was confirmed experimentally for Pt hydrogenation catalysts poisoned with MeS, a relationship of the type: $\alpha_1 s_1 = \alpha_2 s_2$, in which α was a measure of the sensitivity and s of the surface area, being obtained. This relationship apparently held even when the variation in the area of a constant weight of Pt was induced by sintering. A characteristic value for the product αs has been obtained which should make possible the calculation of the surface area of Pt catalysts in general.

6013. Mills, G. A. and Hindin, S. G. **Chemical characterization of catalysts. II. Oxygen exchange between water and cracking catalysts.** *J. Am. Chem. Soc.* **72**, 5549-54 (1950).—*C.A.* **45**, 5394*g*.

O^{18} was used for measuring the rate by which this compd. exchanged O with solid oxides such as silica gel, active silica-alumina cracking catalyst, kaolin, bentonite, and acid-activated bentonite, and acid-activated bentonite, at temps. of 100°C, and in a few cases, at 565°C. After the exchange period, the amt. of O^{18} in the water was detd. by permitting O exchange between water and CO_2, and measuring in the mass spectrometer the ratio O^{18}/O^{16} in the CO_2. These solids having high specific surfaces exchanged rapidly 10 to 25% of all their oxide oxygens, followed by a slow further exchange that led, at 105°C, to exchange of an addnl. 10 to 60% of the oxide oxygens over a period of one month.

6014. MIYAZAKI, SHOZO. **The catalytic decomposition of ammonia. V. The equation of reaction rates.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **71**, 335-8 (1950).—*C.A.* **45**, 5011*e*.

A theoretical equation on the reaction rate was derived by statistical mechanics. The structure of the adsorbed or activated NH_3 gas mol. was discussed by comparing theoretical and empirical equations.

6015. MOORE, A. J. W. **The structure of a metal surface.** *Trans. Australian Inst. Metals* **3**, 37-49 (1950); *Australaisian Engr.* Oct. 7, **1950**, 65-8.—*C.A.* **46**, 8447*c*.

Real surfaces showed large irregularities in contour, relatively thick flims of foreign atoms and considerable deformation at or near the surface. The techniques for the measurement of these surface features and the types of results obtained for them were described.

6016. SCHWAB, GEORGE-MARIA. **Alloy catalysts in dehydrogenation.** *Discussions Faraday Soc.* **8**, 166-71 (1950).

In homogeneous Hume-Rothery alloys the activation energy of HCOOH dehydrogenation increased in proportion to the square of the increase of the electron concentration caused by the multivalent solute metal. The catalytic activation consisted in an entrance of substrate electrons into empty levels of the first Brillouin zone of the metal. It was suggested that in alloys containing polar or covalent bonds the conductivity electron concentration was lowered. Catalytic experience confirmed this view.

6017. SIPS, ROBERT. **The structure of a catalyst surface. II.** *J. Chem. Phys.* **18**, 1024-6 (1950).—*C.A.* **45**, 426*e*.

A revised theory, assuming localized adsorption without interaction, led to only a limited no. of math. forms for the adsorption isotherm. The simplest of these isotherms was a generalization of the Freundlich and Langmuir isotherm.

6018. TAYLOR, HUGH S. **Effect of the heterogeneity of catalysts on chemisorption and chemical kinetics.** *J. Chim. phys.* **47**, 1225 (1950).—*C.A.* **44**, 7132*g*.

In expts. on the exchange between CH_4 and CD_4 it was shown that fragments CH_3, CH_2, CH, C, CD, CD_2, and CD_3, existed on the surface of the Ni catalyst. Furthermore, the ratio of the concn. of the radicals CD, CD_2, and CD_3 to the concn. of C atoms increased as the catalyst temp. was increased from 100° to 225°C. The exchange of N_2^{28} and N_2^{30} to form N_2^{29} occurred rapidly at the temp. of NH_3 synthesis over Fe and Re if the metals were produced by passing pure dry H_2 through the bed of metallic oxide for a sufficient time to effect substantially complete reduction. However, surfaces of these metals, incapable of causing the reaction of N_2^{28} and N_2^{30} because of incomplete reduction, still cause exchange between H_2 and D_2, H_2O and D_2O, and NH_3 and ND_3.

6019. BONCH-BRUEVICH, V. L. **Electronic levels of atoms adsorbed on a crystal surface. II.** *Zhur. Fiz. Khim.* **25**, 1033-42 (1951).—*C.A.* **46**, 2862*h*.

The adsorption of an electropos. atom A on the face of a crystal M^+R^- (body-centered rhombic of parameters a and b) contg. only M^+ ions, was treated as a one-electron problem. Interaction between adsorbed atoms was neglected; they were assumed to form a regular arrangement on the surface, such that between two adsorbed atoms there are N-1 surface ions. Adsorption was possible by reason of the formation of two localized surface levels detaching themselves from the conduction band.

6020. BRUIJN, D. DE. **Heterogeneous catalysis, surface structure, and kinetics.** *Chem. Weekblad* **47**, 436-43 (1951).—*C.A.* **46**, 2383*g*.

Periodic and random discontinuities in crystal lattices were discussed with reference to adsorption and catalysis.

6021. COOK, MELVIN A.; PACK, DOUGLAS H., AND OBLAD, ALEX G. **Structural model of low-pressure "physical" adsorption.** *J. Chem. Phys.* **19**, 367-76 (1951).—*C.A.* **45**, 8846*c*.

A new type of adsorption potential was proposed assocd. with surface strain induced in the elimination of unbonded electron orbitals (1st-order strain), and strain due to surface (chem.) heterogeneities, or surface impurities (2nd-order strain). These surface strains were assumed to give rise to a semi-chem. adsorbate-adsorbent bonds in the 1st layer of multimol. films. Termed "structural adsorption" it was considered largely responsible, along with ordinary van der Waal's potentials, for the low-pressure region of the type II isotherm. The theory was applied in the calcn. of the adsorption isotherms for N_2, O_2, and mixts. of N_2 and O_2 on anatase.

6022. DANCKWERTS, P. V. **Absorption by simultaneous diffusion and chemical reaction into particles of various shapes and into falling drops.** *Trans. Faraday Soc.* **47**, 1014-23 (1951).—*C.A.* 2874*b*.

A substance diffused into an absorbent in which it was destroyed by a 1st-order process. Expressions for the transient concn.-distribution and rate of absorption could be obtained by transformation of expressions for diffusion without reaction. The method was applied to the sphere, parallelopiped, cylinder and semi-infinite absorbent, and also to a liquid drop moving through another liquid. Steady-state solns. were also discussed. The expressions might prove useful in connection with unsteady state diffusion into porous adsorbents and catalysts, liquid drops in two-phase reaction systems, or living cells, including the microörganism.

6023. GINSTILING, A. M. **Physical characteristics of fine-grained crystalline materials and reactions of their mixtures.** *Zhur. Priklad. Khim.* **24**, 567-75 (1951).—*C.A.* **46**, 7841*h*.

The av. distance between the surfaces of neighboring particles of real fine-grained materials is 10^5-10^7 times that of the radius of action of at. and other forces that bind the elements of the cryst. lattice. The speed of mass transfer by "jumping over" of elements of the lattice of one reagent into the lattice of another reagent (without the formation and participation of gaseous and liquid substances) was extremely limited by the insignificant surface contact.

6024. HALSEY, G. D. JR. **The rate of adsorption on a nonuniform surface.** *J. Phys. & Colloid Chem.* **55**, 21-6 (1951).—*C.A.* **45**, 3220*g*.

The activation energy for the adsorption process was assumed proportional to the zero-point energy between the gas and the solid. An expression was derived for the rate of adsorption of a gas on a nonuniform surface. It was in qual. agreement with the observations of Taylor and Liang for the adsorption of H_2on ZnO.

6025. LEVICH, V. G. AND MEĬMAN, N. N. **Theory of slow heterogeneous reactions in a moving liquid.** *Doklady Akad. Nauk S.S.S.R.* **79**, 97-100 (1951).—*C.A.* **46**, 4892*h*.

The differential equation of collective diffusion was solved under the general boundary condition $D(\partial c/\partial n)=\beta c$; further conditions were, $c=c_0$ at $y\rightarrow\infty$, and $c=c_0$ at $x=0$, $y\neq 0$. Near the edge of the x, y plane, the flow was detd. solely by the rate of the chem. reaction; farther from the edge, the rate of transfer of the substance played an increasingly prominent role. At variance with Nernst's elementary theory of the diffusion layer, the effective thickness of the boundary diffusion layer varied following different laws in different portions of the x, y plane.

6026. MACDONALD, J. Y. **Formation and growth of nuclei in the decomposition of solids.** *Trans. Faraday Soc.* 47, 860-3 (1951).—*C.A.* 46, 2371*i*.

Possible mechanisms were examd. in the light of the lattice energies of reactant and product. It was difficult to see how a reversible decompn., such as the dehydration of a hydrate, could occur in the interior of a perfect crystal. The role of surface migration in the decompn. of solid substances was discussed.

6027. MACGILLAVRY, D. **A comparative study of unpolarizable and polarizable metal-solution systems.** *J. Chem. Phys.* 19, 1499-1504 (1951).—*C.A.* 46, 5939*i*.

The properties of the metal-sol. potentials of Ni in Ni-free hydroxide and phosphate solns. were compared with the properties of unpolarizable electrodes and with the properties of polarizable metal-soln. systems. Chemisorption in the inner Helmholtz layer was discussed in connection with "reversibility" and polarizability of the system.

6028. OTOZAI, KIYOTERU. **Activation energy. I. A new empirical rule for the calculation of activation energy.** *Sci. Papers Osaka Univ.* No. 20, 8 pp. (1951).—*C.A.* 46, 3814*b*.

The bond distance in an activated complex was assumed equal to the bond distance corresponding to the inflection point on the potential-energy curve of a pair of atoms. Among all the possible structures that could be constructed by the use of the fixed values of the activated internuclear distances of the bonds to be broken as well as formed, that structure in which the sum of the energies of the activated bonds became a min. represented the structure of the activated complex and this min. sum of the energies of the activated bonds gave the activation energy of the reaction, when it proceeded in the exothermic direction. The activation energy for the dissocd. adsorption of H_2 on the surface of charcoal was calcd. as a function of the distance between two C atoms.

6029. PRIGOGINE, I. **The activated complex. The equilibrium hypothesis in chemical kinetics.** *J. Phys. & Colloid Chem.* **55**, 765-72, discussion 772-4 (1951).—*C.A.* **46**, 25*e*.

The effect of the chem. reaction on the equil. distribution of a constituent taking part in the reaction proceeded mainly from 2 functions: 1st, particles with higher kinetic energy had an increased probability of inelastic collision, and therefore the chem. reaction must decrease the no. of fast mols. and, 2nd, the various species of particles formed by the chem. reaction had, in the moment of their creation, mean energies that generally differed from the mean thermal energy. This excess energy must be redistributed among all the mols. present and finally to the walls.

6030. TOMITA, AKIRA. **Zinc catalysts for methanol synthesis. V. Action of the water molecule on the zinc oxide catalyst in the catalytic decomposition of methanol.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* **54**, 368-70 (1951).—*C.A.* **47**, 5045*b*.

The promoter action of the hydrated water mol. combined with ZnO was discussed thermodynamically.

6031. BALDOCK, G. R. **Electronic bound states at the surface of a metal.** *Proc. Cambridge Phil. Soc.* **48**, Pt. 3, 457-69 (1952).—*C.A.* **46**, 9926*d*.

Modifications were required to produce bound states assocd. with all of the atoms in the surface and bound states assocd. with particular small groups of atoms, since most of the simple crystal structures did not exhibit surface states without modifications being applied. No surface states were assocd. with the following crystal surfaces if interactions between all nearest neighbors were neglected: (1) the (100), (110), and (111) faces of the simple cubic lattice; (2) the (110) face of the body-centered cubic lattice (with next nearest neighbors included); (3) the (100) and (111) faces of the face-centered cubic lattice; (4) the (100) face of the body-centered cubic lattice (including next-nearest-neighbor interaction); (5) the (110) face of the face-centered cubic lattice; and (6) the (0001) and (2110) faces of the hexagonal close-packed lattice. Surface states existed solely by virtue of the lattice geometry in the graphite and diamond lattices.

6032. BLACKMAN, M. **Oriented crystalline overgrowth.** *Proc. Phys. Soc.* (London) **65A**, 1040-3 (1952).—*C.A.* 47, 3073*g*.

The oriented overgrowth of very thin deposits of alkali halides evapd. onto cleavage surfaces was reviewed. The theoretical implications of some of these results were considered. The discussion applied mainly to monolayers on mica.

6033. BOUDART, M. **Electronic chemical potential in chemisorption and catalysis.** *J. Am. Chem. Soc.* 74, 1531-5 (1952).—*C.A.* 46, 6475*f*.

The electronic chem. potential of a semiconductor changed with temp. and impurity concn. This variation was essential to the properties of semiconducting surfaces in adsorption and catalysis. A qaul. discussion of induced heterogeneity and of its consequences was given on the basis of a simple model of a catalyst surface. Active centers were still essential but their localized description became superfluous.

6034. BOUDART, M. **Heterogeneity of metal surfaces.** *J. Am. Chem. Soc.* 74, 3556-61 (1952).—*C.A.* 46, 10780*h*.

An atom was chemisorbed on a clean and bare metal surface by means of a no. of covalent-resonating (metallic) bonds. If a fraction θ of this ideal surface was covered with adatoms, a double layer was set up which changed the work function of the adsorbent by an amt. $\Delta\phi$ and the adsorption heat by an amt. Δq. If the adatoms did not interact, $\Delta\phi$ and Δq varied linearly with θ. Moreover, $\Delta q = (n/2)\Delta\phi$, where n was the no. of valence electrons of the adatom taking part in the bonding. This effect was termed "induction." It provided a quant. explanation of the fall in adsorption heat with coverage in all cases where pertinent data were available.

6035. DOWDEN, D. A. **Catalytic activity of nickel.** *Ind. Eng. Chem.* 44, 977-85 (1952).—*C.A.* 46, 9960*c*.

Chemisorption of substances by metals depended upon the "residual valencies" of the giant-mol. crystallites. Vacant *d* orbitals appeared necessary for rapid, general chemisorption and, therefore, also for catalytic activity of certain types. The binding potential of the valencies varied inversely as the Fermi energy of the metal electrons and inversely as the ionization potential of the relevant substrate valence electron. These concepts were used in a rationalization of the properties (sp area and sp activity) of Ni and its alloys as catalysts in industry and research.

6036. HAUFFE, K. AND ENGELL, H. J. **The mechanism of chemical sorption from the standpoint of the disorder theory.** *Z. Elektrochem.* 56, 366-73 (1952).—*C.A.* 47, 1457*b*.

By the sorption of O_2 at surfaces of semiconductors, barrier layers were formed, either of high resistance for *n*-type (ZnO) or of low resistance for *p*-type semiconductors (NiO, Cu_2O). The formation mechanism of the barrier layer and its dependence on O_2 pressure, as well of this layer as of a polycryst. *n*-seimconductor with comparable values of bulk and barrier cond., were calcd. and compared with measurements of the mixed systems (ZnO with 2 mol. % Ga_2O_3 or 0.5 mol. % Cr_2O_3) with variable donor concn. between 665 and 800°C.

6037. JURY, STANLEY H. AND LICHT, WM. JR. **Drying of gases. Adsorption wave in desiccant beds.** *Chem. Eng. Progress* 48, 102-9 (1952).—*C.A.* 46, 2854*i*.

The transient conditions which prevailed during adsorption in a desiccant bed gave rise to an "adsorption wave" (concn. gradient in the fluid stream) which originated at the entrance and gradually moved toward the opposite end of the bed. Solutions for certain cases showed how, by utilizing a dimensionless form, all cases cited could be reduced to a single generalized theory. The paper also presented results of an investigation of the kinetic mechanism of the reaction between humid air and the granular desiccant, anhyd. $CaCl_2$. The exptly. detd. adsorption waves were presented for various sets of operating conditions as controlled by the variables: gas velocity, granule size, and length of bed.

6038. ROBERTS, L. E. J. AND ANDERSON, J. S. **Fundamental processes in heterogeneous reactions.** *Revs. Pure & Applied Chem.* (Australia) 2, 1-22 (1952).—*C.A.* 46, 8478*h*.

The fundamentals of solid-phase reactions, chiefly gas-solid reactions and particularly chemisorption, in terms of the modern theory of solids, were critically reviewed.

6039. SCHWAB, GEORGE-MARIA. **Lattice defects in surfaces.** *Z. Elektrochem.* 56, 297-302 (1952).—*C.A.*46, 8447*f*.

The lattice defects, responsible for elec. conduction in semiconductors, phosphorescence, etc., formed the "active points" of a solid catalyst surface. The surface energies corresponding to defects caused by an interstitial cation adjacent to a vacant cation site in a NaCl-type lattice were calcd. for different crystal faces and edges. The same calcn. was made on the defect caused by the replacement of a univalent by a bivalent cation, adjacent to a vacant cation site, and on that caused by the replacement of a bivalent by a trivalent cation, adjacent to a point where the bivalent cation had been replaced by a univalent one.

6040. TAYLOR, H. AUSTIN AND THON, NATHANIEL. **Kinetics of chemisorption.** *J. Am. Chem. Soc.* 74, 4169-73 (1952).—*C.A.* 47, 21*i*.

The equation $dq/dt = ae^{-\alpha q}$, where q was the fraction of gas chemisorbed at time t, and a and α were consts. was shown to be applicable to a large body of data on rate of chemisorption. An extended range of the whole course of the adsorption or reaction was covered; most often it failed toward the reaction end only. Initially the prime function of the gas was the production of sites that decayed at a bimol. rate over the course of the slow adsorption. The rate of slow chemisorption was governed solely by the availability of sites. Parallels to the proposed schemes were found in kinetics of luminescence and photocond. of solids.

6041. TURNBULL, DAVID. **Theory of catalysis of nucleation by surface patches.** *J. Chem.Phys.* 20, 1327 (1952).—*C.A.* 46, 10819*d*.

To account for the effect of surface films on the solidification of supercooled Sn droplets, Kimball proposed that each drop contained m units or patches equally effective in catalyzing crystal nucleation. To account for the temp. dependence of m and for the order-unity value commonly found for m, it was now suggested that (1) the radius R of a patch was of the order of the crit. radius r^* for the growth of a nucleus into the supercooled liquid, and (2) there existed a statistical distribution of patch sizes described by $n_A = f(R)$, where n_A was the no. of patches per unit area with radius equal to or greater than R.

6042. UHLIG, HERBERT H. **Metal surface phenomena.** *Offic. Dig. Federation Paint & Varnish Production Clubs* No. **333**, 650-70 (1952).—*C.A.* **47**, 3774*f*.

Unsatisfied valence forces at the surface of a metal led to a state of tension of the surface atoms and compression of metal underneath. These forces also account for adsorbed films of substances bonded to the metal surface in varying degrees. Films with low energies of bonding were so-called physically adsorbed, and with high energies of bonding were said to be chemisorbed.

6043. DIENES, G. J. **Entropies of activation in metallic diffusion.** *Phys. Rev.* **89**, 185-8 (1953).—*C.A.* **47**, 4679*h*.

The various contributions to the entropy of activation for metallic diffusion were examd. theoretically. In particular, the entropy contribution arising from the altered vibrational frequencies around the saddle point was estd. Neg. overall entropies of activation were theoretically permissible and were likely to arise when the over-all activation energy was small.

IV-2. Physical Adsorption of Gases

6044. EVERSOLE, W. G. AND LAHR, PAUL H. **Evidence for a rigid multilayer at a solid-liquid interface.** *J. Chem. Phys.* **9**, 530-4 (1941).—*C.A.* **35**, 6172^4.

Assuming an immobile hydrous multilayer at a wall of fixed potential, equations were derived relating zeta potentials, concentrations of univalent salt solution, wall potential, and thickness of the immobile layer. Values of 8A to 63A were obtained for the thickness of the immobile layer. The values of wall potential and film thickness were considered sufficiently consistent for each set of data to justify the original assumption.

6045. KRAMERS, H. A. AND WANNIER, G. H. **Statistics of the two-dimensional ferromagnet. Part I.** *Phys. Rev.* **60**, 252-62 (1941).

In an effort to make statistical methods available for the treatment of cooperational phenomena, the Ising model of ferromagnetism was treated by rigorous Boltzmann statistics. A method was developed which yielded the partition function as the largest eigenvalue of some finite matrix, as long as the manifold was only one dimensionally infinite.

6046. KRAMERS, H. A. AND WANNIER, G. H. **Statistics of the two-dimensional ferromagnet. Part II.** *Phys. Rev.* **60**, 263-76 (1941).

The sp heat of the two-dimensional Ising model at the Curie point was investigated. The sp heat was infinite at the Curie point. A new closed form approximation of the partition function λ was developed by using the matrix method in its variational form.

6047. ZHUKHOVITSKIĬ, A.; ZABEZHINSKIĬ, YA. L., AND VENICHKINA, A. **Rate of molecular sorption on active charcoal.** *J. Phys. Chem.* (U.S.S.R.) **15**, 174-83 (1941).—*C.A.* **37**, 5298^8.

Theoretical considerations based on the analogy between diffusion and heat transfer and exptl. data (higher rate of adsorption of Et_2O dild. with H_2 than when dild. with air) showed that external diffusion to charcoal grains was more important than the internal diffusion within particle voids.

6048. ANTROPOFF, A. v. **The adsorption of gases at pressures varying from very low up to very high values. I. Mathematical analysis of the equations for ideal absolute and differential adsorption.** *Kolloid-Z.* **98**, 249-57 (1942).—*C.A.* **37**, 4949^8.

A distinction was made between abs. and differential adsorption. The first referred to the total mass of gas adsorbed in a space with dimensions detd. by the range of operative mol. forces. The second one referred to the excess over the amt. normally present in this vol.

6049. ANTROPOFF, A. v. **The adsorption of gases from the smallest to the highest pressures. II. Derivation and physical discussion of the equations of ideal adsorption.** *Kolloid-Z.* **99**, 35-52 (1942)—*C.A.* **37**, 3989^6.

Differential adsorbed gas was characterized by increasing to a max. and then dropping to zero with increase of pressure. It was the quantity usually measured by direct adsorption methods. Abs. adsorbed gas was the total quantity of gas found in the "adsorption space" in which condensation occurred. Equations of the Langmuir type for the abs. adsorption in terms of d. or pressure were derived.

6050. DAMKÖHLER, G. **Laminar boundary layers in the transfer of matter between smooth plates and [a fluid] streaming parallel to them.** *Z. Elektrochem.* **48**, 178-81 (1942).—*C.A.* **37**, 3991^3.

In the transfer of matter from plate to fluid the thickness of the boundary layer depended on both the rate of flow and the length of the plate measured along the direction of flow, whereas in transfer from fluid to plate it was independent of both factors. A practical corollary was that the rate of adsorption of a gas by a granular adsorbent could not, although the rate of desorption could, be increased by increasing the rate of flow and by decreasing the grain size of the adsorbent.

6051. GREGG, S. J. **Resemblance between surface films on solids and on water.** *J. Chem. Soc.* **1942**, 696-708.—*C.A.* **37**, 1912^1.

The quantities *FA* and *FS* (*F*, surface pressure of the adsorbed film, *A*, area occupied per adsorbed mol., *S*, specific surface of the adsorbent, i.e., its adsorbing area per g), could be calcd.

for the adsorbed film of a gas on a solid from the adsorption isotherm by integration of the Gibbs adosprion equation. The gaseous, expanded liquid, condensed liquid, and the intermediate state between expanded and condensed liquid had their analog in gas-solid adsorption. From the linear range of the above plots both the adsorbing area S and the monolayer capacity of the adsorbent (the no. of mols. per g taken up in a completed monolayer) could be found. Sometimes layers more than one mol. thick were formed.

6052. Rowley, H. H. and Innes, W. B. **Relationships between the spreading pressure, adsorption, and wetting.** *J. Phys. Chem.* **46**, 694-705 (1942).—*C.A.* **37**, 1072^9.

The total spreading pressure for an adsorbed phase on a solid surface was subdivided into that due to the first layer and that due to succeeding layers. The contact angle of a liquid on a solid was detd. by the work of wetting of the adsorbed layer rather than of the solid itself. Similarly, the interfacial contact angle of 2 immiscible liquids with a solid was detd. in most cases by the work of wetting a single adsorbed phase rather than the solid itself. The development was applied to porous solids. Data for the spreading pressure of numerous organic vapors on charcoal were given.

6053. Boyd, G. E. **Some aspects of the properties of solid surfaces.** *Pub. Am. Assoc. Advancement Sci.* No. **21**, 128-40 (1943).—*C.A.* **38**, 3888^1.

The free surface energy of solids could be detd. from theoretical considerations or by detg. the heat of soln. of extremely fine and very coarse cryst. powders. Changes in total surface energy of solids on immersion in liquids could be detd. calorimetrically. Values for the change in free surface energy of solids on exposure to vapors or liquids were obtained by the combination of adsorption data with the Gibbs adsorption theorem.

6054. Dunken, H. **Orientation of molecules by electrostatic forces at interfaces and in supermolecules.** *Z. physik. Chem.* **193**, 40-54 (1943).—*C.A.* **39**, 5151^7.

The same theoretical considerations could be used to treat the combination of dipoles and mols. of higher symmetry to form supermols. and their adsorption on metallic surfaces. The conditions for parallel and antiparallel orientations as well as for normal and tangential adsorption were derived.

6055. Jura, Geo. and Harkins, Wm. D. **A new adsorption isotherm which was valid over a very wide range of pressure.** *J. Chem. Phys.* **11**, 430-1 (1943).—*C.A.* **37**, 6518^5.

Condensed monolayers on water exhibited the linear pres.-area relation $\pi = b - a\sigma$ (π = pres.; σ = area). This equation was valid for condensed films on solids: the linear relation persisted up to higher pressures where the film was several mols. thick. For convenient exptl. use, the equation became $\log (p/p_0) = B - A/v^2$ (p = pres.; v = vol.). This equation gave better agreement with expt., especially at pressures above 200 mm Hg, than did the B. E. T. isotherm.

6056. Kao, S. K. and Chang, T. S. **Arrangement of double molecules on a lattice.** *Trans. Faraday Soc.* **39**, 288-94 (1943).—*C.A.* **38**, 1158^8.

The method consisted of a study of the adsorption of double mols. upon a solid surface and a calcn. of the equil. conditions by a method due to Bethe and Peierls. The no. of ways of arranging 1/2 Nθ double mols. on a lattice of N points, valid for all values of θ, were calcd. The agreement obtained was satisfactory.

6057. Löwry, H. **Solidified water films.** *Phil. Mag.* **34**, 67-70 (1943).—*C.A.* **37**, 3988^3.

A simple method, based on a knowledge of electrodynamic vol., was given for detg. the mean d., the vol., and the thickness of solidified water films.

6058. Cassel, Hans M. **Condensation and supersaturation of adsorbed phases.** *J. Chem. Phys.* **12**, 115-16 (1944).—*C.A.* **38**, 1932^2.

Extensions of the simple Langmuir mechanism to the treatment of multilayers in the adsorption of vapors could not account for the final liquefaction of the adsorbate. This was due to the disregard of lateral cohesion in the design of the film model.

6059. Cassel, Hans M. **Cluster formation and phase transition in the adsorbed state.** *J. Phys. Chem.* **48**, 195-202 (1944).—*C.A.* **38**, 5125^3.

Equations derived for the treatment of multilayer adsorption was incompatible with the Gibbs surface-tension equation. Cohesion forces in mono- and polylayers were discussed on the basis of polar attraction between mols. A relation between the crit. temps. of 2- and 3-dimensional condensation was derived assuming van der Waals equation of state for the monolayers and the coexisting vol. phases. Hysteresis observed in the sorption and desorption of vapors on porous and powd. solids was attributed to super-satn.

6060. Gregg, S. J. **A method for determining the internal area of coal.** *Proc. Conf. Ultra-fine Structure of Coals and Cokes, Brit. Coal Utilisation Research Assoc.* **1944**, 110-17.—*C.A.* **39**, 1277^4.

The internal area, or the monolayer capacity, of a porous solid such as coal, was detd. from FA-$F\Sigma$ graphs (F, surface pres. of adsorbed film; A, area occupied per mole of adsorbate; Σ internal area of adsorbent per g). Graphs of FA *vs.* $F\Sigma$, taken from published adsorption data, showed close resemblance to the FA-F curves for surface films of insol. substances on water ("trough films"). Branches of the curves showed changes of state: gaseous (G), expanded liquid (L_1), condensed liquid (L_2), and the intermediate state (I) between L_1 and L_2, similar to those among trough films, and a state O denoting layer thickening.

6061. Guggenheim, E. A. **Statistical thermodynamics of mixtures with zero energies of mixing.** *Proc. Roy. Soc.* (London) **A183**, 203-12 (1944).—*C.A.* **39**, 1339^1.

A general formula was obtained for the no. of distinct arrangements of a mixt. of any no. of different types of mols. each with its own geometric properties. The thermodynamic properties were deduced for such mixts. in which the energies of mixing were zero. The generalization of Raoult's law was derived by a math. technique much simpler than was used in this type of problem. The formulas were derived in an elementary way for systems with zero energy of mixing and zero vol. change of mixing.

6062. Harkins, William D. and Jura, George. **The decrease (π) of free surface energy (γ) as a basis for the development of equations for adsorption isotherms and the existence of two condensed phases in films of solids.** *J. Chem. Phys.* **12**, 112-13 (1944).—*C.A.* 38, 1932³.

Equations were developed for condensed insol. films on water which fit equally well adsorbed films on solids: $\pi = b - a\sigma$ or $\log (f/f_o) = B-(A/v^2) = B' - (A'/m^2) = \log (p/p_o)$, where π = film pressure, p = gas pressure, f = fugacity, σ = mol. area, v = vol. of material adsorbed, and m = mass of material adsorbed.

6063. Harkins, William D. and Jura, George. **Surface of solids. X. Extension of the attractive energy of a solid into an adjacent liquid or film, the decrease of energy with distance and the thickness of films.** *J. Am. Chem. Soc.* **66**, 919-27 (1944).—*C.A.* 38, 4175³.

At 25°C, the energy of vaporization of water was 10,540 cal per mole. If, however, the water was in the form of a monolayer on the otherwise clean surface of cryst. TiO_2 (as anatase), the heat of vaporization was increased by 62%. For the 2nd layer the increase was 13%, or 1380 cal per mole, for the 3rd 4%, or 450 cal per mole, and for the 4th and 5th layers 80 and 40 cal per mole, resp. The film of water adsorbed on TiO_2 (anatase) should have attained a min. thickness of 5 mol. layers before satn. of the vapor was attained. Measurement of the thickness of the film just below satn. confirmed this, since the thickness was over 15 A. (five mol. layers). The measd. thickness attained was 36 A. or 10 mol. layers for N_2 at -195.6°C. Almost all of the films adsorbed on the surfaces of nonporous solids that were investigated were highly multi-mol. at vapor pressures very slightly below satn. Capillary condensation played no significant role in the sorption with a cryst. powder.

6064. Jaffé, George. **The equation of state of monolayers.** *Phys. Rev.* **66**, 131-8 (1944).—*C.A.* **39**, 236².

The equation of state of monolayers was worked out from exactly the same point of view as the statistical theory of liquids. The formulas obtained should be applicable as well to gaseous films as to condensed films, though not to the domain of transition between the 2, since a change in the potential must be supposed to occur in the transition. The resulting formulas were compared with 2 groups of observations of gaseous films.

6065. Jura, George and Harkins, William D. **Existence of expanded and intermediate phases in films on solids.** *J. Chem. Phys.* **12**, 114 (1944).—*C.A.* 38, 1932⁶.

Equations developed for insol. monolayers on water in the liquid expanded and intermediate phases were valid for certain films adsorbed on solids.

6066. Livingston, H. K. **Contact angles and adsorption on solid surfaces.** *J. Phys. Chem.* 48, 120-4 (1944).—*C.A.* 38, 3529³.

Available adsorption and contact-angle data for 2-component solid-liquid-vapor systems indicated that in most cases the thermodynamic contact angle (θ) was zero and the fraction of the solid surface covered with adsorbed mols. from the vapor (σ) was unity.

6067. Livingston, H. K. **The relationship between the Brunauer-Emmett-Teller adsorption isotherm and the new isotherm of Jura and Harkins.** *J. Chem. Phys.* 12, 466 (1944).—*C.A.* 39, 660³.

The observed correlation between the Jura-Harkins and the B. E. T. isotherms were in agreement with the results obtained from a math. treatment of the 2 isotherms.

6068. Onsager, Lars. **Crystal statistics. I. A two-dimensional model with an order-disorder transition.** *Phys. Rev.* 65, 117-49 (1944).—*C.A.* 38, 1930².

6069. Roginskiĭ, S. Z. **Method of deriving statistical relations in the field of surface phenomena and its applications to adsorption problems.** *Compt. rend. acad. sci. U.R.S.S.* 45, 61-4 (1944).—*C.A.* 40, 4931⁸.

The forms of the functions $\theta(Q)$ and $p(Q)$ were considered, where θ was the fraction of surface covered for surface patches on which the heat adsorption = Q. The distribution function for such patches was $p(Q) = dn/dQ$. Relations deduced permitted the approx. calcn. of the distribution function from the adsorption isotherm or vice versa.

6070. Roginskiĭ, S. Z. **Statistical theory of adsorption isobars and isosteres for nonuniform surfaces and a graphical method of finding the distribution from the isotherms and isobars.** *Compt. rend. acad. sci. U.R.S.S.* 45, 194-6 (1944).—*C.A.* 40, 4931⁹.

Equations previously developed were modified so that they could be utilized directly in the analysis of exptl. data.

6071. Stranski, I. N. **Adsorption on solid bodies.** *Z. anorg. Chem.* **252**, 241-8 (1944).—*C.A.* 40, 4274⁷.

The step-like form of adsorption isotherms of solid bodies was traced to the formation of condensed solid films. The decrease of the satg. value of the adsorbate with increasing temp. was due to the existence of such films.

6072. Wang, J. S. and Mei, Jenn-Yueh. **The application of Kirkwood's theory of order-disorder transformation to adsorption.** *Chinese J. Phys.* 5, No. 1, 64-88 (1944) (in English).—*C.A.* 40, 2710⁶.

The penomenon of superlattice formation on an adsorbed layer was treated theoretically by applying both Kirkwood's and Bethe's theories of order-disorder transformation. The adsorbed layer was regarded as a 2-dimensional lattice in which each site was capable of accommodating only one adsorbed atom. The lattice was divided into a-sites and β-sites, and the numbers of the 2 classes were assumed to be equal. For this type of superlattice it was shown that when the interaction energy between the adsorbed atoms in pos. and the temp. was below a certain crit. temp., the slope of adsorption isothermals and heat of adsorption had a discontinuity at a certain transition θ, where θ was the fraction of the surface covered by adsorbed atoms.

6073. CASSIE, A. B. D. **Multimolecular adsorption.** *Trans. Faraday Soc.* **41**, 450-8 (1945).—*C.A.* **40**, 786[3].

Statistical formulas for multi-mol. adsorption of a single species were derived based on the assumption that if A mols. of pure liquid were adsorbed by unit mass of solid, X were adsorbed at low-energy sites, and $(A - X)$ were adsorbed at sites identical with those available to the mols. in the pure liquid. Interchange between the two forms gave a free energy of mixing, and the distribution between the two forms was detd. by the condition that the total free energy of the phase should be a min. Each contribution to the total free energy was calcd. When applied to localized sites, an equation is derived identical with that of B. E. T. When applied to a mobile monolayer, the latter must be gaseous to give an adsorption isotherm or to give surface adsorption that varied with the concn. of the solute in the soln.

6074. FOSTER, A. GRAHAM. **The sorption of condensable vapors by porous solids. III. Multimolecular adsorption.** *J. Chem. Soc.* **1945**, 769-73.—*C.A.* **40**, 1375[5].

A simplified derivation of the general equations of the B. E. T. theory was followed by a discussion of the application of this theory to several abnormal types of isotherms.

6075. FOSTER, A. GRAHAM. **The sorption of condensable vapors by porous solids. IV. Linear isothermals and the Langmuir equation.** *J. Chem. Soc.* **1945**, 773-6.—*C.A.* **40**, 1375[5].

The theory of multimol. adsorption was applied to linear isothermals such as have been reported for MeOH, PrOH, iso-PrOH, and BuOH on certain silica gels. By making due allowance for multilayer adsorption, the first layer adsorption was accurately fitted by the Langmuir equation. The satn. values for unimol. adsorption calcd. from the corrected data at lower relative pressures agreed with those derived by the "point A" method of Emmett and Brunauer from the data at higher relative pressures.

6076. INNES, W. B. AND ROWLEY, H. H. **Equilibria of two-dimensional systems. II.** *J. Phys. Chem.* **49**, 411-17 (1945).—*C.A.* **40**, 2371[9].

Several thermodynamic relations involving equilibria between a three-dimensional gas or vapor phase and a two-dimensional insol. surface phase for a two-component system were derived. One of these relations made possible the evaluation of spreading pressures from two-component adsorption data. Equilibria between a three-dimensional liquid and vapor phase and a surface phase for a two-component system were also treated and several relations derived; one of these related the selective adsorption to the change of spreading pressure with chem. potential.

6077. MCMILLAN, W. G. JR. AND MAYER, JOSEPH E. **The statistical thermodynamics of multicomponent systems.** *J. Chem. Phys.* **13**, 276-305 (1945).—*C.A.* **39**, 3999[6].

Distribution functions for multicomponent systems were defined as proportional to the probability that n mols. in an infinite isothermal system of fugacity set z would occupy the configurational coödinates symbolized by $\{n\}$. All thermodynamic functions could be obtained as certain sums of integrals of these distribution functions. The general equations were applied to the imperfect multicomponent gas, to isotopic gas mixts., and to condensed systems with the variables converted to the usual activities and activity coeffs.

6078. MOKRUSHIN, S. G. **Application of the Maxwell-Boltzmann distribution law to colloid chemistry.** *J. Gen. Chem.* (U.S.S.R.) **15**, 259-68 (1945 (English summary).—*C.A.* **40**, 3324[3].

The Maxwell-Boltzmann equation can be used for the deduction of the basic equations of colloid chemistry, i.e., Gibbs' adsorption equation, Langmuir and Freundlich adsorption equations, Kelvin's vapor-pressure expression, Traube rule, etc.

6079. PICKETT, GERALD. **Modification of the Brunauer-Emmett-Teller theory of multimolecular adsorption.** *J. Am. Chem. Soc.* **67**, 1958-62 (1945).—*C.A.* **40**, 1374[9].

All the simplifying assumptions made in the B. E. T. development except one were accepted. The B. E. T. theory was modified to take into account a decrease in probability of escape of mols. in the nth layer as more of the surface was covered with n layers. The equation was tested with data on the adsorption of N_2 on Fe-Al_2O_3 catalyst. It was assumed that the no. of layers on a part of the surface was limited to n and that more than n layers could be accommodated on the rest of the surface, the fraction of the surface accommodating a given no. of layers being related to the no. exponentially. This equation was tested with hydrated cement paste with good results.

6080. ROGINSKIĬ, S. Z. **A general analysis of processes on inhomogeneous surfaces and its application to the theory of adsorption. I. The adsorption equilibrium.** *J. Phys. Chem.* (U.S.S.R.) **19**, 185-200 (1945).—*C.A.* **39**, 5141[9].

The theory was based on Langmuir's equation for adsorption on inhomogeneous surfaces, i.e., it assumed the adsorption layer to be unimol. and the interaction between the adsorbed mol. to be negligible. It allowed a calcn. of the inhomogeneity from the exptl. isotherms and isobars.

6081. ROGINSKIĬ, S. Z. AND TODES, O. **Statistical theory of the adsorption of gas mixtures. I.** *Acta Physicochim.* U.R.S.S. **20**, 307-26 (1945).—*C.A.* **40**, 785[8].

The statistical theory of the adsorption of gases on complex inhomogeneous surfaces was extended to gas mixts. Probable relations between the heats of adsorption of different gases on the same areas of a complex surface were discussed for the cases when the adsorption forces were of different nature. The heats of adsorption may vary in like or in contrary sense or be unrelated. The conditions and relations governing the mutual displacement of the gases were established for the cases of heats of adsorption varying in the same sense.

6082. Ying, C. F. **Approximate partition function in the statistical theory of adsorption.** *Chinese J. Phys.* **6**, 1-16 (1945).—*C.A.* **40**, 5975^6.
The configurational partition function of the adsorbed layer was modified in two wyas: (1) by correcting the configuration energy expression and (2) by modifying the formulas of equil. distribution. It was evaluated by both methods and the adsorption isotherm, and the heat of adsorption computed for the case of a quadratic lattice with a dipole moment. Values for the last two quantities were also given when a uniform continuous distribution of the distant adsorbed particles was assumed.

6083. Anderson, Robert B. **Modifications of the Brunauer, Emmett, and Teller equation.** *J. Am. Chem. Soc.* **68**, 686-91 (1946).—*C.A.* **40**, 3322^5.
The B. E. T. equation could be fitted to the isotherms to relative pressures greater than 0.7 by multiplying the relative pres. by a const. that was less than one. This const. was interpreted to mean that the heat of adsorption in the second to ninth layers was less than the heat of liquefaction. An equation of a similar type for adsorption isotherms on porous solids and a new type of equation for adsorption limited to n layers were derived. The equation reduced to the Langmuir equation when $n = 1$ and to the simple B. E. T. equation when $n = \infty$. When the relative pres. equaled 1, V was equal to nV_m. The n-equation of B. E. T. reduced to $V_{mc}/(c + 1)$ for the case when $n = 1$ and $x = 1$, whereas the proposed equation reduced to V_m under these conditions.

6084. Bangham, D. H. **The recognition of phase transitions in adsorbed films on solids.** *J. Chem. Phys.* **14**, 352 (1946).—*C.A.* **40**, 4274^9.
From dimensional changes accompanying adsorption, films adsorbed on charcoal blocks were mobile and obeyed equations of state similar to those of films at liquid/gas interfaces. Phase transitions occurred and metastable films frequently were observed. A two-dimensional condensed phase did not necessarily confer complete wettability nor render capillary condensation in cavities inevitable.

6085. Bangham, D. H. **Aggregational states in adsorbed films on incompletely wettable solid surfaces.** *J. Chem. Phys.* **14**, 352-3 (1946).—*C.A.* **40**, 4275^4.
Substances completely wettable by water were those on which the pattern of adsorbed water mols. resembled that of the mols. of ordinary water or could fade imperceptibly into it. Incompletely wettable surfaces were not necessarily those that did not adsorb water, but those on which the pattern was incompatible with that of ordinary water. Differences in behavior between water, C_6H_6 and CCl_4 were too slight to suggest that the more general aspects of the phenomenon depended on the H-bond structure peculiar to water.

6086. Bangham, D. H. **Saturated adsorbed films and the structure of deeply supercooled water.** *Nature* **157**, 733 (1946).—*C.A.* **40**, 5313^4.
Droplets of supercooled water flattened at -50°C and spread to a film at -70°C. In H_2O (and alcs.) the H bond was important in detg. mol. configuration, but the presence of H bonds was not essential to the formation of molecularly thick films in which the mol. pattern differs from that of the normal liquid.

6087. Defay, R. and Prigogine, I. **The extension of the formula of Gibbs to the surface tension of surfaces not in equilibrium.** *Bull. classe sci., Acad. roy. Belg.* **32**, 36-51 (1946).—*C.A.* **41**, 4351^e.
If adsorption equil. is not established, new functions, lateral chem. potential, must be added to the usual chem. potentials in the surface. These affect dynamic surface tension. A Gibbs model with a geometrical surface is discussed and is compared to a model with a finite thickness of interphase layer. For these models equations are compared for the velocity of passage of a component from a bulk phase to the surface region.

6088. Elton, G. A. H. **Note on the multilayer postulate of Eversole and Lahr.** *J. Chem. Phys.* **14**, 463 (1946).—*C.A.* **40**, 5315^7.
The data of Eversole and Lahr were not very consistent, and the validity of their assumption was questionable. Using a similar exptl. technique, values were obtained for the "rigid" layer which approached zero.

6089. Emmett, P. H. **Multilayer adsorption equations.** *J. Am. Chem. Soc.* **68**, 1784-9 (1946).—*C.A.* **40**, 6931^3.
The significance, usefulness, limitations, and relation of the Harkins and Jura method and the B. E. T. method for measuring the surface area of porous or finely divided solids were discussed.

6090. Hill, Terrell L. **Proposed modification of the Brunauer-Emmett-Teller theory of multimolecular adsorption.** *J. Am. Chem. Soc.* **68**, 535-6 (1946).—*C.A.* **40**, 2710^9.
The Pickett modification of the B. E. T. theory of multimol. adsorption applied to those cases where the max. no. of adsorbed layers was restricted. A discussion of Pickett's assumptions led to the conclusion that, although the equations may improve the agreement with exptl. data in some cases, the modification should not be considered a really fundamental improvement over the B. E. T. theory.

6091. Hill, Terrell L. **Theory of multimolecular adsorption from a mixture of gases.** *J. Chem. Phys.* **14**, 46-7 (1946).—*C.A.* **40**, 3322^9.
The B. E. T. theory of multimol. adsorption was extended to a mixt. of two gases.

6092. Hill, Terrell L. **Statistical mechanics of multimolecular adsorption. I.** *J. Chem. Phys.* **14**, 263-7 (1946).—*C.A.* **40**, 3958^8.
The B. E. T. equation, though not completely satisfactory, was apparently the correct equation for the particular model used. Real improvements

in the theory should have followed from refinements in the model rather than from modifications in the treatment. The B. E. T. model was a special case of the model suggested here, but it had the advantage of presenting no math. difficulties. Preliminary results based on improved models indicated that a somewhat refined multimol. adsorption theory was capable of predicting capillary condensation for suitable values of parameters.

6093. Hill, Terrell L. **Theory of multimolecular adsorption from a mixture of gases.** *J. Chem. Phys.* **14**, 268-75 (1946).—*C.A.* **40**, 3959^2.

By making use of the evapn-condensation properties of liquid mixts., the B. E. T. theory of multimol. adsorption was extended to a mixt. of gases. No satisfactory exptl. data were available with which to test the theory.

6094. Hill, Terrell L. **Statistical mechanics of multimolecular adsorption. II. Localized and mobile adsorption and absorption.** *J. Chem. Phys.* **14**, 441-53 (1946).—*C.A.* **40**, 5315^8.

The transition from localized to mobile adsorption (in the first adsorbed layer) took place at rather low temps. for potential barriers of around 1000 cal/mole or less, so that localized phys. adsorption should be a very rare phenomenon at the temps. usually used in adsorption expts. Since the B. E. T. (and Langmuir) isotherm actually assumed localized adsorption, a new approx. isotherm equation was derived on the basis of a mobile first layer obeying a two-dimensional van der Waals' equation. This isotherm was in semi-quant. agreement with the two-dimensional phase changes observed by Jura, et al., and by earlier workers, at very low pressures. The localized-mobile transition in the adsorption of H_2 by metals was mentioned briefly.

6095. Jura, George and Harkins, William D. **Surfaces of solids. XIV. A unitary thermodynamic theory of the adsorption of vapors on solids and of insoluble films on liquid subphases.** *J. Am. Chem. Soc.* **68**, 1941-52 (1946).—*C.A.* **41**, 1908*c*.

Empirical equations of state were derived for the phases (1) gas, (2) liquid expanded, (3) liquid intermediate, (4) liquid condensed, and (5) higher pres. condensed. These equations were valid for adsorbed films on solids. The effects of temp. were in general the same on a solid subphase as on water in the low-pres. region, but the sign of the entropy term was reversed at high pressures. The relations of the various phases on the surface of a solid were capable of statistical treatment. The general phase relations of adsorbed films on solids were essentially the same as those of monolayers of oil on water.

6096. Kiselev, A. V. **Thermodynamics of adsorption processes.** *Uspekhi Khim.* **15**, 456-84 (1946).—*C.A.* **41**, 1139*h*.

6097. Luttinger, J. M. and Tisza, L. **Theory of dipole interaction in crystals.** *Phys. Rev.* **70**, 954-64 (1946).—*C.A.* **41**, 2290*d*.

Dipole arrays may be represented as vectors in a many-dimensional vector space. An arbitrary array may be decompd. into a linear combination of basic arrays, the energies were additive and may be obtained from the characteristic values of the quadratic form. The method was demonstrated by the complete solution of the characteristic value problem of a highly symmetric class of cubic arrays. The min.-energy arrays were obtained without and with an external magnetic field for the simple cubic, body-centered cubic and face-centered cubic lattices.

6098. Powers, T. C. and Brownyard, T. L. **Studies of the physical properties of hardened portland cement paste. III. Theoretical interpretation of adsorption data.** *J. Am. Concrete Inst.* **18**, 469-504 (1946).—*C.A.* **41**, 2545*h*.

Adsorption of water and conditions of equil. were explained in terms of the B. E. T. theory and the capillary condensation theory. Adsorption characteristics were considered with reference to age and original water-cement ratio of hardened pastes and to the influence of cement compn. The sp surface of solids in hardened paste was calcd. from the adsorption characteristics, and was an index of the amt. of colloidal material present.

6099. Roginskiĭ, S. Z. and Todes, O. **Limits of the applicability of statistical methods in the analysis of adsorption phenomena.** *Acta Physicochim. U.R.S.S.* **21**, 519-38 (1946) (in English).—*C.A.* **41**, 19*g*.

The difficulties inherent in any attempt to differentiate between adsorption effects caused by interaction of adsorbed mols. and those caused by heterogeneity of the adsorbent surfaces were discussed. An adsorption expt. using isotopes was suggested as a crit. means of such differentiation.

6100. Temkin, M. and Levich, V. **Adsorption equilibrium on heterogeneous surfaces.** *J. Phys. Chem.* (U.S.S.R.) **20**, 1441-57 (1946) (in Russian).—*C.A.* **41**, 2958*h*.

By assuming that the adsorbed layer was unimol. and that no forces operated between the adsorbed mols., it was possible to calc. the relation between the value of the energy of adsorption and the area for which this value was valid, if the adsorption isotherm was given.

6101. Cassie, A. B. D. **Multimolecular adsorption. II.** *Trans. Faraday Soc.* 43, 615-20 (1947) .—*C.A.* **42**, 3639*df*.

The B. E. T. adsorption isotherm was applicable only to systems in which adsorption occurred as distinct clusters of mols. It was not applicable to multimol. adsorption as continuous layers superposed on a continuous monolayer. If mols. were adsorbed as clusters at the localized sites, distinct configurations may be counted as those that were obtained by interchanging clusters of different size. The increase in the no. of distinguishable configurations by this method of counting gave the required increase of entropy. The surface of keratin at satn. vapor pressure consisted of small clusters of water mols. spaced apart on an otherwise water-repellent surface.

6102. FRÖHLICH, H. AND SACK, R. A. **Light adsorption and selective photoeffect in adsorbed layers.** *Proc. Phys. Soc.* (London) 59, 30-3 (1947).—*C.A.* 42, 1492*a*.

The probability was calcd. for the adsorption of a light quantum by a single layer of atoms adsorbed on a nonmetallic surface. The spectral width of the emission band should increase proportionally to $\sqrt{T}$, similarly to the increase in width of the absorption band in solids. Thus, the higher the temp., the further should the photoelec. threshold be shifted towards longer wave lengths. No exptl. evidence on this point was available.

6103. GURNEY, C. **Surface tension in liquids.** *Nature* 160, 166-7 (1947).—*C.A.* 41, 6788*e*.

The tension stress in planes of surfaces was explained by a mol. interpretation of the thermodynamics of surfaces developed by Gibbs. The chem. potential, μ, of surface mols. was higher than that of interior mols. More mols. thus left the surface than entered it. A tension was then set up in the remaining surface mols. When this stress was increased to that necessary to equalize the μ of surface and interior mols., equil. was established.

6104. HILL, TERRELL L. **Statistical mechanics of multimolecular adsorption. III. Introductory treatment of horizontal interactions. Capillary condensation and hysteresis.** *J. Chem. Phys.* 15, 767-77 (1947).—*C.A.* 42, 806*h*.

Calcns. on multimol. adsorption and capillary condensation, which took into account horizontal interactions in an approx. manner, were presented. Several other topics were discussed briefly, including the quasichem. method and reversible hysteresis. Reversible hysteresis involved the use of metastable portions of the adsorption isotherm. The theory predicted, in agreement with expt., that the adsorption curve should be below the desorption curve.

6105. ITTERBEEK, A. VAN. **Adsorption of gases by solid materials.** *Symposium Grenslaagverschijnselen, Verhandel. Koninkl. Vlaam. Acad. Wetenschap., Belg.* 1947, 38-61.—*C.A.* 43, 3263*f*.

Both activated, unimol. adsorption, and van der Waals' multimol. adsorption are discussed on the basis of the Langmuir, Polanyi, and B. E. T. theories. Van der Waals' adsorption involved 2 kinds of energy, one resulting from direct interaction between surface and gas mols., and one due to forces acting between adsorbed mols. When the latter prevails, the isotherm curve has an S shape, and the adsorbed layer may tend to form a film.

6106. MAYER, JOSEPH E. **Integral equations between distribution functions of molecules.** *J. Chem. Phys.* 15, 187-201 (1947).—*C.A.* 41, 3333*b*.

Integral equations were derived that relate variations in the potentials of av. force between mols. of a system at two different ds. or activities. These permitted the calcn. of the change in thermodynamic properties, or of the change in the distribution of mols. in space, in a liquid or cryst. phase, if either the temp. was varied, or if the mutual potential between the mols. was assumed to change.

6107. MCMILLAN, W. G. **Multilayer gas adsorption on composite surfaces.** *J. Chem. Phys.* 15, 390-7 (1947).—*C.A.* 41, 4992*b*.

The B. E. T. equation for adsorption of a gas on a free plane homogeneous surface was extended to the case of a mixt. of two such surfaces, in an attempt to explain the observed deviations below one monolayer. The resulting equation may be greatly simplified for the case that the adsorption-energy parameter, c, for each component surface, was large with respect to unity, as was usually the case in low-temp. adsorptions of N_2, A, etc. This approx. form of the equation was applied to the N_2 isotherm on an inorg. salt and gave substantially better agreement with expt. than did the simple B. E. T. equation.

6108. RICE, O. K. **The behavior of pure substances near the critical point.** *J. Chem. Phys.* 15, 314-32 (1947).—*C.A.* 41, 2984*f*.

Some aspects of the surface tension of the liquid near the crit. point were considered in some detail. The highest temp. T_m at which a meniscus could exist was assumed to be the temp. at which the surface tension vanished at the same time that the condition for equil. between liquid and vapor phases was fulfilled. The pressure-vol. isotherm at T_m had a finite horizontal region, corresponding to the squeezing out of surface when the surface tension was zero. The slope of the isotherm at T_m in the vapor region outside the horizontal portion was closely related to the slope in the liquid region just to the other side of the horizontal part; these slopes approached zero as the flat part was approached. Above T_m there was still a process that may be called condensation, but no horizontal part to the isotherms.

6109. WHITE, LOCKE, JR. **A limitation of the determination of surface area by the "point B" method.** *J. Phys. & Colloid Chem.* 15, 644-7 (1947).—*C.A.* 41, 4994*d*.

The "point B" method for selecting the point on a low-temp. adsorption isotherm corresponding to a monolayer of adsorbed gas will agree with the B. E. T. method only when the const. c of the B. E. T. equation has a value somewhat larger than 9.

6110. ANDERSON, ROBERT B. AND HALL, W. KEITH. **Modification of the Brunauer, Emmett and Teller equation. II.** *J. Am. Chem. Soc.* 70, 1727-34 (1948).—*C.A.* 42, 6198*g*.

The B. E. T. equation was modified to the form $V/V_m = ckx/[(1 - jkx)[1 - (c - j)kx]]$. The factor j took into account the decrease in area of a pore with increasing adsorption and was defined as the ratio of the no. of mols. required to fill the nth layer to the no. required to fill the $(n - 1)$ layer; k equaled $e^{d/RT}$, d being the no. of cals by which the free energy of adsorption in the second and higher layers differed from the free energy of liquefaction of the adsorbate. For type IV isotherms flattening off at values of x smaller than 0.85 k was in the range 1.4 to 2.2. The relative pres. at which most of the capillaries would have been filled was approx. $1/k$. The const. j was always less than 1 for a porous solid, ranging from 0.01 to as high as 0.9 depending on the pore size of the adsorbent.

6111. BOER, J. DE. **Quantum theory of condensed permanent gases. I. The law of corresponding states.** *Physica* **14**, 139-48 (1948).—*C.A.* **42**, 6187*e*.

The equations of state of the gases H_2, D_2, and N_2 can be written in a reduced form, in which the thermodynamic quantities T, P.V. etc., are expressed in "molecular units," i.e., units obtained from the characteristic parameters of the inter-mol. field. In general, the reduced equations of state contain a parameter A*, h, and the mol. masses. This parameter is a measure of the effect of quantum mechanics.

6112. COOK, MELVIN A. **Theory of adsorption of gases on solids.** *J. Am. Chem. Soc.* **70**, 2925-30 (1948).—*C.A.* **43**, 1237*d*.

The adsorption forces were described by terms expressing (1) the interaction forces of adsorbed mols. with the adsorbent and (2) the adsorbate interaction forces, the latter being largely empirical. The derived equations agreed with sigmoid isotherms over the entire range of relative pressure x above 0.05, certain obvious modifications being required to provide agreement for $x < 0.05$. Heats of adsorption derived from the theory appeared consistent with isosteric and colorimetric heats of adsorption.

6113. CREMER, ERIKA. **Adsorption on solid surfaces.** *Osterr. Chem.-Ztg.* **49**, 1-10 (1948).—*C.A.* **44**, 9769*b*.

Langmuir's adsorption isotherm was theoretically investigated.

6114. DERYAGIN, B. V. AND KROTOVA, N. A. **Electric theory of adhesion of films to solid surfaces.** *Doklady Akad. Nauk, S.S.S.R.* **61**, 849-52 1948); *Uspekhi Fiz. Nauk* **36**, 387-406 (1948).—*C.A.* **43**, 2842*i*, 7769*e*.

A film gutta-percha was made to adhere to the lower face of a solid plate (glass, Ni, Zn, steel) which could be rotated around a horizontal axis so as to form any desired angle α with the perpendicular. Under the action of a load P suspended on the lower end of the film, detachment began to a certain angle α_0 and proceeded at a rate v (in cm/sec.) which increased with P and with α. If the work of detachment A was taken to be equal to the work of the falling load, $A = (P/b)\ (1 - \cos\ \alpha)$. Exptl. plots of A as a function of v showed an initial very rapid increase of A with v, and A of the order of magnitude of 10^5 ergs/cm². A correct theory was developed on the assumption that almost all work of detachment was spent to overcome electrostatic forces between opposite charges formed in the process of detachment.

6115. DOLE, MALCOLM. **Statistical thermodynamics of the sorption of vapors by solids.** *J. Chem. Phys.* **16**, 25-30 (1948).—*C.A.* **42**, 1476*c*.

The statistical method of treating the sorption of vapors was further generalized to include variable heats of sorption in different layers. It was shown under what conditions multilayer sorption could lead to a linear isotherm and to various modifications of the B. E. T. equation. The interaction between sorbed mols. in the same layer was also treated.

6116. FOSTER, A. GRAHAM. **Pore size and pore distribution.** *Discussions Faraday Soc.* **1948**, No. 3, 41-51.—*C.A.* **43**, 1240*c*.

The detn. of capillary radii of porous solids by application of the Kelvin equation and other adsorption methods was discussed. Condensation did not occur until after the formation of an adsorbed layer approx. 2 mols. thick. Assuming that the mol. d. $(\sigma) = 1.33 \times 10^{-8}\ (M/d)^{1/3}$ and that the Kelvin equation gave the remaining radius r, the true pore radius r_0 was given by $r_0 = r - 2\sigma$ for a given adsorbent and should have been independent of the nature of the adsorbed substance. Data of Broad and Foster plotted as r_0 vs. v curves showed virtual coincidence for EtOH, dioxane, morpholime, triethylamine, *n*-hexane, $CHCl_3$, and PhH on Fe_2O_3, but PhMe, cyclohexane, CCl_4, *n*-octane, H_2O and D_2O did not agree so well. There was no proof of the correctness of the values of r calcd. by the Kelvin equation, but only a demonstration of its apparent validity for comparative purposes.

6117. GREGG, S. J. AND MAGGS, F. A. P. **Detection of changes of state in films adsorbed at the gas-solid interface.** *Trans. Faraday Soc.* **44**, 123-36 (1948).—*C.A.* **42**, 6602*d*.

The occurrence of phase transformation in adsorbed films on solids, and the existence of phases resembling the gaseous, liquid-expanded, and liquid-condensed phases of films on water were indicated by plotting the 2-dimensional compressibility β against surface pressure. A method for the calcn. of β from the adsorption isotherm was given. Examn. of the plots of β' against log p for a no. of published isotherms showed: (a) true 1st-order transformations were rare; (b) diffuse 1st order transformations were common; (c) 3rd-order transformations were sometimes found; (d) a true or diffuse 1st order transformation between 2 phases in the monolayer (such as $L_1 \rightleftharpoons L_2$) gave rise to a max. in the curve of β' against log p, multilayer formation was exhibited as a rising branch not followed by a falling branch.

6118. HALSEY, GEO. **Physical adsorption on non-uniform surfaces.** *J. Chem. Phys.* **16**, 931-7 (1948).—*C.A.* **42**, 8573*i*.

Adsorption on a uniform surface with interaction showed that the hypotheses of the B. E. T. theory led to substantially no adsorption beyond the first layer if $E_2 = E_L$, and stepwise isotherms if $E_1 > E_2 > E_3 > \ldots > E_L$. For the monolayer adsorption of gases on Ag, Pt, and steel, the heterogeneous nature of the adsorbing surface was clearly indicated. The typical multilayer isotherm was shown to be composed of 3 regions: noncooperative adsorption on a strongly heterogeneous surface; cooperative adsorption on a still heterogeneous surface; and cooperative multilayer adsorption induced by small van der Waals perturbations some distance from the surface. The isotherm $p/p_0 = \exp. \{-a/\theta^r\}$ was derived.

6119. Hill, Terrell L. **"Derivation" of the complete van der Waals equation from statistical mechanics.** *J. Chem. Education* 25, 347-8 (1948).—*C.A.* 42, 6594*d*.

The assumptions that must be made in deriving the van der Waals equation by statistical mechanics were presented.

6120. Hill, Terrell L. **Statistical mechanics of multimolecular adsorption. IV. The statistical analog of the B. E. T. constant a_1b_2/b_1a_2. Hindered rotation of a symmetrical diatomic molecule near a surface.** *J. Chem. Phys.* 16, 181-9 (1948).—*C.A.* 42, 3236*g*.

An approx. study was made of the restricted rotation of a sym. diatomic mol. near a surface. This makes possible some calcns. concerning the B. E. T. const. $c = R \exp (\epsilon_1 - \Delta)/kT$, and especially the factor R (which is customarily set equal to unity). This factor was of the order of 5-10. A method of estg. the area occupied per mol. in a completely filled monolayer was mentioned. The temp. dependence of the quantity R was of some exptl. interest, and a brief discussion of this dependence as predicted by this approx. treatment was included.

6121. Hill, Terrell L. **Steric effects. I. Van der Waals potential energy curves.** *J. Chem. Phys.* 16, 399-404 (1948).—*C.A.* 42, 4009*c*.

Reliable van der Waals potential energy functions were available in only a limited no. of cases. An approx. semi-empirical method was presented for estg. these curves in other cases, based on an extrapolation from the nature of the curves that were known.

6122. Hüttig, G. F. **The evaluation of adsorption isotherms.** *Monatsh.* 78, 177-84 (1948).—*C.A.* 42, 7598*a*.

The isotherm equation was derived: $\theta = [K_1 p/(1 + K_1 p)][1 + (p/P)]$, where θ was the ratio between the vol. of gas adsorbed and that required to form a single layer on the adsorbent, p was the partial pressure of the adsorbate, P was the liquefaction pressure, and K_1 was the ratio between k_1, the rate of condensation per unit pressure per unit amt. of bare surface, and k_2, the rate of evapn. from a layer per unit no. of mols. in that layer. The equation was shown to apply to the adsorption of MeOH by Fe_2O_3 and to the adsorption of MeOH and EtOH by powd. quartz.

6123. Keenan, A. G. **Anderson's modifications of B. E. T. equation.** *J. Am. Chem. Soc.* 70, 3947-8 (1948).—*C.A.* 43, 4075*f*.

Published data on heats of adsorption of A and N_2 on carbon blacks actually supports Anderson's equation for the monolayer vol. An expression for the vol. adsorbed in the nth layer, when summed for n from 1 to ∞, gives an isotherm equation identical with one derived more directly by Anderson.

6124. Kemball, C.; Rideal, E. K., and Guggenheim, E. A. **Thermodynamics of monolayers.** *Trans. Faraday Soc.* 44, 948-54 (1948).—*C.A.* 43, 8795*d*.

Formulas analogous to those for adsorbed monolayers of a single species were derived for the free energy, spreading pres. (ϕ), and log $l_i p_i/kT$ (l_i was a quantity having the dimensions of length and p_i was the partial v. p. of species $i = 1$ or 2) of both mobile and localized monolayers of 2 adsorbed species. In the special case when $B_{12} = (1/2)(B_1 + B_2)$, it was shown that $l_1 p_1 \exp. (-B_1 \phi/kT) + l_2 p_2 \exp. (-B_2 \phi/kT) + l_2 p_2 \exp. (-B_2 \phi/kT) = \phi$, where the B parameters were analogous to 2nd virial coeffs. of slightly imperfect gases. For ideally dil. solns. a similar equation applied in which $l_1 p_1$ was replaced by $s_1 C_1$ (s_i was a parameter independent of the compn. of the soln.).

6125. Mennessier, André; Boucher, Raymond, and Montigny, Pierre. **Theoretical bases for the coefficient τ of the rates of adsorption.** *Compt. rend.* 226, 1090-2 (1948).—*C.A.* 42, 4817*c*.

An equation is derived on the basis of the Langmuir theory of unimol. adsorption for the rate of adsorption of a gas on a solid. The equation has the following form, $m = m_o{}^{-t/K+b}$, where m is the mass of gas adsorbed, m_o is the mass of gas required for a monolayer, t is the temp., and K and b are consts. This equation is similar to that detd. experimentally, for the rate of adsorption of dry benzene on active charcoal in times greater than 60 sec.

6126. Smith, T. D. and Bell, R. **Relation between the Brunauer-Emmett-Teller and Harkins-Jura isotherms.** *Nature* 162, 109-10 (1948).—*C.A.* 42, 8046*d*.

When the exponent n in the B. E. T. isotherm was finite and equal to or less than 5, the surface pressure calcd. from this isotherm was no longer a linear function of the surface area. Harkins-Jura isotherm would not be expected to apply. This was in accord with the observation that the Harkins-Jura isotherm did not fit adsorption data for highly porous amorphous carbon for which $n < 3$.

6127. Vinogradov, G. V. and Borodulina, L. P. **Nomograms for Langmuir's [absorption] equation.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 21, 249-50 (1948).—*C.A.* 44, 402*b*.

6128. Walker, Wm. C. and Zettlemoyer, Albert C. **A dual-surface B. E. T. adsorption theory.** *J. Phys. & Colloid Chem.* 52, 47-58 (1948).—*C.A.* 42, 2488*g*.

The B. E. T. equation was extended to cases in which the surface was assumed to be composed of two parts, A and B, in relative amts. V_{mA} and V_{mB} characterized by consts. C_A and C_B. They showed that if the heat of adsorption on part A of the surface was small ($C = \sim 2$) and the heat of adsorption on part B was large ($C = \sim 100$), then a plot of $x/V(1-x)$ against x would give a curve concave to the x axis rather than a straight line.

6129. Yu, Hun-Tsen. **A statistical derivation of the Brunauer-Emmett-Teller adsorption equation.** *J. Chinese Chem. Soc.* 15, 193-9 (1948).—*C.A.* 42, 6602*c*.

Derivation directly from distribution considerations was attempted without making explicit reference to the thermodynamic relations. As in the B. E. T. model, localized sites were assumed, and interactions between mols. in the same layer, as well as transmissions of the polarizing effects from the first to higher layers, were neglected.

6130. Band, William. **Anomalous adsorption of helium at liquid-helium temperatures.** *Phys. Rev.* 76, 441-2 (1949).—*C.A.* 43, 8778*d*.

The results of Long and Meyer raised a serious question of the validity of the B. E. T. theory. The anomalously high values of the vol. of gas that would just fill the first monolayer at its satn. of d. yielded by the ordinary B. E. T. plot were real, and indicated only that the B. E. T. theory required generalization.

6131. Cook, Melvin A. and Pack, Douglas H. **Extrapolation of adsorption isotherms to high relative pressures and the determination of the surface pressure of adsorbed films on solids.** *J. Am. Chem. Soc.* 71, 791-7 (1949).—*C.A.* 43, 6033*g*.

Methods were outlined for handling the complex infinite series of the theoretical equation. The convergence and divergence properties of the equation were discussed. The Bangham equation derived from the Gibbs' adsorption equation for the surface pressure π of an adsorbed film was integrated by means of the crit. adsorption isotherm equation and found to yield values that agreed well with those obtained by graphical integration of the exptl. isotherms. The theory offered a method for evaluating the surface pressure from all types of phys. adsorption isotherms, including those exhibiting capillary condensation.

6132. Crisp, D. J. **A two-dimensional phase rule. I. Derivation of a two-dimensional phase rule for plane interfaces.** *Research* (London), *Suppl.*, *Surface Chemistry* 1949, 17-22.—*C.A.* 43, 8795*i*.

A modified general phase rule was developed employing the basic principles of Gibbs for defining phase relations. The generalized equation was considerably simplified when restricted to a single surface, contg. q surface phases. The no. of degrees of freedom, F, was $F = C - P^B - (q-1)$, where C was the no. of components, and P^B the no. of bulk phases. The simplified rule was sufficient to cover most applications.

6133. Drenan, J. W. and Hill, Terrell L. **Statistical mechanics of adsorption. VIII. The statistical analog of the B. E. T. constant a_1b_2/b_1a_2 for simulated benzene and hydrogen iodide molecules on graphite.** *J. Chem. Phys.* 17, 775-81 (1949).—*C.A.* 44, 1303*c*.

The approx. study of the restricted rotation of mols. near a surface was extended to an unsym. diat. mol., HI, and a ring mol., C_6H_6, for a graphite surface in each case. Calcns. of the factor $R[C = R$ exp. $(\epsilon_1 - \lambda)kT]$ were made for these cases. R was the same order of magnitude (2-20) as for the sym. diat. mol., λ = heat of vaporization of the liquid; $-\epsilon$ was the energy of an isolated mol. in its ground state relative to infinite sepn. from the surface as the zero of energy; k was the Boltzmann const.; and T, the abs. temp.

6134. Gorter, C. J. and Frederikse, H. P. R. **Physical adsorption.** *Physica* 15, 891-6 (1949).—*C.A.* 44, 3332*a*.

A method was developed for calcg. the entropy of the adsorbed matter from the measurements. The total entropy was max. when the first layer was approx. half occupied. The kinetic theory gave a valuable first approxn. to the distribution of adsorbed matter, but generally predicted too rapid a variation of the quantity adsorbed with the pressure. The thermodynamic treatment was independent of any model and was also valid in the case of capillary condensation.

6135. Gregg, S. J. **Phase changes in adsorbed films at the gas/solid interface.** *Research* (London), *Suppl.*, *Surface Chemistry* **1949**, 205-16.—*C.A.* 43, 8789*c*.

Film compressibilities calcd. from the adsorption isotherms permitted elucidation of the transformations between the different states in gas films adsorbed on solids. Calcd. abs. values of the compressibilities were of the same order as those established for films on water. Adsorption hysteresis appeared to arise in many, but not all, instances from a suspended phase transformation within the film.

6136. Hill, Terrell L. **Physical adsorption on nonuniform surfaces.** *J. Chem. Phys.* 17, 106 (1949).—*C.A.* 43, 2840*a*.

The B. E. T. model of adsorption, although it assigns extremely unrealistic properties to the liquid state, nevertheless leads to correct deductions.

6137. Hill, Terrell L. **Thermodynamic transition from adsorption to solution.** *J. Chem. Phys.* 17, 507 (1949).—*C.A.* 43, 7804*h*.

Thermodynamic studies indicated that the results of a previous study carried over to the more general case without formal change.

6138. Hill, Terrell L. **Statistical mechanics of adsorption. V. Thermodynamics and heat of adsorption.** *J. Chem. Phys.* 17, 520-35 (1949).—*C.A.* **43,** 8791*e*.

The thermodynamics of an adsorbate on an inert adsorbent was discussed. Particular attention was given to heats of adsorption in an attempt to clarify and extend the available methods in this field. The true equil. $\Delta H = T\Delta S$ of adsorption for adsorbate molecules was given by $(\partial \ln \rho/\partial T)\gamma = \Delta H/RT^2$, where ϕ was the two-dimensional spreading pressure.

6139. Hill, Terrell L. **Physical adsorption and the free-volume model for liquids.** *J. Chem. Phys.* 17, 590 (1949).—*C.A.* 43, 8777*g*.

The method of Lennard-Jones and Corner, in which a free-vol. model of the liquid state was used for treating surface tension, was applied to the liquid like adsorbate (of 3 or more layers) on a free adsorbent surface.

6140. Hill, Terrell L. **Extension of Fowler's treatment of surface tension to physical adsorption.** *J. Chem. Phys.* 17, 668-9 (1949).—*C.A.* 43, 8776*h*.

The free-vol. model of a liquid could be applied to a liquid-like adsorbate (three or more layers). An analogous extension of Fowler's treatment of surface tension was given.

6141. Hill, Terrell, L. **Statistical mechanics of adsorption. VI. Localized unimolecular adsorption on a heterogeneous surface.** *J. Chem. Phys.* 17, 762-71 (1949).—*C.A.* 44, 1303*a*.
The Langmuir isotherm for localized unimol. adsorption was generalized (using statistical methods) in order to discuss adsorption on a heterogeneous surface, with and without interactions between adsorbed mols. The configurational entropy, and the nature of the phase changes on a random heteregeneous surface were discussed. On this type of surface the theory predicted, at least for one special case, that condensation would occur in two steps at low enough temps.

6142. Hill, Terrell, L. **Statistical mechanics of adsorption. VII. Thermodynamic functions for the B. E. T. theory.** *J. Chem. Phys.* 17, 772-4 (1949).—*C.A.* 44, 1303*b*.
Thermodynamic functions were calcd. from the B. E. T. statistical model.

6143. Joly, M. **General theory of transformations of different orders in monolayers.** *Research* (London), *Suppl.*, *Surface Chemistry* 1949, 37-46 (in French) (English summary).—*C.A.* 43, 8796*b*.
The points of transformation were assumed to correspond to states of a stable equil. between all mols. of the films. For areas between points of transformations, the film was formed from a mixt. of mols. corresponding to the nearest equil. states. This hypothesis permitted the establishment of area-temp. diagrams representing the constitution of all possible phases of unimol. films. The transformations of different orders corresponded to a discontinuous transition from one mol. form to another, and the order of transformations depended on the miscibility or nonmiscibility of the successive mol. forms. The transition from one mol. form to another was accompanied by changes in the no. of degrees of freedom. The mols. of the film could occupy only a discrete series of areas characteristic of their degrees of freedom.

6144. Livingston, H. K. **The cross-sectional areas of molecules adsorbed on solid surfaces.** *J. Colloid Sci.* 4, 447-58 (1949).—*C.A.* 44, 19*c*.
The ratio between the cross-sectional area of adsorbed N_2 and of other adsorbed mols. was detd. from published data. The adsorbed areas were calcd. from these ratios, by taking a value of 15.4 A.^{2}/mol. for N_2 adsorbed at -196°C: H_2, 8.3, -253°C; D_2, 7.2, -253°C; CH_4, 16.0, -183°C; C_2H_2, 21.1, -78°C; C_2H_6, 32.3, 25°C; C_7H_{16}, 59.4, 24°C; NH_3, 14.6, -32°C; O_2, 14.6, -183°C; H_2O, 10.8, 25°C; PrOH, 19.8, 25°C; CO, 16.3, -183°C; CO_2, 19.5, -78°C; N_2O, 20.4, -78°C; Ne, 10.0, -253°C; CS_2, 37.9, 0°C; $CHFCl_2$, 38.2, 0°C; EtCl, 24.8, 0°C; A, 14.6, -195°C; Kr, 18.5, -195°C.

6145. Osawa, Fumio and Satô, Hisanao. **A theory of adsorption.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. 20, 94-101 (1949).—*C.A.* 47, 1457*g*.
The adsorption isotherm of gases on solid surfaces obtained in terms of cluster integrals was of the form of a B. E. T. type-II isotherm. The internal structure of adsorbate mols. was ignored in calcn. The necessary conditions for the occurrence of 1st-order phase transition in the adsorbed film were discussed in detail.

6146. Ross, Sydney and Secoy, C. H. **Physical adsorption. III. A simplified equation of state at high pressures and its application to surface films on liquids and solids.** *J. Phys. & Colloid Chem.* 53, 306-18 (1949).—*C.A.* 43, 6034*a*.
An empirical equation of state ascribed to Amagat was put into a form suitable for an integration of the Clausius equation for estg. the latent heat of 2-dimensional phase transitions. Heat values of 4.2, 3.0, and 8.0 kcals. per mole were found for phase transitions of ethyl palmitate, α-monopalmitin, and pentadecylic acid, resp., on a liquid substrate. A value of 11.46 kcals. was obtained for the phase transition of *n*-heptane on solid graphite.

6147. Ross, Sydney. **Physical adsorption. IV. A comparison of two theories of multilayer adsorption.** *J. Phys. & Colloid Chem.* 53, 383-91 (1949).—*C.A.* 43, 6034*b*.
The theory of multilayer adsorption proposed by Hüttig was applied to isotherms of C_2H_6 on NaCl at 90°K., CH_3OH and C_2H_5OH vapor on SiO_2, and TiO_2 at 298°K. The isotherms plotted according to the Hüttig equation were linear up to relative pressures of 0.6 to 0.8, whereas those plotted according to the B. E. T. equation were linear to about 0.35 relative pressure. The two equations yielded the same surface area values.

6148. Semenchenko, V. K. **Molecular theory of surface phenomena in solutions. II. Adsorption in multicomponent systems.** *Kolloid. Zhur.* 11, 109-15 (1949).—*C.A.* 43, 6884*e*.
General equations were derived.

6149. Tanaka, Tomoyasu. **Statistical theory of adsorption.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. 14, 1-17 (1949).—*C.A.* 46, 8455*h*.
The method of characteristic-value problems, such as the 2-dimensional ferromagnetic lattice, was applied to the adsorption of gas on a doughnut-shaped surface. Adsorption isotherms for low- and high-pressure regions were derived, but these 2 limiting curves did not coincide at the intermediate region.

6150. Zhukhovitskiĭ, A. A. and Rubinshtein, R. N. **Theory of multimolecular adsorption.** *Doklady Akad. Nauk S.S.S.R.* 65, 41-4 (1949).—*C.A.* 45, 6452*g*.
The theory was developed for a smooth homogeneous adsorbent with the inclusion of interaction between mols. for the case of a mixt. of substances. The partition functions of the mol. in a liquid cell and in a cell corresponding to the adsorbed phase were assumed identical and independent of the coverage. The B. E. T. equation might have been taken as zero approximation. The latter gave reasonably acceptable values of the

sp surface area at high c, but rendered incorrect isotherms at low and medium c. As an example, at $c = 2$, $p = 0.62$, $x = 1.13$, whereas by B.E.T., $x = 2.03$; at $c = 1.2$, $p = 0.9$, $x = 1.8$, whereas B.E.T. gave $x = 12$.

6151. ZHUKHOVITSKIĬ, A. A. AND RUBINSHTEIN, R. N. **Determination of the surface area of adsorbents.** *Doklady Akad. Nauk S.S.S.R.* 66, 73-5 (1949).—*C.A.* 43, 6036*c*.

If the heat of adsorption was much greater than the heat of condensation, there was a range where the adsorption a was equal to the no. of mols. in a monolayer. At the pres. p_m, the equation could be written $a/a_m = 1 - (1/\Gamma_1 p) + (\Gamma_2 p)$, with the 3 consts. a_m, Γ_1, and Γ_2. A more complete equation was $v = 1 - (1/\eta) + \alpha\eta + B\,[(-1/\eta^2) + \alpha\,^2\eta^2]$; the parameter α characterized the tendency to form a 2nd layer while the 1st layer was not yet completed. The parameter B characterized the interaction between absorbed mols. For practical detn. of a_m, the exptl. adsorption isotherm, in logarithmic coordinates, traced on transparent paper, was made to coincide with one of the family of the theoretical curves $v(\eta)$. The adsorption of H_2O vapor on CuO, $a_m = 18$ mg/g; for N_2 on a promoted Fe catalyst, the value of a_m was almost identical with the B. E. T. value.

6152. DAVIS, LANNES E. AND RIBLE, JOHN M. **Monolayers containing multivalent ions.** *J. Colloid Sci.* 5, 81-3 (1950).—*C.A.* 44, 6242*d*.

Guggenheim's statistical theory of mixed liquids was applied to 2-dimensional systems to develop analogous equations.

6153. DRENAN, JAMES W. AND HILL, TERRELL L. **The two-component van der Waals fluid.** *J. Phys. & Colloid Chem.* 54, 1132-48 (1950).—*C.A.* 45, 1830*h*.

The partition function was derived for a 2-component fluid, each component of which satisfied the statistical model leading to van der Waals' equation of state. The equation of state for the system in 3 dimensions, crit. consts. of the system and the vapor pressures of components were derived from this. Because of deficiencies in the van der Waals concept the model failed when the mol. vols. of the 2 components were very dissimilar.

6154. DUBININ, M. M. AND ZAVERINA, E. D. **Sorption and structure of active carbon. IX. Adsorption of gases by active charcoals.** *Zhur. Fiz. Khim.* 24, 1262-72 (1950).—*C.A.* 45, 5484*h*.

The equations: $a = (W_0/v) \exp\left[-BT^2(\log p/p_s)^2/\beta^2\right]$ (1) and $W = W_0 \exp(-k\epsilon^2/\beta^2)$ (2) were derived from Polanyi's theory and verified for a series of vapors adsorbed on charcoals of the 1st structural type (i.e., with relatively shallow micropores). The symbols meant: W and W_0 = adsorption space and its limiting value (cc./g); β = a scale factor (= 1 for the standard substance, benzene); B = a const. detd. by the pore-size distribution; a = the amt. absorbed (millimol./g); p/p_s = the equil. relative pres.; ϵ (cal/M) = adsorption potential; v = mol. vol. of the liquefied vapor. Adsorption of ethylene, for which $b = v_c/3 = 4.33$, was detd. at 20°C, between 1 and 400 mm on 12 charcoals of 3 origins, activated to various extents in CO_2. Benzene adsorption was also measd. at 20°C on the same samples. The agreement with the theory was good but only semiquant.

6155. EVERETT, DOUGLAS H. **Thermodynamics of adsorption. I. General considerations.** *Trans. Faraday Soc.* 46, 453-9 (1950).—*C.A.* 44, 9768*b*.

Measurement of isotherms at one temp. could never distinguish conclusively between the various possible models. Four heats of adsorption were defined from thermodynamics that were equally fundamental. That which involved principally a consideration of the decrease of potential energy of mols. on adsorption was a more useful quantity to study both experimentally and theoretically than that the interpretation of which involved, in addn., a consideration of spreading pressures.

6156. EVERETT, DOUGLAS H. **Thermodynamics of adsorption. II. Thermodynamics of monolayers on solids.** *Trans. Faraday Soc.* 46, 942-57 (1950).—*C.A.* 45, 4521*f*.

For adsorption, two possible reference systems were the ideal localized monolayer and the ideal nonlocalized monolayer. The former was more appropriate for systems at low temps., and especially where the adsorbent may be expected to possess definite active sites; whereas the latter model should be applicable to systems at high temps., especially where the surface forces were expected to exhibit no strongly localized max.

6157. EVERETT, DOUGLAS H. **Thermodynamics of adsorption. III. Analysis and discussion of experimental data.** *Trans. Faraday Soc.* 46, 957-69 (1950).—*C.A.* 45, 4521*h*.

Thermodynamics of adsorbed monolayers may be discussed very satisfactorily by employing the Langmuir adsorption model as the ideal reference system. Nonideal behavior arises from deviations of both the heat and entropy of adsorption from the ideal values. A linear relation exists between the nonideal entropy and the heat of heat adsorption which for adsorption on charcoal at 0°C is identical with that between heats and entropies of condensation of vapors to pure liquids, or into soln.

6158. FERGUSSON, R. R. AND BARRER, R. M. **Derivation and development of Hüttig's multilayer sorption isotherm.** *Trans. Faraday Soc.* 46, 400-7 (1950).—*C.A.* 44, 9768*g*.

A statistical derivation was given of a generalized sorption isotherm based on evapn.-condensation properties of a sorbed mol. Characteristic isotherm equations were obtained analogous to the various modifications of the B. E. T. isotherm. Isotherms of types I, III, and to some extent V, were obtained, but not types II and IV. A major objection to this and the B. E. T. treatment of multilayer sorption was the lack of interaction laterally with mols. in adjacent columns, although interaction with mols. in the same column was permitted.

6159. Groot, S. R. de; Hooyman, G. J., and Seldam, C. A. ten. **The Bose-Einstein condensation.** *Proc. Roy. Soc.* (London) **A203**, 266-86 (1950).—*C.A.* **45**, 4506*e*.

A variety of potential fields in which the particles of the gas move were investigated, and the no. of dimensions was not restricted to 3. A well-defined transition point appeared only for a very large (theoretically infinite) no. of particles.

6160. Halsey, G. D. Jr. **The role of heterogeneity in adsorption and catalysis.** *Discussions Faraday Soc.* **1950**, No. 8, 54-6.—*C.A.* **45**, 9986*a*.

Deviations from the Langmuir equation were explained in terms of the nonuniformity of the adsorbing surface. For phys. adsorption near the satn. pressure, interaction was important in detg. the isotherm. Refined treatment of a uniform surface did not lead to the B. E. T. equation, but led to the conclusion that heterogeneity and interaction operated simultaneously. The satisfactory B. E. T. surface-area detn. using N_2 was discussed. Because a group of sites which were overwhelmingly important catalytically may not contribute appreciably to adsorption, little direct information could be gained about catalysis from adsorption studies.

6161. Higuchi, Izumi. **Capillary condensation theory and the B. E. T. theory for multimolecular sorption.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, **71**, 142-5 (1950); Chem. Researches (Japan) **9**, 85-131 (English summary, 132) (1951).—*C.A.* **45**, 4100*f*, 7406*e*.

The exptl. results on the freezing of nitrobenzene sorbed on silica gel were assembled and crit. discussions were made on the capillary condensation theory and on the B. E. T. theory. The former was found to succeed in obtaining full understanding of the phenomena, whereas the latter failed even in qual. explanation. The shape of isotherms above the relative vapor pressures P/P_0 (P = vapor pressure of capillary-condensed liquid, P_0 = ordinary vapor pressure) of 0.3 ~ 0.4 depended upon the pore-size distribution of the sorbent, regardless of adopting any theory for the formation of unimol. layer.

6162. Hill, Terrell L. **Statistical mechanics of adsorption. IX. Adsorption thermodynamics and solution thermodynamics.** *J. Chem. Phys.* **18**, 246-56 (1950).—*C.A.* **44**, 9209*g*.

It was shown that the usual soln. thermodynamics could be recast into an equiv. but alternative form that was more natural and useful in adsorption work. Relations between the two systems of thermodynamics were pointed out. The extension to the case of sorption from a mixt. of gases was included.

6163. Hill, Terrell L. **Statistical mechanics of adsorption. X. Thermodynamics of adsorption on an elastic adsorbent.** *J. Chem. Phys.* **18**, 791-6 (1950).—*C.A.* **44**, 10441*d*.

Thermodynamic equations were derived which should be useful in the analysis of exptl. data and theoretical models referring to the adsorption of a one-component gas on an elastic adsorbent. This problem was closely related to the thermodynamics of adsorption of solute from a liquid soln. onto an elastic adsorbent immersed in the soln. (e.g., a myosin thread).

6164. Hill, Terrell L. **Hüttig multilayer adsorption isotherm.** *J. Am. Chem. Soc.* 72, 5347-8 (1950).—*C.A.* **46**, 4880*d*.

The Hüttig modification of the B. E. T. equation is criticized on the following points: (1) violation of the principle of microscopic reversibility, (2) incorrect equil. condition in the Fergusson and Barrer statistical derivation of this theory. The elimination of these 2 difficulties leads uniquely to the B. E. T. equation.

6165. Hüttig, G. F. and Theimer, O. **Theory of adsorption. I. A proposal for a compromise between the adsorption isotherms of Brunauer, Emmett, and Teller, and that of Hüttig.** *Kolloid-Z.* **119**, 69-73 (1950).—*C.A.* **45**, 4994*e*.

Reference was made to the modified and expanded form of Langmuir's adsorption isotherm (Hüttig equation). A compromise equation was proposed that took into account both this Hüttig-isotherm and the B. E. T. equation. The proposed equation fitted the exptl. data better than either one of the 2 other isotherm equations.

6166. Hüttig, G. F.; Schreiner, H., and Klein, R. **Theory of adsorption. II. The phenomena of the real adsorption.** *Kolloid-Z.* **119**, 157-60 (1950).—*C.A.* **45**, 4994*f*.

Factors were enumerated that influence considerably the amts. of gas adsorbed and the shape of the isotherms: (1) presence of foreign gases at the adsorbing surfaces, depending on the previous treatment of the adsorbent, (2) changes of the adsorbing surfaces due to the adsorption and subsequent desorption of a gas, (3) changes of the affinity between adsorbent and adsorbate as a function of time, and (4) effect, on the shape of the adsorption isotherm, of the quantity of gas that was admitted as the first portion to the outgassed adsorbent.

6167. Joly, M. **General theory of the structure, transformations, and mechanical properties of monolayers.** *J. Colloid Sci.* 5, 49-70 (1950).—*C.A.* 44, 6232*b*.

Mols. in a monolayer were assumed to exist only in a finite no. of energy states corresponding to a discrete series of mol. areas, which are the areas at the points of transformation. The transformations of the different orders correspond to the discontinuous change from one mol. form to another, the order depending on the miscibility or nonmiscibility of the successive mol. forms.

6168. Miyake, Akira. **Elasticity of keratin.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. **30**, 63-76 (1950).—*C.A.* **46**, 4889*a*.

The mol. structure of the keratin mol. was assumed to be perfect α-type (bent form) with no load. Part of the α-type configuration then changed gradually to β-type (stretched form) configuration by elongation, becoming perfectly β-type with 30% elongation. The effect of water absorption, which occurred on the back-bone of the chain and affected H bonds, was taken into consideration by use of the B. E. T. theory of multilayer adsorption.

6169. Ono, Syû. **Application of Ursell and Mayer's treatment for imperfect gases to adsorption.** *J. Chem. Phys.* **18**, 397 (1950).—*C.A.* **44**, 6228*b*.

A general development of the Gibbs phase integral was presented for a system consisting of adsorbate mols. and an adsorbent. From the results the adsorption isotherm could, in principle, be calcd.

6170. Ono, Syû. **Statistical mechanics of adsorption.** *Mem. Faculty Eng. Kyushu Univ.* **12**, 9-19 (1950).—*C.A.* **44**, 8733*a*.

Adsorption of gaseous mols. on a solid surface was considered using the statistical theory of multimol. adsorption with suitable terms included for horizontal interaction between mols.

6171. Ono, Syû. **Statistical thermodynamics of multimolecular adsorption. I.** *J. Phys. Soc. Japan* 5, 232-7 (1950).—*C.A.* 45, 924*h*.

The statistical method was applied to the adsorption of gases on a solid wall. It was concluded that the adsorption was effectively unimol. except in the immediate vicinity of the condensing point. Comparison with exptl. results showed considerable discrepancy between theory and expt., especially in the high-pressure region. The discrepancy may be due to neglect of the interactions between the mols. in the 2nd layer and wall.

6172. Ono, Syû. **Statistical mechanics of adsorption. I. II. III.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. **19**, 1-8; No. **21**, 46-58 (1949); No. **23**, 10-17 (1950).—*C.A.* **46**, 10775*g*.

The statistical-mech. theory of multicomponent systems was applied to the adsorption of gases on solid surfaces. Formulations and discussions were given of the mol. distribution function in terms of cluster integrals.

6173. Ôsawa, Fumio and Satô, Hisanao. **A theory of adsorption of polar and asymmetrical molecules.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. **22**, 14-25 (1950).—*C.A.* **47**, 1457*i*.

In the case of adsorption of polar or asym. mols. on a solid, the B. E. T. type-II isotherm was obtained. The adsorbed mols. were apt to lie flat on the surface. There were 2 alternatives of the possibility that the phase transition in the adsorbed film occurred; one corresponded to the condensation of 2-dimensional gas and the other was of new type which was due to the interaction between adsorbed mols. whose orientation was fixed to some extent on the surface.

6174. Peek, H. Milton and Hill, Terrell L. **Lattice theories of the liquid state.** *J. Chem. Phys.* **18**, 1252-5 (1950).—*C.A.* **45**, 2736*a*.

The Lennard-Jones and Devonshire theory of the liquid state was modified by introduction of the quasichem. method to allow for both holes in the liquid and an expandable lattice. The essential step was to minimize the free energy with respect to a lattice-expansion parameter. On the whole, crit. consts. obtained in this way were in appreciably better agreement with expt. than those of the L.-J. and D theory. However, the equil. no. of holes turns out to be much too small.

6175. Taylor, Hugh S. **Physical adsorption in heterogeneous systems.** *J. chim. phys.* 47, 74-81 (1950).—*C.A.* 44, 6699*g*.

The concept of surface heterogeneity permitted the Freundlich equation to be derived from the Langmuir equation by assuming a distribution function for the active centers suggested by Zel'dovich. Conversely, Sips was able to deduce the distribution curve for the active centers from adsorption isotherms. Finally, Halsey's arguments were summarized to show that through coöperative adsorption 2nd and higher layers of physically adsorbed gas may be formed on an adsorbent at relative pressures given approx. by the equation $P/P_0 = e^{-\Delta E/RT}$, where ΔE was the difference between the heat of adsorption of the gas in a higher layer and the heat of liquefaction.

6176. Theimer, O. **Thermodynamic derivation and interpretation of Hüttig's adsorption isotherm in terms of a model.** *Monatsh.* **81**, 1120-8 (1950).—*C.A.* 46, 2871*e*.

Hüttig's adsorption isotherm, corresponded to a monolayer adsorption with group formation. It was shown mathematically that this adsorption isotherm corresponded to the equation of state for the adsorbed phase, $\Pi\Omega = (1 - \alpha)\, RT\ \{1 + [\beta(1 - \alpha)/2\Omega] + [\beta^2(1 - \alpha)^2/3\Omega^2] + \ldots\}$, with $(1 - \alpha) = 1 - Kp + K^2p^2 - \ldots$, where Ω was the partial molar surface, Π was the 2-dimensional pressure, p was the pressure of the gas, α was the fraction of mols. that occurred in groups, and β was approx. 4 times the surface occupied by a mole of densely packed, 2-dimensional arrangement of mols. of the adsorbed substance.

6177. Tompkins, F. C. **Physical adsorption on nonuniform surfaces.** *Trans. Faraday Soc.* **46**, 569-80 (1950).—*C.A.* 45, 18*c*.

The non-uniformity of an adsorbent surface affected the isotherm obtained in phys. adsorption, both for localized and nonlocalized monolayers. Subject to the approxn. that the internal partition function of the adsorbed mol. was independent of the adsorption potential at each site, it was shown that the log pressure vs. log amt. adsorbed was a linear plot, whether the adsorbed film was regarded as a polyphase or nonophase system.

6178. Troesch, A. **Kinetic equations for adsorption and desorption.** *J. chim. phys.* 47, 145-7 (1950).—*C.A.* 44, 8194*c*.

The adsorption of CH_4 on a Ni-Al-Mn-kieselghur catalyst obeyed a simple Langmuir rate equation in which desorption was neglected and the rate of adsorption was proportional to the fraction of the surface not covered by adsorbate. The rate of adsorption of H_2 did not follow such an equation but indicated that the surface was heterogeneous. Desorption of CH_4 from the Ni surface at 170°C and a const. pressure of 10^{-4} mm could not be measured because the evolved gas was all H_2. The rate of

H_2 desorption did not follow the simple Langmuir equation and again indicated surface heterogeneity.

6179. Wentorf, R. H., Jr.; Buehler, R. J.; Hirschfelder, J. O., and Curtiss, C. F. **Lennard-Jones and Devonshire equation of state of compressed gases and liquids.** *J. Chem. Phys.* 18, 1484-1500 (1950).—*C.A.* 45, 3272*g*.

The reduced equation of state for compressed gases and liquids A, N_2, and H_2 was computed according to the theory of Lennard-Jones and Devonshire for many temps. and ds. The corrections due to gas imperfection of internal energy, sp heat, and entropy as well as the compressibility factor (pv/RT) were expressed in terms of reduced variables. The calcns. were made by punched-card methods. The theory of Lennard-Jones and Devonshire was unsatisfactory at ds. near crit. point and lower but improved at higher ds., becoming better for normal liquids.

6180. Aigrain, Pierre; Dugas, Claude, and Germain, Jean. **Adsorption on semiconductors.** *Compt. rend.* 232, 1100-1 (1951).—*C.A.* 45, 6454*a*.

The adsorption of gases on certain semiconductors could be explained on the basis of purely electrostatic phenomena. Such adsorption was due to an ionic bond between the gas impurities in the semiconductor. Values of heats agreed within reasonable limits with exptl. data.

6181. Aston, J. G. and Mastrangelo, S. V. R. **Anomalous first layer of adsorbed helium and a modified Brunauer-Emmett-Teller theory.** *J. Chem. Phys.* 19, 1067-8 (1951).—*C.A.* 46, 2871*i*.

The 1st completed B. E. T. "monolayer" had an anomalous d.; it was composed of more than 1 layer, with thermal properties and d. of packing in layers analogous to those of the bulk solid in equil. with liquid He at the temp. of the isotherm detns. The solid layers melted when the pressure required to solidify them was larger than the effective "system pressure" (analogous to the pressure inside a small drop). There should be transitions analogous to melting on going from 2 to 4°K., at const. coverage, when the 3rd (uppermost), 2nd, and 1st (innermost) layers were melting. When the outer layer was completely liquid and the layer below started to liquefy, the completely liquid layer became the 2nd B. E. T. layer.

6182. Balázs, N. L. **The statistical theory of adsorption.** *Physica* 17, 865-75 (1951) (in English).—*C.A.* 46, 2871*g*.

By using a statistical treatment, not only were the consts. appearing in the kinetic arguments defined, but a description of the totality of the equil. properties was immediately obtained. The method was applied to unilayers that were either mobile or immobile, and to various multilayer models. The isotherms of Langmuir, of Cassie, and of B. E. T. were derived.

6183. Band, William. **Mobile multilayer adsorption of a Bose-Einstein gas: helium.** *J. Chem. Phys.* 19, 435-8 (1951).—*C.A.* 45, 9321*f*.

If the energy of adsorption was assumed to decrease with thickness according to a simple power law, the theory gave an isotherm in good agreement with observations on He adsorption at temps. above the λ-temp. of liquid He, for all gas pressures higher than 10% satn. With mixts. of He^3 and He^4 isotopes the theory predicted appreciable adsorption of He only in the first or localized monolayer; all mobile monolayers should be practically pure He^4 at all gas pressures.

6184. Barrer, R. M. **Hüttig's multilayer isotherm.** *J. Chem. Soc.* 1951, 1874-6.—*C.A.* 45, 9992*a*.

The Hüttig isotherm was thermodynamically consistent with a succession of layers in a potential field, vertical interactions between sorbate mols. in successive layers being omitted with lateral interactions allowed. The Hüttig isotherm was thus complementary to the B. E. T. isotherm where vertical interactions were introduced and lateral interactions were omitted.

6185. Barrer, R. M. and Robins, A. B. **Multilayer sorption in terms of an equation of state.** *Trans. Faraday Soc.* 47, 773-87 (1951).—*C.A.* 46, 317*h*.

Multilayer formation occurred below the crit. temp., and a boundary between a densely populated film and a dil. region may move slowly outward as p/p_0 increased. On plane surfaces allowing unrestricted sorption, N_2 gave Langmuir-like isotherms above its crit. temp. and type-II isotherms near its b.p. Water, on the other hand, in unrestricted sorption may give isotherms of types I, II, and III. Type-III isotherms arose when the van der Waals potential $2a/b$ was considerably larger than the energy of interaction $-E_1$ between monolayer mols. and the sorbent. In the spaces between parallel plates or in cylindrical capillaries open at both ends, N_2 gave type-IV isotherms and H_2O gave isotherms of type IV and V according to the relative values of $2a/b$ and $-E_1$.

6186. Benson, G. C. and Shuttleworth, R. **The surface energy of small nuclei.** *J. Chem. Phys.* 19, 130-1 (1951).—*C.A.* 45, 3677*c*.

The surface energy of a 3-dimensional crystal depended on 3 terms proportional, one each, to the area, edge length, and no. of corners. Various energy and distance relations were calcd. for an aggregate of 13 mols. arranged in cubic close-packed, hexagonal close-packed, and pentagonal forms. Even for clusters of only 13 mols. the surface energy was less than 15% below that for a plane surface.

6187. Bering, B. P. and Serpinskiĭ, V. V. **Theory of unimolecular adsorption on homogeneous surfaces.** *Doklady Akad. Nauk S.S.S.R.* 79, 273-6 (1951).—*C.A.* 46, 19*a*.

The general form of the equations for the two-dimensional pres. π as a function of the no. Γ of mols. adsorbed per unit surface area, and of the coverage θ, was known for a localized layer and for a nonlocalized layer, resp. Assuming the interaction function to be of the form $f(r)=2\mu_e{}^2/r^4$ (where r = distance between mols. in the layer, μ_e = effective dipole moment), the adsorption isotherms were found with the aid of Gibbs adsorption equation. The effective μ_e was considered temp. independent, as in fields of the order of 10^8 v./cm the Langevin function varied by no more than 2% between 200 and 300°K. With the aid of the Clausius-Clapeyron equation, the differential heat of adsorption was: $q = q_o - D\sigma^{3/2} = q_o - 6.66 \times 10^{-24}\ \mu e^2 \alpha^{3/2}/S^{3/2}$, where q_o = heat of adsorption at $\theta = 1$. Exptl. verification was found in the data on adsorption of MeOH on Hg at 25° and 50°C.

6188. CORRIN, M. L. **A comparison of the specific surface areas of solids as calculated by the Brunauer-Emmett-Teller and the Hüttig equations.** *J. Phys. & Colloid Chem.* 55, 612-13 (1951).—*C.A.* 45, 6003*g*.

From the adsorption isotherms of 4 adsorbates on 10 adsorbents the surface area was calcd. by means of the B. E. T. and Hüttig methods. The 40 isotherms yielded 39 B. E. T., and 26 Hüttig, straight-line plots. The B. E. T. results were more self-consistent for different gases on the same solid. As the sp surface area of the solid increased, the no. of isotherms yielding a Hüttig straight line increased, the Hüttig results became more self-consistent, and the agreement between B. E. T. and Hüttig areas improved.

6189. FERIDUN, H. **van der Waals absorption.** *Rev. faculté sci. univ. Istanbul* **16A**, 174-99 (1951) (in English).—*C.A.* 46, 4316*d*.

Several equations of state (van der Waals, Berthelot, Wohl, and Dieterici) were reduced to two dimensions and combined with the Gibbs equation to give adsorption equations applying to mobile gaseous or liquid adsorbed films. The equation derived from van der Waals adequately represented the adsorption of CO on charcoal and of A on charcoal. The derived equation correctly described the adsorption isotherms of Cl_2, Br_2, and I_2 on silica gel even though the 3 forms of isotherms were different.

6190. GUGGENHEIM, E. A. AND MCGLASHAN, M. L. **Interaction between next-nearest neighbors in regular mixtures.** *Trans. Faraday Soc.* 47, 929-37 (1951).—*C.A.* 46, 2869*i*.

The quasichem. treatment of regular mixts. was extended for simple cubic and body-centered cubic lattices so as to include the interaction between next-nearest neighbors in a manner analogous to that used by Hill for monolayers on a simple square lattice. The effect between next-nearest neighbors was much less important than the correction for nonrandom mixing which was itself very small, and, therefore, the effect was entirely negligible.

6191. HALSEY, G. D. JR. **A new multilayer isotherm equation with reference to surface area.** *J. Am. Chem. Soc.* 73, 2693-6 (1951).—*C.A.* 45, 8320*d*.

An isotherm equation for coöperative multilayer adsorption for gases near their b.ps. was derived from the London law for the dispersion force and assuming an exponential distribution of adsorbing centers. When conditions were such that satn. of the 1st layer was complete at a low value of the relative pressure, p/p_0, the equation yielded data that formed a good B. E. T. plot giving a satisfactory value for V_m, the vol. of gas required to form a monolayer. Under certain conditions, isotherms calcd. from the above equation gave only a pseudo-agreement with B. E. T. treatment.

6192. HILL, TERRELL L. **Liquid-vapor transition region and physical adsorption according to van der Waals' equation.** *J. Chem. Phys.* 19, 261-2 (1951).—*C.A.* 45, 3681*a*.

The statistical-mol. foundation of van der Waals' equation was applied to the liquid-vapor transition region and to phys. adsorption. Discontinuities in d. were avoided in the transition regions in both problems. The adsorption isotherm reduced to an equation found previously as a limiting approximation.

6193. HILL, TERRELL L. **Thermodynamics of adsorption.** *Trans. Faraday Soc.* 47, 376-80 (1951).—*C.A.* 45, 8846*a*.

The discussion concerned utility and completeness rather than correctness of different thermodynamic points of view in adsorption work. The B. E. T. theory was used as an illustration. For a one-component system, for purposes of interpretation, the molar integral was of more interest than the differential energy and entropy of adsorbed mols.

6194. HILL, TERRELL L.; EMMETT, P. H., AND JOYNER, L. G. **Calculation of thermodynamic functions of adsorbed molecules from adsorption-isotherm measurements: nitrogen on Graphon.** *J. Am. Chem. Soc.* 73, 5102-7 (1951).—*C.A.* 46, 1839*c*.

The distinction between differential and integral entropies was illustrated by use of the B. E. T. theory. From isotherm measurements for the system N_2 on Graphon the complete set of thermodynamic functions was calcd. The extreme sensitivity of the calcns. to inaccuracies of low-pressure measurements indicated the need for further refinements in exptl. techniques.

6195. JONES, D. C. **The B. E. T. adsorption equation.** *J. Chem. Soc.* **1951**, 126-30.—*C.A.* 45, 4994*c*.

The resemblance between Langmuir's Case VI and the B. E. T. equation for adsorption on a free surface was shown by a series of adsorption equations. The same basic equations held for Langmuir's Case IV. The B. E. T. equations represented an extension of Langmuir's theory to cover the case where adsorption might be limited by the width of the capillary spaces in the adsorbents.

6196. JONES, D. C. AND BIRKS, E. W. **The adsorption isotherm of Langmuir and of Brunauer, Emmett, and Teller for multilayers where *n* is 2.** *J. Chem. Soc.* **1951**, 1127-30.—*C.A.* 45, 7844*g*.

Realizable isotherms changed as a function of the ratio of the relative lives of adsorbed mols. in the 1st and 2d layers.

6197. JONES, D. C. **The adsorption isotherms of Langmuir and of Brunauer, Emmett, and Teller for multilayers where $n = 3$.** *J. Chem. Soc.* **1951**, 1464-7.—*C.A.* 45, 8846*b*.

Equations were derived and graphs discussed in the analysis in which the no. of multilayers was limited to 3. The isotherms changed from type I through IV and V and then to VA as the values of c changed from just greater than 2.16 to about 0.25. Three was the smallest value of n where all the known isotherm types for a limited no. of multilayers could be encountered as c varied. At values of c greater than 1000, the change of adsorption type from I to IV again occurred.

6198. KINGTON, G. L. AND ASTON, J. G. **A correlation of the thermodynamic properties of nitrogen adsorbed on titanium dioxide.** *J. Am. Chem. Soc.* 73, 1934-6 (1951).—*C.A.* 45, 7424*b*.
A comparison of published exptl. thermodynamic properties of N_2 adsorbed on TiO_2 with those calcd. from the B. E. T. theory indicated that the simplified assumptions of the theory were inadequate to predict a set of thermodynamic properties that were even qualitatively consistent.

6199. KRISHNAMURTI, K. **A new adsorption isotherm.** *Proc. Indian Acad. Sci.* 33A, 92-6 (1951).—*C.A.* 45, 7844*f*.
The equation, $n = A/(1 + ae^{-kc})$, where n was the no. of mols. adsorbed, A was the total no. of mols. originally present in the gas space or soln., c was the concn. of the unadsorbed mols., and a and k were consts., was derived for those cases of adsorption where previously adsorbed mols. facilitate the adsorption of more mols. striking the surface of the adsorbent. This equation fits adsorption data yielding S-shaped curves.

6200. LEVIN, V. I. **Multilayer adsorption on heterogeneous surfaces.** *Zhur. Fiz. Khim.* 25, 453-8 (1951).—*C.A.* 46, 2372*b*.
From the B. E. T. equation and with the formalism of adsorption theories characterizing a heterogeneous surface by means of a continuous broad distribution of adsorption heats, a generalized B. E. T. equation was derived. There were 2 limiting cases: (1) For very small relative pressures, the equation gave the known adsorption isotherms on heterogeneous surfaces; (2) for relative pressures corresponding to at least one complete layer, the equation reduced itself to the B. E. T. expression.

6201. LIANG, S. CHU. **The calculation of surface area.** *J. Phys. & Colloid Chem.* 55, 1410-12 (1951).—*C.A.* 46, 7398*f*.
Substituting the V_m from the B. E. T. equation into the Harkins and Jura equations gave log $P/P_o = B - (K/V_m)^2/\theta^2$, where $\theta = V/V_m$ and $K = V_m$. Thus, the Harkins and Jura equation reduced to a form involving the same constant for the surface-area V_m: log $p = X - V_m^2/V^2$, where X was a const. Comparison of surface areas obtained from the B. E. T. equation with those obtained from the above gave good agreement.

6202. MCMILLAN, W. G. AND TELLER, E. **The assumption of the Brunauer, Emmett, and Teller theory.** *J. Phys. & Colloid Chem.* 55, 17-21 (1951).—*C.A.* 45, 3220*f*.
An adsorption-isotherm equation valid in the region of multilayer adsorption was obtained. The effect of surface tension of the adsorbate and the effect of the extension of the adsorbent attractive forces beyond the first adsorbed layer were considered.

6203. MCMILLAN, W. G. AND TELLER, E. **The role of surface tension in multilayer gas adsorption.** *J. Chem. Phys.* 19, 25-32 (1951).—*C.A.* 45, 6454*b*.
The assumptions of the B. E. T. theory were examd. with regard to the possibility of taking account of the effect of surface tension. The surface energy of the adsorbed phase was calcd. by the use of a Fourier analysis of the surface configuration. This energy was then used in the calcn. of the corresponding factor in the partition function, leading ultimately to an isotherm equation that included the surface-tension effect. This isotherm was compared with expt. with the result that the surface-tension effect alone overcorrected the B. E. T. theory. When compared with the result of recent theoretical treatments of the extension of the attractive forces into the adsorbed phase, the authors' expression was shown to have the same dependence on layer thickness, but to be a relatively unimportant correction under usual conditions.

6204. MIYAHARA, KÔSHIRÔ AND TAKAISHI, TETSUO. **Mixed adsorption. I. The critical adsorption of a binary mixture of gases.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. 40, 70-89 (1951).—*C.A.* 46, 4881*h*.
Statistical mech. theory was developed of the mixed adsorption on a given no. of sites. The crit. adsorption which resulted in phase sepn. in the adsorbed phase, could take place even if the interaction between adsorbed mols. was repulsive. The conditions for the existence of phase sepn. were discussed in detail.

6205. ONO, SYÛ. **Statistical mechanics of adsorption from multicomponent systems.** *J. Phys. Soc. Japan* 6, 10-15 (1951)(in English).—*C.A.* 45, 5483*g*.
Math. equations were developed starting from the general development of the Gibbs phase integral.

6206. THEIMER, O. **The theory of adsorption. IV. Critical discussion of more recent adsorption theories.** *Kolloid-Z.* 121, 55-7 (1951).—*C.A.* 45, 8320*a*.
The comparative merits of the newer theories dealing with phys. adsorption of gases and vapors on solids were discussed. The isotherms were compared with exptl. isotherms measured for the adsorption of water vapor on $BaSO_4$. For this case the formulas of Halsey and Theimer yielded isotherms in close agreement with expt., whereas those of B. E. T., and Harkins-Jura deviated appreciably. The phys. meaning of the various equations was discussed.

6207. THEIMER, O. **The "maximum surface concentration x" of adsorbed molecules.** *Z. Elektrochem.* 55, 709-15 (1951).—*C.A.* 46, 4880*f*.
The Langmuir function x(= no. of adsorption sites on the surface) is replaced by x^*, the function that, in the case of an adsorption isotherm that does not follow the Langmuir, Brunauer, of Hüttig formulas, will transform the isotherm automatically into one of these forms. The new function bears the same relation of x that the

"reduced vol." v^* (where v^* = ratio of v to vol. at the crit. point) does to the observed vol. v of a nonideal gas. This concept is extended to developed formulas incorporating "reduced temps." and "reduced 2-dimensional pressures" for nonideal adsorption isotherms.

6208. TOSHIMA, SÔICHIRÔ AND TANAKA, TOMOYASU. **Multimolecular adsorption.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. 40, 90-9 (1951); No. 41, 89-95 (1951).—*C.A.* 46, 8456*a*, 1838*g*.

Multimol. adsorption on a planar trignol lattice was detd. The dependence of the isotherm on the relative magnitudes of W and H was examd., where W and H were the potentials between an adsorbed mol. in the 1st layer and the solid surface and between adsorbed mols., resp. Comparisons of the result with the B. E. T. isotherm were made. A statistical-mech. derivation was developed for the adsorption of gases between parallel walls, by counting no. of configurations directly. The equation gave type-IV and -V isotherms when $W = 10H$ and $W = 4H$, resp., where W and H were attractive energies between a gas mol. and the wall, and between gas mols., resp.

6209. TROESCH, A. **A generalization of the multimolecular adsorption equations of Brunauer, Emmett, and Teller and of Hüttig.** *J. chim. phys.* 48, 454-64 (1951).—*C.A.* 46, 4316*f*.

A generalized equation of adsorption, valid up to satn. contained 4 parameters: V_m = vol. occupied by a unimol. layer of adsorbate; α = a const. characteristic of the no. of layers adsorbed at satn.; c = a const. The ratio c/p_o was characterized by the heat of adsorption of the first layer; β = a coeff. that defined the heat of interaction between adsorbed layers. The general equation was: $V = cV_m x[1 + x(1-b)]/(1-bx)[1 + (c-b)x]$ where $b = \alpha x\beta$ and $x = p/p_o$. The constants were detd. from exptl. data for the adsorption of H_2O on $BaSO_4$ at 0° and 20°C. From β the extent of interaction between adsorbed layers was $\beta = Ae^{Q/RT}$; $Q = 3500$ cal.

6210. BAND, WM. AND EMERY, EARLE B. **Approximate adsorption isotherms for a mixture of two isotopes.** *J. Phys. Chem.* 56, 384-8 (1952).—*C.A.* 46, 8456*c*.

The B. E. T. theory of multimol. adsorption was generalized to include the case of mixts. of 2 isotopes in which one of the 2 was present in only very small concns. Appropriate data for applying the theory to the adsorption of mixts. of He^3 in He^4 did not exist. Application to data for O_2-N_2 systems showed improved agreement as compared to the original B. E. T. equation.

6211. EVERETT, D. H. AND WHITTON, W. I. **General approach to hysteresis.** *Trans. Faraday Soc.* 48, 749-57 (1952).—*C.A.* 47, 2568*b*.

Hysteresis was attributed in general to the existence in a system of a very large no. of independent domains, at least some of which could exhibit metastability. The features of this model that led to hysteresis were analyzed in terms of potential energy surfaces, and it was pointed out that similar surfaces would be observed for mol. systems if the potential energy was replaced by the chem. potential of the system. The thermodynamic implications of this model were considered briefly.

6212. EVERETT, D. H. AND YOUNG, D. M. **Thermodynamics of adsorption. IV. Onset of multilayer formation.** *Trans. Faraday Soc.* 48, 1164-70 (1952).—*C.A.* 47, 6213*i*.

The estd. ideal differential configuration entropy of the surface phase showed an initial fall with coverage following closely the general form of an ideal localized monolayer. Divergence from this curve was observed in most cases at a value of θ between 0.5 and 0.8, when the configurational entropy became larger than that for a monolayer. It was suggested that new adsorption sites on top of the first layer were becoming available.

6213. HALL, W. KEITH. **Halsey's new multilayer adsorption equation.** *J. Am. Chem. Soc.* 74, 1081 (1952).—*C.A.* 47, 4163*h*.

Two of the assumptions made by Halsey in deriving a multilayer isotherm were incompatible.

6214. HALSEY, G. D., JR. **Multilayer adsorption.** *J. Am. Chem. Soc.* 74, 1082-3 (1952).—*C.A.* 47, 4163*h*.

A math. discussion of adsorption and a reply to the criticism offered by Hall.

6215. HERZFELD, KARL F. AND REED, SIDNEY G. JR. **The concept of free surface energy of very small particles.** *Z. Elektrochem.* 56, 308-10 (1952).—*C.A.* 46, 8465*c*.

The free surface energy (the work required for the reversible sepn. of a particle) could not be thermodynamically defined for very small particles (those contg. up to 2000 or 5000 mols.), not because the geometric definition of the surface was difficult, but because the free surface energy depended on the concn. of the particles. The total surface energy was a definite quantity. Another property, the "effective free surface energy," was defined, and applied to particles of solid N_2 contg. 2 to 8 mols.

6216. HILL, TERRELL L. **Statistical thermodynamics of the transition region between two phases. I. Thermodynamics and quasithermodynamics.** *J. Phys. Chem.* 56, 526-31 (1952).—*C.A.* 46, 7859*h*.

An alternative formulation of Gibbs' surface thermodynamics and an improvement on the Tolman quasithermodynamic theory was derived for plane and spherical surfaces.

6217. HILL, TERRELL L. **Statistical thermodynamics of the transition region between two phases. II. One-component system with a plane interface.** *J. Chem. Phys.* 20, 141-4 (1952).—*C.A.* 46, 6476*g*.

An approx. statistical theory was used to investigate the nature of the d.-transition curve in passing from a one-component liquid phase to the equil. vapor phase. This d. curve was related thermodynamically to the surface tension, the surface energy, the location of the surface of tension, and the dependence of surface tension on curvature.

6218. Hüttig, G. F. and Theimer, O. **Gas adsorption at high pressures.** *Monatsh.* 83, 650-63 (1952).—*C.A.* 46, 10772*a*.

At high pressures, lateral interactions predominated; these, however, also depended on the nature of the surface. Mobile adsorption in monolayers on a continuous homogeneous surface led to condensation of the 2-dimensional gas, and therefore to stepwise adsorption isotherms. The B.E.T. theory could therefore apply only to discontinuous surfaces. In this case, most of the usual objections to the theory vanished. The B.E.T. theory was modified by assuming that the chem. potential in layers above the 1st was less than that in the liquid, or that it depended on the pressure. The modified theory was applied to discontinuous homogeneous and inhomogeneous surfaces. It was concluded that, owing to lattice defects, most actual surfaces were discontinuously inhomogeneous.

6219. Innes, W. B. **The treatment of complex adsorbates as a single phase.** *J. Colloid Sci.* 7, 447-8 (1952).—*C.A.* 46, 10775*a*.

Hill's objections to the treatment of a multilayer adsorbate as a single phase could be avoided if the adsorbate was visualized as made of negligibly small phase units (i.e., mols.) all with the same phys. properties. A reply by T. L. Hill was included.

6220. Long, Earl and Meyer, Lothar. **Some experiments on flow in the unsaturated helium II film.** *Phys. Rev.* 85, 1030-5 (1952).—*C.A.* 46, 5918*g*.

The mass flow in adsorbed layers of He was measured. Superfluidity occurred at all temps. below the λ-temp. of the bulk liquid down to 1.5 statistical layers. The bearings of these results on the thermodynamics of transition He I-He II in adsorbed layers was discussed.

6221. Meyer, Lothar and Long, Earl. **Phase transitions in adsorbed films.** *Phys. Rev.* 85, 1035-7 (1952).—*C.A.* 46, 5918*h*.

A thermodynamic treatment of transitions for the case in which a condensed phase did not exist in bulk, but as adsorbed layers, was of interest. Exptl. data have recently become available for 2 examples of such systems: the transition He I-He II (λ-transition) and the m.p. of A. The effect of surface energies on the melting process (as an example of a 1st-order transition) and the λ-transition (as an example of a 2nd-order transition) were treated thermodynamically.

6222. Sakaki, Tomohiko. **Statistical-mechanical interpretations of Harkins-Jura's theory of adsorption.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 218 (1952).—*C.A.* 46, 10773*d*.

6223. Sakaki, Tomohiko. **Physical chemistry of adsorbed layers. I. Relation between isotherms and heat of adsorption. A new theory of adsorption including some important isotherms as its special cases.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, 73, 680-2 (1952); 73, 217 (1952).—*C.A.* 46, 10773*c*.

The theory was based on an improved model of multimol. adsorption. The inhomogeneity of the adsorbing surface and the mutual interaction of the mols. were taken into consideration. An adsorption isotherm was obtained that contained the B. E. T. equation, and the Langmuir isotherm as a special case. The formula led also to the other isotherms such as Harkins-Jura, deBoer-Zwikker, and Freundlich's.

6224. Shimokawa, Junichi. **Interface adsorption and condensation. I. Brunauer-Emmett-Teller theory of multilayer adsorption and phase transitions in monolayers.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. 57, 101-19 (1952).—*C.A.* 47, 1457*f*.

Lattice models were not adequate for the treatment of a system under inhomogeneous field of force such as an adsorbed phase. The theory of imperfect gases of Mayer was extended to the surface phase. The B. E. T. theory of adsorption was inconsistent with the former and gave rise to a phase transition at $\theta = ½$, where θ was the fraction of the surface covered by the adsorbed matter.

6225. Theimer, O. **Multilayer adsorption isotherms.** *Trans. Faraday Soc.* 48, 326-31 (1952).—*C.A.* 46, 9930*h*.

The distribution of adsorbing centers along the surface was restricted in the B. E. T. theory to arrangements excluding 2-dimensional condensation. Under this condition the most probable surface structure allowing for the B. E. T. mechanism was a loose arrangement of centers located practically outside the range of mutual attraction. The adsorbed mols. formed clusters around these centers. The chem. potential μ_h of the mols. adsorbed in higher layers was no longer considered equal to the chem. potential μ_L of mols. in the liquid adsorbate.

6226. Wylie, R. G. **The hysteresis of adsorption on solid surfaces.** *Australian J. Sci. Research.* A5, 288-302 (1952).—*C.A.* 46, 9930*g*.

The effect of surface discontinuities on 2-*dimensional phase transitions* was examd. theoretically. Hysteresis was related semiquantitatively to nucleation, profile, and interfacial free energy of the α-phase.

6227. Bering, B. P. and Serpinskiĭ, V. V. **Adsorption of mixtures of gases. III. Possibility of a statistical treatment of the adsorption of a mixture of gases.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1953, 37-47.—*C.A.* 47, 5757*e*.

If the adsorption functions $a_1^0 = f_1^0 (p_1, \theta)$ and $a_2^0 = f_2^0 (\theta, p_2)$ of the pure sep. components were known, soln. of the problem of finding the functions $a_1(p_1, p_2)$ and $a_2(p_1, p_2)$ of the mixt. was possible, in principle, in any scheme which introduced no new parameters for the mixt. other than those involved in the a^0. The problem was analyzed on the basis of the Langmuir scheme, which met this requirement, with extension to surface inhomogeneity. The analysis was applied to the data on $CO-C_2H_4$ and $C_2H_4-C_3H_6$. The observed growth of the slope of the a_{12} isosteres and the decrease of a_2 with increasing θ was taken to be due to increased importance of portions with greatest ϵ_1 (i.e., greatest b_1) at lower coverages.

6228. Champion, W. M. and Halsey, G. D., Jr. **Physical adsorption on uniform surfaces.** *J. Phys. Chem.* 57, 646-8 (1953).—*C.A.* 48, 21*a*.

Stepless isotherms were calcd. for a uniform surface by use of modifications of Hill's treatment of lateral interaction. In order to secure stepless isotherms several assumptions were necessary. These assumptions were so specific and unreal that the necessity of assuming surface heterogeneity for real isotherms was thereby demonstrated.

6229. Honig, J. M. **Analysis of multilayer gas adsorption isotherms using the concept of surface heterogeneity.** *J. Phys. Chem.* 57, 349-51 (1953).—*C.A.* 47, 6213*h*.

A simple extension of the theory was presented which permitted application of the heterogeneous surface model to multilayer adsorption systems. The adsorption of N_2 on rutile at 77°K. was discussed in terms of the theory.

6230. Maslan, F. D.; Altman, M., and Aberth, E. R. **Prediction of gas-adsorbent equilibria.** *J. Phys. Chem.* 57, 106-9 (1953).

A modified Polanyi-Dubinin theory could be used to correlate the adsorption of various gases on activated carbon, silica gel and activated alumina with good accuracy both above and below the critical point. The adsorbate was considered as a highly compressed gas, and its vol. and fugacity were calcd. at the adsorption temp. The method was tested on nine systems and good checks with exptl. results were obtained. Binary gas adsorption could be predicted from single gas adsorption data when $N_{12}V_{12} = N_1V_1 + N_2V_2$. This method has been tested on the system O_2-N_2-activated carbon with success.

6231. Shimokawa, Junichi. **Interface adsorption and condensation. II. The behavior of the adsorbed layer and derivation of the Brunauer-Emmett-Teller equation.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. 58, 8-16 (1953).—*C.A.* 47, 3079*a*.

The method of cluster integrals was used for deriving the B. E. T. equation by assuming the condensation of adsorbed mols. and by replacing the cluster integrals by the partition function of condensed mols. The sp vol. of the 1st-layer mols. was equal to that of the 2nd-layer mols. after the phase transition in the adsorbed layer had occurred. This fact had been a priori used in previous theories of adsorption. The method surpassed the treatment by the lattice model in that the former dealt with the adsorbed layer as a whole.

6232. Snelgrove, J. A. and McIntosh, R. **The orientation polarization of adsorbed polar molecules.** *Can. J. Chem.* 31, 84-90 (1953).—*C.A.* 47, 5746*i*.

The orientation polarization of a polar mol. adsorbed on a solid surface was deduced for two cases leading to zero temp. coeff. of the polarization arising from oscillating dipoles and to the normal temp. coeff. for freely rotating dipoles within some given angle of permitted rotation.

IV-3. Capillary Condensation of Gases and Other Empirical Theories

6233. Deryagin, B. V. **A theory of capillary condensation in the pores of sorbents, and of other capillary phenomena, taking into account the disjoining action of multimolecular liquid films. Repulsive forces between surfaces divided by liquid films.** *Acta Physicochim. U.R.S.S.* 12, 181-200, 314-16 (1940).—*C.A.* 34, 7697^3.

Capillarly condensation, capillary rise, and the pressure on the walls in flat and cylindrical capillaries were discussed. Exptl. data for dil. electrolytes were in agreement with the above theory, but higher concns. yielded large deviations, and some nonelectrolytes also showed the effect.

6234. Guggenheim, E. A. **Thermodynamics of interfaces in systems of several components.** *Trans. Faraday Soc.* 36, 397-412 (1940).—*C.A.* 34, 3965^2.

The thermodynamic properties of a plane interface having a finite thickness were derived. The treatment was correlated with that of Gibbs. The formulas derived for plane surfaces may be applied to curved interfaces, provided that the thickness of the inhomogeneous layer was negligibly small compared with its radius of curvature, a condition usually fulfilled in practice.

6235. Held, E. F. Maximilian van der. **Diffusion phenomena in connection with the drying of materials.** *Gesundh. Ing.* 64, 211-16 (1941).—*C.A.* 38, 1159^7.

A differential equation was derived for diffusion at const. and variable temps. in a gas, and applied for the case of evapn. from a surface. For diffusion in porous materials a modified diffusion factor was assumed, derived from that for the diffusion of two gases into one another.

6236. Sprengel, Ernst. **Possibility of application of capillary condensation in adsorption refrigeration apparatus.** *Wiss. Veröffent. Siemens-Werken* 20, 135-70 (1941).—*C.A.* 37, 2226^5.

Theoretical consideration was given to the derivation of an equation for pore sizes, dependence of the pore const. on temp. and pressure, effect of mol. diam., heat of sorption, etc. Exptl. results were reported for adsorption of pure CH_2Cl_2, and tech. NH_3, SO_2, and CF_2Cl_2 on silica gel and chabazite at 25-40°C and from 0.1 to 760 mm. Capillary condensation was not significant for NH_3 and another type of binding was present. Sorption on chabazite ceased before satn. pressure was reached.

6237. Velisek, Josef. **Physical reasons for the adhering of soluble materials to capillaries and to the surface of ceramic bodies.** *Stavivo* **22,** 1-3, 17-19, 29-31, (1941).—*C.A.* 37, 2899^5.
The infiltration of water into capillaries and ceramic bodies was governed by the laws of solubility, absorption, diffusion, and osmosis. Equations were used for the osmotic pressure of solutions, absorption of gases by liquids, diffusion in liquids, the heat relationship by changes of the surface of solutions, concentration of solutions in the surface film, vapor pressure in curved surfaces of solutions, salt hydrates in aqueous solutions, dissociation of hydrated salts, and hydrated salts exposed to the atm.

6238. Yu, Hun-Tsen. **Thermodynamics of interfaces in equilibrium.** *J. Chinese Chem. Soc.* **8,** 147-51 (1941).—*C.A.* 37, 6517^4.
By treating the equil. as an equil. between 3 phases in contact the conditions for thermodynamic equil. were obtained for curved surfaces and for 2 cases involving plane surfaces: (1) a nonvolatile liquid and an insol. gas, (2) a surface of n components at a given pressure and temp.

6239. Liempt, J. A. M. van. **The drying of gases.** *Rec. trav. chim.* **61,** 341-7 (1942).—*C.A.* **38,** 2239^1.
It was assumed that a no. of canals were formed in the absorbent and the current of gas divided among them. By considering the diffusion processes which entered into the picture, the following formula was derived for the decrease in concn. of the impurity (in the special case, water vapor): $\log (c/c_0) = -2n(DL/V)^{1/2}$, in which c_0 was the initial and c the final concn., n was the no. of canals per m. diam. of absorbent material, D the diffusion coeff. of the impurity, L the thickness of the layer of absorbent and V the rate of flow.

6240. Rao, Kittur Subba. **Hysteresis in sorption. VII. Scanning of the hysteresis loop. Alumina gel-water system.** *Proc. Indian Acad. Sci.* **16A,** 298-300 (1942).—*C.A.* 37, 3316^2.
A reproducible loop was obtained after 3 sorption cycles at 30°C. The sorptive capacity of the gel at saturation pressure (32 mm) was 28.52 g of water per 100 g of activated gel. At the end of the first desorption, 2.25 g of water per 100 g was held irreversibly.

6241. Rao, Kittur Subba. **Hysteresis in sorption. VIII. Permanence and scanning of the hysteresis loop. Titania gel-carbon tetrachloride system.** *Proc. Indian Acad. Sci.* **16A,** 301-4 (1942).—*C.A.* 37, 3316^3.
The hysteresis loops for the second to twelfth sorption-desorption cycles at 30°C were found to be identical. The capacity for CCl_4 at satn. pressure (14 cm) was 27.32 g per 100 g of activated gel. The characteristics of the loop were explained by the cavity concept.

6242. Rao, Kittur Subba. **Hysteresis in sorption. IX. Effect of temperature on the hysteresis loop. Silica gel-water system.** *Proc. Indian Acad. Sci.* **16A,** 305-6 (1942).—*C.A.* 37, 3316^4.
Hysteresis loops were obtained at 30°, 35°, and 40°C in which the amount of water adsorbed was plotted against relative vapor pressure. The loops were almost identical in shape and size; this was to be expected if the adsorbent was rigid, and the total capillary volume did not change in this temperature range. The sorptive capacity of silica gel for water at 30°C, 35°, and 40°C were 27.71, 27.36, and 27.01 g of water, respectively, per 100 g of activated gel.

6243. Harvey, Edmund N. Jr. **Surface areas of porous materials calculated from capillary radii.** *J. Am. Chem. Soc.* **65,** 2343-6 (1943).—*C.A.* **38,** 905^5.
Equations were developed that permitted relatively easy calcns. of the surface areas of porous adsorbents from the high-pressure portion of adsorption isotherms. When the adsorbed layer was taken into consideration and the desorption isotherm used, pore radii usually gave surface areas in good agreement with those obtained by the "Point B" method of Emmett and Brunauer.

6244. Othmer, Donald F. and Sawyer, Frederick G. **Correlating adsorption data.** *Ind. Eng. Chem.* **35,** 1269-76 (1943).—*C.A.* **38,** 671^7.
A straight line was obtained when the logarithm of the equil. pressure at a const. concn. (g adsorbate/g adsorbent) was plotted against the vapor pressure of some substance at the same temp. The slope was equal to the ratio of the total heat required to desorb 1 mole of adsorbate at the given temp. to the molal heat of vaporization of the reference substance at the same temp. The estd. heats of adsorption checked the calorimetric data closely.

6245. Cohan, Leonard H. **Hysteresis and the capillary theory of adsorption of vapors.** *J. Am. Chem. Soc.* **66,** 98-105 (1944).—*C.A.* **38,** 1158^6.
Several predictions based on the capillary theory of adsorption and the open pore theory of hysteresis were shown to agree reasonably well with exptl. data. The capillary theory of adsorption which postulated the formation of a unimol. layer followed by capillary condensation was a fairly good first approxn. for the adsorption mechanism in the systems considered. The surface tension and molal vol. of a liquid confined in a capillary of radius only twice the diam. of the liquid mol. appeared to be about the same as for the liquid in bulk.

6246. Scholberg, Harold M. and Wetzel, W. W. **Some observations on the theory of contact angles.** *J. Chem. Phys.* **13,** 448 (1945).—*C.A.* **40,** 263^9.
An equation was developed for the contact angle of a meniscus on a plane solid surface. Agreement was found with measurements on paraffin against water.

6247. Deryagin, B. **Dependence of the contact angle on the microrelief or roughness of a wetted solid surface.** *Compt. rend. acad. sci. U.R.S.S.* **51,** 361-4 (1946).—*C.A.* **40,** 6933^2,
In any thermodynamically reversible and isothermal displacement of a wetting boundary along a solid wall, the total work A of the forces of interfacial tension equaled the product of the difference $(\sigma_1 - \sigma_2)$ by ΔS_1, the total increase in the surface area wetted by the liquid. σ_1 and σ_2 represented the work of formation of unit surface of the solid and solid-liquid interface, resp.

6248. GURNHAM, C. FRED AND MASSON, HENRY J. **Expression of liquids from fibrous materials.** *Ind. Eng. Chem.* **38**, 1309-15 (1946).—*C.A.* **41**, 1504*a*.

A general equation, applicable to all fibrous materials, was: $\log P = a + b/V$. Exptl. data were obtained that indicated that the formula gave a good correlation for various substances, under varying conditions of wetness, etc. Certain limitations as to high and low pressures were found.

6249. VERSCHAFFELT, J. E. **Adsorption.** *Symposium Grenslaagverschijnselen, Verhandel. Koninkl. Vlaam. Acad. Wetenschap.* **1946**, 12-19 (Pub. 1947).—*C.A.* **43**, 3263*d*.

From the kinetic theory of gases the quantity of gas adsorbed was correlated with the pressure. A thermodynamic correlation between adsorption and surface tension was presented.

6250. VINOGRADOV, G. V. **Nomograms for the Thomson equation.** *J. Phys. Chem.* (U.S.S.R.) **20**, 1053-64 (1946) (in Russian).—*C.A.* **41**, 2299*i*.

Nomograms were given for detg. the vapor pressures p of small droplets of H_2O, CCl_4, Et_2O, MeOH, hexane, benzene, and EtOH as a function of the drop radius r. At a given r, $\log (p/p_o) = a + bt$, p_o being the vapor pressure above a plane surface, t temp., and a and b consts. Only esters failed to follow this rule.

6251. VINOGRADOV, G. V. AND BORODULINA, L. P. **Calculations by Freundlich's equation.** *J. Applied Chem.* (U.S.S.R.) **19**, 673-7 (1946) (in Russian).—*C.A.* **41**, 4692*e*.

A nomogram was given relating the amt. of adsorbed matter Γ to its concn. c or pressure p for given values of Freundlich's coeff. β and exponent $1/n$, with Γ and β on straight lines, $1/n$ and c, p on an ellipse. A nomogram of two paralled straight lines Γ and c permitted smoothing calcns. interpolations and extrapolations, on exptl. data without the explicit values of β and $1/n$ by locating the center of gravity of points of intersection.

6252. COLIN-RUSS, A. **The theory of desorption in extraction systems of porous complexes.** *Proc. Intern. Congr. Pure and Applied Chem.* **11**, 381-9 (1947); *J. Intern. Soc. Leather Trades' Chemists* **31**, 369-78 (1947).—*C.A.* **44**, 4306*a*; **42**, 1101*h*.

6253. LYKOV, A. V. **Theory of migration of moisture in capillary-porous colloidal bodies.** *Kolloid. Zhur.* **9**, 117-24 (1947).—*C.A.* **47**, 944*f*.

Equations were derived for the isothermal movement of moisture, as liquid and as vapor, in gels (owing to osmotic forces), in porous bodies, and in gels that became porous during drying.

6254. SCHILLING, K. **A simple derivation of the Freundlich adsorption equation.** *Monatsh.* **77**, 134-6 (1947).—*C.A.* **42**, 5297*h*.

The amt., a, of C_2H_5OH adsorbed on Nd_2O_3 obeyed the equation $a = k(vc)^{T/bT'}$ where c was the concn. of the adsorbate in the gas phase, T was the temp. of the expt., b a const. equal approx. to unity, T' the max. temp. to which the oxide was heated prior to the adsorption measurements, k a const., and v a vol. term proportional to the molal liquid vol. of the adsorbate.

6255. CHUMUTOV, K. V. **Sorption phenomena in capillary systems.** *Kolloid. Zhur.* **10**, 47-56 (1948).—*C.A.* **43**, 5256*a*.

Kelvin's formula relating the vapor pressure over a curved liquid surface with its radius of curvature and surface tension was studied using a capillary system consisting of a convex glass or quartz lens pressed against a plane surface. The clearance between the 2 surfaces, at a given distance from the center, was detd. with high accuracy by measurements of the Newton interference rings. The setup was superior to methods using cylindrical capillaries. It provided a continuous series of "capillaries" of increasing radii, and thus represented a model of an actual sorbent with a continuous pore size distribution.

6256. GREGG, S. J. AND JACOBS, J. **Adsorption theory of Brunauer, Emmett, and Teller and Brunauer, Deming, Deming, and Teller.** *Trans. Faraday Soc.* **44**, 574-88 (1948).—*C.A.* **43**, 2065*h*.

The relation that the theory implied between the integration consts. of the vapor equation and the adsorption isostere, resp., was not found to hold in practice. Arguments were given against the assumption that the evapn.-condensation conditions of the adsorbed multilayer differed inappreciably from those of the bulk liquid. The adsorption isotherm could not invariably be represented by a single equation as assumed by the B. E. T.-B. D. D. T. theory; where phase changes occurred, the isotherm was split up into sep. parts, each following its own equation.

6257. HIRST, W. **The mechanical interaction between mobile insoluble adsorbed films, capillary condensed liquid, and fine-structured solids.** *Discussions Faraday Soc.* **1948**, No. 3, 22-8.—*C.A.* **43**, 1238*g*.

In adsorption without capillary condensation, 3 cases were treated: swelling by stretching the structural units in which the simple case for a cylindrically-shaped cavity was derived; the widening of crevices; rigid surfaces held together by surface forces with some elastic restraint. The treatment with capillary condensation dealt with condensation in a cylindrical cavity with thin walls of isotropic material and condensation between plane-parallel rigid surfaces held by restraints.

6258. SHULL, C. G. **The determination of pore-size distribution from gas-adsorption data.** *J. Am. Chem. Soc.* **70**, 1405-10 (1948).—*C.A.* **42**, 6602*i*.

A simplified procedure for applying the theory of capillary condensation to exptl. data on adsorption was presented for detg. the phys. structure of finely divided and porous materials. The adsorption of N_2 on two silica gels was used. Standard inverted isotherms were calcd. for Maxwellian and Gaussian distribution of pore sizes. The observed isotherm was matched with a standard inverted isotherm or resolved into two or more standard isotherms. Thereby, pore distribution and diam. were evaluated.

6259. SHUTTLEWORTH, R. AND BAILEY, G. L. J. **Spreading of a liquid over a rough solid.** *Discussions Faraday Soc.* **1948**, No. 3, 16-22.—*C.A.* **43,** 1240*a*.

Hysteresis of the contact angle arose merely because of the inevitable roughness of solid surfaces. In particular systems, adsorption contributes to hysteresis and the relative importance of the two could be decided only by expt. On solids, whose roughness was formed by isolated pits, subsidiary minimums of total surface energy existed and hysteresis of contact angle arose because the liquid came to rest at a different min. after spreading and recession.

6260. VASSILIOUS, B. AND WHITE, J. **Vapor pressure-capillarity relations in clays and their application to certain aspects of drying.** *Trans. Brit. Ceram. Soc.* 47, 351-77 (1948).—*C.A.* **43,** 2748*c*.

The movement of moisture occurring in clay columns subjected to a temp. gradient was studied. The distributions obtained were consistent with the operation of an evapn.-condensation process, resulting in the setting up of a temporary equil. distribution at any stage detd. by the vapor-pressure/moisture content/temp. relationships for the particular clay. A relationship between *r*, the effective capillary radius, and *W*, the moisture content of the clay, was derived. A reasonable estimate of the surface area of the clay could be made from this relationship.

6261. VINOGRADOV, G. V. **Recalculation of adsorption isotherms.** *Zhur. Priklad. Khim.* **21,** 101-3 (1948).—*C.A.* **44,** 9209*e*.

The equil. adsorption pressures P_1 and P_2 at the abs. temps. T_1 and T_2, and the satn. vapor pressure P_s at T_2, were related by $(\log P_2 - \log P_s)/(\log P_1 - \log P_s) = \theta = B(T_1/T_2)$, where B = affinity coeff., defined by the av. ratio of the adsorption potentials of 2 adsorbed vapors at a stated vol. of liquid condensed in the pores of 1 g of the adsorbent. The magnitude θ, and hence B, was detd. graphically from the exptl. concns. c and c_s, corresponding to the equil. pressures P and P_s. Nomograms were given for the detn. of the equil. c and of the adsorption potential.

6262. ZHDANOV, S. P. **Calculation of the structure of porous sorbents from the sorption isotherms.** *Doklady Akad. Nauk S.S.S.R.* **61,** 853-6 (1948).—*C.A.* **43,** 461*i*.

Adsorption and desorption isotherms were detd. for EtOH on two samples of specially prepd. porous glass. One contained an artificially produced secondary finer pore structure within the original pores, the other consisted of two layers of different porosities glued together. Any correctly derived distribution curve should indicate the bi-dispersity of these sorbents. Actually, only the distribution function calcd. from the desorption branch, by Thomson's equation, gave the expected two peaks.

6263. ANTONOFF, GEORGE. **Evidence of long-range force in capillary phenomena.** *Rec. trav. chim.* **68,** 1011-12 (1949).—*C.A.* **44,** 2821*g*.

Capillary rise for polar liquids was found dependent on the length of the capillary; this indicated a long-range force. This may be due to a liquid film on the wall of the capillary that could support a column of liquid. The thickness of the film may differ according to the range of the force exercised by the solid. The effective radius varied with the nature of solid and liquid, the force of attraction between the 2 being greater than between particles of the liquid itself.

6264. BIKERMAN, J. J. **Remarks on the theory of capillarity.** *J. Chem. Education* **26,** 228-9 (1949).—*C.A.* **43,** 5255*i*.

Two criticisms of the usual theory of capillarity were discussed.

6265. DUBININ, M. M.; ZAVERINA, E. D., AND TIMOFEEVA, D. P. **Sorption and structure of active carbons. VI. The structure types of active carbons.** *Zhur. Fiz. Khim.* **23,** 1129-40 (1949).—*C.A.* **44,** 1303*d*.

There were 3 main types of adsorption carbons: (1) carbons having very small pores, such as carbons in which the wt loss was less than 50%; their adsorption isotherm was $\log a = C - D(\log p_s/p)^2$; a was the amt. adsorbed, p_s the satn. vapor pressure, p vapor pressure, C and D were const., and D was proportional to $(\text{temp.})^2$; (2) carbons having no small pores, such as carbons obtained after a wt loss of more than 75% or nonporous carbons; their isotherm was $\log a = M - N \log (p_s/p)$, i.e. the Freundlich isotherm; N was proportional to temp.; (3) intermediate type in which the isotherm was the sum of the 2 preceding isotherms.

6266. GURNEY, C. **Surface forces in liquids and solids.** *Proc. Phys. Soc.* (London) **62A,** 639-48 (1949).—*C.A.* **44,** 894*e*.

The aspects treated included stresses in the uncontaminated surfaces of solids at temps. at which migration of atoms took place, uniform stresses in uncontaminated surfaces of solids at temps. at which migration of atoms did not take place, the Laplace φ force and equil. at angles of contact, and surface energy and surface tension.

6267. HELD, E. F. M. VAN DER. **Theory of evaporation during drying.** *Chem. Weekblad* **45,** 285-9 (1949).—*C.A.* **43,** 8753*b*.

The mechanism of evapn. was discussed in terms of mol. interaction, and boundary-layer concept. Effects were given of material consts., as thermal cond., heat of vaporization, grain size, capillarity, and moisture retention through adsorption or otherwise upon drying operations.

6268. KATZ, SIDNEY, M. **Permanent hysteresis in physical adsorption. A theoretical discussion.** *J. Phys. & Colloid Chem.* **53,** 1166-86 (1949).—*C.A.* **44,** 4305*f*.

Self-consistency rules were derived for the scanning behavior of adsorption and desorption curves in the hysteresis loop region for rigid nonswelling systems. Application of these rules to existing data, correcting for the possibility of exptl. error, confirmed the ink-bottle mechanism for hysteresis.

6269. LAMER, V. K. AND POUND, G. M. **Surface tension of small droplets from Volmer and Flood's nucleation data.** *J. Chem. Phys.* **17,** 1337-8 (1949).—*C.A.* 44, 4748*g*.

The crit. droplet size for a no. of vapors was computed using the ratio of the crit. supersatn. pressure to the equil. vapor pressure of the bulk phase (P/P_∞) and the value for the surface tension measured on the bulk liquid phase σ_o. Fair agreement was found between measured values of P/P_∞ and the values calcd. from σ_o, but the values of P/P_∞ detd. from σ were in definitely inferior agreement with the measured values.

6270. MIZUSHIMA, MASATAKA. **A new method of estimating the surface area of powder.** *J. Chem. Phys.* **17,** 1357 (1949).—*C.A.* 44, 4749*c*.

From a knowledge of adsorption isotherms, and the contact angle between the liquid used in measuring the adsorption isotherm and the solid on which the isotherm was measured, the surface area of a powder could be measured.

6271. PORKHAEV, A. P. **Kinetics of imbibition of liquids by single capillaries and porous materials.** *Kolloid. Zhur.* **11,** 346-53 (1949).—*C.A.* 44, 903*g*.

Equations were derived for the rate of capillary rise (dl/dt) considering the nonsteady character of the flow and the variation of the liquid mass involved during the process. If l was the length of the liquid column, dl/dt must be a linear function of $1/l$. This conclusion was confirmed by expts. on rise of castor oil (at 6-34°C), glycerol, fish-liver oil, and machine oils in glass capillaries. The effect of the hysteresis of wetting was calcd. and compared with expt.

6272. RADUSHKEVICH, L. V. **Sorption and structure of active carbons. VII. The potential theory of adsorption and the structure of active carbons.** *Zhur. Fiz. Khim.* **23,** 1410-20 (1949).—*C.A.* 44, 2819*e*.

The rule $w = w_o \exp(-k\epsilon^2)$ (w was the liquid vol. of vapor adsorbed at the adsorption potential ϵ, w_o was the max. vol. adsorbed, and k was a const.) was accounted for if $f(\epsilon) = (2k/\rho b)\epsilon^2 \exp(-k\epsilon^2)$. ϵ was proportional to the probability of the adsorption potential being between ϵ and $\epsilon + d\epsilon$, ρ was the d. of the adsorbed liquid, and $b = \epsilon v$; v was the vol. of a pore, and the mean adsorption potential ϵ in the pore was assumed to be inversely proportional to v. The vol. of micropores was not accidental but depended on the mol. structure of the adsorbent.

6273. TVERSKAYA, N. P. **Evaporation of a falling drop.** *Uchenye Zapiski, Leningrad. Gosudarst. Univ. im* A. A. *Zhdanova* No. **120,** *Ser. Fiz. Nauk* No. **7,** 241-66 (1949).—*C.A.* **46,** 7401*a*.

The change in size of drops of water or ice in streams of air flowing at various rates was measured over the temp. range from -20° to +25°C. The drop size was of the the order of 500μ, and the relative humidity of the air varied from 40 to 80%. In static air, the function $X = dD^2/dt$, where D = drop diam. and t = time, was independent of drop size at const. relative humidity and temp. The evapn. rate of supercooled water drops was almost comparable to the rate for ice drops, but the rate for the liquid was always somewhat greater, showing its max. difference at -12°C.

6274. BAXTER, S. **Wetting and contact-angle hysteresis.** *Nature* **165,** 198 (1950).—*C.A.* 44, 5182*b*.

A preliminary account was given on the study of contact angles and contact-angle hysteresis when all interfacial energies were modifed by the adsorption of a wetting agent.

6275. BRIGGS, LYMAN J. **Limiting negative pressure of water.** *J. Applied Phys.* **21,** 721-2 (1950).—*C.A.* 44, 8720*b*.

Water under examn. was held in a capillary tube open at both ends. The tube was spun about an axis normal to it at its center, until the column tore. The neg. pressure was greatest (277 bars) at about 10°C. It dropped to less than 10% of the max. between 5° and 0°C. The temp. coeff. between 25° and 50°C was about 2 bars/degree.

6276. BUFF, FRANK P. AND KIRKWOOD, JOHN G. **The surface tension of small droplets.** *J. Chem. Phys.* **18,** 991-2 (1950).—*C.A.* 44, 7620*e*.

The surface tension of a droplet was not independent of the radius. The macroscopic concepts could not be extrapolated into the realm in which nucleation occurred without a complete and elaborate analysis.

6277. CONSTABLE, F. HURN. **The Freundlich isotherm. Its deduction for adsorption from dilute solutions.** *Rev. faculte sci. univ. Istanbul* **15A,** 127-9 (1950).—*C.A.* 44, 10441*b*.

Thermodynamic consideration of the free energies involved in solute adsorption at a solid-liquid interface led to definitions of k and n, the consts. of the empirical Freundlich equation. It was shown that the Freundlich isotherm was founded on a linear variation of the free surface energy with compn. in the surface layer.

6278. HILL, TERRELL L. **Note on the physical adsorption of gases and capillaries on small particles (nucleation of condensation).** *J. Phys. & Colloid Chem.* 54, 1186-91 (1950).—*C.A.* 45, 3220*h*.

The phenomena of capillary condensation, nucleation of condensation, and adsorption on small spherical particles were treated on the basis of a simple equation in which the concn., Γ, of adsorbed mols. on a surface was related to relative pressure, x, of the adsorbate by the equation $\log x = -a/\Gamma'$.

6279. HILL, TERRELL L. **The dependence of the surface energy and surface tension of spherical drops and bubbles on radius.** *J. Am. Chem. Soc.* **72,** 3923-7 (1950).—*C.A.* **45,** 1841*b*.

The approx. model used by Fowler to investigate theoretically the surface energy and surface tension of a plane liquid surface was extended to spherical drops and bubbles, with the addnl. assumption of liquid incompressibility. It was possible to derive a simple expression for the correction (to the plane surface tension) owing to curvature, which predicted that the surface tension decreased with radius. However, the magnitude of the effect was not large in this zero-order approximation.

6280. Lafargue, Camille. **Freezing of droplets of water at -41°.** *Compt. rend.* **230**, 2022-4 (1950).—*C.A.* 44, 8722*a*.

The freezing of water droplets of 1 to 20mμ diam. at 41°C was due to the mol. structure of water and not to the intervention of strange nuclei. A nucleus isomorphous with ice could cause water to freeze spontaneously at a temp. T detd. by $(T_f - T)T_f = 2SM/rQD$, where T_f was the normal f.p. of water, Q the mol. heat of fusion, M the mol. wt, D the d. of ice, S a coeff. detd. by Volmer as 10.5 ergs/mole, and r the radius in cm of the isomorphous nucleus.

6281. Luchak, G. and Langstroth, G. O. **Applications of diffusion theory to evaporation from droplets and flat surfaces.** *Can. J. Research* **28A**, 574-9 (1950) .—*C.A.* **45**, 1831*g*.

A rigorous treatment, in which the decreasing size of the drop was taken into account, was applied to the problem of the evapn. from droplets. The results indicated that the equations obtained by the method of quasi-stationary states were good to a high degree of approximation under ordinary circumstances.

6282. Manegold, Erich and Hartel, Martin. **Capillaries, capillarity, and capillary systems. XXV. 1. Free and restricted forms of contraction in capillary contraction of lyogels and lyopastes.** *Kolloid-Z.* **116**, 66-80 (1950).—*C.A.* **44**, 7619*b*.

The contracted form of lyogels depended on the presence of skeletonized or nonskeletonized gels, preferential areas of drying detd. the resulting shape. With shrinkage occurring outwardly first from corners and edges geometrical shapes were formed, often with hollow interiors. With inward shrinkage shapes followed the original, but with a crinkled surface. Upon artificial restriction various forms resulted with tendency toward min. surfaces and min. internal tensions.

6283. Schmid, Gerhard. **The electrochemistry of fine capillary systems. I. Summary.** *Z. Elektrochem.* **54**, 424-30 (1950).—*C.A.* **45**, 5544*h*.

Capillary systems in which the pore diams. were so small (less than 0.1 μ) that the usual assumption that the thickness of the Helmholz double layer was negligible compared with the pore diam. no longer held. Expressions for electrokinetic phenomena, elec. cond., and dialysis potential were given, which have been derived consistent with the picture for such systems as homogeneous electrolytes in which the charges on the wall were treated as fixed ions.

6284. Shereshefsky, J. L. and Carter, Clarence P. **Liquid-vapor equilibrium in microscopic capillaries. I. Aqueous system.** *J. Am. Chem. Soc.* **72**, 3682-6 (1950).—*C.A.* **44**, 10416*f*.

An app. for measuring the vapor pressure of liquids in microscopic capillaries was described. The lowering of vapor pressure of H_2O in cone-shaped capillaries of 3 to 10 μ in radius was found to be from 7 to 80 times as great as the values calcd. from the Kelvin equation, $(P/P_0) = \pm 2\sigma V/RTr$. The validity of the Kelvin equation was discussed in light of available exptl. studies.

6285. Shuttleworth, R. **The surface tension of solids.** *Proc. Phys. Soc.* **63A**, 444-57 (1950).—*C.A.* 44, 7607*f*.

Thermodynamic formulas of surface physics were reviewed. The surface free energy appeared in the expression for the equil. contact angle and in the Kelvin expression for the excess vapor pressure of small drops, but the surface tension appeared in the expression for the difference in pressure between the 2 sides of a curved surface. The surface tensions of homopolar crystals were zero if it was possible to neglect the interaction between atoms that were not nearest neighbors. Surface tensions were calcd. for the (100) faces of the crystals of Ne, A, Kr, and Xe and for the (100) faces of NaF, NaCl, NaBr, NaI, KF, KCl, KBr, KI. Except for NaF the calcd. values were neg.

6286. Wilke, C. R. **Diffusional properties of multicomponent gases.** *Chem. Eng. Progress* **46**, No. 2, 95-104 (1950).—*C.A.* 44, 3757*h*.

Approx. methods for calcn. of rates of diffusion in complex mixts. for stagnant films, and also with simultaneous diffusion of all components were presented. Effects of simultaneous diffusion on mass-transfer coeffs. were discussed.

6287. Barrett, Elliott P.; Joyner, Leslie G., and Halenda, Paul P. **The determination of pore volume and area distributions in porous substances. I. Computations from nitrogen isotherms.** *J. Am. Chem. Soc.* **73**, 373-80 (1951).—*C.A.* 45, 6010*a*.

An analysis of the N_2 desorption isotherms based upon the Wheeler theory of combined phys. adsorption and capillary condensation had been developed. A method for computing the pore vol. and area distribution directly from the desorption isotherm of porous substances was presented. The method had been successfully applied to adsorbents covering a wide range of pore vol. maxima.

6288. Carman, P. C. and Raal, F. A. **Physical adsorption of gases on porous solids. I. Comparison of loose powders and porous plugs.** *Proc. Roy. Soc.* (London) **A209**, 59-69 (1951).—*C.A.* 46, 6896*g*.

Comparison was made of adsorption on a given surface both as a free surface and as the internal surface of a porous plug. Direct evidence could be provided both for capillary condensation and for blockage of capillaries with adsorbed layers in porous solids. At the low-pressure end of adsorption isotherms, plug and powder gave identical results, and until blockage or capillary condensation was manifested, the total particle surface was accessible to adsorption. The adsorption isotherms for loose powders and for plugs of various porosities showed that, although pores could be filled by n-limited multilayer formation in certain limited cases, the main method of pore-filling was by capillary condensation. Expts. were made with CF_2Cl_2 on Ag and carbon black.

6289. Carman, P. C. **Physical adsorption of gases on porous solids. II. Calculation of pore-size distributions.** *Proc. Roy. Soc.* **A209**, 69-81 (1951).—*C.A.* 46, 6896*i*.

When capillary condensation took place, it was accompanied by multilayer adsorption in empty capillaries. To apply the Kelvin equation to pore-size distributions, allowance must be made for multilayers, and a method of doing so was presented. Modification of the calcn. when capillaries fill by blockage instead of condensation was discussed. Pore-size distribution curves were derived and compared for plugs of varying porosity. Results were reported for Ag plugs and carbon black.

6290. HILL, TERRELL L. **Gibb's theory of surface tension.** *J. Chem. Phys.* **19**, 1203 (1951).—*C.A.* **46**, 1832*c*.

The objections of Guggenheim to Gibbs' discussion of curved surfaces could be removed by starting with macroscopic independent variables only, avoiding Gibbs' immediate introduction of a dividing surface. The development was carried through.

6291. HIRTZ, J. AND BERNARD, R. **Adsorbed layers on a solid in the vicinity of a drop of liquid having a low vapor pressure.** *J. chim. phys.* **48**, 52-4 (1951).—*C.A.* **45**, 6454*h*.

From the change of the contact angle between a drop and the surface below, as a function of time, it was concluded that a peripheric area was formed that was progressively satd. by the evapn. of the drop. Condensation of the vapor either from the liquid that constituted the drop or water confirmed this hypothesis.

6292. KUHRT, FRIEDRICH. **Vapor pressure of small drops.** *Naturwissenschaften* **38**, 281 (1951).—*C.A.* **46**, 2373*a*.

Instead of the Thomson-Gibbs equation, log $(P_v/P_\infty) = 2\sigma O_v/3kT_v$, where p_v is the vapor pressure of a droplet contg. v mols., R the radius, O_v the surface, and σ the surface tension, the correct equation, if the droplets are free-moving, requires an addnl. term of $-4/v$. The correction is derived statistically and contains a rotation element of $5v/2$ as well as a translation element of $3v/2$. The corrected equation leads to a modified equation for nucleus formation frequency in supersatd. vapors.

6293. POUND, G. M. AND LAMER, V. K. **Surface tension of small droplets as a function of size from critical supersaturation data.** *J. Chem. Phys.* **19**, 506-7 (1951).—*C.A.* **45**, 7408*b*.

There was a small decrease in surface tension as the droplet size was reduced.

6294. WHEELER, AHLBORN. **Reaction rates and selectivity in catalyst pores.** *Advances in Catalysis* **3**, 250-327 (1951).—*C.A.* **45**, 8337*b*.

6295. CARMAN, P. C. **Diffusion and flow of gases and vapors through micropores. IV. Flow of capillary condensate.** *Proc. Roy. Soc.* (London) **A211**, 526-35 (1952).—*C.A.* **46**, 10734*g*.

If capillary condensation occurred in a porous plug and a steady pressure difference of an adsorbed gas was maintained across the plug, capillary condensate behaved as if it were bulk liquid in viscous flow through the pore-space. The driving force producing flow was not the pressure difference of the gas, but a very much larger difference of capillary pressure resulting from this pressure difference, presumably due to action of surface tension at curved menisci in the pores. The mechanism contrasted sharply with flow in adsorbed films. Expts. were reported for Linde silica II and CF_2Cl_2 at -33.1°C.

6296. FOSTER, A. GRAHAM. **Sorption hysteresis. II. The role of the cylindrical meniscus effect.** *J. Chem. Soc.* **1952**, 1806-12.—*C.A.* **46**, 8456*e*.

The correct formulation of the equations for the cylindrical meniscus effect was discussed. The potential due to multilayer adsorption was calcd. from the B.E.T. equation and added to the potential due to the cylindrical meniscus effect in the same pore. This sum (total free-energy decrease accompanying the formation of a given adsorbed layer) passed through a min. at some state of the sorption process. Hysteresis could occur only when the Kelvin potential curve (obtained from the Kelvin equation relating the vapor pressure to the curvature of a liquid surface) intersected the total free-energy curve before the min. was reached. When the pore radius and the no. of adsorbed layers were both large, and the heat of adsorption of the 1st layer was very much greater than that in the subsequent layers, a simplified math. treatment led to the prediction that hysteresis was possible when the product $V\gamma/RT\sigma$ for the adsorbed liquid exceeded unity (where V was the molar vol., γ the surface tension, and σ the mol. diam.).

6297. HENNIKER, JOHN C. **Retardation of flow in narrow capillaries.** *J. Colloid Sci.* **7**, 443-6 (1952).—*C.A.* **46**, 10788*h*.

The flow of H_2O through a ceramic disk was greatly increased by coating the pores with oleic acid. Expts. with flow of water and paraffin oil through a Pyrex disk with and without surface-active additives ($C_{12}H_{25}OH$, $C_{12}H_{23}NH_2$, and $C_{17}H_{35}NH_2$) gave no evidence of slippage. Expts. with the flow of distd. water and 0.0001-0.01 *N* KCl solns. through a normal porcelain filter and the same filter after it had been made hydrophobic by treatment with $C_{12}H_{25}NH_2$ gave no evidence of a streaming potential large enough to affect the results. The intense elec. field in the double layer at the capillary surface may produce the apparent increase in viscosity at the surface of the untreated capillaries.

6298. HIGUCHI, IZUMI AND IWAGAMI, YOSHITOMO. **Calorimetric evidence for the capillary condensation theory.** *J. Phys. Chem.* **56**, 921-7 (1952).—*C.A.* **47**, 959*e*.

The heat capacities of C_6H_6 and CCl_4 on silica gel and of C_6H_6 on charcoal were detd. by calorimetric measurements over the temp. range -160° to 10°C. Heat capacity was measured as the increase of temp. (ΔT) over a time interval (Δt) and plotted *vs.* temp. of calorimeter. Min. in the curve indicated melting of the sorbate. These min. depended on the pore size, which was detd. by means of the Thomson isotherms at 0°C. The pores of the charcoal were too small and no evidence of melting was obtained. The radius of pores in which the max. amt. of sorbate would melt was related to the f.p. depression by the thermodynamically derived $\Delta T/T^\circ = 2\gamma M/\rho r \Delta H$, where ΔT = f.p. depression; ρ = d., γ = surface tension, M = mol. wt,

ΔH = heat of fusion, T° = m.p. of bulk liquid, r = radius of pore. The fit with the exptl. values was good.

6299. Higuchi, Izumi and Utsugi, Hiroshi. **Capillary condensation in the sorption of vapors by nonporous powders. I. II.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **73**, 395-7; 397-9 (1952).—*C.A.* **47**, 4163*i*.

Theoretical. Capillary condensation could take place in the contact zones of nonporous spherical particles. Formulas for capillary condensation curves were given. The sorption equil. of C_2H_5OH by TiO_2 powder was studied.

6300. Huggill, J. A. W. **The flow of gases through capillaries.** *Proc. Roy. Soc.* (London) **A212**, 123-36 (1952).—*C.A.* **46**, 10735*c*.

The flows of H_2, He, N_2, ethylene, A, and CO_2, through capillaries were measured at room temp. in the region of transition between mol. and viscous flow for capillary walls of polymethyl methacrylate and Au. Large nos. of capillaries were used in parallel, each from 2 to 3 mm long and about 0.08 mm in diam. The differential flows of the mixts. N_2/CO_2, A/CO_2 and N_2/ethylene were detd. by measurement of the change of concn. during effusion through similar capillaries, and the discrepancies with kinetic theory were conformed. The expts. on specific flow have shown that the flow of different gases at zero pressure was not exactly proportional to $M^{-1/2}$, but that there were small but definite discrepancies depending on the gas and on the material of the capillary wall.

6301. LaMer, Victor K. and Gruen, Ruth. **Direct test of Kelvin's equation connecting vapor pressure and radius of curvature.** *Trans. Faraday Soc.* **48**, 410-15 (1952).—*C.A.* **46**, 10736*b*.

The verification was based on an extension of the growth method of measuring the radii of monodiperse aerosol droplets initially too small for accurate detn. by light-scattering methods. The range was detd. to which the Kelvin relation controlled under equil. conditions the growth of monodiperse nonvolatile aerosol droplets when exposed to the vapors of a master soln. consisting of the nonvolatile component plus an excess of a volatile miscible solvent. Excellent quant. confirmation has been obtained for the systems dioctyl phthalate + PhMe, and oleic acid + $CHCl_3$. The success of the method depended on starting with a monodiperse aerosol.

6302. Lilley, G. G. **Moisture penetration.** *Refrig. Eng.* **60**, 143-5, 196-200 (1952).—*C.A.* **46**, 4302*i*.

Based on the relation of vapor pressure, capillarity, and absorption, an equation was given for detg. the rate of moisture flow.

6303. Schultze, Karl. **The capillary paradox.** *Kolloid-Z.* **127**, 164-6 (1952).—*C.A.* **47**, 22*h*.

The capillary paradox is the fact that a liquid will rise in a capillary to the same height no matter what the dimensions of the capillary below the meniscus. This is explained on the basis of the angle between the tangent to the outer curve of the meniscus and the horizontal at the base of the meniscus.

6304. Yates, D. J. C. **Proposed equations of state for the expansion of rigid porous solids on the adsorption of gases and vapors.** *Proc. Phys. Soc.* (London) **65B**, 80-1 (1952).—*C.A.* **47**, 4683*h*.

A thermodynamic relation involving the lowering of the free surface energy of a rigid porous solid was derived.

6305. Barrer, R. M. **A new approach to gas flow in capillary systems.** *J. Phys. Chem.* **57**, 35-40 (1953).—*C.A.* **47**, 5212*g*.

Surface areas derived from this method were greater than from steady flow because penetration took place into blind pores. *Surface diffusion coeffs.* could also be calcd.

6306. Briggs, Lyman J. **The limiting negative pressure of mercury in Pyrex glass.** *J. Appl. Phys.* **24**, 488-90 (1953).—*C.A.* **47**, 6194*a*.

Pure Hg in a clean, evacuated, degassed, tube showed a flat meniscus; when the tube was degassed, Hg adhered to the glass wall. A U-tube manometer of 5-mm bore with one leg sealed off was evacuated and degassed at 500°C with a mercury-vapor pump, and then filled with pure Hg by distn. The vertical height of the Hg column from the meniscus in the open tube to the top of the closed leg was 52 cm. When the manometer was again evacuated, the Hg column remained suspended from the top of the tube, withstanding a neg. pressure of two-thirds of an atm. Finally, freshly drawn capillary tubes with fine bores were evacuated, degassed by heating, sealed off, and filled by breaking one end under pure Hg. The neg. pressure which these Hg columns could withstand under centrifugal stress increased rapidly as the degassing improved. The highest neg. pressure observed for Hg was 425 bars at 28°C.

6307. Carman, P. C. **Properties of capillary-held liquids.** *J. Phys. Chem.* **57**, 56-64 (1953).—*C.A.* **47**, 5212*i*.

Attention was directed to (1) mode of condensation and retention of liquid in micropores, (2) the similarity of liquids in micro- and macropores, differences being as to pore radius, (3) the effect of pore radius on d., surface tension, f.p., and heat of vaporization of capillary condensates, (4) hysteresis, and (5) the flow of capillary condensates.

6308. Huckins, H. E. and Kammermeyer, Karl. **The separation of gases by means of porous membranes.** *Chem. Eng. Progr.* **49**, 180-4 (1953).—*C.A.* **47**, 5197*g*.

The permeabilities of H_2, He, CH_4, O_2, A, and N_2 were independent of av. pressure over the pressure range investigated. The permeabilities of $CH_3CH_2CH_3$ and butane, however, varied with av. pressure and temp. These data could be correlated by plotting K_1 against the ratio, P'/P_0, that is, av. pressure, P', to vapor pressure P_0. K_1 was practically independent of av. pressure of CO_2 and $CH_2{:}CH_2$. In this respect they differ from $CH_3CH_2CH_3$ and butane.

6309. NEIMARK, I. E. AND KHATSET, F. I. **The importance of capillary condensation for adsorption by adsorbents of different structures.** *Zhur. Fiz. Khim.* **27**, 50-6 (1953).—*C.A.* **47**, 5759*a*.

If a liquid mixt. of A and B contained *x* mol. % A, its satd. vapor contained *y* mol. % A, and an adsorbent in equil. with the satd. vapor contained *z* mol. % A (and 100—*z* % B), then capillary condensation was predominant when *z* was almost equal to *x*, and unimol. adsorption was predominant when *z* was almost equal to *y*. Four silica adsorbents were used and the sorption and desorption of MeOH detd. Two gels showed no hysteresis and their pore vols. were 0.20 and 0.36 cc./g. The third gel had pores of various sizes, showed adsorption hysteresis (MeOH), and had a pore vol. of 0.81 cc./g. The fourth gel had large pores, small hysteresis, and a pore vol. of 1.64 cc./g.

6310. PIERCE, CONWAY AND SMITH, R. NELSON. **Adsorption in capillaries.** *J. Phys. Chem.* **57**, 64-8 (1953).—*C.A.* **47**, 5211*c*.

Capillaries were classified in 2 categories which differed by the method in which adsorption occurred. The methods and limitations of pore-size calcns. were discussed. Discussion included the adsorption of water by carbon and the importance of surface mobility and external capillaries in the adsorption process.

6311. PIERCE, CONWAY. **Computation of pore sizes from physical adsorption data.** *J. Phys. Chem.* **57**, 149-52 (1953).—*C.A.* **47**, 7287*h*.

A method was described for calcg. the pore distribution of solids from low-temp. adsorption isotherms of N_2. It was considered reliable for pores larger than 25 A. in radius.

IV-4. Adsorption From Solutions

6312. WERGELAND, HARALD. **Surface diffusion.** *Nord. Kemikermode, Forh.* **5**, 253 (1939).—*C.A.* **38**, 1932^1.

Surface transport of materials adsorbed on crystals seemed to be an activated process. A no. of oscillating adsorbed particles about the equil. layer (potential shell) passed with a certain frequency over the energy barrier to a nearby shell, whereby the crystal surface behaved in the readiest manner as a net. An equation was given for the av. square of the displacement.

6313. TARADOIRE, F. **Reactions between solids. III.** *Bull. soc. chim.* **7**, 720-32 (1940).—*C.A.* **36**, 2198^2.

According as the salts were hydrated or not the reactions were accompanied by losses or gains of H_2O. The reactions were initiated by a min. quantity of H_2O adsorbed on the crystal surfaces which could not be considered a satd. soln.

6314. BIKERMAN, J.J. **Immobile layer at the solid-liquid interface.** *J. Chem. Phys.* **9**, 880 (1941).—*C.A.* **36**, 697^9.

No explanation has been advanced for the existence of immobile layers at surfaces. It has no place in the usual hydrodynamics or the usual electrostatic, and no mechanism has been suggested that would prevent ions or mols. from moving along a solid surface. The immobile layer was due to the roughness of the surface.

6315. KARAOGLANOV, Z. **Secondary chemical precipitation processes or adsorption?** *Osterr. Chem.-Ztg.* **44**, 149-54 (1941); *Chem. Zentr.* **1941, II**, 1585.—*C.A.* **39**, 5152^9.

A series of facts were cited that could be explained only with difficulty from the point of view of adsorption but that were explained satisfactorily from the standpoint of secondary chem. pptn. processes. The pptn. of SO_4^{--} and of Ba^{++} as $BaSO_4$, the pptn. of $BaCrO_4$, and reactions in which Pb compds. participated were discussed. The principal pptn. process was considered as a phys. process.

6316. KUHN, W. AND MARTIN, H. **Application of the temperature-dependence of adsorbability to the continuous fractionation or concentration of solutions.** *Z. physik. Chem.* **A189**, 317-26 (1941).—*C.A.* **37**, 6181^5.

The math. treatment was applied to the sepn. of substances in soln. by adsorption at two temp. A simple app. was described and its use illustrated by the sepn. of *l*- from *d*-mandelic acid by means of adsorption on wool.

6317. PALACIOS, JULIO, AND SALCEDO, RICARDO. **Fundamentals of separation methods that use surface effects.** *Anales fis. quim.* **37**, 167-76 (1941).—*C.A.* **37**, 16^1.

By assuming that particles adsorbed in a liquid behaved like a bidimensional gas, and making use of the Gibbs equation, which connected adsorbing power with variation of the capillary constant, the Freundlich empirical equation was reached. From kinetic considerations, it also followed that constant *b* of the Freundlich equation meant the ratio between the number of molecules that were associated in the solution in a single particle, and the same number referred to the surface layer.

6318. ALEIXANDRE, VINCENTE. **Adsorption of non-aqueous solutions.** *Anales fis. quim.* **38**, 378-82 (1942).—*C.A.* **37**, 4950^4.

The adsorption processes agreed rather well with the Bödecker-Freundlich equation. The quantity adsorbed was greater the lower the dipole moment of the solvent. The capillary activity of AcOH on different solvents was detd.

6319. MUTO, YOSHIO. **A simple model treatment of the adsorption of surface-active electrolytes.** *J. Phys.-Math. Soc. Japan* **16**, 104-7 (1942).—*C.A.* **41**, 7200*c*.

When surface-active ion were adsorbed, Coulomb repulsion between similar ions and the repulsion due to the jump of the dielec. const. at the interface acted to reduce the adsorption. The ions of opposite charge in soln. collected close to the adsorption layer and counterbalanced the effect.

6320. SARAVÍ, S. M. **Adsorption indicators.** *Rev. col. farm. nacl.* (Rosario, Arg.) **9**, 20 (1942); *Anales farm. bioquím.* (Buenos Aires) *supl.* **13**, 78-9 (1942).—*C.A.* **37**, 6583^3.

The use of adsorption indicators in titrimetry was discussed.

6321. VERWEY, E. J. W. **Theory of the interaction of two electrochemical double layers in combination with the forces between particles in suspensions and lyophobic sols.** *Chem. Weekblad* **39**, 563-6 (1942).—*C.A.* **38**, 2868^8.

Elec. double layers were treated as a system of immersed charged plates. The theory was compared with exptl. results.

6322. ALEIXANDRE FERRANDIS, V. **Adsorption from nonaqueous solutions.** *Anales fis. y. quim.* **39**, 414-39 (1943).—*C.A.* **42**, 6199*g*.

The adsorption of org. acids increased with the dipole moment of the solvent. The adsorbability of org. acids from liquids contg. double mols. diminished in general at the same rate as the dipole moment in the double mols. The adsorbents used (kaolin, activated Al_2O_3, charcoal) and no sp. effect on adsorption of org. acids in various solvents. The relation of adsorption powers of the various adsorbents was relatively const. with change of dissolved substance and solvent. Monochloracetic, monobromoacetic, and trichloracetic acids had a notably greater adsorbability than the AcOH from which they were derived, but phenylacetic acid less.

6323. BARRER, R. M. **Zone of activation in rate processes.** *Trans. Faraday Soc.* **39**, 237-41 (1943).—*C.A.* **38**, 909^7.

A unit transport process in the zone theory of diffusion may occur at a given point in the liquid when thermal energy fluctuations result in a local accumulation of adequate energy at that time. It was assumed that normally there was need for synchronization between certain rotations and intermol. vibrations within the zone of activation before a successful unit process occurred. Exptl. behavior was described.

6324. GAPON, E. N. **Dependence of the adsorption capacity upon the concentration of H and metallic cations.** *J. Gen. Chem.* (U.S.S.R.) **13**, 382-90 (1943). (English summary).—*C.A.* **38**, 3180^6.

The dependence of adsorption capacity of zeolites, bentonite, etc., upon the concn. of H and metallic cations was represented by: $S = \alpha + \beta$ (pH - (1/n)pM), where α and β are consts., n = cation valence and pM = neg. logarithm of cation concn. The cation adsorption from alk. soln. followed: $S = \alpha' + \beta_0$.pH; from a buffered soln. it was $S = \alpha'' + [n/(n+1)]\beta_0$ (pH - (1/n)pM).

6325. KLEBER, W. **The formation of skeletal crystals.** *Neues Jahrb Mineral., Geol. Monatsh.* **1943A**, 106-27.—*C.A.* **43**, 4070*i*.

A crit. discussion of diffusion and kinetic theory as applied to problems of crystal growth was given. Surface diffusion was an important factor.

6326. HOUWINK, R. **Migration velocity of foreign ions in synthetic resins.** *Kunststoffe* **34**, No. 2, 25-6 (1944).—*C.A.* **38**, 5449^5.

Synthetic resins were sepd. into 2 groups on the basis of cond. behavior. The migration velocity of the ions followed an equation of the type P = D.L, where P was the permeation coeff., D the diffusion coeff. and L the soly. const. D was proportional to activation energy, which was a measure of the energy with which foreign substances attached themselves to the synthetic-resin mols. and brought about their soln. The gradual decrease in migration velocity was due to obstruction by foreign ions already present.

6327. NUTTING, P. G. **Rentention of fluids by solids.** *J. Franklin Inst.* **238**, 177-84 (1944).—*C.A.* **38**, 6143^5.

The energy of vaporization of adsorbed liquid (L) was related to the retention or wt of liquid adsorbed/g of solid by a combination of the thermodynamic equation $RT \log (p°/p) = L$ with an empirical relation between retention and T at const. p or between retention and p, the vapor pressure of adsorbed liquid, at const. T. Data for the mineral deweylite were discussed. In the temp. ranges 90°-480°C and 650°-900°C there were progressive increases in L with decrease in amt. retained. Retention-p data for clays were also considered.

6328. GUGGENHEIM, E. A. **Statistical thermodynamics of the surface of a regular solution.** *Trans. Faraday Soc.* **41**, 150-6 (1945).—*C.A.* **39**, 3717^7.

A statistical-mech. treatment was given for the dependence of the thermodynamic functions of a binary regular soln. on its compn. The grand partition function was constructed with the technique described by Fowler. It was assumed that the difference in compn. of the surface from that of the bulk was confined to a unimol. layer and that the mols. in the surface were packed in the same manner as in the bulk of the soln., making the same contributions per pair of neighbors to the potential energy.

6329. WALTER, JOHN E. **Multiple adsorption from solutions.** *J. Chem. Phys.* **13**, 229-34 (1945).—*C.A.* **39**, 3990^8.

The general theory was presented of the adsorption of solutes from solns. that were treated by a process similar to that employed in chromatography. By assuming a chem. equil. between adsorbed material and the soln., the adsorption equations could be solved explicitly. The two-component problem was discussed in detail; the many-component problem and the extension of the theory to more general adsorption isotherms were considered briefly.

6330. CLAESSON, STIG. **Mathematical characteristics of adsorption isotherms in frontal analysis of several solutes.** *Arkiv Kemi, Mineral. Geol.* **A24**, No. 7, 7 pp. (1946) (in English).—*C.A.* **41**, 6834*f*.

The quant. compn. of a soln. was calcd. from a frontal-analysis diagram on the basis of the adsorption isotherms of Langmuir. When the equation for the isotherm could be written $f_i(c_1,c_2,....c_n) = k_i c_i r(c_1,c_2,....c_n)$ [where c_i was the concn. of the solute i in the presence of other solutes 1,2, ...$i-1$, $i+1$ ....n, k_1 was a const. which was characteristic for substance i, and $r(c_1,c_2,....c_n)$ was an arbitrary function], the validity of the formulas was greater than suspected. The significance of the displacement factor $r(c_1,c_2....c_n)$ was discussed.

6331. Davtyan, O. K. **Diffusion of electrolytes in capillaries.** *J. Phys. Chem.* (U.S.S.R.) **20**, 1043-7 (1946) (in Russian).—*C.A.* **41**, 2300*a*.

The diffusion potential in narrow capillaries must be different from that in wide vessels because of concn. differences created by the elec. double layer. The diffusing ions would be subject also to a streaming potential. An equation for the diffusion coeff. of ions was derived from this point of view.

6332. Defay, R. and Prigogine, I. **The lateral chemical potentials of a surface phase not in equilibrium.** *Bull. classe sci., Acad. roy. Belg.* **32**, 176-84 (1946).—*C.A.* **41**, 4351*f*.

The lateral chem. potentials were expressed in terms of the usual chem. potentials. Only at equil. were the surface chem. potentials in the Gibbs model and in the layer model equal. In the passage of a component from a bulk phase to the surface region (adsorption), the thermodynamic affinity of this process referred to different phenomena for the two models.

6333. Defay, R. and Prigogine, I. **Free energy and surface tension of surfaces not in equilibrium.** *Bull. classe sci., Acad. roy. Belg.* **32**, 335-50 (1946).—*C.A.* **41**, 4351*g*.

For a system in which adsorption equil. was not established, the surface free energy was developed mathematically in terms of the equil. surface free energy and the concns. of the bulk phases. The surface chem. potential of an adsorbed component, the lateral chem. potentials, and the surface tension were similarly expressed. The concept of an ideal surface phase was applied, and simplified expressions were obtained, for surface tension and potentials.

6334. Defay, R. and Prigogine, I. **Dynamic surface tension of a perfect surface.** *Bull. classe sci., Acad. roy. Belg.* **32**, 400-21 (1946).—*C.A.* **41**, 4351*h*.

The dynamic surface tension of a binary soln. with an ideal surface phase was expressed in terms of the surface tension of a pure component, the concns., molar vols., and molar surface areas of the components, and the thickness of the surface layer. Calcns. were given for a hypothetical system. Equations were derived that related the dynamic and static surface tensions of the same binary soln., and sample calcns. were given for a hypothetical system.

6335. Duclaux, J. **The constitution of colloidal particles and adsorption.** *Rec. trav. chim.* **65**, 514-17 (1946) (in French).—*C.A.* **41**, 2978*a*.

Inorg. colloids (hydrosols) were stabilized by condensation with multivalent neg. ions rather than by phys. adsorption. The evidence for the stabilization of As_2S_3 sol by H_2S was reviewed. Since no H_2S was liberated when As_2S_3 sol was coagulated by $BaCl_2$, the excess of H_2S necessary to form a stable colloid was assumed to be in some chem. combination as: $(SH)_2 = As\text{-}S\text{-}As(OH)\text{-}S\text{-}As(OH)_2$. Similarly $Cu_2Fe(CN)_6$ sol contained $K_4Fe(CN)_6$ in varying ratio, depending on the ratios of the original reactants. The tendency of substances to "condense" was postulated as a necessary characteristic for the formation of stable hydrosols.

6336. Levine, S. **The interaction of colloidal particles. I. Particular application to parallel plates.** *Trans. Faraday Soc.* **42B**, 102-17 (1946).—*C.A.* **42**, 7131*i*.

A general expression for the free energy of interaction of two parallel plates was developed by applying methods of statistical mechanics. An explicit formula required the mean potential at an ion and ionic d. in the double layer. An approx. method of calcg. these for small surface potentials was based on the Debye-Hückel approximation to the Poisson-Boltzmann equation. Existence of a min. in mutual free energy assocd. with the double layers of collodial particles was possible without introduction of van der Waals forces.

6337. Verschaffelt, J. E. **Adsorption.** *Bull. classe sci., Acad. roy. Belg.* **32**, 221-51 (1946).—*C.A.* **41**, 4352*a*.

The relations of the various math. quantities to exptly. measured adsorption, to surface tension, and to various thermodynamic quantities were discussed. Some mention was made of adsorption on a solid phase. Two sp examples were considered: one in which each fluid phase was a pure component, and another in which both components were present in each bulk phase.

6338. Ward, A. F. H. and Tordai, L. **Time dependence of boundary tensions of solutions. I. The role of diffusion in time effects.** *J. Chem. Phys.* **14**, 453-61 (1946).—*C.A.* **40**, 5317^7.

A general theory of diffusion to the surface was derived, which allowed for back-diffusion and which made no special assumptions of a phys. nature. Fick's equation was used to calc. the total amt. of solute that diffused from a semi-infinite bulk soln. into the surface if the concn. immediately under the surface was known at various times throughout the process. It was shown how the latter information could be deduced from the varation of surface tension with time together with final equil. values of surface tension.

6339. Born, Max and Green, H. S. **A kinetic theory of liquids.** *Nature* **159**, 251-4 (1947).—*C. A.* **41**, 3672*g*.

A general set of distribution functions for a dense assembly of particles was given which could be shown to contain the kinetic theory of gases as a limiting case for small intermol. interaction, and statistical mechanics as a limiting case for equil. distribution (no time dependence). The formulation for the equil. case suggested new math. approaches to the problem of predicting from mol. data equations of state and phase transformations characteristics, including freezing.

6340. Brewer, A. Keith; Madorsky, Samuel L.; Taylor, John Keenan; Dibeler, Vernon H.; Bradt, Paul; Parham, O. Lee; Britten, Roy J., and Reid, J. Gilman Jr. **Concentration of isotopes of potassium by the countercurrent electromigration method.** *J. Research Natl. Bur. Standards,* **38,** 137-68 (1947) (Research Paper No. 1765).—*C.A.* **41,** 3692*c*.

A flow of electrolyte was directed through a packed column in a direction countercurrent to the migration of the isotopic ions being sepd. and at a rate intermediate between the velocities of these ions. Under these conditions, the faster-moving ions would make headway against the electrolyte stream while slower ones would be carried back. Factors which detd. the efficiency of the method were described. In a series of expts. for the concn. of K^{39}, the abundance ratio $N = K^{39}/K^{41}$ was increased from its normal value of 14.2 to max. of 24 in about 500 hrs of operation.

6341. Gapon, E. N. **Effect of solvent on the adsorption of a solute.** *J. Phys. Chem.* (U.S.S.R.) **21,** 179-86 (1947).—*C.A.* **41,** 6107*a*.

If the solute is neither assocd. nor dissocd., the solvents are completely immiscible and not adsorbed at all and the adsorption layer is unimol. If the adsorption takes place according to Langmuir's mechanism, the activities (a_1 and a_2) of the solute in two solvents at a const. degree of completion of the unimol. layer are in the ratio $a_1 : a_2 = b_2$ exp. $[(U_1 - U_2)RT]/b_1$, where b_1 and b_2 are the consts. in the Langmuir equations for the two solvents, and U_1 and U_2 are the adsorption potentials of the solute in the two solvents.

6342. Hill, C.G.A.; Lovering, P. E., and Rees, A. L. G. **Electrophoretic deposition of powdered materials from nonaqueous suspensions.** *Trans. Faraday Soc.* **43,** 407-17 (1947).—*C.A.* **42,** 1783*i*.

A theory was proposed which considered the mutual interaction of particles. It was assumed that the particles were spherical, that the elec. double layer was spherically symmetrical, and that Stoke's hydrodynamic equations applied. A concentric cylindrical electrode arrangement in which the deposition always occurred on the inner electrode was used. The formation of a layer of high concn. close to the deposit was due to the interaction of the particles approaching the deposit itself. Expts. were carried out with $BaCO_3$-$SrCO_3$ (molar proportions 1:1), pptd. from a soln. of the mixed nitrates by Na_2CO_3.

6343. Kiefer, Charles. **Origin of the charge of suspensions of phyllitic minerals and its relation to their surface lattice structure.** *Compt. rend.* **225,** 1071-3 (1947).—*C.A.* **42,** 1783*g*.

Math. analysis showed that, for the dissocn. process, the charge and electrophoretic velocity increased with diln. whereas for the adsorption process both approached zero with diln. Measurements of velocity showed that suspensions of argillaceous minerals, e.g., kaolinite, owed their charge to adsorption, whereas muscovite was a case of dissocn. A sample of pyrophyllite exhibited both phenomena. These differences in behavior were related to the crystal structure of the minerals.

6344. Nieuwenhuis, K. T. **A qualitative demonstration of the Gibbs surface-tension equation.** *Rec. trav. chim.* **66,** 454-8 (1947).—*C.A.* **42,** 438*i*.

A relatively simple qual. demonstration of the Gibbs formula for the variation of the surface tension of a soln. with its concn. was developed. Two methods, applicable in one case to pos. adsorption and in the other to neg. adsorption, were developed.

6345. Temkin, M. **Logarithmic adsorption isotherm.** *J. Phys. Chem.* (U.S.S.R.) **21,** 517-19 (1947) (in Russian).—*C.A.* **41,** 6791*a*.

6346. Velasco, J. R. and Ruiz, J. Oliver. **Adsorption in solution. II. Graphical verification of the simple Langmuir equation and calculation of its constants. III. Theoretical and bibliographical. IV. Experimental errors, and results.** *Anales fís. y quím* (Madrid) **43,** 197-210, 327-56, 735-62 (1947).—*C.A.* **41,** 6106*h*, 6791*g*; **42,** 1103*d*.

A graphical method, based on projection, was used to det. whether exptl. data of isothermal adsorption complied with the Langmuir equation. The parameters could be calcd. directly. The principal advantages over previous methods were: (1) no prior or subsequent calcns., except transformation of scales, (2) C^2_{n-1} points could be obtained for the traces of the right angle which verified the equation, starting from n pairs of exptl. values, (3) the consts. of the isothermal equation were obtained directly by reading the graph.

6347. Verwey, E. J. W. **Theory of the stability of lyophobic colloids.** *J. Phys. & Colloid Chem.* **51,** 631-6 (1947).—*C.A.* **41,** 5360*i*.

The problem of the interaction of double layers was outlined. A repulsive potential due to interaction was derived from free-energy considerations. Potential-distance curves led to various correct predictions, e.g. the effect of the valency of ions upon flocculation values.

6348. Westhaver, James W. **Concentration of K^{39} by countercurrent electromigration: some theoretical aspects of the operation.** *J. Research Natl. Bur. Standards* **38,** 169-83 (1947) (Research Paper No. 1766).—*C.A.* **41,** 3692*f*.

Equations were derived which described the operations (1) for the early stages of a run, (2) after infinite time with no production, and (3) after infinite time at fixed production. The elementary sepn. factor and the max. sepn. factor were expressed in terms of various channeling factors which detd. the length of the theoretical unit cell, *h*. The optimum production conditions were calcd.

6349. Amundson, Neal R. **Mathematics of adsorption in beds.** *J. Phys. & Colloid Chem.* **52,** 1153-7 (1948).—*C.A.* **43,** 1624*d*.

A complete math. calcn. was made for adsorption by a bed from a stream of fluid for the case in which the adsorption occurred irreversibly at a removal rate that was proportional to the concn. of adsorbate in the fluid stream.

6350. Crank, J. **A diffusion problem in which the amount of diffusing substance is finite. II. Diffusion with nonlinear adsorption.** *Phil. Mag.* **39**, 140-9 (1948).—*C.A.* **43**, 3253*h*.

A method was described of evaluating approx. numerical solutions. The relation between the concns. of deposited and diffusing dye was nonlinear. The method applied to adsorption isotherms of the Freundlich or Langmuir types or to even more complicated isotherms if necessary.

6351. Davies, J. T. and Rideal, E. K. **The distribution of ions at interfaces. The concept of a surface phase.** *J. Colloid Sci.* **3**, 312-22 (1948).—*C.A.* **43**, 18*a*.

The distribution of ions at a charged surface was detd. for a surface phase of a thickness corresponding to the effective radius given by Debye-Hückel Theory. The equations that were derived from the Donnan equations by using the surface-phase concept had the limitation that they applied to ion activities (in the thermodynamic sense) only and were difficult to apply to large ions formed from proteins or dyes for which concns. were not readily convertible into activities.

6352. Fu, Ying; Hansen, Robert S., and Bartell, F. E. **Thermodynamics of adsorption from solutions. I. The molality and activity coefficient of adsorbed layers.** *J. Phys. & Colloid Chem.* **52**, 374-86 (1948).—*C.A.* **42**, 2836*a*.

Evidence for the existence of multilayer adsorption from solns was sought by the detn. of the activity coeff. of adsorbate. At equil., $\log f^s = (u_o - u^s{}_o)/2.303\,RT + \log a - \log m^s$, where s indicated values for the adsorbed state. The adsorption of butyric acid from aq. soln. up to 1 *M* on 4 graphites and 1 carbon black, with ash contents up to 0.18% and surface areas of 11 to 91 $m.^2$ was detd. With an area of 20.5 A^2 for butyric acid, adsorption data indicated that 2.07 mols. of H_2O were displaced by butyric acid. The adsorption data for butyric acid were expressed by a B.E.T. type of equation, $x/m = ((x/m)_m bc)/(c_o - c)(1 + (b - 1)(c/c_o))$, where b was a const. related to the heat of adsorption and desorption, and c_o was a const. depending on the adsorbate.

6353. Komárek, Karel. **Use of capillary phenomena in droplet reactions.** *Chemie* (Prague) **3**, 49-51 (1948).—*C.A.* **46**, 2952*g*.

Capillary phenomena accompanying reactions on filter paper were influenced by the elec. charge of the surfaces of the paper fibers. In many reactions the capillary phenomena may increase the sensitivity of a test. Test papers impregnated with reagents, dyes or indicators, bases, acids, or buffers, and dried before use have increased the sensitivity of many tests.

6354. Levine, S. **Interaction of colloidal particles II. Discussion on basis of theory.** *Trans. Faraday Soc.* 44, 833-43 (1948).—*C.A.* **43**, 3688*i*.

A theory was developed of the mutual free energy of 2 colloidal particles. The theory did not omit any terms of an elec. nature and it avoided the assumption of const. surface potential. A repulsion was obtained between the double layers of 2 colloidal particles in dil. sols.

6355. Plesch, P. H. and Robertson, R. H. S. **Adsorption onto ionogenic surfaces.** *Nature* **161**, 1020-1 (1948).—*C.A.* **42**, 7598*e*.

The adsorption of basic dyes on clays was governed by 2 different mechanisms. A quant. formulation of the theory of adsorption was given based on the equation $dx/dm = (k_1 + k_2 c^n)/[1 + (mn/v) k_2 c^{n-1}]$, where $x =$ no. of milliequiv. of dye removed from v ml of soln. of initial concn. c_o milliequiv./ml by m g of clay; k and n are consts. A theoretical adsorption curve for adsorption of methylene blue on floridin clay was given.

6356. Sheinker, N. S. **Generalized equation of diffusion through porous membranes and its practical utilization.** *Kolloid. Zhur.* **10**, 382-93 (1948).—*C.A.* **43**, 7778*e*.

Diffusion of a solute through a porous membrane followed the equation $\log E - \log (A - c/c_o) = KDt$; c and c_o were the original concns. of the solns. in contact, D was the diffusion coeff., and t was the time since establishing the contact. The consts. E, A, and K had a phys. meaning, but had to be calcd. from diffusion expts. on a compd. whose D was known. KCl was used as such compd., and the D of HCl was detd. in agreement with literature data. The membrane was a sintered-glass plate. D values were precise to within 1%.

6357. Weiser, Harry B.; Milligan, W. O., and Mills, G. A. **Zones of mutual protection against crystallization in dual-oxide systems.** *J. Phys. & Colloid Chem.* **52**, 942-9 (1948).—*C.A.* **42**, 6608*e*.

In a system of mixed oxides, there may exist a mutual protective action of the 2 oxides on each other so as to prevent crystal growth. 10-30 mol. % of BeO, ZrO_2, Bi_2O_3, or SnO_2 retarded or prevented crystn. of Al_2O_3. The action was mutual.

6358. Wilson, A. H. **A diffusion problem in which the amount of diffusion substance was finite.** *Phil. Mag.* **39**, 48-58 (1948).—*C.A.* **43**, 2839*g*.

The simplest law of adsorption of the dye that gave a nontrivial result was chosen. A complete soln. was obtained without recourse to numerical methods. Three problems were solved and two different methods, depending, resp., on an expansion in orthogonal functions and on the Laplace transform, were used. These problems were diffusion into a lamina, diffusion into a cylinder, diffusion when the rate of adsorption was infinitely rapid, diffusion when rates of adsorption and diffusion were comparable.

6359. Barrer, R. M. and Jost, W. **Interstitial diffusion.** *Trans. Faraday Soc.* **45**, 928-30 (1949).—*C.A.* **44**, 2325*a*.

In zeolitic diffusion, in which each unit diffusion process involved only a single jump from one sorption site to the next, the concn. dependence in the diffusion coeff. and the departure from ideality in the mixt. exactly compensated to give Fick's law. However, existing data showed that the product of these 2 factors decreased in some zeolites as the concn. increased, at least for smaller values of concn. This could be so if n-fold, as well as single, jumps occurred in some unit diffusion processes.

6360. CRANK, J. AND HENRY, M. E. **Diffusion in media with variable properties. I. Effect of a variable diffusion coefficient on the rates of absorption and desorption.** *Trans. Faraday Soc.* **45**, 636-50 (1949).—*C.A.* **43**, 8789*f*.

Numerical solutions of the diffusion equation in 1-dimension were detd. for a no. of diffusion coeffs. varying in different ways with the cocn. of the diffusing substance. In all the cases examd. it was found that, when the diffusion coeff. increased uniformly with increasing concn., absorption was quicker than desorption throughout; when the diffusion coeff. decreased was with increasing concn., the reverse was true.

6361. DRAKE, BIRGER. **Some factors affecting frontal sharpness in adsorption analysis.** *Anal. Chim. Acta* **3**, 452-67 (1949).—*C.A.* **44**, 10571*f*.

Filters whose length was more than 100 times the diam. gave better fronts than ones which were short and wide. The velocity of flow should be kept low in order to obtain even fronts. An adsorption analysis should take a day or longer, rather than an hr; it was possible to accomplish this without a diffusion which may destroy the frontal sharpness.

6362. FRUMKIN, A. N. **Dependence of the adsorption of electrolytes on potential and concentration.** *Doklady Akad. Nauk S.S.S.R.* **69**, 821-4 (1949).—*C.A.* **45**, 6454*i*.

Thermodynamic considerations give, for the dependence of the charge d. ϵ on the equil. potential ∂, and the concn. c of the cations, in the case of a negatively charged surface, the functional relation $\epsilon = f[\partial - (RT/nF)\ln c]$, which, when the H^+ ion was potential-detg., could be written $\epsilon = \phi([H^+]/c^{1/n})$, in terms of Gibbs' surface d. Γ of the cations, $\Gamma = -(1/nF)\phi([H^+]/c^{1/n}) = p_2[pH - (1/n)pM]$, where M = metal cation. The specific form of the functions ϕ or f_2 was not given by thermodynamics, and must be assumed. A linear relation between the amt. adsorbed and the log of the concn. need not indicate potential-detg. adsorption, but may be due to penetration of the adsorbed substance into the solid lattice, as in the β-phase of the Pd-H_2 system, and, possibly, also in the sorption of cations by zeolites.

6363. FU, YING; HANSEN, ROBERT S., AND BARTELL, F. E. **Remarks on "Thermodynamics of adsorption from solutions. I."** *J. Phys. & Colloid Chem.* **53**, 454-6 (1949).—*C.A.* **44**, 2820*i*.

Equations were compared to show that the surface activity coeff. was much less sensitive than the surface molality to the conventions adopted for calcg. the amts. of the component. The qual. conclusions held by any convention.

6364. GLUECKAUF, E. **Theory of chromatography. VII. The general theory of two solutes following non-linear isotherms.** *Discussions Faraday Soc.* **1949**, No. 7, 12-25.

The movement of solutes in an ideal adsorbing column during a chromatographic separation depended on the amounts f_1 and f_2 adsorbed in equilibrium with the concentrations c_1 and c_2 of the two solutes. The fundamental relationship was $df_1/dc_1 = df_2/dc_2$. The sequence of concentrations in the column as well as any new concentration plateaux developing spontaneously, and the occurrence of sharp or diffuse boundaries, could be predicted by the application of a few simple rules.

6365. GUASTALLA, JEAN. **Mechanisms of adsorption and the Gibbs' relation.** *Compt. rend.* **228**, 820-2 (1949).—*C.A.* **43**, 4921*h*.

An adsorption equation was derived kinetically for positively adsorbed substances. The no. of mols. entering the surface was assumed proportional to the concn. in the interior and the no. leaving the surface was proportional to the no. in the surface. The activation energy for the escape was detd. from the equation of state for the surface.

6366. OFFORD, A. C. AND WEISS, JOSEPH. **Chromatography with several solutes.** *Discussions Faraday Soc.* **1949**, No. 7, 26-34.—*C.A.* **44**, 9855*i*.

Examples of the application of the theory were given for the chromatogram formed from two solutes and developed with pure solvent, the development of a column consisting of a uniform mixt. of 2 solutes with pure solvent, and the development of an infinite column of uniformly distributed solute with a soln. of a more strongly adsorbed substance.

6367. PRASAD, MATA AND DOSS, K. D. VENKATESHA. **Scattering of light during the process of gel formation.** *J. Colloid Sci.* **4**, 349-65 (1949).—*C.A.* **43**, 7785*b*.

Gel-forming systems were studied by measuring the intensity and depolarization factors of light scattered by the system. Three types of gels were recognized: (1) Those that increased in opacity during setting (e.g. $Sn_3(PO_4)_4$, $Sn_3(AsO_4)_4$), (2) Those that did not change in opacity during setting (e.g. $Th_3(PO_4)_4$), (3) Those that set very slowly with a decrease in opacity during setting (e.g. $Ce_3(PO_4)_4$).

6368. ROMANOVSKI, VSEVOLOD. **Effect of the nature of the dispersing phase on the cohesive properties of a deposit of quartz powder.** *Compt. rend.* **229**, 871-2 (1949).—*C.A.* **44**, 5184*b*.

The forces were detd. that were necessary to start deformation of a deposit of quartz powder (5-7 μ grains) obtained from solns. of 0.001, 0.01, 0.1, and 1 *N* NaCl. The cohesion of the powder decreased as NaCl concn. increased, the greatest change being observed between 0.001 and 0.01 *N*. These effects seemed to originate in electrostatic phenomena that modified the adsorption of water mols. by the quartz grains.

6369. ALEXANDER, A. E. AND POSNER, A. M. **Method of integrating the Gibbs adsorption isotherm.** *Nature* **166**, 432-3 (1950).—*C.A.* **45**, 2285*g*.

The force (π)-area (A) relation for the adsorbed film of a sol. substance can be obtained from the equil. surface pressure (π)-concn. (c) curve by a graphic application of Gibbs adsorption isotherm. This can be applied in 2 equiv. forms: $n = (S/kT)(d\pi/dc)$ (1) and $n = (1/kT)(d\pi/d\ln c)$ (2), where n is the no. of mols./cm^2 $= 1/A$ (assuming that the activity coeff. is unity). In the region $\pi = 0$-10 dynes/cm, where the above equations can be accurately applied, the films are perfectly gaseous and obey an equation of state $\pi A = kT$. Studies on insol. monolayers and some adsorbed films show that for π greater than 15 dynes/cm many films obey a modified form of the above equation, namely, $\pi(A - A_0) = x kT$, where A_0 is the co-area of the mol. and x is a measure of the lateral adhesion of mols. in the film, being unity when there is no adhesion and decreasing as the adhesion increases.

6370. Amundson, Neal R. **Mathematics of adsorption in beds. II.** *Phys. & Colloid Chem* **54,** 812-20 (1950).—*C.A.* **44,** 9770*e*.
Exact equations were developed for adsorption and desorption in a bed of adsorbent for various assumptions as to the distribution of adsorbate on the adsorbent, the variation of the inlet soln. concn. with time, the nature of the slow step in the adsorption process, and the desorption pressure or back pressure exerted by the adsorbate.

6371. Bikerman, J. J. **Surface roughness and contact angle.** *J. Phys. & Colloid Chem.* **54,** 653-8 (1950).—*C.A.* **44,** 8133*c*.
The contact angles θ formed by air, water droplets, and stainless steel plates of 6 com. standard finished were detd. by measuring the diams. of the bases of drops of various sizes (0.008, 0.004, 0.002, and 0.001 cc.) and extrapolating to infinitely small drops which were spherical segments. The θ were almost identical (91° and 89°) for the coarsest (av. height of elevations detd. with a tracer instrument was 3.1 u) and the finest (height 0.025 μ) finish. Spreading of droplets on grooved surfaces showed that contact angles depended on the type of surface roughness rather than on its degree.

6372. Booth, F. **The cataphoresis of spherical particles in strong fields.** *J. Chem. Phys.* **18,** 1361-4 (1950).—*C.A.* **45,** 928*e*.
The problems of detg. the rate of cataphoresis of a solid spherical particle in an electrolyte when relaxation effects were neglected was solved completely. The bearing of the results on the usual methods of finding zeta-potentials from cataphoretic velocities was discussed.

6373. Brown, Callaway. **Adsorbed films from binary liquid solution.** *J. Phys. & Colloid Chem.* **54,** 1278-81 (1950).—*C.A.* **45,** 2742*b*.
Adsorption from aq. soln. of slightly sol. org. compds. by carbons was discussed. The thermodynamic treatment of Harkins and Jura, as well as the B.E.T. theory was applied.

6374. Ekedahl, Erik; Hogfeldt, Erik, and Sillen, Lars Gunnar. **Activities of the components in ion exchangers.** *Acta Chem. Scand.* **4,** 556-8 (1950).—*C.A.* **44,** 8195*g*.
A math. treatment of the subject in which the ion exchanger was regarded as a solid soln.

6375. Fu, Ying and Bartell, F. E. **Thermodynamics of adsorption from solutions. III. Adsorption at liquid-air interfaces.** *J. Phys. & Colloid Chem.* **54,** 537-46 (1950).—*C.A.* **44,** 5676*i*.
Adsorption at water-air interfaces was calcd. from surface-tension data by the exact form of Gibbs' equation. Activity coeffs., surface molalities, mol. areas, and surface pressures gave curves similar to those obtained for solid-liquid interfaces. The adsorption of BuOH, butyric acid, and phenol was of the monolayer type, whereas the adsorption of resorcinol, valeric acid, and caproic acid was of the multilayer type.

6376. Grahame, David C. **Progress and problems in the study of the electrical double layer.** *Record Chem. Progress* **11,** 93-107 (1950).—*C.A.* **44,** 7621*c*.
The kinetic theory of the double layer and its capacity and pseudo-capacity were discussed. Data were presented for double layers between Hg and various solns., and for adsorption of numerous salts.

6377. Grahame, David C. **Effects of dielectric saturation on the diffuse double layer and the free energy of hydration of ions.** *J. Chem. Phys.* **18,** 903-9 (1950).—*C.A.* **45,** 12*h*.
The theory of the diffuse double layer was developed for the case of a dielec. of variable dielec. const. The properties of the diffuse double layer which were experimentally significant were almost unaffected by the onset of dielec. satn. The Born equation for the free energy of hydration of ions was elaborated to include the effects of dielec. satn. which were negligible in the case of the alkali halide ions.

6378. Grimley, T. B. **The contact between a solid and an electrolyte.** *Proc. Roy. Soc.* **A201,** 40-61 (1950).—*C.A.* **44,** 7627*f*.
If lattice defects were present in the crystal in thermal equil., the balancing charge may reside actually inside the crystal in the form of a space charge of lattice defects whose structure was similar, in many respects, to the charged layer in the electrolyte. Equations were derived that related the potential drop in each phase and the total charge on the double layer to the phys. consts. of the system. The thickness of the crystal appeared as a parameter. The self-diffusion coeffs. of the ions in the crystal were functions of position, and this had an important effect on the rates of exchange of radioactive Ag and Br ions between the electrolyte and the crystal.

6379. Janok, Ján. **An osmometric study of cations.** *Chem. Zvesti* **4,** 299-305 (1950).—*C.A.* **45,** 3322*d*.
The rush no. of a metallic cation was greater, the greater the charge. At the same charge it was directly proportional to the square root of its at. wt and inversely proportional to the square root of the mol. wt of the alc.

6380. Lapidus, Leon and Amundson, Neal R. **Mathematics of adsorption in beds. III. Radial flow.** *Phys. & Colloid Chem.* **54,** 821-9 (1950).—*C.A.* **44,** 9770*e*.
General equations for radial-flow adsorption columns were derived and were solved for a case in which a linear isotherm is assumed and for one in which the isotherm is of the Langmuir type.

6381. Lepin, L. K. **Surface reactions. IV. Validity of the phase rule and of the law of mass action.** *Zhur. Fiz. Khim.* **24,** 224-43 (1950).—*C.A.* **44,** 6250*c*.
Ion-exchange reactions on the surface of adsorbents were governed by the phase rule. The

system of ash-free charcoal, O_2, and an aq. electrolyte soln. (KCl) had 5 independent components and consisted of 3 phases. There were 5 degrees of freedom (e.g., pressure P, temp., surface extent, the vol. concn. of OH^- (C_2), and vol. concn. of Cl^- (C_3)). If the 3 first parameters were kept const., adsorption hysteresis occurred; it disappeared if also the pH was kept const. From the law of mass action, an equation was derived for the adsorption of anion. The nonuniformity of the adsorbent surface was another source of discrepancy.

6382. Levine, S. **The interaction of colloidal particles. III. Some theorems concerning the free energy of double layers.** *Phil. Mag.* **41**, 53-65 (1950).—*C.A.* **44**, 6233*f*.

A no. of theorems relating to the free energy of the elec. double layers of colloidal particles in dil. sols were developed. In the case of 2 infinite parallel plates, the difficulty that arose due to the infinity of the surface potential, when all the ions were supposed completely discharged, was satisfactorily explained.

6383. Nagasawa, Mitsuru. **Theory of the membrane potential across films of organic polymers. I. Criticism of the theory of Meyer-Teorell. Influence of ionic radius on membrane potential.** *J. Chem. Soc. Japan*, Pure Chem. Sect., **70**, 4-7 (1949).—*C.A.* **45**, 2744*b*.

The Meyer-Teorell theory of membrane potential was corrected in 3 ways: (1) Sieve effect and ionic mobility were treated independently. (2) The characteristic permeability const. (usually denoted by A) depended on the types of electrolytes. (3) Permeation velocities of cations and anions were taken to be the same. A formula giving the cation:anion ratio in membranes as a function of ionic radius was derived and agreed well with exptl. results.

6384. Ono, Syô. **Statistical thermodynamics of critical and surface phenomena. II. Statistical theory of adsorption from regular solution.** *Mem. Faculty Eng. Kyushu Univ.* **12**, 1-8 (1950).—*C.A.* **44**, 8732*i*.

Adsorption of mols. from soln. on solids was treated statistically based on a consideration of the interacting thermodynamic energies involved.

6385. Stauff, J. **The thermodynamics of colloidal systems.** *Kolloid-Z.* **118**, 73-86 (1950).—*C.A.* **45**, 1405*i*.

Surface energy per particle, particle size and concn., chem. potential, and Coulomb and van der Waals forces were considered, and a new concept of of dispersion entropy was introduced.

6386. Todes, O. M. and Bikson, Ya. M. **Dynamics of sorption on a real granular adsorbent.** *Doklady Akad. Nauk S.S.S.R.* **75**, 727-30 (1950).—*C.A.* **46**, 18*f*.

A gas or liquid contg. the sorbable substance at a concn. c moved down a layer of sorbent at the rate u. The differential equation of the sorption was $\partial c/\partial t = -u\,(\partial c/\partial x) - (\partial a/\partial t) + D\,(\partial^2 c/\partial x^2)$, with a = concn. of the sorbable substance at the given depth x of the layer, and the conditions were, at $x = 0$, $c = c_o$ = const., $a = a_o$, $\partial c/\partial x = 0$; at $t = 0$, $c = 0$, $a = 0$, $\partial c/\partial x = 0$. If the sorption was phys. and detd. by diffusion, $\partial a/\partial t = \beta\,[c - C(a)]$, where $C(a)$ = concn. at the surface in equil. with a. With $\xi = x - vt$ (where v = rate of displacement of the sorption wave), integration over ξ gave $D(dc/d\xi) = (u - v)c - va$, and Shilov's formula for the propagation of a sorption wave, $v = c_o u/(a_o + c_o)$. Elimination of ξ gave $da/dc = -G[(a_o + c_o)/c_o]^2[c - C(a)]/[(a_0 c/c_0) - a]$, where $G = \beta D/u^2$ was a dimensionless criterion.

6387. Trillat, J. J. and Brigonnet, J. **Measurements of thicknesses of molecular layers.** *Rev. inst. franc., petrole* 5, 13-16 (1950).—*C.A.* **45**, 20*f*.

A satd. hydrocarbon lubricant contg. a polar solute such as oleic acid was passed through a column of steel balls. Before and after passage the solute content was detd. by the change of interfacial tension with time of the soln. in contact with water. From the difference in solute content the no. of mols. adsorbed on a known area could be calcd.

6388. Walling, Cheves. **The acid strength of surfaces.** *J. Am. Chem. Soc.* **72**, 1164-8 (1950).—*C.A.* **44**, 5181*e*.

A definition of the acid strength of a solid surface as the ability of the surface to convert an adsorbed neutral base to its conjugate acid was proposed. By observation of the colors of suitable adsorbed indicators the acid strengths of a no. of materials were semiquantitatively detd. Colors of the adsorbed indicators were, in every case, those of the indicator or its conjugate acid as observed in homogeneous soln. Surface acid strengths depended somewhat upon the medium from which the indicator was adsorbed, and were decreased by the presence of weak bases, e.g., Me_2CO or H_2O. Although Al_2O_3 and pure SiO_2 appeared to have neutral surfaces, SiO_2-Al_2O_3 and SiO_2-MgO were strongly acid. Several surfaces contg. strongly coordinating metal ions, e.g., $CuSO_4$, AgCl, etc., were also strongly acid.

6389. Babbitt, J. D. **A unified picture of diffusion.** *Can. J. Phys.* **29**, 427-36 (1951).—*C.A.* **46**, 8918*i*.

If the equation $(\partial p/\partial x) - Ax = 0$, where p was a pressure function and Ax a resistive or frictional force, was taken as the fundamental dynamic equation, it is possible to explain diffusion in solns., in solid solns., and in an adsorbing solid as well as the interdiffusion of 2 gases. In diffusion in both liquid and solid solns. the pressure function was the spreading pressure of the adsorbed layer.

6390. Christiansen, J. A. **Mechanism of precipitation of sparingly soluble salts.** *Acta Chem. Scand.* 5, 676-7 (1951)(in English).—*C.A.* **46**, 4329*f*.

The presence of 2 qualitatively different ionic groups is postulated. A cluster is a group of from 2 to $P - 1$ ions. A germ is a group of P ions. A cluster may gain or lose an ion but a germ will much more probably gain than lose an ion. The summation of probabilities of the cluster to gain or lose an ion reduces to the form $s = k_p C^p$ which by integration yields $T_a C_0^{p-1} = k$.

6391. Dean, Robert B. **The gibbs—a rational unit for adsorption.** *J. Phys. & Colloid Chem.* **55,** 611-12 (1951).—*C.A.* **45,** 6003*f*.

This unit, *G*, defined as 10^{-10} moles per cm^2, is proposed for use in reporting adsorption data in terms of surface concn. The relation between the surface concn. Γ and the area per mol. *A*, expressed in A^2., is $\Gamma = 166.0\ G/A$.

6392. Elton, G. A. H. **Adsorption from binary solutions of completely miscible liquids. I. Calculation of surface mole-fraction isotherms.** *J. Chem. Soc.* **1951,** 2958-61.—*C.A.* **46,** 2874*c*.

A materials balance in the surface layer led to: $x_B^s = 1 - x_A^s = Ax_B - \{a_A(n_A + n_B)\Delta x_B/[A + (n_A + n_B)(a_A + a_B)\Delta x_B]\}$, where x_B^s and x_A^s were the mole fractions of *A* and *B*, resp., in the surface layer, and the *x*'s were the equil. mole fractions in the bulk soln.; the *n*'s were the no. of moles of each component initially present in the soln., the *a*'s their corresponding effective areas per mole, *A* the area of adsorbent available, and Δx_B the change in compn. of the soln. due to adsorption. The method was applied to adsorption from MeOH-CCl_4 mixts. by charcoal.

6393. Eriksson, Erik. **pH, ion activities, and membrane potentials in colloidal systems.** *Science* **113,** 418-20 (1951).—*C.A.* **45,** 5488*d*.

The cause of the potential across an electrically charged colloidal membrane between 2 solns. of different salt activities was discussed. The difference in pH between a suspension and its filtrate was attributed to a suspension effect, which was believed to be a more satisfactory kinetic explanation than the postulate of high liquid-junction potential between a KCl bridge and a suspension.

6394. Frumkin, A. N. and Melik-Gaĭkazyan, V. I. **Determination of the kinetics of adsorption of organic substances by a.-c. measurements of the capacity and the conductivity at the boundary: electrode-solution.** *Doklady Akad. Nauk S.S.S.R.* **77,** 855-8 (1951).—*C.A.* **45,** 6909*e*.

At a metal/soln. interface with a potential difference γ, ϵ = charge per unit surface area of the soln. side of the double layer, Γ = adsorbed amt./cm^2, the c.d. was $i = C_e\,\partial\gamma/\partial t + i'$, where C_e = true electrode capacity at the given const. Γ, and $i' = (\partial\epsilon/\partial\Gamma)\gamma(\partial\Gamma/\partial t)$. At a finite rate of charging, Γ lagged behind γ, and $\partial\Gamma/\partial t$ would depend on the kinetics of the adsorption. If the rate of adsorption was detd. by diffusion, soln. of the differential equation, with the boundary conditions, leads to the addnl. c.d. If the adsorption process proper was slow as compared with the diffusion, the concn. in soln. remained const. Inhibition of the over-all adsorption process by diffusion was more marked at low frequencies, whereas inhibition by adsorption proper was more marked at high frequencies.

6395. Fukuoka, Fumio. **The rate of adsorption in the liquid phase. IV. The effects of agitation on the rate of adsorption in the liquid phase.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. **54,** 203-5 (1951).—*C.A.* **47,** 2568*a*.

It has been proposed that the rate of adsorption is detd. by 2 factors: (1) the rate of diffusion inside the adsorbent particles, and (2) the resistance at the outside layer of the adsorbent particles. A formula is given for the relation between the rate of adsorption and the degree of agitation. The adsorption of I_2 (in KI soln.) by active charcoal is discussed.

6396. Gregor, Harry P. **Gibbs-Donnan equilibria in ion-exchange resin systems.** *J. Am. Chem. Soc.* **73,** 642-50 (1951).—*C.A.* **45,** 4524*i*.

The classical thermodynamic formulations were applied with particular consideration of the pressure-vol. free energy changes involved in the swelling and deswelling processes.

6397. Hansen, Robert S. **Basic concepts in surface thermodynamics.** *J. Phys. & Colloid Chem.* **55,** 1195-1200 (1951).—*C.A.* **46,** 803*g*.

In the case of inert nonswelling solid adsorbents, measured quantities of gas adsorption or liquid-soln. adsorption were related to Gibbsian surface-excesses by multiplicative experimentally determinable consts. The discussion was based on actual expt. procedures. In the case of gas adsorption, measured quantities were most directly related to surface excesses referred to a math. surface located by setting the surface excess of the solid component equal to zero.

6398. Kaneko, Seiji. **Adsorption and stability of colloidal solutions.** *J. Electrochem. Soc. Japan* **19,** 88-9 (1951).—*C.A.* **45,** 8323*h*.

A formula was derived thermodynamically which showed that a colloidal soln. was in general stabilized by dissolving any substance in the dispersion medium.

6399. Kipling, J. J. and Tester, D. A. **Adsorption from binary mixtures of nonelectrolytes.** *Nature* **167,** 612 (1951).—*C.A.* **45,** 8321*d*.

It was suggested that on theoretical grounds the math. forms of both the Freundlich and Langmuir types of equations render them inapplicable to liquid-phase results.

6400. Kobatake, Yonosuke and Nagasawa, Mitsuru. **Theory of membrane permeability. I. The permeation velocity of ions.** *J. Chem. Soc. Japan,* Pure Chem. Sect., **72,** 378-81 (1951).—*C.A.* **46,** 806*d*.

Attempts were made to derive an equation for the permeation velocity of electrolyte through a membrane in line with Eyring's theory of diffusion potential. The permeability was greatly affected by the elec. charge on the membrane.

6401. Levine, S. **Interaction of colloidal particles. IV. General mathematical theory for two identical particles.** *Proc. Cambridge Phil. Soc.* **47,** 217-29 (1951).—*C.A.* **45,** 5487*h*.

An expression for the Helmholtz free energy of the elec. double layers was obtained by the methods of statistical mechanics. The condition of equil. between the ions adsorbed on the surfaces of the colloidal particles and those dissolved in the dispersion medium was accounted for by requiring that the free energy of the whole system be a min. with respect to variation of the ionic d. on the surfaces.

6402. Levine, S. **Interaction of colloidal particles. V. Nature of repulsion between particles in dilute sols.** *Proc. Cambridge Phil. Soc.* **47**, 230-42 (1951).—*C.A.* **45**, 5488*a*.

The contributions of the Coulomb interaction of the ions in the dispersion medium added a repulsion term to the mutual free energy of the 2 particles. This correction term behaved as an inverse power and was the predominant effect at large sepns., although a second-order effect at small sepns. For parallel plates this power was the fourth; for 2 spheres, the sixth.

6403. Levine, S. **The interaction of colloidal particles. VI. Application of the Stern theory of the double layer.** *J. Colloid Sci.* **6**, 1-19 (1951).—*C.A.* **45**, 4115*i*.

A formula for the mutual free energy of the particles was derived.

6404. Levine, S. and Suddaby, A. **Free energy of the double layers of two plates at large separations.** *Proc. Phys. Soc.* (London) **64A**, 431-3 (1951).—*C.A.* **45**, 8323*h*.

An expansion for the interaction of the elec. double layers of two parallel (colloidal) plates at large sepns., when immersed in an electrolyte of the binary sym. type.

6405. Levine, S. **The free energy of the double layer of a colloidal particle.** *Proc. Phys. Soc.* (London) **64A**, 781-90 (1951).—*C.A.* **46**, 9936*i*.

Some theorems concerning the free energy of the elec. double layer of a colloidal particle in a dil. sol were developed. This free energy could be derived by using the fictitious process of charging excess ions in the double layer.

6406. Marshall, C. E. **Measurements in colloidal systems.** *Science* **113**, 43-4 (1951).—*C.A.* **45**, 3219*i*.

It was shown that the Donnan equil. existed in the membrane potential. The method of analysis for Cl must be made on a portion of the cell electrolyte which has not been constrained in any way. The results of Jenny agreed with the Donnan theory.

6407. McCabe, W. L. and Stevens, R. P. **Rate of growth of crystals in aqueous solutions.** *Chem. Eng. Progress* **47**, 168-74 (1951).—*C.A.* **45**, 4535*b*.

The rate at which $CuSO_4$ pentahydrate crystals grow in an agitated soln. at const. supersatn., was studied. The results were consistent with the view that the growth process consisted of a mass-transfer process from the soln. to the crystal surface followed by a reaction at the interface which was as yet not fully understood. In a crystallizer in which the crystals were maintained in suspension by means of an agitator, large crystals grow faster than smaller ones because the larger crystals benefited from a higher relative velocity with respect to the soln. than did smaller crystals, and the relative velocities in both cases were in the low range.

6408. Parsons, Roger and Bockris, J. O'M. **Calculation of the energy of activation of discharge of hydrogen ions at metal electrodes.** *Trans. Faraday Soc.* **47**, 914-28 (1951).—*C.A.* **46**, 2428*f*.

The rate of transfer of a proton from its solvation sheath to an adsorption position on an electrode was formulated in terms of the transition-state theory modified for charged particles. The free energy of activation of the reaction was calcd. approx.

6409. Robert, Louis. **Classification of organic compounds by the stepwise degree of adsorbability on solid surfaces.** *Compt. rend.* **233**, 742-4 (1951).—*C.A.* **46**, 2872*g*.

A partial classification of a series of org. compds. was based on the extent of adsorption on activated charcoal silica gel, and Al_2O_3. The classification was expected to be useful for predicting possible chromatographic sepns.

6410. Scott, E. J.; Tung, L. H., and Drickamer, H. G. **Diffusion through an interface.** *J. Chem. Phys.* **19**, 1075-8 (1951).—*C.A.* **46**, 806*c*.

The diffusion equation was solved for the case of two cells of finite length with an interface between the cells. The effect of an interfacial resistance to mass transfer was considered. The condition of equil. (no resistance) at the interface was special case of this solution.

6411. Tanaka, Minoru and Shibata, Muraji. **Inorganic chromatography. III.** *J. Chem. Soc. Japan,* Pure Chem. Sect. **72**, 221-3 (1951).—*C.A.* **46**, 850*b*.

The mechanism of inorg. chromatographic adsorption on alumina was discussed from the standpoint of electrostatic adsorption. The values $-Ze^2/R$, calcd. according to Bernal and Fowler, for cations and anions gave a series similar to those found experimentally.

6412. Teorell, Torsten. **Quantitative treatment of membrane permeability.** *Z. Elektrochem* **55**, 460-9 (1951).—*C.A.* **47**, 23*i*.

A general theory of permeability applied to convection-free membranes having fixed layers was presented. The theory included systems under external application of elec. current as well as those without current. Formulas were developed for (*a*) individual ionic flow, (*b*) flowing in and out of each individual ionic type, (*c*) individual ionic equiv. wt, (*d*) the flow relation between various anions and cations, (*e*) c.d., (*f*) single membrane potentials, (*g*) membrane cond., (*h*) rectification effect, and (*i*) potential changes and spatial distribution of mobile ions within the membrane.

6413. Thomas, Tudor, L. Jr. **Thermodynamics of adsorption from solution.** *Univ. Microfilms* (Ann Arbor, Mich.), *Pub.* No. **2468**, 119 pp. (microfilm $1.49, paper enlargements $11.90); *Microfilm Abstracts* **11**, No. 2, 257-9 (1951).—*C.A.* **45**, 7845*d*.

6414. Wiklander, Lambert. **Equilibria in ion exchange. I. Effect of the proportions of the exchanging ions.** *Acta Agr. Scand.* **1**, 190-202 (1951).—*C.A.* **46**, 3828*b*.

Theoretical relations between the degree of exchange of adsorbed ions and their relative concns. were derived on the basis of the Donnan equil. The effect of small successive exchange replacements on the relative release of ions as compared to the effect of a large single replacement was emphasized.

6415. BARTLETT, JAMES H. AND KROMHOUT, R. A. **The Donnan equilibrium.** *Bull. Math. Bio-phys.* **14**, 385-91 (1952).—*C.A.* 47, 4692*d*.

Beginning with the assumption that the electrochem. potential for each ionic species was (spatially) const. and that the elec. potential was given by Poisson's equation a complete solution was given for the spatial distribution of ions and potential for a simple Gibbs-Donnan equil. These quantities varied only in a region of approx. 300 A. about the membrane. Outside this region electroneutrality was an extremely good approximation.

6416. EDESKUTY, FRED J. AND AMUNDSON, NEAL R. **Mathematics of adsorption. IV. Effect of intraparticle diffusion in agitated static systems.** *J. Phys. Chem.* **56**, 148-52 (1952).—*C.A.* 46, 8460*b*.

The change in the concn. of a solute with time was calculated in a soln. contg. a porous adsorbent; both equil. and nonequil. cases were considered.

6417. FREISE, V. **Theory of the diffuse double layer.** *Z. Elektrochem.* **56**, 822-7 (1952).—*C.A.* 47, 3654*g*.

The structure of the diffuse double layer on an electrode was calcd. thermodynamically, with the assumption of ideal solns. and 1:1 electrolytes. Not only the concn., but also the pressure had to be assumed to vary locally. The equations obtained could be solved only for special cases, when the vols. of the cation and anion were equal, and the vol. of the solvent twice as large, equal, or half as large.

6418. KASTEN, P. R. AND AMUNDSON, N. R. **Effect of intraparticle diffusion. II. Analytical solution for simple systems in moving-bed adsorbers.** *Ind. Eng. Chem.* **44**, 1704-11 (1952).—*C.A.* 46, 9894*f*.

Adsorption in a moving bed was considered, based on the assumption of uniform, porous spheres as the adsorbent medium, and rodlike flow of both fluid and particles. Under equil. conditions, the relation between the adsorbate concn. of the fluid and solid followed the isotherm for that system. Under nonequil. conditions, a linear, reversible kinetic relation was assumed, solvable by analytical methods.

6419. LEVINE, S. AND SUDDABY, A. **Free energy of the double layers of two parallel plates in a 1-2 electrolyte.** *Proc. Phys. Soc.* (London) **A65**, 405-18 (1952).—*C.A.* 46, 10837*h*.

An expression was obtained for the free energy. Two cases arose depending on whether or not the bivalent ion and the surface charge had the same sign. The exact formulas were involved and simpler expansion series approximations were also given.

6420. MACKOR, E. L. AND VAN DER WAALS, J. H. **The statistics of the adsorption of rod-shaped molecules in connection with the stability of certain colloidal dispersions.** *J. Colloid Sci.* **7**, 535-50 (1952).—*C.A.* 47, 945*i*.

The previously-prepd. model for the stabilization of colloidal dispersions in liquid paraffins by long-chain alkylarenes was investigated by statistical techniques. The expression developed for the free energy of repulsion between 2 parallel planes adsorbing rod-shaped mols. was compared with the available exptl. data. This repulsion must be responsible for the stabilization of carbon black dispersions in nonpolar media.

6421. SCHLÖGL, R. AND HELFFERICH, F. **Theory of exchange-membrane potentials.** *Z. Elektrochem.* **56**, 644-7 (1952).—*C.A.* 47, 3654*e*.

A generalized equation for the membrane potential was proposed.

6422. VOUK, V. B. **Stability of lyophobic sols.** *Nature* **170**, 762 (1952).—*C.A.* 47, 3084*e*.

The Ostwald rule that coagulation takes place at approx. const. value of the activity coeff. of the coagulating ion was derived for sym. electrolytes from the Verwey-Overbeek theory.

6423. WIRTH, J. K. AND MACHU, WILLI. **Quantitative electroösmotic investigation of the structure of colored films.** *Werkstoffe u. Korrosion* **3**, 453-60 (1952).—*C.A.* 47, 4690*f*.

Tests showed that in addn. to the electrolytic soln. pressure inherent in all metals having a natural or artifical colored surface film, an addnl. force must be considered in corrosion phenomena. This force is the electrokinetic potential increase in the boundary layer: capillary wall/capillary fluidity, the so-called ζ potential or a still unknown discharging force, which brings about the potential increase. An idea of the size of this potential increase can be obtained only on the basis of the Helmholtz-Perrin equation.

6424. HANSEN, ROBERT S. AND FACKLER, WALTER V., JR. **A generalization of the Polanyi theory of adsorption from solution.** *J. Phys. Chem.* **57**, 634-7 (1953).—*C.A.* 48, 22*e*.

The Polanyi theory of the adsorption from soln. of solutes of limited soly. was corrected and generalized to nonideal solns. of complete miscibility. Necessary assumptions and their limitations were discussed. Isotherms for the adsorption of water, 1-propanol, and 1-butanol from the vapor phase at 25°C were measured.

6425. HILL, TERRELL L. **Adsorption on proteins, the grand partition function and first-order phase changes, according to approximate statistical-mechanical theories.** *J. Phys. Chem.* **57**, 324-9 (1953).—*C.A.* 47, 6215*e*.

The transition in properties that occurred as the no. B, of adsorption sites per protein mol. got very large, was examd. by the Bragg-Williams approxn. With sufficiently large attractive interactions between adsorbed mols., the usual partition function, Ω, based on an approx. theory, predicted a loop and first-order phase change for $B\rightarrow\infty$. Use of the complete grand partition function instead of Ω eliminated the loop and gave the stable equil. path even with an approx. theory.

Chapter V. REFINING OF SUGARS AND OTHER APPLICATIONS OF ADSORBENTS

The decolorization and purification of sugar liquors represents one of the oldest applications of adsorption in industry. The sugar refining industry since the early decades of the nineteenth century has offered a potential market to a newly proposed adsorbent. The competition for this field of application has contributed in no small degree to the development of adsorbents in general. The literature in this field has been divided into three sections: (1) refining of sugar liquors with bone char, (2) refining of sugar liquors with vegetable carbons, and (3) refining of sugar liquors with miscellaneous adsorbents. Section 3 is quite large and includes the noncarbon adsorbents such as bauxite, clays, ion exchange resins, filter-aid materials, phosphate defecation, and carbonate defecation. There appears to be a place for both granular and finely divided carbon adsorbents in the sugar industry, and the choice depends upon particular local problems. The ion exchange resins are staging a persistent search for their place in the sugar application. There is little doubt that some of the proposed applications are technically sound; the economic justification is the current problem.

The control of tastes and odors in municipal and industrial water supplies by the use of carbon adsorbents has become a technical accomplishment. The demineralization of industrial waters by ion exchange materials is extensively emloyed. The ion exchange resins are finding many additional applications, but the main field of application from tonnage considerations is water purification. The competition of the ion exchange process with the distillation process, which involves a comparison of the cost of regenerant chemicals with the cost of the fuel, seems to have been resolved and depends on the local conditions. There have been a number of recent papers which indicate that one imminent and important problem in this field is the disposal of radioactive contaminants in industrial water supplies.

The petroleum industry employs a considerable tonnage of solid adsorbents in the refining of the products and derivatives which are produced. Improved kilns for the regeneration of these adsorbents, and also for spent catalysts, have been the subject of many publications. Analysis of hydrocarbon mixtures by column chromatography has become a standard procedure, and a commercial-scale separation of olefins, paraffins and aromatics by the same technique has emphasized problems concerned with the physical structure of the adsorbent and catalyst. Many papers on desulfurization and dehydration of gases and liquids indicate unsolved problems on these topics. References to catalysis and to its many attendant problems dominate the adsorbent literature of the petroleum in-industry. Sections 13 and 14 concerned with catalytic processes include more than one-third of all the entries in Chapter V.

The biochemical, medical, and pharmaceutical applications of solid adsorbents (Section 7) are concerned mainly with analytical, purification, and preparation procedures. The large number of publications is a measure of both the value of adsorbents in this field and the complex behavior with which they are concerned. The Subject Index will be found useful in locating specific examples of adsorbent-adsorbate systems.

Aspects of adsorption and adsorbents of interest to agriculture (Section 8) are those concerned mainly with the soil, plant growth, and the processing of agricultural products. The number of publications concerned with soils are in the majority and for the period 1943–53 were three-fold greater than for 1900–43.

It is rarely possible to predict the behavior of an adsorbent applied to a product or process not previously studied. A specific application is sensitive to many variables which influence the adsorbility of the various components of the system and the success of the application often depends on the choice of conditions as well as the adsorbent. In spite of this requirement, the use of the commercial adsorbent appears to be the closest approach to a universal unit operation that is now available to industry.

V-1. Refining of Sugar Liquors With Bone Char

6426. ANON. **Standard specifications for bone char.** *A.S.T.M. Standards* 1942, II, 722-3.

These specifications (A.S.T.M. D 210-41) covered the use of bone char as a pigment: (a) dry pigment; (b) paste in oil; (c) paste in Japan. The color and tone were matched to a reference sample mutually agreed upon by the purchaser and the seller.

6427. ROCK, E. **Determination of the sizes of rotary kilns.** *Tonind.-Ztg.* 66, 288 (1942).—*C.A.* 37, 5287^7.

Equations were developed for the design of rotary kilns.

6428. BROWN, J. M. AND BEMIS, W. A. **Experience with a sand filter used in conjunction with a Williamson-type clarifier.** *Intern. Sugar J.* 45, 319-20(1943).—*C.A.* 38, 1135^9.

Liquor from the Williamson clarifier contained 0.1 g - 1.0 g of insol. matter per gallon. A sand filter, details of which were given, inserted between the clarifier and the char filters removed all insol. matter from the liquor. The trouble with clogging or scum formation in the char filter was entirely removed.

6429. LI, E. K.; CHANG, L. T., AND LIU, P. L. **Decolorization of Chinese crude sugar by bone char.** *Hua Hsueh Chemistry* 7, 136-41(1943).—*C.A.* 39, 3171^4.

A 50% crude sugar soln. was first decanted with egg-white and the clear liquor dild. to the required concns. The pH of the sugar soln. was adjusted by means of 0.1 *N* NaOH prior to decolorization. Bone char (Merck) was added to the sugar soln. heated (steam-bath) to the assigned temp. with const. shaking. After 10-40 min. the soln. was filtered and compared with the original undecolorized soln. in Nessler tubes, with a Duboscq colorimeter. Results showed that, for a soln. (39.2 Brix, pH 7.7) with addn. of 11 wt-% of 80-100 mesh char, optimum conditions were 80°C and a 20-min. reaction period.

6430. SALSAT, JEAN. **Bone char control in the laboratory.** *Bull. assoc. chim.* 60, 193-8 (1943).—*C.A.* 40, 2663^6.

A procedure was outlined to det. the pH of a water extract of a char. A procedure was outlined for evaluation of the color and Ca removal. The results obtained with a new bone char, a well-revivified char, and a poorly revivified char were discussed. A good char should have a pH of 9.6 or over. The sp. gr. of the H_2O ext. and the org. matter should be as low as possible. A good char gave up little Ca salts to the washings, while with a poor char the washings contained more Ca salts than that contained in the melt.

6431. SALSAT, JEAN. **Bone char: technical treatment in the refinery.** *Bull. assoc. chim.* 60, 303-9 (1943).—*C.A.* 39, 3455^6.

Regeneration, by chem. treatment with subsequent revivification in the kiln, was discussed. The char must be sweetened off with very hot H_2O at pH 7.8; the discharge should have a temp. of at least 75°C. If the pH dropped below 7.2, during the operation NaOH or Na_2CO_3 must be added to the H_2O used for further washing. The course of the revivification in the kiln was discussed on the basis of 2 temp.-time curves for the batch and continuous process, resp.

6432. ITSUMI, FUMIO AND TOMITA, HIROTAKE. II. **Preparation of fructose sirup from the rhizome of Brussels chicory.** *J. Agr. Chem. Soc. Japan* 20, 221-6(1944).—*C.A.* 43, 888*c*.

Inulin extd. from the rhizome of Cichorium intybus with H_2O (8 times the vol. of air-dried root) at 100°C 2 hrs was saccharified almost completely (96.56%) by the above mold to fructose sirup (yield 72.86%). It was refined with 0.7% bone char and filtered with diatomaceous earth. The sirup had a pH 6.2 and contained H_2O 28.13, fructose 55.04, total N 0.84, ash 5.53%, and a minute amt. of org. acids. It was yellow and transparent, very sweet without sour or bitter taste, and completely odorless.

6433. KHODOROV, E. I. **Regulating the heat of rotary kilns.** *Tsement* 10, No. 4, 14-18(1944). —*C.A.* 39, 598^9.

The temp. within a rotary kiln could be controlled by regulating the fuel and air supply and the temp. of the flue gases. Formulas were given connecting the factors having direct bearing on the heat requirements and the temp., such as moisture content of the slurry, calorific value of the coal, kiln output, and compn. of flue gases.

6434. BABCOCK, A. B. **Elimination of mineral salts in cane-sugar refining.** *Sugar Ind. Engrs. Papers* 6, 21 pp. (1945) (Separate).—*C.A.* 40, 2015^6.

The removal of ash from sugar liquors followed the form: $K(1-A)/A=(V/W)^N$, where A was % ash, V the unit vol., W the unit wt of bone char, and K and N consts. Ash in the wash water was detd. in a cond. cell. The point where the washing ceased to be economical was independent of the vol.-wt of the char; hence, all bone chars should be washed to the same cell reading (in these expts. 150). Burning of the char appreciably increased its ash-absorbing property.

6435. BABCOCK, A. B. **Aging of bone char.** *Intern. Sugar J.* 47, 128-30 (1945).—*C.A.* 40, 5589^2.

No shrinkage of bone char particles occurred due to heat; the vol. of the bed decreased because the surface of the grains wore smooth by attrition, or Ca phosphate was dissolved therefrom. Increase in wt per ft^3 during use was due to the filling up of the pores with foreign matter, mostly mineral, which was adsorbed from the liquors but not completely washed out. During subsequent heating, part of this mineral matter was made insol. and remained within the bone char as part of the permanent structure.

6436. BLAKE, A. F. **Decarbonization of service chars.** *Intern. Sugar J.* 47, 295-7(1945).—*C.A.* 40, 1338^3.

When lower-grade service chars in a cane-sugar refinery were properly decarbonized under carefully controlled conditions, the improvement in decolorizing and ash absorbing power was appreciable. The ash removal was trebled after the third decarbonization. On the intermediate grade of service char, this improvement was not so pronounced. The particle size was very slightly affected during decarbonization.

6437. DEITZ, VICTOR R. **Bone char research.** *Intern. Sugar J.* 47, 99-100(1945).—*C.A.* 39, 2898^1.

The sp. surface area of new and regenerated bone char was measured. The usual regeneration processes decreased the surface area greatly, often as much as 70%. No correlation was evident between the surface area and the decolorization power of a given char. This was probably due to the fact that equil. between the char surface and the constituents in soln. was never established during any given expt. Slight variations in the pH effects of chars changed the color removal properties and the action of colloidal and suspended matter introduced complications. Oxygen adsorbed on bone char also played an essential role in decolorization. All of these variables must be studied separately before a bone char can be evaluated accurately.

6438. LÖWY, KURT. **The adsorption of electrolytes by bone char and its effect on the decolorization of sugar liquors.** *Anais assoc. quím. Brasil* 4, No. 1, 9-24 (1945).—*C.A.* 39, 5523^6.

Filtration through bone char increased the pH of liquors free from electrolytes, the more the higher the temp. to which the bone char had been heated. The pH of liquors contg. buffer salts changed little. Anions readily adsorbed by the char, such as sulfate, caused an increase in the pH; cations readily adsorbed, such as Ca, decreased it. The pH of the liquors passing through revivified char gradually diminished with the disappearance of the CaO; after satn. the pH remained const. The anions which caused an increase in the pH of the liquors diminished the decolorizing power of bone char, while the cations that decreased the pH had a favorable effect on decolorization.

6439. RICE, WHITMAN. **Reactivation and handling of bone char.** *Sugar Ind. Engrs.' Papers* 6, 7 pp (1945); *Intern. Sugar J.* 48, 211-12 (1946).—*C.A.* 40, 1338^4, 6857^4.

A revolving-drum char revivifier was described.

6440. VICTOR, V. P. **Air recirculation in drying of unbound moisture.** *Chem. & Met. Eng.* 52, No. 7, 105-9(1945).- *C.A.* 39, 4271^2.

The drying of a material was divided into two stages: (1) const. drying rate stage--rate of moisture removal limited by the ability of the circulated air to pick up moisture; (2) falling rate stage--drying rate controlled by the ease with which the material gives up moisture. In the second stage the rate of air circulation was relatively unimportant but its temp. and humidity were very important. Above 260°F (supply-air dry-bulb temp.), the greater the recirculation, the higher will be the drying speed and the heat economy. Below 260°F (supply-air dry-bulb temp.), a compromise between heat economy and drying speed had to be made. Drier performance was often limited by inadequacy of the air supply.

6441. DEWHALLEY, H. C. S. AND ALBON, N. **Some notes on experiments with bone charcoal. Particle size and its effect on decolorizing.** *Intern. Sugar J.* 48, 125-8(1946).—*C.A.* 40, 5940^3.

The amt. of color removed from a sirup was directly proportional to the surface of the char. The rate of color removal, however, was dependent on the rate of access of the sirup to the char surface. Char of small particle size did not effect greater decolorization, but it did effect it more rapidly because the sirup was more quickly exposed to the entire char surface. Char having a mean particle size of 0.0059 in. removed as much color in 15 min. as a char of 0.047 in. particle size did in 6 hours.

6442. DEWHALLEY, H. C. S. AND DICKINSON, D. R. **Some notes on experiments with bone charcoal. Determination of the heat of wetting.** *Intern. Sugar J.* 48, 73-74 (1946).—*C.A.* 40, 3011^7.

The heat of wetting of a refinery char at 20°C with water at 20°C depended upon the temperature to which it was previously heated. A maximum was obtained (after the char was heated to 420°C) of 8.4 to 8.5 cals per g of char. The heat of wetting by 60° Brix sugar liquor was 8.41, indicating that the sugar did not affect the heat of wetting. The rise in temperature, however, was influenced by the specific heat and weight of the sugar present. A new bone char heated to 420°C and cooled to 20°C gave a heat of wetting of 14.3.

6443. KREBSER, E. E. **Washing bone char.** *Intern. Sugar J.* 48, 106(1946).—*C.A.* 42, 6560*f*.

The washing of bone char outside the filter was studied by using a Hardinge countercurrent classifier (18 in. diam., 4 ft long) having a dry char capacity of 400 lb per hr. The amt. of H_2O necessary was 0.3 gal per lb of char. It was concluded that, judged by the decolorizing efficiency and the Babcock gas test, nothing was to be gained by external washing.

6444. LÖWY, KURT. **Influence of anions in the decolorization of sugar sirups by animal charcoal.** *Anais assoc. quím. Brasil* 5, 17-20 (1946).—*C.A.* 41, 1476*h*.

When a sugar soln. (300 g in 170 ml of water) was treated with 10 ml of a *N* soln. of the anion (chloride, acetate, sulfate, tartrate, citrate) and 10 g of bone char at 90°C for 15 min., the color removal decreased regularly in that order, and the pH increased regularly. When the expt. was repeated with the sol. Ca salts in the presence of a neutral borate buffer to keep the pH const., the color removal varied with the anions: univalent 53-58; bivalent 39-43; trivalent (citrate) 3%. The percentage of removal was directly proportional to the amt. of the anion.

6445. PERKTOLD, FRANZ. **Effect of the Weber (column) packing methods upon the distribution of liquid in packed columns.** *Angew. Chem.* B19, 184-5 (1947).—*C.A.* 42, 2142*e*.

A glass column of 30-cm diam and 50-and 100-cm height was packed with 12 × 12 mm Raschig rings using "inside," "outside," and "neutral" loading corresponding to pouring the packing into the column from the periphery, the center, and in horizontal layers. The equipment permitted collection of effluent in 4 concentric zones. Exptl. data were given for central liquid feed and for liquid feed through 32 jets distributed over the column head. In all cases the two outer zones carried appreciably smaller amts. of liquid. A redistribution of the liquid part way down the column was desirable.

6446. BRINN, M. S.; FRIEDMAN, S. J.; GLUCKERT, F. A., AND PIGFORD, R. L. **Heat transfer to granular materials - settled beds moving downward through vertical tubes.** *Ind. Eng. Chem.* 40, 1050-61 (1948).—*C.A.* 42, 6176*i*.

Ottawa sand was observed to move through tubes substantially as a solid rod, and tests of heat transferred at const. wall temp. to Ottawa sand and to ilmenite confirmed the math. theory for this case. Effective thermal cond. of a bed was computed from the rate of heating of the axis of a stationary cylinder.

6447. DEITZ, V. R.; HIGGINSON, HELEN R., AND PARKER, COLA. **Determination of sulfur in bone char.** *J. Research NBS* 40, 263-74 (1948) RP1871.

The established analytical procedures in sugar technology were found to give erroneous results for the "sulfide" S and "total" S in bone char. The error was found to be caused by the presence of org. S in the carbonaceous component. Soln. of the total S in bone char was obtained in three ways. The ppt. of $BaSO_4$ was found to be contaminated with Ca and phosphate from the bone char. $BaSO_4$ was completely sol. in hot 70- percent $HClO_4$. The distribution of the total S between the carbonaceous residue and the acid filtrate of bone char was detd. after digestion in three mixtures: HNO_3 and HCl, $KClO_3$ and HCl, and HCl alone. The distribution of the total S between filtrate, residue, and evolved gases was influenced by deliberate variations in the acid leaching process.

6448. DEITZ, V. R. AND ROBINSON, H. E. **Heat transfer into cylindrical columns of bone char.** *Ind. Eng. Chem.* 40, 1070-5(1948).—*C.A.* 42, 6176*f*.

The equation for the axial temp. of particles moving in rod-like flow through a cylindrical tube of const. temp. was presented and found to describe bone char revivification in tubes 3 in. diam. Lightly compacted bone char was independently found to have a d. of about 80 lb/ft^3, sp. heat of 0.21, thermal cond. of 0.09 B.t.u. per hr ft °F, and thermal diffusivity of 0.0080 ft^2/hr over the conditions employed.

6449. LÖF, G. O. G. AND HAWLEY, R. W. **Unsteady-state heat transfer between air and loose solids.** *Ind. Eng. Chem.* 40, 1061-70 (1948).—*C.A.* 42, 6177*g*.

The heat-transfer coeff. (B.t.u. per hr per ft^2 per °F) from air at 100° to 250°F to beds of gravel with normal voids equaled $0.79\ (G/D)^{0.7}$, where G was the superficial velocity in lb of air per hr per ft^2 and D was the diam. in ft of the particle having the av. vol. This formula should hold for any solids that are not very irregular or rough.

6450. PAUL, J. **Bone char in the sugar industry. Adsorption of lime salts.** *7th Congr. intern. ind. agr., Paris* 1, Pt. 2, 18 (1948); *Sugar Ind. Abstracts* 10, No. 8, 85 (1948).—*C.A.* 43, 6445*g*.

Bone char not only decolorized, but also eliminated part of the non-sugars. The study of lime-salt adsorption curves and hydrometer measurements of wash waters of the char at different stages of filtration and regeneration may assist in detg. the optimum conditions for use and regeneration of the char.

6451. SCHNACKY, J. F. **Simplified method of figuring rotary dryer performance.** *Chem. Eng.* 55, No. 5, 143-4(1948).—*C.A.* 42, 6587*f*.

The moisture content of material as a function of temp. allowed the prepn. of a plot of heat required vs. length of dryer. Dryer requirements could then be estd.

6452. VOGT, E. G. AND WHITE, R. R. **Friction in the flow of suspensions - granular solids in gases through pipe.** *Ind. Eng. Chem.* 40, 1731-8 (1948).—*C.A.* 43, 912*a*.

The pressure differentials required to produce steady flow of suspensions of sand, steel shot, clover seed, and wheat in air through 0.5-in. com. iron pipe were presented. These values and data from the literature on the pneumatic conveying of wheat in pipe sizes ranging from 2 to 16 in. in diam. were correlated by means of an empirical equation.

6453. BABCOCK, A. B. **Tests for revivification of bone char.** *Proc. Tech. Sess. Bone Char* 1949, 19-31.—*C.A.* 43, 8650*b*.

The tests were the cond. and sp. gr. of the wash water and the cond. cell reading of an aq. ext. of the revivified bone char. The completeness of burning was shown by (1) color removal of a sugar liquor, (2) pH of an aq. ext. of the bone char, (3) amt. of color imparted to a lye soln. on boiling, and the accompanying test with Pb acetate paper; (4) the gas test to det. vol. of gas evolved on heating to a specified temp.

6454. BARRETT, ELLIOTT P. **Effects of use and reactivation on some properties of bone char and synthad C-38.** *Sugar Ind. Technicians* 1949, 21 pp.

Natural bone char showed a tendency to develop pores of relatively large radius on repeated cycling and, as a result, its B.E.T. surface decreased rapidly during the first few cycles. Synthad C-38 showed no tendency to develop large pores in use and, in contrast to bone char, gained vol. in pores smaller than 70 A.U. in radius instead of losing it as bone char did. Consequently, the Synthad deteriorated more slowly in B.E.T. surface than did bone char. The bulk density of Synthad C-38 increased more slowly in service than that of natural bone char. A sufficient correlation between "total" area and activity existed to justify, as a practical matter, the handling of chars so as to maintain the maximum possible area.

6455. Barrett, Elliott P. and Brown, J. M. **Some experiments with synthetic granular adsorbents for sugar refining.** *Proc. Tech. Sess. Bone Char* 1949, 198-240.—*C.A.* 43, 8649*e*.

The requisite properties for a bone char replacement were discussed. Some of the properties of a synthetic hydroxyapatite, developed as one component of the product, were presented and the results of a series of lab. expts. on the use and reactivation of a char made with it were described. The results of refinery-scale comparisons were summarized. N_2 adsorption and desorption isotherms at low temp. on the adsorbents were presented from which total pore areas and vols. were calcd. The pore-size distributions, detd. from the desorption branches of the isotherms, were presented.

6456. Bastone, H. J. and Babcock, A. B. **The sweetening-off of bone char.** *Proc. Tech. Sess. Bone Char* 1949, 149-64.—*C.A.* 43, 8650*d*.

The displacement with water of the sugar liquor within a char filter is called sweetening-off. The porosity of bone char, its grain size, and the purity of the liquor filtered had a very definite effect on sweet water formation. Results were shown of several series of expts. indicating the extent of these factors. Other factors also discussed were the effect of dust in the bone char and the intermittent method of sweetening-off.

6457. Beal, C. W. **Factors influencing the pH of bone char filtered liquors.** *Proc. Tech. Sess. Bone Char* 1949, 165-82.—*C.A.* 43, 8650*e*.

Volatile bases, such as NH_3 and pyridine, contributed to the high alky of the first portion of filtrate from a char filter. A second factor was the gradual decrease in Ca^{++} in the filtered liquor as the cycle progressed. This resulted from a depletion of available Ca compds. in the char. The Ca^{++} lost during filtration was restored to the bone char by the breakdown of calcium organates and calcium sulfate during revivification. The revivification temp. was also important. Some pH changes appeared to be assocd. with ion-exchange reactions operating in the H-cycle.

6458. Bemis, W. A. and Reed, W. L. **Commercial char driers.** *Proc. Tech. Sess. Bone Char* 1949, 61-93.—*C.A.* 43, 8649*g*.

A résumé of the operating characteristics of the common types of com. char driers was presented. This was based on data supplied through a questionnaire distributed to all the refineries. Data were also presented on specific drying curves for several types of char in a DeVries type of drier used at the Revere Sugar Refinery.

6459. Friedman, S. J. and Marshall, W. R. Jr. **Studies in rotary drying. I. Holdup and dusting.** *Chem. Eng. Progress* 45, 482-93 (1949).—*C.A.* 43, 8752*e*.

The holdup and dusting in a 1-ft diam. by 6-ft long rotary drier were measured for 11 different materials. Over a wide range of drier slope, rate of rotation, feed rate, air rate, and material characteristics, it was found that the holdup in a rotary drier, for both counter- and co-current air flow, could be estd. satisfactorily from equations that were presented. Although no quant. correlation was obtained, the effects of rate of rotation, slope, feed rate, and air rate on dust losses from the small rotary drier were presented.

6460. Friedman, S. J. and Marshall, W. R. Jr. **Studies in rotary drying. II. Heat and mass transfer.** *Chem. Eng. Progress* 45, 573-88 (1949).—*C.A.* 43, 8752*g*.

The effect of air rate, feed rate, rate of rotation, slope, and no. of flights on the heat transfer occurring from hot air to several different sands was studied in a 1-ft by 6-ft rotary drier; length and volumetric heat-transfer coeffs. were evaluated over 6 incremental lengths of the drier. Tests were also conducted in which sand was dried in the exptl. unit. The magnitude of the heat-transfer coeffs. and the effects of the operating variables in the drying tests were the same as those obtained in the heat-transfer tests. A method of scale-up was suggested.

6461. Knowles, H. I. **Decolorizing and ash-removal tests.** *Proc. Tech. Sess. Bone Char* 1949, 9-17.—*C.A.* 43, 8649*b*.

The function of bone char in sugar refining was discussed. The color and ash adsorption test was intended to show the capacity of the bone char for the adsorption of nonsugar impurities. Different procedures for carrying out the test were mentioned and one which has been proved satisfactory in practice was described in detail.

6462. Krevelen, D. W. van and Hoftijzer, P. J. **Drying of granulated materials. I. Drying of a single granule.** *J. Soc. Chem. Ind.* (London) 68, 59-66 (1949).—*C.A.* 43, 4906*a*.

To predict the dimensions of app. needed, a theoretical presentation was followed by the derivation of equations for granules with no sol. salts and granules with sol. salts crystg. during drying. Exptl. verification was obtained by using wet marl and nitro chalk fertilizer contg. 60% NH_4NO_3 and 40% marl.

6463. Krevelen, D. W. van and Hoftijzer, P. J. **Drying of granulated materials. II. Drying of granules in rotary dryers.** *J. Soc. Chem. Ind.* (London) 68, 91-7 (1949).—*C.A.* 43, 5648*b*.

The relationship for the residence time as a function of the environment was detd. from a study of the movement of material through the dryer. In rotary dryers, the drying rate was from 1/4 to 1/5 of the rate for freely suspended granules without sol. salts, and was equal to that for freely suspended fertilizer granules.

6464. Louviere, W. H. and Varnau, B. H. **Problems in conventional kiln operations.** *Proc. Tech. Sess. Bone Char* 1949, 94-104.—*C.A.* 43, 8648*h*.

The operation of the char house at Sugar Land, Texas, was reviewed. The construction of the combustion chamber specifically for natural gas was found to be essential for satisfactory results with chrome retorts. An arch design constructed of refractories eliminated the conventional sprung arch. Decarbonization of char in the conventional kiln with louvered single cooler pipes was practical and economical.

6465. MACTAGGART, E. F. **Drying machinery and its development.** *Trans. Inst. Chem. Engrs.* (London) 27, 23-35 (1949).—*C.A.* 46, 6871*g*.

The development of driers and the most usual forms of driers in use were described. There were only 15 different designs in industrial use in England. No drier was applicable to all problems and there was usually a considerable difference in operating costs. The steam consumption of various types ranges from 1.1 to 3.1 lb steam/lb H_2O evapd.

6466. MCDONALD, E. J. **Invert formation in sucrose solutions.** *Proc. Tech. Sess. Bone Char* **1949**, 183-97.—*C.A.* **43**, 8714*i*.

The hydrolysis of sucrose, carried out in concd. or dil. soln., is of importance to the sugar industry. In dil. soln. sucrose inversion was a first-order reaction and the well-known Clerget method for sucrose detn. depended upon the change of optical rotation of a dil. sugar soln. before and after inversion. In concd. soln. the reaction was more complex and more difficult to follow. The close relation of inversion and purity in this range make it of utmost importance to the sugar refiner.

6467. PAYNE, G. W. **The cooling of revivified bone char.** *Proc. Tech. Sess. Bone Char* **1949**, 105-18.—*C.A.* 43, 8649*i*.

Indirect contact air coolers were generally inefficient. Improvement might be effected if the char stream were broken up by passing over staggered cross-tubes through which cooling air was blown. Water as the cooling medium in an indirect contact liquid cooler on the Herreshoff furnace resulted in a cooler of small dimensions. Little use can be found in most sugar refineries for the hot water obtained. Other liquids of higher b. p. (e.g. Dowtherm) might be employed to heat air to a temp. suitable for use in the drying section.

6468. PENNINGTON, N. L. AND DEITZ, V. R. **Rapid determination of the carbonaceous residue in bone char.** *Proc. Tech. Sess. Bone Char* **1949**, 32-42.—*C.A.* 43, 8648*d*.

The method was based on a turbidity measurement. The ground sample (screened through a no. 270 sieve) was treated with a small vol. of HCl and the mixt. dild. to a known vol. with distd. water. Turbidimetric readings were taken at 2 or 3 dilns. and a plot made of the values of log of the reciprocal of the transmittance (T) against the concn. (c) of the suspension. A linear plot was found according to the relationship: $\log 1/T = S \times c$. Results were presented for a large variety of bone chars and a common calibration curve appeared to be valid.

6469. ROBINSON, H. E. **Effect of the size and shape of columnar retorts on the heating of granular materials.** *Proc. Tech. Sess. Bone Char* **1949**, 284-302.—*C.A.* 43, 8648*i*.

Theoretical relationships were derived to design columnar retorts for heating granular materials such as bone char. The relations between the shape and size of retort and the throughput, time of heating, and heat duty per ft^2 of retort surface were given for retorts of circular, sq, and rectangular cross section. The throughput capacity of circular and sq retorts was shown to be independent of their size, but that of rectangular retorts depended on the ratio of width to depth. Kilns made with small-diam. retorts with close spacing, heated entirely by a condensing vapor, were proposed to obtain a high-capacity automatically thermostated process.

6470. VAVRUCH, I. **Adsorption and chromatographic separation of sugars on bone char.** *Listy Cukrovar.* 66, 249-51(1949-50).—*C.A.* 46, 7801*e*.

The adsorption of glucose, fructose, galactose, sucrose, maltose, and lactose by a Czechoslovakian bone char (9.4% of C on dry matter, 8.7% of H_2O, ground and sieved to contain no dust or particles > 0.5 mm in diam.) was tested. The bone char (5 kg) was mixed with 5 liter of H_2O, washed for 48 hrs, and dried at 130°C. In each test, 120 g of char was packed in a glass column (3.15 cm in diam.), to 8.5 g per ml, with gauze, etc. at the bottom. The sugar soln. (100 ml) was percolated through the dry char (mostly at 20-25°C), the initial pH value being 6, and the pH value of the filtrates 8.2. Adsorption was measured by examg. the filtrates polarimetrically. Monosaccharides were more easily adsorbed than disaccharides; with increasing concn. of sucrose, the amt. adsorbed increased up to 50%, but was lower with concns. of 60% and over. The amt. of sucrose adsorbed per g of char decreased with decreasing length of column, probably owing to faster flow in the shorter column. Monosaccharides were more readily desorbed by H_2O or by aq. ethanol (7%) than were disaccharides. Ethanol gave more rapid desorption, but the differences found between the sugars with the bone char were insufficient for chromatography; active carbon was better in this respect. Similar results were obtained in tests with invert sugar, mixts. of glucose and sucrose, thick juice, raw sugar, molasses, and honey. The sucrose remaining in the bone char hastened the desorption of glucose from mixts.

6471. BEERWALD, ALEXANDER. **The reduction of magnesium sulfate by carbon.** *Z. anorg. Chem.* 261, 52-62(1950).—*C.A.* 44, 5750*b*.

The basic equation for the reduction was $2MgSO_4 + C \rightarrow 2MgO + 2SO_2 + CO_2$. S was formed by reduction of SO_2 by carbon; the yield of S being greater the more reactive the carbon used. The assumption of some investigators that the basic reaction was $MgSO_4 + C \rightarrow MgO + SO_2 + CO$ could not be supported; with types of carbon which produced small yields of S, the ratio of C to $MgSO_4$ was approx. 0.6:1.

6472. CLERIOT, J. **Calcium salts in animal black.** *Congr. intern. ind. agr., 8th Congr., Brussels* **1950**, 134-42 (in French).—*C.A.* 47, 2961*e*.

Ca salts adsorbed by animal black were divided in two groups (1) alk. salts (saccharate) and $Ca(OH)_2$ and (2) neutral and acid salts. The first showed a strong absorption and were weakly released in contact with water; the second showed the opposite results. Release in water was detd. by the hardness (*DH*) of water with a certain amt. of animal black. Revivification must try to get $DH = 0$; otherwise exchange of Ca ions took place. Heating alone resulted in changing salts of group 1 into those of group 2. This was favored by inlet of some air during heating and best followed by washing with dil. HCl soln.

6473. DEITZ, V. R. AND BROWN, J. M. **Some economic aspects of the bone char process in sugar refining.** *Intern. Sugar J.* 52, 147-150 (1950); *Ing. Intern. Industria* 9, 68 (1950).—*C.A.* **44**, 7573*i*.

A primary factor was the cost of new bone char. Values were given for the period 1905 to 1949. Large quantities of water were used and its quality and the fuel requirements for heating it were important factors. Coal, oil and natural gas have been used in the char kilns, and there is a tendency today to reduce char kiln temps. Possible improvements in the char process were mentioned.

6474. GUERIN, J. **Variations in the properties of animal black during filtration and revivification.** *Congr. intern. ind. agr., 8th Congr., Brussels* **1950**, 142-51 (in French).—*C.A.* 47, 2961*a*.

The most important detns. for reactivated char were the pH and *DH*. (*DH* was the hardness imparted to distd. water added to a sample of char in such amt. that no supernatant liquid was observed). pH must be about 9.3 and *DH* about 0. $DH > 5$ proved bad reactivation; $pH > 9.3$ showed too high a temp. during reaction. Of less importance were absorption coeffs., titration curve (buffer at pH 9.0-9.3), and detn. of carbonates and org. matter.

6475. MUKHERJI, B. K. **Modification of cane molasses. II.** *J. Indian Chem. Soc., Ind. & News Ed.* **13**, 159-62(1950).—*C.A.* **45**, 7367*f*.

Studies were made on the removal of mineral matter from molasses by dialysis, flocculation, and adsorption on chars. Approx. 50% of the ash could be easily dialyzed from molasses through 200 grade parchment paper with a concurrent loss of less than 1/3 of the sugar. Slight alky. of the water favored ash removal and depressed sugar removal. Less than 5% of the ash constituents were removed by the flocculating agents tried. The multivalent hydroxides $Ca(OH)_2$ and $Al(OH)_3$ were the best.

6476. PAYNE, G. W. **The design of pipe kilns for bone char revivification.** *Congr. intern. ind. agr., 8th Congr., Brussels* (1950) **1**, 525.

Methods to increase the efficiency of existing kilns are presented. The char ought to be uniformly regenerated to give the longest possible life in maintaining its decolorizing power and to reduce the mechanical destruction to a minimum. The retorts should have a high thermal efficiency. Results are given for a combination of a single unit of drier, retort, combustion chamber, and cooler.

6477. SPRINGUEL, J. **Estimation of the effect of regeneration of bone char by the amount of organic compounds dissolved by sodium hydroxide.** *Congr. intern. ind. agr., 8th Congr., Brussels* **1950**, 164-6 (in French).—*C.A.* 47, 2961*c*.

Bone char (50 g) was boiled for 2 min. with 100 ml of NaOH soln. (150 g/liter). Evapn. must be prevented. The soln. was filtered through a glass filter with 1 g of kieselguhr (washed with HCl soln. and calcinated). A very slight yellow color showed good regeneration; a colorless soln. showed that regeneration had been excessive. A more precise method was obtained by neutralizing 20 ml of the soln., and then adding water to 100 ml, followed by 10 ml of 2 *N* KOH soln. and 10.00 ml of 0.1 *N* $KMnO_4$ soln. This mixt. was heated to boiling and boiled for 10 min. After cooling, 25 ml of 5 *N* H_2SO_4 soln. was added with 10.00 ml of 0.1 *N* oxalic acid soln., and the excess oxalic acid was found by titration with $KMnO_4$ soln. The result was expressed in mg of O per 100 ml original soln.

6478. BARRETT, ELLIOTT P. **Trends in the development of granular adsorbents for sugar refining.** *Advances in Carbohydrate Chem.* **6**, 205-30 (1951).

The commercial requirements for granular adsorbents were outlined. Bone char, Synthad, and activated carbon were compared according to the pore vol. distribution curves (derived from low temp. N_2 adsorption isotherms), color removal, ash removal, and pH changes.

6479. BARRETT, ELLIOTT P.; BROWN, J. M., AND OLECK, S. M. **Some granular carbonaceous adsorbents for sugar refining. Bone-char replacements based on hydroxyapatite.** *Ind. Eng. Chem.* 43, 639-54 (1951).—*C.A.* 45, 5433*e*.

"Synthads" were developed by carbonizing mixts. of synthetic hydroxyapatite with an appropriate binder to increase mech. strength. They had a bulk d. of about 38-40 lb/ft^3 in 10 × 28 mesh size, and could be made to have a pore vol. and mean pore radius substantially the same as those of bone char. This material was tested in a refinery for 32 cycles of use and reactivation, in comparison with bone char. Synthad C-38 lost area more slowly in service than natural bone char. The bulk d. of bone char increased more rapidly than that of Synthad C-38. This appeared to correlate with a more rapid deterioration in color-and ash-removal power on the part of bone char.

6480. BEMIS, W. A. **Bone char test procedures. I. Preparation of test sample.** *Proc. Tech. Sess. Bone Char* **1951**, 16-23.—*C.A.* 46, 6339*i*.

6481. BLANKENBACH, W. W. AND PENNINGTON, N. L. **Bone char test procedures. II. Carbonaceous residue and insoluble ash.** *Proc. Tech. Sess. Bone Char* **1951**, 24-32.—*C.A.* 46, 6339*i*.

6482. Bosworth, R. C. L. **The revivification of bone char with superheated steam.** *Proc. Tech. Sess. Bone Char* **1951**, 348-62.- *C.A.* **46**, 6419*d*.

Spent bone char was revivified on an exptl. scale by treatment with superheated steam. The vessel contg. the char was closely lagged, and heat was supplied only in the form of the superheated steam. The steam acted as an oxidizing agent and removed the org. impurities. It also hydrolyzed the undesirable CaS present in the char. Dissocn. of the $CaCO_3$ during steam treatment could not readily be repressed by mixt. of the steam with CO_2, but the effective pH of the alk. char could be adjusted after revivification by cooling in a stream of flue gases.

6483. Cantor, S. M. **Bone char test procedures. IX. Hardness test.** *Proc. Tech. Sess. Bone Char* **1951**, 80-90.—*C.A.* **46**, 6340*a*.

6484. Carpenter, F. G.; Barrett, E. P., and Jonnard, A. **Resistance to flow of fluids through columns of bone char.** *Proc. Tech. Sess. Bone Char* **1951**, 237-58.—*C.A.* **46**, 6419*b*.

The correlation of pressure drop (Δp) with fluid viscosity (μ), flow rate (V_0), and the nature of the packing for viscous flow through beds of granular solids was expressed as: $\Delta p = (k\mu V_0 L)/(g_c D_p^2)$, where g_c is a factor for conversion of mass to force units, and L is the depth of the bed. Lab. detns. of the specific flow resistance (k) were made with air and with sugar liquor as the test fluids with equiv. results. The recommended value of k for design purposes in plant-scale bone-char filters was 700.

6485. Carpenter, F. G. and Louviere, W. **Bone char test procedures. VIII. Sieve analysis.** *Proc. Tech. Sess. Bone Char* **1951**, 71-9.—*C.A.* **46**, 6340*a*.

6486. Chapman, W. R. and Needham, L. W. **The thermal drying of coal.** *J. Inst. Fuel* **24**, 51-60(1951).—*C.A.* **45**, 4426*h*.

Descriptions were given of driers used in England, America, and on the Continent including: rotary-drum driers, vertical driers with revolving and stationary trays, cascade driers, screen-type driers, and flash driers, as well as other types still under exptl. study. Performance data were given for some of these driers, with cost data, and comments as to the suitability of driers for specific problems. Only coal drying was discussed, but the data had a wide application to problems of drying other granular materials.

6487. Conrad, George C. **Continuous countercurrent sweetening-off and washing of bone char.** *Proc. Tech. Sess. Bone Char* **1951**, 259-79.—*C.A.* **46**, 6418*i*.

The water treatment of char was investigated in a continuous extractor. The max. wt ratio of water to char was fixed in accordance with existing refinery practice. The increase in the rate of diffusion with increased flow rates indicated that rates higher than those experienced in present char-house procedure are possible in the continuous column. No specific data relative to sugar-liquor filtration were presented, but the operation was briefly outlined.

6488. Cotter, S. E. and Conrad, G. C. **Bone char test procedures. XII. pH of water extract.** *Proc. Tech. Sess. Bone Char* **1951**, 105-17.—*C.A.* **46**, 6340*b*.

6489. Cotter, S. E. and Woehrle, P. P. **Bone char test procedures. XI. Lye test.** *Proc. Tech. Sess. Bone Char* **1951**, 91-104.—*C.A.* **46**, 6340*a*.

6490. DeVries, R. P. and Bemis, W. A. **Preliminary experiments with new drier for bone char.** *Proc. Tech. Sess. Bone Char* **1951**, 363-71.—*C.A.* **46**, 6419*a*.

Efforts to redesign and improve the regular DeVries Char Drier were reported. The use of screens to contain the wet char was not practical, because plugging could not be prevented. The use of flue gases in direct contact with the char appeared to be undesirable, since these gases carried too much moisture derived from the combustion of the fuel. A heat exchanger would utilize the heat in the flue gases without the accompanying danger from moisture.

6491. DeWhalley, H. C. S. **Bone char test procedures. VI. Moisture.** *Proc. Tech. Sess. Bone Char* **1951**, 57-9.—*C.A.* **46**, 6340*a*.

6492. Gillett, E. C. **Bone char test procedures. XIII. Batch tests for color and ash removal.** *Proc. Tech. Sess. Bone Char* **1951**, 118-24.—*C.A.* **46**, 6340*b*.

6493. Gillette, E. D. **Double char filtration of high-purity sirups as practiced at Refined Syrups & Sugars, Inc.** *Proc. Tech. Sess. Bone Char* **1951**, 228-36.—*C.A.* **46**, 6417*a*.

The method applied to high-purity liquors resulted in a definite improvement in the char filtration operations. Data were presented for operations before and after the initiation of double filtration with particular emphasis on color removal. The color and ash removal, and the pH changes were presented graphically at various filter positions in the first and second stages of the system.

6494. Gillette, E. D. and Janeiro, F. **Bone char test procedures. XIV. Column test for color and ash removal.** *Proc. Tech. Sess. Bone Char* **1951**, 125-34.—*C.A.* **46**, 6340*b*.

6495. Grant, E. J. **Bone char test procedures. III. Carbon dioxide, acid-evolved.** *Proc. Tech. Sess. Bone Char* **1951**, 33-40.—*C.A.* **46**, 6339*i*.

6496. Howe, W. L. and Moult, A. M. **Reactivation of bone char.** *Gas. J.* **266**, 109-14, 119-20, 123 (1951) *Gas World* **133**, No. 3479, *Ind. Gas Suppl.*, 44-8 (1951).—*C.A.* **45**, 5433*h*.

The reactivation of bone char by direct contact with the hot products of combustion of manufd. gas in a multiple-hearth, gas-fired kiln was reported. Tests of the kiln showed that the quality of the char was good, and could be maintained at a high level of uniformity. Decolorization of the liquor, ash removal, and pH could be maintained at a level equal to that obtainable with the best retort-burned chars.

6497. Knowles, H. I. **Bone char test procedures. IV. Determination of combined sulfur in bone char.** *Proc. Tech. Sess. Bone Char* **1951**, 41-50.—*C.A.* 46, 6340*a*.

6498. Luethge, J. A. **How to scale up a rotary kiln.** *Chem. Eng.* 58, No. 12, 151-3 (1951).—*C.A.* 46, 2859*d*.

Evaluation and operation of rotary kilns were improved by the use of 4 short-cut formulas which permitted calcns. of (1) the right dimensions for equiv. fuel usage, (2) the right diam. for equiv. dust pick up, (3) the proper speed of rotation, and (4) approx. fuel consumption for extra-large kilns.

6499. McLellan, Jack H. and Wayne, Truman B. **An experimental fluidized bed for char revivification studies.** *Sugar J.* 13, No. 9, 13-15, 18-19, 27(1951).—*C.A.* 47, 3014*i*.

A pilot plant for the study of bone char revivification was proposed.

6500. Meade, G. P. **Bone char test procedures. V. Determination of heavy metals (iron, manganese, copper).** *Proc. Tech. Sess. Bone Char* **1951**, 51-6.—*C.A.* 46, 6340*a*.

6501. Muller, G. W., Jr. **Use of recording and controlling pyrometers in char kilns.** *Proc. Tech. Sess. Bone Char* **1951**, 372-5.—*C.A.* 46, 6418*c*.

Modern controller-recorder instruments were a valuable asset to char kilns. The preferred locations of the thermocouples in a char kiln were about 3-4 ft from the top of the retorts and in the center between the cold and hot rows.

6502. Owen, William L. **Development of microörganisms during sugar manufacture. Significance relative to sucrose losses.** *Ind. Eng. Chem.* 43, 606-9(1951).—*C.A.* 45, 5434*c*.

Bone char and decolorizing carbons accelerated the destructive action on sugar of thermophilic bacteria at 132°F, at concns. of 10 and 65° Brix. Part of the undetd. sugar loss was attributable to this effect. The development of microörganisms may also affect the odor and taste of the sugar, while algae in the water supply have a similar effect.

6503. Payne, G. W. and Stordy, J. J. **Plaistow wharf pipe kiln.** *Proc. Tech. Sess. Bone Char* **1951**, 307-47.—*C.A.* 46, 6418*d*.

The kiln was designed to revivify 8000 lb/hr and was divided into two sections on either side of a combustion chamber circulating hot gases. Each comprised a static louvre drier (DeVries type), 100 chrome-steel retorts (thin wall) 3-in. diam., 8.5 ft long in 5 × 20 rectangular arrangement, a cooler contg. 400 steel tubes 1-in. diam., 5 ft long. Air in multipass cross-flow arrangements cooled char to 158°F and was heated to 302°F. Decarbonizing was carried out in a chamber which divided the cooler into two sections. Draw-off gear was of new design. The retort chambers were kept at about 1112°F.

6504. Pickering, R. W.; Feakes, F., and Fitzgerald, M. L. **Time for passage of material through rotary kilns.** *J. Applied Chem.* (London) 1, 13-19(1951).—*C.A.* 45, 5980*i*.

The following expression was derived for the time of passage of a material through a kiln: $T = L \sin \theta / 2\pi r R \sin \alpha$, where T = time in min., L = length of kiln in feet, θ = flow angle between horizontal and surface of charge in plane perpendicular to axis of kiln, r = radius of kiln in feet, R = rate of rotation of kiln in r.p.m., and α = angle of inclination of kiln. The formula was compared with exptl. results and previously derived formulas.

6505. Rosenquist, Terkel. **A thermodynamic study of the reaction $CaS + H_2O = CaO + H_2S$ and the desulfurization of liquid metals with lime.** *J. Metals* 3, *Trans.* 535-40(1951).—*C.A.* 45, 6910*e*.

The reaction $CaS(s) + H_2O(g) = CaO(s) + H_2S(g)$ was studied from 750° to 1425°C. The desulfurization of liquid Cu with CaO was studied at 1200°C. The S content in the Cu was closely proportional to the H_2O/H_2 ratio in the atm.

6506. Saeman, W. C. **Passage of solids through rotary kilns. Factors affecting time of passage.** *Chem. Eng. Progress* 47, 508-14 (1951).—*C.A.* 46, 297*g*.

Equations based on theoretical considerations were developed to give time of passage, axial transport velocity, bed depth, and other characteristics related to the passage of material through rotary kilns without flights. The equations were corroborated by exptl. data, and were particularly useful for evaluating the effects of constrictions in kilns and to calc. the bed depth in Roto-Louvre driers.

6507. Shearon, Will H., Jr.; Louviere, W. H., and Laperouse, R. M. **Cane sugar refining.** *Ind. Eng. Chem.* 43, 552-63 (1951).—*C.A.* 45, 5429*i*.

The equipment and operation of the refinery, the lab control, the consumption of power and auxiliary materials, and the tech. utilization of sugar and by-products were described with flow sheets, diagrams, and photographs.

6508. Snowden, H. C. and Hurlburt, H. Z. **Bone char test procedures. VII. Bulk density.** *Proc. Tech. Sess. Bone Char* **1951**, 60-70.—*C.A.* 46, 6340*a*.

6509. Wenzel, Leonard A. and White, Robert R. **Drying granular solids in superheated steam.** *Ind. Eng. Chem.* 43, 1829-37 (1951).—*C.A.* 45, 8821*b*.

An exptl. study was reported of the use of superheated steam as compared to air as a drying medium for granular materials. Results indicated that higher drying rates and thermal efficiencies were possible when drying with superheated steam rather than air. The use of steam for drying heat-insensitive solids depended on the savings in operating costs as compared to the greater capital expenditure required by the higher temp. and pressure ranges.

6510. WING, E. AND PATTERSON, R. S. **Experiments with a plant-scale rotary char kiln.** *Proc. Tech. Sess. Bone Char* **1951**, 376-405.—*C.A.* 46, 6418*b*.

Expts. were conducted over a period of yrs with a rotary type of kiln that was originally a Weinrich decarbonizer. Changes and modifications were made to adapt the decarbonizer to revivification as well as to decarbonization. Char from regular kilns was compared with that from the rotary unit as to color removal, ash removal, pH, C-content, etc., and the rotary produced better char.

6511. BARRETT, ELLIOTT P. **The development of a synthetic replacement for bone char in cane sugar refining.** *Sugar J.* 15, No. 6, 18-28 (1952).

Evidence accumulated both in the lab. and in full-scale operation of Synthad as a refining aid was presented. Research on Synthad is being continued with the object of improving its performance and minimizing its cost.

6512. BARRETT, ELLIOTT P. **Comparison between bone char and Synthad (artificial calcium hydrophosphate).** *Sugar Ind. Technicians* **1952**, 9 pp.—*C.A.* 46, 9331*d*.

New Synthad removed 2/3 as much ash and color from refinery liquors and 1/4 as much from the sweetwater. After the 2 materials were regenerated the situation was reversed, with the advantage largely in favor of Synthad. Regenerated Synthad retained ash more tenaciously than bone char so long as the brix of the sweetwater was high, and then gave it up more readily with a saving of 2-3 hrs in the washing cycle.

6513. BARRETT, ELLIOTT P.; JOYNER, L. G., AND HALENDA, P. P. **Granular adsorbents for sugar refining - some factors affecting porosity and activity in service.** *Ind. Eng. Chem.* 44, 1827-33 (1952).—*C.A.* 46, 11727*g*.

Bone char washed with hot water gained vol. in the pore-radius range of 70-140 A. and lost vol. in the 20-70-A. range. When heated to 1000°F, the washed bone char lost further vol. in the pore-radius range of 10 to 30 A. and gained vol. in the pores of radius greater than 75 A. Comparison of fresh washed, heated bone char with a 32-cycle char showed wide differences in pore-vol. distribution. Treatment of new bone with NaOAc during the heat treatment gave a product resembling 32-cycle bone in pore-vol. distribution. The NaOAc deposited in the pores of 70-100-A. radius. A synthetic bone char (Synthad C-38) showed similar pore-vol. changes under similar treatment. If all of the mineral matter picked up by the char from the sugar liquor could be washed out before burning, the crystallite growth and the area loss would be negligible.

6514. DEWHALLEY, H. C. S. **Battery sweetening-off in the refinery and washing of char filters.** *Intern. Sugar J.* 54, 96-7 (1952.—*C.A.* 46, 6418*g*.

A battery of 5 bone-char filters was used in the tests. All liquor above 45° Brix was considered full-weight liquor. Each filter of the battery was sweetened off with lights from the preceding filter except the last filter which was sweetened off with water. Sweetening-off was thus effected with a min. of H_2O and a large amt. of the desorbed impurities were depressed to a lower degree of Brix, and eventually to H_2O and drain. The 1.8° Brix lights from the battery tests was lower purity than from H_2O sweetening off; hence lights of higher than 1.8° Brix could be sent to the drain.

6515. FETZER, W. R.; CROSBY, E. K., AND ENGEL, C. E. **Laboratory evaluation of granular carbons.** *Anal. Chem.* 24, 1558-63 (1952); *Intern. Sugar J.* 55, 222 (1953).—*C.A.* 47, 1913*f*.

The color adsorption power of bone char was compared with a reference powd. carbon. The char was first ground to pass 200 mesh and the mesh distribution of the char detd. By means of factors for each fraction, the over-all color removal power was calcd. Factors for reducing batch process figures to a percolation basis were given.

6516. HILL, S. **Channeling in packed columns.** *Chem. Eng. Sci.* 1, 247-53(1952).—*C.A.* 47, 5705*i*.

The sugar-refining operation upon which this work was based was the displacement of sugar liquors by water from columns of bone char and the reverse of this operation. The crit. velocity of flow was defined in terms of the viscosities and ds. of the 2 fluids. The least tendency to channeling was obtained when the denser of the 2 liquids was the lower one in the column for either upward or downward flow.

6517. KRAMERS, H. A. AND CROOCKEWIT, P. **The passage of granular solids through inclined rotary kilns.** *Chem. Eng. Sci.* 1, 259-65 (1952).—*C.A.* 47, 4575*i*.

Formulas were derived for the hold-up of an inclined rotary kiln, with and without end restrictions. The bulk of material in the kiln was assumed to have no relative motion with respect to it, a particle at a distant *r* from the kiln axis described a circular path in a plane perpendicular to the axis with the same angular velocity as the kiln wall. When this particle reached the surface it cascaded down along a straight path. Good agreement was found between the theoretical values and the exptl. results.

6518. MULLER, ROBERT F. AND OTHMER, DONALD F. **Ferric chloride treatment of bone char.** *Sugar* 47, No. 6, 40-3, 54 (1952).—*C.A.* 46, 11729*d*.

Various grades, ranging from new to the poorest grade of refinery bone char, were treated with $FeCl_3$, and burned and revivified at temps. from 700 to 1100°F. The resulting products were used for decolorizing in lab. char filters a 60° Brix soln. of 600 Lovibond color (Series #500), prepd. by mixing a clarified, highly colored blackstrap with a colorless 67° Brix sugar soln. of high purity. The effect of bone char treated with 1, 4, 8, and 12% $FeCl_3$ and burned at 900°F on color, Brix, pH, ash, Fe, and pol of the liquor was detd. A considerable improvement in color removal was realized.

6519. OWEN, W. L. **The role of bacteriostatic activated carbons and bone char in the sugar-refining industry.** *Sugar J.* 14, No. 9, 16, 19, 20, 36, 37, 41 (1952).—*C.A.* 46, 7350*f*.

Loss of sucrose under thermophilic conditions was the result of microbial activity. Substitution of a bacteriostatic carbon for the untreated carbon as a filter prevented this loss. The loss was accompanied by a corresponding increase in reducing sugars.

6520. BARRETT, ELLIOTT P.; JONNARD, AIMISON, AND MESSMER, J. H. **Granular adsorbents for sugar refining. Some physical properties of bone char and Synthad.** *Ind. Eng. Chem.* 45, 1524-26 (1953).

Because Synthad was used in the same way as bone char and in the same equipment, obtaining strictly comparable results for the two adsorbents, rather than absolute accuracy, was stressed in making the measurements. Heat of wetting, thermal cond., and sp heat were detd. on both adsorbents under comparable conditions. The heat of wetting of Synthad was 0.6 that of bone char. Thermal cond. and sp heat were substantially identical for the two adsorbents.

6521. BERGÉ, A. AND BAERTS, F. **The bone char station at Tirlemont Refinery.** *Proc. Tech. Sess. Bone Char* 1953, 113-33.

The flow diagram at Tirlemont changed many times a year. The char house had to filter liquors of a quality varying with the kind of raw materials, but the "liquor-off" must always be of the same high quality for making Adant as a "basic production". The char house was described and the needs and difficulties of each period were given. The char was evaluated by the quality of the char, liquor-on and -off, sweet water, general figures, losses, regeneration, etc.

6522. BLACK, R. F. AND BEAL, C. W. **Refining scale study of Synthad C-38.** *Proc. Tech. Sess. Bone Char* 1953, 77-95.

The exptl. unit consisted of one full-size kiln and drier, four char filters (1600 ft^3 each), storage bin for the revivified char, screen, and the usual conveying equipment. The av. particle size and boundary surface area of the 6 to 20 mesh Synthad were somewhat different from any of the stock chars. After 28 cycles of service, the Synthad was sepd. into two fractions: (1) remaining on No. 12 and (2) passing No. 12 sieve. This fine fraction had a boundary surface area about the same as the better stock char. At the 40th cycle the fractions were recombined (coarse fraction reduced in particle size) to form a single stock of 10 to 28 mesh material. There was a definite dependence of color removal on the particle-size distribution of the Synthad and the total boundary surface area was shown to be an important contributing factor. There was also an indication that Synthad C-38 was harder than regular bone char. Synthad appeared to hold more water than bone char and has required somewhat different handling in the drier and kiln.

6523. BROWN, J. M. **Washing of char filters and status at various refineries.** *Proc. Tech. Sess. Bone Char* 1953, 5-20.

Details were presented of procedures used to wash plant-scale bone char filters. The discussion was based on replies to a questionnaire submitted to various sugar refineries. The variables involved were the type of available water, the vol. used, rate of washing, and temp. of the water. The many variations were described without reference to the underlying reasons, either economic, physical, or chem. Some data were given for the analysis of the ash for Ca, Na, and K and the ash balances detd. It was concluded that the wide variations now prevalent could not all be justified.

6524. CARPENTER, FRANK G. **Sampling and abrasion hardness of bone char.** *Proc. Tech. Sess. Bone Char* 1953, 257-72.

Sampling heterogeneous granular solids was treated from a fundamental point of view. It was possible to calc. the min. wt of sample which should be used in a test (if sampling were free from bias) from a knowledge of the desired precision, the av. value of the property being tested, the distribution of this property among the particles, and the wt of the individual particles. Known sampling procedures were evaluated and examd. for possible bias due to variations in particle sizes and particle d. The construction and performance of a multiple sample-divider, which reduced a batch of material into eight subsamples, were illustrated and described. The different types of hardness tests were discussed.

6525. CHAPMAN, F. M. **Thermal economy in the char house.** *Proc. Tech. Sess. Bone Char* 1953, 51-55.

Means were discussed for reducing the heat demand in the bone char process. Some of the direct methods were the use of waste heat to dry the washed char, washing char with water at min. temp., and the max. use of capillary drainage before the char driers. Indirectly, heat could be saved by improving the efficiency of the entire process. Attention was directed especially to improving the quality of liquor sent to char, use of more reactive char, use of char of smaller particle size, and sweetening-off slowly or in battery.

6526. DOMINGUES, LOUIS P. **Sulfur in bone char.** *Proc. Tech. Sess. Bone Char* 1953, 307-12.

Char revivified in the presence of SO_2 increased in total S. The extent depended upon the initial concn. of SO_2, the time, and the temp. The increase was in the inorg.-S, the reducible-S, and that combined with the carbonaceous residue. The SO_4-content imparted to char liquors could increase greatly without forming a "sulfate haze." Analyses of test liquors for Ca and SO_4 were given before and after passing through a service char, through a mech. mixt. of char and $CaSO_4$, and through a char regenerated in the presence of SO_2.

6527. DUFFY, J. P. **Rates of drying in tray and rotary driers.** *Chem. & Process Eng.* 34, 49-51, 62 (1953).—*C.A.* 47, 6711*i*.

The efficiency of a tray or rotary drier could be assessed on the basis of the rate of drying. This was a complex function of the phys. properties of the material being dried and the operating variables predetd. by the type of drier and the state of the drying medium. Rotary driers were more efficient than tray driers.

6528. FREEMAN, H. P. **Surface area and oxygen chemisorption.** *Proc. Tech. Sess. Bone Char* 1953, 297-305.

The quantity of chemisorbed-O on bone chars was proposed as one measure of chem. activity in the removal of color from sugar liquors and the B.E.T. area as a measure of the total surface. The O chemisorbed on various service chars was shown to vary approx. in the same order as known color-removal capacities. The surface area, the chemisorbed-O, and the color removal were discussed as a function of the residual carbonaceous residue upon decarbonization of a service char.

6529. HOWE, W. L. AND MOULT, A. M. **Reactivation of bone char in a gas-fired kiln.** *Intern. Sugar J.* 55, 8-10(1953).—*C.A.* 47, 3015*g*.

The operation of a Nichols-Herreshoff kiln was described. Its advantages were: uniformity of burning, production of char with good color and ash removal, uniformity of char over long periods of time, low dust formation, closer control of carbon content of the char, greater sterility of char, and use of waste heat for drying wet char.

6530. KNOWLES, H. I. **Continuous versus intermittent washing of bone char filters.** *Proc. Tech. Sess. Bone Char* 1953, 25-31.

After sweetening-off the char filter was drained and then repeatedly filled with hot water and drained. The comparison with continuous washing was made on the basis of total solids and ash in the wash water and in that extracted subsequently from the char. A more uniformly washed char might be obtained by continuously washing if the flow of water is reversed one or more times during the washing period. The intermittent method may lead to entrapped air with the bed of char and thus decrease the contact boundary between the char and water.

6531. LOEBENSTEIN, W. V. **Adsorption wave applied to char columns.** *Proc. Tech. Sess. Bone Char* 1953, 285-95.

The removal of color from sugar liquors passing through a char column might be represented by a wave front progressing through the column. Mass transfer considerations of a highly simplified model for this complex process resulted in the well-known Mecklenburg equation. The scope of this equation was limited to the comparison of different chars of the same grist under identical conditions.

6532. LÖWY, KURT. **Ash adsorption by bone char and its desorption by chemical treatment.** *Proc. Tech. Sess. Bone Char* 1953, 241-53.

Ash adsorption by bone char was of ionic type in aq. and of mol. type in nonaq. solns., but it was always accompanied by exchange reactions. A mutual influence of cations and anions in the adsorption process was observed. SO_4 could be desorbed by treatment with hydroxide, carbonate, or Na- or NH_4-citrate. Good results were obtained for Ca desorption with salts of monovalent org. acids (sodium or ammonium acetate) at pH 4.5. At lower pH a decomph. of the bone char structure was observed. Na- or NH_4-citrate at pH 4.5 could be used for both anion and cation desorption, but the great quantities required and the high price of these products make such a process uneconomical. A two-bath process with Na_2CO_3 and Na acetate gave best results.

6533. MACDONALD, R. J. G. AND DEWHALLEY, H. C. S. **British bone char manufacture and decolorizing power measurements of chars by column test.** *Proc. Tech. Sess. Bone Char* 1953 59-69.

Specifications of new bone char supplied to British Refineries was presented including the methods of sampling and analysis. The column method for testing the decolorizing power of new and stock chars was described. Results were given for the change in decolorizing power of new char through fifteen cycles.

6534. PENNINGTON, NEIL L. **Color removal by bone char.** *Proc. Tech. Sess. Bone Char* 1953, 273-83.

The detn. of color removal in lab. test procedures was a difficult problem because of the many variables influencing the results. Some of these difficulties were pointed out and discussed with special reference to the measurements of "color" of sugar liquor.

6535. SWINTON, E. A. AND WEISS, D. E. **Countercurrent adsorption separation processes. I. Equipment.** *Australian J. Appl. Sci.* 4, 316-28 (1953).—*C.A.* 47, 9062*i*.

The adsorbent flowed across a no. of horizontal decks, each made of wire screen and arranged one above the other in a tower. The liquid, to which pulsations were applied through a diaphragm at the base of the tower, flowed up through the adsorbent, and the adsorbent, introduced at the top of the tower, made its way downwards to its discharge point. The pulsating flow fluidized the adsorbent bed on each stroke, thus permitting high fluid capacities but avoiding channelling. The adsorbent was immobilized on each downstroke, thus avoiding turbulence within the bed.

V-2. Refining of Sugar Liquors With Activated Carbons

6536. BRETSCHNEIDER, R. **Some practical comments upon filtration conducted with filtering aids.** *Listy Cukrovar.* 59, 59-64 (1940).—*C.A.* 42, 781*b*.

An equal mixt. of diatomaceous earth (Hyflo, Speedex, Calofilter) and activated charcoal (Carboraffin) produced a cake which functioned well 1-3 days before it began to loss its decolorizing powers. In com. operation the 50% addn. of a diatomaceous earth began to clog the filter cake rather soon, but the presence of only 25% accomplished the desired effect of reducing the time of sedimentation and of prolonging the service of the filter cake.

6537. RAO, A. N. AND JAIN, N. S. **Use of activated carbons in white-sugar factories.** *Proc. Sugar Tech. Assoc. India* 10, 239-48 (1941).—*C.A.* 37, 6485[3].

"B-" and "C-" sugars were well cured to yield products of not less than 96-8 polarization, after which they were melted to give a sirup of about 50° Brix. After raising the temp. to about 85°C, 0.4.-0.6% (on solids) of activated carbon with about 0.2-0.4% of filter-aid were added, the liquor being well mixed for 15-20 min. It was then filtered, later to be boiled to grain.

6538. BAILLEUL, GUSTAV AND AEHNELT. **Decolorization of sugar solutions with activated carbon.** *Centr. Zuckerind.* 50, 325-6 (1942).—*C.A.* 38, 1898[1].

Differences in color removal by activated carbon depended on the process of their manuf. One color component could not be adsorbed completely without removing some of another color.

6539. NOSSEN, E. **Determination of the activity of decolorizing agents.** *Chem. Weekblad* 39, 581-5 (1942).—*C.A.* 38, 4466[8].

The activity of active carbons and "Collactivits" used in the sugar industry was detd. with methylene blue in highly acid solns. The results of these detns. were related directly to the decolorization of molasses with these materials. The effect of particle size on the activity of the "Collactivits" was tabulated.

6540. MIDUNO, SHIGERU AND KATO, YOGORO. **Active carbon. II. Application of hydrated active carbon in the plantation white-sugar factory.** *J. Soc. Chem. Ind. Japan* 46, 961-6 (1943).—*C.A.* 42, 6517*d*.

About 0.1, 0.5, and 2.0% of hydrated active carbon was required to replace the 2nd sulfitation, the whole sulfitation, and the whole carbonation and sulfitation, resp. In all cases a smaller quantity was required of $ZnCl_2$-activated carbon with less clogging of the filter cloth.

6541. MITI, KIMIYO. **Aconitic acid monoethyl ester from sugar-cane molasses.** *Bull. Inst. Phys. Chem. Res.* (Japan) 22, 671-3 (1943).—*C.A.* 41, 6742*h*.

A sirup was obtained by treating Java molasses, acidified to pH 2, with activated carbon, extg. the carbon with 90% EtOH, and distg. This sirup was dissolved in water at pH 1.6 and repeatedly extd. with ether. After distg. the ether the residue was sepd. into $CHCl_3$-insol. and $CHCl_3$-sol. portions. From the insol. portion trans-aconitic acid was obtained. The $CHCl_3$ was distd. from the sol. portion, the residue dissolved in water, clarified with $Pb(OAc)_2$, concd., extd. with ether, crystd., and recrystd. from ether and petr. ether. Monoethyl aconitate was obtained.

6542. TISELIUS, A. AND HAHN, L. **Adsorption analysis. II. Analytical separation of the products formed in the breaking down of starches.** *Kolloid-Z.* 105, 177-82 (1943).—*C.A.* 38, 3921[4].

Mono- to tetra-saccharides could be adsorbed on charcoal and removed selectively with the aid of ephedrine. Losses during the process were prevented by treating the charcoal 2-10 times with the dil. displacement soln. of ephedrine. before attempting to adsorb the desired compds. In this way, the differences in adsorption tendencies of the various products became more pronounced and their sepn. from mixts. was facilitated.

6543. MACDONALD, J. CAMPBELL. **Sugar refining in the beet-sugar factory using decolorizing carbon.** *Intern. Sugar J.* 46, 294-7, 318-21 (1944).—*C.A.* 39, 1309[4].

Very little change was required to adapt a sugar factory to refinery use. Details of the refining process were given with typical charts of recoveries. The daily refining capacity of the plant was about one-fifth of the beet-working capacity. For a 500-ton plant this required 4 white, 1 high raw, 2 low raw, and 1 after product pans, each of 900 ft^3 capacity and 1800 ft^2 heating surface. Centrifugals should be divided into 8 for white, 2 for high raw, 3 for low raw, 2 for after-product, and 6 for affination.

6544. MACDONALD, J. CAMPBELL. **Refining raw cane sugar in the factory using decolorizing carbon.** *Intern. Sugar J.* 47, 40-4 (1945).—*C.A.* 39, 2663[6].

The cane-sugar factory could be used successfully as a refinery during the interim period. Little addnl. equipment was necessary. Addnl. filters and a carbonation plant were required. The refining capacity was one-eighth the cane capacity of the factory. Care must be exerted to keep the temp. and pH within very narrow limits to prevent inversion of the cane sugar and destruction of the invert sugar.

6545. COALSTAD, S. E. **The influence of adsorption on the crystallization of sucrose from impure solutions.** *J. Soc. Chem. Ind.* 65, 206-8 (1946).—*C.A.* 41, 609*h*.

The failure of sucrose to crystallize further from molasses (a highly supersatd. soln.) was due to the presence of surface-active impurities which were adsorbed by the surfaces of the crystals and thus inhibit their growth. When these impurities were removed by the addn. of excess adsorbent carbon, the sucrose crystallized out almost completely. The ratio of sucrose to surface-active impurities was much more fundamental and valuable in appraising the purity of molasses than the older criterion, the reducing sugar-ash ratio.

6546. MENA VAILLANT, ARTURO DE. **Sugar refining in Cuba.** *Intern. Sugar J.* 48, 148-50 (1946).—*C.A.* 40, 5587[6].

The modern methods included decolorization of a 56° Brix remelt at 80°C with vegetable carbon.

The temp. rise was obtained by passing the sirup through tubular heaters. $Na_2S_2O_4$ was used in all strikes, the amount varying with the type of strike. The presence of nonsugars often presented serious difficulties in practice. The best results were obtained by defecation with phosphoric acid and calcium hydroxide followed by air agitation, which brought the floc to the surface, where it could be skimmed off.

6547. Smirnov, V. A. and Goncharenko, S. E. **Adsorption of coloring substances on Collactivite carbon.** *J. Applied Chem. (U.S.S.R.)* 20, 449-53 (1947) (in Russian).—*C.A.* 42, 2489*g*.

Color removal was detd. with the Stammer colorimeter on 50-ml samples of a 6% soln. of tech. xylose, d. 1.03, initial color 557.1° Stammer treated with 0.25 g Collactivite (made from hydrolytic cellolignin) at 80°C for 1 hr. Acidification of the soln. decreased the color which was again restored on neutralization; hence, the coloring substance was a weak org. acid with colored (yellow) anion, formed in the decompn. of xylose. Collactivite could be considered to be a H^+ zeolite, exchanging its H^+ with the cations of the coloring substance and thus converting the colored anions into the colorless undissocd. org. acids. After 10, 20, 30, 60 min. Norit produced 68.6, 87.2, 94.7, 96.7% color removal, resp.; Collactivite 28.2, 46.2, 55.2, 60.0%.

6548. Wickenden, Leonard. **The Percofil process.** *Sugar* 42, No. 1, 32-5 (1947).—*C.A.* 41, 1859*g*.

In the Percofil process the color was distributed over the surface of an inert carbonaceous carrier in granulated form, which was hard, resistant to abrasion, very porous, and could be used in existing bone-char cisterns. Since irreversible colloids were adsorbed better by bone char, and reversible colloids better by vegetable char, a combination of the 2 gave best results. Tests in a sugar refinery have shown that 0.05% of vegetable carbon used as indicated could replace 30% of the normal amt. of bone char.

6549. Freed, B. and Hibbert, D. **Some aspects of the decolorization of sugar juices.** *Intern. Sugar J.* 50, 263-5 (1948).—*C.A.* 43, 887*b*.

Data were given to show that (1) high temp., approx. 80°C, was an important factor in promoting color removal: (2) there was no interaction between the carbon and SO_2, which were independently acting factors; (3) color removal was a linear function of amt. of carbon added at all pH values; (4) whereas color removal was more complete at low pH values, the amt. of color removed by a given quantity of SO_2 was greater in the initial stages of pH lowering.

6550. Bevenue, Arthur. **Determination of sugars in plant materials. Use of decolorizing carbon in the ferricyanide method.** *Anal. Chem.* 21, 586-7 (1949).—*C.A.* 43, 6542*a*.

Treat 100 ml of solns. of dextrose, levulose, or sucrose (contg. 0.2-1% of the individual sugars) with 500 mg of animal charcoal (325 mesh) without loss of any of the sugars by adsorption. With sugar concns. of 0.05% there was a small loss of sucrose (about 4%) but no significant loss of the monosaccharides. Carbons other than animal charcoals gave sucrose recoveries varying from 43 to 87% with 0.1% sucrose solns. The addn. of neutral $Pb(OAc)_2$ followed by pptn. with a slight excess of Na_2HPO_4 for the removal of nonsugar-reducing material did not influence the results.

6551. Goncalves de Lima, Oswaldo; Magalhães Neto, B.; Leõncio de Albuquerque, Ivan, and Simõnes Filho, Sebãstiao. **Citric acid production from cane-sugar molasses in Pernambuco.** *Anais assoc. quím. Brasil* 8, 264-7, (1949); *Rev. quím. ind.* 19, No. 216, 19-20 (1950).—*C.A.* 45, 305*f*.

The addn. of saline mixt. or adsorbent clay to molasses did not improve the yield of citric acid by fermentation with *Aspergillus niger 198*. Activated charcoal improved the yield of citric acid to 44.7% at pH 2.3 and 6.5. The production of oxalic acid was increased to about 4% at the higher pH.

6552. Heertjes, P.M. and Haas, H. v.d. **Studies in filtration.** *Rec. trav. chim.* 68, 361-83 (1949) (in English).—*C.A.* 44, 2289*g*.

Tests were carried out on suspensions of puritine (an active carbon) or glass spheres in water (small concns. 0.001-4 g/liter) with either duck or nylon cloths. It was found that for each system, two types of filtration may occur-blocking filtration or cake filtration, depending on the concn. of the solids in the feed. Blocking changed to cake filtration as the concn. of the suspension increased. Under const. pressure, the specific resistance of the cake decreased with increasing concn.

6553. Kastner, Frantisek. **An attempt to prepare pure sucrose by an industrial method.** *Listy Cukrovar.* 66, 39-41 (1949).—*C.A.* 44, 2775*f*.

With a spodium filtration 50-kg batches of sugar were prepd. on 11 different occasions which contained 0.003% ash detd. by the elec. cond. method and 30 mg of interfacially active substances. Attempts to produce large batches of sugar having a "polarographic zero" were not successful either in the lab. or in the refinery. The use of Carboraffin improved the quality of the prepd. sugar.

6554. Meloun, Bedřich. **The adsorption of reducing sugars by Carboraffin and Norit.** *Listy Cukrovar.* 66, 75-81(1949).—*C.A.* 44, 4699*i*.

In solns. contg. 50 mg of sugar per 100 ml of water, 2 g of Carboraffin adsorbed 14% of the glucose, 10.5% of the fructose, and 10.7% of the invert sugar; Norit adsorbed 28% of the invert sugar. Ten g of Carboraffin adsorbed 26% of the glucose, 22% of the fructose, and 23% of the invert sugar; 10 g of Norit adsorbed 53% of the glucose, 49% of the fructose, and 50% of the invert sugar. The adsorption was complete in 5 min. at 20°C. Norit showed a definite selectivity for reducing sugars.

6555. Ohira, Toshihiko and Kobayashi, Kohei. **The preparation of sugar sirup from Jerusalem artichoke.** *Agr. Chem. Soc. Japan* 23, 103 (1949).—*C.A.* 44, 3727*g*.

The crushed tubers of fresh Jerusalem artichokes were boiled with an equal quantity of 1% $Ca(OH)_2$ for 30 min. Colloidal substances such as pectin were pptd. and filtered off. The filtrate was made to pH 5-5.5 with H_2SO_4. Then active carbon 0.5% was added to the filtrate. Five-min. boiling was suitable to remove bad odor and taste. The filtrate was concd. to 1/2 vol. and then hydrolyzed with H_2SO_4. The hydrolyzate after half-hr boiling was neutralized, filtered, and concd. One kg of fresh tubers gave 139 g of sirup of Be. 41°. It contained fructose 30.27, glucose 14.95, and ash 3.56%.

6556. Pavlas, Petr and Häuslerova, O. **The influence of activated carbon on the determination of invert sugar in molasses according to Ofner.** *Listy Cukrovar.* 65, 115-18 (1949).—*C.A.* 43, 8715*a*.

Four brands of molasses collected from different sugar mills and from different seasons were analyzed for invert sugar with the addn. of 0.5, 2, 4, and 6 g of carbon (Carboraffin and Norit) per 20 g of molasses in 200 cc. of soln. The results showed that the 4 g of charcoal recommended by Ofner satisfied the conditions which he specified for the detn.

6557. Rogge, Robert H. **Dextrose from corn starch.** *Ind. Eng. Chem.* 41, 2070-5 (1949).—*C.A.* 43, 8716*e*.

A pilot plant to handle 5000 lb of dextrose per day was designed and operated to study improved methods of dextrose production. Starch was converted in a continuous converter coil at a concn. of 8° to 10° Bé. for approx. 17 min. at 315°F and 1.9 pH. Insol. and colloidal material were removed by filtration with bentonite. The filtrate was refined in ion-exchange columns, decolorized with activated carbon and evapd. to 72% dry substance. The heavy liquor was crystd. for 72 hrs while cooling from 120° to 70°F. The cryst. dextrose was filtered in centrifuges and dried. The mother liquor was carbon-refined, concd., and crystd. in a second set of crystallizers. Yields of 82% were obtained.

6558. Zaleski, J. **Activated carbons.** *Gaz. Cukrownicza* 89, 21-30 (1949); *Sugar Ind. Abstracts* 11, 67 (1949).—*C.A.* 45, 3625*c*.

The properties and uses of active carbons of the Carboraffin and Norit types for sugar decolorization were reviewed. Investigations were carried out with two carbons made in Poland: "Eponal 3," prepd. by steam activation of charcoal, and "Glukonit 4," produced by treatment of Eponal with 2% of SO_2. Both were of the Norit type. Decolorization results were compared with those obtained with Carboraffin.

6559. Doss, K.S.G. and Singh, Adjit. **Evaluation of decolorizing carbons.** *Proc. Intern. Soc. Sugar Cane Technol.* 7, 620-3 (1950).—*C.A.* 46, 3241*c*.

The carbon suspended in 10 ml of a NaOAc-HOAc buffer soln. of 4.5 pH and ionic strength of 0.2 *M* was moderately boiled 30 min. under reflux and examd. with a Lovibond tintometer or a Kober-Klett colorimeter.

6560. Honsch, W. and Lorner, W. **Condition of juices of starch sirup during boiling-down and during treatment with activated charcoal under factory conditions.** *Die Starke* 2, 195-8 (1950).—*C.A.* 44, 11139*b*.

In boiling down juices of starch sirup, the pH value increased 0.3 to 0.4 units, without change of ash or Ca content. When activated charcoal was added, the pH of the juices remained unchanged or increased slightly, the ash content also remained practically unchanged, but the Ca content increased slightly. To get best results, quality and quantity of activated charcoal to be used must be selected carefully.

6561. Sorgato, Ippolito. **Chemical factors determining the coloration of the intermediates in sugar production.** *Ricerche sez. sper. zuccheri, Univ. studi Padova, Ist. chim. ind.* 5, 43-56 (1950-1951).—*C.A.* 46, 766*c*.

The chem. reactions causing the formation of colored products in sugar juice and sirup processing due to the decompn. of the sucrose and the reaction of decompn. products with N compds. were discussed. The methods for measuring the color, the adsorption equilibria, and the decolorizing effect of adsorbents were given.

6562. Tullin, V. **Color formation in various stages of the manufacture of beet sugar.** *VIII° Congr. intern. inds. agr., Brussels* 1950, 227-40 (in English).—*C.A.* 45, 6405*i*.

Coloring substances were divided into 4 groups: caramel, melanoidins, polyphenols-Fe compds., and melamines. Electrophoresis and ultracentrifugation showed that the dark color of press juice was carried by the main protein compd. This could be sepd. by centrifugation. It showed the reactions of melamines. Tyrosinase was responsible. The coloring was absent when H_2S was added but appeared again after addn. of Cu ions. CaO gave irreversible bleaching. In thick juice melanoidins and polyphenols-Fe compds. were the main coloring substances.

6563. Vavruch, I. **Estimation of refined sugar by the polarographic method.** *Collection Czechoslov. Chem. Communs.* 15, 217-31 (1950) (in English).—*C.A.* 45, 2693*h*.

The amt. of surface-active substance was estd. by the decrease in the O max. in 0.002 *N* K_2SO_4. Methyl orange was used as a reference. A standard sugar was prepd. by treating 200 g sugar plus 200 g H_2O with charcoal and adding 3 liter of EtOH also treated with charcoal and filtering through sintered glass.

6564. Whistler, Roy L. and Durso, Donald F. **Chromatographic separation of sugars on charcoal.** *J. Am. Chem. Soc.* 72, 677-9 (1950).—*C.A.* 45, 1839*h*.

A modification of the Tiselius technique was developed whereby a mixt. of mono-, di-, and trisaccharides could be resolved by chromatographic adsorption on charcoal and displacement by water, 5% EtOH, and 15% EtOH in succession. Neither the adsorption nor the desorption was affected by the degree of diln. of the sugar mixt., or by the presence of salts such as NaCl, $NaHCO_3$, or NaOAc in various concns. Other developers such as MeOH, EtOH, AcOH, and Me_2CO for monosaccharides, and PhOH, citric acid, and HCl for disaccharides were studied.

6565. YOSHIDA, YUJI. **The caking and coking properties of coal.** *J. Fuel Soc. Japan* **29**, 173-82 (1950).—*C.A.* 45, 2180*b*.

The caking and coking properties of coal were reviewed from the viewpoint of the manuf. of coke. Caking property essentially depended on the aggregating power or the type of linkage by which the fundamental units of coal were bound to each other rather than on the amt. of caking constituents. As regards coking property, however, the behavior of the humin substance, especially its affinity with bitumen, was considered to be more important than in the case of caking phenomena.

6566. BERGDOLL, MERLIN S. AND HOLMES, ELIZABETH. **Heating of sucrose solutions. I. Relationship of 5-(hydroxymethyl) furfural to color formation.** *Food Research* **16**, 50-6 (1951).—*C.A.* 45, 4951*c*.

The estn. of 5-(hydroxymethyl) furfural in heated sucrose solns. was improved when the solns. were chromatographed on charcoal. The production and accumulation of 5-(hydroxymethyl) furfural increased in heated sucrose solns. Color formation in heated sucrose solns. was simultaneous with hydrolysis of the sucrose and 5-(hydroxymethyl)-furfural formation. The addn. of 5-(hydroxymethyl) furfural in quantities equiv. to those produced in heated sucrose solns. did not affect color formation. More color was produced by the substitution of invert sugar than by the addn. of 5-(hydroxymethyl) furfural.

6567. CHADWICK, D.W.; THOMASON, A.F., AND WIGGINS, L.F. **Lactic acid and certain of its derivatives from molasses by chemical means.** *Proc. Brit. West Indies Sugar Technol.* **1951**, 135.—*C.A.* 46, 11729*b*.

Molasses (500 g) contg. 37.7% of sucrose was dissolved in 700 ml of H_2O and heated with agitation in an autoclave to 230-35°C for 2 hrs with 147 g of CaO. The cooled mixt. was treated with H_2SO_4 to remove $CaSO_4$ and filtered. The filtrate was treated with active charcoal; $ZnCO_3$ was added to form Zn lactate which was recrystd. from 50% alc.

6568. COTTON, ROBERT H.; NORMAN, LLOYD W.; RORABAUGH, GUY, AND HANEY, H.F. **Semipilot production of sucrose from sorghum.** *Ind. Eng. Chem.* 43, 628-35(1951).—*C.A.* 45, 5433*i*.

Small-scale factory expts. were made with sorghum, variety Rex, as raw material, during 2 seasons. The diffusion process, at or below 70°C, was found to be superior to milling. First carbonation at 55°C, and 2nd carbonation at 70°C, with a final pH of 8.3, removed the greater part of the remaining starch. After sulfitation and treatment with vegetable carbon the juice was carbonated and boiled to sugar. Treatment of the juice with pancreatin at 55-70°C for 1.5 hrs removed the starch effectively, but this may be found not to be necessary. Removal of the *aconitic acid* from the thick juice as the Ca-Mg salt facilitated crystn. of the sucrose.

6569. MCDONALD, EMMA J. AND PERRY, ROGER E., JR. **Corn-Sirup analysis involving selective adsorption.** *J. Research Natl. Bur. Standards* 47, 363-6 (1951) (Research Paper No 2263).—*C.A.* 46, 8399*e*.

The sepn. of corn sirups into the components dextrose, maltose, and dextrins was done chromatographically by adsorbing the carbohydrates on a column consisting of equal wts of Darco G-60 and Celite. Dextrose was eluted with H_2O, maltose with 5% EtOH, and dextrins with 30% EtOH. By passing the eluting agents through the column under 30-50 lb pressure the sepn. could be performed in approx. 1.5 hrs. Recoveries on mixts. averaged 96.45% dextrose and 97.12% maltose.

6570. BRONSHTEĬN, D.G. **The application of activated carbon of the Carboraffin type in sugar refineries.** *Sakharnaya Prom.* **26**, No. 12, 20-2 (1952).—*C.A.* 47, 6688*a*.

Description of different methods of application of Gluconite, a vegetable carbon similar to Carbonaffin.

6571. CAROLAN, ROBERT. **The manufacture of table sirup in Ireland.** *Intern. Sugar J.* **54**, 106 (1952).—*C.A.* 46, 6417*g*.

Imported raws were remelted. A portion of the melt was completely inverted and then added back to the remainder of the melt and the whole decolorized with active carbon. Better results were obtained by filtering before inversion. Although Peruvian sugar was superior in lab. tests, Cuban sugar was used in actual production because of its greater availability.

6572. RINEHART, THOMAS M. AND FORTIER, RIVERS. **Activated carbon in cane-sugar refining.** *Sugar* 47, No. 3, 35-8(1952).—*C.A.* 46, 4825*i*.

The Darco process of refining, either in conjunction with a raw-sugar factory or as a sep. refining unit, was described and illustrated by flow sheets. It was particularly adaptable to refining units of 200-500 tons capacity.

6573. WITTENBERGER, WALTER. **Rules for the application of activated carbon as decolorizing agent.** *Chem.-Ztg.* 76, 88-9 (1952).—*C.A.* 46, 4700*i*.

Activated carbon decolorized chiefly by adsorption. The amt. used should be as low as possible. The effect of the purification with activated carbon depended furthur on the nature of the solvent, the pH concn., and the concn. of the soln. The temp. had a less pronounced effect. Easily oxidizable substances could be protected through the addn. of a reducing agent, such as $Na_2S_2O_4$ or SO_2.

6574. KITAGAWA, MUTSUO AND KAZAI, HATSU. **Decolorizing test on caramel solution with active carbon. I.** *Sci. Ind.* 27, 20-3(1953).—*C.A.* 47, 5706*f*.

Charcoal, activated by $ZnCl_2$, decolorized caramel solns. far more rapidly and to a greater extent than charcoal activated by steam.

6575. MUKHERJEE, S. AND SRIVASTAVA, H. C. **Aconitic acid from molasses.** *Proc. 20th Conv. Sugar Tech. Assoc. India,* **1951**, Part II 77-79. *Intern. Sugar J.* **55**, 136 (1953).

Molasses, acidified with H_2SO_4 to Congo Red after dilution to 40° Brix, formed a heavy precipitate which was filtered off on a bed of kieselguhr. The filtrate was continuously extracted with ethyl acetate until it gave no reaction for aconitic acid with pyridineacetic anhydride (no reddish-purple color). The extract was decolorized with charcoal and evaporated under reduced pressure, giving a residue crystallized from glacial acetic acid, m.p. 184-186°C (decompn.).

6576. OWEN, W. L. **Sugar Refining under Bacteriological Control.** *Sugar J.* (La.), 1952, 14, No. 10, pp. 26-34. *Intern. Sugar J.* **55**, 222 (1953).

Application of bacteriological control to a vegetable carbon refinery resulted in the consistent production of a sugar free from mould fugi, yeasts and mesophilic bacteria. Any outbreak of mesophilic or thermophilic contamination could be quickly traced to its source by constant vigilance in appraising the number of bacteria which were dust-borne, in the water supply, and in the spent carbon. There were valid grounds for suspicion that a high concentration of thermophilic bacteria in the once-used carbon was correlated with undetermined losses in sucrose during refining.

V-3. Refining of Sugar Liquors With Miscellaneous Products

6577. DUBOURG, J. AND GOLDSTEIN. **Studies on saturation.** *Chem. Zentr.* **1938**, **II**, 2358.—*C.A.* 34, 5691[3].

CO_2 gave a sol. compd. with dissolved Ca saccharate which rendered the soln. viscous and, when present in sufficient concn., formed an amorphous ppt. which was able to assume a gel form. When all the saccharate had been converted into this compd. the latter decompd. and formed a cryst. ppt. of calcite. The amorphous ppt. appeared much sooner when the soln. was hot than in the cold; it also decompd. more rapidly.

6578. KUTSEV, S. S.; GOROVITS, T. L., AND SERGEEV, P. S. **Purification of raw [sugar] juice with colloidal $CaCO_3$.** *Rept. Sci. Inst. Sugar Ind.* (U.S.S.R.) *Sbornik Trud.* TSIN-Sa **1939**, 35-51.—*C.A.* 38, 6122[7].

Colloidal $CaCO_3$ obtained by partly carbonating a mixt. of diffusion juice and CaO, was added to the main raw juice, which was then filtered. To the filtrate was added a further quantity of Colloidal $CaCO_3$, and then the mixt. was heated, carbonated to the optimum alky. of a 2nd carbonated juice, and again filtered. The purifying action of colloidal $CaCO_3$ was much greater than that of $CaCO_3$ as ordinarily formed in carbonation. Filtration was slower, but this was compensated by the much smaller vol. of ppt. to be handled.

6579. HEINEMANN, B. **The regularity of alkali discoloration of certain sugars.** *Centr. Zuckerind.* **48**, 469-71, 493-6, 509-11 (1940).—*C.A.* 36, 6036[4].

The discoloration at 100°C of glucose and of sucrose-glucose mixts. by NaOH and Na_2CO_3, glucose by CaO, $Sr(OH)_2$, and MgO, sucrose-glucose mixts. by MgO and CaO, and glucose and sucrose-glucose mixts. by CaO + 0.02% NaOH and CaO + Na_2CO_3 were studied. The effect of the subdivision of CaO was also investigated. The main cause of discoloration of the raw beet juice was the reaction of CaO with aldo- and keto-sugars.

6580. KAISLER, JOSEF. **An attempt to determine the influence of potassium sulfide upon the color of saturated sugar juices.** *Listy Cukrovar.* **59**, 34-6 (1940).—*C.A.* 42, 780*b*.

Sugar juice (14.5%) and K_2S were mixed in increments from 0.0228 to 0.228 g K_2S per 200 g of juice and CaO (3.32 g) added. The mixts. were heated to 89°C and CO_2 added to produce an alky. of 0.007% CaO. The control juice without any K_2S showed 12.52° Stammer units, the addn. of 0.0228 g K_2S raised the color to 14.11° St., and the addn. of 0.228 g of K_2S raised the color to 18.52° St.

6581. KOPECKY', RUDOLF. **Where does the sediment from sugar juices belong?** *Listy Cukrovar.* **59**, 66 (1940).—*C.A.* 42, 779*f*.

Sediments from filter presses contained 0.04% K salts, 0.25-0.30% N, 1.0% P_2O_5 besides CaO which should return to the soil. When cakes were dried according to the Rema-Rosin method they could be distributed evenly over field and serve as an effective fertilizer.

6582. OPLATKA, G. AND BARCSAY, J. **Juice purification.** *Centr. Zuckerind.* **48**, 760-2; 783-6 (1940).—*C.A.* 35, 1659[8].

When the amt. of lime was reduced from 75 to 50% of the amt. usually used in the clarification and satn. of thin juices, the purity of the thin juices and subsequent molasses was higher. These thin juices required less carbonation, filtered more readily, and less sugar was lost in the carbonation sediment. Juice purification at lower alky. was more rapid and required less equipment.

6583. PAVLAS, P. AND VOTAVA, J. **The effect of different methods of clarification on the foaming of the juice during saturation.** *Z. Zuckerind. Böhmen Mähren* 64, 1-16 (1940).—*C.A.* 37, 277[7].

A foaming-time curve was obtained for the whole period of saturation under different conditions. Foaming was reduced by the use of higher clarification temperatures and by the addition of larger amounts of lime. Prolonging the clarification had no appreciable effect on foaming.

6584. CLELAND, J. E. AND FETZER, W. R. **Use of filter-cel for corn sirup.** *Ind. Eng. Chem., Anal. Ed.* 13, 858-60 (1941).—*C.A.* 36, 925[8].

Acid-washed filter-cel (25 g) was dried in a 250-ml weighing bottle, 5-10 g of corn sirup added and incorporated with the filter-cel to form a friable damp mass; drying was effected for 15 hrs at 60°C in a vacuum oven. A rapid method, with precision of 0.1%, was to dil. 5 g of sample with 5 g of H_2O, mix with 10 g of filter-cel in an Al weighing dish and dry *in vacuo* at 100°C.

6585. HAMOUS, J. **The use of resinous exchange absorbents.** *Z. Zuckerind. Böhmen Mähren* 64, 241-2 (1941).—*C.A.* 38, 1898[7]:

Preliminary expts. have shown that Wofatite removed Ca from sugar solns. to such an extent that the filtrates gave no ppt. with $(COONH_4)_2$. The application to the sugar industry was pointed out.

6586. PERRUCHE, LUCIEN. **Aids to filtration.** *La Nature* 1941, 70-2.—*C.A.* 38, 1917[7].

The advantages and properties of kieselguhr as an aid to the filtration of difficultly filterable liquids was discussed for large-scale manuf. of chemicals.

6587. SPENGLER, O. AND TÖDT, F. **Deliming with phosphate in juice purification without primary defecation.** *Z. Wirtschaftsgruppe Zuckerind.* 91, 87-102 (1941).—*C.A.* 37, 1291[4].

Deliming with 0.02% KH_2PO_4, and in unfavorable conditions with 0.04%, led to the preparation of juices, without primary defecation with 0.3-0.4% total lime additions, which contained as much and in many cases less dissolved lime salts than the same juices normally defecated with 2% CaO. In the primary defecation 3-4 g and in the preliminary defecation alone about 2-3 g of nonsugar materials on 100 g of sugar were removed from the juices.

6588. SUZUKI, KAKUO. **Influence of manganese salt on sugar manufacture. II. Influence of NaCl on evaporation of sugar solutions.** *J. Soc. Chem. Ind. Japan* 44, 1081-4 (1941).—*C.A.* 42, 6558*e*.

Sugar solns. contg. a very small amt. of $MnSO_4$ and various amts. of NaCl were evapd. at 50° and 60°C. The presence of NaCl had no effect on the rate of evapn. In the absence of Mn salt, a small amt. of NaCl favored the formation of large crystals, but in presence of Mn salt the addn. of NaCl had no effect.

6589. SUZUKI, KAKUO. **Influence of manganese salt on sugar manufacture. III. Drying of sugar.** *J. Soc. Chem. Ind. Japan* 44, 1081-4 (1941).—*C.A.* 42, 6558*e*.

Concd. sugar solns. contg. various amts. of $MnSO_4$ were dried. The crystals thus obtained were of larger sizes when more than 0.001% of the salt was present. The time required to dry was shortened also by the addn. of $MnSO_4$.

6590. ALVAREZ, ALEJANDRO S. **Processes for reducing the lime salt content of clarified juice.** *Rev. ind. agr. Tucuman* 32, 127-41 (1942).—*C.A.* 37, 2207[7].

In order to reduce incrustations in the evaporators and other difficulties caused by Ca salts, the clarified juice should be left neutral or slightly acid, 0.001-0.005% expressed as equiv. CaO. If Na_3PO_4 were added to such juices, a large part of the Ca salts was removed. As the acidity increased, the effect of the Na_3PO_4 decreased and became negligible at an acidity of 0.021-0.03%. The best results were obtained by adding 300 mg of Na_3PO_4 per liter of juice before treatment with SO_2.

6591. ENGLIS, D. T. AND FIESS, H. A. **Production of a palatable artichoke sirup.** *Ind. Eng. Chem.* 34, 864-7 (1942).—*C.A.* 36, 4620[2].

The aq. ext. from the dried material was treated with a cation org. exchanger, in the H cycle, and the pH lowered to near 3.5. The drawn-off soln. was treated under a pressure of 15-20 lb for 30 min. and decolorized with an active carbon. The acid content was reduced with an anion exchanger, and the soln. concd. to a sirup of 80% solids, the quality of which was superior to that produced by former methods. The flocculation of impurities, caused by the lowering of the pH of the ext., slowed down the rate of flow in the cation exchanger, making the column method of treatment impracticable. The batch method of operation was satisfactory.

6592. GUNDERMANN, ERICH. **The use of electric current for the purification of juices and sirups in the sugar industry.** *Centr. Zuckerind.* 50, 315-17, 323-5 (1942).—*C.A.* 38, 1657[8].

Elec. current removed the inorg. and org. impurities from sugar solns. by electrolysis and electrodialysis. Salts were decompd., proteins pptd., and colors removed. Elec. current had little effect on the lime salts, decompd. a small amt. of the org. acid, produced CO_2 and caused the hydrolysis of the sugar.

6593. IWATA, YOSHI; SUZUKI, SHIN-ICHI, AND KAWAI, YUTAKA. **Some properties of the cane molasses produced by the sulfitation process.** *J. Agr. Chem. Soc. Japan* 18, 289-96(1942).—*C.A.* 45, 2694*h*.

Cane molasses produced by the carbonate and sulfitation methods were analyzed, and had, resp., Brix. 90.84, 87.46 , 92.90; sucrose 18.52, 22.81, 23.74; reducing sugars 23.00, 22.98, 22.33; total sugars 42.50, 46.99, 47.32%; gravity purity 20.39, 26.08, 25.55; total N 0.56, 0.52, 0.62%; ash 9.60, 6.21, 7.21%; and SO_2 trace, 8.30, 81.80 mg/100 g. On diln. the molasses by the ordinary and sulfitation methods formed a large ppt.

6594. KNOWLES, H. I. **Filtration of phosphate-defecated affination sirup.** *Ind. Eng. Chem.* 34, 422-4 (1942).

The filtration may be accomplished by means of Vallez filters using inexpensive paper pulp to precoat the filter leaves. The av. operating filtration rate was approximately 0.4 gallon per ft² per hr for a cycle period of about 4 hrs. The most influential factor affecting the filtration rate, was the matter adsorbed and occluded by the phosphate ppt.

6595. KORTSCHAK, HUGO P. **The calcium phosphate precipitate in limed cane juice.** *Hawaiian Planters' Record* 46, 105-9 (1942).—*C.A.* 37, 2207⁵.

The Ca phosphate ppt. in limed sugar-cane juice was not a definite compd. After pptn., the Ca content of the ppt. was increased by absorption of $Ca(OH)_2$ from the juice. When the juice and ppt. were heated, the pH value dropped. The 3 major reasons for the high Ca content of clarified juice were the original Ca concn., replacement of pptd. MgO by CaO, and the reduced activity of the Ca ion.

6596. MAFFEI, FRANCISCO J. **Utilization of bauxite as an absorbing agent in the clarification of sugar.** *Anais assoc. quím. Brasil* 1, 11-15 (1942); *Rev. brasil. quím.* 18, 113-14 (1944).—*C.A.* 37, 1619⁹.

Bauxite dehydrated at various temps. was used in granular form to percolate an 18% soln. of a 2nd sugar. A reduction of 4/5 in color and 2/3 in ash was obtained with bauxite dehydrated at about 400°C. The spent decolorant was regenerated at the same temp. without loss of substance. There was little difference in the decolorizing efficiency of 2 grades when freshly dehydrated, but the efficiency of the more impure grade was not completely restored by regeneration.

6597. MENA VAILLANT, ARTURO DE. **Filterability and color of sugars.** *Mem. 16th conf. anual, Asoc. tec. azucar. Cuba* 1942, 161-6.—*C.A.* 37, 6485².

A 1:1 soln. of the raw sugar was heated to 85°C and poured onto a paper filter contained in a funnel that was enclosed in an oven maintained at a temp. of 85°C; 3 min. later the flask contg. the filtrate was removed and weighed. The wt of the filtrate, calcd. as percentage of the wt of the filtrate from a similarly treated soln. of pure sucrose, represented the filterability of the raw sugar; sirups were treated analogously. Color was detd. by colorimetric comparison with a standard soln. of caramel.

6598. MIYAKE, SUGURU; HAYASHI, KANEO, AND SANO, YASUICHI. **Formation of lactic acid from cane sugar and molasses by the action of alkali.** *J. Soc. Trop. Agr., Taihoku Imp. Univ.* 14, 291-7 (1942).—*C.A.* 42, 2792*d*.

A 25% sucrose soln. contg. 5 mols. CaO was heated at 197°C for 3 hrs. Ca lactate with a highest yield of 61.5% was obtained. Under the same conditions except for adding 6 mols. instead of 5 mols. of CaO, a molasses gave Ca lactate with the highest yield of 61.3%.

6599. PARASHAR, D. R. **Clarification of juices. IV. Settling and filtration with reference to pH and juice colloids in sulfitation plants.** *Proc. 11th Ann. Convention Sugar Tech. Assoc. India* 1942, I,.99-113.—*C.A.* 37, 6149⁶.
