Catalysts (Ni = 0.125 to 4%) were prepd. by a 40-45 min. impregnation at 30-35°C of 1 g activated charcoal with 2 ml soln. of $Ni(NO_3)_2$, drying at 125°C, and reduction in H_2 at 330°C. Hydrogenation of C_6H_6 was carried out in a stream of excess H_2 at 115-176°C, space velocity 0.025-0.2 liter/liter catalyst/hr; dehydrogenation of cyclohexane at 300-302°C, space velocity 0.2. The first proceeded to a significant extent with catalysts contg. 1% Ni or more; the reaction was just barely noticeable with 0.5% Ni. The degree of hydrogenation was practically const. between 120° and 176°C.

9990. STANIER, H. AND MCKEAN, J.B. **The production of town gas by the catalytic gasification of petroleum oils.** *Inst. Gas Engrs., Copyright Pub.* No. 375, 36 pp.; *Gas World* 132, 550-3(1950).—*C.A.* 45, 2177*h*.

With catalysts based on Na_2CO_3 or CaO and under suitable conditions, gas oil was gasified with almost the complete absence of carbon deposition or tar formation, to produce a gas low in unsatd. hydrocarbons and rich in H_2, with a d. of about 0.45, and a heating value of 400-480 B.t.u./$ft.^3$ For application to a full-scale process a suitable catalyst was prepd. from a mixt. of bauxite, $CaCO_3$, and bentonite combined in the proportions of 63:34:3, molded in hollow, cylindrical shapes, and fired for 16 hrs at 1350°C. The expts. showed that equally good results could be obtained when one of the heaviest types of petroleum fuel oils was gasified.

9991. STOCKMAN, C.H. AND BRAY, J.L. **The hydrogenation of coal at high temperatures.** *Purdue Univ. Engl. Expt. Sta., Research Ser.* No. 111, 44 pp.(1950).—*C.A.* 45, 6819*g*.

The hydrogenation of Indiana 4th seam bituminous coal in a batch autoclave was investigated at 1200-1450°F and up to 6000 p.s.i. Gases with higher CH_4 content and heating values were produced at lower pressures provided the equil. point was satisfactory. The fraction of the coal gasified and the no. of moles of CH_4 produced were greater at higher pressures. Increasing the temp. increased the rate of CH_4 production.

Finely divided coal was not markedly more reactive than coarse coal.

9992. Weller, Sol; Clark, E.L., and Pelipetz, M.G. **Mechanism of coal hydrogenation.** *Ind. Eng. Chem.* 42, 334-6(1950).—*C.A.* 44, 5563*d*.

It was postulated that coal (or asphalt) was thermally split into reactive fragments (splitting being catalyzed by halogen acids). These fragments then either polymerized to form benzene-insol. materials, or were stabilized by addn. of H_2 to form sol. products (stabilization being catalyzed by Sn).

9993. Weller, Sol; Pelipetz, M.G.; Friedman, Sam, and Storch, H.H. **Coal-hydrogenation catalysts batch autoclave tests.** *Ind. Eng. Chem.* 42, 330-4(1950).—*C.A.* 44, 5563*e*.

Comparative catalyst tests were reported for hydrogenation at 450°C for 1 hr in absence of whole Bruceton coal (Pittsburgh bed), Bruceton anthraxylon and Rock Springs coal (Wyoming subbituminous). Initial cold H_2 pressures of 1000 p.s.i. were used. NH_4Cl alone was not an effective catalyst, but was an effective promoter for Sn (itself a moderate catalyst). HCl, CCl_4, chloroacetic acids were equiv. as promoters for Sn catalysts; NaCl was inert, free Cl_2 was harmful. MoO_3, Ni on kieselguhr, and Cu chromite were relatively ineffective. Zn showed appreciable activity and when promoted with NH_4Cl could replace 90% of the Sn normally used. Proper phys. distribution of Sn catalyst on coal was found to be quite important.

9994. Brinkley, Stuart R. Jr. **Evaluation of performance factors of fuel-oxidant mixtures.** *Ind. Eng. Chem.* 43, 2471-5(1951).

Generally applicable methods appropriate for application to automatic equipment were described for the computation of the thermodynamic properties of combustion gases. The results of such computations were the equivalent, in numerical form, of a Mollier chart for each fuel-oxidant mixt. The application of these results, employing automatic computational equipment, to the calcn. of flame temp. and fuel performance parameters was described.

9995. Brinkmann, G. **Catalytic reactions of active carbon.** *Kolloid-Z.* 123, 116-29(1951).—*C.A.* 46, 8787*h*.

Reactions comparable to those exerted by enzymes, such as catalase, oxidase, and hydrolase, were treated in more detail. The surface-active groups of active carbon which detd. its chem. behavior in various reactions were discussed. Also studied was the role played by those groups in the inhibition of catalysis. More completely treated reactions were the catalytic decompn. of H_2O_2 on active carbon compared with the analogous reaction of catalase, the question of the nature of surface-active groups in this case being especially discussed, the autoöxidation of active carbon, and the catalytic oxidation of formic acid and of hydrazine.

9996. Browning, L.C. and Emmett, P.H. **Equilibrium measurements in the system carbon-methane-hydrogen.** *J. Am. Chem. Soc.* 73, 581-3(1951).—*C.A.* 45, 4534*f*.

Equil. consts. for the reaction $CH_4 = C + 2H_2$ were measured in the range 380-838°C, the carbon present being formed from the decompn. of Fe_3C. The values obtained were close to those for the reaction in which the carbon form was β-graphite.

9997. Chaigneau, Marcel. **The sulfo-chromic oxidation of carbon.** *Compt. rend.* 232, 1112-14(1951).—*C.A.* 46, 4897*h*.

Oxidation of graphite by chromic acid without a catalyst at room temp. yielded no more gas after 130 hrs. The gas was about 75% CO_2, < 1% CO, and O_2. The oxides accounted for at least 99.75% of the sample. With a 10% chromic acid soln. in H_2SO_4 of d. 1.140, the oxidation at 100°C was complete in 5 hrs.

9998. Csuros, Zoltán; Géczy, István, and Keipert, Miklós. **Investigations on catalysts. VI. Mechanism and kinetics of hydrogenation of stereoisomeric ethylenecarboxylic acids.** *Acta Chim. Hung.* 1, 22-45(1951)(in German).—*C.A.* 45, 10022*i*.

Pd-animal charcoal prepd. according to Gattermann-Wieland was used as the catalyst with *maleic*, *fumaric*, and *cinnamic acids*. The curves of hydrogenation velocity showed a max. and a min. with increased amounts of catalyst. The product of the reaction had an inhibiting effect on the hydrogenation process, and its presence apparently changed the mechanism of the reaction. It was observed that the product of reaction repressed both the adsorption of the substance and the adsorption of H_2. The differences observed in the hydrogenation velocities of maleic and fumaric acid were caused by differences in their adsorptions.

9999. Dryden, I.G.C. **Action of solvents on coals at lower temperatures. III. Behavior of a typical range of British coals towards specific solvents.** *Fuel* 30, 217-33 (1951).—*C.A.* 45, 10542*g*.

The action of specific solvents (ethylenediamine proved the best for the purpose) on 23 bright coals covering a wide range of rank and on specimens of gray and black durain, fusain, and cannel coal, was described. When plotted against rank (C content) the extn. yield, quantity of solvent imbibed, and heat of wetting in ethylenediamine of the bright coals formed well-defined bands, each with a moderate degree of scatter. Coals were divided into 3 classes; the first comprised free-burning and caking coals (chemically reactive towards the solvent), the second both strongly coking and dry steam coals, and the third anthracites.

10000. Dubrisay, René and Favart, Michel. **Catalytic action of metallized carbons in certain oxidation reactions.** *Compt. rend.* 232, 2099-2100(1951).—*C.A.* 46, 1855*d*.

Carbon metallized by $AgNO_3$ or AgOH catalyzed the air oxidation of EtOH to a greater extent than did carbon alone. Cu exerted a similar, but much smaller, catalytic effect.

10001. Dunlop, E.C. **Quantitative analysis by means of catalytic hydrogenation reactions.** *Ann. N.Y. Acad. Sci*, 53, 1087-92 (1951).—*C.A.* 46, 3895*g*.

Maleic acid, methyl vinyl ketone, styrene, and cyclooctatetraene were detd. by hydrogenation in 95% EtOH, AcOH, or dioxane with PtO_2, Pd on charcoal, or Ni W-6 catalysts. Flasks with sealed side arms to hold the sample permitted working in a closed system.

10002. Funasaka, Wataru; Yokokawa, Chikao; Suga, Sôhei; Kito, Yoshiyuki, and Awaya, Tetsuro. **Caking properties of coal. II.** *Bull. Inst. Chem. Research, Kyoto Univ.* 25, 18-23(1951).—*C.A.* 46, 3237*b*.

The properties of caking and noncaking coals were compared. Each coal was extd. under N_2 with pyridine, benzene, and cyclohexanone in a Soxhlet app. and with benzene for 3 2-hr periods in an autoclave at 230-60°C. The amt. of the extd. matter, except that by pyridine, was parallel to the caking power. The extd. residues were oxidized with *N* $KMnO_4$ and the oxidation coeffs. were detd. with oxalic acid. They revealed the difference of carbonization degree between the caking (34.6-42.7) and the noncaking (51.7-70.6) coals.

10003. Funasaka, Wataru; Yokokawa, Chikao; Ueno, Shoji; Matsumiya, Saburo, and Miyazaki, Yoshiaki. **The chemistry of coal. VII. Oxidation of artificial coal containing nitrogen by means of alkaline potassium permanganate.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 579-81(1951).—*C.A.* 47, 6633*f*.

Five different artificial coals contg. N and several natural coals were oxidized with alk. $KMnO_4$ soln. N in each coal was converted to NH_3 or NO_3^-. The value of NH_3/NO_3^- was large in the initial stage of oxidation, and became smaller with the progress of reaction. The final values of NH_3/NO_3^- for cellulose coals were greater than those of lignin coals.

10004. Gel'd, P.V.; Vlasov, V.G., and Serebrennikov, N.N. **Reduction of metal oxides by solid carbon.** *Doklady Akad. Nauk S.S.S.R.* 78, 693-6(1951).—*C.A.* 45, 8421*c*.

The reduction proceeded: (I) $MO + CO \rightarrow M + CO_2$ and (II) $CO_2 + C \rightarrow 2CO$. Proof was supplied by trapping and detg. the amt. of CO_2 evolved on heating *in vacuo* pressed pellets of finely ground Cr_2O_3 or MnO mixed with finely divided graphite, outgassed under 10^{-5} mm Hg. and by detg. the loss of wt of the pellets. The proportions used were $1Cr_2O_3$: 5C and 1 MnO: 4C, resp. The components were ignited to 1200°C prior to mixing and pelleting. The amt. of CO_2 produced was practically the same in all expts.

10005. Grothe, Hans. **Physical-chemical problems in thermal zinc recovery and their significance for practice.** *Z. Erzbergbau u. Metallhüttenw.* 4, 133-7(1951).—*C.A.* 45, 6135*g*.

The gas content of the coal used had no accelerating effect except that the introduction of CO was more advantageous than an inert gas. Briquetting was of no particular advantage.

10006. Hallonquist, Earl G. **Catalytic hydrogenolysis of wood.** *Ind. Eng. Chem.* 43, 1427-30(1951).—*C.A.* 45, 8243*g*.

Simultaneous hydrogenation and hydrolysis of wood was carried out at 250-290°C, and pressures of 4-6000 p.s.i. Nickel catalysts were found most effective. Optimum yields of about 50% of the wt of the wood were obtained as nonaq. distillable liquids.

10007. Hansen, Christian J. **Low-temperature carbonization of bituminous coal.** *Brennstoff-Chem.* 32, 97-104(1951).—*C.A.* 45, 5907*a*.

High-volatile noncoking coals should be subjected to low-temp. carbonization before use, as a satisfactory smokeless coke can be made from these coals, with the recovery of large vols. of tar and considerable gas. Where a lower-volatile but free-burning coke is required, the semicoke may be subjected to a second heating stage. Such coke was much less graphitized and freer burning than high-temp. coke. Various proposals for combining low-temp. carbonization with gas manuf. were suggested.

10008. Herbo, Cl.; Lefebvre, C., and Muylle, R. **Adsorption in heterogeneous catalysis.** *Ind. chim. belge* 16, 82-5(1951).—*C.A.* 45, 6029*e*.

A flow method was used to det. isotherms for the hydrogenation of Me_2CO and C_6H_6 with a Ni-ZnO-Cr_2O_3 catalyst at 130°-140°C and for the reaction of H_2 with Br_2 on activated charcoal at 295°C. If p_x stood for the equil. pressure of H_2 or Br_2 when the adsorbing surface was x% covered, the ratios p_{75}/p_{50} and p_{75}/p_{25} were 1.5 and 3.0, resp., in all 3 cases. Since values of 3 and 9 were predicted from a Langmuir isotherm, the low values indicated that mols. already adsorbed favor further adsorption on the free surface with a corresponding increase in heat of adsorption.

10009. Hopkins, D.W. and Adlington, A.G. **Factors affecting the reduction of zinc oxide by carbon.** *Bull. Inst. Mining Met. No.* 530, 101-16 (1951).—*C.A.* 45, 2833*e*.

Nut charcoal, carbon black, and electrode carbon, of particle size less than 5 μ, were mixed with powd. ZnO and caused to react at temps. between 980° and 1100°C in small fused silica retorts especially fitted with means for the rapid removal and shock-cooling of the effluent gases. The rate of reduction increased rapidly above 1000°C and at any temp. was related to the compn. of the retort amt. irrespective of the type of carbon used.

10010. Inouye, Yoshiyuki and Mitani, Shiro. **Vacuum distillation of turpentine with active carbon and sulfur.** *Mokuzai Kenkyu* (Wood Research) No. 6, 1-6 (1951).—*C.A.* 45, 9890*c*.

To increase the yield of retene, a decarboxylating agent for abietic acid, such as active carbon or S, was employed in the distn. of turpentine from *Pinus thunbergii*, estd. to contain 45.89% abietic acid. The max. yield of retene was 3.4% based on turpentine when 33.3% active carbon was employed, and 9.1% when 29.6% S was employed.

10011. Ishiwara, Torajirô; Niwa, Kichizô, and Itô, Toshio. **Utilization of pyrrhotite principally composed of iron and sulfur. III. Making sulfur by the catalytic reduction of roasting gases with blast-furnace gases. IV. Direct reduction of roasting gases with coke** *Science Repts. Research Insts., Tohoku Univ.*, Ser. A, 3, 397-406, 407-12(1951).—*C.A.* 47, 2441*i*.

SO_2 was catalytically reduced with CO with 3 kinds of catalysts. Roasting gases, from which O_2 was removed, gave better results than pure SO_2. The S yields were detd. at different reaction temps. where the roasting gases, contg. equal weights of SO_2 and O_2, were introduced into the direct reducing furnace contg. coke. At 850°C, even if the S yields were only 70%, the ratio of CO to SO_2 was about 2 to 1. Residual SO_2 could be reduced almost completely through the use of a catalyst.

10012. Jeanprost, Charles. **The Kubierschky principle and reactions between pulverized solids and gases or vapors.** *Chimie & industrie* 65, 191-9, 339-47(1951).—*C.A.* 45, 5502*g*.

A vertical column was divided into a no. of compartments by perforated plates or screens. The pulverized solid was fed into the top and, passing through the screens, fell by gravity from one compartment to the next. The reacting gas entered the bottom of the column, moved through vertical passageways to the top of the 1st compartment and then, in contact with the falling solids, passed downward to the bottom of the compartment, where the gas entered another passageway, moved to the next upper compartment and, thence, through the entire column. The application of the principle was the displacement of heavier gases or vapors from the bottom of each compartment by lighter gases entering at the top. Production of sponge iron, metallurgical coke and lime, SO_3, hydrocarbons by the Fischer-Tropsch process, P_2O_5 from phosphorite, activated carbon, and $2Na_2O.3SiO_2$ from SiO_2, NaCl, and carbon were discussed.

10013. Kiuchi, Shumji. **Reactivity and mechanism of formation of metallurgical coke.** *Tetsu to Hagane* (J. Iron & Steel Inst. Japan) 37, 140-4 (1951).—*C.A.* 46, 7742*i*.

Expts. on cokes and anthracites with a thermobalance showed remarkable differences in combustion velocities which were thought to be caused by different activation energies, but the activation energies actually detd. were of almost equal value. The contradiction may be explained by considering the frequency factor of burning carbon aggregates in the Arrhenius equation. The essential step was considered to be a growth of carbon grains. Coke grains were considered to have a larger degree of growth than the anthracite grains.

10014. Kobozev, N.I. **Some remarks concerning the paper of Sokol'skiĭ and Stender.** *Zhur. Fiz. Khim.* 25, 375-9(1951).—*C.A.* 46, 2894*a*.

The published data gave a value of *n* equal to 2, very exactly when the formulas of Kobozev were correctly applied.

10015. Kordesch, Karl and Marko, Adolf. **A new carbon oxygen-electrode process.** *Österr. Chem. Ztg.* 52, 125-31 (1951).—*C.A.* 46, 839*b*.

The electrodes were impregnated with various heavy metal salts to serve as catalysts. The porous carbon-O electrode made possible the formation of higher compds. through electrolytic action with the primary atm. elements. Cathodic oxidation proceeded through the formation of H_2O_2 by the electrochem. reduction of O or by essentially chem. oxidation of oxidizable materials. The special catalytic property of the carbon electrode would be gradually used up by the oxidizing reactions.

10016. Lewis, W.K.; Gilliland, E.R., and Sweeney, M.P. **Gasification of carbon. Metal oxides in a fluidized powder bed.** *Chem. Eng. Progress* 47, 251-6(1951).—*C.A.* 45, 5906*g*.

The exptl. procedure, equil. results, interpretation of data, and engineering significance were described. CuO on silica gel was not a suitable O_2 carrier. Fe_2O_3 appeared worthy of further study.

10017. Loison, R. **Underground gasification.** *Rév. ind. minerale* 32, 330-46(1951).—*C.A.* 46, 2779*b*.

The present status of transforming solid combustible minerals into a combustible gas by gasification on the site of the deposit was surveyed.

10018. Minachev, Kh. M.; Shuĭkin, N.I., and Rozhdestvenskaya, I.D. **Hydrogenation and dehydrogenation of hydrocarbons in the presence of cobalt catalysts with a low metal content.** *Doklady Akad. Nauk S.S.S.R.* 76, 543-6(1951).—*C.A.* 45, 3698*d*.

In the flow hydrogenation of C_6H_6 at 180°C at a space velocity of 0.04 liter/liter catalyst/hr, on active charcoal with 4,2,1,0.5, 0.25% Co the degrees of conversions were 100,100, 100, 72.8, 20.2%. In the dehydrogenation of cyclohexane at 300°C, 0.2 liter/liter catalyst/hr, on the same catalysts, degrees of conversion were 26.6, 27.6, 25.0, 13.2, 5.0%. At const. space velocity, 0.076, with 4 and 2% Co, the conversion remained at the 100% level for 100 and 66 hrs, resp.; with the 1% Co catalyst, at a space velocity of 0.045, the activity was still at the 85% level after 266 hrs of service. With the 0.5% Co catalyst, at space velocity 0.035, at 180°C, the activity fell to 36.8% in 285 min., and with 0.25% Co, to 5.6% in 128 min.

10019. Orchin, M.; Golumbic, C.; Anderson, J.E., and Storch, H.H. **Studies of the extraction and coking of coal and their significance in relation to its structure.** *U.S. Bur. Mines, Bull.* No. 505, 15 pp. (1951).—*C.A.* 46, 4768*i*.

Removal of the binding material led to complete disintegration of the colloidal structure of the coal and peptization of the micelles in the solvent. Inexpensive solvents obtained directly from coal, could be substituted for phenanthrene for various purposes. Catalytic hydrogenation of a noncoking subbituminous coal under comparatively mild conditions coverted it to a coal with good coking properties, the conversion requiring the consumption of 0.6% H. Coking properties of bituminous coal lost upon air oxidation were restored by mild hydrogenation. The oxidative attack probably resulted from the formation of a hydroperoxide or a peroxide that started an autoxidative chain reaction.

10020. Papp, Elemer; Antonescu, Hadrian, and Holló, Mária Gy. **Study on the oxidizability of coals with special reference to anode carbons. I.** *Aluminium* 3, 13-17(1951).—*C.A.* 45, 8737*e*.

Coke residues (obtained by C_6H_6 extn. of raw anode masses) were screened, and material of grain size 1.5-0.06 mm and below was used for test. One g was treated with 15 ml 40% CrO_3 30 mins. on the water bath, then 300 ml cool distd. water was added. The soln. was filtered, the filtrate dild. to 500 ml, and an aliquot portion titrated iodometrically. The oxidation diagrams obtained by this method showed that coke of finer grain size was more oxidizable than was coarse coke. The rate of oxidation depended to a high degree on the amt. of bonding material adhering to the surface of coke grains, which was not sol. in C_6H_6. Ignited petroleum coke consumed much less CrO_3.

10021. PAPP, ELEMÉR; ROMWALTER, ALFRÉD, AND ANTONESCU, HADRIAN. **Study on the oxidizability of coals with special reference to anode carbons. II.** *Aluminium* 3, 28-32(1951).—*C.A.* 45, 8737*e*.

The amt. of CO_2 as a function of time was used as the basis of oxidizability. The coal or carbon sample was treated with H_2SO_4 contg. chromic acid at 100°C. The CO_2 was removed by a stream of N_2 at a velocity of 6 liters/hr and absorbed by 2% $Ba(OH)_2$. The oxidizability had an approx. linear relation to surface. The degree of oxidizability of the same coal or carbon varied according to the heat treatment. When subjected to heat treatment the oxidizability of petroleum coke heated up to 800°C decreased and then again increased when the heating temp. was above 800°C. Acheson graphite was most readily oxidized and anthracite least readily.

10022. PATAI, SAUL AND HOFFMANN, ELIAHU. **Catalysis of the air oxidation of carbon black.** *Bull. Research Council Israel* 1, No. 1/2, 131 (1951).—*C.A.* 46, 5414*b*.

At an air pressure of 200 mm, a slow reaction occurred between carbon black and atm. O_2 at 367°C, in the presence of $KClO_4$, during 1-2 hrs, almost all of the O_2 being consumed in the oxidation to CO_2. The following reaction occurred concurrently: $KClO_4 + 2C = KCl + 2CO_2$. KCl had the same effect. Plotting log $(a - x)/(b - x)$ vs. t, where $a - x$ = amt. of carbon black and $b - x$ = amt. of O_2 present at time t, gave straight lines up to 65% reacted.

10023. PAUSHKIN, YA. M. AND LIPATOV. YU. S. **Inhibition and activation of cracking on carbon and on aluminosilicates.** *Doklady Akad. Nauk S.S.S.R.* 76, 547-50 (1951).—*C.A.* 45, 6371*f*.

In cracking on activated carbon as catalyst, addn. of BF_3 lowered the yield of gasoline almost by a factor of 2, lowered its Br_2 no. considerably, and lowered the yield of gas and the content of unsatd. compds. At 350-450°C, in the presence of BF_3, a distillate heavier than the original oil was obtained. The same proportion of BF_3 introduced into cracking runs on an aluminosilicate cracking catalyst increased the yield of gasoline by 10-15%, and yielded a lighter gasoline than aluminosilicate alone.

10024. POTTER, CHARLES AND BARON, SEYMOUR. **Kinetics of the catalytic formation of phosgene.** *Chem. Eng. Progress* 47, 473-80 (1951).—*C.A.* 45, 10018*f*.

The kinetics of the catalytic formation of phosgene from CO and Cl_2 with activated carbon was studied in a flow system by means of the differential bed technique. An analytical method was developed to measure small changes in compn. of CO, Cl_2, and $CO+Cl_2$ mixts. Measurement of the reaction rate in the temp. range from 31° to 99°C showed that surface reaction between adsorbed Cl_2CO was the controlling mechanism. Introduction of N_2 into the reaction mixt. increased the adsorption coeff.of Cl_2 and $COCl_2$. The effective enthalpy of adsorption of Cl_2 and $COCl_2$, however, remained unchanged.

10025. RAUSCHENBACH, P.. **Directions for the use of artificial coal as bearing material.** *Die Technik* 6, 330-1 (1951).—*C.A.* 46, 4146*b*.

The raw materials were bituminous coke, lignite-tar coke, petroleum coke, soot, natural graphite, charcoal, and Cu, Pb, Sn, and Zn powder, with pitches or tars as binders, or less often synthetic or natural resins. The ground, mixed, and pressed masses were fired at up to 1450°C. The finished artificial coal had less that 1% ash, sp. gr. 2.20-2.23, apparent d 1.55-1.7 g/ml, and vol. of pores 15-30%. Oxidation became noticeable above 450°C.

10026. ROMWALTER, ALFRED. **The stability of coke.** *Acta Tech. Acad. Sci. Hung.* 1, No. 2, 75-82 (1951)(in German).—*C.A.* 46, 238*h*.

The stability of coke and the clinkering capacity of coking coal were examd. in the light of the most recent knowledge of crystal structure. The stability of the coke could be deduced from the stability of the microcryst. units. The stability of the coke increased with increasing av. size of the graphitic crystallites, and this apparently was confirmed by practice.

10027. SHUĬKIN, N.I.; MINACHEV, KH. M., AND RUBINSHTEIN, A.M. **Dehydrogenating and hydrogenating properties of low-content palladium catalysts.** *Doklady Akad. Nauk S.S.S.R.* 79, 89-92 (1951).—*C.A.* 45, 10020*e*.

Catalysts with 2.0, 1.0, 0.25, 0.10, and 0.05% Pd on active carbon were tested in dehydrogenation of cyclohexane in a weak stream of H_2, and in hydrogenation of C_6H_6, in excess H_2. The activity of all catalysts in the dehydrogenation of cyclohexane fell very slowly with time with the 2.0, 1.0, and 0.25% Pd catalysts, faster with 0.10 and 0.05% Pd: however, even the 0.05% Pd catalyst had still at least 5% of its initial activity left after about 12 hrs. The measured differences of activity were, apparently, due not only to the different contents of Pd but to differences of structure of the Pd.

10028. SOKOL'SKIĬ, D.V. AND STENDER, K.I. **The role of the carrier in heterogeneous catalysis.** *Zhur. Fiz. Khim.* 25, 369-74(1951).—*C.A.* 46, 2894*a*.

The rate of hydrogenation of dimethylethynyl carbinol was studied on charcoal covered with various amts. of Pd($7.75 \times 10^{-4} < \theta < 1.16 \times 10^{-2}$). The no. n of Pd atoms in the active ensemble may be approx. 2 but it also may be 9; in fact, it did not seem to have any precise meaning.

10029. Tamaru, Kenji. **The action of carriers in the hydrogenation of acetylene by palladium catalyst.** *Bull. Chem. Soc. Japan* 24, 177-80 (1951) (in English).—*C.A.* 46, 8944*i*.

C_2H_2 was hydrogenated by Pd deposited on such carriers as carbon black, active carbon (Merck), Japanese acid clay, French chalk, silica gel, granular active carbon, quartz sand, Al_2O_3, and kieselguhr. The ratio of Pd to carrier was 1:100 in each instance. The expts. were made by the static method at 30°C. The catalysts deposited on the 1st four carriers catalyzed the hydrogenation in 2 distinct steps at 30° in the same manner as Al_2O_3 and kieselguhr. When the granular active carbon was used as a carrier, the hydrogenation of C_2H_2 and C_2H_4 proceeded not in two steps, but simultaneously. When the quartz sand was used as a carrier, the hydrogenation of the two hydrocarbons occurred at the same time.

10030. Terbeck, W. **A water-gas diagram.** *Brennstoff-Chem.* 32, 65-9(1951).—*C.A.* 45, 5908*c*.

Diagrams based on the water-gas reactions and the water-gas equil. were presented which made it possible to calc. the O_2 requirements to gasify 1 kg carbon. These calcd. values were compared with values measured in O_2-gasification operation at Leuna, showing fair agreement. Diagrams were also presented for the equil. gas compn.

10031. Thiele, Heinrich and Weise, Eberhard. **Graphite as anode.** *Z. Elektrochem.* 55, 193-9 (1951).—*C.A.* 45, 7896*c*.

In the anodic polarization of graphite, 3 different reactions occurred: (1) evolution of O_2; (2) an attack perpendicular to the surface, which attacked the honeycomb plane of the graphite lattice and oxidized it to CO_2 and CO; (3) a swelling, an attack parallel to the plane of the C_6-ring which remained intact. The type of attack depended on the kind and concn. of acid or of anion.

10032. Watanabe, Jun and Shiramoto, Tomizo. **Activated carbon electrodes for air-depolarized wet cells. I. The decomposition of hydrogen peroxide on account of activated charcoals.** *J. Electrochem. Soc. Japan* 19, 274-9(1951).—*C.A.* 46, 1891*e*.

The activity of charcoals activated by many inorg. reagents was studied by measuring the decompn. velocity of aq. H_2O_2 in the presence of the sample charcoal. The charcoals activated with NaOH, KOH, $KMnO_4$, H_2SO_4, H_3PO_4, and other metallic sulfates gave the lowest decompn. velocity values; while $HClO_4$, HNO_3, NH_4Cl, $(NH_4)_2SO_4$, $MgCl_2$, $FeCl_2$, $Co(NO_3)_2$, $SnCl_2$, etc., gave medium values; and $MnCl_2$, $CoCl_2$, $PdCl_2$, H_2PtCl_6, etc., gave considerably higher values.

10033. Weller, Sol and Pelipetz, M.G. **Coal hydrogenation catalysts. Studies of catalyst distribution.** *Ind. Eng. Chem.* 43, 1243-6 (1951).—*C.A.* 45, 5907*e*.

The activity of a no. of catalysts was found to be much greater when they were impregnated on the coal from aq. soln. than when they were added as powders to the powd. coal. The ball-milling of coal and catalysts together was of intermediate effectiveness. With a Wyoming coal, the activity of $SnCl_2$ was equaled by impregnated $NiCl_2$ and surpassed by impregnated $(NH_4)_2MoO_4$ + H_2SO_4.

10034. Yagishita, Hideharu and Araki, Harumi. **Coking. I. Thermochemical properties of coal and oil coke.** *Misc. Repts. Research Inst. Natl. Resources* No. 23, 23-38(1951).—*C.A.* 47, 289*f*.

From the thermoanalysis of hard to soft coals from 9 different mines heated at 100-1000°C and their x-ray diffraction patterns (the swelling tested at 300-500°C), the coking property seemed to depend upon the development of a 2-dimensional lattice of unit C chains which changed into a 3-dimensional graphite structure by heating, releasing hydrocarbon mols. loosely linked with the main C chains as gases.

10035. Zelinskiĭ, N.D. and Levi, G.I. **Irreversible catalysis of cyclohexene on activated carbon of high purity.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1951, 819-20.—*C.A.* 46, 3839*c*.

Cyclohexene passed at the rate of 0.6 ml/ml catalyst/hr over high-purity carbon (from sucrose, ash ~ 0.01%), in the absence of H_2, disproportionated to the extent of 12.5, 29.5 (max.), 26.1%, at 400, 450, 475°C, resp. The reaction was $3C_5H_{10} \rightarrow 2C_5H_{12} + C_6H_6$. In an excess of H_2, neither disproportionation nor hydrogenation took place, and the reaction for C_6H_6 in the catalyzate was neg.

10036. Ahlers, Walter. **Water-gas generation in large horizontal chamber ovens.** *Gas- u. Wasserfach* 93, 5-15, 69-70(1952).—*C.A.* 46, 4198*f*.

Advantages of steaming were the use of the sensible heat in the coke, and the increased flexibility of operation of the plant. Disadvantages were addnl. gas losses due to leakage through the walls on account of the gasification of carbon deposited in the walls; steam losses due to leaks in the steam conduits, and a slight deterioration of the coke quality. With short steaming periods the coke deterioration will be very slight, but this must be considered with respect to the coke use.

10037. Andreev, E.A. and Kavtaradze, N.N. **Catalytic oxidation of phosphine in a broad temperature range.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1952, 1021-32.—*C.A.* 47, 5777*f*.

On an active carbon (without Cu), if PH_3 was first adsorbed at 315°C, under a pressure of 110 mm, the amt. desorbed was 3 times (by wt) the amt. adsorbed; consequently, this 1st portion of PH_3 had been oxidized by O_2 which was chemisorbed in the carbon. On C/Cu (4%) the total adsorption (reversible + irreversible) of PH_3 (under 100 mm) decreased with the temp. rising from 130 to 264°, and then increased somewhat with further rising temp. On powd. CuO and Cu_2O without carbon carrier, adsorption of PH_3 was 2 mg/g at room temp.; at 130°C, it was of the order of 9-10% of the wt of the oxide. Expts. of oxidation of gaseous mixts. $PH_3 + 2O_2$ on carbon/Cu (treated with NH_3) were made at 21°C under 0.4 mm Hg (higher pressures result in ignition). Chemisorption of PH_3 was evidently a necessary but not a sufficient condition for oxidation.

10038. Archibald, R.C.; May, N.C., and Greensfelder, B.S. **Experimental catalytic and thermal cracking at high temperature and high**

space velocity. *Ind. Eng. Chem.* 44, 1811-17 (1952).—*C.A.* 46, 10593*i*.

Three feed stocks were used: isopropylbenzene, *n*-hexadecane, and a heavy West Texas gas oil. Special induction-heated equipment was used and runs were made both with and without catalysts (silica-alumina). Coke formation during catalytic cracking was found to decrease with rise in temp. for the whole range studied. Coke reduction resulted from the higher volatility of the reactants and products, which diminished their retention on the catalyst, and from min. thermal and metal-catalyzed coking because of the short contact time.

10039. **Barkley, L.W.; Corrigan, T.E.; Wainwright, H.W., and Sands, A.E.** **Catalytic reverse shift reaction. A kinetic study.** *Ind. Eng. Chem.* 44, 1066-71(1952).—*C.A.* 46, 7733*f*.

A study was made of the feasibility of adjusting the ratio of H_2 to CO in synthesis gas by the use of the reverse shift reaction CO_2 (g) + H_2(g) $\rightleftarrows$ CO(g) + H_2O (g) by using the standard shift reaction catalyst. The kinetics of the reaction were studied, and a probable mechanism for the reaction was postulated. This method of adjusting the synthesis gas compn. was feasible, but that its use would depend upon the economic advantage of employing a large excess of superheated steam in the coal-gasification step.

10040. **Baron, Seymour.** **The kinetics of the catalytic formation of phosgene.** *Univ. Microfilms* (Ann Arbor, Mich.), *Pub.* No. 3319, 129 pp. (microfilm $1.61, paper enlargements $12.90);—*Dissertation Abstracts* 12, 10(1952).—*C.A.* 46, 7415*e*.

10041. **Bellini, G.** **Theoretical conditions to avoid carbon black formation in reforming of methane.** *Riv. combustibili* 5, 694-700(1952).—*C.A.* 46, 5292*c*.

The thermodynamics in reforming CH_4 and the equil. consts. at various temps. involving the Components CH_4, H_2O, H_2, CO, and CO_2 were discussed. From the consts. and temp. and pressure conditions (based on C_{gas}) the min. steam/CH_4 ratio for avoiding carbon black formation was calcd.

10042. **Colclough, R.O.** **Study of the mechanism of ionic polymerization using radioactive tracers.** *J. Polymer Sci.* 8, 467-75(1952).—*C.A.* 47, 5163*i*.

Styrene was polymerized in cyclohexane for 15 min.at 25°C by using $SbCl_5$ catalyst having radioactive Sb. The polymer soln. was brought into contact with activated char. All of the Sb was adsorbed by the char; none remained in the effluent polymer soln. Suggested polymerization mechanisms which required that catalyst remain attached to polymer chains were incorrect.

10043. **Dryden, I.G.C.** **Action of solvents on coals at lower temperatures. IV. Characteristics of extracts and residues from the treatment of coal with amine solvents.** *Fuel* 31, 176-99(1952).—*C.A.* 46, 4764*f*.

The application of pptn. by nonsolvents and by ions, dialysis and electrodialysis, chromatography, electrophoresis, chlorination, condensation with amines, and heats of wetting was reported. There was evidence that the coal particles in soln. had a wide size distribution, perhaps 90% being too large to pass through a Cellophane membrane and a small proportion probably being very small; the mean size of the colloidal portion may be independent of rank, at least up to 86% C content.

10044. **Falkum, E. and Glenn, R.A.** **Coal-hydrogenation-process studies. III. Effects of time on restricted hydrogenolysis of Spitsbergen coal with Adkins catalyst.** *Fuel* 31, 133-52 (1952).—*C.A.* 46, 4765*g*.

The effects of a no. of variables on the restricted hydrogenolysis of a Spitsbergen coal for the range 375-388°C for 72 hrs by using Adkins catalyst with no vehicle and a cold H_2 pressure of 1800 p.s.i. were studied, including the effects of time at the temps. 325°, 350°, 375°, and 400°C and also the effects of temp. for zero time over the range 325-470°C. The restricted hydrogenolysis of Spitsbergen coal occurred in two distinct stages which were influenced greatly by changes in temp. over the range studied.

10045. **Ghosh, J.C.; Bhattacharyya, S.K.; Muthanna, M.S., and Mitra, C.R.** **Electrolytic reactions on porous carbon anodes. I. The preparation of *p*-benzoquinone by the oxidation of benzene.** *J. Sci. Ind. Research* (India) 11B, 356-61(1952).—*C.A.* 47, 2064*e*.

The prepn. of *p*-benzoquinone by electrochem. oxidation of benzene in a special cell was studied for optimum conditions. The cell utilized a thick-walled carbon anode and Pb cathodes with an unglazed porcelain diaphragm between chambers. The anode was made of extruded wood charcoal and baked at 1300°C in a reducing atm. Its apparent porosity was 50.7%.

10046. **Ghosh, J.C.; Bhattacharyya, S.K.; Rao, M.R.A.; Muthanna, M.S., and Patnaik, R.B.** **Electrolytic reactions on porous carbon anodes. II. The preparation of chlorobenzene from benzene.** *J. Sci. Ind. Research* 11B, 361-64 (1952).—*C.A.* 47, 2064*g*.

Chlorobenzene was prepd. by electrolytic chlorination of benzene. Eighteen % HCl was used as the catholyte. The best current efficiency of 89% was obtained with cyanuric acid (1.34% of wt of the carbon anode), an anolyte of 100% soln. of monochloroacetic acid in concd. HCl, a temp of 38°C, and a c.d. of 4.3 amp./sq dm. for 2 hrs.

10047. **Gordon, Alvin S.** **The reaction between methane and steam in the temperature region 1000° to 1100°.** *Ind. Eng. Chem.* 44, 1857-9 (1952).—*C.A.* 46, 11637*a*.

Between 1000° and 1100°C at 1 atm. abs., the reaction of CH_4 with steam was probably a combination of CH_4 decompn. followed by the steam-carbon reaction. Until carbon was formed as a result of the decompn., steam behaved as an inert gas.

10048. **Hecker, Eberhard.** **Carbonization of American coals.** *Gas- u. Wasserfach* 93, 118-23(1952). —*C.A.* 46, 5294*b*.

The first American coal received in 1948 had a high S content, and the volatile matter content was so high that the resultant coke was weak even when only 10% was used in admixt. with German coals. More suitable coal was later bought on the basis of specifications and this gave excellent results. Carbonization results were reported for American coals for two periods. Under present conditions the American coal was as cheap delivered at the gas plants as suitable European coal.

10049. Khundkar, M.H. **Reduction of borax and boric oxide melts by carbon.** *J. Indian Chem. Soc.* **29**, 477-83(1952).—*C.A.* 47, 3743*i*.

The reducibility of B_2O_3 and $Na_2B_4O_7$ melts with various forms of carbon was studied between 900° and 1000°C. Appreciable reduction of $Na_4B_2O_7$ commenced at 900°C, and of B_2O_3 at 950°C. The rate of reduction was highest with active carbon, as compared to graphite and coke. With increasing amts. of carbon, the reduction reached a max. of 87.33% at a ratio of 3.75 carbon per 1.043 $Na_2B_4O_7$; further increases in carbon resulted in lower conversion rates. The rate of oxidation of carbon depended directly on the fluidity of the mass.

10050. Kotelkov, N.Z. **Catalytic properties of some activated carbons.** *Zhur. Priklad. Khim.* **25**, 337-41(1952).—*C.A.* 47, 5044*g*.

Rates of dehydrogenation of iso-PrOH, fed at the rate of 0.05 ml/min., were measured between 300° and 400°C on tech. active carbon reclaimed from wastes of furfural production, and on dendrite carbon formed in the decompn. of org. compds. The carbons, in amts. of 0.1-0.85 g, were supported on nichrome wire spirals. Activation energies (calcd. from 1st-order rate consts.) varied from 15.6-16.9 kcal on the dendritic and one industrial carbon, to 10 kcal on activated furfural waste carbon; on the latter, the conversion was 90.5% at 400° and it showed the highest heat of wetting with C_6H_6 and the fastest bleaching action on methylene blue.

10051. Long, F.J. and Sykes, K.W. **The effect of specific catalysts on the reactions of the steam-carbon system.** *Proc. Roy. Soc.* (London) **215A**, 100-10 (1952).—*C.A.* 47, 4180*f*.

The reactions of the steam-carbon system were studied by the static method at 750°C with extd. coconut charcoal to which Fe, Na, Ca, and Al were added separately. The steam-carbon reaction was catalyzed chiefly by Na, the CO_2-carbon reaction by Fe and Na, whereas the heterogeneous oxidation of CO by steam was enhanced by all the addns. except Al. The gasification of the carbon was unaltered. The general course of the gasification was not altered by the impurities in 2 main types of catalyst, the transition metals and the alkali metals. The added substances interacted with the gases to a much greater extent than did the natural impurities, though both were efficient catalysts.

10052. Long, F.J. and Sykes, K.W. **The catalysis of the carbon monixide-steam reaction.** *Proc. Roy. Soc.* (London) **215A**, 111-19(1952).—*C.A.* 47, 4581*f*.

The kinetics of the CO-steam reaction occurring heterogeneously at the surface of coconut charcoal were detd. before and after the extn. of the metallic impurities. The impurities catalyzed the reaction. The results were attributed to active sites consisting of surface C atoms more firmly bound to the rest of the lattice than those attacked during gasification of the C by steam or CO_2.

10053. Minachev, Kh. M.; Shuĭkin, N.I., and Rozhdestvenskaya, I.D. **Poisoning of platinum catalysts with low contents of the active metal on a carrier, in dehydrogenation catalysis.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1952**, 603-15.—*C.A.* 46, 10823*g*.

Dehydrogenation of cyclohexane was run, without externally fed H_2, on 2.5 g of catalysts contg. 3.21, 1.41, 0.62, and 0.37% Pt on activated carbon, reduced in H_2 4 hrs at up to 310°C; the feed rate of cyclohexane in all expts. was 0.5 ml/5 min. Poisoning was done at 280°C as long as there was no H_2S in the outgoing gas. The different poisons had about the same action, except than on 3.21% Pt, PrSH, iso-AmSH, and thiophene, lowered the activity more rapidly than did the other poisons. Pt on silica gel was poisoned more easily than Pt on carbon, and Pt on ultraporous glass even more easily. The relatively low susceptibility of Pt on carbon to poisoning was attributed to its large sp surface area.

10054. Mulford, Robert N.R. and Russell, W. Walker. **Catalytic hydrogenation of the oxides of carbon to higher hydrocarbons.** *J. Am. Chem. Soc.* 74, 1969-74(1952).—*C.A.* 46, 7738*h*.

The synthesis of hydrocarbons from H_2, CO, and CO_2 at atm. pressure was studied upon ceria-promoted, Cu-contg. Co catalysts to which was added CO_3^{2-}, Cl^-, SO_4^{2-}, $S_2O_3^{2-}$, or S^{2-} as Na or K salts prior to catalyst pptn. All catalysts produced oil when the initial CO_2-H_2 mixt. was first passed over a supported Fe, water-gas catalyst; with no water-gas catalyst present only the Co catalysts contg. K_2CO_3 or K_2SO_4 produced oil. Catalyst additives altered the distribution between liquid and gaseous synthesis products.

10055. Nistler, Friedrich. **New methods for producer-gas generation from bituminous coal.** *Glückauf* **88**, 346-9(1952).—*C.A.* 46, 7736*e*.

Preheated air and coal dust were admitted tangentially through nozzles to the cyclone-shaped producer. The turbulent gas flow caused the liquefied slag to be thrown to the walls of the chamber; the liquid slag then drained down into a water bath where it was granulated. The producer gas was freed from the larger suspended particles in a cyclone, and flowed through an air preheater and a waste-heat boiler. The gas was then further purified by means of a multiclone, a washer, and an elec. precipitator. The resulting gas was similar to blast-furnace gas, with a gross heating value of about 1051 kcal/m³.

10056. Padovani, C. **The chemical utilization of natural gas.** *Riv. combustibili* 6, 84-104(1952). —*C.A.* 46, 8350*d*.

Natural gas was decomposed to obtain carbon black or higher hydrocarbons depending on conditions used. CH_4 at 1 atm. began to dissoc. at 400°C, and the dissocn. was practically complete at 900°C. To attain a higher reaction rate, temps. higher than 1000°C were employed. The use of metallic catalysts to increase the rate caused difficulties as they form carbides which set up secondary equil. with CH_4 and products of decompn. The reaction was essentially a surface type and was influenced by inert material placed in tubes. Addn. of H_2 retarded cracking and gave better yields of higher hydrocarbons. Addn. of N_2 retarded it to some degree. Temp. of 1000°-1200°C and times of 0.1 sec were employed.

10057. Patai, Saul; Hoffmann, E. and Rajbenbach, L. **The oxidation of carbon by air. I. Catalysis in the oxidation of carbon black by air.** *J. Applied Chem.* (London) 2, 306-10(1952).—*C.A.* 46, 10817*c*.

The influence of K salts of various anions and that of the chlorides of alk. earth and alkali metals on the oxidation by air was investigated. Tablets were pressed from ground mixts. of carbon black and various amts. of the salts. A part of the sample was weighted and degassed in the reaction chamber of the evacuated app. at about 250°C, then withdrawn. The reaction chamber was heated to the desired temp., air admitted till the initial pressure (generally 200 mm) was established and the sample reintroduced. The pressure drop was measured manometrically and at the end of the reaction the residual gas analyzed for CO and O_2. CO_2 was absorbed by ascarite. Most of the measurements were carried out at 367°C. Strong basicity of the salt-catalyst seemed to be a sufficient condition for high activity.

10058. Patai, Saul; Rajbenbach, L., and Hoffmann, E. **The oxidation of carbon by air. II. Catalytic effects in the oxidation of graphite, Nuchar, and sugar charcoal by air.** *J. Applied Chem.* 2, 311-14(1952).—*C.A.* 46, 10817*g*.

The rate of oxidation of graphite by air was measured at 453°C, for Nuchar at 306°C, and of sugar charcoal at 273°C. The exptl. curves obtained in the kinetic measurements could be presented by a second-order kinetic equation. Salts of strongly basic reaction, such as K_2CO_3 and K_3PO_4, which had a very marked effect as catalyst, enhanced the breakdown of the surface oxides. Other active salts, e.g. KI and LiCl. work as O_2 carrier.

10059. Patry, Marcel. **Manufacture of hydrogen from natural gas.** *Chimie & Industrie* 67, 399-409(1952).—*C.A.* 46, 6808*e*.

The natural-gas-reforming plant, built by Chem. Construction Corp. in Toulouse, France, for Onia, and the BASF plants at Oppau, Ludwigshafen, Germany, and Pierrefittes, Pyrenees, France, were described. The last one used natural gas to react with steam and O_2 in the presence of a catalyst.

10060. Powell, Alfred R. **Relation of coal gasification to the production of chemicals.** *Gasification and Liquefaction of Coal Symposium, Ann. Meeting AIME, New York, N.Y.*, Feb. 20-1, 1952, 196-296.—*C.A.* 47, 4580*h*.

The possible production of a mixt. of H_2 and CO by direct gasification of coal was discussed. The largest potential use of synthesis gas made from coal was an as intermediate in the Fischer-Tropsch type of process for manuf. of synthetic liquid fuel. Many oxygenated products could be recovered and marketed, including alcs., aldehydes, ketones, and aliphatic acids.

10061. Rao, M.N. and Hougen, O.A. **Catalytic oxidation of nitric oxide on activated carbon.** *Chem. Eng. Progress Symposium Ser.* 48, No. 4, *Reaction Kinetics and Transfer Processes*, 110-24(1952).—*C.A.* 47, 2025*e*.

The oxidation of NO to NO_2 using activated carbon as a catalyst was studied in a series-type flow reactor. The catalytic reaction using activated carbon followed the same apparent mechanism as that using silica gel as the catalyst. This mechanism consisted of the formation of the NO complex $(NO)_2$, equil. adsorption of the complex on single sites of the catalyst, surface reaction between the O_2 in the gas phase and the adsorbed complex, and finally desorption of the NO_2. The surface reaction was the rate-controlling step.

10062. Rayner, J.W.R. **Gasification by the moving-burden technique.** *J. Inst. Fuel* 25, 50-9; *Gas Times* 70, 30, 32, 37, 39(1952).—*C.A.* 46, 4197*i*.

Coke was blown from the carbonizing chamber into the combustion tube; cyclones at the top of this tube caught the larger part of the ash and partly burned coke and returned this to the carbonizing chamber, while the combustion products passed through a secondary combustion chamber to which was also led dust purged from the bottom of the carbonizing chamber. The gases from this secondary combustion chamber were passed through a boiler, heat exchanger for heating air for the combustion chamber, through dedusting equipment, and to the stack. Gas from the carbonizing and steaming chamber was passed through a waste heat boiler, heat exchanger (for heating steam used in carbonizing and steaming chamber), an economizer, cyclone for removing dust, scrubber, and disintegrater.

10063. Rayner, J.W.R. **Gasification by the moving-burden technique. II.** *Gas Times* 70, No. 757, 103, 106, 109(1952).—*C.A.* 47, 290*f*.

The problem of dust losses from the coke gasification process was discussed. Operating data were given for a 400-kg hr coal-gasification process. Both a coking coal and a slightly caking coal (minus 1/8 in.) were satisfactorily carbonized at 930°-950°C in a bed fluidized with steam. The plant operated smoothly with no build-up of deposits in the units. Temps. could be controlled within ±5°.

10064. Savich, T.R. and Howard, H.C. **Oxidation of bituminous coal to organic acids by nitric acid and oxygen.** *Ind. Eng. Chem.* 44, 1409-11 (1952).—*C.A.* 46, 8347*g*.

Twenty-g samples of —200 mesh Pocahontas No. 3 coal were slurried in a rocking autoclave with 200 ml of HNO_3 of specified concn. and O_2 at 400 p.s.i.g. At 110°C, the reaction was too slow, except with 16 *M* acid. With 0-4.5 *M* acid, oxidation proceeded at a satisfactory rate at nearly 200°C, optimum conditions being 1-2 *M* acid at 190°C. With 4.5 *M* acid, the max. yield of sol. acids was obtained at 170°C for 4-8 hrs. Increase of O_2 pressure in the range 400-600 p.s.i.g. was without significant effect. Considerable corrosion of the stainless steel reactor was observed above 120°C.

10065. Schuster, Fritz. **Coke and gas production of gas works, with special attention to the**

use of noncaking or poorly caking coals. *Gas- u. Wasserfach* 93, 57-67(1952).—*C.A.* 46, 4198*i*.

The practical upper limit for coke production was reached for a const. heating value gas composed of coal and water gas, when the oven was heated with coal gas and light oil was removed as completely as possible. Complete gasification of coal in a gas plant had the advantage that a wide range of coals could be used without paying the premium for scarce high-volatile coals, and that the gas plant operation became more flexible.

10066. Swann, Sherlock Jr.; Chen, C.Y., and Kerfman, H.D. **Electrolytic reduction of organic compounds at carbon cathodes.** *J. Electrochem. Soc.* 99, 460-6(1952).— *C.A.* 47, 53*f*.

Cathodes of graphite, gas-baked coke, and lampblack were compared in relative activity against each other in the reduction of maleic acid, pyridine, acetophenone oxime, benzophenone oxime, diethyl ketoxime, K benzenediazotate, azobenzene, *N*-benzohydrylideneaniline, and K glyoxylate in alk. soln. in diaphragm divided cells. Lactic acid was tested in a cell without diaphragm. Generally, graphite electrodes were most effective in reductions.

10067. Tesner, P.A. and Rafal'kes, I.S. **Formation of carbon on the surface in the thermal decomposition of hydrocarbons.** *Doklady Akad. Nauk S.S.S.R.* 87, 821-4(1952).—*C.A.* 47, 3671*e*.

Mixts. of CH_4, C_2H_2, and C_6H_6, with N_2, were passed at temps. from 700° to 1000°C over lampblack or Pt, and the amts. of carbon deposited as a result of the decompn. were detd. by weighing. With the rate of carbon deposition from pure CH_4 taken as unity, the relative rates in the mixts. were proportional to the hydrocarbon content; the N_2 acted only as a diluent. Exptl. points for the 3 hydrocarbons lie on the same straight line. On Pt, porcelain, quartz, Al_2O_3, and aluminosilicate the rate was slower than on a carbon surface and increased gradually as the surface became coated with carbon. The amt. of H_2 collected corresponds stoichiometrically to the amt. of carbon deposited.

10068. Watanabe, Jun and Shiramoto, Tomizo. **Activated-carbon electrodes for air-depolarized wet cells. II. The decomposition of hydrogen peroxide by activated charcoal (2).** *J. Electrochem. Soc. Japan* 20, 135-7(1952).—*C.A.* 47, 52*e*.

The relation between the temp. and the logarithm of the velocity const. k_1 of primary decompn. of H_2O_2 by activated charcoal was almost linear, and the tangent of the line was nearly 0.024. The relation between the wt of charcoal M and k_1 was not linear: $k_1/k_1' = (M/M^n)^n$, where n was 1.2-1.3. The effect of pH on k_1 and the type of decompn. was large. With α-type charcoal activated by NH_4Cl the values of k_1 dropped steeply at about pH 3, but with the β-type charcoal activated by $MgCl_2$, k_1 dropped at about pH 7.

10069. Watanabe, Jun and Shiramoto, Tomizo. **Activated carbon electrodes for air-depolarized wet cells. III. The decomposition of hydrogen peroxide by activated charcoal.** *J. Electrochem. Soc. Japan* 20, 386-90(1952).—*C.A.* 47, 2060*d*.

When wood charcoal was heated in a current of NH_3 gas, the N-content of the charcoal increased and the charcoal was activated to a very high degree. The degree of activity was correlated to the decompn. velocity of H_2O_2. The catalytic activity of the charcoal depended on the temp., the NH_3 gas rate, and the reaction time but not upon the N-content.

10070. Whittingham, G. **Production of sulfur trioxide during the combustion of carbon in air containing small quantities of sulfur dioxide.** *Nature* 169, 155-6(1952).—*C.A.* 46, 5293*i*.

SO_2 was oxidized to SO_3, but if the latter passed over carbon in an O_2-depleted atm., it was again reduced to SO_2.

10071. Musaev, I.A. and Gal'pern, G.D. **Catalyst for analytic hydrogenation and dehydrogenation of hydrocarbons.** *Doklady Akad. Nauk S.S.S.R.* 88, 71-2(1953).—*C.A.* 47, 5233*h*.

Active carbon impregnated overnight with a mixt. of solns. of H_2PtCl_6 and of $FeCl_3$, evapd. to dryness, and reduced in a stream of H_2 for 6-8 hrs at a temp. gradually raised from 150° to 180°C, provided a catalyst on which C_6H_6, passed at 180°C in a stream of H_2, was hydrogenated to cyclohexane in a single pass, and cyclohexane passed at 300°-305°C in a weak stream of H_2 was dehydrogenated to C_6H_6. On the other hand, this catalyst failed to act on methylcyclopentane in a stream of H_2 at 300°, or on indane, whereas platinized carbon without Fe did open the cyclopentane ring, and converted indane to *o*-methylethylbenzene.

10072. Pelipetz, M.G.; Salmon, J.R.; Bayer, James, and Clark, E.L. **Catalyst-pressure relationship in the hydrogenolysis of coal.** *Ind. Eng. Chem.* 45, 806-9(1953).—*C.A.* 47, 5661*h*.

In order to det. the interchangeability of catalyst activity and H_2 pressure, tests were made on specific reaction rates for the hydrogenolysis of Rock Springs coal in the presence of Sn and Mo catalysts at several H_2 pressures. Because the conversion was a 1st-order reaction, a plot of the specific reaction rates as a function of pressure resulted in a numerical dependence between H_2 pressure and catalyst activity.

10073. Robinovich, E. Ya.; Snegireva, T.D., and Tesner, P.A. **Specific catalytic activity of carbon.** *Doklady Akad. Nauk S.S.S.R.* 88, 95-7 (1953).—*C.A.* 47, 5233*i*.

Channel carbon black of 100 m^2/g proved to have a definite cracking catalytic capacity, as the degree of decompn. of paraffins at 500-20°C, on the carbon, was 3-4.5 times as great as in an empty tube at the same temp. For an acetylene carbon of 65 m^2/g, the sp cracking activity was of the same order. At the end of the 135 hrs, 4-5 new at. layers of carbon were added to the original carbon black, and, consequently, the cracking was taking place most of the time on new carbon formed through the very cracking; consequently the newly deposited carbon has the same activity as the original carbon black. In cracking on an aluminosilicate catalyst, in which carbon is deposited in the course of the process, the B.E.T. surface area of the catalyst was found to remain very nearly const. as long as the amt. of carbon deposited did not exceed 3%.

V-14. Catalytic Processes on Non-Carbons

10074. Bodenstein, M. and Fink, C. G. **Heterogeneous catalytic reactions. IV. Kinetics of contact sulphuric acid.** *Z. physik. Chem.* **60,** 1-45 (1907).—*C.A.* **1,** 2849^5.

The velocity of the reaction on the immediate surface of the Pt was assumed to be very great. The surface was protected by a layer of adsorbed SO_3 thru which the SO_2 and O_2 must diffuse. The velocity of the reaction ordinarily depended only on the rate at which the more slowly diffusing gas (SO_2) passed thru this layer of SO_3. When the concn. of the O_2 was relatively small, its rate of diffusion thru the SO_3 layer was the detg. factor in the reaction.

10075. Sabatier, Paul. **Action of metallic oxides on primary alcohols (reducible oxides).** *Compt. rend.* **147,** 16-8 (1908).—*C.A.* **2,** 3057.

Sb_2O_5, Sb_2O_3 and Bi_2O_3 were reduced to the metals when heated with EtOH vapor at 360°C. The metallic powders did not have appreciable catalytic influence. NiO, CoO, PbO_2, Pb_3O_4, PbO, Cu_2O, CuO were reduced to the metals when heated with EtOH vapor at 350°C, and the metals acted catalytically on the alc., giving aldehyde and H_2. WO_3 and EtOH at 350°C gave a blue oxide intermediate between WO_2 and WO_3.

10076. Sabatier, Paul and Mailhe, A. **New applications of hydrogenation by divided metals.** *Ann. chim. phys.* **16,** 70-107 (1909).—*C.A.* 3, 1274.

Hydrogenation of various compds. was accomplished by passing the vapors with an excess of H_2 over finely-divided Ni at various temps.

10077. Hartley, H. **Electrical condition of a gold surface during the adsorption of gases and their catalytic combustion.** *Proc. Roy. Soc.*(London)**A90,** 61-8 (1914).—*C.A.* **8,** 2102..

A Au surface acquired a negative charge during the catalytic combustion of gases in contact with it. The metal became negatively charged during the occlusion of combustible gases (H_2 or CO) and positively charged during the occlusion of O_2.

10078. Reichinstein, D. **Relationship between electrolytic and purely chemical processes. III.** *Z. Elektrochem.* **20,** 406-17 (1914).—*C.A.* 8, 3760.

The soln. of Ni in $H_2O_2 + H_2SO_4$ soln. took place in steps: (1) Adsorption of H_2O_2; (2) $H_2O_2 \rightarrow O + H_2O$; (3) $2O \rightarrow O_2$; (4) $Ni + O + 2H^+ \rightarrow Ni^{++} + H_2O$. In a soln. 0.970 *N* H_2O_2 and 0.045 *N* H_2SO_4, the passivity of Ni lasted about 90 min.; in a soln. 0.423 *N* H_2O_2 and 0.057 *N* H_2SO_3, the passivity lasted about 170 min.

10079. Reichinstein, D. **Relationship between electrolytic and purely chemical processes. IV.** *Z. Elektrochem.* **21,** 359-72 (1915).—*C.A.* 9, 3019.

The slow passivation of Ni in CrO_3 was explained by the slow O_2 formation in the electrode surface. The reaction proceeded in 4 stages: (1) adsorption of a part of the liquid phase (H^+ and oxidizing agent) by the Ni; (2) $H_2O_2 = H_2O + O$, or $2CrO_4^{--} + 10\ H^+ = 2\ Cr^{+++} + 5\ H_2O + 3\ O$; (3) assocn. of a part of the atomic O in the electrode surface vol.; (4) the soln. process $Ni + O + 2\ H^+ = Ni^{++} + H_2O$.

10080. Lemoine, G. **Catalysis of hydrogen peroxide in heterogeneous media. II. Experiments with platinum.** *Compt. rend.* **162,** 657-63 (1916).—*C.A.* **10,** 1959.

The time required for 50% decompn. of H_2O_2 (8.6% soln.) alone and in the presence of Pt black and Pt sponge was measured. With Pt black the decompn. was very regular, but extraordinarily rapid. The time of half-decompn. decreased rapidly with increasing quantities of catalyzer and increased with decreasing concn. of H_2O_2.

10081. Lemoine, G. **Catalysis of hydrogen peroxide in heterogeneous media. III. Experiments with oxides.** *Compt. rend.* **162,** 702-8 (1916).—*C.A.* **10,** 1959.

Fe_2O_3 (pptd. and dried at 180°C) caused a rapid decompn. of H_2O_2, increasing the speed of decompn. 5790 times for 21°C and 770 times for 70°C. Expts. were also made with CeO_2, SiO_2 and ThO_2; in each case an increase was found.

10082. Tschischewski, N. **The occurrence and influence of nitrogen in iron and steel.** *Engineering* **101,** 171-3, 217-19 (1916).—*C.A.* **10,** 1321.

When Fe, Mn or Al was heated and exposed to the action of NH_3, considerable N was adsorbed with the formation of nitrides. With Fe the temp. optimum was about 600°C and about 8.9% N taken up. In the case of Fe nitride, the N was obtained almost entirely as NH_4Cl when the metal was dissolved in HCl. Mechanical tests proved that the presence of N had a considerable effect especially with regard to the elongation. The hardness of the metal was increased and the elasticity reduced.

10083. Maxted, E. B. **The influence of lead on the catalytic activity of platinum.** *J. Chem. Soc.* **117,** 1501-6 (1920).—*C.A.* **15,** 1646.

The poison effect for a given quantity of Pt catalyst was a linear function of the quantity of Pb. One mg of Pb appeared to inhibit completely the catalytic activity of 8.8 mg of Pt as shown by the velocity of adsorption of H_2 by oleic acid induced by catalytic Pt. This velocity of adsorption varied directly with the wt of Pt. These results were analogous to those observed on the inhibition of occlusion of H_2 by Pd due to H_2S.

10084. Iredale, Thomas. **The role of protective colloids in catalysis.** *J. Chem. Soc.* **119,** 109-15 (1921).—*C.A.* **16,** 189.

The inhibitive effect of protective colloids on the catalytic decompn. of H_2O_2 by colloidal Pt was found to be in the following order: gelatin and glue, egg albumin, gum arabic, sucrose (the last having no effect). The stronger the substance as a protective colloid, the greater its inhibition of catalytic activity; in the case of gelatin inhibition was noticeable at dilutions of 0.000005%.

10085. LANGMUIR, I. **The mechanism of catalytic action of platinum in the reactions $2CO + O_2 \rightarrow 2CO_2$ and $2H_2 + O_2 \rightarrow 2H_2O$.** *Trans. Faraday Soc.* **17**, 4 (Advance Proof) (1921).—*C.A.* **16**, 864.

Pt wires were heated in mixts. of CO and O_2 or H_2 and O_2 at pressures below 1000 dynes per cm^2, the products of the reaction being condensed by liquid air. The rate of decrease in pressure served as a measure of the reaction velocity. With the Pt at 750° to 1050°K the velocity was practically independent of the temp., being limited largely by the rate at which the gases came in contact with the surface. With an excess of O_2, the velocity was proportional to the pressure of CO, while with an excess of CO the rate was proportional to the pressure of O_2. Every O_2 mol. which hit a clean Pt surface condensed on the surface in the form of single atoms combined with sep. Pt atoms. The adsorbed O atoms were very active in their ability to react with CO.

10086. MAXTED, EDWARD BRADFORD. **Influence of mercury, sulfur, arsenic and zinc on the catalytic activity of platinum.** *J. Chem. Soc.* **119**, 225-33 (1921).—*C.A.* **15**, 1646.

The rate of absorption of H_2 by 3 ml of oleic acid dissolved in 9 ml of acetic acid in the presence of 5 mg of active Pt was const. almost to the satn. point both with and without poisons. The inhibitive effect of Hg was a linear function of the Hg present in the reacting mixt. almost down to complete extinction of activity. The residual catalytic activity decreased less rapidly with increasing Hg content. With S this point was somewhat lower than with Hg, while As and Zn deviated from the linear course at a slightly higher point.

10087. ADKINS, H. **The selective activity of alumina for decarboxylation or for dehydration.** *J. Am. Chem. Soc.* **44**, 2175-86 (1922).—*C.A.* **16**, 4116^6.

The catalytic effect of Al_2O_3 from different sources was tested on the decompn. of AcOEt to Me_2CO, CO_2 and C_2H_4. The catalysts were prepd. by ignition of $Al(OH)_3$ that had been prepd. both by pptn. in aq. soln. and by slow decompn. of Al alkoxides with H_2O vapor. The size and shape of the alkyl group replaced detd. the size of the interstices left in the catalyst when the OH was later eliminated as H_2O. The reaction was carried out at 465°C. The highest yields of C_2H_4 were obtained with Al_2O_3 from $Al(OH)_3$ which had been prepd. by pptn. in aq. soln.

10088. ARMSTRONG, E. F. AND HILDITCH, T. P. **Discussion on heterogeneous reactions.** *Trans. Faraday Soc.* **17**, 669-70 (1922).

From expts. on hydrogenation of unsat. org. liquids in presence of Ni, the primary action was thought to be between Ni and the org. compd., and the resulting unstable intermediate complex. H_2 must react either by collision with the Ni-ethylenic compd. complex or by preliminary assoc. of H_2 with Ni.

10089. LENHER, V. **Some properties of selenium oxychloride. II.** *J. Am. Chem. Soc.* **44**, 1664-7 (1922).—*C.A.* **16**, 3277.

A small amt. of moisture materially modified the behavior of $SeOCl_2$ and a high degree of purity was essential that its behavior be not confused with reactions not due to $SeOCl_2$ itself. $CoCO_3$ formed a sensitive detector of moisture. Reactions of $SeOCl_2$ with 16 additional substances were described.

10090. RUFF, O. **Reactions at metal boundary surfaces.** *Z. physik. Chem.* **100**, 419-24 (1922).—*C.A.* **16**, 2058.

Ca, alloyed with more positive metals or with Ca_3M_2, took up N_2 more readily than pure Ca.

10091. ADKINS, H. AND NISSEN, B. H. **Selective activation of alumina. II. Reactions of formic acid at the surface of alumina.** *J. Am. Chem. Soc.* **45**, 809-15 (1923).—*C.A.* **17**, 2104.

The effect of H_2O and temp. was studied on the decompn. of HCOOH passed over (1) Al_2O_3 prepd. from Al-Hg and H_2O, (2) Al_2O_3 from $(Me_2CHO)_3Al$ on pumice (3) Al_2O_3 from $(Me_2CHO)_3Al$ in pills, (4) Al_2O_3 from $(BuO)_3Al$ on pumice, (5) glass wool, and (6) pumice. The amts. of H_2 and CO_2 formed agreed with the reactions $HCOOH = CO_2 + H_2$ and $HCOOH = CO + H_2O$. The results indicated that Al_2O_3 may be selectively activated towards the 2 reactions by modifying the distance between the Al atoms.

10092. ALMQUIST, J. A. AND BRAY, W. C. **Catalytic oxidation of carbon monoxide. I. Efficiency of the catalysts, manganese dioxide, cupric oxide and mixtures of these oxides.** *J. Am. Chem. Soc.* **45**, 2305-22 (1923).—*C.A.* **17**, 3824.

Temp. efficiency curves were obtained for 3 series of partially hydrated porous catalysts of MnO_2 and CuO. Pronounced improvement in activity was caused by the addn. of small amts. of either oxide to the other. Partial dehydration was necessary to bring a catalyst to the region of max. activity, but with little change in the efficiency. Continued dehydration however finally lowered the efficiency and caused loss of O_2 (except in the case of CuO).

10093. BOSWELL, M. C. AND MC LAUGHLIN, R. R. **The mechanism of catalysis by platinum.** *Trans. Roy. Soc. Can.* (3) **17**, 1-20 (1923).—*C.A.* **18**, 1077.

The prepn. of Pt black was minutely described. H_2, O_2 and mixts. of H_2, O_2 and N_2 of known compn. were passed over and the changes in vol. of the gases and the H_2O formed were detd. Charged O and H atoms and OH groups in the adsorption films reacted stoichiometrically with H_2 and O_2.

10094. KINGDON, K. H. AND LANGMUIR, I. **The removal of thorium from the surface of a thoriated tungsten filament by positive-ion bombardment.** *Phys. Rev.* 22. 148-60 (1923).—*C.A.* **18.** 17.

The removal of Th by positive-ions of A, Cs, He, H, Ne and Hg as a function of voltage and time was studied. A, Cs, Hg, and Ne ions all started to sputter the Th at about 50 v. To explain the fact that the amt. of Th sputtered did not increase linearly with the time at the beginning, it was suggested that some Th atoms were driven into the filament by the first impacts; if one of these depressed atoms was struck again the ion was reflected and knocked off one of the surrounding Th atoms.

10095. PEASE, R. N. **Catalytic combination of ethylene and hydrogen in the presence of metallic copper. II. Measurements of reaction velocity at 150°, 200° and 250°C.** *J. Am. Chem. Soc.* **45**, 2235-42 (1923).—*C.A.* **17**, 3823.

The reaction was more nearly bimol. in the region 150-250°C than at 0°C where it was approx. monomol. with respect to H_2 and partially inhibited by excess of C_2H_4. Non-adsorption of the gases by the catalyst probably accounted for the more nearly normal character of the reaction at the higher temps.

10096. SANDONNINI, C. **The behavior of some metals as catalysts. II.** *Gazz. chim. ital.* **53**, 453-61 (1923).—*C.A.* **18**, 190⁹.

Temps. ranging from 250° to 720°C were used. The results showed that carbon may not be considered a catalyst for detonating gas. At temps. from 300° to 500°C, carbon adsorbed O_2, which it gave off at higher temps. as CO and CO_2. Finely divided Ni, besides being an active catalyst for the detonating mixt., was also a catalyst for the reaction that led to the oxidation of carbon.

10097. SCHLENK, W. AND WEICHSELFELDER, T. **Nickel hydride and the mechanism of hydrogenation with nickel catalyzers.** *Ber.* **56B**, 2230-4 (1923).—*C.A.* **18**, 207.

A Ni ethersol, prepd. by action of Ph-Mg bromide in Et_2O soln. on anhyd. $NiCl_2$ under N_2, absorbed H_2 avidly, the dark-brown soln. being decolorized with formation of a black finely flocculent ppt. The vol. of H_2 absorbed corresponded closely to NiH_4 but after drying in a current of H_2 the solid corresponded to NiH_2. The hydride was stable in Et_2O. Contact with atm. O_2 rendered it inactive at ordinary temp. Catalytic action of Ni in hydrogenation may be due to formation of hydride.

10098. WHITESELL, W. A. AND FRAZER, J. C. W. **Manganese dioxide in the catalytic oxidation of carbon monoxide.** *J. Am. Chem. Soc.* **45**, 2841-51 (1923).—*C.A.* **18**, 613.

The prepn. of MnO_2 by methods which gave a product little contaminated by adsorbed alkali resulted in a material which was catalytic in the oxidation of CO as low as -20°C. It was rapidly poisoned by H_2O, but resumed its activity when the H_2O was removed by heating. CO_2 had no poisoning effect. The CO adsorbed by the oxide was desorbed as CO_2. Since this material was more active than Hopcalite, it was suggested that the function of the promoters in the latter was merely to neutralize the deleterious effects of the impurities present.

10099. ADKINS, H. AND LAZIER, W. A. **Organic reactions at the surfaces of dehydrogenating catalysts.** *J. Am. Chem. Soc.* **46**, 2291-305 (1924).—*C.A.* **18**, 3357.

Two distinct types of Ni were produced thru reduction by EtOH and by H_2. The catalysts were different in their ability to promote hydrogenation of C_2H_4, considerably different in their power to dehydrogenate EtOH, and very different in their ability to break C-C linkages in AcH and other compds. The proportion of reactions taking place at the surface of ZnO and Fe_2O_3 may be modified by prepg. these oxides from the hydrates or hydroxides and from different metallic alkoxides. The spacing of the active points of a Ni catalyst was a matter of fundamental importance.

10100. ADKINS, H. AND NISSEN, B. H. **Causation of organic reactions by alumina and theories of catalysis.** *J. Am. Chem. Soc.* **46**, 130-45 (1924).—*C.A.* **18**, 1982³.

The nature of the rearrangement and subsequent reaction on a catalyst was detd. by the spatial configuration of the catalyst. The formation of ketones from acids, of nitriles from amides and of olefins from alkyl halides was not affected by modifications in the spatial configuration of the Al catalysts. The reactions of esters and alcs. were quite sensitive.

10101. BROWN, A. B. AND REID, E. E. **The catalytic alkylation of ammonia.** *J. Phys. Chem.* **28**, 1067-76 (1924).—*C.A.* **19**, 35.

The alkylation of NH_3 by MeOH, EtOH, PrOH and BuOH was measured by passing the alc. vapors with NH_3 over catalysts at 300°-500°C. The order of effectiveness was: special silica gel; silica gel impregnated with thoria, ZrO_2; silica gel impregnated with NiO, alumina, com. silica gel, blue oxide of W. Silica gel showed wide variations in its activity with seemingly slight variations in its prepn.

10102. FORESTI, B. **Catalysis through the action of subdivided metals. II. The thermal effect of the hydrogenation of ethylene on the surface of finely divided nickel.** *Gazz. chim. ital.* **54**, 132-46 (1924).—*C.A.* **18**, 2634.

The hydrogenation of C_2H_4 occurred in 3 phases: (1) adsorption of C_2H_4 and of H_2 by the Ni; (2) combination of adsorbed mols. to give adsorbed C_2H_6; (3) evapn. of adsorbed C_2H_6 from the surface of the Ni. The mol. heat of adsorption by Ni at const. vol. for C_2H_4 was 5845.6 cal. and for C_2H_6 5004.7 cal.

10103. GAUGER, A. W. **Critical potentials of hydrogen in the presence of nickel catalyst.** *J. Am. Chem. Soc.* **46**, 674-80 (1924).—*C.A.* **18**, 1226.

A Ni grid activated by dipping it in HNO_3 and $Ni(NO_3)_2$ soln. and subsequent reduction with H_2 at 300°C after drying in air at 400°C was subjected to electronic bombardment in a vacuum tube, The breaks obtained in the photoelectric current-grid voltage curves were 10.4, 120.0, 13.6, 16.4, 18.2, 20.5, and 22.6 v., four of these being attributed to the atom, two to the mol. and one to the Ni-H complex.

10104. HURST, W. W. AND RIDEAL, E. K. **Promoting action of palladium on copper. I. Catalytic combustion.** *J. Chem. Soc.* **125**, 685-94 (1924).—*C.A.* **18**, 1775.

The ratio of CO to H_2 burned in a mixt. of gases containing O_2 at the surface of Cu and at surfaces of Cu + Pd was measured. A specific promoting effect was observed and the addition of Pd to Cu definitely increased the ratio CO: H_2.

10105. PALMER, W. G. AND CONSTABLE, F. A. **The catalytic action of copper. IV. The periodic variation of the activity with temperature of reduction.** *Proc. Roy. Soc.* (London) **106A**, 250-68 (1924).—*C.A.* **19**, 204.

Expts. were made with Cu catalysts reduced from 220° to 420°C. A curve showing 3 max. was obtained for the reaction velocity at any const. temp. plotted against temp. of reduction. With a temp. of reduction of 420°C a profound change took place in the structure of the Cu film. Its activity was permanently raised and the periodic curve showed much less sharp max. and min.

10106. ARMSTRONG, E. F. AND HILDITCH, T. P. **A study of catalytic actions at solid surfaces. XII. Some observations relative to those particles of a catalyst which participate in chemical change.** *Proc. Roy. Soc.* (London) **108A**, 111-20 (1925).—*C.A.* **19**, 2443.

Expts. on the hydrogenation of whale oil in the presence of Ni catalysts and the toxic action of impurities were in accordance with the earlier concept of "active patches or particles" in the surface of the catalyst. Taylor's concept of isolated or semi-isolated Ni atoms was not completely satisfactory.

10107. BONE, W. A. AND ANDREW, G. W. **Studies upon catalytic combustion. I. The union of carbon monoxide and oxygen in contact with a gold surface.** *Proc. Roy. Soc.* (London) **A109**, 459-76 (1925).—*C.A.* **20**, 537.

The catalytic combn. of CO and O_2 on a Au wire gauze at about 300°C and pressures below 1 atm. was studied by a static method. The gas mixts. contained CO and O_2 in the proportions $2CO/O_2$, CO/O_2, and $4CO/O_2$. The final const. rate of reaction attained with the $2CO/O_2$ mixt. after prolonged operation was regarded as the "normal" activity and was used as the reference state. The normal catalytic activity of the catalyst could be greatly reduced by cooling the catalyst down to room temp. or by evacuating it at the reaction temp., and could be increased by previous exposure to CO or O_2 at 300°C.

10108. KAUTSKY, H. **Chemiluminescence.** *Trans. Faraday Soc.* **1925** (Advance Proof).—*C.A.* **20**, 551.

The chemiluminescent spectrum emitted by either rhodamine B or rhodamine sulfonate adsorbed on colorless oxidation products of $Si_6O_3H_6$, when the latter were oxidized either in soln. by permanganate or dry by O_3, was the same as the fluorescent spectrum of the adsorption compd. These dyes adsorbed on silicic acid may be oxidized by $KMnO_4$ but no chemiluminescence appeared.

10109. KUBOTA, B. AND YOSHIKAWA, K. **The toxicity of thiphene for nickel catalyzer; a new action of copper catalyzer.** *Japan J. Chem.* 2, 45-62 (1925) (in French).—*C.A.* **20**, 860.

The toxicity of C_4H_4S was studied by detg. the amt. required to inhibit completely the action of the catalyst. Contrary to catalysis with Cu, variations in the rate of H_2 had but very little effect. Differences in toxicity of various compds. were attributed to the fact that some reacted with all the forms of active Ni while others acted selectively only on the most active forms.

10110. KUBOTA, B. AND YOSHIKAWA, K. **The toxicity of thiophene for catalytic nickel and another action of catalytic copper.** *Sci. Papers Inst. Phys. Chem. Research Japan* 3, 33-50 (1925).—*C.A.* **19**, 2771.

The decrease in activity of catalytic Ni for the hydrogenation of benzene, containing 1% of thiophene, was studied at 300°C. Though rapidly poisoned as a result of the formation of NiS, it maintained its activity for the hydrogenation of phorone giving undiminished yields of valerone. Reduced Cu was not affected by thiophene as regards its ability to hydrogenate either C_6H_6 or phorone.

10111. KUBOTA, B. AND YOSHIKAWA, K. **The composition of reduced nickel catalysts.** *Sci. Papers Inst. Phys. Chem. Research Japan* 3, 223-31 (1925).—*C.A.* **20**, 138.

A reduced Ni catalyst was composed of many active unstable hydrides coexisting in the catalyst. The hydrides were sepd. into 3 classes: those poisoned by thiophene, by Et_2S and by H_2S. The relative amts. of each class of hydrides were detd. by measuring the S-content of the Ni catalyst when it became completely and successively poisoned for each of the 3 hydrogenation reactions.

10112. PEASE, R. N. AND STEWART, L. **The catalytic combination of ethylene and hydrogen in the presence of metallic copper. III. Carbon monoxide as a catalyst poison.** *J. Am. Chem. Soc.* 47, 1235-40 (1925).—*C.A.* **19**, 1981.

The velocity of combination of C_2H_4 and H_2 in the presence of a metallic catalyst at 0°C was measured by a static method; 0.05 ml CO reduced by 88% the activity of the Cu catalyst. The Cu catalyst could adsorb at 1 mm pressure 5 ml of CO. The reaction velocity measurements were compared with adsorption measurements; adsorption at pressures even as low as 1 mm was not a trustworthy index of catalytic activity for hydrogenation catalysts.

10113. RUSSELL, W. W. AND TAYLOR, H. S. **The promoter action of thoria on nickel catalysts.** *J. Phys. Chem.* **29**, 1325-41 (1925).—*C.A.* **20**, 325.

The reaction $CO_2 + 4\ H_2 = CH_4 + 2H_2O$, a surface reaction was strongly affected by the adsorbing power of the catalyst surface for the reactants. The activity of Ni alone as catalyst, either supported or unsupported, was greater the lower the temp. at which the Ni was reduced. The primary function of ThO_2 as promoter with supported Ni catalysts was to make possible the existence of a greater no. of Ni atoms of a highly unsatd. character per unit of catalyst, through the creation of ThO_2-Ni interfaces.

10114. SCHMIDT, OTTO. **The catalytic hydrogenation of organic substances.** *Z. physik. Chem.* **118**, 193-239 (1925).—*C.A.* **20**, 1017.

Expts. were described on powdered Fe, Co, Ni, Cu, Ag, Au, Zn and Pb as catalyzers for the $C_2H_4 + H_2 \rightarrow C_2H_6$ reaction. The actual hydrogenation process took place in the metal between dissolved ionized H_2 and dissolved C_2H_4. Results of expts. on the surface and H_2 adsorption of Ni powders were given. The surface was detd. from the decrease in wt on subjecting the powder to HCl (2.5%) for a short interval (11 sec). Only part of the H_2 could be pumped off.

10115. WELO, L. A. AND BAUDISCH, O. **The catalytically active and unactive forms of ferric oxide.** *J. Biol. Chem.* **65**, 215-27 (1925).—*C.A.* **19**, 3197.

Several forms of iron oxides were prepd. and compared for their activity in accelerating the oxidation of benzidine by H_2O_2, in accelerating the growth of *Bacillus leptisepticum* and in increasing the O_2-absorption of broth or H_2O-cultures thereof. The activity depended upon the intramol. arrangement and not upon the presence of Fe^{++} nor on the adsorptive capacity.

10116. ALMQUIST, J. A. **The nature of the catalyst surface and the effect of promoters.** *J. Am. Chem. Soc.* **48**, 2820-6 (1926).—*C.A.* **21**, 2593.

The inhibiting effect of small concns. of O_2 or H_2O (0.008%-0.04%) upon Fe catalysts for NH_3 synthesis at 444°C and 1 atm. was studied. Calcns. based on the reaction of $3/4\ Fe + H_2O = 1/4\ Fe_3O_4 + H_2$ showed that both the catalytic activity for NH_3 synthesis and the ability to form oxide in the presence of low concns. of H_2O were properties of Fe atoms in the same range of unsatn. The ratio of active atoms to the total Fe in the catalyst was estd. at about 1 atom in 2000 for pure Fe and about 1 in 200 for Fe promoted with Al_2O_3.

10117. ALMQUIST, J. A. AND BLACK, C. A. **The poisoning action of oxygen on iron catalysts for ammonia synthesis.** *J. Am. Chem. Soc.* **48**, 2814-20 (1926).—*C.A.* **21**, 691.

The catalysts and their activity at 1 atm. and 444°C were recorded. With varying concns. of O_2 there was a lowering of the NH_3 concn. produced to a const. value. This concn. was lower at the higher O_2 concn. for a given catalyst; for equal concns. of O_2 it was lower for the less active catalyst. Some iron oxide formed, the quantity being greatest for the most active promoted catalyst. Water vapor produced idential results for corresponding equiv. concn. of free O_2 and water vapor.

10118. ALMQUIST, J. A. AND CRITTENDEN, E. D. **A study of pure-iron and promoted-iron catalysts for ammonia synthesis.** *Ind. Eng. Chem.* **18**, 1307-9 (1926).—*C.A.* **21**, 802.

A direct comparison of several pure and promoted Fe catalysts was made. The activity of pure Fe depended upon the state of oxidation of the fused oxide from which it was obtained by reduction; Fe_3O_4 gave the best results. The addition of K_2O alone lowered the activity of pure Fe, but when SiO_2 was also added there was a promoting action. K_2O had a marked promoting action in the presence of difficulty reducible oxides of an acidic nature, e.g., those of Mn, W, Si and Al.

10119. BONE, W. A. AND ANDREW, G. W. **Studies in catalytic combustion. II. The union of carbon monoxide and oxygen in contact with nickel, copper and their oxides.** *Proc. Roy. Soc.* (London) **A110**, 16-34 (1926).—*C.A.* **20**, 2443.

Enhanced activity of Ni (by preliminary exposure to CO or O_2) was attributed to the formation of a highly reactive surface film of Ni carbonyl or oxy-carbonyl. Granular NiO catalyzed very considerably the oxidation of CO without any appreciable reduction of the NiO, the catalytic action involved the formation of a film of active O at the surface as the effective oxidizing agent. CuO was rapidly reduced by CO in the presence of O_2, and the rate of CO oxidation in the presence of O_2 was considerably slower. The catalyzing process did not consist of rapidly alternating reductions and re-oxidations of the surface.

10120. BONE, W. A. **Studies upon catalytic combustion. III. The influence of steam upon the catalytic combustion of carbonic oxide.** *Proc. Roy. Soc.* (London) **A112**, 474-99 (1926).—*C.A.* **21**, 522.

The catalytic combustion of CO over catalysts of porous porcelain, granular CuO, granular Ni-, Au gauze and Ag foil, in the presence and absence of H_2O vapor was exhaustively studied. The facts were difficult to reconcile with the Langmuir adsorption theory of catalysis, or any of its modifications.

10121. BRAY, W. C. AND DOSS, G. J. **The catalytic oxidation of carbon monoxide. III. Catalytic efficiency of mixtures of dry manganese dioxide and cupric oxide.** *J. Am. Chem. Soc.* **48**, 2060-6 (1926).—*C.A.* **20**, 3260.

Catalysts for the oxidation of CO by air were prepd. by grinding together certain samples of dry powd. $MnO_{1.83}$ and CuO. The efficiencies of these mixts. were compared with the efficiencies of the constituent oxides alone. In every case the mixts. were more efficient in catalyzing the reaction then the single oxides.

10122. NORRISH, R. G. W. AND JONES, G. G. **Studies of valency. VII. Surface polarity and the reaction of ethylene and chlorine. The effect of the adsorbed water layer.** *J. Chem. Soc.* **1926**, 55-62.—*C.A.* **20**, 1744.

A study was made of the reaction between C_2H_4 and Cl_2, each at an initial partial pressure of 200 mm, at the surface of glass, paraffin wax and stearic acid. By taking special precautions, a paraffin-wax surface was prepd., showing a reactivity some 1200 times smaller than that of glass. H_2O vapor, present at a partial pressure of 6 mm, increased the reactivity of the glass surface by 30%, while it had no effect on the paraffin-wax surface. The adsorbed H_2O layer was the polar catalyst with glass surfaces.

10123. TAYLOR, HUGH S. **The colloid particle is revealed by catalytic studies.** *Coll. Symposium Mon.* 4, 19-28 (1926).—*C.A.* **21**, 1390.

The catalyst surface contained atoms more loosely bound than in the crystal surface. An oxide catalyst surface was regarded as composed, not of a single catalyst, but of 2 catalysts, metal ions and oxide ions; the nature of the changes induced in the adsorbed reactant was detd. by the charge of the ion on which the reactant mol. was adsorbed.

10124. BENTON, A. F. **Kinetics of catalyzed gas reactions in flow systems.** *Ind. Eng. Chem.* **19**, 494-7 (1927).—*C.A.* **21**, 1744.

The yield in catalyzed gas reactions carried out by flow processes was expressed in terms of the quantity of catalyst, the rate of passage, the total pressure, and the compn. of the gas mixt. These equations represented satisfactorily the available data for (1) the combination of H_2 and O_2 over a Ag catalyst, (2) the synthesis of NH_3 over Mo and promoted Fe catalysts, and (3) the contact H_2SO_4 reaction over Pt.

10125. BILLMANN, EINAR AND KLIT, ANDREAS. **Colloidal palladium as catalyst in the hydrogen electrode.** *Z. physik. Chem.* **130**, 566-71 (1927).—*C.A.* **22**, 528.

H_2 electrodes of sheet Pt or Au in solns. sufficiently catalyzed by colloidal Pd (with lysalbinic acid or protalbinic acid as protective colloid) gave the same potentials as Pt or Au with Pt-black or Pd-black surfaces. As little as 2 mg of colloidal Pd per liter catalyzed the conversion of H_2 to H^+ so that polarization did not occur and well-defined potentials were obtained.

10126. CONSTABLE, F. H. **Nature of the sintering of active copper catalysts.** *J. Chem. Soc.* **1927**, 1578-84.—*C.A.* 21, 3531.

Sintering of an active Cu surface produced a reduction of the area of the exposed surface, and collapse of some of the active centers on the surface. The course of oxidation of Cu was followed by measurements of the elec. cond of the Cu-oxide mixt. and by estn. of the thickness of the surface film of oxide by means of its color in normally reflected light. The surface area was reduced to about 1/3 while the catalytic activity was reduced to about 1/7.

10127. HESSENBRUCH, W. AND OBERHOFFER, P. **An improved rapid method for the determination of gases in metals, especially of oxygen in steel.** *Arch. Eisenhuttenw.* **1**, 583-603 (1927); *Stahl u. Eisen* **48**, 486-7 (1938).—*C.A.* **22**, 2525.

At 1600°C the max. amt. of oxygen was obtained. The presence of metals whose oxides had a higher heat of formation than FeO caused errors unless very high vacuum was used. The formation of H_2O occurred only below 1000°C. A normal S-content was without any effect; with 0.050% S the error was 0.0003% oxygen. At higher S-content H_2S and CS_2 were formed. The graphite crucible used must be degasified and kept in a vacuum.

10128. HOOVER, G. I. AND RIDEAL, E. K. **The decomposition of ethyl alcohol at the surface of thoria. I.** *J. Am. Chem. Soc.* **49**, 104-15 (1927).—*C.A.* **21**, 690.

The reaction velocities of the ethylene and aldehyde decompns. were measured and the energy activation and temp. coeff. of each reaction calcd. At 300°C the value for the temp. coeff. of the velocity const. was 1.43 for H_2 and 1.58 for C_2H_4. The corresponding energies of activation were 24,000 and 30,000 cal.

10129. ADHIKARI, G. AND FELMAN, J. **Experimental contribution to the theory of hetergeneous reactions.** *Z. physik. Chem.* **131**, 347-62 (1928).—*C.A.* **22**, 1715.

The reaction between Hg and I_2 served as an example of the Ostwald-Langmuir three-phase theory of catalytic behavior. A stream of I_2 vapor was sent against Hg drops, the excess of I_2 being removed by a Ag foil. The expts. showed that the reaction went very rapidly when a HgI_2 crystal was touching the Hg surface. The mechanism of heterogeneous reactions was discussed on the basis of Volmer's theories of adsorption and supersatn.

10130. ALLEN, P. C. AND HINSHELWOOD, C. N. **The catalytic decomposition of gaseous acetaldehyde at the surface of various metals.** *Proc. Roy. Soc.* (London) **121A**, 141-55 (1928).—*C.A.* **23**, 755.

The decompn. of acetaldehyde was studied at the surface of elec. heated wires of Au, Pt, W and Pt-10% Rh alloy. The surface reaction involved two mols., but at pressures above 150 mm, the surface became satd. with adsorbed mols. and the reaction appeared unimol. The relation between reaction rate and pressure, the heat of activation and the abs. rate of reaction were markedly similar with all the metals.

10131. BAHR, H. A. AND BAHR, TH. **Decomposition of carbon monoxide on nickel.** *Ber.* **61B**, 2177-83 (1928).—*C.A.* 23, 756.

Metallic Ni or NiO catalyzed the reaction $2CO = C + CO_2 + 38.9$ cal. by first forming Ni_3C. Below 270°C the decompn. of CO continued until the Ni was completely transformed into Ni_3C; then the reaction stopped. Between 270° and 380-420°C, the CO decompn. continued after this point was reached, the catalyst being Ni_3C free from metallic Ni. The amt. of C bound chemically by the catalyst corresponds to Ni_3C, excess C being present as the free element.

10132. CONSTABLE, F. H. **Reichinstein's displacement principle.** *Proc. Cambridge Phil. Soc.* **24**, 56-64 (1928).—*C.A.* 22, 1261.

Surface action was assumed to take place only on particular spots on the surface, called "centers of activity" and these centers of activity occupied by one mol. at a time. In a bimol. reaction at a catalyst surface, the total no. of mols. of all substances adsorbed by a given surface was const. and independent of their concns. in the space around the surface layer.

10133. FROLICH, PER K.; SPALDING, H. B., AND BACON, T. S. **Destructive distillation of wood and cellulose under pressure.** *Ind. Eng. Chem.* **20**, 36-40 (1928).—*C.A.* **22**, 1035.

Distn. of wood under autogenous pressure increased the MeOH yield up to 280-370°C; beyond this temp. decompn. set in and the yield decreased. Substitution of H_2 for the autogenous pressure further increased the MeOH yield. With Ni as a catalyst and H_2 under 200 atms., cellulose was almost completely converted to gaseous and liquid products, the latter consisting of phenols and hydrocarbons.

10134. SCHMIDT, OTTO. **Theory of sorption. II. Mechanism of heterogeneous catalysts.** *Z. physik. Chem.* **133**, 263-303 (1928).

The sorption at 1 atm. pressure and at const. temp. between 0° and 150°C of gases for which the mol. diam. was less than the mean diam. of the pores of the adsorbent, was expressed by log $c = a(\lambda)^{1/2} - b$, where c was the quantity of gas adsorbed per unit weight of adsorbent, λ the latent heat of evapn., and a and b consts. which for a given adsorbent were independent of the nature of the gas, but varied with temp. and pressure. Deviations were found when chem. reaction took place readily.

10135. Wright, W. M. **The thermal decomposition of hydrogen peroxide.** *Trans. Faraday Soc.* **24**, 539-42 (1928).—*C.A.* **23**, 2639.

Pure silica gel had only a slight catalytic activity for the decompn. of H_2O_2, but this activity was greatly increased in the presence of $AgNO_3$. The addn. of a trace of alkali increased the activity of the Ag salt several hundred times. Clean sheet Ag was a very feeble catalyst.

10136. Balandin, A. A. **Splitting of organic compounds by catalytic hydrogenation over nickel. The role of the catalyst in heterogenous catalysis.** *Z. physik. Chem.* **B3**, 167-94 (1929).—*C.A.* **23**, 5090.

On the basis of available data on the hydrogenation of org. compds. over Ni, the groups which split off could be arranged in definite series. The ease of splitting of the groups from the mol. was greater, the greater the affinity of the group for the catalyst, and the less their affinity for one another in the mol.

10137. Cremer, E. **Catalytic behavior of rare-earth oxides.** *Z. physik. Chem.* **144A**, 231-42 (1929).—*C.A.* **1930A**, 44.

The decompn. of EtOH was studied from 350° to 470°C when catalyzed by oxides of the rare-earths and of other elements of group III. The heats of activation increased in the order: Al, In, Sc, Yt, La, while those of Ce, Pr, Nd, Sm, Gd, and Dy did not differ appreciably from one another. The relationship, $c = A\exp(q/a)$, between the heat of activation (q) and the activity of the catalyst (c) was established.

10138. Cremer, E. and Schwab, Georg-Maria. **A possible connection between heat of activation and activity in contact catalysis. II.** *Z. physik. Chem.* **A144**, 243; **B5**, 406-12 (1929).—*C.A.* **24**, 544.

The fraction of active centers on a surface may be proportional to $\exp(q/R\theta)$, where θ was an arbitrary temp. obtained by equating the relations $c = K\exp(q/RT)$ and $c = A\exp(q/a)$, where c was the activity of the catalyst.

10139. Donnelly, R. P. and Hinshelwood, C. N. **Combination of hydrogen and oxygen on the surface of platinum.** *J. Chem. Soc*, **1929**, 1727-33.—*C.A.* **23**, 5398.

The reaction was studied on a Pt wire heated below the temps. at which explosion takes place. The reaction at ordinary pressures followed a different law from that found by Langmuir at low pressures. The reaction was independent of the pressure of H_2 and dependent on the pressure of O_2, indicating no appreciable displacement of O_2 by H_2 on the wire. The max. rate of combination found possible without explosion was 4% per min. at 200 mm H_2 and 100 mm O_2.

10140. Emmett, P. H. and Love, Katherine S. **Comparison of the catalytic and chemical characteristics of cubic and rhombohedral ferric oxide.** *J. Phys. Chem.* **34**, 41-62 (1929).—*C.A.* **24**, 1016.

Cubic and rhombohedral Fe_2O_3 were prepd. Oxidation of benzidine and guaiac resin by H_2O_2 gave approx. the same results with both forms. Heating to 550°C for several hrs destroyed this catalytic activity. At 250°C the catalytic activity of both forms toward the combination of H_2 and O_2 was the same and heating to 550°C did not affect their activity. H_2O sorption on cubic Fe_2O_3 was 10-60% less than on the rhombohedral form and heating to 550°C lowered the sorption rate by 75-80% as compared with samples dried at 300°C.

10141. Pietsch, Erich; Kotowski, Alfons, and Berend, Gertrud. **The topochemistry of contact catalysis. IV. Experimental proof of adlineation in topochemical reactions.** *Z. physik. Chem.*, **Abt. B**, 5, 1-13 (1929).—*C.A.* **24**, 290.

The reactions studied were K_2CrO_4 and concd. H_2SO_4 to give CrO_3; $CuSO_4.5H_2O$ and H_2S in alc. or ether; $NiSO_4.7H_2O$ and H_2S in alc. or ether; $K_2Cr_2O_7$ and H_2O_2 in ether-water solns. to give violet KH_2CrO_7; $CuSO_4.5H_2O$ and KCNS in alc.; $CuSO_4.5H_2O$ and KCN in alc.-water mixts.; $Bi(NO_3)_3$ and an ether soln. of alc.; $Na_2S_2O_3.H_2O$ and $FeCl_2$ in dil. ether; decompn. of $Na_2S_2O_3.H_2O$ crystals; dehydration of $CuSO_4.5H_2O$ with concd. H_2SO_4; NaOAc crystals and $FeCl_3$ in dil. ether soln.; $NiSO_4.7H_2O$ and dimethylglyoxime in alc.; and $K_4Fe(CN)_6$ and $FeCl_3$ in ether solns. of HCl.

10142. Schenck, Rudolf and Wesselkock, H. **The activation of metals by addition of foreign substances.** *Z. anorg. allgem. Chem.* **184**, 39-57 (1929).—*C.A.* 24, 2035.

The effect was studied of CaO, MgO, MnO and Al_2O_3 separately and Al_2O_3 and MgO jointly on the oxidation of Ni and Co at 900°C in an atm. of CO_2. The activities of both Ni and Co were increased by the presence of the oxides in the order CaO, MgO, MnO. These oxides had the same crystal lattice as NiO and CoO. The activity was not closely related to the similarity of crystal lattice consts. of these oxides with those of Ni and Co.

10143. Smekal, A. **Crystal faults and active centers in heterogeneous catalysts.** *Z. Elektrochem.* 35, 567-73 (1929).—*C.A.* 23, 5395.

Optical data gave the active fraction of faults on a surface as 10^{-5} to 10^{-3} of the total surface. This agreed well with the results of expts. with catalyst poisons of surfaces.

10144. Balandin, A. A. **Osmium as a dehydrogenation catalyst for decahydronaphthalene.** *Z. physik. Chem.* **B9**, 49-72 (1930).—*C.A.* 24, 4984.

The rate of dehydrogenation of decahydronaphthalene in the presence of Os increased with temp. over the range studied, 228-277°C. The reaction products, naphthalene and H_2, exerted no influence on the speed of reaction. The catalyst was slowly poisoned by further decompn. of the naphthalene. After considerable use of the catalyst a sudden increase of activity was observed, due to a decrease in poisoning, and the energy of activation increased from 10,000 to 16,500 cal. per mol.

10145. Bowden, F. P. and O'Connor, E. A. **The change in the area and catalytic activity of metallic surfaces on passing from the solid to the liquid state.** *Proc. Roy. Soc.* (London) **A128**, 317-29 (1930).—*C.A.* 24, 5585.

"Accessible" area was measured by the quantity of electricity necessary to cause a given increase in the electrode potential in evolving H_2 from dil. acid. The relative accessible area of a fusible alloy (Wood's metal) under different conditions was: liquid, 1; solidified from liquid 1.4; solid rubbed with glass paper, 6.3; etched with HNO_3, 800-1000. The relative catalytic activities were 1, 2, 2.4 and 1200, resp. For liquid and solid Ga, the values were 1 and 1.7 for both area and activity.

10146. Dankoff, R. **Preparation of catalysts.** *Nature* **126**, 860 (1930).

Ni, Pt and Fe catalysts for hydrogenation of ethylene were prepd. by depositing metals from the vapor on cold surfaces. In case of Ni, a dependence of catalytic activity on the thickness of the deposit was found, indicating the porous nature of the surface.

10147. Mittasch, A. **Complex catalysts.** *Z. Elektrochem.* **36**, 569-80 (1930).—*C.A.* **25**, 21.

The development of complex or mixed catalysts was reviewed. The oxidation of NH_3 and the reaction of CO with H_2 to give MeOH were discussed.

10148. Porter, Alfred W. **Catalysis.** *Nature* **126**, 349 (1930).—*C.A.* 24, 5583.

The energy of activation which makes effective collisions between reacting mols., had its normal value in catalysis.

10149. Rupp, E. and Schmid, E. **Electron reflection by passive iron. I.** *Naturwissenschaften* **18**, 459-61 (1930).—*C.A.* 24, 4690.

For a study of the nature of the surface film of passive Fe the electron-reflection method was employed on (1) Fe single crystals (001 and 011 faces), (2) the same made passive by HNO_3 or (3) oxidized with H_2O vapor, (4) hematite and magnetite in large crystals. Addnl. maxima in the curves of passive Fe, which appeared at the same voltage regardless of the orientation of the underlying Fe crystal face, indicated the presence of a passive film. The maxima of passive Fe could not be identified with those of surface oxide, or with those of hematite or magnetite.

10150. Srikantan, B. S. **Reactions at the surface of hot metallic filaments. V. Thermionic emission and catalytic activity at the surface of hot metallic wires: $H_2 + CO_2 \rightarrow CO + H_2O$ at the surface of Pt, Pt coated with BaO and thoriated W.** *Indian J. Physics* **5**, 685-98 (1930).—*C.A.* **25**, 2908.

The min. temp. at which thermionic emission from a Pt wire was perceptible was obtained by extrapolation at 975°C. Interaction of CO_2 and H_2 started at 979°C. Hence, emission of electrons from a surface had an important influence on activation of gases.

10151. Suhrmann, R. **The change in the electrical condition of the surface of a metal after charging with hydrogen ions and bombarding with electrons.** *Z. Elektrochem.* **35**, 681-6 (1930).—*C.A.* 24, 1285.

Au and Ag when charged with H ions were more sensitive to light and gave off photoelectrons at longer wave lengths than normal. After electron bombardment the reverse was true; the max. wave length necessary for the emission of photoelectrons was lowered. The significance of this for the theory of catalytic action was considered.

10152. Taylor, Guy B.; Kistiakowsky, George B., and Perry, John H. **Platinum black catalysts. I. Physical properties and catalytic activity.** *J. Phys. Chem.* 34, 748-52 (1930).—*C.A.* 24, 2663.

The particle size of Pt catalysts prepd. in 3 different ways was examined by x-ray powder photographs, by photomicrographs, by rate of sedimentation in castor oil, and by analysis with an ultracentrifuge. The smaller ultimate particle size of 2 prepns. showed the greater catalytic activity, the one being better for oxidation reactions, the other for hydrogenation.

10153. Bonhoeffer, K. F. and Farkas, A. **The para hydrogen transformation on platinum: A relation between catalysis and accommodation.** *Z. physik. Chem.* B12, 231-46 (1931).—*C.A.* **25**, 3908.

The transformation of para H_2 into ordinary H_2 between 135° and 620°C was catalyzed by a hot Pt wire. The transformation reaction on pure Pt caused an abnormal increase in the accommodation coeff., while on poisoned Pt the coeff. were normal. The velocity of the transformation was increased by O_2. The heat of activation of 14,500 cal calcd. from the temp. coeff. of the reaction was approx. equal to the heat of adsorption of H_2 on Pt.

10154. Ingersoll, L. R. **Synthesis of gas-metal compounds by sputtering.** *J. Am. Chem. Soc.* **53**, 2008-9 (1931).—*C.A.* 25, 2931.

Ni sputtered in N_2 under special conditions gave a nitride film, decompd. by heating at 350°C; on heating to 150°C in H_2, NH_3 and Ni were formed. Compds. of Co and Fe with N_2 and of Ni and H_2 were also prepd.

10155. Travers, Morris W.; Hockin, Leslie E., and Pearce, Thomas J. P. **Influence of hydrogen on chemical changes in silica vessels.** *Nature* **128**, 66 (1931).—*C.A.* 25, 5075.

Reproducible results in the condensation of ethane in silica vessels at 600°C were obtained only when the exptl. conditions insured satn. of the silica with H_2. A sudden change in the rate of formation of the condensate was observed always 2-1/2 hours after the beginning of the expt.

10156. Balandin, A. A. **Logarithmic relation between the constants of the Arrhenius equation. Activation energy of dehydrogenation of cyclohexane in the presence of nickel catalysts prepared in various ways.** *Z. physik. Chem.* **B19**, 451-61 (1932).—*C.A.* 27, 1262.

The consts. in the equation, $k = k_0 \exp(-Q/RT)$, were related as follows: $\ln k_0 = aQ + b$. In the dehydrogenation of cyclohexane catalyzed by Ni supported in Al_2O_3, $Q = 16,230$ kcal per mol.; $Q = 9850$ kcal for ordinary Ni catalysts. Similar observations were made with TiO_2 as the support, and neither catalyst was able to effect the decompn. of CH_4. The $Ni-Al_2O_3$ approximated Pd supported on asbestos.

10157. Brewer, A. K. **Effect of adsorbed gases on the photoelectric emissivity of iron and platinum.** *J. Am. Chem. Soc.* **54**, 1888-900 (1932).—*C.A.* **26**, 3435.

The photoelectric properties of Fe and Pt in the presence of N_2, H_2 and NH_3 were characteristic of composite surfaces. The degree of dissocn. of the various gases was estd. from curves of known ion density as a standard. Threshold measurements on surfaces of known ion density showed that the field of influence about an ion extended to many times its normal radius. Catalysis was discussed in the light of this phenomenon.

10158. Brill, Rudolf. **Röntgenographic studies on iron catalysts for synthesis of ammonia.** *Z. Elektrochem.* 38, 669-73 (1932).—*C.A.* 26, 5707.

An x-ray examn. of the catalysts was made both before and after reduction in H_2. Added Al_2O_3 acted as a promoter only when Fe oxide-Al mixt. was treated so as to form homogeneously distributed, easily reducible, mixed crystals.

10159. Nyrop, J. E. **The surface electrons [of metals].** *Phys. Rev.* 39, 967-76 (1932).—*C.A.* 26, 2644.

The photoelec. effect, thermionic emission, adsorption of gases on metals, and catalysis were interpreted in terms of the surface electrons; particular emphasis was laid on the "maximum velocity" of the electrons in a particular metal.

10160. Schenck, Rudolf; Kurzen, Fritz, and Wesselkock, H. **Activation of metals by foreign substances. II.** *Z. anorg. allgem. Chem.* **206**, 273-88 (1932).—*C.A.* 26, 4549.

Fe and W in MgO made it difficult to form carbide by action of CH_4, if in the carbides of these metals 1 C atom was attached to several metallic atoms as in Fe_3C or W_5C_2. Carbide formation was not hindered by the addn. of inert oxides if the carbide consisted of an equal no. of metal and C atoms, as WC.

10161. Krczil, Franz. **The application of glass filters to the determination of the adsorptive or catalytic activity of technical adsorbents.** *Chem.-Ztg.* 57, 803-5 (1933).—*C.A.* 28, 18^5.

Fritted-glass diaphragms were described for filtering gas, for bubbling gas through liquids, and for supports for solids over which gases flow.

10162. Maxted, E. B. and Lewis, G. J. **The energies of catalysis. I. The energetic homogeneity of a platinum surface.** *J. Chem. Soc.* **1933**, 502-4.—*C.A.* 27, 4472.

The temp. coeff. of the decompn. of H_2O_2 by Pt black was independent of the percentage poisoning by Hg^{++} ions between 0° to 25°C and up to about 0.03 mg of Hg per mg of Pt. The apparent energy of activation for the decompn. was about 12,000 cal.

10163. Schmidt, Otto. **Reaction mechanisms. V. The active places of typical hydrogenation catalysts.** *Z. physik. Chem.* **A165**, 133-46 (1933).—*C.A.* 27, 4472.

Activation of H_2 and hydrogenation on the usual catalysts occurred on active places situated within the catalyst rather than on the surface. The catalysts discussed included elements of the Fe and Pt groups as well as Cu. Hydrogenation involved the satn. of a double-bonded C compd. with H_2.

10164. Schmidt, Otto. **Different classes of hydrogenation catalysts.** *Naturwissenschaften* **21**, 351 (1933).—*C.A.* 27, 4997.

Different metals were tested in finely porous condition for their catalytic activity in C_2H_2 hydrogenation at 0-200°C and atm. pressure. There were 2 groups: (1) Cs, Ca, Sr, Ba of large at. vol., low electron exit work, weak ion field, stable hydrides, H functioning as neg. ion and (2) Cu, Cr, Mn, Re, Fe, Co, Ni, Pd, Pt of small at. vol., etc., H acting as pos. ion.

10165. Balandin, A. A. and Bork, A. Kh. **The relative life periods of ethyl alcohol and acetaldehyde molecules on the surface of a copper catalyst.** *Uchenui Zapiski* (Moscow State Univ.) 2, 217-20 (1934).—*C.A.* **30**, 6276^5.

The dehydrogenation velocity of EtOH was detd. in the presence of MeCHO on a Cu catalyst. Under the conditions of the expts. the MeCHO mol. remained on the surface of the catalyst 5 times as long at 270°C and 3 times as long at 240°C as the EtOH mol.

10166. Farkas, A.; Farkas, L., and Rideal, E. K. **Experiments with heavy hydrogen. IV. Hydrogenation and exchange reaction of ethylene with heavy hydrogen.** *Proc. Roy. Soc.* (London) **A146**, 630-9 (1934).—*C.A.* 29, 41^5.

The reaction of C_2H_4 with H_2 contg. D_2 on an active Ni catalyst took place according to the equations: $C_2H_4 + HD \rightleftharpoons C_2H_3D + H_2$ and $C_2H_4 + HD \rightarrow C_2H_5D$. The catalytic surface was originally covered with C_2H_4 and hydrogenation occurred when this mol. evapd. from the Ni thus admitting H_2 which reacted. At low temp., H_2 and D_2 reacted at nearly the same rate, but at higher temp. some of the C_2H_4 left the surface with a consequent loosening of the C-H bond and the exchange reaction took place.

10167. Finch, G. I. and Bradford, B. W. **The electrical condition of hot surfaces during the adsorption of gases. VI. A gold surface catalyzing the combustion of carbon monoxide.** *Proc. Roy. Soc.* (London) **A144**, 320-39 (1934).—*C.A.* 28, 4285^2.

The effect of H_2O on the catalytic activity of Au toward the combustion of CO and on the elec. activities of the metal were observed simultaneously. The reaction velocities were invariably higher in the moist than in the dry reaction system; with increasing temp., however, the differences diminished.

10168. Horiuchi, J.; Ogden, G., and Polanyi, M. **Catalytic replacement of protium by deuterium in benzene.** *Trans. Faraday Soc.* **30**, 663-5 (1934).—*C.A.* 28, 6627^3.

While the hydrogenation of benzene with Pt-black catalyst was almost imperceptible at ordinary temps. a rapid reaction occurred when the

H_2 used had a high content of D. The D replaced H in benzene in the presence of Pt or Ni catalyst.

10169. LONG, J. H.; FRAZER, J. C. W., AND OTT, E. **Activity and crystal structure of mixed metal catalysts.** *J. Am. Chem. Soc.* **56**, 1101-6 (1934).—*C.A.* **28**, 3976^2.

Hydrogenation of C_6H_6 to C_6H_{12} was used to study the efficiency of pure metal and mixed pure metal catalysts. Fe, Co, Ni and Cu and compds. of Fe and Ni, Co and Ni, Ni and Cu, and Fe and Co were tested for activity. The crystal structure of these various catalysts was detd.; face-centered cubic lattices were especially active for this reaction.

10170. MAXTED, EDWARD B. AND STONE, VICTOR. **The energetics of catalysts. II. The poisoning coefficients and energies of activation in hydrogenation.** *J. Chem. Soc.* **1934**, 26-9.—*C.A.* **28**, 2254^7.

The fractional decreases in activity of a Pt catalyst caused by poisoning with a given concn. of $HgCl_2$ were the same for the hydrogenation of crotonic, oleic and benzoic acids. The energies of activation were 3100, 4600 and 9700 cals per mol., resp., for the three acids between 20° and 60°C. The sp rates at 40°C were 11.3, 7.25 and 0.65, resp.

10171. MAXTED, EDWARD B. AND STONE, VICTOR. **The energetics of catalysis. III. Further studies of the poisoning coefficients of hydrogenation processes.** *J. Chem. Soc.* **1934**, 672-4.—*C.A.* **28**, 5322^7.

The fractional decrease in activity of a Pt catalyst per unit concn. of poison was the same for nitrobenzene, acetophenone, benzene and oleic acid when Hg ions were used as poison, and for C_6H_6 and acetophenone when CS_2 was employed as a poison.

10172. WHITE, ERNEST C. AND SHULTZ, J. F. **Fused cobalt oxide as a water gas catalyst.** *Ind. Eng. Chem.* **26**, 95-97 (1934).

Catalysts made by the fusion of cobalt oxide, when properly reduced in H_2, effectively catalyzed the water-gas reaction to equilibrium at temps. as low as 283°C and space velocities as high as 1800. The addition of various promoters largely repressed the simultaneous formation of CH_4. Fe in quantities as high as 3% inhibited the formation of CH_4 without cutting down appreciably the activity toward the water gas reaction. Cu as a promoter gave promising results. A Co catalyst containing 38% Cu was active as a water-gas catalyst without synthesizing significant quantities of CH_4.

10173. ANDRUSSOW, LEONID. **The catalytic oxidation of ammonia-methane mixtures to hydrocyanic acid.** *Angew. Chem.* **48**, 593-5 (1935); *Ber.* **71B**, 776-8 (1938).—*C.A.* **29**, 8244^3; **32**, 4416^6.

It was essential that NH_3, CH_4 and O_2 (air) enter the reaction chamber containing Pt gauze in stoichiometric proportions according to the equation: $2NH_3 + 3O_2$ (or 14.4 air) $+ 2CH_4 = 2HCN + 6H_2O + 229{,}800$ cal. In the period of a few hundred thousandths sec. all of the O_2 disappeared and CH_4 was transformed to HCN, and partially to CO and H_2. At 1000°C 58-63% of the NH_3 was converted to HCN, about 8-12% to N_2 and about 26-30% remained undecompd. A small excess of either NH_3 or CH_4 was not harmful, but with increasing amts. of CH_4 most of the O_2 was used for the formation of $CO + 2H_2$, with decreasing yields of HCN.

10174. CHARACHORIN, F.; ELOVITZ, S., AND ROGINSKII, S. **The mechanism of the catalytic oxidation of carbon monoxide on manganese dioxide. III. Existence of a critical lower pressure limit in heterogeneous catalysis.** *Acta Physicochim. U.R.S.S.* **3**, 503-8 (1935) (in German).—*C.A.* **30**, 7987^3.

At pressures from 1 atm. to 10 mm the oxidation of CO by O_2 on a MnO_2 surface was approx. a first-order reaction with an E value of 6000 cal. At pressures below 0.525 mm the reaction was almost of zero order and almost independent of temp. The high-pressure reaction was related to activated adsorption, but the low-pressure reaction was not.

10175. GRIFFITH, R. H. AND PLANT, J. H. G. **Catalysis in hydrocarbon. II. Decomposition of low-boiling hydrocarbons.** *Proc. Roy. Soc.* (London) **A148**, 186-90 (1935).—*C.A.* **29**, 2335^2.

The effect of Mo catalysts on the decompn. of hexane and cyclohexane was measured at ordinary pressures. The activity of the catalyst was influenced by the addn. of silica. The peak of activity at 4.4 atoms Si to 100 atoms Mo coincided with the position of least activity observed at high pressure with low-temp. tar.

10176. HEDVALL, J. ARVID AND SANDFORD, FOLKE. **The effect of ferromagnetic transformation on the catalytic power of nickel in the reaction** $2CO = CO_2 + C$. *Z. physik. Chem.* **B29**, 455-63 (1935).—*C.A.* **30**, 369^6.

Four kinds of Ni catalysts were prepd. and the reaction $2CO = CO_2 + C$, catalyzed with Ni, was then studied. As with other reactions, the rate increased sharply at the Curie point. The effect of impurities on the reaction was also studied as well as the condition of formation of Ni carbide and its effect on the reaction.

10177. MORIKAWA, K.; BENEDICT, W. S., AND TAYLOR, H. S. **Catalytic exchange of deuterium and methane.** *J. Am. Chem. Soc.* **57**, 592-3 (1935).—*C.A.* **29**, 2842^4.

The exchange at reduced Ni catalyst surfaces between D_2 and CH_4 formed heavy methanes in the range 184° to 305°C. At the upper temp. equil. on the heavy-methane side was established within 20 hrs. At 218°C the equil. position was established in 50 hrs. The conversions were still slower at 184°C. Curves of reaction velocity indicated very low rates of exchange below 170°C.

10178. TAYLOR, H. S. AND JUNGERS, J. C. **Exchange between ammonia and deuterium on catalytic iron surfaces.** *J. Am. Chem. Soc.* **57**, 660-1 (1935).—*C.A.* **29**, 3893^4.

The exchange reactions of dry. D_2 and dry NH_3 in the presence of $Fe\text{-}K_2O\text{-}Al_2O_3$, catalyst at room temp. in a quartz vessel were studied. At the end of one month the absorption spectra revealed the presence of all the ammonias. No reaction occurred at 300°C on quartz surface. The rate-detg. reaction in NH_3 synthesis was given as: N_2 (gas) $\rightleftharpoons$ 2N (absorbed).

10179. Temkin, M. and Puizhov, V. **Heterogeneous oxidation of nitric acide at liquid-air temperature.** *Acta Physicochim. U.R.S.S.* **2**, 473-86 (1935).—*C.A.* **29**, 6522^{9}.

At liquid-air temps. by the heterogeneous oxidation of NO on glass surfaces, O_2 and NO reacted in the ratio 1:3 to give a brown liquid, N_3O_5 condensing out on the walls. The homogeneous reaction was very small. At $p = 5 \times 10^{-3}$ to 8×10^{-2} mm and $T =$ 83° to 88°K, the reaction mechanism was assumed to be: $2NO + O_2 = N_2O_4$; $N_2O_4 + NO = N_3O_5$. NO was first adsorbed on the walls and reacted with gas phase O_2.

10180. Toyama, Osamu. **Hydrogenation of ethylene with nickel as a catalyst at low temperatures.** *Proc. Imp. Acad.* (Tokyo) **11**, 319-21 (1935).—*C.A.* **30**, 2091^{4}.

The reaction was studied between 0° to −78°C and the rate measured at const. vol. and const. partial pressure of H_2 and C_2H_4. H_2 favored the initial rate of reaction, C_2H_4 retarded it and C_2H_6 had scarcely any effect. The reaction velocity increased with increase of H_2 pressure, but decreased gradually with increase of C_2H_4 pressure. At const. H_2 pressure, the rate of reaction increased and reached a max. near the end of the reaction; at const. C_2H_4 pressure the rate decreased rapidly and, when const. pressure of C_2H_4 was high, almost in proportion to the H_2 pressure. The concn. of C_2H_6 in the gas phase had little effect.

10181. Adadurov, I. E. **Andrussov's theory of the catalytic preparation of hydrocyanic acid.** *Ukraïn. Khem. Zhur.* **11**, 237-48 (in German 248-9) (1936).—*C.A.* **31**, 1688^{5}.

Andrussov's theory is thermodynamically untenable. NH_3 and CH_4 cannot exist at 1473°K at which the HCN was formed on the Pt gauze. The catalytic formation of HCN could be suitably explained by the oxidation of NH_3 to NO and the Angelucci reaction.

10182. Erofeev, B. and Mochalov, K. **New method for investigation of catalyst surfaces.** *Acta Physicochim. U.R.S.S.* **4**, 859-60 (1936).—*C.A.* **30**, 7986^{9}.

After pure Fe filings in a glass tube were reduced in H_2 at 450°C to remove surface oxide films, the resistance of the filings at room temp. fell from an immeasurably high value to a few ohms and did not change under the action of electromagnetic radiation sent by a Hertz vibrator. The admission of air to the tube increased the resistance up to some thousand ohms and the tube recovered its lost capacity of acting as a coherer. The expt. was repeated; and Fe NH_3-catalyst with 1% Al_2O_3 as a promoter was used. In spite of prolonged reduction at 450°C, this catalyst retained its capacity of acting as a coherer.

10183. Farkas, Adalbert. **The catalytic interaction of ammonia with deuterium.** *Trans. Faraday Soc.* **32**, 416-27 (1936).—*C.A.* **30**, 2836^{7}.

The exchange of H atoms between D_2 and NH_3 on an Fe catalyst was studied at 30-400 mm and 160-230°C. The abs. rate of exchange was independent of the concn. of NH_3 and increased approx. according to the square root of D_2. The apparent energy of activation was 15 cal. The relative rates of *ortho-para* conversion of H and D and of the reaction $H_2 + D_2 = 2HD$ were 5:2:1, resp., but all these reactions were much faster than the exchange reaction having energies of activation of 8-9 cal. The *ortho-para* conversion of H_2 was inhibited by NH_3, possibly owing to nitride formation on the catalyst.

10184. Morikawa, K.; Benedict, W. S., and Taylor, H. S. **Activity of specific bonds in complex molecules at catalytic surfaces. I. The carbon-hydrogen bond in methane and methane-d_4.** *J. Am. Chem. Soc.* **58**, 1445-9 (1936).—*C.A.* **30**, 6632^{9}.

CH_4 exchanged with D_2, CD_4 and D_2O on active Ni catalysts at 138°C and above. At 184°C the rate of reaction decreased in the order CD_4, D_2 and D_2O. The activation energy of reaction for CD_4 was approx. 19 kg-cals, and for D_2 approx. 28 kg-cals. The reaction was explained by an activated, dissociative adsorption of CH_4 on surface areas not occupied by H-D or D_2O.

10185. Schmidt, Otto. **The mechanism of reaction. VII. The velocity of the catalytic hydrogenation of double bonds in dissolved straight-chain molecules.** *Z. physik. Chem.* **A176**, 237-59 (1936).—*C.A.* **30**, 6633^{3}.

The times required for consumption of half the H_2 were detd. for 25 different aliphatic and aliphatic-aromatic hydrocarbons, alcs., acids and esters with an olefine double bond and straight chains as well as branched chains on contact Ni, Pt and Co catalysts in a series of solns. in alcs., o-methylcyclohexanol, cyclohexane and MeOH. The velocity const. k corresponded to that of a diffusion process through the solvent into the metallic phase. All factors affecting diffusion affected the reaction velocity.

10186. Schwab, Georg-Maria and Naicker, Kannappan. **The water-gas reaction on a platinum surface at low pressures.** *Z. Elektrochem.* **42**, 670-3(1936).—*C.A.* **30**, 7979^{2}.

The kinetics of the reaction $H_2 + CO_2 = CO + H_2O$ was studied on a Pt filament between 700° and 1200°C and at pressures up to 0.3 mm. The reaction was autocatalytic in the absence, but not in the presence, of an initial partial pressure of CO. If P_2O_5 was used to remove the H_2O formed, the time of half conversion was proportional to pressure; the rate was independent of the H_2 pressure. If a cold bath (-90°C) was placed around the reaction vessel to remove the H_2O formed, the character of the reaction changed completely. No reaction occurred below 730°C.

10187. Farkas, A. and Farkas, L. **Mechanism of some catalytic exchange reactions of heavy hydrogen.** *Trans. Faraday Soc.* **33**, 678-90(1937).—*C.A.* **31**, 7322^{8}.

Catalyst exchange of H atoms between gaseous D_2 and H_2O and some alcs. was investigated with a platinized Pt foil. The following processes were assumed in the adsorption layer: ($R = C_2H_5O$, or OH, etc.) (1) $RH \rightarrow R + H$, (2) $D_2 \rightarrow D + D$, (3) $R + D \rightarrow RD$ and (4) $H + D \rightarrow HD$. With low concn. of H_2O or alc., equation (1) was the rate-governing step; at higher concn. equation (2) was.

10188. FARKAS, A. AND FARKAS, L. **The catalytic interaction of heavy hydrogen and benzene on platinum.** *Trans. Faraday Soc.* 33, 827-37 (1937).—*C.A.* 31, 6542^5.

The rate of interaction on Pt foil placed in the gas phase was measured by the thermal-cond. method at room temp. and at partial pressures of C_6H_6 and H_2 ranging from 3 to 150 mm Hg. Hydrogenation and exchange occurred simultaneously and independently. The abs. rate of hydrogenation was proportional to the H_2 pressure and independent of the C_6H_6 pressure; the abs. rate of exchange was independent of the H_2 pressure and approx. proportional to the 0.4th power of the C_6H_6 pressure. The catalyst was mainly covered with H_2, and the C_6H_6 mols. were adsorbed very strongly on a few places.

10189. GRIFFITH, R. H. **Catalysis in hydrocarbon chemistry. V. Promoter concentrations.** *Trans. Faraday Soc.* 33, 407-9 (1937).—*C.A.* 31, 3773^6.

When a Mo oxide catalyst was promoted by the addn. of another oxide, the promoter concn. for greatest activity was the same for Na, Cr, Fe, Cu, Ce, Al, Ba, Pb, B and Th. When present as a metal, the promoter concn. was half that necessary when present as an oxide.

10190. GRIFFITH, R. H. AND HILL, S. G. **Catalysis in hydrocarbon chemistry. VI. Conversion of phenol to benzene.** *Trans. Faraday Soc.* 33, 409-12 (1937).—*C.A.* 31, 3773^6.

A Mo oxide catalyst promoted with SiO_2 and Al_2O_3 was used to study the reduction of PhOH by H_2. The promoter concn. for max. reactivity differed from that in the case of hexane decompn. Compd. formation occurred in certain cases between the promoter and catalyst.

10191. GRIFFITH, R. H. AND HILL, S. G. **Catalysis in hydrocarbon chemistry. VII. Carrier action and molecule size.** *Trans. Faraday Soc.* 33, 412-16 (1937).—*C.A.* 31, 3773^6.

The decompn. of dekalin, decane, hexane and cyclohexane over CuO, TiO_2, Cr_2O_3 promoted with MgO as a carrier, and Cr_2O_3 with lead silica as a promoter was studied. Most active catalysts did not necessarily have the largest no. of active centers. The lowering effect of carriers was not due to compn. formation with the catalyst, and for a catalyst with many active centers a carrier will lower the activity at a concn. depending on the size of the reacting mol.

10192. JULIARD, A. **Heterogeneous catalysis. I. Study of promotion in the conversion of cyclohexane to benzene and methane.** *Bull. soc. chim. Belg.* 46, 549-618 (1937).—*C.A.* 32, 3244^4.

Promoters of easily reducible oxides (Fe, Cu, Cd, Pb) decreased the activity as well as 1% of $CaCO_3$ or $BaCO_3$. The oxides of Mn, Zn, Cr, Ce, Th, Al and Be increased the activity of Ni catalysts. Ni-ZnO mixts. showed a dehydrogenation proportional to the ZnO content, but other mixts. simultaneously caused dehydrogenation and conversion to CH_4.

10193. KUBOKAWA, MASAO, **A note on "The decomposition of methane on the surface of platinum".** *Rev. Phys. Chem. Japan* 11, 217-19 (1937) (in English).—*C.A.* 32, 2817^7.

Retardation was treated as a diminution in the active centers during the reaction, the adsorption equil. being always established. The energy distribution of the active centers of a catalyst was studied.

10194. LEL'CHUK, S. L. AND VELTISTOVA, M. V. **Catalytic production of esters from alcohols.** *Org. Chem. Ind.* (U.S.S.R.) 4, 147-52 (1937).—*C.A.* 32, 2085^4.

95-6% EtOH was passed over Cu with and without the addn. of Cr_2O_3, Al_2O_3, MnO, MgO and TiO_2. At 275°C and a circulation rate of 15 ml/hr over 25 ml catalyst, Cu gave in the 1st run 28.4% AcOEt, 4.92% AcOH, 15.27% AcH and a gas contg. 85% H_2. The stability of the Cu catalyst was improved and the AcOEt yield somewhat increased by adding 2% Cr_2O_3. An equally good yield was obtained with the contact mixt. contg. 20% Al_2O_3, though it is mechanically unstable. Results, superior to Cu-Ce and equal to Cu-Zr, were obtained with the contact mixt. of Cu with 10% Al_2O_3 and 2% Cr_2O_3, giving a condensate contg. 45% AcOEt, 6.4% AcOH and 7% AcH with 50% utilization of the alc. in the first run and 75% in 3 recirculations.

10195. LEL'CHUK, S. L. AND VELTISTOVA, M. V. **Combined production of acetic acid and ethyl acetate by catalytic decomposition of ethyl alcohol at ordinary pressure.** *Org. Chem. Ind.* (U.S.S.R.) 4, 245-53 (1937).—*C.A.* 32, 2085^7.

In the catalytic esterification of alc. with a Cu catalyst, the AcOH yield was considerably increased by raising the temp. to 300°C and introducing water vapors for the hydration of the AcH formed in the catalysis: $AcH + H_2O = AcOH + H_2$. The AcH and uncondensed gaseous portion was passed through a 2nd reaction chamber over the Cu catalyst; 47.7% AcH contg. 8% H_2O was converted into AcOH at 300-25°C.

10196. MORIKAWA, K.; TRENNER, N. R., AND TAYLOR, H. S. **Activation of specific bonds in complex molecules at catalytic surfaces. III. Carbon-hydrogen and carbon-carbon bonds in propane and ethylene.** *J. Am. Chem. Soc.* 59, 1103-11 (1937).—*C.A.* 31, 8340^7.

The exchange reaction between propane and D_2 on a Ni catalyst occurred about 90°C lower than the hydrogenation-decompn. forming ethane and methane. Both reactions were inhibited by H_2 adsorbed on the catalyst. Not only the H_2 adsorbed upon the catalyst, but also the H in the bound water in the kieselguhr support, was available for exchange reactions. Cu catalysts favored the exchange reaction, but not the decompn.

10197. PAVELKA, FRITZ. **Significance of the boundary surface as participant in reaction.** *Mikrochemie* 23, 202-16 (1937).—*C.A.* 32, 2010^2.

Examples were cited in which so-called "catalysis" was merely adsorption, whereby the reaction was stabilized. Thus, a neg. catalyst was often made ineffective as a result of its adsorption by a colloid. In electrochem. reactions (corrosion) the protection afforded by a colloid might be the result of the adsorption of microquantities of more noble ions; in this way the formation of electrolytic couples was avoided.

10198. Schenck, Rudolf and Kurzen, Fritz. **The activation of oxides by foreign oxides. II. The activation of the oxides of copper.** *Z. anorg. allgem. Chem.* 235, 97-109 (1937).—*C.A.* 32, 2818^{1}.

The O_2 tension of CuO was increased by the addn. of Fe_2O_3, Al_2O_3, Mn_2O_3, and especially by Cr_2O_3, because the Cu_2O formed compds. with the sesquioxides. With Mn_2O_3 was formed a cupricupromanganite, $CuO.(Cu_2O.Mn_2O_3)_2$, partly miscible with cupromanganite, $Cu_2O.Mn_2O_3$. The mixt. 3CuO + Cr_2O_3 gave excellent results in the micro-elementary analysis of very difficultly combustible org. substances.

10199. Taylor, H. S. and Joris, G. G. **The characteristics of a copper catalyst activated by magnesia.** *Bull. soc. chim. Belg.* 45, 241-52 (1937).—*C.A.* 31, 8341^{4}.

The catalyst was prepd. by co-pptn. of the hydroxides of Cu and of Mg in the mol. proportions of 1 $Cu(OH)_2$ to 4 $Mg(OH)_2$, washing, drying and reducing in H_2. C_2H_4 was hydrogenated at 0 °C and C_6H_6 at 225 °C by the catalyst. Cyclohexane was dehydrogenated into C_6H_6 between 330° and 460 °C without side reactions. The energy of activation was 8.6 kcal. The catalyst was less active than Ni in breaking the C-C bond. The conversion of C_2H_4 and H_2 into CH_4 took place slowly at about 400 °C.

10200. Toyama, Osamu. **The kinetics of the catalytic hydrogenation of ethylene with nickel. I. II. Reaction at high temperatures.** *Rev. Phys. Chem. Japan* 11, 153-65 (1937)(in English); 12, 115-24 (1938)(in English).—*C.A.* 32, 2414^{4}; 33, 1580^{1}.

From the temp. coeff. of the const. k_2, the heat of adsorption of C_2H_4 was about 15 kcal/mol. The temp. independence of k_1 indicated that the true heat of activation for the reaction was roughly as large as the sum of the adsorption heats of both reactants. In the hydrogenation of C_2H_4 with Ni catalyst at 99-165 °C, as at lower temps., the rate of reaction was practically independent of C_2H_6 and the pretreatment of the catalyst with any reactant gas.

10201. Adadurov, I. E. and Prozorovskii, N. A. **Effect of support on sintering of catalysts.** *J. Phys. Chem.* (U.S.S.R.) 12, 445-50 (1938).—*C.A.* 34, 3161^{8}.

The hydrogenation of C_2H_4 catalyzed by Ni supported on sulfates of bivalent metals showed that the greater the radius of the cation of the support, the smaller was the tendency of the catalyst to sinter and the greater its activity. With an oxide of a quadrivalent metal as support, the activity was greater and the tendency to sinter smaller than with a sulfate of a bivalent metal as support.

10202. Bork, A. Kh. and Tolstopyatova, A. A. **Catalyst poisoning from the viewpoint of the specificity of active centers. VII. Kinetics of the dehydration of ethyl alcohol on aluminum oxide. VIII. Orientation of the molecules of the aliphatic alcohols $C_nH_{2n+2}O$ in the dehydration of the alcohols on aluminum oxide. IX. Influence of methyl substituents on the activation energy of the dehydration of the aliphatic alcohols $C_nH_{2n+2}O$ on aluminum oxide.** *Acta Physicochim. U.R.S.S.* 8, 577-90; 591-602; 603-16 (1938).—*C.A.* 33, 6694^{4}.

The dehydration of EtOH by Al_2O_3 behaved similarly to the dehydrogenation of EtOH. The ratio a_2/a_1 of the adsorption coeffs. of H_2O to that of EtOH at 350 °C was 0.65. The dehydration of PrOH and iso-PrOH was similar; a_2/a_1 for PrOH and iso-PrOH was identical with that for EtOH. The influence of Me substituents on the activation energy of the dehydration of 6 aliphatic alcohols was experimentally investigated.

10203. Dunbar, Ralph E. **Preparation and use of copper-chromium oxide catalysts in dehydrogenations.** *J. Org. Chem.* 3, 242-5 (1938).—*C.A.* 33, 961^{8}.

Cu-Cr oxide catalysts were pptd. upon inactive material as an adequate support where this catalyst was used in the dehydrogenation of BuOH and other similar alcs. The supporting materials studied were arranged in the increasing order of effectiveness as Al_2O_3, pumice and celite. The catalyst retained its activity well over prolonged periods.

10204. Farkas, A. and Farkas, F. **Catalytic interaction of ethylene and heavy hydrogen on platinum.** *J. Am. Chem. Soc.* 60, 22-8 (1938).—*C.A.* 32, 2414^{5}.

The interaction of D_2 and C_2H_4 was studied on platinized Pt foil at pressures of 10-100 mm in the range 0-236 °C. Two reactions occurred: hydrogenation according to $C_2H_4 + D_2 = C_2H_4D_2$ and exchange according to $C_2H_4 + D_2 = C_2H_3D + HD$. In the range 0°-150 °C the hydrogenation had a temp. coeff. higher than unity corresponding to an energy of activation of 10 kcal. Above 150 °C the temp. coeff. was smaller than unity. A comparison of the hydrogenation with the ortho-para-conversion of H_2 and D_2 and with the reaction $H_2 + D_2 \rightleftharpoons 2HD$ showed that in the lower temp. range the rate-detg. step was the activation of H_2 mols.

10205. Juliard, A. and Herbo, Cl. **Researches on heterogeneous catalysis. II. Study of promotion for the hydrogenation of benzene.** *Bull. soc. chim. Belg.* 47, 717-69 (1938).—*C.A.* 33, 3243^{4}.

Ni and Co were poor catalysts for the hydrogenation of benzene to cyclohexene; Fe, Cu and Cd from the reduction of the mixts. NiO-Fe_2O_3, NiO-CuO and NiO-CdO were inhibitors; $CaCO_3$ and $BaCO_3$ in small amts. were inhibitors; oxides of Be, Al, Cr, Ce and Zn were marked promoters.

10206. Khrizman, I. A. **The mechanism of the catalytic decomposition of ammonia.** *Ber. Inst. phys. Chem., Akad. Wiss. Ukr. S.S.R.* 8, 37-57 (1938).—*C.A.* 34, 5731^{6}.

The catalytic decompn. of NH_3 was studied: (a) fixation of the intermediate compds. and investigation of their properties, (b) nature of intermediate products obtained in the synthesis of NH_3, (c) adsorption of N_2, H_2 and NH_3 by ammonia catalysts, (d) kinetics of the catalytic decompn. and synthesis of NH_3 and the kinetics of decompn. of nitrides.

10207. Maxted, E. B. and Evans, H. C. **Catalytic toxicity and chemical structure. II. Influence of various factors on toxicity of sulfur compounds.** *J. Chem. Soc.* **1938**, 455-8.—*C.A.* 32, 5288^1.

The addn. of a second terminal S to a hydrocarbon chain decreased the toxicity. This was due to decrease of mobility, because the effect was absent if the 2 S atoms were adjacent.

10208. Pisarzhev'skii, L.; Chrelashvili, S., and Savchenko, G. **Prevention by irradiation of the poisoning of catalysts.** *Ber. Inst. physik. Chem., Akad Wiss. Ukr. S.S.R.* **8**, 9-22 (1938).—*C.A.* 34, 5731^7.

Ultraviolet irradiation of Pt during and before the decompn. of H_2O_2 greatly diminished the poisoning of the catalyst by H_2S, C_2H_5OH and I_2.

10209. Rapoport, I. B. and Lang, A. **Genesis of catalyst skeletons.** *J. Applied Chem.* (U.S.S.R.) **11**, 1056-62 (1938) (in French, 1063).—*C.A.* 33, 4115^8.

The properties were investigated of catalyst skeletons which were obtained by the treatment of alloy (Ni-Co-Al or Ni-Al) with an alkali to remove most of Al. The catalyst skeletons were more stable against poisoning with S-contg. org. compds. than the pptd. catalysts (oxides). The hydrogenation of caprylene, octyl alc., cyclopentanone and 1, 3, 4-xylenol in a current of H_2 at 190-5°C disclosed that the Ni-Co-Al catalyst skeleton was a very active hydrogenation catalyst. Above 260°C (280-320°), the surface of the catalyst was gradually covered with a carbon film and the catalyst completely lost its activity.

10210. Rusov, M. T. and Roiter, V. A. **Kinetics of the catalytic synthesis of ammonia.** *J. Phys. Chem.* (U.S.S.R.) **11**, 390-9 (1938).—*C.A.* 33, 4115^5.

Catalyst No. 340 (of the GIA) was used. The velocity of the reaction and total partial pressures of the components and the compn. of the reaction mixt. were related. In all cases the total pressure was less than 1 atm. The adsorption of NH_3 on the catalyst followed the equation: $A = abp/(1 + bp)$, where $a = 0.2$ ml and $b = 0.001$. The equation $U = K\ (p_{H_2} p_{N_2}^{0.5}/p^{0.25})$, accounting for the adsorption of NH_3 on the catalyst, represented quite well the kinetics.

10211. Tanaka, Yosio. **Nickel catalysts in chemical industries.** *Japan Nickel Rev.* **6**, 262-70 (1938).—*C.A.* 33, 3539^9.

The prepn. of Ni catalysts and their application in the hydrogenation of oils and the production of tetralin, cyclohexane, cyclohexanol and methylcyclohexanol were described.

10212. Taylor, A. and Weiss, J. **Defect lattices and catalytic activity.** *Nature* **141**, 1055 (1938).—*C.A.* 32, 6535^9.

X-ray examn. of Ni-Al alloys showed the existence of Ni_3Al, Ni_2Al_3 and $NiAl_3$, all with distinct structures. Upon treating this alloy with NaOH soln., Al atoms were removed from the lattice, leaving vacant sites. When 0.5% Al remained, the structure ultimately collapsed and formed the face-centered cubic structure of Ni.

10213. Tutumi, Shigeru. **Promoting action of promoters and carriers. VI. The relation between the dispersity of catalysts and the catalytic activity.** *J. Chem. Soc. Japan* 59, 1407-11 (1938).—*C.A.* 33, 2290^8.

In the catalytic reduction of C_6H_6 the following catalyst was most effective: To the soln. of $Co(NO_3)_2$ a slight excess of K_2CO_3 was added. The ppt. was dried at 200°C, mixed with kieselguhr and water in a mortar, and dried at 100°C. The ratio of Co to kieselguhr was 1:40. A catalyst having the compn. (4Ni + Co) + 7.5% Cr was prepd. for the synthesis of liquid hydrocarbons from CO and H_2.

10214. Baukloh, W. and Knapp, B. **The progress of the reaction between hydrogen and carbon in iron.** *Arch. Eisenhuttenw.* 12, 405-11 (1939); *Iron and Steel Inst. (London), Carnegie Schol. Mem.* 27, 149-64 (1938).—*C.A.* 33, 3732^2.

The basic reaction $Fe_3C + 2H_2 \rightleftharpoons 3\ Fe + CH_4$ was discussed. At first H_2 dissolved, independently of temp. and carbon present on the Fe surface. The Fe formed in this stage obstructed further direct access of H_2 and the reaction continued only after diffusion of H_2. Beginning at 850°C the migration velocity of carbon was higher than the reaction velocity of H_2 and carbon. The reaction became the slower process and was detd. by the equil. conditions.

10215. Beeck, O.; Wheeler, A., and Smith, A. E. **Catalytic activity and crystal orientation of metal films.** *Phys. Rev.* 55, 601-2 (1939).—*C.A.* 34, 4947^9.

10216. Buben, N. and Shekhter, A. **Chemical reactions in electric discharges. IV. Recombination of nitrogen atoms on metals.** *Acta Physicochim. U.R.S.S.* **10**, 371-8 (1939) (in German).—*C.A.* 33, 6163^4.

Considerable recomb. of N atoms occurred on Au, Cu, Fe and Ag surfaces at room temps. On Ni surfaces, the recomb. of N atoms had an activation energy of about 2500 cal/mol, between 300° and 1200°K. Above 1200°K the surface recomb. decreased rapidly. The temp. of the max. rate of recomb. was 1170°K at 0.005 mm and 1320° ± 25°K at 0.02 mm Hg. The heat of adsorption of N atoms on Ni was about 55 ± 2 kcal/mol.

10217. Canneri, G. and Cozzi, D. **The mechanism of the catalytic action of the oxides of vanadium in the conversion of methanol to formaldehyde.** *Chimica e industria* (Italy) **21**, 653-5 (1939).—*C.A.* 34, 3237^3.

The reactions considered were: (1) $6MeOH + V_2O_5 \rightarrow 2Me_3VO_4 + 3H_2O$; (2) $2Me_3VO_4 + 2H_2O \rightarrow V_2O_4 + 5MeOH + CH_2O$; (3) $2Me_3VO_4 + H_2O \rightarrow V_2O_3 + 4MeOH + 2CH_2O$. As formation of the intermediate oxides of V controlled the reaction, addn. of O_2 to the reaction mixt. up to the theoretical limit increased the yield.

10218. Chakravarty, K. M. **Hydrogenation of nickel carbonyl.** *Ind. Eng. Chem.* **31**, 1069-60 (1939).—*C.A.* **33**, 7498⁶.

The principal reactions in the hydrogenation process were $CO + H_2 = C + O_2$ and $2CO + 2H_2 = CO_2 + CH_4$.

10219. Elovich, S. Yu. and Zhabrova, G. M. **Mechanism of the catalytic hydrogenation of ethylene on nickel. I. Kinetics of the process. II. Role of the activated adsorption of ethylene and hydrogen in the hydrogenation process. General scheme of the process.** *J. Phys. Chem.* (U.S.S.R.) **13**, 1761-74, 1775-86 (1939).—*C.A.* **35**, 373⁵.

H_2 and C_2H_4 were held by activated adsorption to a Ni catalyst prepd. by reduction of NiO. The energy for the activated adsorption for H_2 was 16 ±1 kcal and for C_2H_4, 9 kcal. When the reaction was carried out stepwise, i.e., adsorption of H_2 and then of C_2H_4, or the reverse, no hydrogenation occurred. As the temp. rose, the rate of activated adsorption of C_2H_4 increased relatively more rapidly than the rate of hydrogenation until finally its abs. rate was also greater.

10220. Ipatieff, V. N.; Corson, B. B., and Kurbatov, I. D. **Copper as a catalyst for the hydrogenation of benzene.** *J. Phys. Chem.* **43**, 589-604 (1939).—*C.A.* **33**, 5269⁸.

The activities of several Cu catalysts were correlated with chem. compn., conditions of reduction, and phys. structure (studied microscopically and by the emanation method). Traces of impurities, especially Ni, greatly affect activity. Pure Cu catalyzed the hydrogenation of benzene at 100 kg/cm² pressure, but only slightly at atm. pressure. The presence of 3.5% Cr_2O_3 increased the surface and the activity.

10221. Joris, George G. and Taylor, Hugh S. **Exchange reactions of nitrogen isotopes on iron and tungsten surfaces.** *J. Chem. Phys.* **7**, 893-8 (1939).—*C.A.* **33**, 9128².

Fe synthetic-NH_3 catalysts and W filaments in promoting the reaction between N_2^{15} and N_2^{14} were studied from room temp. to 725°C with Fe and to 900°C on W. In contrast to the exchange reaction of mol. H_2 isotopes, the exchange reaction of N_2 mols. was very slow, being first measurable above 450°C. The exchange was accelerated by the presence of H_2. The temp. coeff. of exchange in a N_2:$3H_2$ mixt. was about 50 kcal. Measurements of the velocity of N_2 adsorption at about 400°C on synthetic-NH_3 catalysts involved true activated adsorption.

10222. Kawakubo, Syoitiro. **Studies on the catalytic oxido-reduction of some metallic complex salts. XII. Catalytic oxidation of pyrogallol by the complex salts of platinum group.** *J. Chem. Soc. Japan* **60**, 1031-6 (1939).—*C.A.* **34**, 1582³.

Generally, the ammine complex salts of Pt, Pd, Rh and Ru had no catalytic action; some even showed retarding action. The catalytic action of metallic complex salts depended on their constitution and on the nature of the central metal.

10223. Kazanskii, B. A. and Tatevosyan, G. T. **Influence of the substituents on the velocity of catalytic hydrogenation of certain trisubstituted ethylenes in the presence of platinum.** *J. Gen. Chem.* (U.S.S.R.) **9**, 1458-64 (1939).—*C.A.* **34**, 2783⁵.

1-Methyl-2,2-diethyl-, 1,2-dimethyl-1-phenyl-, 1-methyl-2,2-diphenyl- and triphenylethylene were hydrogenated in 96% alc. in the presence of Pt black at room temp. The velocity of hydrogenation of trisubstituted ethylenes decreased with increasing no. of aryl substituents in the mol.

10224. Kobozev, N. I. and Klyachko-Gurvich, L. L. **A theory of the formation of catalytically active "ensembles" on surfaces. II. An application of the theory to the synthesis of ammonia and to the catalytic and electrocatalytic hydrogenation of the ethylene bond.** *Acta Physicochim. U.R.S.S.* **10**, 1-24 (1939) (in English).—*C.A.* **33**, 7654⁵.

The av. no. of atoms in active ensembles was 3 Fe for the reaction $N_2 + 3H_2 = 2NH_3$; 3 Pt for $2H_2 + O_2 = 2H_2O$; 2Pd for fumaric acid hydrogenation; 4Pt or 4 Ni for $C_2H_4 + H_2 = C_2H_6$; 2 Fe or 2 Pt for the electrocatalytic hydrogenation of cinnamic acid in the presence of traces of $HgCl_2$ and K_3AsO_4 catalyst poisons as activators. For reactions of H_2 with dissocd. mols., the ensembles contained 3 atoms; for addn. to the C=C bond they probably contained 2-4 atoms.

10225. Kostelitz, O. and Hensinger, G. **Catalytic dissociation and synthesis of methanol.** *Chimie & industrie* **42**, 757-73 (1939).—*C.A.* **34**, 3572³.

ZnO prepns. were obtained by different processes from $ZnCO_3$ and treated in various ways. The catalytic action of these prepns. after they had been used for the synthesis were studied on the dissocn. of MeOH to see what changes were undergone during the high-pressure synthesis tests. In the synthesis of MeOH Smithsonite was the most active catalyst, followed by ZnO pressed under 1000 atm. and by $ZnCO_3$ pressed under 2000 atm. and subjected to preliminary treatment in MeOH vapor at 300°C. Tests on the dissocn. of MeOH with catalysts that had been used for synthesis showed a considerable decrease in the catalytic power, and the sp. activity of these catalysts also seemed to have undergone considerable modifications.

10226. Levina, R. Ya. **The contact isomerization of ethylene hydrocarbons over metallic oxides. III. Comparative action of certain contact substances in the isomerization of allylbenzene.** *J. Gen. Chem.* (U.S.S.R.) **9**, 2287-90 (1939).—*C.A.* **34**, 4730⁷.

When $PhCH_2CH{:}CH_2$ was passed at a rate of 2-3 drops/min. in a weak CO_2 current over 30-cm layers of Cr_2O_3 and Fe_2O_3 at 220°C, it was isomerized to give 72% PhCH:CHMe. The reaction at 300°C over activated clay, silica gel, and charcoal gave PhCH·CHMe in 35, 58, and 42% yields, resp.

10227. Litkenhous, E. E. **Hydrogenation of nickel carbonyl.** *Ind. Eng. Chem.* **31**, 1059-60 (1939).—*C.A.* **33**, 7498⁶.

It was assumed and established that the principal reaction was $2C + 2H_2O = CH_4 + CO_2$.

10228. Monblanova, V. V.; Koboziv, N. I., and Filippovich, P. H. **Activation process and the nature of the centers in electrocatalytic hydrogenation.** *J. Phys. Chem.* (U.S.S.R.) **13**, 326-40 (1939); *Acta Physicochim. U.R.S.S.* **11**, 317-42 (1939) (in English).—*C.A.* 34, 1256^6.

The electrocatalytic hydrogenation of cinnamic acid was studied at electrodes with large (Cu, Ag, Hg, Pb, Sn) and small (Pt, Fe) H overvoltages and in the presence of catalyst poisons such as K_3AsO_4 and $HgCl_2$. The first group of metals was poisoned and the second activated up to a certain max. concn., 1×10^{-5} mols./liter in alkali, 6×10^{-4} in acid for $HgCl_2$ on a Pt cathode and 1×10^{-4} mols./liter for K_3AsO_4 on an Fe cathode. On a clean Pt cathode the energy of activation between 0° and 51°C was 5.95 cal, on a Hg film 1.5 mol. thick 2.32, and on an amalgamated Pt cathode 1.21 cal/mol.

10229. Osame, Gohei and Hirai, Taizo. **The manufacture of sulfuric acid by means of vanadium catalyst on an intermediate scale. II. Increase of the draft-resistance in a small converter.** *J. Soc. Chem. Ind., Japan* 42, Suppl. binding 434 (1939).—*C.A.* 34, 3025^8.

Vanadium catalyst, fouled by Fe sulfate, was slightly inferior to the uncontaminated catalyst in layers at 425°C.

10230. Roginskii, S. Z. and Rozing, V. S. **The nature of the catalytic activity of platinum.** *Uchenye Zapiski Leningrad. Gosudarst. Univ., Ser. Fiz. Nauk* **1939**, No. 5 (No. 38), 67-72; *Khim. Referat. Zhur.* **1940**, No. 4, 5.—*C.A.* 36, 3092^5.

The catalytic activity of Pt increased under the influence of the mixt. of H_2 and O_2. H_2 alone inactivated Pt; O_2 increased its catalytic activity at 430°C. After removing O_2 from the surface of Pt by means of H_2 the Pt surface was inactivated, but treating it with the mixt. of the two gases rapidly restored the initial activity. The results indicated that O atoms or O_2 mols. imbedded in the porous Pt lattice were the active centers on the surface of Pt.

10231. Rubinshteĭn, A. M. **Relation of the activity and the selective action of mixed nickel-alumina catalysts to their composition and structure.** *J. Phys. Chem.* (U.S.S.R.) **13**, 1271-81 (1939).—*C.A.* 35, 374^2.

Exptl. data were obtained on the dehydration and the dehydrogenation products of iso-Am alc. on various mixed $Ni-Al_2O_3$ catalysts at 200-300°C as functions of compn., lattice consts. and dispersity of the catalyst. Although no simple relation between dispersity and compn. existed, the activity-compn. curve for dehydrogenation at all temps. passed through a max. near 30 and a min. near 70% Ni, whereas that for dehydration passed through a max. near 70% Al_2O_3. The 1 to 1 ratio Al_2O_3:Ni gave the best conditions for development of a phase boundary.

10232. Stearn, Allen E.; Johnston, H. P., and Clark, Chas. R. **The significance of activation entropy in catalytic mechanisms.** *J. Chem. Phys.* 7, 970-1 (1939).—*C.A.* 33, 9109^9.

The rate of a reaction was detd. by the heat of formation of the activated complex and its entropy of formation. The conditions under which ΔH^* or ΔS^* dominated the reaction were discussed: this detd. whether catalysis was pos. or neg. ΔH^*, ΔS^* and k' were given for: xanthogenic acid decompn.-alc., decompn. of malic acid by H_2SO_4-water, addn. of amylene to $CCl_3COOH-Me_2CO$, denaturation of egg albumin-urea, denaturation of oxyhemoglobin-alc., denaturation of oxyhemoglobin-$(NH_4)_2SO_4$.

10233. Talmud, D. L. **Organic catalysts.** *Vestnik Akad. Nauk S.S.S.R.* **1939**, No. 2-3, 119-22.—*C.A.* 34, 4083^6.

Linear adsorption at the boundary between 3 phases was discussed. The relationship between adsorption and the catalytic activities of org. adsorbents and the orientation of mols. in the surface layer of these adsorbents were studied.

10234. Teletov, I. S. and Gritsan, D. N. **The relation between the decomposition velocity of H_2O_2 and the degree of dispersion of gold sols. I. The role of alkali in the catalytic decomposition of H_2O_2 by gold.** *Zapiski Khar'kov. Sel'skokhoz. Inst.* 2, No. 1-2, 47-58 (1939); *Byull. Khim. Obshchestva im. Mendeleeva* **1940**, No. 8, 22-4; *Trudy Inst. Khim. Khar'kov Gosudarst. Univ.* 5, 235-46 (1940).—*C.A.* 37, 3659^7.

Au alone did not decomp. aq. solns. of H_2O_2. Addn. of NaOH decompd. H_2O_2 in the presence of Au plates, the velocity of the decompn. depending on the character of the surface of the plates. During the first 30-40 min. the reaction-velocity const. decreased continuously, the decrease being greater the more concd. the NaOH soln. KOH decompd. H_2O_2 more energetically than did NaOH. Au acted as a promoter and the mechanism of the decompn. of H_2O_2 was: $H_2O_2 \rightleftharpoons H^+ + HO_2^-$; $H^+ + OH^- = H_2O$; $HO_2^- = OH^- + O$.

10235. Temkin, M. and Pyzhev, V. **Kinetics of the synthesis of ammonia on promoted iron catalysts.** *J. Phys. Chem.* (U.S.S.R.) **13**, 851-67 (1939); *Acta Physicochim. U.R.S.S.* **12**, 327-56 (1940).—*C.A.* **34**, 6512^7; **35**, 7273^9.

From exptl. data on the synthesis and decompn. of NH_3 on tech. Fe catalysts promoted by Al_2O_3 and K_2O at 400-450°C and 1 atm. pressure and $H_2:N_2$ ratios of 0.5 up to 8.5, the rate consts. were $k = 1.04 \times 10^3$ at 400°C and 7.78 at 450°C. The rate of formation of NH_3 was given by $v = k_1 P_{N_2} (P^3_{H_2}/P^2_{NH_3})^{\alpha}$, with $\alpha = 0.5$. The detg. factor in the forward process was the rate of activated adsorption on the N_2-free surface. For the reverse process, the rate of NH_3 desorption was the rate-detg. factor.

10236. Tutumi, Sigeru. **Catalysts for the synthesis of liquid hydrocarbons from carbon monoxide and hydrogen. III. Catalysts prepared by the roasting method.** *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 35, 481-6 (1939).—*C.A.* 33, 6535^4.

Catalysts contg. 5% Co and 12% Cu or 5% Co and 4% Cu, activated with U_3O_8, were less active and had lower optimum reduction temps. when prepd. by roasting below 300°C than when prepd. by pptn. More kieselguhr must be added to the roasted catalysts to obtain the activity of the pptd. material.

10237. Tutumi, Sigeru. **Catalysts for the synthesis of liquid hydrocarbons from carbon monoxide and hydrogen. IV. Catalysts prepared by the roasting method.** *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 36, 47-52 (1939).—*C.A.* 33, 6535^4.

The optimum reduction temp. for Co catalysts prepd. by roasting was lower, and the decrease in activity from using high reduction temps. was greater than for pptd. Co catalysts. The amt. of kieselguhr in the roasted catalysts must be increased to raise their activity. The decrease in activity of roasted Co catalysts was greatest when Mn was a promoter, less with heavier ThO_2 and least with the heaviest U_3O_8.

10238. Tutumi, Sigeru. **Catalysts for the synthesis of liquid hydrocarbons from carbon monoxide and hydrogen. VIII. Changes on the catalyst surface caused by the addition of promoter and carrier.** *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **36**, 335-43 (1939).—*C.A.* **33**, 9103^7.

A Ni-7.5% Cr-50% kieselguhr catalyst was more active than a Ni-10% Al_2O_3-100% kieselguhr catalyst for the reaction of CO with H_2. For the hydrogenation of benzene, the activity varied in the opposite order. In the Ni-kieselguhr catalyst, the optimum ratio of kieselguhr to Ni was 1:2 for the CO-H_2 reaction and 50:1 for the hydrogenation of benzene. The action of the promoter did not differ greatly from that of the carrier, although a larger amt. of the carrier was needed to prevent sintering during reduction of the catalyst.

10239. Tutumi, Sigeru. **Catalysts for the synthesis of liquid hydrocarbons from carbon monoxide and hydrogen. IX. The relation between the surface dispersity of catalysts and the catalytic activities.** *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **36**, 344-51 (1939).—*C.A.* **33**, 9103^7.

Co-kieselguhr catalysts for the hydrogenation of benzene were prepd.: (1) $Co(NO_3)_2$ was treated with K_2CO_3 in the presence of kieselguhr; (2) $Co(NO_3)_2$ was treated with K_2CO_3 and the ppt. dried and mixed with kieselguhr in a little H_2O; (3) $Co(NO_3)_2$ and kieselguhr were mixed and roasted. The products were dried and reduced by H_2 at various temps.

10240. Twigg, George H. **Mechanism of catalytic exchange reactions between deuterium and olefins.** *Trans. Faraday Soc.* **35**, 934-45 (1939).—*C.A.* **33**, 9103^2.

The olefin mol. was adsorbed on the Ni catalyst at 2 points through the opening of the double bond; a D atom formed a Ni-alkyl radical which then decompd. to reform the adsorbed olefin mol. and released a H atom. All the H atoms in the higher olefins were exchangeable with D under conditions where no exchange took place between ethane and D; no double bond migration occurred in the absence of H.

10241. Veltistova, M. V. and Lel'chuk, S. L. **Synthesis of acetates of higher alcohols by catalytic dehydrogenation.** *Org. Chem. Ind.* (U.S.S.R.) **6**, 657-60 (1939).—*C.A.* **34**, 5414^2.

The dehydrogenation of BuOH and AmOH in the mixts. proceeded at a nearly equal rate to give complex mixts. of the corresponding Et, Bu and Am acetates, butyrates and valerates and acids and aldehydes. With increasing mol. proportion of EtOH, the yields of esters increased and those of acids and aldehydes decreased.

10242. Balandin, A. A. and Liberman, A. L. **Kinetics of dehydrogenation of *sec*-butyl alcohol and reversible poisoning of copper catalysts.** *Compt. rend. acad. sci. U. R. S. S.* **28**, 794-9 (1940) (in English).—*C.A.* **35**, 2781^8.

The mean life of mols. of secondary alcs. on the surface of Cu was detd. and their dehydrogenation products (the ketones). A considerable irreversible poisoning was noticed in the dehydrogenation of *sec*-BuOH on Cu (particulary above 240°C). The curves obtained for the equations showed that the activation heats of secondary alcs. were lower than those of primary alcs.

10243. Beeck, Otto; Smith, A. E., and Wheeler, Ahlborn. **Catalytic activity, crystal structure and adsorptive properties of evaporated metal films.** *Proc. Roy. Soc. London* **A177**, 62-90 (1940).

Metal films of high and reproducible catalytic activity were obtained by condensation of their vapors on glass at any desired temp. The catalytic activity was measured by the hydrogenation of ethylene. The crystal structure of these films was investigated by electron diffraction. By controlling the pressure of an inert gas (N_2, A, etc.) during evaporation of the metals, unoriented and oriented films could be produced at will, and their catalytic activities were compared. Oriented gas-evaporated Ni films have twice the B.E.T. surface per gram of randomly oriented high-vacuum films but ten times the activity. The most extensive studies were made on Ni films, but films of Fe, Co, Pd, Pt and Cu were also investigated, and with the exception of Cu similar results were obtained.

10244. Bhatnagar, S. S.; Prakash, Brahm, and Singh, Jarnail. **Magnetism and catalysis. I. Catalytic decomposition of potassium chlorate by manganese dioxide and ferric oxide.** *J. Indian Chem. Soc.* **17**, 125-32 (1940).—*C.A.* **34**, 4972^4.

Mixts. of $KClO_3$ and MnO_2 were heated to various temps. for 0.5-1.0 hr and the resulting products were then analyzed. The mechanism of the catalyzed decompn. of $KClO_3$ and MnO_2 involved the formation of an intermediate compd. Similar expts. on mixts. of $KClO_3$ and Fe_2O_3 gave no significant differences between the exptl. and calcd. values of the susceptibilities.

10245. Boreskov, G. K. and Pligunov, V. P. **Mechanism of the oxidation of sulfur dioxide in the presence of activated vanadium catalysts. I. Stability of vanadium compounds under the condition of sulfuric acid catalysis.** *J. Applied Chem.* (U.S.S.R.) **13**, 329-35 (in German, 336) (1940).—*C.A.* **34**, 8185^6.

KVO_3, $NaVO_3$, $Ba(VO_3)_2$ and V_2O_5 were treated with a gas contg. SO_2 5, SO_3 5 and O 17.0% at 480°C for 12-16 hrs. Except V_2O_5, all were active catalysts. V_2O_5 reacted with SO_2 very slowly, forming vanadyl sulfate. Addn. of small amts. of K_2O or K_2SO_4 increased the velocity of reaction of V_2O_5 with SO_2, yielding vanadyl sulfate and K_2SO_4 and $K_2S_2O_5$. In the presence of SiO_2, the reduction of V_2O_5 decreased with an increase of the amt. of SiO_2.

10246. Boreskov, G. K. and Pligunov, V. P. **Mechanism of oxidation of sulfur dioxide in the presence of activated vanadium catalysts. II. Influence of an admixture of salts of alkali elements and amorphous silicic acid.** *J. Applied Chem.* (U.S.S.R.) 13, 653-61 (in French, 662) (1940).—*C.A.* 35, 3396^8.

The catalytic activity of pure V_2O_5, V_2O_5 + amorphous SiO_2 (1 mol. to 8 mols., resp.), V_2O_5 + 0.1 mol. K_2SO_4 and 1 mol. V_2O_5 +8 mols. SiO_2 +0.1 mol. K_2SO_4 was investigated. Pure V_2O_5 did not change in compn. during catalysis, even at temps. below 500°C, and the apparent energy of activation of SO_2 oxidation was 38,000 cal. Addn. of 8 mols. of SiO_2 per mol. of V_2O_5 did not change the character of the relation of reaction velocity and temp., but the activity at all temps. was approx. 1/15 of that with V_2O_5 alone. Addn. of K_2SO_4 to the V_2O_5 decreased by about 90% the velocity of oxidation at temps. below 490°C.

10247. Briner, E. **The role of ozone as an oxidation catalyst. Interpretation of the favorable effect of dilution based on the laws of adsorption.** *Helv. Chim. Acta* 23, 590-6 (1940).—*C.A.* 34, 7168^9.

The catalytic action of O_3 in ozonized air for the oxidation of BzH, butyraldehyde and H_2SO_3 was assumed proportional to the amt. of O_3 adsorbed in the surface of the liquid and the adsorption obeyed the Freundlich equation. The enormous increase with diln. of the no. of O_2 mols. activated per O_3 mol. and the observed rate of oxidation as a function of concn. of O_3 were explained.

10248. Duhamel, A. **Comparison of the activities of two nickel catalysts.** *Bull. soc. chim.* 7, 358 (1940).—*C.A.* 39, 3721^9.

Exptl. data on a large no. of unsatd. compds., ketones, and unsatd. ketones showed that ethylene double bonds were reduced at the same rate by Raney-Ni and by Ni pptd. from Ni salt solns. by Zn. Carbonyl groups were reduced four times as rapidly by Raney-Ni in alk. soln. as by Ni.

10249. Eley, D. D. and Rideal, E. K. **Parahydrogen conversion on tungsten.** *Nature* 146, 401-2 (1940).—*C.A.* 34, 7710^7.

The W filament was most active catalytically when free of adsorbed O. The clean wire, exposed to gaseous H_2, took up a stable film of H, which did not evap. appreciably at room temp., and so could not give a para-H_2 conversion by Farkas' mechanism. It was more probable that the conversion occurred by a surface interchange of the type para-H_2 + WH → ortho-H_2 + HW.

10250. Eru, I. **Liquid fuel from brown coal.** *Novosti Tekhniki* 1940, No. 10, 32.—*C.A.* 34, 7087^3.

Finely ground Aleksandriisk brown coal and heavy oil and Fe catalyst were mixed with H_2 at 200 atm. and 400°C and the hydrogenated products sepd. and fractionated. About 95% of the org. mass of the coal was liquefied. In the 2nd stage of the process the middle oil obtained by hydrogenation was fed at a definite and const. rate into a chamber contg. highly active Mo-Ni catalyst. By recycling, it was possible to raise the gasoline yield to 75-80% or 45% of the org. matter.

10251. Farkas, L. and Sandler, L. **The heterogeneous ortho-para conversion on paramagnetic crystals.** *J. Chem. Phys.* 8, 248-51 (1940).—*C.A.* 34, 2686^8.

The rate of conversion of para-H_2 and ortho-D_2 was measured on paramagnetic crystals: $CuSO_4$, $NiCl_2$ and Nd oxalate. In the last case the conversion rate had a max. at 0°C. Below 0°C the desorption rate of the H_2 and the D_2 was rate-determining. The rate of desorption increased with increasing temp. and at higher temps. the rate of conversion on the surface became the slow process. The ratio of the rates for H_2 and D_2 approached 11 in this region. The heat of adsorption of H_2 on Nd oxalate was about 2.4. kcal/mol.

10252. Foresti, Bruno. **The effect of the pH on the rate of catalytic hydrogenation of olefins, benzene and some of its homologs.** *Boll. soc. Eustachiana* 38, 19-27, 29-38 (1940).—*C.A.* 36, 6400^4, 6400^6.

The rate of hydrogenation in the presence of Pt as a function of the apparent pH was detd. for the following unsatd. compds.: 1-heptene, asym. methylethylethylene, 2-pentene, tri-methylethylene, cyclopentene, cyclohexene, cyclopentadiene and dicyclopentadiene. The curve showed a slight rise with increase in the pH in acid media and a sharp drop in alk. media. Similar curves were detd. for some aromatic hydrocarbons: benzene, toluene, o-xylene, p-xylene, p-cymene and mesitylene.

10253. Frost, A. V. **Reactions of hydrocarbons on active aluminum silicates.** *J. Phys. Chem.* (U.S.S.R.) 14, 1313-18 (1940).—*C.A.* 35, 3883^2.

Polymerizations, isomerizations and cracking were discussed.

10254. Glushnev, V. E. and Gerasimov, M. M. **The effect of various factors during the refining of cracked gasolines by $ZnCl_2$.** *Vostochnaya Neft* 1940, No. 12, 29-30; *Khim. Referat. Zhur.* 4, No. 9, 120 (1941).—*C.A.* 38, 1867^1.

Gasoline obtained by vapor-phase oxidation cracking was treated at 185-365°C with $ZnCl_2$ added to pumice in an amt. equal to 52.6%. The optimum refining temp. was 220-30°C. Light gasoline could be refined at 150°C. Heating above 275°C resulted in the cracking of the product and lowered its quality.

10255. Grosse, Aristid, V.; Morrell, Jacque C., and Mavity, Julian M. **Catalytic dehydrogenation of monoölefins to diolefins. Source materials for synthetic rubber and resins.** *Ind. Eng. Chem.* 32, 309-11 (1940).—*C.A.* 34, 2646^1.

The following hydrocarbons were catalytically dehydrogenated to give conjugated diolefins of the same C framework: *n*-butenes, 3-Me-1-butene, 2-Me-1-butene + 2-Me-2-butene, 2-pentene, and cyclopentane. The reaction was carried out over alumina impregnated with 4% Cr_2O_3, at 190 mm and at 600°C with 0.34 to 0.75 sec. contact time. With cyclopentane, the temp. was 500°C and contact time 1.85 sec.

10256. Hüttig, G. F. and Bischoff, V. **Decomposition of calcium sulfate by silica.** *Reichsamt Wirtschaftsausbau, Chem. Ber. Pruf-Nr.* 93, (PB52008), 171-5 (1940) (Pub. 1941).—*C.A.* **41,** 5809*a*.

When heated to 800°C, $CaSO_4.2H_2O$ lost its H_2O. Further heating at 1000°-1300°C with an equimolar amt. of SiO_2 caused decompn. of the $CaSO_4$. The heating was done in Pt in an oven controlled to ± 2.5°. Dry SO_2 allowed the least decompn. when a stream was led through the oven at 2 or 4 liters/hr; O_2, air, and N_2 allowed somewhat more decompn. A stream of steam moving at 4 liters/hr allowed 92% decompn. after 4 hrs at 1100°C.

10257. Ipatieff, V. N. **Copper catalysts for the hydrogenation of benzene.** *Bull. soc. chim.* **7,** 281-95 (1940).—*C.A.* **36,** 4014^2.

Cu prepd. by a reduction of the oxide contg. 0.1% of Ni easily hydrogenated benzene at 225°C and ordinary pressure. Cu prepd. from the pptd. hydroxide or carbonate and contg. 0.2% of O easily hydrogenated benzene at pressures above atm., but weakly at atm. pressure. Cu obtained by the reduction of copper ions by H_2 under pressure did not hydrogenate benzene even at high pressure. The presence of 3.5% of Cr oxide increased the catalytic activity and the surface as detd. by the emanation method. At 350-400°C the activity of the catalyst and the surface decreased rapidly.

10258. Ipatieff, V. N.; Corson, B. B., and Kurbatov, J. D. **Mixed copper-chromium oxide hydrogenation catalysts.** *J. Phys. Chem.* **44,** 670-9 (1940).—*C.A.* **34,** 4869^3.

Hydrogenations of C_6H_6 and isopentene at atm. and superatm. pressures were used as a method of evaluating the hydrogenating activities of Cu-Cr_2O_3 catalysts. Cr_2O_3 increased the activity of Cu up to 5% oxide, and then decreased it. Cu and Cu-Cr_2O_3 catalysts were very sensitive to activation by traces of Ni.

10259. Iwasaki, Tomokichi. **Studies of the catalytic oxido-reduction by some metallic complex salts. XV. Catalytic oxidation by copper complex salts.** *J. Chem. Soc. Japan* **61,** 400-4 (1940).—*C.A.* **34,** 5338^7.

The catalytic oxidation of polyphenols and some other inorg. salts caused by the addn. of complex salts of Cu was studied by measuring the adsorption of O_2. The polyphenols, e.g., pyrogallol, were easily oxidized. The inorg. substances, e.g., NH_4Cl, $NaNO_2$, etc., were less affected by the addn. of Cu complex salts.

10260. Kawamoto, Tokio. **Dehydrogenation catalysts (preliminary report).** *J. Chem. Soc. Japan* **61,** 521-4 (1940).—*C.A.* **36,** 7016^5.

Isobornylaniline was dehydrogenated by heating at 300-400°C for 1-1.5 hrs in the presence of a metallic catalyzer to obtain an oily product from which, upon hydrolysis with dil. H_2SO_4 and distn. under 30 mm pressure, camphor was sepd.

10261. Kiyoura, Raisaku. **Activity center of a catalyst.** *Science* (Japan) **10,** 126 (1940).—*C.A.* **34,** 7169^4.

The catalyst of V_2O_5 type in the reaction, $SO_2 + \frac{1}{2}\ O_2 \rightleftarrows SO_3$, was investigated and the mols. of molten catalyst existing on the surface of the carrier were very active. The co-catalysts such as K_2SO_4, Na_2SO_4 or Li_2SO_4 caused the acceleration of the reaction catalyzed by V_2O_5 because such co-catalysts lowered the m.p. of the chief catalyst.

10262. Kobozev, N. I. **Theory of the formation of catalytically active ensembles on surfaces. IV. Application of the theory to the poisoning of catalysts.** *Acta Physicochim. U.R.S.S.* **13,** 469-504 (1940) (in German).—*C.A.* **35,** 2401^7.

The mols. of a catalyst poison were assumed to act only on the activity of a single ensemble independently of processes occurring in neighboring ensembles. The theory was able to explain many exptly. observed catalysis-poisoning phenomena. Calcns. were given for the NH_3 reaction on Fe, hydrogenation of the ethylenic bond on Pt, Pd. etc.

10263. Kurin, N. P. **Investigations of the activities of the ZnS-CuS methanol catalysts.** *Nauch. Tekh. Konferentsiya v Svyazi s Sorokaletnim Yubileem Uchebno-Nauch. Deyatel'-nosti Tomsk. Ind. Inst., Tezisy Dokladov* **1940,** 108-10; *Khim. Referat. Zhur.* **4,** No. 4, 100 (1941).—*C.A.* **37,** 5306^6.

The ZnS-CuS catalysts were obtained by the sep. pptn. of ZnS and CuS and they contained various amts. of CuS. Pure CuS and ZnS also were studied. The activities of the catalysts were detd. by the decompn. of MeOH vapors at vol. velocities from 420-2100 (vols. of vapor per unit vol. of catalyst per hr) and from 250° to 450°C. H_2S poisoned the catalysts, but their activities were restored by the passage of MeOH vapors. The decompn. process of MeOH took place into HCHO and H_2 and the decompn. of HCHO into CO and H_2.

10264. Kurin, N. P. **Investigation of the activity of ammonia catalysts reduced by pure hydrogen.** *Nauch.-Tekh. Konferentsiya v Svyazi s Sorokaletnim Yubileem Uchebno-Nauch. Deyatel'-nosti Tomsk. Ind. Inst., Tezisy Dokladov* **1940,** 112-13; *Khim. Referat. Zhur.* **4,** No. 4, 88 (1941).—*C.A.* **37,** 5560^5.

A remelted NH_3 catalyst contg. Fe_3O_4, Al_2O_3 and and K_2O was used for investigating the reduction process and the activity of the catalyst by the dynamic method at atm. pressures, at various temps. and various vol. velocities. At const. vol. velocities, the reduction velocity of the catalyst by H_2 increased with the increase in temp. The use of H_2 for the reduction (instead of the H_2 + N_2 mixt.) increased the activity of the catalyst.

10265. Kurin, N. P. and Orman, G. A. **Selective catalytic oxidation of carbon monoxide in the presence of hydrogen.** *Nauch.-Tekh. Konferentsiya v Svyazi s Sorokaletnim Yubileem Uchebno-Nauch. Deyatel'-nosti Tomsk. Ind. Inst., Tezisy Dokladov* **1940,** 113-14.—*C.A.* **37,** 5833^5.

Investigation of the com. value of Hopcalite, and other mixts. of MnO_2 and CuO to free a N_2-H_2 mixt. from CO was described. At 95°C the oxidation of CO (0.5% concn.) at high velocities was 97%. The reaction was bimol. and its velocity depended linearly on both CO and O_2. At 25-75°C the activation energy was 6500-860 cal/mol., increasing to 16,500-17,300 cal/mol. at 75-115°C.

10266. MAXTED, E. B. AND MARSDEN, A. **Catalytic toxicity and chemical structure. VI. Poisoning of platinum catalysts by metals.** *J. Chem. Soc.* 1940, 469-74.—*C.A.* 34, 4971^7.

The effect varied with the size of the atom and the valence.

10267. MEL'NIK, B. D.; LESOKHIN, I. G., AND TRABER, D. G. **Investigation of catalysts for the oxidation of nitric oxide to nitrogen dioxide.** *Trudy Leningrad. Krasnoznamen. Khim.-Tekhnol. Inst. im. Leningrad. Soveta* 9, 3-12 (1940).—*C.A.* 37, 4615^6.

Pumice as a catalyst had no effect on the oxidation of NO to NO_2 between 15° and 50°C. In the presence of iron oxide supported on pumice an insignificant acceleration occurred; Sb oxide on pumice increased the speed of reaction five-fold. MnO_2 and hopcalite (40% Cu + 60% MnO_2) increased the velocity of reaction at 20°C five-fold, at 60°C ten-fold. A Carboalum gel was most effective causing a forty-fold acceleration at 20°C.

10268. MORITA, NORIYOSI. **Catalytic isotopic exchange of gaseous oxygen. VI. Exchange of oxygen atom between oxygen and water vapor on the surface of oxides of the second, fourth and sixth groups of the periodic system. (2) Theoretical part.** *Bull. Chem. Soc. Japan* 15, 71-6 (1940).—*C.A.* 34, 4972^2.

The catalytic activities were compared of the oxides of Mg, Ca, Sr, Ba, Zn, Cd, Ti, Zr, Th, Cr, Mo and W. Elements of the 4th group had the lowest activity. Activity for those in the 2nd group increased with increasing at. no. and in the 6th group, it decreased with increasing at. no.

10269. MORITA, NORIYOSI. **Catalytic isotopic exchange of gaseous oxygen. X. Exchange reaction of gaseous oxygen between oxygen and water vapor on the surface of aluminum oxide. Influence of the composition of the gaseous reaction mixture on the degree of the exchange reaction.** *Bull. Chem. Soc. Japan* 15, 298-308 (1940).—*C.A.* 34, 7712^3.

With an O_2/H_2O ratio of 2/1, the reaction rate became measurable at 520°C; above 700°C the rate was rapid and equil. established quickly. The rate was independent of compn. Desorption of water vapor from the oxide surface detd. the rate. The activation energy was found to be 18 to 22 kcal.

10270. MURATA, YOSHIO AND MAKINO, SHÔZÔ. **The benzine synthesis from carbon monoxide and hydrogen. LII. Influence of the initial materials, the support and filler on the iron catalyst.** *J. Soc. Chem. Ind. Japan* 43, No. 7, 210-5 (1940).

The nitrate was best and the sulfate poorest for pptg. the iron catalyst. Kieselguhr was preferred to magnesia as the carrier. Alkali was a good accelerator; KOH and Rb_2CO_3 were better than K_2CO_3, but the former lost its activity very fast. In applications using Fe + 25% Cu + 125% kieselguhr and $CO/H_2 = 1$ to 1 as the initial gas, the best addn. of K_2CO_3 and KOH was 2% based on the Fe.

10271. MURATA, YOSHIO AND YAMADA, TETUZŌ. **The benzine synthesis from carbon monoxide and hydrogen under ordinary pressure. LIV. Influence of carbon dioxide in the initial gas upon the iron catalyst.** *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 38, 118-31 (1940) (in German).—*C.A.* 35, 2297^8.

A gas mixt. contg. varying CO_2 and approx. equal vols of CO and H_2 was passed over a catalyst consisting of (Fe + 25% Cu + 125% kieselguhr + 2% KOH) at 253°C at a rate of 3.8-4.3 liter/hr. Expts. with catalysts composed of Fe + 25% Cu + 2% Mn + 125% kieselguhr and 0-5% KOH at 254°C showed that the yield of liquid product and the C:H ratio of the gas resulting from the reaction increased with increase in alkali content of the catalyst. With a catalyst composed of Fe + 25% Cu + 2% Mn + 125% kieselguhr + 2% KOH at 254°C the yield of liquid product increased with a decrease of gas velocity to 2.6 liters-hr when the gas charge contained approx. 20% CO_2.

10272. PICHLER, H. AND BUFFLEB, H. **Behavior of ruthenium catalysts in synthesis of paraffin hydrocarbons of high molecular weight.** *Brennstoff-Chem.* 21, 273-80 (1940).—*C.A.* 36, 2253^6.

The activity of the catalyst was the same whether it was first reduced with H_2 or with $2H_2 + CO$ at atm. pressure, or was reduced directly with synthesis gas under pressure without pretreatment. No improvement in the catalyst was effected by addition of H_3PO_4 or phosphates.

10273. PUCHKOV, P. V. **Catalytic isomerization of monocyclic hydrocarbons in the presence of molybdenum disulfide.** *J. Phys. Chem.* (U.S.S.R.) 14, 1319-20 (1940).—*C.A.* 35, 3883^3.

Between 400 and 700°C under high H_2 pressures, destructive hydrogenation produced cracking and isomerization. Hexamethylenes gave methylpentamethylenes, ring compds. gave open-chain compds. of the normal and the iso series; unsatd. and aromatic hydrocarbons also resulted. Aromatic hydrocarbons gave methylcyclopentanes. Ethylbenzene lost its ethyl group and was then reduced.

10274. RAVICH, M. B. AND ZAKHAROV, B. A. **Influence of chemical activation of refractories on the combustion of firedamp.** *Compt. rend. acad. sci. U.R.S.S.* 26, 65-8 (1940).—*C.A.* 34, 6424^7.

Reaction rates were studied with stoichiometric mixts. of H_2 and O_2 in packed and unpacked quartz tubes at 400°, 700°, 850°, 900° and 950°C and initial pressure of approx. 1 mm Hg. The rate of reaction was increased at low temps. by the presence of commercial grog with surface coatings of Ni and Fe oxides and by Ural dunite. The activated grog and dunite yielded rates at 400°C comparable to that obtained with the unactivated refractory at 950°C.

10275. RAVICH, M. B. AND ZAKHAROV, B. A. **The catalytic effect of the oxides of rare elements on the combustion of hydrogen.** *Compt. rend. acad. sci. U.R.S.S.* 27, 473-6 (1940) (in French).—*C.A.* 34, 7711^9.

The velocity of combustion of H_2 was increased in the presence of a chamotte by applying to the latter a mixt. of ThO_2-CeO_2, or CeO_2 and a fraction of the rare earth oxides. For a temp. of 500°, these catalysts induced a reaction velocity equal to that attained in the presence of a non-activated chamotte at 950°C. The rare earth oxide fraction extd. from apatite had considerable catalytic activity and was a cheap substitute for the Th-Ce and Ce catalysts.

10276. Sano, I. **The effect of gases upon the catalytic decomposition of oxalic acid by colloidal platinum.** *Bull. Chem. Soc. Japan* 15, 204-6 (1940).—*C.A.* 34, 6512^4.

The decompn. of $H_2C_2O_4$ in aq. soln. was slight in the presence of colloidal Pt (obtained by dialysis of Pt carbonyl) in N_2 and in air under reduced pressure, but was markedly accelerated in O_2. The low rates in N_2 and under low pressure were attributed to residual dissolved O_2.

10277. Schawb, Georg-Maria and Drikos, Georg. **The combustion of carbon monoxide on Hopcalite and on its components.** *Z. physik. Chem.* **A185**, 405-25 (1940).—*C.A.* 34, 4972^8.

The velocity of the reaction between CO and O_2, catalyzed by CuO, by MnO_2 and by a 40-60 mixt. of the two, was detd. and the change in wt of the catalyst was detd. at the same time. On CuO the reduction of the catalyst by CO began at 140°C; the re-oxidation by O_2 began at room temp. The corresponding temps. for MnO_2 are 30° and 100°C; for Hopcalite, 70°C and room temp. Gas mixts. with excess CO reduced the catalysts; those with excess O_2 oxidized them, but for MnO_2 the latter reaction took place only to a slight extent.

10278. Schwab, Georg-Maria and Drikos, Georg. **Carbon monoxide combustion by a mixed catalyst, "Hopcalite," and its components.** *Praktika Akad. Athenon* (Athens) **15**, 12-23 (1940).—*C.A.* 46, 5224*h*.

In a comparison of 3 catalytic agents, where O-oxidized active Cu at any temp., CuO was reduced by means of CO at 150°C and above in proportion to the CO_2 evolved. MnO_2 required min. temps. for reduction. In the mixt. of the three (Hopcalite), CuO range and the steady reactivity of MnO_2 were combined. The latter mediated the reduction.

10279. Shurmovskaya, N. and Bruns, B. **Mechanism of the catalytic oxidation of carbon monoxide on manganese dioxide.** *J. Phys. Chem.* (U.S.S.R.) 14, 1183-94 (1940).—*C.A.* 35, 3881^8.

The mechanism of the catalytic action involved reduction of MnO_2 to Mn_2O_3 followed by reoxidation. Data were given for both chemically and electrolytically prepd. MnO_2, and the oxidation reactions carried out at 0°-70°C and up to 1 atm. on a catalyst previously heated in O_2 at 200°C and pumped out at the same temp.

10280. Tikhonov, A. V. **The mechanism of catalysis and a method for the selection of catalysts from the point of view of intermediate products.** *Trudy Vsesoyuz. Prom. Akad.* 1940, No. 2, 14-20; *Khim. Referat. Zhur.* 4, No. 9, 13 (1941).—*C.A.* 38, 910^8.

During catalytic oxidation, the catalyst was reduced in the intermediate states from the highest to the various lower degrees of oxidation. The heat effect was regarded as the activation energy of the total catalytic reaction. The most effective active catalyst possessed a min. heat of reduction. In the oxidation of SO_2, the catalyst can be reduced to V_2O_4 or V_2O_3. Activators retarded the reduction to lower degrees, which required greater amts. of energy.

10281. Agliardi, N. **Activity, structure and preparation of some nickel catalysts.** *Atti. accad. sci. Torino, Classe sci. fis. mat. nat.* 77, 82-96 (1941).—*C.A.* 37, 5560^7.

The rate of hydrogenation of C_6H_6 to cyclohexane was detd. at ordinary pressure and varying temps., over Ni-catalysts by a flow method. Some catalysts were pure Ni, others contained foreign metals (Cu, Co, Fe) in proportions so small that an examn. by x-rays showed no modification of the space lattice. Pure Ni was the most active catalyst. All catalysts showed a distinct max. at about 220°C.

10282. Babkova, M. and Mochan, I. **Adsorptive properties of promoted and inactive tungsten layers.** *Compt. rend. acad. sci. U.R.S.S.* **30**, 32-6 (1941) (in English).—*C.A.* 35, 3884^6.

The permanency of the W catalysts used in hydrogenating C_2H_4 was increased by forming the W sublimate in the presence of greases ordinarily used as cock lubricants. Contrary to the general behavior of most promoters, the activity of the catalyst actually increased with successive hydrogenations. Catalytic activity of the layers was not affected by the adsorption of inert gases (e.g., A), but was decidedly reduced by H_2 and C_2H_4.

10283. Bargagnolo, Giuseppe. **l-Ascorbic acid and oxidation catalysts (metals and carbon). I.** *Ann. chim. applicata* **31**, 250-68 (1941).—*C.A.* 39, 1588^3.

Cu, Ag, Au, Mg, Zn, Hg, Al, Si, Sn, Pb, As, Sb, Bi, Mn, Fe, Co, Ni, Cr, Te, W and C catalyzed the oxidation of 0.01 *N l*-ascorbic acid in varying degrees. The results depended on the quantity of powd. metal used, its state of division, and the duration of the reaction. Cu, Mg and Mn showed as instantaneous effect (within 1 min.), but the other metals were slower. A pos. catalytic effect was shown in descending order as follows: Cu, Mg, Mn, Si, Ni, Te (unpurified) and Fe. As made the ascorbic acid a stronger reducing agent.

10284. Bodenstein, M. **Some reactions of hydroxylamine and the catalytic oxidation of ammonia.** *Z. Elektrochem.* 47, 501-18 (1941).—*C.A.* 36, 4014^3.

The decompn. of NH_2OH was not increased by the addn. of NH_3; hence, $NH_2OH + NH_3 \rightarrow N_2 + H_2O + 2H_2$, did not take place. With at. O prepd. by a contact reaction with MnO_2, the following reaction occurred: $NH_2OH + O \rightarrow NOH + H_2O$. The following reactions for the oxidation of NH_3 were proposed: (1) Primary reaction: $NH_3 + O \rightarrow NH_2OH$. (2) Formation of NO: $NH_2OH + O_2 \rightarrow HNO_2 + H_2O$, followed by (*a*) $HNO_2 + O_2 \rightarrow HNO_4$, and (*b*) $HNO_4 \rightarrow NO + O_2 + OH$, and $2OH \rightarrow H_2O + O$. (3) Formation of N_2O: $NH_2OH + O \rightarrow HNO + H_2O$, followed by $2HNO \rightarrow H_2O + N_2O$. (4) The formation of N_2 follows in two ways: $HNO_2 + NH_3 \rightarrow 2H_2O + N_2$ (at higher temps.), and $HNO + NH_2OH \rightarrow 2H_2O + N_2$ (at lower temps.).

10285. Bogdanov, I. F. **Selective catalysis. IV. Hydrogenation of binary mixtures of acetylene derivatives.** *J. Gen. Chem.* (U.S.S.R.) 11, 979-82 (1941).—*C.A.* 36, 6882^9.

Mixts. of phenylacetylene and phenylpropiolic acid in 80% alc. soln. were shaken with H_2 and either Pt black or Pd-Ni at 20 °C. The triple bond of phenylacetylene was reduced to the double bond up to 97% before even traces of phenylpropiolic acid were reduced.

10286. BRODOVICH, K. I. **Kinetics of the oxidation of sulfur dioxide.** *J. Applied Chem.* (U.S.S.R.) **14**, 894-9 (1941) (French summary).—*C.A.* **39**, 3997⁶.

Oxidation of SO_2 on V catalyst differed from that on Pt in respect to the effect of O_2, the concn. of which to the 0.8th power was directly proportional to reaction velocity. Equations and theoretical discussion of the reaction were presented. The consts. derived from exptl. data were tabulated.

10287. DEEM, A. GARRELL AND KAVECKIS, JOSEPH E. **Catalytic poisoning in liquid-phase hydrogenation. Effect of sulfur compounds of various degrees of oxidation.** *Ind. Eng. Chem.* **33**, 1373-6 (1941).—*C.A.* **35**, 7944².

Methyl *p*-toluenesulfonate promoted the hydrogenation of PhOH at 120 °C over a Raney Ni catalyst. Na-benzenesulfonate had a slight poisoning effect. With diphenylsulfone poisoning was complete after hydrogenation of 4 C atoms of the PhOH. In the hydrogenation of quinoline the catalyst was partially poisoned by all compds., but to a lesser degree. During the first stage at 130 °C, only thiophenol was an active poison. Only during the second stage at 230 °C did the other compds. poison the catalyst. The degree of poisoning depended on the degree of oxidation of the S compd. and on the material being hydrogenated.

10288. EĬDUS, YA. T.; KAZANSKIĬ, B. A., AND ZELINSKIĬ, N. D. **The influence of the type of carrier on the synthesis of liquid hydrocarbons over Ni-MnO-Al_2O_3 catalysts at atmospheric pressure.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* **1941**, 27-33.—*C.A.* **37**, 5306⁹.

Supports of kieselguhr from different parts of Russia were studied for the (5Ni + Mn) + 10% Al_2O_3 catalyst used in prepg. hydrocarbons from CO and H_2. The degree of washing the catalyst after pptn. had great influence on its activity, and the sepn. of Fe and ignition were not always required.

10289. ELEY, D. D. AND RIDEAL, E. K. **The catalysis of the para-hydrogen conversion by tungsten.** *Proc. Roy. Soc.* (London) **178A**, 429-51 (1941).—*C.A.* **36**, 22⁴.

The para-H_2 conversion was measured on the surface of W as a function of the surface concn. of adsorbed O_2 acting as a poison. The O_2 decreased the fraction of the metal surface available for reaction and also affected the reactivity of the neighboring chemisorbed hydrogen. A part of the O adsorbed on W was removed at room temp. by reaction with H_2. Films of CO, N and ethylene also acted as poisons. The activated complex theory was more in accordance with a conversion mechanism based upon an interchange between loosely adsorbed H_2 and chemisorbed H rather than with the original idea of the recombination of chemisorbed H atoms.

10290. FEHRER, HAROLD AND TAYLOR, HUGH S. **The mechanism of reaction and of poisoning in the dehydroaromatization of heptane.** *J. Am. Chem. Soc.* **63**, 1387-92 (1941).—*C.A.* **35**, 4271².

The poisoning of Cr_2O_3 catalyst by ethylene, olefin-aromatic production with progressive poisoning, and olefin-aromatic production at various temps. were studied with the following catalysts: Cr_2O_3, Cr_2O_3 with ZrO_2, SnO_2, ZnO, MoO_3, MnO or alumina; for alumina with V_2O_5 or ThO_2; for $Al(OH)_3$ with V_2O_5; and for CeO_2 gel. The initial cyclization of 1-heptylene on Cr_2O_3 catalysts caused them to poison more rapidly. 1-Heptylene in 15% concn. in heptane reduced the over-all conversion to toluene. Methylcyclohexane was more rapidly dehydrogenated to toluene than heptane or 1-heptylene and did not poison the catalyst. Dehydrogenation of the heptane was inhibited by heptylene and was the slow process in the whole sequence.

10291. HAMAI, SENZO. **Physicochemical investigations on catalytic mechanism. II. The Fischer-Tropsch synthesis of hydrocarbons with special reference to its reaction mechanism.** *Bull. Chem. Soc. Japan* **16**, 213-28 (1941).—*C.A.* **36**, 739⁹.

CO was adsorbed or displaced H_2 adsorbed on the Co surface, forming Co—Co(—C═O)Co which was reduced first by adsorbed H_2 to Co—Co(—HCOH)Co, then to Co—Co(—CH_2)Co. The (CH_2) "mols." adsorbed on the Co surface migrated freely over the surface to interact with one another to form Co—Co(—$CH_2CH_2CH_2CH_2$......)Co which, upon desorption, yielded $(CH_2)_n$ and finally liquid products by hydrogenation. At 200 °C, Co—Co(—C═O)Co did not form CH_4 by hydrogenation, but at 300 °C CH_4 was formed; CH_4 formation probably resulted from reaction of CO and H_2 in the gas phase. Max. adsorption did not necessarily coincide with max. catalytic activity.

10292. HARTECK, P. AND JENSEN, H. **Reaction velocity with colloidal catalysts.** *Z. Physik* **118**, 416-23 (1941).—*C.A.* **37**, 2892⁵.

The diffusion relations that determined the quality of the catalyst were discussed for reactions that followed the scheme: A (gas) + B (liquid) → AB (liquid). First, a solid plane catalyst surface was treated, then a catalyst consisting of spherical particles distributed in the liquid, and finally a non-ideal catalyst.

10293. HENK, H. J. **The influence of catalysts on the decomposition of peroxides and solutions of persalts.** *Fette u. Seifen* **48**, 508-9 (1941).—*C.A.* **37**, 2524².

Metal salts and oxides, but not the pure metals, had a catalytic effect. Heavy metal salts were effective in all pH ranges by reaction with H_2O_2 to form initially unstable peroxides; with increase of H-ion concn. the decompn. of H_2O_2 decreased. Further decrease in rate of decompn. of H_2O_2 was possible by use of capillary-active materials, such as alcs., ketones, urethans, silicates, proteins and their hydrolysis products with protective colloidal activity.

10294. HERBO, CL. **The mechanism of catalytic reactions. I. Kinetic investigations of the**

catalytic hydrogenation of benzene. *Bull. Soc. chim. Belg.* 50, 257-96 (1941).—*C.A.* 37, 4614^7.

The hydrogenation of C_6H_6 was studied in the presence of Ni catalysts (catalyst *A* 98.4 g Ni, 1.6 g Cr_2O_3; catalyst *B* 2.7 g Ni, 97.3 g BeO) at atm. pressure in a flow system. With catalyst *B* the rate of hydrogenation became measurable above 60°C and increased with the temp. at const. flow rates and const. compn. of the gas up to 180°C, but decreased above this temp. and became zero at 310°C. The catalyst was used in such a thin layer that the continuous yield at higher flow rates was directly proportional to the amt. of catalyst used, and the compn. of the gas along the catalyst bed changed very slightly.

10295. Holmes, John W. and Taylor, Ellison H. **The effect of method of preparation upon the activity of co-precipitated copper hydroxide-magnesium hydroxide catalysts.** *J. Am. Chem. Soc.* 63, 2911-15 (1941).—*C.A.* 36, 322^1.

The effect of the rate of pptn. of $Cu(OH)_2$-$Mg(OH)_2$ catalysts was studied by detg. the relative effects of these catalysts toward H_2O_2. The data indicated that the activity of the catalysts was affected by changes in the rate of pptn. and the extent of washing. Similar catalysts prepd. by reverse co-pptn. (addn. of metal nitrates to base) were affected only slightly by these variables.

10296. Itterbeek, A. van and Dingenen, W. van. **Catalytic action of nickel and copper-thorium in the formation of methane and heavy gases.** *Z. physik. Chem.* B50, 341-60 (1941).—*C.A.* 37, 1917^5.

The adsorption of H_2-CO mixts. by Ni foil was detd. at low pressures (less than 2 mm Hg) and over a wide temp. range. At 167° and 329°C H_2 and CO were adsorbed in the ratio 3:1 corresponding to CH_4 formation; at 125° and 378°C, they were adsorbed in the ratio 2:1 corresponding to higher paraffin formation. The reaction rates also showed max. at these temps. Cu adsorbed H_2, and to a smaller extent CO, only if it contained traces of Th. At 250° and 325°C H_2 and CO were adsorbed in the ratio 3:1. Similar expts. with D_2 were described.

10297. Kobayashi, Kyuhei and Ishikawa, Heishichi. **The catalytic decompn. of neutral salts with Japanese acid clay and other minerals. III. Actions of activated clays, silica gel, hydrous aluminum hydroxide, and ferric hydroxide gels.** *J. Soc. Chem. Ind., Japan* 44, Suppl. binding, 238-39 (1941).—*C.A.* 44, 8214*e*.

For the catalytic decompn. of NaCl, activated clay and $Al(OH)_3$ gel were superior, especially below 500°C; silica gel and $Fe(OH)_3$ were inferior below 500°C and gradually improved above 600°C. The difference for activated clay and silica gel was caused by their permeability to NaCl soln. The superiority of $Al(OH)_3$ gel was due to chem. affinity.

10298. Kobayashi, Kyuhei and Ishikawa, Heishichi. **Catalytic decomposition of neutral salts with Japanese acid clay and the other minerals. IV-V. The catalytic decomposing action of Japanese acid clay on sodium chloride.** *J. Soc. Chem. Ind., Japan* 44, Suppl. binding, 282-3 (1941).—*C.A.* 44, 8067*f*.

The decompn. of NaCl by steam in the presence of Japanese acid clay was dependent on the steam velocity and mixing of NaCl and clay. Clay activated with HCl was more effective than raw clay, indicating that the catalytic effect was due to hydrous Al silicate.

10299. Kodama, Shinjiro; Tarama, Kimio; Oshima, Taichi, and Fujita, Koichi. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. I. Effect of temperature with the iron catalyst. II. Effect of rate of flow of the starting gases with the iron catalyst.** *J. Soc. Chem. Ind., Japan* 44, Suppl. binding, 272-4, 274-5 (1941) (in German).—*C.A.* 44, 7507*i*.

In order to synthesize predominantly C_4 hydrocarbons, a synthesis gas composed of equal parts of CO and H_2 was passed at temps. varying from 242° to 299°C over an Fe catalyst contg. Cu 25, Mn 2, kieselguhr 125, H_3BO_3 20, and K_2CO_3 3%. Increase in temp. resulted in a decrease in CH_4 formation and also a decrease in reaction velocity. The max. yield of gasoline was reached at 250°C, while the yield of C_4 hydrocarbons increased up to 270°C and remained practically const. above this temp.

10300. Koyano, Tadabumi and Ito, Rihei. **Relation between the α-γ transformation of iron-nickel alloy and the velocity of catalytic decomposition of ammonia gas. I.** *J. Chem. Soc. Japan* 62, 984-9 (1941).—*C.A.* 41, 2863*h*.

With the Fe-Ni alloy (Ni 9.8%) as catalyst, the decompn. of NH_3 was studied in the range 400-610°C. The rate of decompn. of NH_3 was accelerated near 600°C, at which temp. the α-γ transformation took place; the rate of decompn. showed no hysteresis in heating and in cooling.

10301. Krauss, W. and Neuhaus, Adalbert. **Catalytic oxidation of ammonia to nitrous oxide in presence of oxides.** *Z. physik. Chem.* B50, 323-40 (1941).—*C.A.* 37, 1917^3.

NH_3-air and NH_3-O_2 mixts. were passed over heated oxides of Mn, Bi, Ba, Fe and Ni, and the yields of N_2O, NO and N_2 were detd. A reaction scheme was discussed in which NH_3 and O united to form NH_3O which then reacted with O to form HNO + H_2O or with O_2 to form HNO_2. The NH_3O also reacted with HNO to form $N_2 + H_2O$. The HNO_2 reacted with NH_3 to form N_2. N_2O was formed by the union of two HNO.

10302. Liberman, A. L. **Isotherm of heterogeneous catalytic reactions carried out under flow method conditions and a new method for determining the relative adsorption coefficients.** *Compt. rend. acad. sci. U.R.S.S.* 31, 448-52 (1941) (in English).—*C.A.* 37, 563^1.

A mathematical treatment was applied to the results of previous experiments.

10303. Love, Katherine S. and Emmett, P. H. **The catalytic decomposition of ammonia over iron synthetic-ammonia catalysts.** *J. Am. Chem. Soc.* 63, 3297-3308 (1941).—*C.A.* 36, 959^3.

Catalysts 931 (Fe-K_2O-Al_2O_3), 954 (Fe-Al_2O_3) and 973 (pure Fe) were used. The rate of the reaction over catalyst 931 was, within exptl. error, proportional to $(P_{NH_3})^{0.6}/(P_{H_2})^{0.85}$. The apparent energy of activation was 45,600 ± 2000 cal. Within a considerable range of temp. and gas compn. the rate of the reaction over catalyst 954 was directly proportional to the partial pressure of H_2, indirectly proportional to the partial pressure of NH_3; the apparent energy of activation was very small. At higher and lower temps. the kinetics of the reaction more nearly approached those of the reaction over catalyst 931. The reaction kinetics over catalyst 973 were similar to those over catalyst 954.

10304. Luytenk, L. **The kinetics of the methane synthesis on nickel.** *Natuurw. Tijdschr.* **23**, 25-6 (1941).—*C.A.* **37**, 3662³.

The poisoning effect of CO on active Ni used as catalyst in the synthesis of CH_4 from CO and H_2 was studied, including those in which D_2 was used. The higher the CO content of the gas mixt. and the smaller the activity of the catalyst, the greater was the difference between the reaction velocities of the two isotopes. The difference between the zero-point energies caused a relatively greater difference between the two isotopes.

10305. Makishima, Gen-ichiro. **Alumina catalysts.** *J. Chem. Soc. Japan* **62**, 770-9 (1941).—*C.A.* **41**, 5371g.

The most efficient alumina catalyst for the formation of acetylene by the dehydration of alc. was the monohydrate, $Al_2O_3.H_2O$.

10306. Murata, Yoshio and Yamada, Tetuzō. **The benzine synthesis from carbon monoxide and hydrogen under ordinary pressure. LV. Influence of nitrogen, methane, oxygen and ammonia in the initial gas upon the iron catalyst.** *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **38**, 218-29 (1941) (in German).—*C.A.* **35**, 5284⁶.

A mixt. of approx. mol. proportions of CO and H_2 was dild. with N_2 and passed at 253°C over a catalyst having the compn. Fe + 25% Cu + 125% kieselguhr + 2% KOH and at a gas velocity of 3.4 to 4.1 liters/hr. The yield of liquid product decreased (with respect to CO and H_2) with increasing amt. of N_2 in the initial gas mixt. The I_2 no. of the liquid product increased.

10307. Nakata, Shigeo. **Catalytic oxidation of sulfur dioxide with heavy oxygen. I. Experimental. II. Discussion of the results.** *J. Chem. Soc. Japan* **62**, 519-24; 525-8 (1941).—*C.A.* **35**, 7811¹.

The mixt. consisting of SO_2 and O_2 rich in heavy O isotope was passed over Pt-sponge heated from 300 to 600°C, and the SO_2 oxidized. The quantity of heavy O remaining was detd. and the mechanism of the oxidation estd. The exchange reaction of O atom between SO_2 and O is the exchange reaction between the reaction product SO_3 and O.

10308. Nakata, Shigeo and Morita, Noriyoshi. **Catalytic oxidation of sulfur dioxide by heavy oxygen on the surface of platinum sponge.** *Bull. Chem. Soc. Japan* **16**, 463-71 (1941).—*C.A.* **41**, 4366f.

Catalytic oxidation of SO_2 by heavy O on the surface of Pt sponge was studied. Below 400°C exchange reaction did not occur between the free O_2 phase and the O in SO_2 or SO_3. Above this temp. exchange took place between SO_3 and free O_2. The rate-detg. step of the reaction was the thermal dissocn. of SO_3.

10309. Pshezhetski, S. Ya. and Gladyshev, A. T. **Kinetics of the catalytic dimerization of ethylene.** *J. Phys. Chem.* (U.S.S.R.) **15**, 333-45 (1941).—*C.A.* **36**, 6400⁹.

Ethylene was polymerized on a Ni catalyst at temps. from 260° to 460°C. The Raman spectrum analysis of the products showed 50% α-butylene, 25% *cis*- and 25% *trans*-butylene. The rate of dimerization was directly proportional to the pressure of the ethylene in the gas phase.

10310. Rampino, Louis D. and Nord, F. F. **Preparation of palladium and platinum synthetic high-polymer catalysts and the relationship between particle size and rate of hydrogenation.** *J. Am. Chem. Soc.* **63**, 2745-9 (1941).—*C.A.* **35**, 7810⁷.

Pd and Pt catalysts were prepd. with synthetic high polymers as protective colloids. The particle size of the protective colloid and the rate of hydrogenation were related by studies of polyvinyl alc. in various degrees of polymerization as the protecting agent. Polymethyl methacrylate and polymethyl ester of polyacrylic acid were used for hydrogenations in org. solvents. The catalysts were tested for adsorption of H_2 and CO.

10311. Roginskii, S. Z. **Nature of the active surface of metallic catalysts.** *Compt. rend. acad. sci. U.R.S.S.* **30**, 29-31 (1941) (in English).—*C.A.* **35**, 3884⁴.

Gas-promoted catalysts lost their activity upon degasification at low temps., but were reactivated upon heating in O_2. The activity of the catalyst varied with the amt. of promoter entrained, following an exponential law.

10312. Roginskii, S. Z. **Active contacts, their formation and nature. I. Nature of active contacts.** *J. Phys. Chem.* (U. S. S. R.) **15**, 1-30 (1941).—*C.A.* **36**, 320⁷.

The presence of impurities and deviations from stoichiometric proportions were important factors for the appearance of catalytic activity in metals and oxides. The activation of Pt and Pd catalysts by evacuation and treatment with various gases, especially O_2, was discussed. The adsorbed O atoms were not on the surface, but just beneath the upper layer of metal atoms and decreased the work of removal of atoms from the surface. The sp surface of catalysts was practically unchanged by treatment with gases, but the rate of activated adsorption was greatly increased.

10313. Salley, Donovan J.; Fehrer, Harold, and Taylor, Hugh S. **Thermal stability, poisoning, revivification and reactivity of chromium oxide gel catalysts for dehydrocyclization.** *J. Am. Chem. Soc.* **63**, 1131-3 (1941).—*C.A.* **35**, 3513⁵.

The desorption of H_2O from Cr_2O_3 catalyst, was detd. for the period of revivification of Cr_2O_3

catalyst with N_2 and O_2 mixts. and for the effect of H_2O vapor on heptane dehydrogenation at 475°C over Cr_2O_3 catalyst. Cr_2O_3 gel was found to be stable, when properly controlled, up to temps. as high as 600°C. Dehydrogenation and aromatization of normal heptane was predominant up to 525°C. Conditions for revivification of spent Cr_2O_3 gel catalyst were defined.

10314. SERGIENKO, S. R. **The mechanism and relative rapidity of the aromatization of paraffinic hydrocarbons. I.** *Bull, acad. sci. U.R.S.S., Classe sci. chim.* **1941**, 177-90.—*C.A.* **37**, 3064[7].

Octane and 1:1 mixts. of octane and heptane were aromatized in the presence of Cr_2O_3-CoO and Al_2O_3-Cr_2O_3-CoO catalysts at 475-500°C and a throughput of 0.15-0.3 vol. % of the starting material per vol. of catalyst. By periodic regeneration (after every 2-12 hrs) of the catalyst, it will retain its original activity after 700 working hrs. Under these conditions, octane was aromatized 1.5 times more rapidly than heptane.

10315. SUITO, EIJI. **Thermal analysis of the catalytic action of colloids. II. The effect of temperature and heat-treatment of platinum sol on the catalytic decomposition of hydrogen peroxide by colloidal platinum.** *Rev. Phys. Chem. Japan* **15**, 1-16 (1941).—*C.A.* **35**, 6503[5].

The rate of decompn. of H_2O_2 catalyzed by Pt sol was detd. by a termo-analytical method at 25°, 30°, 35°,....60°C. The max. rate was attained at 45°-50°C. The surface of the Pt colloid was sintered by heating it for 2 hrs at 95°C, and its catalytic activity was reduced one-half. Oxygen adsorbed on the Pt sol reduced its activity, but was expelled by boiling for 2 hrs. Boiling the Pt sol for 7 hrs coagulated it and decreased its activity, as did also freezing the sol.

10316. TURKEVICH, JOHN; FEHRER, HAROLD, AND TAYLOR, HUGH S. **Chromium oxide gel catalysts for dehydro-cyclization of *n*-heptane.** *J. Am. Chem. Soc.* **63**, 1129-31 (1941).—*C.A.* **35**, 3513[3].

Chromium oxide catalysts were prepd. by formation from a jelly, pptn. as gel from chromic acetate, and reduction of chromic acid by alc. and other org. reducing agents. The activities of these catalysts were studied with reference to dehydrogenation-cyclization activity toward normal heptane and as to the compn. of the liquid product in olefins and aromatics. Catalysts obtained by alc. reduction of chromic acid possess high activities and are readily prepd. in bulk.

10317. TURKEVICH, JOHN AND SELWOOD, PIERCE W. **Solid free radical as catalyst for ortho-para hydrogen conversion.** *J. Am. Chem. Soc.* **63**, 1077-9 (1941).—*C.A.* **35**, 3512[8].

The magnetic characteristics were detd. of α,α-diphenyl-β-picrylhydrazyl, the corresponding hydrazine, active ZnO and ignited ZnO. H_2 adsorption at liquid-air temp. was detd. on the original compd., active ZnO, and on an intimate mixt. of the two. *Ortho-para* H_2 conversion at liquid-air temp. was slow on ZnO and slow on the free radical, but very rapid on an intimate mixt. of the two.

10318. TWIGG, G. H. **The catalytic isomerization of 1-butene.** *Proc. Roy. Soc.* (London) **A178**, 106-17 (1941).—*C.A.* **35**, 5775[9].

The double-bond migration on a Ni catalyst in the presence of H_2 was examd. simultaneously with the exchange and hydrogenation reactions. The energies of activation were found for the temp. range 76°-126°C. At the lowest temp. the rate of double-bond migration was 6 times that of exchange. The step that detd. the rate in the double-bond migration was the second fast step of the exchange reaction.

10319. VAINSHTEIN, F. M. AND POLYAKOV, M. V. **Mechanism of the catalytic oxidation of ammonia.** *J. Phys. Chem.* (U.S.S.R.) **15**, 164-73 (1941).—*C.A.* **36**, 6400[9].

Exptl. data were obtained on the oxidation of a 9.5% NH_3 stream by O_2 in a 1-cm tube at temps. from 550° to 800°C, and on the yields of NO for various temps. and distances between the 2 or 3 Pt screens used. The catalytic oxidation of ammonia was an hetero-homogeneous reaction.

10320. ZENGHELIS, C. AND STATHIS, E. **Oxidation of carbon monoxide in the presence of colloidal rhodium.** *Praktika Akad. Athenon* (Athens) **16**, 10-16 (1941).—*C.A.* **46**, 5398*a*.

Colloidal Rh was found to be considerably more active an absorbent of CO than were other Pt-group metals.

10321. BALANDIN, A. A. **Kinetics of catalytic unimolecular reactions in a flow system, taking into consideration the displacement of molecules by foreign substances.** *J. Gen. Chem.* (U.S.S.R.) **12**, 153-9 (1942).—*C.A.* **37**, 2645[2].

The general kinetic equation for the stationary process was derived and solved; several approximations were discussed. Equations were given for cases of dehydrogenation of alcs. and catalytic isomerization.

10322. BALANDIN, A. A. **Selectivity of action of nickel catalyst and the energy of chemical linkages.** *J. Gen. Chem.* (U.S.S.R.) **12**, 337-41 (1942) (English summary, 342).—*C.A.* **37**,2982[3].

Modern data on bond energies were used in calculations, based on the multiple theory, of the choice by the molecule of an organic substance of a particular direction of reaction in dehydrogenation, desulfurization, dehydration, disproportionation, dimerization, and other reactions under the influence of Ni catalyst. The calculated order of reactions agreed satisfactorily with experimental data.

10323. BALANDIN, A. A. **Preferential reaction paths in contact catalysis.** *Acta Physicochim. U.R.S.S.* **17**, 73-81 (1942).—*C.A.* **37**, 6531[1].

New data for bond energies were used to check the preferential direction of several reactions such as dehydrogenation, dehydration and reduction on Ni with those calcd. on the basis of the multiplet theory. The agreement was very good.

10324. BALANDIN, A. A. AND KOTELKOV, N. Z. **Dehydrogenation and decomposition of cyclohexane at high temperatures over metallic cata-**

lysts. *J. Applied Chem.* (U.S.S.R.) 15, 139-50 (1942).—*C.A.* 37, 2253^7.

The dehydrogenation and decompn. of cyclohexane was studied at 300-600°C over electrically heated spirals of platinized nichrome, palladized nichrome, nichrome, chromed Fe and Fe. A dendrite hypothesis of carbon deposition, based on the multiplet theory of catalysis, offered a satisfactory explanation.

10325. Balandin, A. A., and Kotelkov, N. Z. **Catalysis of dehydrogenation and decomposition of cyclohexane and the dendrite hypothesis of deposition of C.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* **1942,** 230-1.—*C.A.* **39,** 1588^1.

Cyclohexane was passed over Pt, Pd and Ni catalysts at 300-600°C. On platinized nichrome, cyclohexane was only dehydrogenated to 400°C; at 500°C complete decompn. to carbon, H_2 and CH_4 occurred. Pd-nichrome caused some dehydrogenation at 400°C, but nichrome alone was weakly active at 400°C. Fe was not active to 500°C. Deposition of carbon to a certain extent failed to diminish the dehydrogenation reaction.

10326. Berk, Bernard and Brown, Oliver W. **Catalytic activity of intermetallic compounds in the vapor-phase reduction of nitrobenzene. II.** *J. Phys. Chem.* 46, 964-8 (1942).—*C.A.* 37, 2982^2.

The vapor-phase reduction of nitrobenzene was studied using metallic catalysts of the composition indicated by the formulas Cu_2Zn_3, Cu_3Sn, and Cu_3Sb. The Cu-Zn catalyst exhibited the same general properties as pure Cu. The Cu-Sn catalyst appeared to exhibit properties of both Cu and Sn. The Cu-Sb catalyst showed maximum activity at 345°C compared with 250°-260°C for Cu and 320°C for Sb. The maximum aniline yields were in the range 92 to 99%.

10327. Bobtelsky, M. and Simchen, A. E. **Catalysts for peroxide decomposition.** *J. Am. Chem. Soc.* 64, 2492-8 (1942).—*C.A.* 36, 6882^7.

The green cobaltocitrate complex was an extremely active catalyst (the most active of all the complex citrates) for the decompn. of H_2O_2, but it could not decompose lead or manganese dioxides. During all these operations the citrates were not attacked at all, while corresponding reactions with tartrates lead to attack of the tartrate ion.

10328. Brown, Henry T. and Frazer, J. C. W. **Mixed heteropoly and catalysts for the vapor phase air oxidation of naphthalene.** *J. Am. Chem. Soc.* 64, 2917-20 (1942).

A series of catalysts were prepared from heteropoly-acid crystals containing W and Mo. The activities of these catalysts were studied for the partial oxidation of naphthalene. The catalyst from $H_4SiMo_9W_3O_{40}$ gave considerably higher conversion to phthalic anhydride than either of the parent acids, $H_4SiMo_{12}O_{40}$ or $H_4SiW_{12}O_{40}$. The addition of CO_2 to this air oxidation reaction improved the yield of phthalic and decreased the yield of maleic anhydride. The catalyst from $H_4SiMo_9W_3O_{40}$ was employed in the oxidation of phthalic anhydride, naphthoquinone-1,4 and CO.

10329. Chitani, Toshizo; Nakata, Shigeo, and Kanome, Akira. **Catalytic oxidation of carbon monoxide by heavy oxygen on the surface of copper oxide.** *Bull. Chem. Soc. Japan* 17, 288-96 (1942).—*C.A.* 41, 4366*d*.

Catalytic oxidation of CO on the surface of CuO was studied, with heavy O as tracer. The reaction proved to be an alternate reduction and oxidation of CuO by CO and O. $2CuO + CO \rightarrow Cu_2O + CO_2$; $Cu_2O + 1/2\ O \rightarrow 2CuO$. If the temp. was raised to 400°C, the catalytic oxidation became complete, and the following reaction began: $CuO + CO_2 \rightleftharpoons CuCO_3$. In this case, the exchange of O isotopes reached only 40% when heated to 600°C. From the fact that above 550°C exchange reaction of O isotopes between CO and O_2 gas took place, the following reaction was concluded to start above 550°C: $2CuCO_3 \rightleftharpoons Cu_2O + 2CO_2 + 1/2\ O_2$.

10330. Cohen, B. **Catalytic decomposition of hydrogen peroxide by basic beryllium iodide hydrosols.** *J. Am. Chem. Soc.* 64, 1340-1 (1942).—*C.A.* 36, 4014^9.

In the decompn. of H_2O_2, the catalytic effect of the I^- ion sorbed by colloidal beryllium oxide was greater than that of the free I^-.

10331. Cohn, G. and Hedvall, J. A. **Influence of the transition from ferromagnetism to paramagnetism on catalytic activity.** *J. Phys. Chem.* 46, 841-7 (1942).

The catalytic activity of ferromagnetic substances was changed by the transition from ferromagnetism to paramagnetism. The activation energy of the decomposition of HCOOH at 130° to 180°C and an initial pressure of 25 mm by a Co-Pd alloy was increased by about 30% by the transition to the paramagnetic state of the catalyst. A state of higher electronic order in a catalyst might yield an energetically stronger catalytic action.

10332. Coleman, Howard S. and Yeagley, Henry L. **The method of thin films for the study of intermetallic diffusion and chemical reactions at metallic surfaces.** *Trans. Am. Soc. Metals*, Preprint No. 17, 17 pp (1942).—*C.A.* 36, 6858^2.

Intermetallic diffusion rates of Au into Pb and Cu into Zn were studied by depositing one metal and then another from the vapor phase on a microscope slide, and observing change in reflectivity at one surface with varying temp. The method was rapid and accurate and proved the applicability of Fick's law. Diffusion of gases could be studied at sub-zero temps.

10333. Cozzi, D. **The mechanism of the catalytic action of the oxides of vanadium on the conversion of alcohols.** *Chimica e industria* (Italy) 24, 351-4 (1942).—*C.A.* 38, 4499^8.

EtOH was oxidized at 300°-50°C with 150-200 ml air-alc. vapor/min/3 ml catalyst. At 300°C and O_2/EtOH ratio of 0.6, the conversion was 48%, the selectivity of the aldehyde formation 94%. With increasing O_2/EtOH ratio the conversion increased, the aldehyde selectivity decreased; at 350°C the conversion was 63% for a ratio of 1.6;

66.4% aldehyde and 16% acid were formed. No oxidation took place below 200°C; the product was colored with ethyl orthovanadate. Ester formation was the intermediary step in the catalytic action of vanadic anhydride.

10334. Eĭdus, Ya. T. and Zelinskiĭ, N. D. **The reaction of carbon monoxide with cobalt catalysts used in the synthesis of gasoline from water gas.** *Bull, acad. sci. U.R.S.S., Classe sci. chim.* **1942**, 45-54 (English summary).—*C.A.* **37**, 2909^7.

When CO was passed over a mixt. of 100 parts Co, 18 parts ThO_2 and 100 parts kieselguhr at 192-272°C, two reactions occurred forming resp. Co_2C and carbon. At 192-212°C, carbide formation predominated, but as the temp. rose. more free carbon was formed. Poisoning of the catalyst with SO_2 also reduced Co_2C formation. Reduction of Co_2C by H_2 went faster and at a lower temp. on this catalyst than on pure Co.

10335. Eĭdus, Ya. T. and Zelinskiĭ, N. D. **Carbide formation as an intermediate stage in the catalytic synthesis of hydrocarbons from water gas.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* **1942**, 190-4 (English summary).—*C.A.* **39**, 2391^6.

The Co carbide formed by the action of CO on the Co-ThO_2-kieselguhr catalyst was neither an intermediate product nor a catalyst of the synthesis of gasoline from CO and H_2. Intermediate formation of methylene radicals during this synthesis was confirmed.

10336. Farkas, A. and Farkas, L. **The mechanism of the catalytic conversion of parahydrogen on nickel, platinum and palladium.** *J. Am. Chem. Soc.* **64**, 1594-9 (1942).—*C.A.* **36**, 5414^9.

The catalytic conversion of *para*-H_2 was investigated at room temp. and a pressure of about 0.01 mm on evapd. layers of Ni, Pd and Pt. There was a stable layer of H_2 on the catalysts which was not removed by pumping at room temp. and exchanged readily with mol. H_2 or D_2. The amt. of exchangeable H_2 in the stable layer was taken as an indication of the no. of active centers on the catalyst. This no. was 10^{14} to $10^{15}/cm^2$.

10337. Fricke, R. and Weitbrecht, G. **Active substances. LI. The equilibria of CO/CO_2 with Ni/NiO, and with (NI + γ-Al_2O_3)/$NiAl_2O_4$, and their dependence on the physical state of the solid reactants.** *Z. Elektrochem.* **48**, 87-106 (1942).—*C.A.* **37**, 559^9.

Equil. was approached from both sides and at different temps.; the effect of thermal diffusion were taken into account. The equil. const. of the system Ni/NiO, CO/CO_2 was: $\log K_p = (2348.16/T) - 0.0264$. Evaluation of the surface energy of the very small particles led to the conclusion that the equil. measured for the system (Ni + γ-Al_2O_3)/$NiAl_2O_4$ were very strongly modified by the relative total surfaces.

10338. Fricke, R. and Weitbrecht, G. **The Boudouard reaction in the system Ni/NiO and (Ni + γ-Al_2O_3)$NiAl_2O_4$.** *Z. Elektrochem.* **48**, 106-10 (1942).—*C.A.* **37**, 560^4.

The equil. between Ni/NiO and CO/CO_2 could be falsified to a considerable extent by small amts. of carbon dissolved within the nickel. By establishing the equil. between (Ni + γ-Al_2O_3)/$NiAl_2O_4$ and CO/CO_2 from the side of reduction, the correct equil. were found under the same conditions.

10339. Frost, A. V. **Catalytic action of activated silica-alumina. Action of activated clay on normal octyl alcohol and cyclohexanone.** *Compt. rend. acad. sci. U.R.S.S.* **37**, 223-5 (1942).—*C.A.* **37**, 5306^8.

Octyl alc. and cyclohexanone were refluxed with activated clay, and the distillate and residue were measured. Dehydrogenation of the carbonyl group of the ketone took place and was accompanied by polymerization and dehydrogenation. Because of the latter, satd. naphthenic hydrocarbons were formed.

10340. Gonikberg, M. G. **Method of determination of heat effects of catalytic reactions.** *Bull. acad. sci. U.R.S.S., Classe sci. tech.* **1942**, No. 1-2, 105-7.—*C.A.* **38**, 4183^8.

Changes of temp. were detd. at various points in the catalyst mass in definite periods of time. This was used as a basis for calcn. or graphical estn. of av. catalyst temp. change in the absence of heat exchange with the surroundings.

10341. Grim, Reuben Joseph. **Catalytic activity of an intermetallic compound of cadium and copper in the vapor-phase reduction of nitrobenzene.** *J. Phys. Chem.* **46**, 464-9 (1942).—*C.A.* **36**, 5415^3.

The intermetallic compd. Cd_3Cu_2 was shown to have appreciable catalytic power in the vapor-phase reduction of $PhNO_2$ to $PhNH_2$.

10342. Gwathmey, Allan T. and Benton, Arthur F. **The reaction of gases on the surface of a single crystal of copper. I. Oxygen.** *J. Phys. Chem.* **46**, 969-80 (1942).

A spherical surface of Cu was prepd. by electrolytic polishing followed by annealing in H_2 at 550°C. The relative rates of oxidation in air at 200°C and atmospheric pressure were detd. for various crystallographic faces. The (100) and (210) regions showed the greatest rates and the (311) region the least.

10343. Hamai, Senzo; Hayashi, Shiro, and Shimamura, Kiyoshi. **Physicochemical investigations on catalytic mechanisms. III. Desorption of various gases from the catalyst used in the Fischer-Tropsch synthesis.** *J. Soc. Chem. Ind. Japan* **45**, 313-18 (1942).—*C.A.* **43**, 2401*h*.

A Co catalyst with certain promoters was heated to 190°-200°C and satd. with one of the following: H_2, CO, or N_2. Another one of the 3 gases was then passed over the catalyst, and the velocity of desorption of the original gas was measured by analysis of the exhaust gas. H_2 was more quickly desorbed than CO. A comparison of the desorption of CO by H_2 and of H_2 by CO indicated that CH_4 formation predominated when there was an excess of H_2.

10344. Hamai, Senzo; Hayashi, Shiro; Shimamura, Kiyoshi, and Igarashi, Hiroshi. **Physicochemical investigations of catalytic mechanisms. IV. The Fischer-Tropsch synthesis of hydrocarbons. (Experimental series I.)** *Bull. Chem. Soc. Japan* 17, 166-71 (1942).—*C.A.* 41, 4366*h*.

The reaction vessel of Terex glass was made double-walled, so that the gas mixt. ($CO + 2H_2$) led in could be heated before entering the catalyst zone. The catalyst used was made of Co, CeO_2, ThO_2, B_2O_3, and diatomaceous earth. The reaction was run at 200°C at the rate of flow 4 liters/hr. The reaction products were collected in two traps, condensed by water and solid CO_2-C_2H_5OH mixt., resp. The gas contraction and oil yield were not parallel unless the reaction was normalized. In the initial stage CH_4 formation predominated, cutting down the oil formation, but as time proceeded side reactions other than oil formation were inhibited.

10345. Hamai, Senzo; Hayashi, Shiro, and Shimamura, Kiyoshi. **Physicochemical investigations of catalytic mechanisms. V. Fischer-Tropsch synthesis of hydrocarbons.** *Bull. Chem. Soc. Japan* 17, 252-9 (1942).—*C.A.* 41, 4367*a*.

Co with kieselguhr was used as catalyst with various amounts of ThO_2, CeO_2, and Cu promoters; gas contraction and oil formation from CO and H_2 were detd. The gas contraction was higher for 15-10% CeO_2 and for 20-30% ThO_2. When CeO_2 percentage was low, the addn. of ThO_2 lowered the activity; if CeO_2 was high, the addn. of ThO_2 did not improve the gas contraction. CeO_2 gave a relatively high yield of oil and low yield of CH_4, whereas ThO_2 gave a relatively high yield of CH_4 and low yield of oil.

10346. Hamai, Senzo. **Physicochemical investigations of catalytic mechanisms. VII. Durability and pretreatment of the catalyst used for the Fischer-Tropsch synthesis of hydrocarbons.** *J. Chem. Soc. Japan* 63, 1606-15 (1942).—*C.A.* 41, 3273*h*.

The catalyst used in the Fischer-Tropsch synthesis of hydrocarbons could be revivified by reducing with H_2.

10347. Hamai, Senzo; Hayashi, Shiro, and Shimamura, Kiyoshi. **Physicochemical investigations of catalytic mechanisms. VIII. Fischer-Tropsch synthesis of hydrocarbons with special reference to the durability of catalyst.** *Bull. Chem. Soc. Japan* 17, 451-61 (1942).—*C.A.* 41, 4367*c*.

The reaction $CH_2 \to C_2H_4$ was faster than $CH_2 \to CH_4$. In the normalized reaction $CH_2 \to C_2H_4$ predominated under various conditions of stage of reaction, temp., etc., whereas $CH_2 \to CH_4$ predominated at the initial stage and as the reaction became normalized. $CH_2 \to CH_4$ must be prohibited when the reaction mixt. $CO + H_2 = (1{:}2)$, was passed through the catalysts, Co + 15%, ThO_2 + 100% kieselguhr or Co + 12% U_3O_8 + 2.8% Cu + 100% kieselguhr, each separately at 190°-250°C.

10348. Hamai, Senzo; Hayashi, Shiro, and Shimamura, Kiyoshi. **Physicochemical investigations of catalytic mechanisms. IX. Fischer-Tropsch synthesis of hydrocarbons with special reference to factors essential to the particular catalysts.** *Bull. Chem. Soc. Japan* 17, 463-77 (1942).—*C.A.* 41, 4367*d*.

The factors studied were: the compn. of the catalysts (Co, U_3O_8, Cu, Mn, and kieselguhr), preactivation temp., and reaction mixt. $CO + H_2$. The presence of kieselguhr contributed to oil formation, but not CH_4 formation. Generally higher temp. promoted the formation of gaseous products, such as CH_4 and CO_2, and a very small amt. of oil.

10349. Hedvall, J. A. and Ahlgren, G. A. **Activation of catalysts by electric waves.** *Kolloid-Z.* 100, 137-40 (1942).—*C.A.* 38, 1678^9.

Electrolytic Ni in the form of Fe-free filings (0.3-0.6 mm long), packed in a spiral tube 22 cm long and of 5 mm bore, was used as catalyst in the decompn. of N_2O at 304°C. When the tube was exposed to waves from a 4-watt radio-transmitter or from a large induction coil the decompn. was increased by 14-38% This behavior was related to that of the "coherer" formerly used for detecting electromagnetic waves, the action of the waves being to modify the surface of the metal particles so that they became conducting.

10350. Herbo, Cl. **Research on the mechanism of catalytic reactions. II. Kinetic studies on the dehydrogenation of cylohexane.** *Bull. soc. chim. Belg.* 51, 44-62 (1942).—*C.A.* 37, 5307^1.

An equation was derived for the reaction velocity for the dehydration of cyclohexane to benzene on a Ni-BeO catalyst. It was postulated that the adsorption of the hydrocarbons on the catalyst was independent of that of H_2. Accordingly, different active centers were active. The true activation energy of the dehydration and the heat of adsorption were calcd.

10351. Herfurth, O. **Possible applications for silica gel in practical operations.** *Zellwolle, Kunstseide, Seide* 47, 67-72 (1942).—*C.A.* 37, 4536^4.

Among the possible applications discussed were the use of silica gel as a catalyst carrier, the recovery of solvents, drying air and gases, and an ingredient in salves and pastes.

10352. James, T. H. **Variation of reaction mechanism with surface conditions in the reduction of silver salts by hydroxylamine.** *J. Chem. Phys.* 10, 464-8 (1942).—*C.A.* 36, 5413^5.

AgBe oxidized $HONH_2$ at pH 10.2-10.8 to N_2 and H_2O. Under comparable conditions AgCNS yielded a mixt. of N_2 and N_2O as the gaseous products. By varying the surface conditions of the thiocyanate, the compn. of the reaction product could be varied over a wide range. Small addns. of bromide or iodide greatly influenced the N_2O yield.

10353. Kanome, Akira and Chitani, Toshizo. **Catalytic oxidation of carbon monoxide with heavy oxygen on the surface of copper oxide. I.** *J. Chem. Soc. Japan* 63, 36-40 (1942).—*C.A.* 41, 2974*f*.

The contact oxidation of CO in the presence of the catalyst CuO was studied by means of heavy O. It was found that: (1) the contact oxidation took place vigorously above 150°C and the oxidation was complete above 400°C, (2) above 400°C the reaction $CuO + CO_2 \rightleftharpoons CuCO_3$ began, and (3) above 550°C, the two reactions started: $2CuCO_3 \rightarrow Cu_2O + 2CO_2 + 1/2\ O_2$ and $Cu_2O + 1/2\ O_2 \rightarrow 2CuO$.

10354. Kawamoto, Tokio. **Dehydrogenation.** *J. Chem. Soc. Japan* **63**, 45-54 (1942).—*C.A.* **41**, 2975*f*.
The catalytic reaction of isobornylaniline and methylamine was studied in the presence of Ni chromite. The best Ni-Cr catalyst was prepd. as follows: 18.6 g $(NH_4)_2CrO_4$, 17.4 g $Ni(NO_3)_2$, and 300 ml of water were mixed. By keeping the mixt. at 30°C, the complex salt was pptd. The calcining of the ppt. at 400°C gave the best results.

10355. Kobayashi, Kyukei and Ishikawa, Heishichi. **Catalytic cracking and contact refining of low-temperature tar with Japanese acid clay. I.** *J. Soc. Chem. Ind. Japan* **45**, 1171-4 (1942).—*C.A.* **43**, 7667*h*.
To utilize low-temp. tar effectively it was distd. with the addn. of Japanese acid earth. The effect on various constituents in the tar was investigated.

10356. Kobayashi, Kyuhei; Ishikawa, Heishichi, and Isoda, Tadao. **Hydrochloric acid produced from common salts by catalytic decomposition with acid clay and colloid earth.** *Waseda Applied Chem. Soc. Bull.* **18**, 133-9 (1942).—*C.A.* **44**, 7029*d*.
NaCl mixed with acid clay and heated in a silica tube at 700°-800°C, through which steam was passed at space velocity 500, was decompd. 63% to 0.97 (initially 3.22) *N* HCl. Similarly, with colloid earth 44% was decompd. to 1.51 (initially 4.03) *N* HCl. As tested, the HCl was pure except for admixt. of SO_2. The method was industrially feasible.

10357. Kodama, Shinjiro; Tahara, Hidekazu; Fukushima, Iwao; Iwao, Masamichi; Komazawa, Seido, and Kimure, Katsue. **Hydrocarbon synthesis from carbon monoxide and hydrogen under medium pressure. II. Characteristics of hydrocarbon synthesis under medium pressure with an iron catalyst. Durability of the catalyst.** *J. Soc. Chem. Ind. Japan* **45**, 1263-71 (1942).—*C.A.* **43**, 2397*e*.
Petroleum synthesis was carried out at 230-60°C under a pressure of 10 kg/cm^2 with an equimol. mixt. of CO and H_2; 40 ml of Fe catalyst (Fe:Cu:Mn:kieselguhr: H_3BO_3: K_2CO_3 = 100:25:2:125:20:7) and a gas velocity of 6 m^3 at standard conditions per hr were used continuously for 180 days to det. the durability of the catalyst. The durability of the catalyst was very great even at higher reaction temps., and Fe catalysts presumably had greater durability than Co catalysts under high pressure. The production of CH_4 did not increase even when the activity of catalyst was increased by raising the temp.

10358. Kodama, Shinjiro; Tahara, Hidekazu; Fukushima, Iwao; Iwao, Masamichi; Komazawa, Seido, and Kimure, Katsue. **Hydrocarbon synthesis from carbon monoxide and hydrogen under medium pressure. III. Effect of adding alkali and changes in the reaction temperature on the activity of Fe-Cu-Mn-H_3BO_3 catalysts. IV. Effect of changing alkali, boric acid, and kieselguhr contents on the activity of iron catalysts.** *J. Soc. Chem. Ind. Japan* **45**, 1263-71 (1942).—*C.A.* **43**, 2397*h*.
Catalysts with 7 to 20 parts K_2CO_3 and other components were compared in medium pressure petroleum synthesis to det. the optimum compn. The catalyst contg. 7 to 10 parts K_2CO_3 gave the best yield of oil. The best reaction temp. was found to be 230-50°C. The addn. of H_3BO_3 lowered the activity of Fe catalyst. The optimum amt. of alkali was 4-5 parts when no H_3BO_3 was used. The optimum amts. of Cu and kieselguhr to be added were 25 parts and 50-125 parts, resp.

10359. Koidzumi, Masao. **Catalytic exchange reaction of hydrogen between two different hydrocarbons. I. The exchange reaction between heavy ethylene and propylene.** *J. Chem. Soc. Japan* **63**, 1516-21 (1942).—*C.A.* **41**, 2974*e*.
The exchange reaction took place between heavy ethylene and propylene in the presence of Ni catalyst. The degree of exchange was slight; after more than 10 days at room temp. two H atoms in a propylene mol. took part in the exchange reaction.

10360. Komatsu, Shigeru and Kuraku, Hideshi. **Catalytic action of nickel-magnesium on the reaction between methane and steam.** *J. Chem. Soc. Japan* **63**, 1551-4 (1942).—*C.A.* **41**, 3267*b*.
About 91-95% CH_4 was decompd. by steam at 650-700°C in the presence of Ni-Mg catalyst. The best catalyst was prepd. as follows: $Ni(NO_3)_2$ and $Mg(NO_3)_2$ were dissolved in water (Ni:Mg = 9:1). The soln. was absorbed by granules of pumice stone which were then calcined at 400°C and reduced by H_2.

10361. Kuraku, Hideshi. **Dehydrogenation of methane. I.** *J. Chem. Soc. Japan* **63**, 1147-50 (1942).—*C.A.* **41**, 3353*d*.
The catalytic activity of chromites on the dehydration of CH_4 by steam was studied. The chromites were prepd. from NH_4-chromite hydrates. The order of the catalytic activity was: $Ni(CrO_2)_2 > Fe(CrO_2)_2 > Mg(CrO_2)_2$, $Zn(CrO_2)_2$.

10362. Kuraku, Hideshi. **Dehydrogenation of methane. II. The reaction of methane with carbon dioxide.** *J. Chem. Soc. Japan* **63**, 1512-15 (1942).—*C.A.* **41**, 2974*d*.
The dehydrogenation of CH_4 with CO_2 in the presence of Fe chromite catalyst was studied. The catalyst was prepd. by calcining $(NH_4)_2CrO_4.(FeCrO_4)_3.H_2O$ at 300°C.

10363. Kuraku, Hideshi. **Dehydrogenation of methane. III. Catalytic action of iron chromite in the reaction between coal gas and steam or carbon dioxide.** *J. Chem. Soc. Japan* **63**, 1755-8 (1942).—*C.A.* **41**, 3353*e*.
Iron chromite catalyst showed good catalytic activity in the dehydrogenation of CH_4 in coal gas by CO_2; the rate was 50 to 86% at 800-900°C. The decompn. rate by steam was 62 to 94% at 800-900°C. The coal gas contained 0.2 g S per 100 m^3.

10364. Lo, Chien-Pen and Chu, Lucy Ju-Yung. **Catalytic dehydration of castor oil by normal sulfates and alums.** *J. Chem. Eng. China* **9**, 1-5 (1942).—*C.A.* **40**, 2587^7.
Castor oil (25 g) was treated with 4% of catalyst at 240-50°C for 30 min. and the I_2 no. detd.;

23 catalysts, i.e., normal sulfates, and alums were tested. The greatest increase in unsatn. was given by the following catalysts yielding in each case products with the I_2 nos. indicated: $CuSO_4$, 145.2; $Cu(NH_3)_4SO_4$, 128.8; $Fe(NH_4)_2(SO_4)_2$, 117.0; $Fe(NH_4)(SO_4)_2$, 114.7; $(NH_4)_2SO_4$, 114.6.

10365. Love, Katherine S. and Brunauer, Stephen. **The effect of alkali-promoter concentration on the decomposition of ammonia over doubly promoted iron catalysts.** *J. Am. Chem. Soc.* 64, 745-51 (1942).—*C.A.* 36, 3094^4.

A series of doubly-promoted catalysts were prepd. by treating an Al_2O_3-promoted catalyst with KOH solns. of varying strengths in order to find the optimum alkali-promoter concn. for Fe synthetic NH_3 catalysts. The total surface areas and the surface concns. of the promoters were detd. for each catalyst by adsorption measurements and the effects of temp. and gas compn. on the kinetics of NH_3 decompn. were investigated. The most active catalyst toward NH_3 decompn. was obtained when about 30% of the catalyst surface was covered by the alkali promoter.

10366. Luyten, L. and Vlieghere, R. de. **Activated adsorption and catalytic dehydration on chromic oxide.** *Natuurw. Tijdschr.* 24, 79-91 (1942).—*C.A.* 37, 5307^3.

The reduction of the catalyst, its adsorptive power for H_2, and its effectiveness in the dehydrogenation of cyclohexane and in the cyclization of heptane were studied with catalyst mixts. in various proportions of Cr_2O_3 with Al_2O_3, ZnO and ThO_2. The amt. of H_2 required for the reduction was not proportional to the amt. of Cr_2O_3; it was notably higher for the mixts. For the mixts. Cr_2O_3-ZnO and Cr_2O_3-ThO_2 the quantity of H_2 adsorbed attained a max. at each of the ratios 4:1 and 1:4 in the mixts., but for Cr_2O_3-Al_2O_3 there was only one max., at the ratio 4:1.

10367. Mikhnovskaya, A. A. and Frost, A. V. **Catalytic action of activated silica-alumina. Influence of treatment with activated clay upon unsaturated compounds contained in cracked gasoline.** *Compt. rend. acad. sci. U.R.S.S.* 37, 221-2 (1942).—*C.A.* 37, 5575^5.

The 90-122°C fraction of cracked gasoline was passed over the catalyst at 260°C at a rate of 0.25 ml of liquid per 1 ml of apparent catalyst volume per hr. Analysis showed the formation of satd. compds. from hydrogenation.

10368. Murata, Yoshio; Tatsuki, Yutaka; Yamada, Hiloemon, and Sawada, Yasuhisa. **The synthesis of gasoline from carbon monoxide and hydrogen. LVII. Effect of some added substances on iron-copper catalysts.** *J. Soc. Chem. Ind. Japan* 45, 557-60 (1942).—*C.A.* 43, 2399*g*.

With Fe catalysts the results were: (1) $K_2C_2O_4$, HCOOK, KOH, K_2CO_3, and KNO_3 accelerated the action, and the optimum amt. was about 1.5% as K; (2) Org. acids were injurious; (3) $Cr(NO_3)_3$, CrF_3, $Cr_2(CO_3)_3$, and $Cr(OAc)_3$ were injurious to the catalyst, but Cr_2O_3 was not; (4) $Zn(NO_3)_2$, ZnO, $Zn_3(PO_4)_2$, $Zn(OAc)_2$, and Zn stearate were injurious, but $Zn(OH)_2$ was not.

10369. Murata, Yoshio; Sawada, Yasuhisa, and Takezaki, Yoshizane. **The synthesis of gasoline from carbon monoxide and hydrogen. LVIII. Mutual influence of boric acid and alkali in promoting activities of iron-copper catalysts.** *J. Soc. Chem. Ind. Japan* 45, 670-5 (1942).—*C.A.* 43, 2399*h*.

The mutual influence of diatomaceous earth, H_3BO_3, and alkali on Fe-Cu catalysts was investigated. The activating action of H_3BO_3 was very weak for Fe catalysts with no alkali; it increased with the addn. of alkali. H_3BO_3 prevented the formation of high-mol. hydrocarbons, such as solid paraffins, and promoted the formation of satd. hydrocarbons. With increases in the amt. of H_3BO_3 added, the durability of the catalyst increased.

10370. Murata, Yoshio and Yasuda, Masao. **The synthesis of gasoline from carbon monoxide and hydrogen. LIX. Activation of iron-copper catalysts by boron.** *J. Soc. Chem. Ind. Japan* 45, 675-7 (1942).—*C.A.* 43, 2400*a*.

Various B compds. were added to Fe catalyst, and their influence was studied. Mn and Mg borates had the same action as H_3BO_3. The addn. of B compds. was effective even by mech. mixing, while alkali had no effect by the same treatment.

10371. Murata, Yoshio; Yashiro, Ryuichi, and Tashiro, Eiichi. **The synthesis of gasoline from carbon monoxide and hydrogen. LX. Effect of copper on iron catalysts.** *J. Chem. Soc. Ind. Japan* 45, 1117-21 (1942).—*C.A.* 43, 2400*a*.

Cu had excellent accelerating action on the activity of Fe catalyst, and the optimum amt. of Cu was different for catalysts of different compns. When H_3BO_3 and alkali were added, the optimum amt. of Cu was about 10%. Cu had no effect on the durability of Fe catalysts. The effect of alkali on the Fe catalyst was not affected by the amt. of Cu present.

10372. Murata, Yoshio; Yoshioka, Yasuo; Oji, Genichi, and Saito, Shigeru. **The synthesis of gasoline from carbon monoxide and hydrogen. LXI. Reaction temperature and durability of iron catalysts.** *J. Soc. Chem. Ind. Japan* 45, 1271-86 (1942).—*C.A.* 43, 2400*c*.

The durability of Fe catalysts was studied on the compn. $Fe:Cu:Mn:kieselguhr:H_3BO_3:K_2CO_3 = 100:25:2:125:x:y$, where $x = 0$ or 20 and $y = 1, 2, 3$ or 4 in powd. form, and $x = 20$ and $y = 4$ in tablet form, used in the Fischer synthesis with a gas mixt. $(CO:H = 1:1)$ at 200-70°C. The durability of Fe catalysts active at 230-60°C, could be greatly increased by choosing a lower reaction temp. The optimum reaction temp. was lowered more when the catalyst was in the form of tablets compared to powd. form.

10373. Murata, Yoshio; Yoshioka, Yasuo; Oji, Genichi, and Saito, Shigeru. **The synthesis of gasoline from carbon monoxide and hydrogen. LXII. Durability of iron catalyst and the composition of gas used in the synthesis.** *J. Soc. Chem. Ind. Japan* 45, 1271-86 (1942).—*C.A.* 43, 2400*e*.

The Fischer synthesis was carried out with catalysts similar in compn. with gas mixts. of compn. CO:H_2 = 1:2, 1:3, and 1:5. With increase in H_2 the most suitable reaction temp. was lowered, and the durability of Fe catalyst was remarkably increased. Thus with a mixt. of CO:H = 1:2 or 1:3 the same catalyst can be used continuously for about 1 month at a suitably fixed reaction temp. The property of H_3CO_3 in promoting the catalytic activity decreased with increases in H_2.

10374. Murata, Yoshio; Yoshioka, Yasuo; Oji, Genichi, and Saito, Shigeru. **The synthesis of gasoline from carbon monoxide and hydrogen. LXIII. Iron catalysts and the composition of gas used in the synthesis.** *J. Soc. Chem. Ind. Japan* 45, 1271-86 (1942).—*C.A.* 43, 2400*g*.

The Fischer synthesis was carried out with a gas mixt. of compn. CO:H_2 = 2:1 with an Fe catalyst of high activity contg. H_3BO_3. The yield of oil was much smaller with gas of compn. CO:H_2 = 2:1 than with compn. 1:1. The durability of the catalyst was also reduced.

10375. Nakata, Shigeo. **Catalytic oxidation of carbon monoxide with heavy oxygen on the surface of copper oxide. II,** *J. Chem. Soc. Japan* 63, 41-4 (1942).—*C.A.* 41, 2974*g*.

The contact oxidation of CO at the surface of CuO was studied by means of heavy oxygen at 120°-300°C. With the progress of the reaction, the O in CuO was gradually replaced by heavy O. Similarly, if the reaction between CO and O took place at 120-130°C on the surface of Cu oxide prepd. by using heavy O, the heavy O in the Cu oxide was gradually replaced by ordinary O.

10376. Nozaki, Kenzie. **The catalytic interchange of groups in aliphatic amines. I.** *J. Am. Chem. Soc.* 64, 2920-3 (1942).

When aliphatic amines were heated with metal halide catalysts, the groups attached to the nitrogen were redistributed. This redistribution reaction was studied with respect to the catalytic activity of several substances and the order of the reaction with respect to catalyst concentration.

10377. Ogawa, Eijior and Murata, Kenzo. **Catalytic action of nickel-iron-cobalt wire under tension on the reaction between ethylene and hydrogen.** *J. Soc. Chem. Ind. Japan* 45, Suppl. binding, 386-7 (1942).—*C.A.* 44, 7636*i*.

The activation energy of the $H_2 + C_2H_4$ reaction was raised from 16,400 to 17,800 cal by placing under tension Ni-Fe-Co alloy wire used as a catalyst. The difference was caused by the orientation of the magnetic axis of each magnetic domain from its random distribution.

10378. Ota, Nobuhito. **Preparation of hydrogen and carbon monoxide from methane and carbon dioxide. I. Catalyst. II. Prevention of carbon as a by-product.** *Rept. Tokyo Ind. Testing Lab.* 37, 59-76; 77-93 (1942).—*C.A.* 43, 4445*g*.

10379. Ota, Nobuto. **Water gas by the reaction of methane and carbon dioxide. I. Catalysts.** *J. Soc. Chem. Ind. Japan* 45, 284-90 (1942).—*C.A.* 43, 1944*f*.

An equiv. mixt. of CH_4 and CO_2 under atm. pressure was passed through a layer of catalyst at 700°-800°C to obtain CO and H_2. Catalysts composed of Ni and various oxides and carriers in different ratio were used, and among those tried one contg. Ni, MgO, and kieselguhr in the ratio 1:1:4 gave the best yield of CO + H_2 at 700°C with the least formation of carbon on the catalyst.

10380. Ri, Ki Chin. **Ferric oxide catalyst. I. Activation energy of water gas reaction with various catalysts.** *J. Soc. Chem. Ind. Japan* 45, 35-9 (1942).—*C.A.* 43, 1945*f*.

The reaction $CO + H_2O = CO_2 + H_2$ was studied at 400°, 450°, and 500°C in a chamber contg. Fe_2O_3 (or Fe_2O_3 and Cr_2O_3) prepd. in various ways in the form of small cylindrical pills, and the progress of the reaction with time was detd. by analyzing the reacting mixt. The velocity const. k calcd. from the results by the formula of the bimol. reaction was fairly const. for each temp. The catalyst Fe_2O_3 contg. 7 mol. % of Cr_2O_3 was the most powerful.

10381. Ri, Ki Chin. **Ferric oxide catalyst. II. Effect of a small quantity of hydrogen sulfide on the water gas reaction.** *J. Soc. Chem. Ind. Japan* 45, 35-9 (1942).—*C.A.* 43, 1945*g*.

When a small amt. of H_2S was added to the reaction mixt., the reaction velocity decreased and stayed at a definite value. However, when a pure gas mixt. was led through the catalytic chamber, the reactivity gradually returned to the original value.

10382. Sakai, Wataru; Hukuyama, Hiroto, and Okuno, Toshiro. **Catalytic powers of manganese oxides. I. Composition and thermal decomposition of manganese oxides.** *J. Soc. Chem. Ind. Japan* 45, 25-33 (1942).—*C.A.* 43, 1623*f*.

Several different samples of Mn oxides were prepd. from $Mn(NO_3)_2$, $MnSO_4$, $KMnO_4$, etc., and the content of available O of each sample was analytically detd. The MnO_2 and Mn_2O_3 contained in the original sample were calcd. from the sharp breaks in the decompn. curve at 500-80°C and 970-1070°C, which corresponded to the change of MnO_2 → and Mn_2O_3 and $Mn_2O_3 \rightarrow Mn_3O_4$, resp.

10383. Sakai, Wataru; Hukuyama, Hiroto, and Okuno, Toshiro. **Catalytic powers of manganese oxides. II. Adsorption equilibrium of carbon dioxide by manganese oxides.** *J. Soc. Chem. Ind. Japan* 45, 25-33 (1942).—*C.A.* 43, 1623*h*.

Preliminary to the investigation of the catalytic power of Mn oxides in oxidizing CO to CO_2, their power of adsorbing CO_2 at 25° and 50°C was measured. The adsorption occurred in 2 stages, the primary stage reaching satn. almost instantaneously, and the secondary stage taking place gradually but to a very small extent, except for one sample. The results were satisfactorily represented by the adsorption formula $a = kp^{1/n}$, where k ranged 0.10-0.88 and 0.26-0.55 at 25° and 50°C, resp.

10384. Sakai, Wataru; Hukuyama, Hiroto, and Okuno, Toshiro. **Catalytic powers of manga-**

nese oxides. III. Adsorption velocity of carbon dioxide by manganese oxides. *J. Soc. Chem. Ind. Japan* **45**, 25-33 (1942).—*C.A.* 43, 1623*i*.

With the samples of Mn oxide that showed a measurable secondary adsorption velocity, that velocity was measured at 25° and 50°C. Activation energy was obtained from the change in the adsorption velocity with temp.

10385. Schwab, Georg-Maria and Drikos, Georg. **Kinetics of the catalytic combustion of carbon monoxide on copper oxide—absolute calculation of the catalytic reaction velocity.** *Z. physik. Chem.* **B52**, 234-52 (1942).—*C.A.* 37, 6186^1.

For pressures ranging from 0.3 to 150 mm the speed of the reaction from 300° to 430°C between CO and O_2 in the presence of CuO was proportional to the concn. of CO, and independent of the concns. of CO_2 and O_2. The apparent heat of activation was 18 kcal per mol. Hence, the step which detd. the rate of reaction was the reduction of CuO by CO. The surface was moderately rough and a heat of activation of the mols. of about 21 kcal. from 3 to 4 degrees of freedom of the oscillating system CO-CuO was concd. on the crit. linkages so that the transformation occurred.

10386. Suito, Eiji. **Thermal analysis of the catalytic action of colloids. IV. Hydrogen-, oxygen-, and nitrogen-platinum sols.** *Rev. phys. Chem. Japan* **16**, 1-16 (1942).—*C.A.* **44**, 10474*c*.

Sols were prepd. by dispersing Pt into water contg. H_2, O_2, and N_2, by the use of high-frequency a.c. Catalytic actions of these sols on the decompn. of H_2O_2 were observed. The decompn. of H_2O_2 proceeded as a first-order reaction, but in the earlier stage of the process the reaction rate decreased more rapidly than in the main part when H_2-Pt sol was used as the catalyst, but less rapidly when O_2-Pt or N_2-Pt sol was used.

10387. Tamamushi, Bun-ichi. **Kinetics of the rearrangement of cis-trans isomers in the gaseous state. III. The isomerization of dichloroethylene under the influence of glass-wall and metallic catalysts.** *Bull. Chem. Soc. Japan* **17**, 321-5 (1942).—*C.A.* **41**, 4364*d*.

The isomerization of *cis*-dichloroethylene into the trans compd. and the reverse reaction were studied. Neither reaction was affected by Pt gauze or silvered wall of the vessel. Both reactions were considered practically homogeneous. However, both reactions were catalyzed by Pt black. In this case, thermal decompn. took place simultaneously.

10388. Tamura, Mikio and Shida, Syoji. **Decomposition of methanol with zinc-chromium oxide catalyst.** *Rev. Phys. Chem. Japan* **16**, 68-82 (1942) (English summary).—*C.A.* 46, 4339*e*.

The decompn. of CH_3OH by a catalyst contg. 25 at. % Cr was studied by a static method for initial pressures of 70-80 mm at 270°-300°C. The course of the pressure could be accounted for by the consecutive 1st-order reaction, $CH_3OH \rightarrow CH_2O + H_2 \rightarrow CO + H_2 + H_2$. Side reactions could be neglected. The apparent heats of activation were 43 and 30 kcal, resp., for the decompn. of CH_3OH and CH_2O. Expts. on the addn. of H_2O vapor indicated the possibility of neglecting the intermediate formation of CH_2O.

10389. Ueno, Seiichi. **Influence of the conditions of precipitation on the activity of nickel catalysts. I. Precipitation with caustic soda.** *J. Soc. Chem. Ind. Japan* **45**, 650-2 (1942).—*C.A.* 43, 5211*b*.

When the amt. of NaOH was insufficient for complete pptn. of $Ni(OH)_2$, the catalyst obtained was less active than when prepd. from $Ni(OH)_2$ completely pptd. with an equiv. amt. of NaOH soln. The catalyst prepd. from $Ni(OH)_2$ pptd. with a slight excess of NaOH soln. was most active. Temp. of pptn. had no definite effect on the catalyst.

10390. Von Elbe, Guenther and Lewis, Bernard. **Mechanism of the thermal reaction between hydrogen and oxygen.** *J. Chem. Phys.* **10**, 366-93 (1942).—*C.A.* 36, 4397^8.

Explosion limits and reaction rates of H_2 and O_2 were detd. in spherical quartz and Pyrex vessels of varying diam., clean and coated with various substances (KCl, $BaCl_2$, $K_2B_2O_4$, $K_2B_4O_7$ and Na_2WO_4) and for various temps., pressures, and mixt. compns., including addn. of inert gases. Clean and B_2O_3-coated surfaces gave rise to rapid and erratic reaction. The reaction was self-accelerating, probably because of poisoning of the surface by H_2O.

10391. Abe, Shiro. **Research on alumina-gel catalyst. VI.** *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **40**, 331-2 (1943).—*C.A.* **41**, 6122*h*.

Colloidal $Al(OH)_3$ was pptd. in a soln. of agar-agar, glue or starch, and the mixt. was dried and coagulated. By peptizing the half-gelatinized gel of agar-agar, glue, etc., with a warm aq. soln. of weak acid, Al_2O_3 gel was made porous. This catalyst was very active for the dehydration of EtOH at 180°C.

10392. Balandin, A. A. **Spatial arrangement of atoms in contact catalysis and the dehydrogenation of hydrocarbons with open chains.** *Acta Physicochim. U.R.S.S.* **18**, 69-90 (1943) (in English).—*C.A.* 37, 6530^9.

The value of $(1/a) \times 10^{-3}$ in the equation $\ln k_0 = aQ + b$ (where Q was the activation energy of the Arrhenius equation) was nearly const. for various substances on a given catalyst. It was about 2.0 for metals and about 3 for oxide catalysts. The decompn. of butane at 570°C in contact with Cr_2O_3 for 1.5 sec. produced H_2 37.5, C_2H_4 2.4, C_2H_6 3.7, C_2H_4 0.3, C_3H_8 0.1, C_4H_8 29.0 and C_4H_{10} 26.8%. The max. yield of butadiene was 75%, obtained from 2-butene at 570°C in 0.3 sec.

10393. Balandin, A. A. and Kotelkov, N. Z. **Dendrite hypothesis of carbon deposition. Chemical behavior of cyclohexane when in contact with electrically heated metallic coils.** *Acta Physicochim. U.R.S.S.* **18**, 406-19 (1943) (in English).—*C.A.* 38, 5720^1.

Both the catalytic dehydrogenation and decompn. of cyclohexane were studied in the range from 300° to 600°C on platinized nichrome, palladized nichrome, nichrome, chromized Fe and Fe. A simple and convenient app. was described and a considerable economy in Pt achieved. To explain the facts observed a dendrite hypothesis of carbon deposition was advanced.

10394. BALANDIN, A. A. AND PATRIKEEV, V. V. **Formation of carbon dendrites by catalytic decomposition of alcohols on metals.** *Doklady Akad. Nauk. S.S.S.R.* **40**, 171-4 (1943); *Compt. rend. acad. sci. U.R.S.S.* **40**, 152-4 (1943) (in English).—*C.A.* **38**, 6179^2.

Soot dendrites were formed on a constantan wire when iso-PrOH was passed over it at 450°C. The dendrites, having an empirical formula $(C_{23}H_4O)_x$, probably were cryst. layers of 6-member C rings arranged in the graphite lattice, with the H atoms attached to the C atoms of the periphery.

10395. BECKMANN, R. B.; PUFAHL, A. E., AND HOUGEN, O. A. **Catalytic hydrogenation rates-interpretation of results.** *Ind. Eng. Chem.* **35**, 558-62 (1943).—*C.A.* **37**, 4614^5.

Exptl. data indicated that the controlling step was the rate of surface reaction, that the mass-transfer step was negligible, and that adsorption equil. was maintained between the gas phase and adsorbed components. Reaction-rate equations were developed, including the effect of activated adsorption and surface reaction expressed in terms of concns. for two catalysts.

10396. BOULLÉ, ANDRÉ. **Catalysis by cathodic projection.** *Bull. soc. chim.* **10**, 361-71 (1943).—*C.A.* **38**, 4858^6.

The catalysis of $N_2 + 3H_2 \rightarrow 2NH_3$ at about 3 mm pressure by the emanations from various metallic cathodes was studied. Al, Sb, Ag, Sn, Pt, Pb and Si in various chem. and phys. forms were tested as catalysts. A Pt spring was found best as catalyst. NH_3 yields were comparable to those of a high-pressure reaction. The thermodynamic equil. of the reaction and the temp. of cathode discharge were detd.; no catalysis was found at the anode.

10397. CONSTABLE, F. H. **Distribution of catalytically active centers on surfaces.** *Nature* **152**, 135-6 (1943).—*C.A.* **37**, 6531^5.

Further studies of the auto-poisoning of catalytically active Cu in dehydrogenating EtOH above 280°C were reported. A formula was derived which agreed reasonably well with exptl. data. The more active centers poisoned less rapidly than did the less active centers.

10398. CONSTABLE, F. H. AND ÇAĞLAR, M. **Cadmium and tin as catalysts.** *Rev. faculté sci. univ. Istanbul* **8**, 328-31 (1943).—*C.A.* **40**, 2723^9.

The heats of activation for both metallic Sn and Cd as catalysts for the dehydrogenation of alc. were greater than that for an active reduced Cu catalyst. Liquid Sn was also active, and there was no great change in activity on melting.

10399. DAMKÖHLER, GERHARD. **Excess temperature in catalyst grains.** *Z. physik. Chem.* **193**, 16-28 (1943).—*C.A.* **39**, 2689^3.

The max. excess temp., θ_{max} in a stationary catalyst grain during reaction was independent of the chem. reaction velocity, as well as the radius of the grain. It was detd. solely by the heat of reaction Q, the internal diffusion coeff. D_{ji}, the internal thermal cond. λ_i, and the external concn. c of the reactants. The following equation was derived: $\theta_{max.} \approx QD_{ji}(c_{jr} - c_{jo})/\upsilon_j \lambda_i$, where c_{jo} was the equil. concn. of reactants and υ_j the stoichiometric coeff. of constituent j. $\theta_{max.}$ for SO_2 oxidation was 0.42, for NH_3 synthesis 0.20° at 200 atms. and 0.57° at 1000 atms., for MeOH synthesis 1.0°, for butane synthesis from CO and H_2 3.0°.

10400. DOLIQUE, R. AND GALINDO, J. **Oxidation of carbon monoxide by means of mixed catalysts of the hopcalite type.** *Bull. soc. chim.* **10**, 64-72 (1943).—*C.A.* **38**, 2555^1.

The velocity of oxidation of CO to CO_2 was detd. in mixts. formed of equal parts of CO and O_2 in contact with ternary (CuO, MnO_2, Co_xO_y) and binary (CuO, MnO_2 and CuO, Co_xO_y) catalysts by measuring the contractions of the gas vol. resulting from the oxidation and from a subsequent adsorption of CO_2 by the catalyst, as a function of the time of contact. A triangular diagram and the photograph of a plaster model of the surface representing the velocities as a function of the compn. of the catalysts were given. This surface was not plane but showed elevations and cavities corresponding to the different catalytic activities. The max. velocity corresponded to a very high MnO_2 content (90% MnO_2, 6% CuO, 4% Co_xO_y).

10401. EĬDUS, YA. T. AND ELAGINA, N. V. **Activity and stability of Fe-Cu-ThO_2-K_2CO_3 catalyst in the synthesis of liquid hydrocarbons from CO-H_2 mixture as influenced by composition of the catalyst and the nature of the carrier.** *Bull. acad. sci, U.R.S.S., Classe sci. chim.* **1943**, 305-11 (English summary).—*C.A.* **38**, 5648^7.

Eighteen catalysts of compn. Fe-Cu-ThO_2-K_2CO_3-carrier were examd. in the synthesis of liquid hydrocarbons from 1:1 CO-H_2 mixt. The results contradicted the view of catalyst support as an inert mass. The Fe catalysts investigated showed poor stability, which was not improved with variations of ThO_2 content.

10402. EĬDUS, YA. T.; EPIFANSKIĬ, P. F.; PETROVA, L. V.; ELAGINA, N. V., AND AL'TSHULLER, S. B. **Activating effect of certain metal oxides on Fe-Cu contacts, used in the synthesis of gasoline from water gas.** *Bull. acad. sci. U.R.S.S. Classe sci. chim.* **1943**, 145-51 (English summary).—*C.A.* **38**, 4117^2.

Of the oxides of Mg, Al, Mn and Th, the first 2 had the highest activating effect on Fe-Cu-K_2CO_3-kieselguhr catalysts prepd. by pptn. The catalysts were used in the synthesis of gasoline from water gas.

10403. EMMETT, P. H. AND KUMMER, J. T. **Kinetics of ammonia synthesis.** *Ind. Eng. Chem.* **35**, 677-83 (1943).—*C.A.* **37**, 4958^5.

The dependence of the rate NH_3 synthesis upon pressure, temp., space velocity and gas compn. were studied. The data for the synthesis and the decompn. of NH_3 over an iron catalyst, promoted with K_2O and Al_2O_3 were in satisfactory agreement with theory. On the other hand, neither the theory nor the equations appeared applicable to the decompn. of NH_3 over a singly promoted Fe-Al_2O_3 catalyst.

10404. Emmett, P. H. and Skau, Nis. **The catalytic hydrogenation of benzene over metal catalysts.** *J. Am. Chem. Soc.* **65**, 1029-35 (1943).—*C.A.* **37**, 4294[8].

The surface area of inactive Fe catalysts was as large as that of very active Co or Fe-Co alloys. Cu catalysts substantially free from Ni were inactive at 200°C, although their surface areas were several fold those of active Co catalysts. Cu contg. small addns. of Ni was slightly active at 200°C. Pd was active, Ag inactive; two Pd + Ag alloys had activities per unit Pd content that decreased markedly with a decrease in the percentage of Pd. CO was chemisorbed on both reduced Cu and reduced Ni catalysts instantly at -195°C. CO_2 was chemisorbed at -78°C on Ni catalysts prepd. by reduction of oxide formed by alkali pptn.

10405. Fricke, R. and Wessing, G. **Active substances. LXII. The catalytic behavior of diversely prepared samples of γ-Al_2O_3 and γ-Al_2O_3 + BeO.** *Z. Elektrochem.* **49**, 274-7 (1943).—*C.A.* **38**, 1166[5].

Three Al_2O_3 prepns., dehydrated at 600°C for different times and at 860°C, showing H_2O contents from 1.71% to 3.36%, two Al_2O_3-BeO mixts. with small amts. of BeO, and two equimol. mixts. of Al_2O_3 and BeO were used. The dehydration of isopropyl alc. was of zero order in the range 137° to 221°C and initial isopropyl alc. pressures between 5 and 13 mm for all of the catalysts. The activation energy increased with increasing dehydration or preheat temp. of the catalyst. The addn. of BeO decreased the velocity const.

10406. Hasegawa, Shigeo. **Formation of the reaction nuclei in the reduction of cupric oxide by hydrogen.** *Proc. Imp. Acad.* (Tokyo) **19**, 393-7 (1943) (in English).—*C.A.* **41**, 5777*h*.

The velocity of the reduction of CuO by H_2 was plotted against time. Two straight lines were obtained, the initial horizontal line being followed by one with an increase in slope. The reduction was explained by 3 assumptions: (1) a reaction between adsorbed H_2 and CuO occurred at the interface of reduced Cu, creating a reaction nucleus; (2) the nuclei on CuO were small in no. and were not initially in contact with one another; (3) the reaction progressed in proportion to the velocity of the growth and increase in number of the nuclei.

10407. Hedvall, J. Arvid and Hedin, R. **The importance of the nature of the surface for the velocity of thermal decomposition of solid materials.** *Tek. Tid.* **73**, No. 7, Uppl. A-C, *Kemi* 9-12 (1943).—*C.A.* **40**, 5625[9].

Three samples of $CaCO_3$ with edges 3-4 mm long [a column-rhombohedron, a thin section ground parallel to the base of the crystal, and a thin section ground parallel to the surface of the prism] were heated in dry N_2 first for 5 min. at increasing temps., 710-820°C and then at a const. temp. of 760°C. The loss of wt due to the reaction $CaCO_3 = CaO + CO_2$ was detd. by weighing before and after the test. Below 750°C the differences in the rates of decompn. were very small. Thin sections ground parallel to the prism surface decompd. the fatest. Two samples of FeS_2 crystals, a cube and an octahedron (3-4 mm long), were heated and cooled under the same conditions as $CaCO_3$, only that the temp. ranged from 590 to 620°C and the test periods from 5 to 10 min. The cube surface decompd. faster than that of the octahedron.

10408. Herbo, Cl. and Hauchard, V. **Mechanism of catalytic reactions. III. Study of the interaction of hydrogen with the catalyst.** *Bull. soc. chim. Belg.* **52**, 135-56 (1943).—*C.A.* **40**, 4941[5].

Nickel-thoria catalyzed the hydrogenation of benzene solely to cyclohexane giving no other hydrocarbons condensable at -80°C, similar to the results previously obtained with nickel-chromia and nickel-beryllia catalysts. This reaction was affected in the vapor phase at 50-224°C and the max. rate of reaction was attained at 185°C. The existence of these 2 types of active centers was confirmed by expt. The energy of activation for the hydrogenation of benzene was found to be 11,700 cal. and the heat of adsorption of H_2 on the Ni-thoria catalyst was 39,500.

10409. Hirai, Taizo **Regeneration of the waste vanadium catalyst for contact sulfuric acid plant and extraction of vanadium.** *J. Soc. Chem. Ind. Japan* **46**, 427-8 (1943).—*C.A.* **42**, 6496*f*.

Spent V catalyst for a contact H_2SO_4 plant was extd. with water, and then regenerated by adding V_2O_5 and K_2O. V was recovered from the extn. liquor in a yield of 95%. The catalyst thus regenerated was less effective than the original one.

10410. Ishikawa, Seiichi and Kuroda, Eiichi. **Synthesis of lubricating oil from alcohols. I. Lubricating oil from cetyl alcohol.** *Bull. Inst. Phys. Chem. Research* (Tokyo) **22**, 854-60 (1943).—*C.A.* **43**, 8125*h*.

By heating cetyl alc. with active earth, dehydration and polymerization of the olefins produced took place at 150°C. After 4 hrs, the yield of oily product was 69%. The light portion of the oil consisted of a naphtene $C_{15}H_{30}$ and a paraffin $C_{15}H_{32}$. The heavy portion was a monocyclic naphthene $C_{32}H_{64}$.

10411. Jablotchkoff, N. **The pyrolysis of propylene on silica gel at high temperature.** *Rev. universelle mines* **19**, 114-16 (1943).—*C.A.* **38**, 5719[2].

The pyrolysis of C_3H_6 on silica gel was studied at a high temp. The gas passed with different flow velocities through a quartz vessel partly filled with the gel in an elec. furnace. Repeated expts. at 660°C and different times from 0.03 to 0.005 sec. gave reproducible results and showed with increasing contact time a decrease of the total amt. of gas (CH_4 increased, C_2H_4 decreased), but an increase of the liquid products and the aromatic hydrocarbons. After a certain length of time the gel is covered with graphite. Whether the catalytic action was due to the gel itself or to the deposited graphite must yet be detd.

10412. Kazanskiĭ, B. A. and Rožengart, M. I. **Polymerization of isobutylene on hydrosilicate catalysts. III.** *J. Gen. Chem. (U.S.S.R.)* **13**, 304-8 (1943) (English summary).—*C.A.* **38**, 1207[3].

The polymerization of isobutylene was studied on pyrophosphoric acid deposited on kieselguhr and on Gayer type catalysts; also on Zn or Tl deposited on silica; finally the effect of a Th catalyst deposited on silica was studied. The first 2 catalysts gave products similar to each other in compn., which showed the similarity of the polymerizing action of these catalysts.

10413. Khrizman, I. A. and Korneiuchuk, G. **Kinetics of NH_3 decomposition on iron catalysts.** *Acta Physicochim. U.R.S.S.* **18**, 420-9 (1943) (in English).—*C.A.* **38**, 5719^6.

The kinetics of NH_3 decompn. were investigated on Fe catalysts differing in structure as well as in compn. Expts. were made in the interval 350°-500°C with an initial pressure of 50 or 100 mm, using a quasistatic method. If conditions assuring a const. catalyst surface were observed, reproducible results were obtained. The velocity const. of the NH_3 decompn. on promoted Fe free from nitride was approx. 100 times as large as the velocity const. of the same process on promoted iron nitride. The mechanism of NH_3 decompn. on pure Fe, on a promoted tech. Fe catalyst, and on the latter after the preliminary formation of nitrides was the same.

10414. Kinumaki, Jo.; Shirai, Sanji, and Ogawa, Toru. **Iron catalyst for the benzene synthesis.** *J. Soc. Chem. Ind. Japan* **46**, Suppl. binding, 80-3 (1943) (in German).—*C.A.* **46**, 1186*h*.

The prepn. of better Fe catalysts for synthesized benzene from gas mixts. of CO and H_2 was studied. It was recommended to replace the alkali carbonates with alkali nitrate. This alkali nitrate was always converted at the reduction process into the alkali carbonate, which caused a homogeneous distribution of the alkali on the surface of the diatomaceus earth. By superheating the catalyst, the synthesis of benzene was often impaired. The selective adsorption of the alkali on the catalyst metals and the diatomaceous earth was of great importance.

10415. Kodama, Shinjiro; Tarama, Kimio; Mishima, Akira; Fugita, Koichi, and Yasuda, Motomu. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. III. The influence of copper, manganese, potassium carbonate, and boric acid on iron catalysts IV. The influence of the temperature of the synthesis on various promoters in the catalysts.** *J. Soc. Chem. Ind. Japan* **46**, 69-77 (1943).—*C.A.* **43**, 2398*b*.

K_2CO_3 greatly increased the mean mol. wt of the product, as did Cu to a lesser degree. The effect of adding H_3BO_3 and Mn was the reverse. However, the effect of the substances on the production of Gasol (mixt. of C_2H_6, C_3H_3, and C_4H_{10}) was not very marked. Of the various catalysts used, 100 Fe—125 kieselguhr gave the best results, yielding a product contg. 78% Gasol, although this catalyst had less power of causing CO and H_2 to react.

10416. Kodama, Shinjiro; Tarama, Kimio; Mishima, Akira; Fujita, Koichi, and Yasuda, Motomu. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. V. Influence of potassium carbonate on iron catalyst. VI. Influence of boric acid on the iron catalysts.** *J. Soc. Chem. Ind. Japan* **46**, 404-8 (1943).—*C.A.* **43**, 2398*d*.

The addn. of K_2CO_3 increased the mean mol. wt of the hydrocarbons produced and decreased the formation of CH_4, while the addn. of H_3BO_3 decreased the mean mol. wt.

10417. Kondrat'ev, V. and Ziskin, M. **Reaction of water-gas conversion in quartz vessels.** *Acta Physicochim. U.R.S.S.* **18**, 197-209 (1943) (in English).—*C.A.* **38**, 5131^5.

The rate of conversion of water gas in a mixt. of CO_2 and H_2 flowing through quartz tubes of 15 and 40 mm diam. at 700° and 800°C in the absence of catalysts showed that the reaction was not purely heterogeneous. The reaction rate was not governed by the contact time. The percentage of H_2 transformed into water increased with increasing temp. according to an exponential law; even at 800°C, however, the equil. $CO_2 + H_2 \rightleftarrows H_2O + CO$ was was far from being attained. A relative increase of the surface of the reaction vessel had an inhibiting effect on the reaction.

10418. Koyano, Tadabumi. **The relation between the α-γ- transformation of iron-nickel alloy and the velocity of catalytic decomposition of ammonia gas when this alloy is used as catalyst. II. Effect of the nickel content of the alloy.** *J. Chem. Soc. Japan* **64**, 1396-8 (1943).—*C.A.* **41**, 3356*f*.

The catalytic activity of the alloy (Ni = 15%, Fe = 85%) for the decompn. of NH_3 was studied at various temps. There was a difference in the catalytic activity during the rise and fall of temp. A tentative explanation was given in the light of the lattice theory.

10419. Koyano, Tadabumi. **The relation between the α-γ- transformation of iron-nickel alloy and the velocity of catalytic decomposition of ammonia gas when this alloy is used as catalyst III. Effect of the surface treatment of the alloy.** *J. Chem. Soc. Japan* **64**, 1480-5 (1943).—*C.A.* **41**, 3356*g*.

The effect of various treatments of the Ni-Fe alloys (Ni = 10, 15%) upon the catalytic activity for the decompn. of NH_3 was studied. When the alloys were washed with 15% HNO_3 and reduced at 800°C by means of H_2, no effect of α-γ- transformation was observed in the catalytic activity. When the alloys were oxidized by O_2 and then reduced at 800°C with H_2, hysteresis of the catalytic activity was observed.

10420. McKinney, Aubrey R. **The decomposition of ethylene and carbon monoxide on metallic catalysts.** *J. Phys. Chem.* **47**, 152-63 (1943).—*C.A.* **37**, 3649^5.

The metals Fe, Co and Ni rapidly decomposed CO above 250°C; Os, Pt, Cu and Pd were comparatively inactive. The active group of metals all formed carbonyls. The order of decreasing activity for C_2H_4 decompn. by Ni, Co, Fe and Cu was compared to their resp. atomic radii, 1.24, 1.25, 1.27 and 1.28 A. Cu produced no CH_4 up to 460°C, the reaction products being H_2 and C_2H_6. With Fe large amts. of both H_2 and CH_4 were formed. From an equimol. C_2H_4-CO mixt. the decompn. of C_2H_4 reached 90% at 10° to 60°C lower than without CO.

10421. Mikai, Kiyoshi. **Velocity of reduction of cuprous chloride by hydrogen and deuterium.**

Bull. Inst. Phys. Chem. Research (Tokyo) **22**, 665-71 (1943).—*C.A.* **41**, 5778*a*.

The reduction velocity at 400-19°C was expressed by $dp/dt = kp_{H_2}(1+Bp_{HCl})$, where k was the velocity const., p_{H_2} the partial pressure of H_2, p_{HCl} the partial pressure of HCl, and B the ratio between the adsorption and desorption velocity consts. of HCl. The same equation applied to D_2. The ratio between the velocity consts. of H_2 and D_2 was about 2. From the temp. coeffs. of the consts., the apparent activating energies of H_2 and D_2 were calcd. to be 49.14 and 50.26 kcal, resp.

10422. Munro, L. A.; Dewar, D. J.; Gertsman, S., and Monteith, G. **The effect of gel water on catalytic activity. III. The decomposition of formic acid over alumina.** *Can. J. Research* **21B**, 21-33 (1943).—*C.A.* **37**, 4001[5].

The effect of gel-water content on the catalytic activity at 215° and 250°C, was studied. There were two peaks in the curves showing the relation between activity and gel water content. The ratio CO/CO_2 changed with gel water content, i.e., the course of the reaction could be altered by surface modification of the catalyst. The gel showing max. catalytic activity showed greatest sorption.

10423. Murata, Yoshio; Masayuki, Nakagawa; Tashiro, Eiichi, and Umemura, Tadashi. **The synthesis of gasoline from carbon monoxide and hydrogen. LXIV. Methods of preparing iron catalysts.** *J. Soc. Chem. Ind. Japan* **46**, 52-68 (1943).—*C.A.* **43**, 2400*h*.

The effect of the pptg. method and temp., the method of washing, the ppt., the concn. at the time of pptn., the quality and preliminary treatment of kieselguhr, the purity of reagents, the amt. of alkali used in pptn., the method of adding alkali as promotor, etc., on the activity of the catalyst was studied. The catalyst contg. Fe 100, Cu 25, kieselguhr 125, and K_2CO_3 2 parts by wt was used with a gas mixt. of $CO:H_2 = 1:1$ at 253°C.

10424. Natta, G. and Beati, E. **Kinetics of the catalytic hydrogenation of glucose to sorbitol, and of the catalytic isomerization of glucose.** *Chimica e industria* (Italy) **25**, 211-14 (1943).—*C.A.* **40**, 3046[6].

In the reaction of catalytic hydrogenation of glucose with Ni catalyzers, an anomalous behavior was observed between 120° and 135°C. The hydrogenation speed of glucose remained unchanged or even decreased. This fact was due to an isomerization of glucose, which took place with rapidity at 120°C in the presence of Ni catalyzers.

10425. Nikolaeva, A. F. and Frost, A.V. **Catalytic action of active aluminosilicates. III. Conversion of hexylene over activated clay.** *J. Gen. Chem.* (U.S.S.R.) **13**, 733-5 (1943) (English summary).—*C.A.* **39**, 662[9].

The passage of hexylene over activated clay at 260°C resulted in formation of hexane, 2-methylpentane and 3-methylpentane. Under the conditions studied, no change into benzene was observed.

10426. Osame, Gohei and Hirai, Taizo. **Manufacture of sulfuric acid by vanadium catalyst. III. Increase of the draft resistance in the large converter.** *J. Soc. Chem. Ind. Japan* **46**, 431-2 (1943).—*C.A.* **42**, 6495*i*.

The increase in draft resistance in the large converter was due to the swelling and accompanying destruction of catalyst, which was a result of absorption of water by the catalyst. When the converter operated at 20-30% of capacity, the temp. did not rise sufficiently to prevent absorption of water from gas.

10427. Plate, A. F. and Tarasova, G. A. **Mechanism of contact transformations of hydrocarbons on vanadium catalyst. I. Contact transformations of heptane.** *J. Gen. Chem.* (U.S.S.R.) **13**, 21-34 (in English, 34-5) (1943).—*C.A.* **38**, 16[1].

The reaction of dehydrogenation of heptane on V_2O_3-Al_2O_3 catalyst was investigated in the interval from 440° to 510°C, with the overall reaction being followed by detn. of H_2 evolved per 3 min. Variation of space velocity from 0.3 to 12.8 did not affect the rate of H_2 evolution. In a prolonged expt. (66 min.) it was shown that gas evolution was const., that the catalyst was not poisoned and that the evolved gas was essentially H_2, although with increased temp. there was an increased evolution of CH_4. Carbonization was important as deposited carbon coated the active points of the catalyst.

10428. Plate, A. F. and Tarasova, G. A. **Mechanism of contact transformations of hydrocarbons on vanadium catalyst. II. Kinetics of the reaction of cyclization of heptane.** *J. Gen. Chem.* (U.S.S.R.) **13**, 36-40 (1943) (in English, 41).—*C.A.* **38**, 16[4].

The overall reaction of dehydrogenation of heptane on V catalyst obeyed Arrhenius' equation, the apparent energy of activation being 41,100 cal/mol. The individual reactions also appeared to follow the same law, with the following energy values: aromatization: 50,700 cal/mol., olefin formation: 17,600 cal/mol., carbonization: 56,400 cal/mol., and CH_4 formation: 60,800 cal/mol.

10429. Plate, A. F. and Sterligov, O. D. **Mechanism of contact transformations of hydrocarbons on vanadium catalyst. III. Contact transformations of ethylcyclopentane.** *J. Gen. Chem.* (U.S.S.R.) **13**, 202-12 (1943) (English summary).—*C.A.* **38**, 1420[7].

Dehydrogenation of ethylcyclopentane on V catalyst was studied between 440° and 500°C. The reactions involved aromatization, dehydrogenation to olefins and decompn. to carbon and H_2. Apparent activation energy of the summary reaction was 31,500 cal/mol. for fresh catalyst and 34,900 for regenerated catalyst. At 500°C the 3 reactions formed a ratio 2:2:1.

10430. Rampino, Louis D,; Kavanagh, Kevin E., and Nord, F. F. **Relation between particle size and efficiency of Pdpolyvinvl alcohol (Pd-PVA) catalysts.** *Proc. Natl. Acad. Sci. U. S.* **29**, 246-56 (1943).—*C.A.* **37**, 6538[3].

Pd catalysts prepd. by the reduction of $PdCl_2$ soln. were more active toward the hydrogenation of nitrobenzene the smaller the particle size.

10431. Rao, B. Sanjiva. **Catalysis of the interaction between hydrogen sulfide and sulfur di-**

oxide by silver sulfide. *Current Sci.* **12**, 323 (1943).—*C.A.* **38**, 4858^7.

The reaction $2H_2S + SO_2 \rightarrow 2H_2O + 3S$ was highly autocatalytic in the presence of Ag. Ag_2S catalyzed this reaction in the presence of water; in the absence of water it was inactive. A glass surface had a much smaller catalytic effect than a Ag_2S surface.

10432. RAO, B. SANJIVA AND RAO, M. R. ASWATHNARAYANA. **Catalytic activity of silver sulfide.** *Current Sci.* **12**, 323-4 (1943).—*C.A.* **38**, 4858^8.

Ag_2S catalyzed the decompn. of SO (and of S_2O_2). It also catalyzed the reaction $SO + H_2S \rightarrow 2S + H_2O$, even when both gases were carefully dried over P_2O_5. SO_2, an impurity in SO, was inactive at the surface of Ag_2S when dried over P_2O_5.

10433. RIENÄCKER, G.; MÜLLER, E., AND BURMANN, R. **Catalytic investigations on alloys. XI. The properties of Cu-Pd and Cu-Pt alloys as catalysts for the hydrogenation of ethylene.** *Z. anorg. allgem. Chem.* **251**, 55-70 (1943).—*C.A.* 37, 6539^5.

Pd and Cu-Pd alloys with 47% or more of Pd as well as Pt and Cu-Pt alloys with 16% or more of Pt were about equally effective and hydrogenated at around 100°C. Cu and Cu-rich alloys had very little action and catalyzed only at high temps. Between these two groups of catalysts there exists a difference in activity of 10^6. The influence of the arrangement of the atoms on the activation energy previously observed for HCOOH decompn. was established for C_2H_4 hydrogenation on Cu-Pt alloys.

10434. ROITER, V. AND RUSOV, M. **Kinetics of the catalytic oxidation of acetylene on activated manganese dioxide.** *J. Phys. Chem.* (U.S.S.R.) **17**, 87-96 (1943).—*C.A.* **38**, 3540^4.

The catalytic oxidation of C_2H_2 by O_2 in air mixts. contg. 0.04 to 0.57% C_2H_2 passed over an active MnO_2 surface at the rate of 30-100 liter/hr per ml of catalyst proceeded as an internal kinetic reaction at temps. from 140 to 170°C, as an internal diffusion reaction from 170° to 220°C, and as an internal diffusion reaction above 220°C. The transition from one region to another was characterized by a change in the order of the reaction and in the magnitude of the energy of activation.

10435. SCHEEPERS, LÉON. **The catalytic dissociation of carbon monoxide.** *Rev. universelle mines* **19**, 121-31 (1943).—*C.A.* **38**, 5720^3.

The dissocn. of CO was investigated with natural magnetite and at the same time the reduction of the Fe_3O_4 contained therein in a semiautomatic app. under a current of gas. The crushed magnetite was sepd. into 3 fractions. The strongly magnetic material had at first a small and then increasing reaction; the formation of CO_2 tended to assume a const. value even though the reduction was not yet complete. With increasing temp. the dissocn. increased up to a max. at 550°C and then decreased again. The less magnetic material had a much stronger and almost immediate action. A first period of fast CO_2 formation gradually slowed down and became stationary. The catalyst mixt. with 15% Al had a superior effect to all others and to Fe_2O_3.

10436. SCHWAB, GEORG M. AND HOLZ, GÜNTER. **Electron concentration, lattice loosening and catalysis.** *Naturwissenschaften* **31**, 345-6 (1943).—*C.A.* **38**, 1679^5.

The catalytic effect was studied of Ag alloys on dehydration of HCOOH. The admixts. used were Cu, Zn, Ga, Pd, Cd, In, Sn, Sb, Pt, Au, Hg, Tl, Pb and Bi as α mixed crystals. The heat of activation of the reaction was detd. All elements to the right of the Ag group raised the activation heat; Pd, Pt and Au lowered it. The increases were very high (30 kcal as against 17.6 kcal for pure Ag) for Sb, Pb, Bi.

10437. SCHWAB, GEORG M. AND SCHWAB-AGALLIDIS, ELLY. **Alloys as catalysts.** *Naturwissenschaften* **31**, 322-3 (1943).—*C.A.* **38**, 1679^3.

An alloy of Al with 9.7 at. % Ag had the homogeneous δ phase above 490°C; below this temp., the hexagonal γ phase. This change of phases, however, did not affect the catalytic effect of the alloy on decompn. of EtOH above and below 490°C. The heat of activation of the reaction with the alloy was 25-26 kcal; that on the separately prepd. pure γ phase, 28 kcal. The same was true for MeOH decompn. With the decompn. of HCOOH over Cu-Ag catalysts, it appeared that the heat of activation changed from 18 kcal for pure Ag to 24 for Cu; it was 24 for 5 at. % Ag, and 20.2 for 7.5 at. % Cu.

10438. SCHWAB, GEORG M. AND SCHWAB-AGALLIDIS, ELLY. **Alloys as catalysts.** *Ber.* **76B**, 1228-50 (1943).—*C.A.* **39**, 4791^3.

In a series of metallic systems used as catalyst, no striking changes in the heat of activation were produced: (1) by the sepn., (2) by the alloy formation itself, or (3) by the tempering of the alloys. In the system Ag-Al, the gross heat of activation of cracking EtOH and MeOH did not show any systematic dependence on the previously existing alloy phases, or on the sepn. of the Ag-rich δ-solid soln. In the Cu-Ni system, neither the solid soln. approx. CuNi (23 kcal) nor the Ni (25 kcal.) differed appreciably from Cu.

10439. SEDLATSCHEK, KARL. **Catalytic effect of copper powders of different thermal treatment on the decomposition of formic acid vapor.** *Kolloid-Z.* **104**, 203-8 (1943).—*C.A.* **38**, 1420^5.

Powd. Cu was preheated at different temps. either in H_2 or in HCOOH vapor. The decompn. velocity of HCOOH at 180°C, the energy of activation and the relative no. of "active" centers were recorded as a function of the temps. of preheating. In the curves for the activation energy as a function of the temp. of preheating 2 maxima were recorded which were related to the surface structure of the powder and to the lattice deformation. Preheating in HCOOH displaced the location of these maxima and improved the catalytic effect of the Cu in the decompn. of the acid.

10440. SEMENOV, N. N. **Rupture of chains in chain reactions at the surface of solid bodies.** *Acta physicochim. U.R.S.S.* **18**, No. 2-3, 93-147 (1943) (in English).—*C.A.* **38**, 3189^2.

The general problem was solved for the special cases of a plane wall, a cylindrical, and a spherical vessel. The lower limit of inflammation and the effect of admixts. or solid particles such as metallic rods or globes or of dust particles in a glass or quartz sphere were detd.

10441. Shirai, Sanji; Kinumaki, Susumu, and Ogawa, Toru. **Iron catalyst for synthesis of gasoline.** *J. Soc. Chem. Ind. Japan* **46**, 329-31 (1943).—*C.A.* **42**, 6082*g*.

The catalyst for the hydrogenation of CO should not be heated to a temp. above that at which it was to be used in the synthesis. The alkali promoter should be evenly distributed; this was accomplished by using KNO_3 instead of K_2CO_3 to activate the catalyst.

10442. Takayasu, Masaaki. **Catalytic action of copper hydroxide. I. II.** *J. Chem. Soc. Japan* **64**, 675-83, 684-95 (1943).—*C.A.* **41**, 3353*f*, *g*.

The catalytic action of Cu oxide prepd. by various methods on butyraldehyde was studied. At 100°C under 78 atm. 17% of butyraldehyde gave 29 mol. % of Bu butyrate and 41 mol. % of butyric acid. At 150°C, 46% of butyraldehyde gave 19 mol. % Bu butyrate, 6 mol. % of butyric acid, 15 mol. % of paraldehyde, and 5 mol. % of ethylpropylacrolein. At 200°C, 66% of butyraldehyde gave 9 mol. % of Bu butyrate and 33 mol. % of ethylpropylacrolein.

10443. Takenaka, Yutaka. **Destructive hydrogenation of synthetic petroleum. I. Effect of catalyst.** *J. Soc. Chem. Ind. Japan* **46**, 658-62 (1943).—*C.A.* **43**, 2415*g*.

Kogasin oil (synthesized from CO and H_2 under pressure) was fractionated into 3 portions. Each portion was hydrogenated 5 mins. in a rocking autoclave at 480°C by using 20% of Ni_2O_3, MoO_3, MoS_3, or $Mo(PO_4)_2$ with or without kieselguhr as catalyst and H_2 under 35 atms. initial pressure to yield gasoline. The effect of using various catalysts on the compn. of the product was studied. With Ni_2O_2 on kieselguhr a gasoline fraction contg. mostly aromatic and napthene hydrocarbons was obtained.

10444. Tanida, Shigeo. **Mixed catalysts. I. The promoting action of molybdenum and tungsten on the nickel catalyst for hydrogenation.** *Bull. Chem. Soc. Japan* **18**, 30-6 (1943).—*C.A.* **41**, 4368*c*.

The influence of Mo and W upon Ni catalyst for hydrogenation of benzene into cyclohexane were studied. The mixed catalysts were prepd. by adding Ni carbonate to ammonical soln. of $MoO_2(OH)_2$ and of ammonium tungstate. Ten kinds of Ni-Mo and 8 kinds of Ni-W catalysts which had various ratios of compn. were obtained, and, after being reduced at 450°C by H_2, used for the hydrogenation. The promoting action of Mo reached its max. at the ratio of 15 Mo atoms to 100 Ni atoms, and in the case of W, the same max. was attained at the ratio of 5 W atoms to 100 Ni atoms.

10445. Tiggelen, Ad. van. **Determination of carbon monoxide with the aid of silver oxide.** *Ann. mines Belg.* **44**, 145-51, 391-7 (1943).—*C.A.* **39**, 2942^1.

Detailed directions were given for detg. CO by a procedure in which the combustion of the CO was catalyzed by pumice impregnated with Ag_2O. To prep. the catalyst, place granulated pumice in 8% $AgNO_3$ soln. and then in 8% KOH soln. After thorough washing, dry 5 hrs at 100°C and then 2 days at 270°C in a vacuum. The method was used for detg. traces of CO; CH_4 and H_2 did not disturb.

10446. Tomita, Akira. **Zinc catalyst. II. Influence of the starting salts and precipitants on the precipitated zinc catalysts.** *J. Chem. Soc. Japan* **64**, 431-7 (1943).—*C.A.* **41**, 3353*i*.

The starting salts, $ZnSO_4$, $Zn(NO_3)_2$, and $Zn(OAc)_2$, gave almost the same activity, but $ZnCl_2$ gave a lightly smaller activity. The effect of the precipitants were in the following order: $KHCO_3 > NaHCO_3 > K_2CO_3 > Na_2CO_3 > (NH_4)_2CO_3 >> KOH > NaOH >> NH_4OH$. A trace adsorbed alkali on the precipitant gave the catalyst a considerable activity.

10447. Tomita, Akira. **Action of zinc oxide catalyst in the decomposition reaction of methanol.** *Science* (Japan) **13**, 285-7 (1943).—*C.A.* **45**, 10023*f*.

Basic Zn carbonate, $Zn(OH)_2$, and $Zn(NO_3)_2$ were heated at various temps. The activity of ZnO catlyst in the decompn. of MeOH was compared. The tests of the catalyst by a thermal balance showed that ZnO prepd. from basic Zn carbonate or $Zn(OH)_2$ adsorbed H_2O mols. on the surface. The unimol. film of H_2O was considered to play an important role in the decompn. of MeOH.

10448. Ueno, Seiichi and Morita, Naohiko. **Influence of the conditions of precipitation on the activity of nickel catalysts. II. Precipitation with sodium carbonate.** *J. Soc. Chem. Ind. Japan* **46**, 45-7 (1943).—*C.A.* **43**, 5211*b*.

The $NiCO_3$ was pptd. on kieselguhr at 20°, 30°, and 50°C with equiv., slightly deficient, and slightly excessive amts. of Na_2CO_3 and with 5 different combinations of 2, 5, and 10% $NiSO_4$ soln. and 2, 5, and 10% Na_2CO_3 soln. The catalytic power was tested by hydrogenating soybean oil with 0.3% Ni 1 hr at 180°C with H_2 at 40 atms.

10449. Ueno, Seiichi and Tsuda, Sanae. **Velocity of hydrogenation of oleyl alcohol.** *J. Soc. Chem. Ind. Japan* **46**, 481-3 (1943).—*C.A.* **42**, 6629*g*.

Pure oleyl alc. prepd. from sperm oil was hydrogenated over a Pt-black catalyst in ethereal soln., and the vol. of H_2 absorbed was measured. The hydrogenation was a unimol. reaction, and its velocity was expressed: $dx/dt = K(a - x)$, where $K = (1/t) \ln [x/(a-x)]$ and t = time in min., a = vol. of H_2 required in the perfect hydrogenation, x = vol. of the hydrogen absorbed, and K = reaction velocity.

10450. Uyehara, O. A. and Watson, K. M. **Solid catalysts and reaction rates—oxidation of sulfur dioxide.** *Ind. Eng. Chem.* **35**, 541-5 (1943).—*C.A.* **37**, 4294^7.

Rate equations were tested with published data on the oxidation of SO_2 in a flow system over a platinized asbestos catalyst. The data were represented by an equation based on the assumption that the rate-controlling step was a surface reaction between SO_2 and at. O.

10451. Vol'fkovich, S. I. and Margolis, F. G. **Catalysts for the production of K_2SO_4 or Na_2SO_4 from KCl or NaCl by reaction with SO_2.** *Doklady*

Akad. Nauk S.S.S.R. **41**, 23-5 (1943).—*C.A.* **38**, 4500^1.

Catalysts tested for the reaction $4KCl + 2SO_2 + 2H_2O + O_2 \rightarrow 2K_2SO_4 + 4HCl$ included Al_2O_3, CuO, $Co(NO_3)_2$, $CoSO_4$, Fe_2O_3 and various Fe-contg. metallurgical by-products. The most effective catalysts were those contg. Fe, especially roasted pyrite ash, titanomagnetite slag and products obtained from the latter by acid or alkali treatment. At the optimum temp., 500-50°C, use of 1% of pyrite ash decreased the time required for 95-96% conversion of KCl to K_2SO_4 from 16-20 days to a matter of hrs. Catalysts contg. Fe were effective also in accelerating the reaction, $2KCl + SO_2 + O_2 \rightarrow K_2SO_4 + Cl_2$.

10452. WATANABE, SUSUMU; MORIKAWA, KIYOSHI, AND IKAWA, SHIGEYOSHI. **Synthesis of benzine by catalytic reduction of carbon monoxide at atmospheric pressure. V. Effect of adding lower hydrocarbons to the feed gas.** *J. Soc. Chem. Ind. Japan* **46**, 967-71 (1943).—*C.A.* **43**, 2406*e*.

The Fischer synthesis was carried out with 2 vols. CO and 1 vol. H_2 mixed with 8-13% hydrocarbon, and the result was compared with that for feed gas having no admixt. A catalyst of compn. $Co:Cu:ThO_2 = 9:1:2$ was used. When the feed gas contained satd. hydrocarbons, the rate of consumption of CO and the formation of CO_2 were lowered, and the formation of olefins was slightly increased. When the feed gas contained unsatd. hydrocarbons, the consumption of CO was lowered, but the production of oil was not decreased, about 50% of olefin added being hydrogenated and 30% taking part in polymerization.

10453. WATANABE, SUSUMU. **Synthesis of benzine by catalytic reduction of carbon monoxide at atmospheric pressure. VI. Consumption of carbon monoxide in passing through catalyst layer.** *J. Soc. Chem. Ind. Japan* **46**, 1128-30 (1943).—*C.A.* **43**, 2406*h*.

The synthesis of benzine was carried out by use of CO and H_2 in the ratio 1:2 and a catalyst of the compn. $Co:Cu:ThO_2 = 9:1:2$ at 197°C under pressure of 7-369 mm. The relation $x = ap^b$ held between the reaction pressure, p, and x, which represented the yield of oil, contraction of gas vol., or consumption of CO; a and b were consts. As the above formula was of the same form as that of Freundlich's adsorption isotherm, $y = a p^n$, it was observed that there was a direct relation between the consumption of CO and the adsorption of CO. The formula $x = ap^b$ held only when p was 30-200 mm.

10454. AKULOV, N. S. **The role of catalysis in the process of self-ignition.** *Compt. rend. acad. sci. U.R.S.S.* **43**, 301-5; *Doklady Akad. Nauk. S.S.S.R.* **43**, 317-21 (1944).—*C.A.* **39**, 3997^4.

The effect of a change in the ratio of the surface S of a neg. catalyst to the vol. V of the reaction space was studied. The scale of the boundary curve for the region of self-ignition along the axis of concns. increased proportional to $S^{1/2}/V^{1/2}$. The shifting of boundary curves along the temp. axis and the shape of theoretical boundary curves of the region of self-ignition agreed quantitatively with expt.

10455. ALEXANDER, JULIAN AND SHIMP, H. G. **Laboratory method for determining the activity of cracking catalysts.** *Natl. Petroleum News* **36**, R537-8 (1944).—*C.A.* **38**, 5067^3.

An accurate, reproducible test was developed. The app. and the operating procedure were described.

10456. APPLEBY, W. G.; DOBRATZ, C. J., AND KAPRANOS, S. W. **Vapor-phase dehydration of 1-heptanol over activated alumina.** *J. Am. Chem. Soc.* **66**, 1938-9 (1944).—*C.A.* **39**, 455^3.

1-Heptene was the principal product of dehydration of 1-heptanol over activated alumina at 380-400°C. No evidence of any chain-branching isomerization of 1-heptene over alumina was obtained.

10457. ATROSHCHENKO, V. I. **Losses of platinum-rhodium catalyst in the contact oxidation of ammonia.** *Trudy Khar'kov. Khim.-Tekhnol. Inst. im. S.M. Kirova* **4**, 138-40 (1944).—*C.A.* **42**, 6066*h*.

In a set of 15 (Pt 93%-Rh 7%) wire nets, (diam. 0.09 mm), the initial wt of one net (193-200 g) under 7 atm., concn. of NH_3 10.5-11.0%, temp. of the gas 175-85°C, temp. of contact 880-900°C, decreased after 5, 15, and 21.5 days by 5.56, 11.5, and 21.15 g, resp.; that of the 13th net, 2.43, 8.73, and 10.43 g. Instead of the present practice of replacing the nets one by one, it was recommended that the whole set be reversed after 2-3 regenerations.

10458. BAILEY, KENNETH C. **The retardation of chemical reactions, XI. "Retardation," "inhibition", and "negative catalysis". A case of negative catalysis.** *Proc. Roy. Irish Acad.*, Nov., **1944**, 3 pp.—*C.A.* **39**, 2448^7.

A distinction was suggested between the terms inhibition and retardation, involving restriction of the former to cases in which a reaction was brought to an apparent standstill. It was also suggested that a retardation be termed a neg. catalysis only if the usual criteria of catalysis be present. The reaction of EtOH with AcOH was retarded by minute amts. of alk. substances. This reaction now appears to be a true case of neg. catalysis.

10459. BALANDIN, A. A. AND PATRIKEEV, V. V. **Differential thermocouple in heterogeneous catalysis.** *J. Gen. Chem.* (U.S.S.R.) **14**, 57-69 (1944) (English summary).—*C.A.* **39**, 858^5.

Differential-thermocouple installations were used in the study of heterogeneous catalysts and catalytic processes in flow systems with automatic continuous recording. The procedure was applicable in a wide variety of studies of comparison of catalyst activities, detn. of relative activity vs. time, detn. of thermal data of the reactions. When alcs. were passed over Al_2O_3 in CO_2 a brief exothermic effect was found.

10460. CHAKRAVARTY, K. M. AND SARKER, J. M. **Catalytic formation of CH_4 from CO and H-a study of Ni and Ni-alumina catalysts prepared from the Hydroxide using KOH, NaOH and NH_4OH as precipitants.** *Current Sci.* **13**, 127 (1944).—*C.A.* **38**, 6178^9.

In a mixt. of CO, H_2 and H_2O, roughly 1:1:1, 2 reactions occurred in the presence of Ni catalysts:

(1) $2CO + 2H_2 \rightarrow CH_4 + CO_2$, (2) $CO + H_2O \rightarrow CO_2 + H_2$. The influence of KOH, NaOH and NH_4OH, used to ppt. Ni, was small. Alumina promoted reaction (1); its max. activity occurred at a concn. below 0.16%. The addn. of K_2CO_3 to the catalyst promoted reaction (2).

10461. Cheylan, Étienne. **Manganese carbonate oxidation catalysts.** *Mém. services chim. état (Paris)* **31**, 299-303 (1944).—*C. A.* **40**, 5986^4.

Com. hopcalite was made as follows: A mixt. of Cu and Mn salts was pptd. in the cold with or without additions of salts of Co, Ni, or Ce by means of an alk. carbonate, preferably $(NH_4)_2CO_3$. The ppt. was washed and converted, by rapid heating to 300°C in dry air, to a mixt. of CuO, MnO_2, and higher oxides of Ni, Co, and Ce.

10462. Cheylan, Étienne. **Thermal deactivation of manganese carbonate hopcalite.** *Mém. services chim. état (Paris)* **31**, 304-15 (1944).—*C.A.* **40**, 5986^6.

Deactivation resulted from a modification of structure; the chem. compn. remained unchanged. The CuO promoter did not enter into this change in structure. Heating for 15 mins. at 350°C lowered the activity of the "normal" product 11%.

10463. Dickinson, E. J. **Properties of chromic oxide gel and its catalytic activity for the aromatization of heptane.** *Trans. Faraday Soc.* **40**, 70-9 (1944).—*C.A.* **38**, 4499^5.

The reduction of Cr_2O_3 gel by H_2, the action of O_2 and H_2O on the reduced gel, and the action of heptane on both the oxidized and reduced forms were studied at low pressures. At 450°C dry H_2 reduced Cr_2O_3 to a limited extent, and some H_2 was irreversibly adsorbed. At 800°C the irreversible adsorption of gas was small or negligible, but the extent of reduction was greater than at 450°C. At 450°C O_2 oxidized the reduced gel completely and removed any combined H_2 as H_2O. H_2O oxidized only a small fraction of the reduced gel at 450°C, and a proportion was reversibly adsorbed.

10464. Dunbar, Ralph E. and Arnold, M. R. **Preparation and reclamation of copper-chromic oxide catalyst.** *Ind. Eng. Chem., Anal. Ed.* **16**, 441 (1944).—*C. A.* **38**, 5371^5.

Two inert carriers, Celite Carrier Type VII and Carborundum Brand, were found satisfactory for supporting Cu-Cr_2O_3 in the dehydrogenation of alcs. An alternate method of prepn., by heating the catalyst to 150°C for 10 hrs in place of the usual AcOH leaching, produced a catalyst of the same initial activity which was more readily lost with prolonged use. The reactivation was accomplished by controlled heating and a subsequent AcOH leaching.

10465. Eidus, Ya. T. **Catalysts for hydrogenation of carbon monoxide by joint application of the dynamic and static methods. I. Activity of the complex Fe-Cu-ThO_2-K_2CO_3 kieselguhr catalyst. II. Study of activity of catalysts composed of components of complex Fe-Cu-$ThO_2K_2CO_3$-kieselguhr catalyst.** *Bull. acad. sci. U.R.S.S. Classe sci. chim.* **1944**, 255-62, 349-58 (English summary).—*C. A.* **39**, 2391^6, 3142^3.

The reaction was studied in a current of gas and also, by rate of change of pressure, in a closed system. On Fe-type catalysts, in contrast to the Co-type catalysts, the intermediate step in the synthesis was the formation of carbides. Fe, Cu, and either ThO_2 or K_2CO_3 must be present. The complex catalyst at 245-65°C showed an activation energy of 28.7 cal/mol.

10466. Emmett, P. H. and Gray, Joseph B. **The hydrogenation of ethylene, propylene and 2-butene on iron catalysts.** *J. Am. Chem. Soc.* **66**, 1338-43 (1944).—*C.A.* **38**, 5133^9.

The kinetics, temp. coeffs. and effects of promoter on the hydrogenation of C_2H_4, C_3H_6 and 2-butene were detd. over six different Fe catalysts. There was no evidence that an activated adsorption of C_2H_4 played an important part in the hydrogenation. Below 0°C the adsorption of C_2H_4 and C_3H_6 were instantaneous and reversible. At -35°C and pressures from 100 to 400 mm of C_3H_6, the surface of the catalyst was covered by a quantity of adsorbed gas sufficient to form more than one layer of mols; the same was true for butene at -10°C. The rate of hydrogenation was nearly independent of the partial pressure of the olefins. For butene hydrogenation at -10°C, the rate of reaction was nearly const. although the thickness of the layer of adsorbed butene changed considerably. The inhibiting effect of the promoter of the promoted Fe synthetic-NH_3 catalysts on the rate of olefin hydrogenation was related to K_2O.

10467. Faith, W. L. and Rollins, E. J. **Catalytic vapor-phase oxidation of fatty oils.** *Ind. Eng. Chem.* **36**, 91-2 (1944).—*C.A.* **38**, 884^7.

Red oil (quality similar to U. S. P. grade oleic acid), sardine oil and soybean oil were converted to maleic acid, CO_2 and aldehydes in a one-step process of combined thermal decompn. and vapor-phase oxidation at 425°C. Dry preheated air and an oil spray in the vaporizer produced a mixt. of cracked oil vapor and air which was passed over a V_2O_5 catalyst, deposited on Alfrax pellets, in a converter.

10468. Giovannini, Erminio. **Influence of mixed catalysts on the ethanol-ammonia system.** *Chimica e industria* **26**, 5-7 (1944).—*C.A.* **41**, 7217*a*.

In the presence of mixed catalysts consisting of Al, Ni, and Ce oxides and of kaolin, Ni oxide acted primarily in the direction of dehydrogenating the alc. Appreciable amts. of AcH and heterocyclic compds. contg. the pyridine ring were obtained. The catalyst was prepd. by stirring kaolin in the soln. of the Ce, Al, and Ni salts to a pasty consistency and calcining the mass thus obtained. The abs. alc. satd. with gaseous NH_3 was placed in contact with the catalyst and subjected to various temps.

10469. Giovannini, Erminio. **The action of the ternary catalyst $Al_2O_3 + ZnO + CeO_2$ on the system ethyl alcohol-ammonia.** *Chimica e industria (Italy)* **26**, 132-4 (1944).—*C.A.* **40**, 3046^7.

The action of ZnO and Al_2O_3 increased the formation of AcH, higher aldehydes, hydrocarbons both satd. and unsatd., and their condensation products with NH_3. The max. of the dehydrogenating power of the catalyzers was observed with the ratio $ZnO/Al_2O_3 = 1:4$.

10470. HASEGAWA, SHIGEO. **Organic peroxides. I. Decomposition of methylhydroperoxide catalyzed by platinum sol.** *Rev. Phys. Chem. Japan* **18**, 33-46 (1944).—*C.A.* **41**, 4698*i*.

The decompn. velocity of methylhydroperoxide in aq. soln. in the presence of a Pt sol, detd. by the iodometric titration, showed an initial rapid decrease for 10-20 min. followed by a main linear decrement in which the apparent heat of activation was 14.5 kcal/mol. The higher the concn. of Pt sol, the greater was the retardation in the initial stage, but the concn. hardly affected the main stage.

10471. HERINGTON, E. F. G. AND RIDEAL, E. K. **Poisoning of metallic catalysts.** *Trans. Faraday Soc.* **40**, 505-16 (1944).—*C.A.* **39**, 2248^8.

Poisoning was examd. in active hydrogenating catalysts (e.g., Ni, Co, Pt, Pd in the face-centered cubic form). It was assumed that the rate was proportional to the surface concn. of the given reactant. If after poisoning with a substance that occupied one active center a fraction θ of the active spots was bare and an isolated group of n centers was required for reaction, then the no. of unpoisoned groups was proportional to θ^n. The plot of activity against poison concn. was linear throughout the entire poison range only when $n = 1$. It was stated that an explanation of catalytic behavior requiring "active spots" appeared in many cases to be unnecessary.

10472. HIRAI, TAIZO. **Manufacture of sulfuric acid by vanadium catalyst. IV. Swelling of vanadium catalyst.** *J. Soc. Chem. Ind. Japan* **47**, 507-11 (1944).—*C.A.* **42**, 6496*d*.

A catalyst that did not swell was prepd. by heating the molded compn. of V_2O_5, kieselguhr, clay, and KOH to 700°-800°C to produce a semi-melted porous mass. The swelling and disintegration of V catalyst was thought due to the formation of a hydrated double salt of K_2SO_4 and $V_2(SO_4)_5$; analysis of the red-brown matter produced on the surface of swollen catalyst indicated a compd. of formula $K_2SO_4V_2(SO_4)_5 \cdot 26H_2O$.

10473. HIRAI, TAIZO. **Manufacture of sulfuric acid by vanadium catalyst. V. Effect of carrier and contents of vanadium pentoxide and potassium oxide on the catalytic activity.** *J. Soc. Chem. Ind. Japan* **47**, 507-11 (1944).—*C.A.* **42**, 649*e*.

V catalyst was prepd. on an industrial scale, and the effect of carrier and the contents of V_2O_5 and K_2O on the rate of conversion of SO_2 into SO_3 was studied. A catalyst low in V_2O_5 had a high conversion rate, and the content of K_2O was varied through a wide range; no special advantage was found for the mol. ratio 1.66 of K_2O:V_2O_5.

10474. HÜTTIG, GUSTAV F. AND CADA, OLGA. **Thermal decomposition of alcohol vapors catalyzed by hydrated aluminum oxide given different preliminary treatments. The direction-setting effect.** *Kolloid-Z.* **109**, 1-4 (1944).—*C.A.* **41**, 2973*i*.

Cryst. $Al_2O_3 \cdot 2.5H_2O$ was partly dehydrated by heating (at 300°C) in the presence of various vapors and gases. The catalytic effects of these dehydration products on the decompn. of MeOH and EtOH vapors were then detd. The most effective catalyst for decompn. of the MeOH was the one dehydrated in the presence of MeOH. For decompn. of EtOH vapor the catalysts dehydrated in the presence of EtOH and BuOH were more effective than those heated in the presence of MeOH or PrOH vapors.

10475. ISHIKAWA, SEIICHI; KURODA, EI-ICHI, AND ISHINO, KIGEN. **Synthesis of lubricating oil from alcohols. II. Dehydration of cetyl alcohol and polymerization of resulting olefins.** *Bull. Inst. Phys. Chem. Research* (Tokyo), *Chem. Ed.* **23**, 373-81 (1944).—*C.A.* **42**, 7013*b*.

Cetyl alc. was dehydrated in the gaseous phase by passing the vapor through a tube contg. active clay heated to 300-450°C, and the resulting mixt. of olefins was polymerized by $AlCl_3$ to produce lubricating oil. Max. yield of 95.1% of olefin oil contg. 27.0% 1-hexadecene was obtained when the dehydration was carried out at 400°C.

10476. ISHWATARI, TAKEHIKO AND CHITANI, TOSHIZO. **Catalytic oxidation of carbon monoxide on the surface of silver. I. Experiments at the temperature from 353° to 464°C.** *J. Chem. Soc. Japan*, **65**, 13-16 (1944).—*C.A.* **41**, 3354*b*.

A mix. of $CO + O_2$ having various compn. was passed over a Ag catalyst, the total pressure of the mixt. being kept at 1 atm. With excess O_2, the reaction velocity increased with the partial pressure of CO; with excess CO, it increased with the partial pressure of O_2.

10477. JAGITSCH, ROBERT AND HEDVALL, J. ARVID. **Investigation of the reaction kinetics in the powder system magnesium oxide-salts.** *Arkiv Kemi, Mineral Geol.* **A19**, No. 14, 14 pp. (1944) (in German).—*C.A.* **41**, 5368*h*.

The rate of reaction of powd. MgO with powd. Ag_2SO_4 and Ag_3PO_4 was followed by the O_2 pressure produced by the instantaneous decompn. of the product Ag_2O. The observations were explained by the reaction being maintained by continuous migration of matter from the MgO to the Ag salt, since the total reaction surface continually decreased in agreement with theory when a definite Ag salt particle size was used.

10478. JOHN D. H. O. **The preparation of Adams' platinum oxide catalyst in quantity.** *J. Soc. Chem. Ind.* **63**, 256 (1944).—*C.A.* **39**, 393^4.

A new method of prepg. Adams' Pt oxide catalyst in 250 g quantities was described. Yields 92-98% were obtained rapidly by one operation.

10479. JOHNSTONE, H. F. AND WINSCHE, W. E. **Fused salt mixtures as reaction media.** *Ind. Eng. Chem.* **36**, 435-9 (1944).—*C.A.* **38**, 3187^7.

The thermal phase diagram for NaCl-$ZnCl_2$ was detd. ZnO suspended in this fused salt medium reacted very slowly with SO_2 and O_2 at 420-530°C, as did NaCl in NaCl-Na_2SO_4 at 700°C. Fe_2O_3 reacted with SO_2 and O_2 to form insol. $Fe_2(SO_4)_3$ in fused NaCl-$FeCl_3$ at 400°C. The rate was detd. by both diffusional and chem. resistances. Ilmenite suspended in the latter medium reacted above 550°C, with a preferential attack on the Fe constituent.

10480. KIPNIS, FRANK. **Separation of catalysts from hydrogenation reaction mixtures.** *Ind. Eng. Chem., Anal. Ed.* **16**, 637 (1944).—*C.A.* **39**, 3^5.

A filter aid, such as Dicalite 4200, was used with a Büchner funnel to give a clear filtrate.

10481. Korneichuk, G. P. and Khrizman, I. A. **Kinetics of the decomposition of ammonia on iron catalysts.** *J. Phys. Chem.* (U.S.S.R.) **18**, 389-94 (1944).—*C.A.* **39**, 3197^8.
Exptl. data were obtained at 350-500°C and initial pressures of 50-100 mm by a quasistationary method. With const. surface of the catalyst, the dynamic and the quasistationary methods gave the same result. The rate of the reaction was about 100 times as great on a promoted Fe catalyst, Fe—Al_2O_3—K_2O, free of nitride as on one contg. a nitride layer. The kinetic equation for the reaction was the same for pure Fe, promoted tech. Fe catalyst, and a nitrided promoted catalyst.

10482. Kwan, T. **Sulfur-coated nickel catalysts. II. Effect of amines and hydrogen pressure on catalytic hydrogenation.** *Bull. Inst. Phys. Chem. Research* (Tokyo), *Chem. Ed.* **23**, 163-72 (1944).—*C.A.* **43**, 7802*h*.
With Ni catalysts coated with a film of sulfide, the attempt was made to det. by kinetic studies whether the intermediate form of H was H^+ or $H_2{}^+$.

10483. Kwan, T.; Okada, K., and Matsushita, S. **Sulfur-coated nickel catalysts. III. Catalytic decomposition of isopropyl alcohol.** *Bull. Inst. Phys. Chem. Research* (Tokyo), *Chem. Ed.* **23**, 173-80 (1944).—*C.A.* **43**, 7802*h*.
In the catalytic decompn. of iso-PrOH, the presence of Ni treated with thiophene (and thus coated with NiS) accelerated the dehydration and retarded the hydrogenation of the $MeCH:CH_2$ which was formed. Up to the highest temp., the C—C bond was not broken.

10484. Lefrancois, Philip A. **Cuprous oxide as a catalyst: the effect of varying the proportions of promoter and stabilizer.** *Iowa State Coll. J. Sci.* **19**, 41-3 (1944).—*C.A.* **39**, 663^1.
To Cu_2O (Cu_2O 94%, H_2O 4% and Cu 2%) was added V_2O_4 or Cr_2O_3 as a stabilizer and alk. earth as a promoter. The catalysts contg. Cr_2O_3 were more active than those contg. V_2O_4, but their Cu_2O was reduced to Cu by acetophenone, whereas those contg. V_2O_4 were stable. The best promoter was CaO. When MgO was the promoter, the hydrogenation of furfural went beyond the production of furfuryl alc.

10485. Lel'chuk, S. L.; Balandin, A. A.; Vaskevich, D. N., and Groer, I. I. **Dehydrogenation of EtOH over mixed catalysts.** *J. Applied Chem.* (U.S.S.R.) **17**, 60-4 (1944).—*C.A.* **39**, 1130^9.
Using 3-component catalysts of Cu-Al_2O_3 promoted by Cd or Ti oxides, EtOH was dehydrogenated with the formation of considerable amts. of AcOH and EtOAc. The Cd-promoted catalyst had no advantage over the Cu-Al_2O_3 catalyst, while TiO_2 promoter favored the EtOAc formation. The formation of EtOAc on the TiO_2-promoted catalyst had a lower activation energy (5770 cal/mol.) than on the Cd oxide-promoted catalyst (14,500 cal/mol.).

10486. Loisy, R. **The rate of reaction on a point of a catalytic mass.** *J. chim. phys.* **41**, 82-5 (1944).—*C.A.* **40**, 1726^2.
An equation was derived for the rate of reaction of a liquid passing over the surface of a catalyst. $V_o = D_o\ (\gamma C_o/\gamma V_o)_E$, where V_o was the rate of the reaction, D_o the rate of flow of the liquid, C_o the concn. of the product studied, V_o the vol. of the catalytic mass.

10487. McCarthy, W. Walter and Turkevich, John. **Butene-1 and butene-2 equilibrium.** *J. Chem. Phys.* **12**, 405-8 (1944).—*C.A.* **39**, 239^2.
The equil. between $H_2C:CHEt$ and MeCH:CHMe was attained on activated alumina at 400° and 450°C. The total (*cis + trans*) MeCH:CHMe in mole % at those temps. was found to be 78.5 ± 1.5 and 75.5 ± 1.5, resp., in good agreement with the calcd. values of 79.2 and 77.1, resp.

10488. Morita, Noriyoshi. **Low-temperature catalytic oxidation of ammonia by oxide catalysts.** *J. Chem. Soc. Japan* **65**, 542-8 (1944).—*C.A.* **41**, 3356*e*.
The catalytic oxidation of NH_3 between 220°-440°C was studied in the presence of oxides of Ca, Cu, Cd, Ti, Al, Th, V, Cr, Mo, Mn, Fe, Ni, Co. The catalytic action of oxide was found in the order: Cr > Ni > Co > Mn > Fe > V > Cu > Cd.

10489. Ogawa, Toru; Kimumaki, Jo, and Fujisaki, Tokuo. **Iron catalyst for synthetic petroleum. II. Some characteristic properties of iron catalyst for synthetic petroleum.** *J. Soc. Chem. Ind. Japan* **47**, 242-3 (1944).—*C.A.* **42**, 7011*d*.
The activity of the ordinary Fe catalyst, which did not contain excess alkali, increased with time, passed through a max., and then decreased. The max. was affected strongly by the reaction temp. The higher the reaction temp. or activation temp., the earlier was the appearance of the max.

10490. Ogawa, Toru; Kimumaki, Jo, and Fujisaki, Tokuo. **Iron catalyst for synthetic petroleum. III. Influence of barium nitrate on iron catalyst.** *J. Soc. Chem. Ind. Japan.* **47**, 244-7 (1944).—*C.A.* **42**, 7011*e*.
$Ba(NO_3)_2$ was found to be an excellent accelerator for Fe catalyst, especially for low-alkali catalyst. The optimum amt. of K_2CO_3 for the catalyst was 2%. The order of immersion in K_2CO_3 and $Ba(NO_3)_2$ did not affect the activity.

10491. Ogura, Toyosaburo and Ichimaru, Tenji. **Reaction of methane and oxygen.** *J. Soc. Chem. Ind. Japan* **47**, 540-3 (1944).—*C.A.* **42**, 6082*c*.
When no catalyst was used, CH_4 and O_2 did not react below 600°C. As catalyst, Co was the most effective and Ni was the next. With Co as catalyst, the reaction took place even below 300°C when more than twice the vol. of O_2 was added to CH_4 producing CO_2 and H_2O. When an equiv. amt. of CH_4 and O_2 was taken, CO_2 and H_2O were produced and a part of the CH_4 remained below 800°C, while above 800°C, all CH_4 was changed to CO and H_2.

10492. Perperot, Henri; Cheylan, Étienne; Fleury-Larsonneau, Aandrée; Dodé, Maurice; Mering, Jacques, and Mathieu, Marcel. **Structure of catalytically active solid phases. III. Acid attack on montmorillonites (preliminary study).** *Mém. services chim. état (Paris)* **31**, 332-46 (1944).—*C.A.* **40**, 5986^3.

Boiling concd. acids removed from montmorillonite all metallic cations and probably also the ions O and OH that were between the 2 simple layers of silicates that formed the elementary plates of the structure. The structure of these plates was not altered by removal of cations so long as the no. of valences extd. did not exceed 8.

10493. Petrov, A. A. **The influence of catalysts on the order of addition of alcohols to propylene oxide.** *J. Gen. Chem.* (U.S.S.R.) **14**, 1038-43 (1944).—*C.A.* **40**, 7153^4.

Different isomeric monoethers of H_2C:CHMe were prepd. by reacting propylene oxide with large excesses of MeOH, EtOH, or PrOH in the presence of various catalysts. It was believed that Na alcoholates catalyzed the reaction by increasing the reactivity of the alc. without disturbing the relative stability of the two C—O bonds in propylene oxide, while in contrast, a change in relative stability of these bonds was effected by $ET_2O.BF_3$ and strong acids by virtue of formation of coordinate complexes with the epoxy O.

10494. Reyerson, L. H. and Oppenheimer, Hans. **The catalytic oxidation of ethylene to ethylene oxide.** *J. Phys. Chem.* **48**, 290-5 (1944).—*C. A.* **38**, 6178^1.

Catalysts of finely divided Ag supported on fused Al_2O_3 or produced by thermal decompn. of $Ag_2C_2O_4$ showed an optimum activity at 260-90°C, with yields of ethylene oxide of 30-45%. Addn. of steam lowered the activity slightly. Catalysts made by reduction of $Ag(NH_3)_2NO_3$-treated silica gel showed an optimum activity in the same temp. range with yields of 4-7% if the gas mixt. contained equal parts of steam and air.

10495. Riesz, C. H.; Pelican, T. L., and Komarewsky, V. I. **Catalytic dehydrogenation of natural-gas hydrocarbons.** *Oil Gas J.* **43**, No. 10, 67-9, 96-7 (1944).—*C.A.* **39**, 4749^8; **40**, 195^9.

Since neither a Cr_2O_3 gel catalyst nor a Cr_2O_3 catalyst supported on Al_2O_3 gave entirely satisfactory results, a catalyst was prepd. by co-pptn. of Cr and Al hydroxides. Expts. using this catalyst for the dehydrogenation of C_2H_6, C_3H_8, butane, and isobutane showed that equil. was almost attained at 450°-500°C for the latter 3 hydrocarbons. Above 500°C side reactions occurred and catalyst selectivity decreased.

10496. Roginskiĭ, S. Z. and Tsellinskaya, T. **Experimental investigation of the role of supersaturation in the preparation of catalysts.** *Acta Physicochim. U.R.S.S.* **19**, 225-47 (1944) (in English); *J. Phys. Chem. (U.S.S.R.)* **18**, 477-92 (1944).—*C.A.* **39**, 2447^8.

The decompn. of $NiCO_3$ was effected in an app. in which the CO_2 pressure was controlled by freezing out CO_2 in a cryostat maintained at various temps. The decompn. was autocatalytic. This decompn. was extremely rapid at CO_2 partial pressures of 10^{-4} to 10^{-2} mm of Hg; near the equil. pressure the decompn. was slow. The water content of the sample of $NiCO_3$ had a peculiar and as yet enexplained effect on the kinetics of the decompn.

10497. Schwab, Georg-Maria and Holz, Günther. **Electron concentration, lattice loosening, and catalysis.** *Z. anorg. Chem.* **252**, 205-24 (1944). *C.A.* **40**, 4282^6.

The velocity and the heat of activation of the dehydration of HCOOH by Ag alloys and a few Au alloys were detd. Vaporized HCOOH was passed over the catalyst in an elec. oven and the decompn. products were measured directly by flow meters. The alloying metals were Pt, Hg, Tl, Pb, Bi, Pd, Cd, In, Zn, Sb, Sn, and Ga. Pd, Pt, and Au decreased the heat of activation to a value that was between their own and that of Ag alone; all other elements increased it. Sb, Pb, and Bi gave very high increases. The activity increased linearly with the heat of activation.

10498. Schwab, George-Maria and Karatzas, Alexander. **Catalytic action of intermetallic phases and their mixtures.** *Z. Elektrochem.* **50**, 242-9 (1944).—*C.A.* **40**, 4942^6.

The activity and true heat of activation for the dehydration of formic acid were detd. by a dynamic technique on the various phases as revealed by x-ray examn. in the alloy systems Ag-Sb and Cu-Sn. Within the region of homogeneity of the α and β-phases, true heat of activation increased with the electron concn. and was of about of equal magnitude in the satd. phases and in the n-phase CuSn. The γ phase showed a striking max. in true heat of activation. These results were correlated with the wave-mech. theory of Hume-Rothery phases.

10499. Schwab, Georg-Maria and Schwab-Agallidis, Elly. **Is there coupled gas-solid catalysis?** *Kolloid-Z.* **109**, 99-106 (1944).—*C.A.* **41**, 2974*b*.

The catalytic splitting of HCOOH on solid Na_2SO_4 and $KClO_4$ had no effect on the very rapid transformation of the cryst. form of these salts. The temp. of the reaction BaO + $CuSO_4$ was reduced from 345° to about 280°C and that of the reaction BaO + $ZnSO_4$ from 340° to 305°C by the simultaneous catalyzed decompn. of EtOH. The results indicated that the reaction centers of the materials in the solid phase were too rigid to be changed by gas catalysis.

10500. Suito, Eiji. **Studies of colloidal catalysts by thermal analysis of the reaction velocity. V. Surface condition of the platinum catalyst judged from the carbon monoxide poisoning in the hydrogen peroxide decomposition reacton.** *Rev. Phys. Chem. Japan* **18**, 96-108 (1944).—*C.A.* **41**, 4698*f*.

The H_2O_2 decompn. reaction in the presence of Pt sol was retarded in the beginning owing to the transitory poisoning of Pt sol by CO before it acquired the ordinary reaction velocity when CO was removed by its oxidation by H_2O_2 or O_2 adsorbed from the air. The H-Pt sol was black and remained black after satn. with CO, the removal of which restored the original catalytic activity. The O-Pt sol was brown (owing to PtO_n on the surface) and turned red after satn. with CO.

10501. Tanida, Shigeo. **Studies on mixed catalysts. IV. High-pressure hydrogenation of benzene by means of nickel-molybdenum and nickel-tungsten catalysts. V. Promoting action of molybdenum and tungsten in the alloy systems for hydrogenation.** *Bull. Chem. Soc. Japan* **19**, 122-7, 129-39 (1944).—*C.A.* **42**, 329*i*, 330*h*.

If Mo or W was added to a Ni catalyst, the catalyst became heat-proof and acquired great activity. Prepn. of the catalyst by reduction should be carried out at a temp. as low as possible. If a gas mix. of H_2 and either benzene or ethylene was used, the reduction proceeded more smoothly at a lower temp. Nitro-benzene or acetone was hydrogenated in the presence of mixed catalysts composed of 2 or 3 elements: Ni-Al, Ni-Mo-Al, Ni-W-Al, Ni-Fe-Al, Ni-Si, Ni-Mo-Si.

10502. THACKER, CARLISLE M. AND MILLER, ELMER. **Carbon bisulfide production. Effect of catalysts on reaction of methane with sulfur.** *Ind. Eng. Chem.* **36**, 182-4 (1944).—*C.A.* **38**, 1080^6.

High yields of CS_2 were obtained by reaction of CH_4 with S at 700°C and below in the presence of catalysts. Particularly suitable catalysts were silica gel, activated Al_2O_3, promoted activated Al_2O_3, and Florite. Activated Al_2O_3 contg. a small amt. of Cr oxide gave yields of over 90% at below 700°C.

10503. TOMITA, AKIRA. **Zinc catalyst. III. Effect of the temperature of heat-treatment on catalytic activity.** *J. Chem. Soc. Japan* **65**, 478-86 (1944).—*C. A.* **41**, 3354*a*.

Oxides of Zn were prepd by adding K_2CO_3 or KOH to aq. soln. of $Zn(NO_3)_2$ and then heating the resulting ppt. at various temps. for dehydration. The oxide obtained by heating at 200°C gave the best result.

10504. TURKEVICH, JOHN. **Magnetic studies of chromium oxide catalysts.** *J. Chem. Phys.* **12**, 345-6 (1944).—*C.A.* **38**, 5452^2.

Cr oxide gel, obtained by the slow interaction in dil. soln. of $Cr(NO_3)_3$ with NH_3, was an efficient catalyst in hydrogenation-dehydrogenation reactions of hydrocarbons. This gel catalyst was unstable with respect to inactive cryst. Cr_2O_3, and reverted to the latter, undergoing the "glow phenomenon". Activated H_2 adsorption did not markedly affect the magnetic susceptibility of the active gel catalyst. The dried gel had an O-content intermediate between Cr_2O_3 and CrO_3.

10505. VAN ANTWERPEN, F. J. **Thermofor catalytic cracking.** *Ind. Eng. Chem.* **36**, 694-8 (1944).—*C. A.* **38**, 5067^1.

The thermofor process employed a moving catalyst. The catalyst flowed by gravity through the reaction zone after having been carried to the top of the reactor and regeneration kiln by elevators. The reaction temperatures were between 850-950°F and the reaction pressure was about 10-15 p.s.i. Clay of mesh size 6 was employed as catalyst and its regeneration was accomplished by burning off the carbon. A two-pass operation yielded butylenes equivalent to 8 percent of the gas oil.

10506. YAMAGUCHI, SHIGETO AND KWAN, TAKAO. **Electron-diffraction study of the surface structure of a catalyst. I.** *J. Chem. Soc. Japan* **65**, 378-80 (1944).—*C. A.* **41**, 3352*i*.

The surface of the Ni catalyst used in the hydrogenation of acetone was studied. The catalyst was prepd. as follows: pure Ni plate was polished, oxidized by air at 400°C overnight, reduced by means of H_2 at 300-400°C for 2 days, exposed to H_2S at 3 cm Hg pressure at 300°C for 5 hrs. The formation of NiS on the surface was confirmed. The effect of the ionic layers of S on the surface on the catalytic action was discussed.

10507. ALDRICH, R. C. **Manufacture and regeneration of Fischer-Tropsch catalyst.** *Natl. Petroleum News* **37**, No. 45, R922-4 (1945).—*C. A.* **40**, 195^7.

A study of the normal Co-Mg-Th-kieselguhr type catalyst used in a com. plant at Harnes, France, was given.

10508. ALEKSEEVSKIĬ, E. V. AND FRID, K. V. **The sorption and catalyst properties of active manganese dioxide toward vaporous and gaseous substances. IV. Catalytic properties of α-, β-, and γ-modifications of manganese dioxide.** *J. Gen. Chem.* (U.S.S.R.) **15**, 3-8 (1945) (English summary).—*C.A.* **40**, 1382^3.

Three modifications of MnO_2 were prepd. and their x-ray patterns detd. The size of crystals was smallest in α-, medium in γ-, and largest in β-modification. The catalytic oxidation of $PhNH_2$ into PhN:NPh proceeded effectively in the presence of the α-modification (the yield 45%), less in the presence of γ-(the yield 3%), and not at all in the presence of β-(the yield traces). The catalytic oxidation of CO was effected only in the presence of α-modification.

10509. ARCHIBALD, R. C. AND GREENSFELDER, B. S. **Promoted chromia-alumina catalyst for converting heptane to toluene.** *Ind. Eng. Chem.* **37**, 356-61 (1945).—*C.A.* **39**, 2629^2.

An active catalyst for the cyclization of paraffins was prepd. by adding chromic acid to γ-Al_2O_3 in just enough water for the CrO_3 to be absorbed completely. It was then calcined. Of promoters tried, K proved to be one of the best. Non-aromatizable hydrocarbons present in the charge had a poisoning action.

10510. BALANDIN, A. A. **Kinetics of hydrogenation and of related reactions. I. Mechanism of hydrogenation, dehydrogenation, and deuterium exchange. II. Kinetics of hydrogenation with nickel, platinum, and copper. III. Selective hydrogenation.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* **1945**, 339-58 (English summary); *Acta Physicochim. U.R.S.S.* **22**, 81-100, 101-20, 338-56 (1947).—*C.A.* **40**, 4593^7; **41**, 6801*a*.

Two kinds of active centers were assumed: K, capable of activating the adsorbed H_2, and K', activating only the hydrogenatable org. substance. Both K and K' adsorbed both H_2 and the initial, intermediate, or final products; the establishment of the adsorption equil. was faster than the subsequent reaction. Quant. treatment of these assumptions led to reaction rate equations for the cases of hydrogenation, dehydrogenation, and deuterium exchange, in terms of concns. of the initial, final, and extraneous products and of H_2 pressure, and of the rate consts. of the elementry steps of adsorption, activation, and chem. reaction.

10511. BALANDIN, A. A. **Catalytic hydrogenation. I. Kinetic equation of hydrogenation and dehydrogenation over nickel catalyst. II. Catalytic hydrogenation over nickel and platinum.**

Hydrogenation by deuterium. *J. Gen. Chem.* (U.(U.S.S.R.) **15**, 608-18, 619-27 (1945).—*C.A.* **40**, 5627^2.

Hydrogenation was assumed to require different areas of a Ni catalyst for activation of the hydrogenating substance and for activation of H_2. The adsorption on the active points of either type occurred according to the Langmuir isotherm. The kinetic equations deduced from these considerations explained the quant. relations observed in hydrogenation of toluene over a Ni catalyst on an Al_2O_3 carrier. The theory was used to explain the variation of the temp. effect with pressure, and the change of reaction order in catalyst poisoning by CO.

10512. BALANDIN, A. A. **Catalytic hydrogenation. 111. Further development of the theory. Hydrogenation over copper and palladium.** *J. Gen. Chem.* (U.S.S.R.) **15**, 770-80 (1945).—*C.A.* **40**, 6326^3.

The chem. reaction was assumed to take place between adsorbed material to be hydrogenated and adsorbed H_2 with the formation of an adsorbed semihydrogenated product. The latter reacted with adsorbed H_2 in a second step to form adsorbed hydrogenated product. Data for the hydrogenation of C_2H_4 over Cu, and of C_6H_6 and PhMe over Pd, could be expressed approx. by equations developed for the equalibria of the assumed reactions.

10513. BALANDIN, A. A. **Catalytic hydrogenation. IV. Modification of the hydrogen surface. Selective hydrogenation of mixtures.** *J. Gen. Chem.* (U.S.S.R.) **15**, 781-90 (1945) (English summary).—*C.A.* **40**, 6326^6.

The theoretical rate of hydrogenation was found to be zero order at the beginning of the reaction and first order near the end, which was in agreement with known facts. An equation was derived for selective hydrogenation that expressed correctly the complex aspect of the kinetic curves that had been reported.

10514. BALANDIN, A. A.; BOGDANOVA, O. K., AND SHCHEGLOVA, A. P. **Catalytic dehydrogenation of commercial butane-butylene fraction of cracking gas.** *J. Applied Chem.* (U.S.S.R.) **18**, 609-11 (1945).—*C.A.* **40**, 6791^4.

Catalytic dehydrogenation of com. mixt. of butane-butylene showed the possibility of production of butadiene from petroleum cracking gases. Three catalysts were approx. equally effective in producing 35-49% butadiene at 570-625°C with contact time of 1-2 sec.

10515. BALANDIN, A. A. AND EĬDUS, YA. T. **Principle of conservation of the valence angle in the multiplet theory of catalysis.** *Compt. rend. acad. sci. U.R.S.S.* **49**, 655-7 (1945) (in English).—*C.A.* **40**, 5627^5.

The stereofactors in the formation of activated complexes on hydrogenation and dehydrogenation catalysts were considered. The optimum internuclear distance in the crystal lattice of the active metal could be calcd. from the valence bonds and angles of the complex, and on this basis, W, Mo, V, Cr, and Fe were suggested as catalysts for the hydrogenation of ethylene. The difference in hydrogenation activities of different planes of Ni crystals was offered as addnl. evidence for the theory.

10516. BENTLEY, F. J. L. AND FEACHÉM, C. G. P. **Alumina catalysts for organix reactions.** *J. Soc. Chem. Ind.* **64**, 148-9 (1945).—*C.A.* **39**, 4279^7.

The active form of Al_2O_3 catalysts γ-alumina, was hydrated to boehmite. Repeated hydration and and dehydration enchanced or restored the activity of alumina catalysts as evaluated by the dehydration of ethanol to ethylene. The hydrations were accomplished in water at 60°C for 3-day periods, each of which was followed by dehydration at 450°C in air.

10517. BOOTH, N.; WILKINS, E. T.; JOLLEY, L. J., AND TEBBOTH, J. A. **Catalytic synthesis of methane. Experimental work at the Fuel Research Station.** *Gas Research Board, Communi.* **GRB21**, 39 pp. (1945).—*C.A.* **43**, 2402*a*.

Synthesis from H_2-enriched blue water-gas on a reduced catalyst containing Ni 100, ThO_2 22, kieselguhr 100 pts. became vigorous at approx. 220°C. The temp. of the catalyst rose and the reaction reached equil. at a space velocity 3700 vols. per vol. per hr. The catalyst was very sensitive to S compds. Carbon deposition decreased rapidly as the H_2/CO ratio (R) rose, but still occurred at the inlet end of the bed when $R = 1.5$. Deposition of carbon was retarded by replacing part of the ThO_2 by MgO, by washing and calcining the kieselguhr carrier at 700°-800°C, and by pptg. the catalyst in the presence of small amts. of phosphate.

10518. BURFORD, W. B., III AND FRAZER, J. C. W. **The poisoning of nickel hydrogenation catalysts by water vapor.** *J. Am. Chem. Soc.* **67**, 331-2 (1945).—*C.A.* **39**, 1350^3.

Water vapor poisoned Ni hydrogenation catalysts, the effect being noticeable as low as 3×10^{-4} mm pressure of water vapor. The poisoning was reversible, the catalyst being reactivated by heating in H_2.

10519. CHAO, TSUNG-YAO; HSU, WEI-WEN, AND WEN, CHANG. **A study of iron catalysts for the synthesis of liquid fuels from carbon monoxide and hydrogen.** *J. Chinese Chem. Soc.* **12**, 1-14 (1945).—*C.A.* 40, 3865^7.

Fe plus varying amts. of Cu as promoter were dissolved in HNO_3, mixed with starch, kieselguhr, and K_2CO_3 and ignited. Water gas was passed through the reactor at a rate of 2 liters per hr and the yield measured in terms of ml/m^3 of gas. Each run was continued for 20 days or more and the products were examd. daily. Optimum results at 240°C were obtained when about 0.5% of K_2CO_3 was present and the Fe:Cu ratio 5:1.

10520. EĬDUS, YA. T. **Investigation of the catalysts for hydrogenation of carbon monoxide by joint application of the dynamic and the static methods. III. Role of the alkaline activator in the formation of the surface of the Fe-Cu-ThO_2-K_2CO_3-kieselguhr catalyst.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* **1945**, No. 1, 62-70 (English summary).—*C.A.* **39**, 4792^2.

The activity of 5 catalysts, comprising the components of the complex catalyst, and their combinations was investigated. The alk. activator K_2CO_3 occupied a substantial portion of the contact surface, caused the interaction of CO_2 with the catalytic surface at 258°C, and played an important part in the catalytic processes of carbide formation and hydrogenation of CO.

10521. EUCKEN, A. AND WICKE, E. **The interpretation of heterogeneous dehydrating catalyses by exchange of hydrogen atoms.** *Naturwissenschaften* 32, 161-2 (1945).—*C.A.* 40, 2062⁵.

The heat of adsorption of PrOH and of H_2O on the catalytically active centers of bauxite was about the same (30 to 25 kcal per mole). Intensive degassing of the bauxite, 900°C in high vacuum, caused the activity to decrease, and to recover only after an induction period. The catalyst lost considerable H_2O during degassing. Treatment of the degassed bauxite with H_2O vapor eliminated the induction period.

10522. FAIRBROTHER, F.; SKINNER, H. A.; SYKES, P. H.; EVANS, A. G.; POLANYI, M.; MELVILLE, H. W., AND EVANS, M. G. **Friedel-Crafts Catalysts and polymerization.** *Nature* 156, 638-9 (1945).

The most active catalysts showed greater percentage bond-contraction than did the weaker catalysts. The effectiveness of the catalyst may be due to the decrease in free energy from catalyst—reactant complex to catalyst-product complex being more marked than the decrease in free energy of the reaction in the absence of catalyst. The polymerization of *iso*-butene catalysed by BF_3 suggested an energy chain-mechanism. Experiments on the photopolymerization of vinyl acetate were discussed. The steric factor for propagation in polymerization given by the transition state theory was of the same order as that found experimentally. In the case of termination reactions, however, the theory was unable to interpret the experimental results.

10523. FREĬDLIN, L. KH.; BALANDIN, A. A.; LEBEDEVA, A. I., AND FRIDMAN, G. A. **Catalytic replacement of halogen by hydroxyl in the aromatic series. I. Catalytic activity of silica gels and their deactivation.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* 1945, 53-60 (in English, 60-1).—*C.A.* 40, 4576⁶.

The activity of silica gels in the vapor-phase hydrolysis of PhCl was studied. The temp. and the space velocity were the most important factors affecting the direction and the rate of the reaction. Silica gels were deactivated above 550-600°C (Okatov's gel), and some were deactivated even at 450°C (German gel). The impregnation of silica gel with H_3PO_4 deactivated it for the vapor-phase hydrolysis of PhCl, but made it 24 times as active in the reaction of dehydration of alc.

10524. FREĬDLIN, L. KH.; BALANDIN, A. A.; FRIDMAN, G. A., AND LEBEDEVA, A. I. **Catalytic replacement of halogen by hydroxyl in the aromatic series. II. Activators of silica gel.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* 1945, 375-83 (English summary).—*C.A.* 40, 4576⁹.

With highly active purified silica gel catalysts (in quartz or Pyrex reaction tubes 15-20 mm long, catalyst 50 ml, temp. const. within ± 1°) most inorg. salts were actually found to lower its catalytic activity with regard to the yield of phenol. The catalyst was regenerated by heating in a stream of air at 500°C for 5 hrs. With $CrCl_3$ (5%) in the catalyst, the activity was lowered in the whole temp. range 450°-550°C; at 550°C, the phenol yield was 8-10%, as compared with the 20-22% without salt.

10525. GHOSH, J. C. AND ROY, A. N. **Catalytic formation of diolefins from monoölefins.** *Current Sci.* 14, 156-7 (1945).—*C.A.* 39, 4791⁵.

The chem. equil. in the catalytic dehydrogenation of $EtCH:CH_2$ and of $Me_2CHCH:CH_2$ at low pressures was studied. The temp. of neutral equil. for $EtCH:CH_2$ was found to be 744°C, for $Me_2CHCH:CH_2$, 671.5°C. The various thermodynamic functions involved in the dehydrogenation equil. were calcd. and tabulated.

10526. GHOSH, J. C. AND SASTRY, S. L. **Chromium oxide as a promoter in catalysts for the Fischer-Tropsch synthesis.** *Nature* 156, 506-7 (1945).—*C.A.* 40, 1083⁵.

The use of a Cr_2O_3 catalyst (composed of Co 34%, Cu 4%, ThO_2 2.3%, Ce_2O_3 0.24%, Cr_2O_3 4.6%, on kieselguhr) gave yields of liquid hydrocarbons about double those obtained with Fe-Cu catalysts.

10527. GLUKHOVSKAYA, L. AND BRUNS, B. **Catalytic oxidation of hydrogen in the presence of manganese dioxide.** *J. Phys. Chem.* (U.S.S.R.) 19, 262-5 (1945).—*C.A.* 40, 514⁴.

A mixt. of H_2 and O_2 was recirculated over MnO_2 previously heated for several hrs at 200-300°C. The yield of H_2O was immeasurably small below 100°C. At 125° and 150°C the activity of the catalyst decreased during an expt. to about 0.6 of the original activity; at 175°C its activity was const. The rate of reaction was independent of O_2 (37 to 300 mm of dibutyl phthalate) and roughly proportional to H_2 (75 to 300 mm of dibutyl phthalate). The energy of activation was 14,300 cal per mol.

10528. GREENSFELDER, B. S. AND VOGE, H. H. **Catalytic cracking of pure hydrocarbons. Cracking of paraffins.** *Ind. Eng. Chem.* 37, 514-20 (1945).—*C.A.* 39, 4445⁵.

A series of individual paraffin hydrocarbons from C_3H_8 to wax were subjected to cracking with "UOP cracking catalyst type B," of which the principal components were SiO_2, ZrO_2, and Al_2O_3. C_3H_8 underwent little change. C_4H_{10} was not isomerized. Cracking was not extensive until decane and isodecane were reached. The catalyst had little effect on the 1st and 2nd C—C bonds of normal paraffin chains, but caused the inner bonds to break more easily. Isomerization occurred chiefly in olefinic compds. No direct isomerization of paraffins was noted.

10529. GREENSFELDER, B. S. AND VOGE, H. H. **Catalytic cracking of hydrocarbons; cracking of olefins.** *Ind. Eng. Chem.* 37, 983-8 (1945).—*C.A.* 39, 5443².

Cracking of olefins over a SiO_2-ZrO_2-Al_2O_3 catalyst was studied under conditions similar to those used in the cracking of paraffins. Aliphatic 2-16-C olefins and several diolefins and cyclic olefins were examd. Generally 400°C was used for aliphatic olefins and 500°C for the others. The olefins were more reactive than were the paraffins. The cyclic olefins showed even higher reactivity and gave exceptionally large quantities of higher-boiling products.

10530. GREENSFELDER, B. S. AND VOGE, H. H. **Catalytic cracking of pure hydrocarbons. Cracking of naphthenes.** *Ind. Eng. Chem.* 37, 1038-43 (1945).—*C.A.* 40, 699^7.

Naphthenes such as cyclohexane, methylcyclopentane, methylcyclohexane, hexahydroindan, isopropylcyclohexane, decalin, cyclopentylcyclohexane, amylcyclohexanes, bicyclohexyl, and amyldecalins were investigated. Under conditions similar to the cracking of olefins and paraffins over a SiO_2 (86.2%)—ZrO_2 (9.4%)—Al_2O_3 (4.3%) catalyst, it was found that the total decompn. increased with mol. wt from 7% for C_6 to 79% for C_{18}. A comparison with thermal cracking was made and showed that catalytic cracking was 500 to 4000 times faster, gave more satd. gases and liquids, a higher ratio of liquid to gas, and showed a smaller amt. of condensation products.

10531. GREENSFELDER, B. S.; VOGE, H. H., AND GOOD, G. M. **Catalytic cracking of pure hydrocarbons. Aromatics and comparison of hydrocarbon classes.** *Ind. Eng. Chem.* 37, 1168-76 (1945).—*C.A.* 40, 1010^6.

The catalytic cracking of 22 aromatic hydrocarbons over a SiO_2-ZrO_2-Al_2O_3 catalyst was studied. The preferred flow rate was 13.7 moles of hydrocarbon per liter of catalyst per hr. At 500° and 550°C the percentages of toluene cracked were 1.7% and 1.2%, resp. Propylbenzene and isopropylbenzene were decompd. (43% and 80%, resp.) almost exclusively into propylene and benzene. Mild cracking (400) of butylbenzene, *sec*-butylbenzene, and *tert*-butylbenzene resulted in 13.9%, 49.2%, and 80.4% decompn.

10532. GREKHNEV, M. A. AND EROSHEVSKIĬ, I. G. **Relation between the rate of catalytic reactions and the quantity of catalyst used.** *J. Gen. Chem.* (U.S.S.R.) 15, 146-50 (1945) (English summary).—*C.A.* 40, 1382^5.

The dehydrogenation of isoborneol over Cu-Ni catalyst at 185-96°C increased with increase in the quantity of catalyst used to a limiting value, beyond which almost no increase was achieved.

10533. GRINEVICH, V. M. **Selection of new raw materials for ammonia catalyst.** *J. Applied Chem. (U.S.S.R.)* 18, 313-21 (1945) (English summary).—*C.A.* 40, 3576^2.

Ores, after magnetic sepn. from SiO_2, were possible NH_3 catalysts since the presence of SiO_2 up to 2% did not show a neg. effect on the catalyst activity, provided that enough K_2O was present. The ore was subjected to double magnetic sepn., alk. fusion, and followed by a double sepn. to yield 23% of finished product. The catalyst could be regenerated by oxidation of KNO_3.

10534. GRYAZNOV, V. M.; KOROBOV, V. V., AND FROST, A. V. **Active centers of aluminosilicate catalysts.** *Compt. rend. acad. sci. U.R.S.S.* 48, 339-42 (1945).—*C.A.* 40, 4942^4.

A no. of catalysts for enriching benzene and cracking gas oil were studied. The catalysts were prepd. by impregnating pure silica gels with acidified aq. $Al_2(SO_4)_3$ solns. of various concns. The disproportioning of H_2 proceeded as a reaction of the first order, which provided a method of estg. the activity of a catalyst. The active centers were groups of two Al atoms each.

10535. HASEGAWA, SHIGEO. **Physicochemical studies of copper catalyst. V. The decomposition of methanol by reduced copper.** *Rev. Phys. Chem. Japan* 19, 132-9 (1945) (English summary, 151-2).—*C.A.* 44, 2356*g*.

CuO obtained by adding KOH soln. to $Cu(NO_3)_2$ was reduced by H_2 at 280°C for 24 hrs. The results indicated: $CH_3OH \rightarrow H_2 + HCHO \rightarrow H_2 + CO$. If the initial pressure of methanol was a and the pressures of HCHO and of CO at time t were x and y, resp., the reaction velocity was expressed by $dz/dt = K_1(a - z)/-z^n$, where $z = x + y$ and n was const. greater than 1. The apparent heats of activation of the first and second reaction stages were $E_1 = 17.7$ and $E_2 = 14.0$ kcal, resp.

10536. HERBO, CL. AND HOU, S. **The mechanism of catalytic reactions. IV. The benzene-catalyst interaction.** *Bull. soc. chim. Belg.* 54, 203-35 (1945) (in French).—*C.A.* 41, 1537*e*.

The interaction of benzene with Ni-Cr_2O_3 catalyst during hydrogenation and the nature of the forces involved were studied. The heat of adsorption of benzene on Ni catalyst was 12,300 cal/mol. The heat of adsorption of H_2 under the same conditions was much greater (about 40,000 cal/mol.). H_2 dominated the catalytic surface almost to the complete exclusion of the benzene mols. Since hydrogenation of the benzene must take place through union with H_2 on the catalytic surface, the reaction was very slow on Ni-Cr_2O_3 catalyst, because few gaseous benzene mols. reached the surface of the catalyst.

10537. HERINGTON, E. F. G. AND RIDEAL, E. K. **The catalytic cyclization of aliphatic hydrocarbons. I. II.** *Proc. Roy. Soc.* (London) A184, 434-46, 447-63 (1945).—*C.A.* 40, 1796^2.

The aromatization of a paraffin proceeded through the formation of a monoölefin which was held on the catalyst by two-point contact. The promoter action of the central atoms in heteropoly acids of Mo could be attributed to the stabilization of the MoO_2 produced during the H_2 pretreatment. The alumina used as a support for Mo catalysts played the same role.

10538. HULBURT, HUGH M. **Chemical reactions in continuous-flow-systems—heterogeneous reactions.** *Ind. Eng. Chem.* 37, 1063-9 (1945).—*C.A.* 40, 2^6.

An analysis of kinetics of wall-catalyzed reactions in a stream flowing through a cylinder showed that conversion depended on 2 dimensionless ratios involving diffusion rate, specific reaction rate, and over-all flow rate (space velocity).

10539. KOBOZEV, N. I.; NIKOLAEV, L. A.; ZUBOVICH, I. A., AND GOL'DFEL'D, YU. M. **The principle of ensemble and aggravation in catalysis. I. The**

method of fluctuation analysis of active centers. Catalysis in the range of subcrystalline structures. *J. Phys. Chem.* (U.S.S.R.) 19, 48-71 (1945); *Acta Physicochim.* U.R.S.S. 21, 289-320 (1946).—*C.A.* 39, 3722¹; 40, 6325⁹.

The active part of a catalyst consisted of a few atoms having the right configuration and being located on the surface of a support. If the no. of catalytically-active atoms in a cell equaled that required for the given reaction, this cell was an "active spot"; if *n* was too small or too large, this cell was inactive. The no. was 3 for Fe on charcoal or asbestos for NH_3 synthesis, 4 for Mo on charcoal for NH_3 synthesis, 2 for Pd on charcoal or $BaSO_4$ for hydrogenation of ethylene derivs., 2 for Pt-Hg for electrolytic hydrogenation of cinnamic acid, 2 for Fe-As for the same reaction, 2 for Pt on charcoal for hydrogenation of toluene.

10540. Kobozev, N. I. **The principle of ensemble and aggravation in catalysts. II. The principle of aggravation and a structure classification of catalysts.** *J. Phys. Chem.* (U.S.S.R.) **19**, 142-51 (1945).—*C.A.* **39**, 3997³.

The active atom, mol., or particle of a catalyst could combine (chemically or physically) with another active unit, forming an "active ensemble" or with an inactive unit ("aggravator") which, however, affected the activity of the active group.

10541. Kodama, Shinjiro; Tarama, Kimio; Takazawa, T.; Fujita, Koichi; Tejima, T.; Ito, S., and Yokomaku, Y. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. VII. Effect of temperature on synthesis with cobalt catalysts.** *J. Soc. Chem. Ind. Japan* **48**, 3-8 (1945).—*C.A.* 43, 2398*e*.

Hydrocarbons were prepd. from a 1:2 mixt. of CO and H_2 by means of Co 100, Cu 12.5, ThO_2 2.5, U_3O_8 1.25 and diatomaceous earth 125 parts, at 180°-290°C, and a period of operation of 24 hrs. Temp. elevation increased the yield of the lower hydrocarbons, but did not increase the relative yield of CH_4 as was the case with the Fe catalysts. The difference in comparing Co and Fe catalysts was explained by evapn. of hydrocarbons from the surface of the catalyst and a decrease in adsorbed H atoms.

10542. Kodama, Shinjiro; Tarama, Kimio; Takazawa, T.; Fujita, Koichi; Tejima, T.; Ito, S., and Yokomaku, Y. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. VIII. Effect of compn. of the synthesis gas on iron catalysts.** *J. Soc. Chem. Ind. Japan* **48**, 3-8 (1945).—*C.A.* 43, 2398*g*.

A catalyst of Fe 100, Cu 25, diatomaceous earth 125, and K_2CO_3 2 parts was used at 270°C over a period of 6 hrs. For the Gasol synthesis the optimum CO:H_2 ratio was 50-60 to 50-40. For the least CH_4 production the ratio was 1:1. For max. Gasol production with least CH_4 the ratio was 1:1.5.

10543. Kodama, Shinjiro; Tarama, Kimio; Takazawa, T.; Fujita, Koichi; Tejima, T.; Ito, S., and Yokomaku, Y. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. IX. Effect of addn. of diatomaceous earth on iron catalysts.** *J. Chem. Soc. Ind. Japan* **48**, 3-8(1945).—*C.A.* 43, 2398*h*.

A catalyst of Fe 100 + Cu 24 parts was used with CO and H_2 (1:1) at 270°C over a period of 16 hrs. The addn. of diatomaceous earth improved the life of the catalyst; 125% diatomaceous earth was most suitable for Gasol synthesis.

10544. Kodama, Shinjiro; Tarama, Kimio; Takazawa, T.; Fujita, Koichi; Tejima, T.; Ito, S., and Yokomaku, Y. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. X. Effect of various carriers on the iron catalysts.** *J. Chem. Soc. Ind. Japan* **48**, 3-8 (1945).—*C.A.* 43, 2398*i*.

A catalyst of Fe 100, Cu 25, and K_2CO_3 2 was used with CO and H_2 (1:1.5). With active carbon an increase in the volatile fractions was found. With white clay, the Gasol yield was very small, but its compn. was unusual being high in C_4 and C_3 hydrocarbons, and the degree of unsatn. high (70-85%). Japanese acid clay increased the yield of gaseous hydrocarbons, 125% giving max. Gasol (27.4 liters per m³).

10545. Kodama, Shinjiro; Tarama, Kimio; Takazawa, T.; Fujita, Koichi; Tejima, T.; Ito, S., and Yokomaku, Y. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. XI. A comparative study of the synthesis under normal pressure and other pressures. XII. Effect of pressure. XIII. Effect of temperature at constant pressure.** *J. Soc. Chem. Ind. Japan* **48**, 3-8 (1945).—*C.A.* 43, 2398*e*, 2399*a*, *b*.

With a catalyst of Fe + 25% Cu on 125% diatomaceous earth at 5-20 kg/cm² the yield of Gasol and the rate of reaction showed max. values at 15 kg/cm². With the same catalyst + 2% K_2CO_3 on 125% white clay at 5-40 kg/cm² there was no change in the yield of oil. Elevation of temp. increased the yield of lower hydrocarbons, but increased yields of CH_4 also occurred because of the increase in the reactivity of H_2.

10546. Kodama, Shinjiro; Tarama, Kimio; Takazawa, T.; Fujita, Koichi; Tejima, T.; Ito, S., and Yokomaku, Y. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. XIV. Effect of various carriers and promoters.** *J. Chem. Soc. Ind. Japan* **48**, 3-8 (1945).—*C.A.* **43**, 2399*c*.

The effect of white clay and active carbon as carriers was studied for Fe + 25% Cu + 2% K_2CO_3. White clay increased the yield of hydrocarbons and decreased the reactivity of H_2. Active carbon increased the reactivity. The effect of K_2CO_3 on the following catalysts was studied: Fe + 25% Cu + 250% white clay, Fe + 25% Cu + 125% active carbon, and Fe + 25% Cu + 125% Japanese acid clay. K_2CO_3 increased the yield of higher hydrocarbons, decreased the reactivity of H_2, and increased the unsatd. content of the Gasol.

10547. Kodama, Shinjiro; Tarama, Kimio; Takazawa, T.; Fujita, Koichi; Tejima, T.; Ito, S., and Yokomaku, Y. **Synthesis of gaseous hydrocarbons from carbon monoxide and hydrogen. XV. Summary of the studies on the synthesis under pressure.** *J. Chem. Soc. Ind. Japan* **48**, 3-8 (1945).—*C.A.* **43**, 2399*e*.

Pressure increased the life of Fe catalysts, and increased the total rate of reaction; the yield of Gasol approached 30 liters/m^3. The optimum temp. was 270-320°C. Raising the pressure increased the tendency to form higher hydrocarbons as well as lower hydrocarbons, especially CH_4 and C_2H_6.

10548. Lel'chuk, S. L. **Effect of promoters in the catalytic dehydrogenation of alcohols to esters as related to their place in the periodic table.** *Compt. rend. acad. sci. U.R.S.S.* 49, 652-4 (1945) (in English).—*C.A.* 40, 5627^7.

The activity of metals and their oxides as promoters for the catalytic dehydrogenation of alcs. to esters over Cu was related to their position in the periodic system. Data on conversions of EtOH to ethyl acetate (and acetaldehyde) showed greatest activity with 0.1% U^{+3} on Cu, with 55.7% conversion to ethyl acetate. Active elements included Ce in group III, and the even series in groups IV, VI, and VIII, more effective with increasing at. wt.

10549. Luyten, L. and Jungers, J. C. **The kinetics of the catalytic synthesis of methane in nickel.** *Bull. soc. chim. Belg.* **54,** 303-18 (1945).—*C.A.* 41, 2310*f*.

The reaction was characterized by a strong adsorption of CO on the catalyst and a comparatively weak adsorption of H_2 (or D_2). The reaction was not inhibited by the products of the reaction. The energies of activation were $E_{CH_4} = 27,000$ cal, $E_{CD_4} = 25,000$ cal.

10550. Mamedli, M. G. **Catalytic desulfurization of gasolines.** *J. Applied Chem.* (U.S.S.R.) **18,** 62-8 (1945).—*C.A.* **39,** 5443^6.

Some samples of Apsheron clays could be used directly as desulfurizing catalysts in vapor-phase gasoline treatment at 300°C and 1 atm. pressure with 1:1 ratio between clay vol. and gasoline vol. per hr. The S content was reduced by 75%.

10551. Mavity, Julian M.; Zetterholm, Earl E., and Hervert, Geo. **Styrene production by catalytic dehydrogenation—low pressure operation.** *Trans. Am. Inst. Chem. Engrs.* **41,** 519-28 (1945).—*C.A.* **40,** 240^6.

The catalytic dehydrogenation of ethyl-benzene to styrene was discussed with particular regard to the effect of the operating variables, pressure, temp., space velocity, and process period length on conversion, styrene yield, and extent of carbon deposition. Correlations based on lab.-scale expts. with Universal Oil Products com. dehydrogenation catalyst showed favorable effects from reduction of pressure or from increase in temp. within the respective ranges investigated (80 mm abs. to 50 p.s.i.g., and 550° to 630°C).

10552. Maxted, Edward B. **The detoxication of of catalyst poisons. I. General survey of some detoxicants.** *J. Chem. Soc.* **1945,** 204-7.—*C.A.* **39,** 3997^8.

The applicability of various peracids or their salts as detoxicating agents for Pt hydrogenation catalysts was studied. Poisons investigated were cysteine, β-thionaphthol, and thiophene. Persulfates, perphosphates, perchromates, and other compds. were considered.

10553. Maxted, Edward B. **Form of catalyst poisoning curves.** *Trans. Faraday Soc.* **41,** 406-10 (1945).—*C.A.* **39,** 5160^8.

The poisoning of Pt catalysts by thiophene and by β-thionaphthol for the hydrogenation of crotonic acid was studied. Exptl. conditions were chosen so that zero-order hydrogenation was obtained with an unsupported formate-reduced Pt of approx. uniform grain size, and a nearly zero-order hydrogenation with another kieselguhr-supported catalyst made by reduction with H_2 of Pt Cl_4 in glycerol suspension.

10554. Maxted, Edward B. **Studies in the detoxication of catalyst poisons. II. Use of various oxidizing agents for the detoxication of cysteine.** *J. Chem. Soc.* **1945,** 763-6.—*C.A.* **40,** 3046^9.

The detoxication of cysteine was studied (in the hydrogenation of unsatd. compds. with a Pt catalyst) by means of perphosphoric acid, potassium persulfate, dil. HNO_3 and H_2O_2. The first and the last together were probably the most satisfactory reagents. The soln. at the concn. used did not appreciably attack the double bond of the unsatd. substance in which the cysteine occurred as poison.

10555. Maxted, Edward B. and Marsden, Arthur. **Studies in the detoxication of catalyst poisons. III. Detoxication of cysteine with metallic peracids.** *J. Chem. Soc.* **1945,** 766-8.—*C.A.* **40,** 3047^1.

Complete restoration of the activity of Pt catalyst, previously reduced to about 1% of the original value, was obtained by using solns. contg. small quantities of pertungstates, permolybdates, or pervanadates. Twenty-fold amts. of pertitanates and peruranates were less effective.

10556. McBee, E. T.; Hass, H. B., and Wiseman, P. A. **Catalytic vapor-phase oxidation of ethylene.** *Ind. Eng. Chem.* 37, 432-8 (1945).—*C.A.* 39, 2736^4.

C_2H_4 was converted to ethylene oxide, CO_2, and H_2O in a catalytic vapor-phase air oxidation. A controlled mixt. of air and C_2H_4 was preheated and oxidized over a Ag catalyst in a Pyrex tube surrounded by a molten salt bath. The catalyst was prepd. by coating pieces of corundum with Ag_2O.

10557. Mercier, Stanley M. **Hot-catalyst elevators.** *Mech. Eng.* 67, 635-8 (1945).—*C.A.* **40,** 4^2.

Catalyst elevators used in Thermofor catalytic cracking units were described. Bucket-type elevators employing 2 strands of chain of welded construction were found most suitable and a Ni-Cr-iron bushing specially heat-treated to work with a medium Cr-Mo heat-treated pin was developed.

10558. Newton, R. H.; Dunham, G. S., and Simpson, T. P. **The TCC catalytic cracking process for motor gasoline production.** *Trans. Am. Inst. Chem. Engr.*, **41,** 215-32 (1945); *Natl. Petroleum News* 37, R441-52; *Oil Gas J.* **44,** No. 4, 84-95 (1945).—*C.A.* 39, 2863^8.

The TCC process had sep. reaction and regeneration zones and continuous movement of a solid catalyst through each. The factors governing rate of flow of pellet catalyst in beds, and methods of insuring uniform flow and distribution were studied in plant-scale models. The characteristics of the cracking catalyst required a min. temp. of about 900°F to burn off the coke deposit in order to regenerate the catalyst; and also the max. temp. must not be over about 1200°F, in order not to damage the catalyst.

10559. Newton, R. H. and Shimp, H. G. **The design and operating features of Houdry fixed-bed catalytic cracking units.** *Trans. Am. Inst. Chem. Engrs.* **41**, 197-213; *Natl. Petroleum News* **37**, R333-6 (1945).—*C.A.* **39**, 2864².

The oil to be cracked and the air for regeneration of the catalyst were alternately passed through a bed of pelleted catalyst. The alternate oil and air cycles made it necessary to purge the catalyst before and after each operation. The cyclic operation was carried out with 3 or more catalyst vessels so that the flow of both oil and air was continuous. The heat control of the catalyst vessels was accomplished by circulating an inorg. salt heat-transfer medium. To promote rapidity of combustion of the carbon deposit, and permit max. utilization of the catalyst, air at about 45 p.s.i. was used for regeneration.

10560. Nikolaeva, A. F.; Tatevskiĭ, V. M., and Frost, A. V. **The catalytic action of aluminosilicates. IV. Transformation of cyclohexene over activated clay.** *J. Gen. Chem. (U.S.S.R.)* **15**, 796-8 (1945).—*C.A.* **40**, 6945⁶.

Passage of cyclohexene over activated clay at 260°C resulted in formation of methylcyclopentane and cyclohexane in the ratio 10:1. Small amts. of unsatd. and aromatic hydrocarbons were formed and there was a 14% loss as gas or tar.

10561. Paty, Marcel. **The activation of Raney nickel by sodium hydroxide.** *Compt. rend.* **220**, 827-9 (1945).—*C.A.* **40**, 2062⁸.

Hydrogenations were performed with 6 g Ni in 100 ml boiling EtOH. The addn. of 0.6 g NaOH cut the hydrogenation time of $Me_2C{:}CHMe$ (1/50 mole) from 2 hrs 13 min. to 1 hr 16 min.; for $PhCH_2CN$ (1/20 mole), 0.6 g NaOH cut the time from 129 min. to 54 min., but 1 g NaOH increased the time to 4 hrs; for anethole (1/10 mole), 0.3 g NaOH cut the time from 61 to 31 min., but 0.6 g NaOH increased it to 112 min. The alky. disappeared soon after the addn. of the NaOH. Action of the NaOH on residual Al or Al-Ni alloy in the Raney Ni was thought to change the activity of the catalyst.

10562. Rao, K. Venkateswara. **Synthesis of ammonia from active nitrogen.** *Proc. Indian Acad. Sci.* **22A**, 239-42 (1945).—*C.A.* **40**, 2594⁹.

Comparative tests were reported for 55 substances as catalysts for the synthesis of NH_3 from N_2 activated by a condensed elec. discharge. The catalysts giving the highest yields of NH_3 were, in decreasing order: Sn-Pb alloy, Mg, W, Rose metal, tin.

10563. Roginskiĭ, S. Z. **Kinetics of catalytic processes on highly nonuniform surfaces.** *Compt. rend. acad. sci. U.R.S.S.* **47**, 412-16; *Doklady Akad. Nauk S.S.S.R.* **47**, 430-4 (1945).—*C.A.* **40**, 4942².

A surface was assumed with a broad distribution of sites with respect to the heat of formation of the transition complex. The Langmuir system of equations of the kinetics was replaced by a new system which included (1) quasi van't Hoff kinetics equations, (2) zero orders for one or several components, (3) logarithmic or fractional power increase of the quantity adsorbed with time or complete independence of the concns. of the initial reactants, (4) fractional powers of the concns. of the reaction components.

10564. Roginskiĭ, S. Z. **Concentration isotherms of catalyst poisoning.** *Compt. rend. acad. sci. U.R.S.S.* **47**, 558-60; *Doklady Akad. Nauk S.S.S.R.* **47**, 579-81 (1945).—*C.A.* **40**, 3969⁹.

10565. Roĭter, V. A.; Gaukhman, S. S., and Tudorovskaya, M. A. **Catalytic oxidation of hydrogen sulfide in the presence of hydrogen.** *J. Applied Chem. (U.S.S.R.)* **18**, 459-68 (1945) (English summary).—*C.A.* **40**, 4858⁴.

The efficiency of a Ni-Pb catalyst on kieselguhr for the reaction of oxidation of H_2S in the presence of O_2, N_2, and H_2 was studied in relation to temp., space velocity, H_2S concn., O concn., and moisture. The extent of oxidation depended primarily on temp. and the ratio of O_2 to H_2S; this ratio was 2.5 to 4.0 for complete oxidation, with an apparent temp. max. at 370°C.

10566. Sakata, Tokuji. **The effect of pressure on the catalytic reaction between hydrogen and carbon monoxide.** *Rev. Phys. Chem. Japan* **19**, 50-66 (1945).—*C.A.* **45**, 3681e.

The synthesis of MeOH with a catalyst prepd. from CrO_3 and ZnO was studied at 330-400°C in the pressure range from 100 to 300 atms. The content of MeOH in the crude liquid product increased with pressure. A catalyst prepd. from $K_2Cr_2O_7$, ZnO, and KOH was used for the synthesis of isobutanol from H_2 and CO. The crude liquid product obtained at 300 atms. was richer in isobutanol than that at 100 atms., but the ratio of isobutanol to MeOH was not affected by the pressure.

10567. Simpson, T. P. **T.C.C. (Thermofor catalytic cracking) announces liquid processing using pelleted clay or beaded catalyst.** *Oil Gas J.* 44, No. 1, 88-90 (1945).—*C.A.* **39**, 3150⁹.

The catalyst was either pelleted clay or synthetic bead and the handling was the same for both the liquid and vapor charge processes. Normal operating ranges were 800-950°F, pressure 5-15 p.s.i.g., catalyst to oil ratio 1:1-6:1 catalyst residence time from a few min. to 2 hrs and space velocity of 0.2-3. Coke deposits were 2-3 times those for gas oil charge, but normal for heavy stocks.

10568. Simpson, T. P.; Eastwood, S. C., and Shimp, H. G. **Liquid-charge technique in thermofor-catalytic-conversion processing.**

Petroleum Refiner **24**, No. 11, 436-42 (1945); *Natl. Petroleum News* **37**, R977-83 (1945); *Oil Gas J.* **44**, No. 29, 119-29 (1945).—*C.A.* **40**, 447^7.

Concurrent solid-bed downflow type reactors were used and the feed either total liquid or liquid-vapor, or alternately vapor and liquid charged separately at the top of the reactor. Data were given showing properties of typical charge stocks and products. Deasphalting of charge greatly reduced coke and resulted in improved yields of motor gasoline. Catalyst may be synthetic bead, synthetic pellets, or pelleted clay.

10569. SPANGENBERG, JUAN G. **Esterification of acetic acid in the vapor phase. Catalytic action of some salts and metal oxides.** *Industria y quim.* (Buenos Aires) 7, 393-401 (1945).—*C.A.* **41**, 4028*e*.

Oxide catalysts were prepd. by satg. pumice with acetate or nitrate solns. and heating until oxides formed; salt catalysts, also on pumice, were heated to below decompn.: (1) ZrO_2 90.9, Ce_2O_3 9.1%; (2) Co_3O_4 98.5, ThO_2 1.5%; (3) ThO_2; (4) BeO; (5) CdO; (6) $ThO_2$50, Al_2O_3 50%; (7) Ce_2O_3; (8) $AgVO_3$ 92.6, Ag 7.3%; (9) $SrMoO_4$; (10) $Co_3(PO_4)_2$; (11) ZrO_2; (12) TiO_2. Yields were given for the vapor-phase esterification of AcOH with 5 primary, 1 primary unsatd., 2 secondary, and 3 tertiary alcs. The catalyst temp. varied from 245° to 410°C; the velocities ranged from 40 to 100 ml/hr. Best results were obtained with TiO_2, ThO_2, and ZrO_2 in descending order for all alcs. tested.

10570. STEINER, H. **Catalytic dehydrocyclization of paraffins.** *J. Am. Chem. Soc.* **67**, 2052-4 (1945).—*C.A.* **40**, 792^3.

Dehydrogenation and cyclization were both affected by the poisoning of the catalyst. Where the poisoning action was due to accumulation of polymer, the 2 reactions were affected to much the same extent. When H_2O, and particularly C_2H_4, was poison, the dehydrogenation rate was repressed even more than the cyclization, but the decline was still parallel.

10571. STOURDZÉ VISCONTI, YVONNE. **Obtaining elementary sulfur. The catalytic property of vanadium oxide in the reduction of sulfurous gas by carbon monoxide.** *Rev. quím. ind.* (Rio de Janeiro) **14**, No. 163, 22-6 (1945).—*C.A.* **40**, 5212^2.

Bauxite, impregnated with V salts, was used as catalyst in 197 tests carried out to obtain S from SO_2 and CO. The V catalyst acted not only by its surface action, but also by means of its lower oxides. Since SO_2 and CO both had a reducing action on the V oxides, especially V_2O_5, the S yields were affected in some tests by the reduction of the catalyst. The S yield increased with increasing concn. of the gas mixt. and improved at a ratio $CO/SO_2 > 2$, especially at a low velocity. The best results were obtained at 600°C and 25 liter/hr.

10572. THOMAS, CHARLES L. AND HOEKSTRA, JAMES. **Fluidized-fixed-bed method for contacting solids with gases and vapors.** *Ind. Eng. Chem.* **37**, 332-4 (1945).—*C.A.* **39**, 2024^5.

The flow of gases counter-to-gravity through a mass of powd. solid produced a "fluidized fixed bed" at certain crit. rates of flow. The fluidized fixed bed was particularly adapted to catalytic reactions where powd. catalysts could be used. Localized thermal effects in the catalyst bed were eliminated by the moving catalyst. The powder d., particle size and shape, and bed dimensions affected the limits of flow rate that would give the fluidized-fixed-bed condition. The procedure was applied to catalytic cracking of gas oil and to H_2-transfer treatment of unsatd. gasoline.

10573. TREJO, ALFONSO. **Catalysis by activated adsorption.** *Quimica* (Mex.) 3, 117-119 (1945).—*C.A.* **39**, 5160^6.

A design was suggested for a surface-catalytic reactor for, e.g., the oxidation of SO_2 on Pt black.

10574. VOORHIES, JR., ALEXIS. **Carbon formation in catalytic cracking.** *Ind. Eng. Chem.* **37**, 318-22 (1945).—*C.A.* **39**, 2194^5.

The wt percentage of carbon formed on the catalyst during catalytic cracking of hydrocarbons was approx. a logarithmic function of the length of time elapsed since the catalyst was regenerated. An equation was developed showing the interrelation of feed stock conversion, feed rate, and length of period between catalyst regenerations in a typical case. Carbon on the catalyst functioned as a diffusion barrier and the rate of diffusion was inversely proportional to the wt percentage of carbon on the catalyst.

10575. WAGNER, CARL. **Conversion over catalysts of maximum efficiency.** *Chem. Tech.* **18**, 1-7 (1945).—*C.A.* **44**, 10472*d*.

With streams in tubular canals and in corpuscular motion, the unconverted substrate fraction decreased exponentially with the length of the catalyst bed. The limiting length of the bed was that necessary for the disappearance of a substrate concn. for a given starting concn. In laminated gas streams, the limiting length was proportional to the stream velocity; however, with turbulent streams, the limiting length decreased only slightly with increased velocity. For the oxidation of NH_3 over a 3000-mesh/cm^2 Pt gauze, the upper limit of the velocity was 6 cm/sec when 99% of the NH_3 came in contact with the Pt surface.

10576. WAGNER, CARL. **Temperature adjustment on catalysts of maximum efficiency.** *Chem. Tech.* **18**, 28-34 (1945).—*C.A.* **44**, 10472*g*.

When the gas temp. was relatively low and the catalyst surface of the order of the max. temp., it was possible to have a completely adiabatic reaction course. The stability of specific operating conditions, such as the relation of the catalyst temp. and the change in the inlet gas temp., activation energy of the catalyst, substrate concn., and gas-stream velocity, was studied in detail.

10577. ZIMENS, KARL ERIK. **Kinetics of heterogeneous exchange reactions. I. Study of solid**

reactions by means of isotope exchange. *Arkiv Kemi, Mineral. Geol.* **A20**, No. 18, 1-26 (1945) (in German).—*C.A.* **41**, 4027*d*.

The general features of heterogeneous tracer reactions were outlined. The following steps were considered: (1) diffusion through the surrounding soln. or gas medium to the solid surface, (2) the chem. exchange in the boundary layer, (3) diffusion into the interior of the solid phase.

10578. ALCHUDZHAN, A. A. AND VVEDENSKIĬ, A. A. **Kinetics and mechanism of the reaction of catalytic hydrogenation of hydrocarbons. III. Kinetics of hydrogenation of benzene over nickel.** *J. Gen. Chem.* (U.S.S.R.) **16**, 415-19 (1946).—*C.A.* **41**, 644*e*.

The hydrogenation of benzene over Ni was studied at 100°, 120°, 140°, 180°, and 227°C in the vapor state. The max. of reaction rate was observed at stoichiometric ratio of H_2 to benzene. Increase of reaction temp. caused the reaction rate to pass through a max., the position of the latter being dependent on the activity of the catalyst sample used and located within the limits of 150-170°C.

10579. ALCHUDZHAN, A. A. AND VVEDENSKIĬ, A. A. **Kinetics and mechanism of the reaction of catalytic hydrogenation of hydrocarbons. IV. Peculiarities of inconstancy of activity of nickel catalyst in benzene hydrogenation.** *J. Gen. Chem.* (U.S.S.R.) **16**, 420-6 (1946).—*C.A.* **41**, 644*g*.

After a change of operating temp. during benzene hydrogenation over Ni, the activity of Ni catalyst changed in time (upward or downward) to a const. value. On changes of contact time or on introduction of steam into the reaction mixt., the degree of hydrogenation changed, but upon return to the standard conditions the catalyst reverted to its original activity instantly. Treatment of the Ni catalyst with benzene brought the activity to zero, whereas treatment with H_2 increased its activity.

10580. ANON. **Thoria-alumina catalyst best for isoparaffin synthesis—zinc oxide is less efficient, less expensive.** *Tech. Rept. No.* **110-45**; *Oil Gas J.* **44**, No. 37, 86, 89 (1946).—*C.A.* **40**, 1643^9.

A catalyst composed of alumina and thoria proved to be the best for use in German isoparaffin syntheses. Increase of alumina content increased CH_4 formation. Zinc oxide and alumina catalyst showed slightly lower yields but better promise as a com. catalyst. Pressures of 4,500 p.s.i. and temps. of 788-842°F were used to form isoparaffins from CO and H_2 by the Fischer-Tropsch synthesis.

10581. ANTIPINA, T. V. AND FROST, A. V. **The catalytic activity of pure aluminum hydroxide.** *Compt. rend. acad. sci. U.R.S.S.* **53**, 45-6 (1946).—*C.A.* **41**, 1539*h*.

Spectroscopically pure $AlCl_3$ was hydrolyzed with water vapor, the powd. alumina mixed with sugar sirup, and 4 catalyst samples were ignited at 400°, 500°, 800°, and 1200°C. Their activity for the dehydration of 96% EtOH was studied at 375°, 420°, 425°, and 450°C. Dehydration rates for 400° and 450°C were given, the max. being 277 ml (S.T.P.) of C_2H_4 per min. per ml catalyst at 400°C, space velocity 4.7, catalyst ignited at 500°C.

10582. ANTIPINA, T. V.; SAVUSHKINA, V. I., AND FROST, A. V. **Kinetics of catalytic dehydration of ethyl alcohol.** *Vestnik Moskov. Univ.* **1946**, No. 3/4, 119-22.—*C.A.* **42**, 2850*d*.

The linear relation between $v_0 \ln[1/(1-y)]$ and $v_0 y$ held for $C_2H_5OH \rightarrow C_2H_4 + H_2O$ with both abs. alc. over an Al_2O_3-SiO_2 catalyst at 425°C, $\alpha = 0.4$ and $\beta = 0.8$, and with alc.-water mixts. at 400°C over an Al_2O_3 catalyst heated at 800°C. y = degree of conversion of the initial reactant, v_0 = vol. of reactant fed into the catalytic space per unit of time; α and β on the products of the adsorption coeffs. of the initial substance and the reaction products by the corresponding stoichiometric mol. no. and the pressure.

10583. AVDEEVA, A. V.; ADON'EVA, N. V., AND BUKHAREVA, E. M. **Catalytic oxidation of hydrogen sulfide to sulfur dioxide in purifying natural gas.** *Khim. Prom.* **1946**, No. 11, 17, 18.—*C.A.* **41**, 3940*b*.

Oxidation of H_2S to SO_2 was studied with and without catalysts: an empty tube, a tube packed with pumice, and pumice on which were deposited Ni, Ni-Pb, Ni-Bi, Ni-Ag, Ni-Mo, Ni-Al, Ni-Pb-Al, Ni-Bi-Al, Ni-Pb-Bi, etc. The compn. of the gas used in these expts was N_2 96-7, O_2 2.8-3.25, and H_2S 0.2-0.75%. The temps. were 200-360°C. As the velocity of the gas increased the effectiveness of the empty reactor dropped faster than that of the one packed with pumice. Of the catalysts tested the most effective was Ni-Al.

10584. BALANDIN, A. A.; BODANOVA, O. K., AND SHCHEGLOVA, A. P. **Kinetics of the dehydrogenation of butylene on a chromium catalyst.** *Izvest Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1946**, 497-513.—*C.A.* **42**, 6218*e*.

Cr catalyst ("No. 41") was tested for const. activity by the rate of dehydrogenation of butylene to butadiene at const. space velocity and temp., and regenerated in an air stream between runs. Conditions for kinetic study were 540-70°C and high space velocity, 11,500 liter/liter catalyst/hr. The amt. of butadiene formed was independent of the length of the run (6.9 and 12 min.). At a time of contact of 0.3 sec, the apparent activation energy of butylene → H_2 + butadiene was 26.26-27.93 kcal/mole at 551-600°C and 34.34-34.74 at 535-559°C.

10585. BALANDIN, A. A.; KHARINA, Z. V., AND TEIS, R. V. **Isotopic exchange in the hydrogenation of benzene with deuterium over platinum and chromic oxide catalysts.** *Compt. rend. acad. sci. U.R.S.S.* **53**, 715-18 (1946).—*C.A.* **41**, 4698*d*.

Exchange with D_2 occurred during the hydrogenation of benzene over a Pt-on-asbestos catalyst and over Cr_2O_3. At 100°C with the Pt catalyst and with a H_2-benzene mole ratio of 4, complete hydrogenation was achieved, but the degree of isotopic exchange was 5-34%. With the Cr_2O_3 catalyst at 160°C, and with the other conditions the same, the degree of hydrogenation was about 8-12%, whereas the degree of isotopic exchange amounted to as much as 74%.

10586. Balandin, A. A. and Vasiunina, N. A. **Effect of the nature of the asbestos carrier on the activity of platinum catalysts.** *Compt. rend. acad. sci. U.R.S.S.* **52**, 139-42 (1946) (in English).—*C.A.* **41**, 2310*c*.

Fibrous chrysotile asbestos and straight-fiber asbestos, amphibole type, were carefully washed with HNO_3 to remove all Fe, then with water till the diphenylamine test for NO_3 was neg. Active Pt catalysts (8% Pt) were prepd. The rate of dehydrogenation of cyclohexane to benzene when chrysotile asbestos was used as carrier for the catalyst was found to be twice that with amphibole asbestos as carrier, and the activation energy in cal/mole was 13,600 for the chrysotile-type catalyst and 14,300 for the amphibole type.

10587. Balandin, A. A. and Vasserberg, V. **The distribution of active centers on mixed catalysts. I. Decomposition of isopropyl alcohol on $Al_2O_3.ZnO$.** *Acta Physicochim. U.R.S.S.* **21**, 678-88 (1946) (in English).—*C.A.* **41**, 1539*e*.

Isopropyl alc. (0.5-5 mm pressure) was completely adsorbed by 4.64 g of 90% Al_2O_3-10% ZnO catalyst which had been dried at 300°C for 40-50 hrs to 0.00004 mm pressure. The reaction was followed at 82°-106°C by measuring C_3H_8 pressure. At small surface covering from 0.06 to 0.15 ml (N.T.P.) per g, the reaction velocity rose linearly; it remained const. to about 0.8 ml per g, above which the const. fell. The activation energy at sparse covering of the surface was 18,000 cal per mol., and 8,900 in the horizontal range.

10588. Bloch, Herman S. and Schaad, Raymond E. **Dehydroisomerization of butane.** *Ind. Eng. Chem.* **38**, 144-7 (1946).—*C.A.* **40**, 2611⁵.

Two catalysts were tried for the production of isobutylene from *n*-butane by the process of first dehydrogenating and then isomerizing. One consisted of equal vols. of granular olefin-isomerization catalyst, 20 SiO_2:1Al_2O_3:0.1 ThO_2, and granular dehydrogenation catalyst, 10% Cr_2O_3 on Al_2O_3. These were mixed and were called "mixed catalyst". For the 2nd, the "composited catalyst", the 2 component catalysts were ground together in about the same proportions and pelleted. The mixt. of granules was much more effective as a catalyst than the composited catalyst.

10589. Bogoyavlenskaya, M. L. and Koval'skiĭ, A.A. **Initiating a homogeneous reaction in a gas by solid catalyst.** *J. Phys. Chem.* (U.S.S.R.) **20**, 1325-31 (1946) (in Russian).—*C.A.* **41**, 2972*g*.

A thermocouple was placed along the axis of the reaction vessel and readings were compared when the catalyst was: (a) spread over the wall of the vessel, and (b) formed a coating on the thermocouple. The two readings were alike for the reaction between CO and SO_2 in the presence of Al_2O_3 at 170-250 mm Hg (starting pressure) and 568-574°C. The reaction between SO_2 and H_2 in the presence of Al_2O_3 also seemed homogeneous. The oxidation of SO_2 in the presence of Pt was heterogeneous. The oxidation of H_2 and of NH_3 on Pt seemed partly heterogeneous.

10590. Butyagin, P. Ya. and Elovich, S. Ya. **Kinetics of catalytic oxidation of propylene.** *Compt. rend. acad. sci. U.R.S.S.* **54**, 603-6 (1946) (in English).—*C.A.* **41**, 5007*f*.

Catalytic oxidation of C_3H_6 was governed by the same law as the activated adsorptions of O_2 and C_3H_6. The reaction proceeded mainly in space. The catalyst generated active centers, part of which were bound firmly to the catalytic surface, whereas the rest were desorbed and initiated a space reaction of the chain type. Hence, catalytic oxidation of C_3H_6 was a combination of a heterogeneous and a homogeneous process.

10591. Buu-Hoï. **Transfers of energy among mixed catalysts.** *Bull. soc. chim.* **1946**, 115-17.—*C.A.* **40**, 5986⁵.

A mechanism was proposed, based on transfer of energy without loss between atoms of the promoter and the support, so that the energy absorbed by the whole catalyst was conveyed by jumps to certain centers where it was used in the chem. reaction.

10592. Capell, R. G.; Amero, R. C., and Wood, W.H. **Fuller's earth as a binder for catalysts and adsorbents.** *Petroleum Refiner* **25**, No. 2, 69-71 (1946).—*C.A.* **40**, 2595⁵.

Florigel, a grade of floridin, was kneaded with H_2O to form a sticky, plastic substance. The characteristics which made Florigel suitable as a binder were summarized.

10593. Cotton, Ernest. **Germany's Fischer-Tropsch process.** *Natl. Petroleum News* **38**, No. 23, R425-34 (1946).—*C.A.* **42**, 9112*b*.

Com. methods of prepg. and purifying synthesis gas, manuf. of the catalyst, type of reactors employed, the actual synthesis procedure, and the products obtained were discussed.

10594. Craxford, S. R. **Mechanism of the Fischer-Tropsch reaction.** *Trans. Faraday Soc.* **42**, 576-80 (1946).—*C.A.* **41**, 262*g*.

When a mixt. of CO and $2H_2$ was passed over a catalyst suitable for hydrocarbon synthesis at 185°C, the amt. of oil formed at first increased to a max. with increase in length of catalyst bed. It then decreased, the oil formed in the first part of the catalyst bed being decompd. to CH_4 in the second part.

10595. Craxford, S. R. **Function of the promoters in the catalysts for the Fischer-Tropsch synthesis.** *Trans. Faraday Soc.* **42**, 580-5 (1946).—*C.A.* **41**, 262*i*.

The rates of some simple pertinent reactions were detd. for 5 catalysts: (1) Co; (2) Co-ThO_2, 100-18; (3) Co-kieselguhr, 1:1; (4) Co-ThO_2-kieselguhr, 100:18:100; (5) Co-ThO_2-kieselguhr, 100:21:100. All of these catalysts were equally active for the reaction: $C_2H_4 + H_2 \rightarrow C_2H_6$ at 20°. Both kieselguhr and thoria were powerful promoters for the reaction $2CO + 2Co = Co_2C + CO_2$. The most effective catalyst contained 18% ThO_2 and no kieselguhr; catalyst (5) reacted very much more slowly than (4). The ThO_2 and kieselguhr did not act primarily by increasing the available area of the Co, but as specific promoters for the formation and reduction of CoC_2.

10596. Csuros, Zoltán. **Catalysis and catalysts.** *Magyar Tech.* **1**, 41-5 (1946).—*C.A.* **40**, 6945^5.

No direct parallelism could be detected between the quantity of catalyst and the reaction velocity, but the existence of a max. and a min. could be proved. Variation of the amount of catalyst made possible selective hydrogenation.

10597. Csuros, Zoltán; Zech, Konstantin, and Pfliegel, Tódor. **Selective hydrogenation by means of catalysts. II.** *Hung. Acta Chim.* **1**, 24-47 (1946).—*C.A.* **41**, 110*c*.

Crotonic, tiglic, and cinnamic aldehydes and PhCH:CHCOPh were hydrogenated in a semimicro app. with colloidal Pd, or with Pd pptd. on $BaSO_4$ as catalysts. The effects of the amt. of catalyst on the velocity of hydrogenation and the result of reaction were detd. With an optimal amt. of catalyst, the carbonyl group could be hydrogenated before the double bond.

10598. Daniels, L. S. **Fluid-catalyst technique.** *Petroleum Refiner* **25**, No. 9, 435-42 (1946).—*C.A.* **42**, 9139*a*.

The fluid-catalyst cracking process was discussed using powd. catalyst mixts. to accomplish the essential operations of oil reaction, catalyst transfer, and catalyst regeneration. Diagrams showing the operations of the various parts of the process were shown.

10599. Dodd, R. H. and Watson, K. M. **Process design of catalytic reactors—dehydrogenation of butane.** *Trans. Am. Inst. Chem. Engrs.* **42**, 263-91 (1946).—*C.A.* **40**, 4941^8.

A small pilot plant was designed and built for the engineering analysis of catalytic processes. The design permitted operation over wide ranges of conditions on a variety of systems employing solid catalysts. Operation was either as an "integral reactor," to simulate the results of a com. reactor, or as a "differential reactor" for the direct detn. of abs. reaction rates. The equipment, coupled with thermodynamic and kinetic principles, permitted the establishment of optimum process conditions from a relatively few small-scale expts.

10600. Eĭdus, Ya. T. **Synthesis of liquid and solid hydrocarbons from water gas at atmospheric pressure on a precipitated $Fe\text{-}Cu\text{-}ThO_2\text{-}K_2CO_3$-marshallite catalyst.** *J. Gen. Chem.* (U.S.S.R.) **16**, 869-74 (1946).—*C.A.* **41**, 1987*g*.

Pptd. $Fe\text{-}Cu\text{-}ThO_2\text{-}K_2CO_3$-marshallite catalyst was shown to have a rather high effectiveness in the synthesis of hydrocarbons from water gas at 250 °C at atm. pressure. The best catalyst contained 1/2 ratio between ThO_2/K_2CO_3, which were used in 2% amt. relative to Fe.

10601. Eĭdus, Ya. T. **Reduction of catalysts for the synthesis of aliphatic hydrocarbons from mixtures of carbon monoxide and hydrogen.** *J. Gen. Chem.* (U.S.S.R.) **16**, 875-83 (1946).—*C.A.* **41**, 1824*g*.

A comparative study was made on reduction of the following water-gas catalysts: $Co\text{-}ThO_2$-kieselguhr (100:18:100), $Fe\text{-}Cu\text{-}ThO_2\text{-}K_2CO_3$-kieselguhr (100:25:2:2:125), and $Fe\text{-}CuThO_2\text{-}K_2CO_3$-marshallite (100:25:2:2:125). CO was adsorbed on the 1st catalyst 4 times more effectively than on the 2nd and 3rd, after H_2 reduction. Slow heating-up of the latter catalysts during H_2 reduction gave most active catalysts.

10602. Eĭdus, Ya. T. **Investigation of catalysts for the hydrogenation of carbon monoxide with joint application of the dynamic and the static methods. IV. Comparative study of the kinetics of carbide formation and the hydrogenation of carbon monoxide on cobalt, nickel and iron catalysts.** *Izvest. Akad. Nauk Otdel. Khim. Nauk* **1946**, 447-53.—*C.A.* **43**, 6063*g*.

The reactions taking place on $Co\text{-}ThO_2$ (100:18), $Ni\text{-}Mn\text{-}Al_2O_3$ (100:20:10), and $Fe\text{-}Cu\text{-}ThO_2\text{-}K_2CO_3$ catalysts were studied. The catalysts were deposited on marshallite in a 1:1 ratio. With the Co and Ni catalysts the hydrogenation reaction (2 $CO + H_2 \rightarrow CO_2 + CH_2 \rightarrow CH_2)_n$) took place much faster than the carbide formation (2 $CO \rightarrow CO_2$ + carbide C).

10603. Eĭdus, Ya. T. and Pusitskiĭ, K. V. **Catalytic hydrocondensation of carbon monoxide with ethylene.** *Compt. rend. acad. sci. U.R.S.S.* **54**, 35-8 (1946) (in English).—*C.A.* **41**, 3741*h*.

Using Co, two Co catalysts, the catalytic interaction of C_2H_4 with CO in the presence of H_2 at 760 mm pressure, was studied. A hydrocondensation reaction of CO with C_2H_4 in the presence of H_2 took place; 75% by vol. of liquid product was formed at the expense of the initial C_2H_4. The presence of a considerable amt. of O-contg. compds. was detected, particularly alcs.

10604. Elovich, S. Ya.; Zhabrova, G. M.; Margolis, L. Ya., and Roginskiĭ, S. Z. **Laws underlying the selection of catalysts for complete oxidation of organic compounds.** *Compt. rend. acad. sci. U.R.S.S.* **52**, 421-3 (1946).—*C.A.* **41**, 1538*g*.

The catalytic activity and stability of a no. of metals, oxides, and combinations of oxides were detd. Nontransitional elements and colorless oxides of transitional elements failed to show appreciable activity. Cr_2O_3, MnO_2, and NiO were quite active at first but soon lost their activity.

10605. Erchak, Michael, Jr., and Ward, Roland. **Catalytic properties of the products of the solid phase reaction between barium carbonate and ferric oxide.** *J. Am. Chem. Soc.* **68**, 2093-6 (1946).—*C.A.* **41**, 24*e*.

CO with excess O_2 (free from CO_2 and H_2) was passed over a given wt of catalyst at a const. rate at 325 °C. The CO_2 formed was detd. Catalysts corresponding to various compns. and temps. of prepn. were tested. Contour diagrams were prepd. in which the temps. of prepn. were the ordinates, the compns. of the original mixts. the abscissas, and the lines of the contours connected points corresponding to equal catalytic activity.

10606. Evans, A. G.; Holden, D.; Plesch, P.; Polanyi, M.; Skinner, H. A., and Weinberger, M. A. **Friedel-Crafts catalysts and polymerization.** *Nature* **157**, 102 (1946).—*C.A.* **40**, 2105^8.

Expts. on the polymerization of isobutene and the dimerization of diisobutene with Friedel-Crafts catalysts showed that a 3rd component, probably water, was necessary for rapid reaction. With small amts. of catalyst the extent of the reaction depended on the amt. of BF_3.

10607. FARAGHER, W. F. AND HORNE, W. A. **Manufacture and regeneration of catalysts at I. G. Farbenindustrie A.-G. plants, Ludwigshafen/ Oppau, Germany.** *U.S. Bur. Mines*, Circ. **7368**, 6 pp. (1946).—*C.A.* **40**, 7535^8.

The method of making and regenerating the 4 principal catalysts for high-pressure synthesis of hydrocarbons was described and flow sheets given. Four addnl. catalysts were described briefly.

10608. FISHER, F. E.; WATTS, H. C.; HARRIS, G. E., AND HOLLENBECK, C. M. **Catalytic conversion of hydrocarbons. Catalytic promoting effect of antimony tetroxide in the aromatization of hydrocarbons with a chromia-alumina catalyst.** *Ind. Eng. Chem.* **38**, 61-4 (1946).—*C.A.* **40**, 1647^8.

CrO_3 was deposited on Al_2O_3 and the dried and ignited catalyst contained 8 wt % of Cr_2O_3. To this catalyst, moistened with acetone, was added Sb_2O_5 sufficient to make the Sb_2O_5 content of the final dried and ignited mass from 8 to 10%. The Sb_2O_4 acted as a promoter in the dehydrogenation and cyclization reactions and the yields of aromatic hydrocarbons were improved. The catalyst in use underwent 65 regenerations with little loss of activity. When heptane was cyclized, 24% of the charge was lost in fragmentation. The yield of aromatic hydrocarbons, chiefly toluene, was 25.7% of the theoretical. Carbon formation on the catalyst and losses in handling and measuring accounted for 12.5% of the charge.

10609. FREĬDLIN, L. KH.; BALANDIN, A. A.; LEBEDEVA, A. I., AND FRIDMAN, G. A. **The mechanism of the vapor-phase catalytic substitution of hydroxyl for aryl halogen.** *Acta Physicochim. U.R.S.S.* **21**, 55-79 (1946).—*C.A.* **40**, 5627^9.

Silica gel was used as a catalyst for the replacement of aryl halogen by OH. Only Cu and its salts promoted the action of silica gel, whereas other salts decreased it. A theory based on the formation of intermediate silicate esters was proposed.

10610. FROST, A. V. **Kinetics of catalytic cracking.** *Vestnik Moskov. Univ.* **1946**, No. 3/4, 111-17.—*C.A.* **42**, 2850*a*.

The formula was derived: $v_0 \ln[1/(1 - y)] = \alpha + \beta v_0 y$, where y = degree of conversion of the initial reactant, v_0 = vol. of reactant fed into the catalytic space per unit of time, the consts. α and β depended on the products b_1 and b_i of the adsorption coeffs. of the initial substance and of the reaction products by the corresponding stoichiometric mol. no. and the pressure, on the increase n of the total no. of mols., the surface area S of the catalyst, and the 1st-order rate const. k_1 at the surface, in the form $\alpha = k_1 b_1 S/(1 + n + \Sigma\ b_i)$ and $\beta = (n - b_1 + \Sigma b_1)/(1 + n + \Sigma b_i)$. The disproportionation of H_2 (decrease of the iodine no.) in a cracking-gasoline fraction b. 100-150°C, over an activated clay and a synthetic aluminosilicate catalyst of area 250-300 m^2/g was explained.

10611. GOL'DANSKIĬ, V. I. AND CHIRKOV, N. M. **Heterogeneous ionic catalysis. (Study of esterification and of hydrolysis of esters in the vapor phase.)** *J. Phys. Chem.* (U.S.S.R.) **20**, 1333-45 (1946) (in Russian).—*C.A.* **41**, 2973*a*.

The reaction between EtOH and AcOH vapors at 75°C in a glass vessel was immeasurably slow, but was much accelerated by HCl (1-36% of AcOH). In the presence of HCl the equil, between equimol. amts. of EtOH, AcOH, EtOAc, and H_2O was reached at 92 mol. % of EtOAc. The rate of esterification up to 40% transformation was independent of time, and the reaction was completely heterogeneous. The above esterification was the first example of a heterogeneous catalysis in a multimol. adsorption layer.

10612. GOL'DANSKIĬ, V. I. AND ELOVICH, S. YU. **Catalytic hydrogenation of organic compounds in the liquid phase. II. Kinetics of hydrogenation of oleic acid.** *J. Phys. Chem.* (U.S.S.R.) **20**, 1085-93 (1946) (in Russian).—*C.A.* **41**, 2973*e*.

Solns. of 0.7 g of oleic acid in 20 ml of AcOH $+ Ac_2O$ were shaken with H_2 in the presence of 0.1 g of Pt on $BaSO_4$. The rate of consumption of H_2 increased with the rapidity of shaking up to 300 (at 15°C) or 600 (at 40°C) shakes per min. and remained const. at a more intense agitation. It was concluded that below 300-600 shakes the rate v of reaction was detd. by diffusion, and at higher frequencies by the kinetics of the chem. process.

10613. GOL'DANSKIĬ, V. I.; SEMENOV, N. N., AND CHIRKOV, N. M. **Heterogeneous catalysis in polymolecular adsorption layers.** *Compt. rend. acad. sci. U.R.S.S.* **52**, 777-9 (1946) (in English).—*C.A.* **41**, 5371*f*.

EtOH was esterified with AcOH in the presence of 0.6-18.0% HCl at 56-336 mm and 45-82°C with varying surface area of the glass vessel. The rate of the initial zero-order reaction was proportional to the area. Equil. was obtained at 92% esterification in the adsorbed layer as compared with 66% in the liquid phase, but the temp. coeff. were practically identical.

10614. GORDON, ALVIN S. **Uncatalyzed reaction of natural gas and steam.** *Ind. Eng. Chem.* **38**, 718-20 (1946).—*C.A.* **40**, 5545^8.

The uncatalyzed reaction of natural gas with steam was studied in a porcelain reaction chamber between 1225° and 1516°C with gas to steam ratios of 1.5 and 5, and contact times, t, between 0.21 and 4.6 sec. The extent of carbonization was a function of the gas to steam ratio and varied erratically with temp. and t; there was some carbonization even at high temps., long t, and a gas to steam ratio of 5.

10615. HASEGAWA, SHIGEO. **Organic peroxides. II. The decomposition of ethyl hydroperoxide catalyzed by platinum solution.** *Rev. Phys. Chem. Japan, Shinkichi Horiba Commen.* Vol. **1946**, 21-30.—*C.A.* **44**, 4319*e*.

The decompn. velocity of Et hydroperoxide and of H_2O_2 in aq. soln. catalyzed by a Pt sol was measured by iodometric and manganometric titrations, resp., between 30 and 50°C. The decompn. proceeded like that of Me hydroperoxide. After an initial stage of rapid decrease of the rate, the main stage was a 1st-order reaction with an apparent activation energy of 15 kcal/mole in the case of Et hydroperoxide and of 11.6 kcal/mole in the case of H_2O_2.

10616. HEILMANN, RENÉ; DUBOIS, JACQUES E., AND BEREGI, LADISLAS. **Preparation and activation of Raney nickel.** *Compt. rend.* **223**, 737-9 (1946). — *C.A.* 41, 6376*e*.

Ni catalyst was prepd. by 2 methods and platinized by two methods. The effect of the Pt was a function of the method of introduction and of the activity of the Ni.

10617. HERBO, CL. AND HAUCHARD, V. **The mechanism of catalytic reactions. V. Contributions to the study of promotion.** *Bull. soc. chim. Belges* **55**, 177-201 (1946). — *C.A.* 41, 4368*h*.

The activity of a catalyst was expressed by the kinetic coeff., *k*, of the elementary process constituting the slowest step in the over-all reaction. From the effect of temp. on *k* it was possible to decide whether the variation of the activity from one catalyst to another was due to the quality or the quantity of active centers. The activities of a series of Ni-BeO catalysts for the hydrogenation of benzene showed that the no. of active centers varied, but the quality of the centers was unchanged. The curve for active surface per g of Ni approached asymptotically a horizontal limit for increasing quantities of BeO promoter.

10618. HICKINBOTTOM, W. J. **Activation of catalysts in olefin reactions.** *Nature* **157**, 520 (1946). — *C.A.* 40, 4282^5.

Neither BF_3 nor $AlCl_3$ alone caused polymerization of olefins; promoters such as HCl or traces of H_2O must also be present. Olefins reacted with isoparaffins in the presence of BF_3 or $AlCl_3$ with HCl, inorg. halides, H_2O, HF, or finely divided metals as promoters.

10619. HINSHELWOOD, C. N. **The more recent work on the reaction between hydrogen and oxygen.** *Proc. Roy. Soc.* (London) **A188**, 1-9 (1946). — *C.A.* 41, 3349*b*.

Chain mechanisms were reviewed and the various explosion limits discussed. Effect of the state of the walls was considered, particularly the coating of the reaction vessel walls with salts. The mechanism of the removal of radicals at the surface was discussed, particularly with reference to a wall coated with KI.

10620. JAGITSCH, ROBERT AND BENGTSON, BO. **Investigation of the reaction kinetics in the system lead oxide-lead silicate.** *Arkiv. Kemi, Mineral Geol.* **A22**, No. 6, 18 pp (1946) (in German). — *C.A.* 41, 5369*d*.

For the reactions $PbO + PbSiO_3 \rightarrow Pb_2SiO_4$ and $2\ PbO + Pb_2SiO_4 \rightarrow Pb_4SiO_6$ the rates of reaction followed the expression: $dm/dt = \text{const.}/m$, where m was the quantity of product formed. For the cell $Pt|PbO|Pb_2SiO_4|PbSiO_3|Pt$ at 680°C the e.m.f. was about 0.01 v., and the sp cond. of lead orthosilicate from 570° to 715°C was given by $48\exp(-25{,}500/RT)$ ohm cm. The small cond. indicated that the reaction was not due to migration of ions, but to uncharged PbO mols.

10621. JAGITSCH, ROBERT AND PERLSTROM, GUNVOR. **Investigation of the reaction kinetics in the system MgO-$Mg_2P_2O_7$.** *Arkiv. Kemi, Mineral Geol.* **A22**, No. 5, 16 pp. (1946) (in German). — *C.A.* 41, 5369*b*.

Pellets of MgO and $Mg_2P_2O_7$ placed in contact and heated to 890°-1050°C formed $Mg_3(PO_4)_2$. The pellets and product film were easily sepd. By x-ray diagrams, by marking the original interface with Pt black, or by impregnating either MgO or $Mg_2P_2O_7$ with $Ra(NO_3)_2$, it was shown that the product $Mg_3(PO_4)_2$ was formed on both sides of the original contact film. The elec. cond. of $Mg_3(PO_4)_2$ at these high temps. showed a transference no. = 1 for Mg^{++}.

10622. KAGAN, M. YA. AND FLID, R. M. **Kinetics and mechanisms of catalytic hydro-dehydrogenation reactions. I. The kinetics of the dehydrogenation of cyclohexane and methylcyclohexane in the presence of a hydrogen acceptor.** *Acta Physicochim. U.R.S.S.* 21, 358-76 (1946) (in English); *J. Phys. Chem.* (U.S.S.R.) 20, 503-16 (1946). — *C.A.* 40, 6950^6.

The kinetics of the reaction $C_6H_{12} + C_6H_5CH_3 \rightleftharpoons C_6H_6 + C_6H_{11}CH_3$ were studied in both forward and reverse directions over a 16% Pd on silica gel and 20% Cr_2O_3 on silica gel catalyst. The temp. range was 125-170°C for the Pd, 327-366°C for the Cr_2O_3 catalyst. No H_2 was evolved. The activation energies of the forward and reverse reactions were equal, ~ 10-kcal on Pd and ~ 13 kcal on Cr_2O_3. Dehydrogenation of cyclohexane over Cr_2O_3 in absence of a H acceptor (with liberation of H_2) had an activation energy of 40 kcal.

10623. KIPERMAN, S. AND TEMKIN, M. **Kinetics of ammonia synthesis on molybdenum catalyst.** *Acta Physicochim* 21, 267-82 (1946) (in English); *J. Phys. Chem.* (U.S.S.R.) 20, 369-78 (1946). — *C.A.* 40, 6950^9.

A flow system was used with 2 ml of Mo catalyst prepd. by reducing ammonium molybdate in NH_3 for 20 hrs at 600-650°C. X-ray diffraction patterns indicated the presence of metallic Fe and Mo_2N. The apparent activation energy of NH_3 decompn. on Mo catalyst as calcd. from the synthesis rate was 42.5 kcal/mole. The NH_3 synthesis on Fe and Mo had the same mechanism.

10624. KLIMENOK, B. V. **Tubular laboratory furnace for the study of catalytic processes by flow method.** *J. Applied Chem.* (U.S.S.R.) 19, 1231-2 (1946) (in Russian). — *C.A.* 41, 6083*d*.

A tube of Mo glass of 2.5 cm diam. had an axial sheath for the thermocouple, 3 side tubes at the upper end for introduction of the catalyst, the starting material, and, if necessary, a gas (air), and a three-way stopcock at the lower end for removal of the products. The tube could be heated to 500°C with 250-400 watts and reached that temp. in 20-30 min. Between 200° and 600°C the temp. was uniform over a length of about 15 to about 55 cm from the upper end.

10625. KOROBOVA, M. I. AND KOROBOV, N. I. **Catalytic agents for the reduction process in blast furnaces.** *Bull. acad. sci. U.R.S.S., classe sci. tech.* **1946**, 567-77. — *C.A.* 42, 8737*a*.

Since H_2 was more effective than CO in reducing iron ore above 840°C, addn. of 2-9% steam to the blast was tried. During a 23-day test in a Magnitogorsk furnace, the av. production rate with steam added was 1455 tons per day as compared to 1135 on dry blast. The blast temp. was maintained at 750-800°C when steam was added. The addn. of steam increased production from 1000 to 1113 tons per day, the blast temp. ranging from 500° to 730°C.

10626. Lavrovskiĭ, K. P. and Mikhnovskaya, A. A. **Catalytic alkylation of hydrocarbons as method of production of motor fuels.** *Bull. acad. sci. U.R.S.S., Classe sci. tech.* **1946**, 1589-602 (in Russian).—*C.A.* **41**, 3283*c*.

Gas-phase alkylation of aromatic hydrocarbons with paraffin-olefin mixts. was studied with 3 synthetic aluminosilicate catalysts and three activated natural aluminosilicates, askanite, gumbrin, and Zikeev clay. The clays (250 g), finely ground and wetted with 900 ml water, were treated with 176.5 ml of 35.39% HCl, dried for 2 hrs at 100°C, washed, decanted, and dried on the filter, then in a drying oven until cessation of evolution of water vapor. The expts. were carried out in a catalyst vol. of 100 ml.

10627. Lel'chuk, S. L.; Vaskevich, D. N.; Belen'kaya, A. P., and Dashkovskaya, F. A. **Kinetics of the direct esterification of alcohol. I. Effect of promotors on the reaction velocity.** *Izvest. Akad. Nauk S.S.S.R., Otdel Khim. Nauk* **1946**, 191-200.—*C.A.* **42**, 6630*g*.

The catalysts were prepd. by pptg. with alkali from Cu acetate and the nitrate of the corresponding promotor, washing to neutral, and drying at 100°C. The yields of reactions $EtOH \rightarrow AcH + H_2$, $AcH + H_2O \rightarrow AcOH + H_2$, $EtOH + AcOH \rightarrow AcOEt + H_2O$ satisfied the Arrhenius linear relation between log k and 1/T (assuming the yield to represent the reaction velocity k) on Cu-Zn, Cu-Fe, Cu-Zr, and Cu-Ce catalysts. The apparent activation energies were calcd.

10628. Luntz, D. M. and White, E. A. **A résumé of the development of thermofor catalytic cracking.** *Calif. Oil World* **39**, No. 17, 11-16; No. 18, 37-42 (1946).—*C.A.* **40**, 7579^7.

Thermofor Catalytic Cracking units the catalyst moved downward countercurrent to the oil vapors. Spent catalyst was transferred by means of continuous bucket-type elevators to the regenerator and back to the reactor. Modifications of the original design included a larger-size catalyst (4-10 mesh).

10629. Mankash, E. K.; Borisova, G. P.; Orochko, D. I., and Frost, A. V. **Kinetics of catalytic cracking of paraffin over activated aluminum silicate.** *Neftyanoe Khoz.* **24**, No. 6/7, 26-34 (1946).—*C.A.* **41**, 2879*h*.

The cracking of a wax (mol. wt 320) in a reaction tube packed with activated aluminum silicate catalyst conformed closely to a unimol. consecutive reaction. The velocity const. slightly decreased at low feed rates. The apparent energy of activation, calcd. from these equations, was 13,-550 for the overall decompn. of the feed, 16,400 for the decompn. of cracked gasoline, 11,900 for the formation of gasoline and 15,000 cal mol. for the decompn. of the residue recycled to the second pass.

10630. Margolis, Ya. L. and Todes, O. M. **The kinetics of exothermal catalytic reactions in a current. II. Theory of reaction on a short contact layer.** *Inst. Phys. Chem. Moscow,* **21**, 885-98 (1946) (in English).—*C.A.* **41**, 3356*h*.

Two steady regimes for a comparatively short reactor, "quiet reaction" and "combustion regime", were established. For an unsteady extinction regime, the rate of cooling of the reactor and the activity of the catalyst were connected by an almost linear relation; this permitted the development of a simple method of evaluating the relative activities of catalysts for a given reaction.

10631. Margolis, L. Ya. and Todes, O. M. **The kinetics of catalytic oxidation in a stream—oxidation of isoöctane.** *Compt. rend. acad. sci. U.R.S.S.* **52**, 515-18 (1946) (in English); *Doklady Akad. Nauk S.S.S.R.* **52**, 519-22 (1946) (in Russian).—*C.A.* **41**, 4028*c*.

Air-isoöctane streams were passed over 8 spinel-like catalysts at 300-600°C. The catalyst concn., spread on asbestos, varied from 0.5 to 67%. Similar Pt and Pd catalysts contd. 0.05-0.1% metal. The products were practically stoichiometric CO_2 and H_2O. By variation of isoöctane concn. the reaction was found to be second order and independent of O_2.

10632. Martinuzzi, Enzo A. **Catalytic oxidations in the gas phase. Vanadium pentoxide as catalyst.** *Rev. facultad quim. ind. y agr.* **15/16**, No. 26, 97-107 (1946/47).—*C.A.* **42**, 8058*h*.

Catalysts of Ag metavanadate, V_2O_5, V_2O_5 with Fe, Ca, and K, were prepd. on silica gel and infusorial earth; also a zeolitic structure of Cr_2O_3, SnO_2, SiO_2 with 10% gypsum. Oxidation of SO_2 and of EtOH were studied with different catalysts temps., space velocities, and compns. of gases. Best conversion of SO_2 occurred with SO_2 7-8% of the entering gas and Ag metavanadate, and Fe, Ca, and K.

10633. Maxted, E. B. and Marsden, Arthur. **The catalytic removal of organic sulfur compounds from coal gas by metallic thiomolybdates.** *J. Soc. Chem. Ind.* **65**, 51-2 (1946).—*C.A.* **40**, 3868^6.

The S-content of coal gas was reduced by destructive hydrogenation with $CoMoS_4$ supported on bauxite granules as a catalyst. The H_2S was removed by adsorption with iron oxide or $Cu_3(PO_4)_2$. At 450-480°C at a space velocity of about 750, the S-content was reduced from about 18 grains per ft^3 to below 5 grains. Under these conditions the catalyst could be used continuously for over a month without revivification.

10634. Moldavskiĭ, B. L. and Bezedel, L. S. **Aluminum silicate-catalyzed dealkylation of side chains in aromatic hydrocarbons.** *J. Gen. Chem.* (U.S.S.R.) **16**, 1633-42 (1946) (in Russian).—*C.A.* **41**, 4779*b*.

The catalyst, a natural Gruzin (Georgian) bleaching clay, finely ground, was activated by 20% HCl in the cold during a few days, washed, dried at 100°C, pressed, and granulated to 2-3 mm. The reactions were carried out uniformly at 410°C, 1.5 vols. hydrocarbon per 1 vol. catalyst, for 1 hr, with 14 compds. The mechanism of the silicate catalysis was interpreted in terms of a formation of a complex between the alkylbenzene and the neg. charged O atoms of the catalyst, polarization of the alkyl-ring bond, exchange of alkyl against proton, and desorption of C_6H_6 from the catalyst.

10635. MORA, A.; BLASCO, E., AND DOBLAS, J. **Catalytic aromatization of Puertollano gasoline.** *Combustibles (Zaragoza)* 6, No. 31/32, 3-22 (1946).—*C.A.* 42, 8449*g*.

Varying catalysts, temps., and pass velocities were tested to det. optimum conditions. With a Cr_2O_3 catalyst deposited on silica gel at 550 °C and a velocity of 0.3 ml/hr/ml of catalyst zone, 49% of liquid product was obtained of which 63% was aromatic (13% of total aromatic compds. was benzene, 43% toluene). This optimum catalyst decreased in activity after 30 hrs but could be almost completely regenerated. Higher temps. increased the percentage yield of aromatic compds. in the total liquid, but reduced the yield.

10636. NICOLAI, J.; D'HUNT, M., AND JUNGERS, J.C. **Synthesis of methane from carbon dioxide and hydrogen over nickel.** *Bull. soc. chim. Belges* 55, 160-76 (1946).—*C.A.* 41, 4699*a*.

The kinetics were compared for the hydrogenation of CO and CO_2 over Ni in the range 0.1 to 1 atm. and 180-300 °C. Kinetics of the CO-H_2 reaction indicated that H_2 was feebly adsorbed, CO strongly adsorbed by Ni. The velocity was not significantly affected by the presence of the products. Reaction was more rapid when D_2 was used in place of H_2. Kinetics of the CO_2-H_2 reaction indicated that both reactants were weakly adsorbed, the products retarded the reaction and D_2 behaved exactly like H_2.

10637. NIKOLAEV, L. A. AND KOBOZEV, N. I. **The "catalase" properties of cobalt and nickel ions.** *J. Phys. Chem.* (U.S.S.R.) 20, 145-50 (1946).—*C.A.* 40, 5626^9.

$CoSO_4$ and $NiSO_4$, either in aq. soln. or adsorbed on asbestos, Al_2O_3, $BaSO_4$, H_2SnO_3, or charcoal, did not greatly accelerate the decompn. of dil. H_2O_2. Co^{++} and Ni^{++} adsorbed by silica gel were a little more active. The "catalase" activity of a Ni^{++} ion on silica passed through one, and that of a Co^{++} ion through two maxima when the ratio metal: silica increased.

10638. OBRYADCHIKOV, S. N. AND MARUSHKIN, B. K. **Investigation of the fluid catalyst process.** *Neftyanoe Khoz.* 24, No. 11, 36-45 (1946).—*C.A.* 41, 3946*c*.

The laws relating to the behavior of finely divided solid particles in conditions simulating the fluid catalyst process were studied on models made of glass, by using fine sand suspended in a stream of water. The pressure losses were directly proportional to the weight of the particles in the fluidized layer. In a system with continuous circulation of the catalyst from the bottom towards the top, the concn. of the catalyst at various levels of the reactor were detd. by measuring the pressure gradient at the different levels.

10639. PANCHENKOV, R. M. AND TOPCHIEVA, K. V. **Kinetics of the disproportionation of hydrogen in gasolines over aluminosilicate catalysts of various compositions.** *Vestnik Moskov. Univ.* 1946, No. 2, 39-46.—*C.A.* 42, 3163*d*.

Six catalysts were studied with various silica and Al_2O_3 contents: 100,0; 90, 10; 84,16; 70,30; 50,50; 0,100. Silica and alumina gels were mixed and formed into cubes, dried 6-7 hrs at 40-50 °C, then 48 hrs at 170 °C, and heated in an air stream 4 to 5 hrs at 500 °C. The effect of these catalysts on a cracking-gasoline fraction was followed by detn. of I_2 number.

10640. PAUL, R. **The activation of Raney nickel by the addition of metals other than the precious metals.** *Bull. soc. chim.* 1946, 208-11.—*C.A.* 40, 6380^9.

Raney catalysts prepd. from alloys of Al, Ni, and Co, Cr or Mo in the ratio 52% Al to 48% other two metals were compared as catalysts for the hydrogenation of safrole, benzonitrile, and furfural. The added metals acted as promotors for Ni at 3-10% concn. in the catalyst.

10641. PAVLIC, A. A. AND ADKINS, HOMER. **Preparation of a Raney nickel catalyst.** *J. Am. Chem. Soc.* 68, 1471 (1946).—*C.A.* 40, 6763^2.

Details were given of the prepn. of a Raney Ni catalyst from the Ni-Al alloy at approx. 50%C. It was more active, particularly below 100 °C, than the catalyst prepd. by other methods.

10642. PEARCE, A. W. **Catalytic cracking for gasoline production.** *Trans. Inst. Chem. Engrs.* (London) 24, 133-40 (1946).—*C.A.* 43, 6814*c*.

The advantages of catalytic over thermal cracking were presented. Operating details of the Houdry process were discussed in which one ounce of catalyst per barrel of feed was usually consumed. The operating details of the Thermofor, Fluid catalytic, and small-scale Universal Oil Products M-S fluid process were also discussed.

10643. POLANYI, M. **Activation of catalysts in olefin reactions.** *Nature* 157, 520 (1946).—*C.A.* 40, 4282^4.

The reaction of isobutene with $TiCl_4$ at low temp. was induced by traces of H_2O but not affected by dry HCl.

10644. PORTER, RICHARD W. **Unusual techniques feature the production of synthetic bead catalyst.** *Chem. & Met. Eng.* 53, No. 4, 94-8, 138-41 (1946).—*C.A.* 40, 4185^1.

The process was described with aid of a flowsheet.

10645. PSHEZHETSKIĬ, S. A. AND RUBINSHTEIN, R.N. **Kinetics of heterogeneous reactions on porous catalysts.** *J. Phys. Chem.* (U.S.S.R.) 20, 1127-36 (1946) (in Russian); *Acta Physicochim. U.R.S.S.* 21, 1075-88 (1946) (in English).—*C.A.* 41, 2972*c*.

The diffusion of the reactants to the surface of a porous catalyst was discussed. Conditions were defined under which (a) no hydrodynamic flow was created by the reaction, (b) diffusion of only one reactant had to be considered, and (c) the temp. gradient within the catalyst grain had a measurable effect.

10646. RADLOVE, S. B.; TEETER, H. M.; BOND, W.H.; COWAN, J. C., AND KASS, J. P. **Catalytic iso-**

merization of vegetable oil. Nickel catalysts. *Ind. Eng. Chem.* 38, 997-1002 (1946).—*C.A.* 40, 7656^2.

Catalysts, effective for the isomerization of vegetable oils to conjugated forms, were diatomaceous earth and carbon black, Ni on kieselguhr, and Ni on carbon black. These catalysts did not split ester linkages. Ni-on-carbon was most effective, particularly when prepd. by the reduction of a suitable Ni salt on Nuchar XXX or Nuchar C-190. When 6-8% of reduced catalyst was heated for 6 hrs at 170°C with alkali-refined soybean or linseed oil, 30-45% conjugation was obtained. A sample of catalyst could be used to isomerize 5 to 10 batches of oil before its activity was lost.

10647. Riesz, C. H.; Komarewsky, V. I.; Kane, L. J.; Estes, Frances, and Lurie, Pierre. **Catalytic gasification of higher hydrocarbons.** *Am. Gas Assoc. Monthly* 28, 159-64 (1946).—*C.A.* 40, 3334^7.

Ni catalysts (5, 10, and 15% by wt) supported on Al_2O_3 were tested for activity in the steam-hydrocarbon reaction at 527°, 727°, and 827°C. Propane (99.9% pure) and hexane (75% hexane and 25% methylcyclopentane) showed nearly complete conversion to CO_2, CO and H_2. Carbon deposition on the catalyst was avoided by the employment of high steam-hydrocarbon ratios. Addnl. H_2 or air was found to suppress carbon formation.

10648. Roginskiĭ, S. Z. and Todes, O. M. **Kinetics of catalytic reactions in a flow system. I. Dynamics of processes at constant activity of the catalyst.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1946, 381-9.—*C.A.* 42, 8054*i*.

A differential equation was developed and solved relating the change in concn. with distance from the entrance of the reaction space, no. of active centers, order of the reaction, and the chem. reaction rate const. Generally, the higher the order of the reaction, the longer was the zone over which the reaction extended. The fall of the stationary-state concn. along the tube, for a reaction governed by a Langmuir-type law, was intermediate between the line corresponding to zero order (steepest fall) and the 1st-order curve. This type of kinetics held for cases where adsorption on the catalyst surface was established practically momentarily, and the chem. reaction was of the 1st-order with respect to the surface concn.

10649. Roginskiĭ, S. Z. and Todes, O. M. **Kinetics of catalytic reactions in a flow system. III. Dynamics of processes in the presence of catalyst poisons.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1946, 475-81.—*C.A.* 42, 8055*h*.

The case of a poison carried by the gas stream and adsorbed on consecutive layers of the catalyst column was treated. On passing consecutive layers of the column, the rate of sorption of the poison fell continuously. The head of the sorption wave, with a low concn. of the reactant, moved along with the gas stream with the velocity u. The tail of the wave, where the concn. of the reactant had reached its final value, moved at the considerably lower velocity v. The width of the wave increased proportionally to the time.

10650. Roy, A. N. **The catalytic formation of diolefins from monoölefins. II. Poisoning and promotion of chromium oxide catalysts in the dehydrogenation of monoölefins to diolefins.** *Proc. Natl. Inst. Sci.* 12, 103-6 (1946).—*C.A.* 42, 3246*b*.

The yield of butadiene decreased progressively from 30.8 to 11.3% as the preliminary drying period for the catalyst was increased from 7 to 39 hrs. Na vapor did not affect the reaction and did not promote polymerization. The introduction of 10% P_2O_5 into the catalyst lowered the yield but did not promote polymerization. Small amts. (1.0-1.5%) of S promoted the activity of the catalyst, but the products contained H_2S. In the dehydrogenation of 3-methyl-1-butene to isoprene over Cr_2O_3 at 330-400°C and at 15-30 mm progressive deactivation of the catalyst occurred, but its activity could be restored by treatment with H_2.

10651. Roy, A. N. **The catalytic formation of diolefins from monoölefins. III. Catalytic dehydrogenation of 1-butene in the presence of air at reduced pressure.** *Proc. Natl. Inst. Sci.* 12, 107-10 (1946).—*C.A.* 42, 3246*d*.

The presence of approx. an equal vol. of air increased the yield of butadiene although equil. was not reached. Over a $Cr_2O_3$80, $Al_2O_3$5, Cu 15% catalyst at 500°C and 300 mm 1-butene and air in a 61:39 vol. ratio yielded 47.4% butadiene. Increasing the vol. of air lowered the yield. Expts. with equal vols. of air and 1-butene were made at 500-50°C and at pressures of 160-230 mm. The yield reached 34.9% at 550° and 165 mm with a space velocity of 56.8.

10652. Rubinshteĭn, A. M. and Fribitkova, N. A. **Primary submicroscopic crystals in heterogeneous catalysis.** *Acta Physicochim. U.R.S.S.* 21, 79-100 (1946) (in English).—*C.A.* 40, 6325^9.

The activity, selectivity, and activation energy of MgO catalysts were studied in relation to their phys. structure. Samples were selected by x-ray analysis on the basis of primary crystal size and crystal lattice consts. Their activity was detd. for the conversion of butanol at 400°-460°C to butyraldehyde by dehydrogenation and butylene by dehydration. Catalysts with normal MgO lattice spacing and crystal size of 22-63 A. showed max. activity for both butyraldehyde by dehydrogenation and butylene by dehydration in the size range 25-30 A.

10653. Saegebarth, E. O. **Catalytic reforming process of Standard Oil Company of California.** *Petroleum Engr.* 17, No. 8, 95-100 (1946).—*C.A.* 40, 5911^4.

A charging stock of gasoline boiling range was reformed over a co-pptd. Al_2O_3-MoO_3 catalyst to dehydrogenate naphthenes and produce toluene or xylenes. Nitration-grade toluene was produced by isolating a product of 85-90% purity and reforming this product over the catalyst to increase the toluene content.

10654. Sakaki, Tomohiko. **Heterogeneous catalytic hydrogenation in gaseous systems. I. Reaction of acetylene and steam.** *J. Chem. Soc. Japan* 67, 117-19 (1946).—*C.A.* 45, 538*g*.

C_2H_2 and steam were passed over a ZnO catalyst at 300-550 °C. The ZnO was prepd. by heating $Zn(OH)_2$ at 450 °C in a quartz reaction tube. The C_2H_2 flow was 100 ml/min., and the C_2H_2:H_2O ratio was 1:13. The following reactions probably took place: $C_2H_2 + H_2O = CH_3CHO$; $2C_2H_2 + 3H_2O = (CH_3)_2CO + CO_2 + 2H_2$; $C_2H_2 + 2H_2O = CH_3CO_2H + H_2$; and $2C_2H_2 + 4H_2O = CH_3CO_2H + CO_2 + 2H_2 + CH_4$.

10655. Selwood, Pierce W.; Hill, Fred N., and Boardman, Harold. **A new magnetic effect applied to the structure of catalytically active soils.** *J. Am. Chem. Soc.* **68**, 2055-9 (1946).—*C.A.* **41**, 23*b*.

Magnetic susceptibility measurements were applied to catalytically active solids such as Cu-Cr_2O_3 to indicate oxidation states and structural properties in these substances. The magnetic properties of a supported transition group oxide approached those of the same element at high magnetic diln. The anomalous temp. coeff. of susceptibility shown by pure Cr_2O_3 was not due to Cr—O bonds, but rather to Cr-Cr interaction. Measurements were also made in catalysts consisting of MoO_3 supported on γ-Al_2O_3 and on a group of the so-called "chromite" catalysts.

10656. Suito, Eiji. **Studies of colloidal catalysts by thermal analysis of reaction velocity. VII. The permanent poisoning of catalysts.** *Rev. Phys. Chem. Japan, Shinkichi Horiba Commem. Vol.* **1946**, 35-41.—*C.A.* **44**, 4319*g*.

The permanent poisoning of H_2O_2 decompn. in the presence of Pt sol by $HgCl_2$, $Hg(CN)_2$, KCN, and KCl was studied. In the case of $HgCl_2$ and $Hg(CN)_2$ the activity of the catalyst decreased in proportion to the log of the poison concn.; with KCl the log of the activity had a linear relation to the log of the poison concn.; with KCN no simple relation was found. The poisoning was complete when a unimol. film of poison covered the Pt surface.

10657. Sussman, Sidney. **Catalysis by acid-regenerate cation exchangers.** *Ind. Eng. Chem.* **38**, 1228-30 (1946).—*C.A.* **41**, 839*b*.

Acid-regenerated cation exchangers were applied as esterification catalysts in acetal synthesis, ester alcoholysis, acetal alcoholysis, alc. dehydration, ester hydrolysis, and sucrose inversion. These catalysts simplified the procedures for reactions involving high-boiling and viscous compds., because the catalysts could be sepd. from the reaction products by simple filtration. Compds. which polymerize in the presence of acid, such as furfural, were esterified directly by cation exchangers.

10658. Tamura, Mikko and Shida, Shoji. **Comparison of the catalytic activities of some solid salts in the recombination of hydrogen free atoms (atomic hydrogen) and hydroxyl free radicals (free hydroxyl radicals).** *Rev. Phys. Chem. Japan, Shinkichi Horiba Commens. Vol.* **1946**, 115-20.—*C.A.* **44**, 1313*f*.

Water vapor was passed through a Wood's discharge tube, past a thermometer coated with the solid salt, through a trap cooled with solid CO_2 and alc., and finally was removed by vacuum pumps. The rise in temp. was measured for KF, KCl, KBr, KI, KCl, NaCl, RbCl, LiCl, NaF, LiF, Li_2CO_3, Na_2SO_4, $NaNO_3$, K_2SO_4, NH_4Cl, KNO_3, $MgCl_2$, $Ca(NO_3)_2$, CaF_2, Pt, K_2CO_3, and glass. The order of catalytic activity decreased in the order Rb, K, Na, Li for carbonates, halides, and nitrates and in the order metal carbonates, nitrates, halides for K and Na salts.

10659. Tatievskaya, E. P. and Chufarov, G. I. **Kinetics of reduction and dissociation of metal oxides.** *Bull. acad. sci. U.R.S.S., Classe sci. tech.* **1946**, 1005-14 (in Russian).—*C.A.* **41**, 1538*h*.

The dissocn. pressure of CuO in the given temp. interval was about 10^7 times higher than that of Cu_2O. The rates of reduction of both oxides by H_2, however, were found to be approx. equal, in measurements with initial H_2 pressures of 200, 100, and 50 mm Hg, at 200 and 250 °C. The rate of dissocn. of CuO into Cu_2O and O_2 was a linear function of the difference between the equil. dissocn. pressure of O_2 and the prevailing pressure. The B.E.T. surface areas of CuO and Cu_2O were 0.203 and 0.167 m^2/g, resp., and accounted for the approx. equality of the rates of reduction.

10660. Temkin, M. and Pyzhev, V. M. **Methods of preparing a nonpyrophoric reduced catalyst for ammonia synthesis.** *J. Phys. Chem.* (U.S.S.R.) **20**, 151-2 (1946).—*C.A.* **40**, 5887³.

The com. catalyst for NH_3 synthesis was made nonpyrophoric if after reduction at 500 °C it was cooled in a N_2-H_2 mixt. and then treated with a mixt. of N_2, H_2, and 0.5-1% of air. The catalyst became covered with an oxide film, but was readily reduced by N_2-H_2 at 475 °C; this had no effect on its activity. The nonpyrophoric catalyst with H_2 formed 0.0006 to 0.0024 g H_2O/g catalyst.

10661. Ternisien, Jean and Mélot, H. F. **The catalysis of oxidation of combustible gases.** *Chimie & industrie* **57**, 11-21 (1946).—*C.A.* **41**, 5781*a*.

The catalysis of Mn, Ni, and Co catalysts, activated by Pt, was studied. With coal gas and a mixed Mn-Pt catalyst, the max. combustion temp. (940.5 °C) was obtained with 25% $PtCl_4$ to 100% $Mn(NO_3)_2$. With Co-Pt catalyst under the same conditions, the max. combustion temp. (940.5 °C) was obtained with 25% $PtCl_4$ to 100% $Co(OAc)_2$. The max. temp. with Pt alone was 928 °C.

10662. Todes, O. M. **Kinetics of exothermal catalytic reactions in flow. I. Theory of the reaction across a long layer of contact.** *Izvest. Akad. Nauk. S.S.S.R., Otdel. Khim. Nauk* **1946**, 47-56.—*C.A.* **42**, 6626*i*.

A theory was developed from the material balance per unit vol. of the catalyst column, and from the expression of the heat balance, including the heat of the reaction, the heat conveyed by the gas flow, that transmitted by conductance and that given up across the walls of the reaction tube. At not too high temps. T, in the kinetic region, c (concn. of reactants at time t) first increased with $(T - T_0)$, up to a max. of the order RT_0^2/E (where E = activation energy of the reaction), then fell off a little with further increasing T. On still further-rise of T. the reaction went over into the diffusional zone where *c* again increased with rising ($T - T_0$).

10663. Todes, O. M. **Kinetics of exothermal catalytic reactions in flow. II. Dynamics of processes on aging catalysts.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1946**, 483-8.—*C.A.* **42**, 6627*g*.

A stationary concn. wave was established along the tube; at a given time *t*, *c* decreased along *x*, the depth into the tube, from a high c_2 to a low c_1, the values of c_2 and of c_1 decreasing uniformly, each along its own course, with increasing *x*. At a given *x*, *c* increased with time from c_1 to c_2. The width of the wave in all cases decreased with rising temp. Relations were qualitatively similar for reactions other than first-order.

10664. Tschernitz, John L.; Bornstein, Sidney; Beckmann, R. B., and Hougen, O. A. **Determination of the kinetics and mechanism of a catalytic reaction.** *Trans. Am. Inst. Chem. Engrs.* **42**, 883-905 (1946).—*C.A.* **41**, 644*c*.

The vapor-phase hydrogenation of mixed isooctenes (commonly called codimer) by a solid supported Ni catalyst was analyzed into 17 possible chem. steps. The independent diffusion of reactants to the catalyst surface and of the product away from the surface was recognized. For the stated reaction the rate mechanism consisted of a surface reaction between activatedly adsorbed H_2 and codimer to form activatedly adsorbed hydrogenated codimer.

10665. Turkevich, John and Smith, Robert K. **Unitary theory of hydrocarbon catalytic reactions.** *Nature* **157**, 874 (1946).—*C.A.* **40**, 5628¹.

In the isomerization of 1-butene by H_3PO_4 the rate of exchange of T at 27 °C was slower than the rate of isomerization, the difference corresponding to a difference in activation energies of 3 kcal. The differences in the rate were due to the different zero-point energies of H and T bonds. T_2O and TCl did not exchange with butene; T_3PO_4 did not exchange with C_2H_4, but did exchange with C_3H_6. The catalyst must furnish a H atom and accept a H atom at a distance of ~ 3.5A. This condition was satisfied by H_2SO_4 (3.45A), H_3PO_4 (3.46A), silicic acid (3.50A), $HClO_4$ (3.41A), wet $AlCl_3$ ($HAlCl_4$) (3.46A), and partially hydrogenated Ni (3.52A).

10666. Twigg, G. H. **The mechanism of the catalytic oxidation of ethylene. I. Experiments using a flow system.** *Proc. Roy. Soc. London*, **A188**, 92-104 (1946).—*C.A.* **41**, 3354*e*.

The catalytic oxidation of ethylene was detd. in a flow system on an Ag catalyst. The products of reaction were ethylene oxide and CO_2 and H_2O. The isomerization of ethylene oxide to acetaldehyde by the catalyst in the absence of O_2 proceeded to a large extent through a preliminary isomerization of the ethylene oxide to acetaldehyde. The rate of oxidation of acetaldehyde was extremely rapid and no trace of acetaldehyde was found during the oxidation of ethylene or of ethylene oxide. An energy of activation of about 27 kcal was found for the production of ethylene oxide.

10667. Twigg, G. H. **The mechanism of the catalytic oxidation of ethylene. II. Reactions between ethylene, etc., and chemisorbed oxygen monolayers.** *Proc. Roy. Soc. London* **A188**, 92-104 (1946).—*C.A.* **41**, 3355*a*.

Expts. were made at 263°C and higher temps. between adsorbed O atoms on an Ag catalyst, and ethylene, ethylene oxide, and acetaldehyde. The course of reaction was followed by measuring the change in pressure, and the products analyzed by microfractionation of the gases at low temps. The absence of an induction period in the pressure-time curve showed that oxidation of ethylene to CO_2 and H_2O was possible by a route not through ethylene oxide. The reaction of acetaldehyde with the oxygenated catalyst was too fast to measure. On a clean catalyst, ethylene oxide was simultaneously isomerized to acetaldehyde and converted back to ethylene and adsorbed O. Both ethylene oxide and acetaldehyde, but not ethylene, were adsorbed with decompn. to form a nonvolatile layer on the catalyst.

10668. Twigg, G. H. **The mechanism of the catalytic oxidation of ethylene. III. The reactions between ethylene and oxygen in a static system.** *Proc. Roy. Soc. London* **A188**, 123-41 (1946).—*C.A.* **41**, 3355*i*.

At 263°C the rate of oxidation of ethylene to ethylene oxide on a Ag catalyst was proportional to the ethylene pressure and to the first power of the concn., c of adsorbed O on the catalyst. The rate of the direct oxidation of ethylene to CO_2 was proportional to the ethylene pressure and to c^2. The rate of oxidation of ethylene oxide was proportional to the ethylene oxide pressure and independent of c. The kinetic equations for the course of reaction with time were integrated by means of the Bush differential analyzer. A large part, and possibly the whole, of the catalyst surface must be engaged in reaction.

10669. Twigg, G. H. **The catalytic oxidation of ethylene.** *Trans. Faraday Soc.* **42**, 284-90 (1946).—*C.A.* **41**, 2385*d*.

The catalyst was made by plating glass-wool fibers with a thin coating (10^{-4} mm) of Ag. O was chemisorbed as atoms whereas none of the other reactants was adsorbed. The adsorption and desorption of O were slow activated processes, and it was possible to form surface layers of O, pump out the reaction vessel, and allow various gases to come in contact with the O layer. In addn. to carrying out reactions in both flow and static systems, information was also obtained from reactions between O adsorbed on the catalyst and the other gases concerned. C_2H_4 could be oxidized either to ethylene oxide, or directly to CO_2 and H_2O.

10670. Voge, H. H.; Good, G. M., and Greensfelder, B. S. **Catalytic cracking of pure hydrocarbons.** *Ind. Eng. Chem.* **38**, 1033-40 (1946).—*C.A.* **42**, 2749*g*.

Secondary reactions were studied: the nature and extent of olefin isomerization; olefin satn. via H transfer and effect on satn. of temp., flow rate, and diluents; the effect of olefin structure upon H transfer reactions; Decalin and Tetraline as H donors; a comparison of H transfer and catalytic hydrogenation; and the production of polymers and aromatic hydrocarbons from olefins. A silica-alumina-zirconia cracking catalyst, a com. synthetic silica-alumina, a silica-alumina-magnesia, and an activated natural clay all gave similar results as catalysts.

10671. VVEDENSKIĬ, A. A.; DOBRONRAVOV, R. K., AND FROST, A. V. **Kinetics and the mechanism of catalytic hydrogenation of hydrocarbons.** *J. Gen. Chem.* (U.S.S.R.) **16**, 71-6 (1946) (English summary).—*C.A.* **40**, 6950^5.

The rate of hydrogenation of benzene over Pd black at 240°C at atm. pressure was independent of the partial pressure of benzene between 0.1 and 0.45 atm. The reaction was hindered by cyclohexane long before equil. conditions were reached. It was proposed that the reaction proceeded between benzene adsorbed on the catalyst and H_2 dissolved in Pd catalyst.

10672. VVEDENSKIĬ, A. A. AND SIDOROV, N. V. **Kinetics of the synthesis of ammonia under high pressure. I. The temperature conditions in the reaction zone.** *J. Appl. Chem.* (U.S.S.R.) **19**, 1157-68 (1946) (in Russian).—*C.A.* **41**, 6122*b*.

In order to insure uniformity of temp. over the reaction zone, it was necessary and sufficient to distribute the catalyst non-uniformly. In particular, the catalyst must be dild. in the first segments of the reaction column. With a mixt. of 5 ml (12.5 g) catalyst of grain size 1-2 mm, with 25 ml (220 g) of Cu of grain size 1-1.5 mm, total height about 180 mm, the temp. remained const. over the whole length within ± 5°, except under $p = 800$ where an increase of the rate of flow r of the H_2 and N_2 mixt. from 150 to 1500 liters/hr caused the temp. of the gas to rise by 40°C. Under $p = 100$ to 500, at $r = 150$ to 1500, the temp. was practically uniform. Instead of Cu, corundum grains can be used as diluent with the same effectiveness. Diln. of the catalyst lowered the yield of NH_3 as against the conventional operation under conditions of temp. drop along the reaction column.

10673. ZAL'KIND, YU. S. AND BAL'YAN, KH. V. **Action of some inhibitors in catalytic hydrogenation in the presence of palladium.** *Trudy Leningrad. Tekhnol. Inst. im.Leningrad. Soveta* **1946**, No. 12, 73-86.—*C.A.* 44, 7220*i*.

The inhibiting action of NH_4CNS, $(NH_2)_2CS$, $Pb(OAc)_2$, and $Cu(OAc)_2$ during hydrogenation with colloidal Pd of $(\vdots CC(OH)Me_2)_2$, $Me_2C(OH)C\vdots CH$, and $Me_2C(OH)CH{:}CH_2$ in general decreased in the above order. The Pb salt was more active with alcs., and the Cu salt with the glycol.

10674. ZHABROVA, G. M.; ROGINSKIĬ, S. Z. AND FOKINA, E. A. **The promotion of contacts by means of metal-organic compounds.** *Compt. rend. acad. sci. U.R.S.S.* **52**, 313-16 (1946) (in English).—*C.A.* 41, 1539*i*.

A copper chromite catalyst, prepd. by the pyrolysis of $CuCrO_4$ and corresponding closely to the formula $CuCr_2O_4$ after removal of excess CuO with 10% CH_3COOH, was treated with pure $PbEt_4$. Its activity was investigated for the decompn. of H_2O_2 (static system) the oxidation of H_2 (static system), and the oxidation of isoöctane (dynamic system). About 1/8 of the Pb used was taken up by the catalyst. The decompn. of 1.7 *M* H_2O_2 reached a max. with about 3% PbO_2 in the catalyst.

10675. ADKINS, HOMER AND PAVLIC, A. A. **Hydrogenation of esters to alcohols over Raney nickel. I.** *J. Am. Chem. Soc.* **69**, 3039-41 (1947).—*C.A.* 42, 3327*g*.

The hydrogenations were carried out at 50°C for 7 hrs under 150-200 atm. H_2; the reaction mixt. was 20-35 ml EtOH. Et 1-piperidineacetate with the Raney-Ni catalyst contg. 12-13% Al yielded 98% 1-piperidineëthanol; digestion of the catalyst for 6 hrs reduced the yield to 55%; digestions for 24 hrs or elimination of the digestion period gave catalysts which yielded 14 and 4%, resp. The Al content of the catalyst and its catalytic activity did not appear to be closely related.

10676. ALEXANDER, JULIAN, JR. **Standard laboratory method for the determination of cracking catalyst activity.** *Proc. Am. Petroleum Inst.* **27**, III, 51-6 (1947).—*C.A.* 42, 6094*f*.

A modified procedure for evaluating activity, when heavy reduced-crude charging stock was used, consisted of adding 20% steam, replacing quartz with Corhart grain, and raising the cracking temp. to 850°F. The app. was used to study the effect of space velocity on activity. A variation of 1% of the former corresponded to a change of 0.1 of the latter.

10677. ANDERSON, ROBERT B.; KRIEG, ABRAHAM; SELIGMAN, BERNARD, AND O'NEILL, WILLIAM E. **Fischer-Tropsch synthesis - tests of cobalt catalysts at atmospheric pressure.** *Ind. Eng. Chem.* **39**, 1548-54 (1947).—*C.A.* 42, 1039*a*.

A Co:thoria:magnesia:kieselguhr (100:6:12:200) was described. Pelleted catalysts produced more light hydrocarbons and CO_2 than granular catalysts. The flow of synthesis gas was varied and the temp. adjusted to give the same percentage conversion. Under these conditions the degree of unsatn. increased with increase in flow and temp., while the most unsatd. products had a Br number of 30. Over-all activation energies were 24 to 27 kcal per mole. Yields of liquid hydrocarbons were found to range between 60 and 85% of the total weight of hydrocarbons formed.

10678. BALANDIN, A. A. AND EGOROVA, N. P. **The catalytic properties of the pentoxides of columbium and tantalum.** *Doklady Akad. Nauk S.S.S.R.* **56**, 255-8 (1947).—*C.A.* 44, 8215*a*.

The catalytic prepns. included $Cb_2O_5 + Ta_2O_5$ in varying proportions alone, on asbestos, on Al_2O_3, also with the addn. of Cb or Ta metal; also pure Cb and Ta metals and V_2O_5 alone and on asbestos. These prepns. were tested as catalysts at 300°-500°C for the oxidation (of napthalene), dehydration (isopropyl alc., cyclohexanol), and esterification (isoamyl alc. + HOAc). The oxides were more effective catalysts than the prepns. contg. metallic Cb and Ta. The catalytic activity of Ta_2O_5 was about 1.3 times that of Cb_2O_5. Comparison with V_2O_5 showed that the latter was especially effective as a catalyst for dehydrogenation whereas Cb_2O_5 and Ta_2O_5 catalyzed dehydration reactions predominantly.

10679. Batchelder, H. R. **Sulfur-resistant catalysts.** *Am. Gas. Assoc. Monthly* **29**, 222-5 (1947).—*C.A.* **41**, 5371*g*.

A large no. of catalysts were tested for the C_3H_8-steam reaction in the presence of H_2S. The best were based on NiS. Attempts to promote by addn. of Th or Zr oxide were unsuccessful.

10680. Berti, V.; Salvi, G., and Ghisoni, V. **Production of gaseous olefins by catalytic pyrolysis of mineral oils.** *Riv. combustibili* **1**, 129-48 (1947).—*C.A.* **42**, 8451*f*.

Catalytic cracking was effected at 770-80°C (810-30°C was necessary when the reaction was carried out in tubes packed only with Fe fillings), with less carbonization and tar formation. With an $Al_2O_3.SiO_2$ catalyst, only 4-6% of heavy residue (b.p. 360°C) resulted, whereas 10-15% was formed in the absence of a catalyst.

10681. Birkhimer, E. R.; Macuga, S. J., and Leum, L. N. **Bench-scale test method for evaluating cracking catalysts.** *Proc. Am. Petroleum Inst.* **27, III**, 90-9 (1947).—*C.A.* **42**, 6094*i*.

A small amt. of feed (24 ml) was charged to each test, and a distn. technique was employed on vols. of liquid products as low as 5-10 ml. Two hundred g of pelleted catalyst was used in the standard test, but other quantities were used in modified tests for product distribution measurements over a range of conversions.

10682. Bitepazh, Yu. A. **Relation between catalytic activity and ion-exchange ability of aluminosilicates.** *J. Gen. Chem.* (U.S.S.R.) **17**, 199-207 (1947).—*C.A.* **42**, 21*h*.

A rough parallelism was found between the cation-exchange capacity of 6 different natural clays and kaolins, as expressed by their total content of the exchangeable cations $H^+ + Al^{+++}$ (in milliequiv./100 g), and their cracking catalytic activity after acid activation and ignition at 500-20°C. The catalytic activity was detd. by the yield in vol. of gasoline (fraction b.p.<200°C) in cracking a raw oil b.p. 230-300°C, and by the enrichment in aromatics and unsatd. compds. of a cracking-gasoline of I_2 no. 89, aromatics content 0%. The high catalytic activity was due primarily to an exchange of Na^+, not to the increased porosity brought about by an acid treatment.

10683. Bosworth, R. C. L. **Chemical similarity in heterogeneous catalysis.** *Trans. Faraday Soc.* **43**, 399-406 (1947).—*C.A.* **42**, 1459*g*.

When the reaction mixt. was passed over the catalyst mass, the thermal energy and each particular mol. species produced (or destroyed) by chem. reaction was carried along by the stream or carried to the walls by diffusion in the case of mol. species, or by conduction, turbulent conduction, or radiation in the case of heat. When all the conditions for similarity in chem. systems involving heterogeneous catalysis were satisfied, when conduction (or turbulent conduction) provided the dominant mode of heat transfer, the length of the reaction tube and the size of the catalyst grains were directly proportional to the diam. of the reaction tube.

10684. Bridger, G. L.; Pole, G. R.; Beinlich, A. W. Jr., and Thompson, H. L. **Production and performance of ammonia-synthesis catalyst.** *Chem. Eng. Progress* **43**, No. 6, *Trans. Am. Inst. Chem. Engrs.* 291-302 (1947).—*C.A.* **41**, 5265*e*.

The process consisted of (1) purification of high-grade natural magnetite ore by dry tabling on an air separator table, (2) prepn. of synthetic magnetite by burning high-purity ingot Fe in O_2, and (3) fusion of a mixt. of synthetic magnetite, purified natural magnetite, ingot Fe, KNO_3, Al_2O_3, and recycled catalyst fines, followed by sizing of the fused product by crushing, tumbling, and screening. The catalyst contained about 66% Fe_2O_3, 31% FeO, 1.0% K_2O, and 1.8% Al_2O_3.

10685. Brinkley, Stuart R. Jr. **Heat transfer between a fluid and a porous solid generating heat.** *J. Appl. Phys.* **18**, 582-5 (1947).—*C.A.* **41**, 5007*e*.

A theory was applied to the description of temp. in a catalytic reaction, such as the Michael process for the synthesis of hydrocarbons from CO and H_2.

10686. Brown, O. W. and Frishe, W. C. **Catalytic oxidation of aniline in the vapor phase.** *J. Phys. & Colloid Chem.* **51**, 1394-1400 (1947).—*C.A.* **42**, 1793*h*.

Thallium, lead, bismuth and their intermetallic compds. were good catalysts for the vapor phase reduction of nitrobenzene to azobenzene and aniline. The mixt. of air and aniline vapor was passed over the oxide under atm. pressure and from 250° to 500°C. The nonalk. products were condensed and the alk. ones absorbed in 1 *N* H_2SO_4. The catalyst consisted of 60% thallic oxide and 40% asbestos. The yield of azobenzene and phenazine and on the percentage conversion of aniline indicated that the optimum temp. was about 350°C.

10687. Bruns, B. P. **Catalysis in stages.** *J. Phys. Chem.* (U.S.S.R.) **21**, 1011-18 (1947) (in Russian).—*C.A.* **42**, 2501*e*.

If the reaction between 2 gases, *A* and *B*, could be accelerated by a catalyst when the catalyst was brought in contact with first *A* alone and then *B* alone, the catalysis occurred in stages. Catalysis in stages was impossible if the catalyst was chemically altered during catalysis (e.g., MnO_2 is reduced to Mn_2O_3 when it accelerated the reaction between CO and O_2). The hydrogenation of ethylene in the presence of Pt could not be realized in stages, because the metal surface contained two types of regions one of which was blocked by the adsorbed gas.

10688. Chirkov, N. M. and Vinnik, M. I. **Heterogeneous acid-base catalysis in multimolecular films.** *Doklady Akad. Nauk S.S.S.R.* **58**, 1697-1700 (1947).—*C.A.* **46**, 4339*b*.

Treatment of app. walls with HCl vapor catalyzed the decompn. of paraldehyde and the rate rose sharply with increase of temp. Up to P/P_{d}

(P_d =dewpoint) 0.3 the content of HCl was linear with the amt. of adsorbed HCl. At P/P_d 0.5-0.6 the activation energy of depolymerization was 26 kcal/mole. The catalytic activity of the wall-adsorbed HCl dropped with introduction of H_2O vapor; a smaller decline occurred with EtOH vapors.

10689. Conn, M. E. and Connolly, G. C. **Testing of cracking catalysts.** *Ind. Eng. Chem.* **39**, 1138-43 (1947).—*C.A.* **41**, 7085*g*.

A small lab.-scale, fixed-bed catalytic cracking app. was designed for testing catalysts both as to the effect of different methods of prepg. them and as to changes in their activity during use. Relative activity of a catalyst was found from a single detn. of percentage converted because the percentage of oil converted was linear with respect to throughput, plotted on log-log paper. Gas-forming and carbon-depositing tendencies of catalysts could also be rated from the test data.

10690. Constable, F. H. **The dynamics of selective catalytic autopoisoning.** *Proc. Intern. Congr. Pure and Applied Chem.* **11**, 391-6 (1947).—*C.A.* **44**, 8214*a*.

On a homogeneous surface, the reaction velocity was an inverse exponential in the time. The rate of poisoning of the different centers in a distribution of active centers varied with the heat of activation on each. The distribution const. was proportional to the temp. at which the surface was frozen in equil. The dehydrogenation of alc. by active Cu was detd. between 602° and 673°K.

10691. Craxford, S. R. **The chemistry of the Fischer-Tropsch synthesis.** *Fuel* **26**, No. 6, 119-23 (1947).—*C.A.* **42**, 737*h*.

The best catalyst for the reaction of CO and H_2 to form higher hydrocarbons contained Co, thoria, magnesia, and kieselguhr in the proportions by weight of 100:5:8:200. It was prepd. by pouring a boiling soln. of the mixed nitrates, a boiling soln. of Na_2CO_3, and the kieselguhr, made into a thin paste with H_2O, simultaneously and rapidly into a vessel fitted with a stirrer, filtering at once and washing thoroughly. With a suitable kieselguhr, this catalyst gave about 77% conversion of CO at 185°C with a CO + $2H_2$ flow of 1 liter per g Co per hr. The catalyst was best reduced at 350°-400°C for a period of 40 to 120 min. with H_2 rates of about 500 m^3/m^3 of catalyst/hr. The addn. of CH_4 to the reaction mixt. suppressed the normal formation of CH_4 favoring production of higher hydrocarbons.

10692. Craxford, S. R. **The Fischer-Tropsch synthesis with cobalt catalysts.** *J. Soc. Chem. Ind.* **66**, 440-4 (1947).—*C.A.* **42**, 3648*d*.

The best catalysts contained Co with one or more activators and were prepd. by pptg. the carbonates onto kieselguhr as a carrier. The moist filter cake was dried immediately. The activators were usually ThO_2 and MgO. The surface area of a catalyst (Co 100, $ThO_2{}^6$, MgO 12, kieselguhr 200) was much larger than that of the sep. constituents. The reduction of the catalyst was the most crucial step; normal temps. were 350° to 400°C with times of 42 to 120 min. and H_2 rates of 5,000 vols. per vol. of catalyst per hr. The best catalysts were 65-70% reduced.

10693. Csuros, Zoltan. **Selective catalytic hydrogenation.** *Muegyetemi Közlemények* **1947**, 110-18.—*C.A.* **42**, 3726*g*.

Cis and *trans* isomers were each hydrogenated at different rates by varying the amt. of Pd catalyst. The speed of hydrogenation was not a linear function of the amt. of catalyst, but reached a max. and min. value with a definite amt. of catalyst. These conclusions were verified with fumaric and maleic acids; oleic and elaidic acids; angelic and tiglic acids; brassidic and erucic acids; meconic and citraconic acids; cinnamic, coumaric, coumarinic, and crotonic acids.

10694. Darlington, F. H. **Organic sulfur removal process.** *Am. Gas Assoc. Monthly* **29**, 147 (1947).—*C.A.* **44**, 5077*i*.

Org. S compds. in carburetted water-gas were removed. The gas, compressed to 10 p.s.i. and preheated to 426.5°C, entered the top of a catalyst chamber contg. $MgSO_4$-ZnO catalyst. On leaving the bottom at 343°C, the gas was cooled and passed through an oxide purifying box. Org. S compds. were reduced from 15 to less than 3 grains per ft^3. Weekly revivification of the catalyst was effected by passing air for 12 hrs at a rate of 8 ft^3 per min.

10695. Davidson, R. C. **Cracking sulfur stocks with natural catalyst.** *Petroleum Refiner* **26**, No. 9, 663-72 (1947).—*C.A.* **42**, 9138*f*.

The relation between the crystal structures of montmorillonite catalyst and the phenomenon of rehydration were shown. The importance of rehydrating catalyst before cracking high-S stocks of gas oil was described.

10696. Delépine, Marcel. **Hydrogenation with Raney nickel.** *Compt. rend.* **224**, 1396-9 (1947).—*C.A.* **41**, 5780*i*.

Many hydrogenations over Raney Ni reported in which high temperatures and pressure were used could be run under ordinary conditions adaptable to most labs., particularly if Na_2CO_3 was added. Thus, glutaconic ester was prepd. by hydrogenation of $CO(CH_2COEt)_2$ at ordinary temp. and pressure followed by dehydration.

10697. Dupont, G. and Dulou, R. **Study of the catalytic properties of clays.** *Verre silicates ind.* **12**, No. 8, 19-21 (1947) *Ceram, Abstracts in J. Am. Ceram. Soc.* **31**, No. 6, 143 (1948).—*C.A.* **43**, 6799*a*.

Montmorillonitic clays treated by heating to 360°C in H_2 were used as catalysts for isomerization from pinene to camphene.

10698. Eastwood, S. C.; Hornberg, C. V., and Potas, A. E. **Thermofor catalytic cracking unit.** *Ind. Eng. Chem.* **39**, 1685-90 (1947).—*C.A.* **42**, 1413*d*.

The construction and operation of a Thermofor catalytic cracking pilot unit with max. charge capacity of 2 barrels per day was described in detail.

10699. Eischens, Robert P. and Selwood, Pierce W. **Susceptibility-composition isotherm for the**

chromium-aluminum oxide catalyst system. *J. Am. Chem. Soc.* 69, 1590-4 (1947).—*C.A.* 41, 7214*b*.

Results were given for Cr_2O_3 supported on γ-Al_2O_3, the concn. of Cr varying from 0.11 to 41.4% by wt. The susceptibility per g of Cr was calcd. in each case by the Wiedemann additivity law. At 85°K this varied from 300 for 0.11% Cr to 61.9 for 41.4% Cr. A diagrammatic representation of the possible structure was presented, showing the relative arrangements of the O^{-2}, Al^{+3}, and Cr^{+3} ions.

10700. EUCKEN, ARNOLD AND WICKE, EWALD. **Hydrogen exchange on oxidic contact catalysts.** *Z. Naturforsch.* 2a, 163-6 (1947).—*C.A.* 42, 7148*d*.

The dehydration of alcs. on oxidic contact catalysts (bauxite and Al_2O_3) was studied. Surface OH groups of the contact substance were catalytically active, and this activity was based on an exchange of H particles according to the "principle of least structure change." Pretreatment of the catalyst by dehydration or by exposure to O_2 or at. O, successful application of the catalyst to dehydration of *trans*-crotyl alc., and proof that the primary product was HDO when the catalyst contained OD groups were used to verify the concept.

10701. FUNASAKA, WATARU AND FUKUSHIMA, RYOICHI. **Removal of organic sulfur compounds from gas mixtures for synthesis. X. Influence of impurities on the purification of industrial gases.** *J. Soc. Chem. Ind. Japan* 50, 122-4 (1947).—*C.A.* 44, 9136*g*.

C_2H_4 had a deleterious effect on Fe and Al catalysts for the removal of org. S compds., but not on Ni and Cu at 250°C. At 400°C no effect was detectable. C_6H_6 had no effect, while C_2H_2 had a deleterious effect. Acidic gases, such as CO_2 or HCN, transformed CS_2 to H_2S, especially at high temperature. A high CO_2 content had a deleterious effect at high temps. HCN also had a deleterious effect. Air, N_2, and water vapor gave good results.

10702. FUNASAKA, WATARU; FUKUSHIMA, RYOICHI; JINTA, TOMIO; INABA, TESUO; MATSUBARA, ITSUO, AND YUGUCHI, MASAYASU. **Removal of ethyl mercaptan and ethyl sulfide from hydrogen, natural gas, and cracking gas.** *J. Soc. Chem. Ind. Japan* 50, 125-6 (1947).—*C.A.* 44, 9136*i*.

EtSH could be removed easily, Et_2S with difficulty. Fe, Ni, Cu, Mn, Cr, Al, and Mg catalysts were suitable for EtSH and Cu and Ni for Et_2S. Et_2S gave H_2S with Cr and Al catalysts.

10703. FUNASAKA, WATARU; FUKUSHIMA, RYOICHI; JINTA, TOMIO; MATSUBARA, ITSUO, AND YUGUCHI, MASAYASU. **Removal of carbon disulfide and thiophene from water gas and natural gas.** *J. Soc. Chem. Ind. Japan* 50, 124-5 (1947).—*C.A.* 44, 9136*h*.

CS_2 could be removed by Ni, Cu, and Sn catalysts and thiophene by Fe, Ni, Cu, Mn, Cr, Al, and Mg. With Cr as a catalyst H_2 was formed.

10704. GHOSH, J. C.; BASAK, N. G., AND BADAMI, G. N. **Nickel-thoria-kieselguhr catalyst for the Fischer-Tropsch reaction. I.** *Current Sci.* 16, 318-19 (1947).—*C.A.* 43, 5921*f*.

A catalyst was prepd. by pptn. of Ni and Th carbonates on kieselguhr by addn. of NH_4HCO_3 to a soln. of the nitrates in presence of excess of CO_2, and subsequent reduction in H_2 first at 500°C and then at 300-350°C (for 6 hrs in each case). The catalyst gave 147.5 g of hydrocarbons other than CH_4 per m^3 of synthesis gas with a space velocity of 0.90 liter per hr per g of Ni.

10705. GHOSH, J. C.; BASAK, N. G., AND BADAMI, G. N. **Nickel-thoria-kieselguhr (100:18:100) catalyst for the Fischer-Tropsch reaction. II.** *Current Sci.* 16, 353 (1947).—*C.A.* 43, 3167*f*.

Expts. with the catalyst at 195°C and atm. pressure with water gas (CO:H_2 ratio of 1:1) gave hydrocarbon yield comparable to that obtained with synthesis gas (CO:H_2 ratio of 1:2). Max. yield of approx. 18 g of CH_4, 80 g other gaseous hydrocarbons, and 45 g liquid hydrocarbons per m^3 of water gas was obtained with space velocity of 0.91 liter per hr per g of Ni.

10706. GHOSH, J.C.; BASAK, N.G., AND VENKATESAN, C. **Nickel-thoria-kieselguhr (100:18:100) catalyst for the Fischer-Tropsch synthesis at medium pressure. III.** *Current Sci.* 16, 377 (1947).—*C.A.* 43, 3167*h*.

At 70 p.s.i. with synthesis gas as well as water gas, the best reaction took place at 205°C. When synthesis gas was used, the yield of CH_4 was high. With water gas, the yield of CH_4 decreased with a corresponding increase of gaseous and liquid hydrocarbons.

10707. GOL'DANSKIǏ, V. I. **Heterogeneous catalysis in multimolecular adsorption layers. Esterification equilibrium in two-phase systems.** *J. Phys. Chem.* (U.S.S.R.) 21, 431-8 (1947) (in Russian).—*C.A.* 41, 6801*b*.

The equil. const. K for the reaction AcOH + EtOH = AcOEt + H_2O in liquid phase was calcd. from the equil. in the vapor phase and the vapor pressure of the constituents. The equil. in the vapor at 45-75°C corresponded to 92% AcOEt, and the equil. const. was 305 at 45°C and 196 at 75°C. The equil. in the presence of multimol. adsorption layers must depend on the relative vols. of the gas phase and the adsorbed layers.

10708. GOL'DANSKIǏ, V. I. AND CHIRKOV, N. M. **Heterogeneous ionic catalysis. Study of acid-catalyzed reactions of esterification and ester hydrolysis in the vapor phase.** *Acta Physicochim. U.R.S.S.* 22, 363-80 (1947) (in English).—*C.A.* 41, 6800*f*.

10709. GOL'DANSKIǏ, V. I. AND KARASEV, V. V. **Application of polarization-microscopic techniques in the study of catalysis in multimolecular adsorbed layers.** *Doklady Akad. Nauk S.S.S.R.* 57, 793-5 (1947).—*C.A.* 46, 5951*h*.

A study of EtOH-AcOH esterification was briefly reported. The kinetic characteristics in adsorbed layer were identical with that in the liquid state if the adsorbed layer contained at least 5-10 mol. layers.

10710. GONCHAROVA, M. A. AND KABANOVA, M. F. **The mechanism of the catalytic refining of thermally cracked or reformed distillates with activated clay.** *Azerbaidzhanskoe Neftyanoe Khoz.* 26, No. 1/2, 24-7 (1947).—*C.A.* 42, 7515*d*.

Several thermally cracked or reformed distillates were subjected to catalytic refining four different ways: (1) treated with nonactivated clay at 200°-400°C; (2) hydrogenated over an aromatizing catalyst of the Al_2O_3-CrO_3 type at 350°C and 30 atm.; (3) treated in the vapor phase with activated Al_2O_3 at 250°-450°C; and (4) treated in the vapor phase with activated clay at 400°C. The group compn. and octane nos. of the products indicated that treatment over clay-type catalysts involved H-disproportionation in which part of the cyclic olefins was dehydrogenated to aromatics and the other part to naphthenes.

10711. Good, G. M.; Voge, H. H., and Greensfelder, B. S. **Catalytic cracking of pure hydrocarbons. Cracking of structural isomers.** *Ind. Eng. Chem.* 39, 1032-6 (1947).—*C.A.* **41**, 7085*e*.

Six groups of isomeric hydrocarbons were subjected to cracking in the presence of SiO_2-Zr_2O_3-Al_2O_3 catalyst, in order to study the influence of structure on rate of cracking. The presence of tertiary C increased the rate. The presence of quarternary C reduced it. It had been concluded from previous work that naphthenes crack faster than paraffins. This depended, however, upon how much tertiary C the paraffin isomer contained in its structure.

10712. Gracasso, Guiseppe. **Nomogram for, and considerations on, the catalytic conversion of carbon monoxide.** *Chimica* 2, 321-5 (1947).—*C.A.* **42**, 9118*f*.

A nomogram was given for the catalytic conversion of CO with H_2O vapor, in relation to the concn. of vapor, at temps. from 350° to 600°C, with an initial content of CO up to 100%.

10713. Graham, Ronald P. and Thomas, Arthur W. **The reactivity of hydrous alumina towards acids.** *J. Am. Chem. Soc.* 69, 816-21 (1947).—*C.A.* **41**, 4395*d*.

The catalytic effect of hydrous alumina on the hydrolysis in water of Me oxalate and of MeI was found to be in the order of the rates of reaction of the resultant acids with alumina. The reactivity of hydrous alumina as regards complete soln. in acids was shown to decrease with increasing temp. of prepn. of the oxide, the effect being ascribed to an increasing oxolation of the alumina structure. With increasing temp. of prepn., the no. of surface hydroxo groups passed through a max., and became zero in the case of ignited alumina.

10714. Greensfelder, B. S.; Archibald, R. C., and Fuller, D. L. **Catalytic reforming. Fundamental hydrocarbon reactions of petroleum naphthas with molybdena-alumina and chromia-alumina catalysts.** *Chem. Eng. Progress* 43, No. 10 *Am.' Inst. Chem. Engrs.* 561-8 (1947).—*C.A.* **41**, 7714*d*.

Characteristics of certain MoO_2-Al_2O_3 and Cr_2O_3-Al_2O_3 catalysts were compared. With pure hydrocarbons, the Cr_2O_3 catalysts were highly effective for the dehydrogenation of cyclohexane homologs and the dehydrocyclization of amenable aliphatic hydrocarbons to aromatic. Under H_2 pressure, the MoO_2 catalysts were superior from the standpoint of sustained high activity for dehydrogenation of cyclohexane homologs and for their ability to catalyze paraffin isomerization and the dehydroisomerization of the homologs of cyclopentane to those of benzene.

10715. Gridger, G. L.; Pole, G. R.; Beinlich, A. W. Jr., and Thompson, H. L. **Production and performance of ammonia-synthesis.** *Chem. Eng. Progress* 43, No. 6, *Trans. Am. Inst. Chem. Engrs.* 291-302 (1947).—*C.A.* **41**, 5265*e*.

The catalyst contained about 66% Fe_2O_3, 31% FeO, 1.0% K_2O, and 1.8% Al_2O_3; amts. of impurities were kept low by proper choice of raw materials and by extreme care to avoid contamination in the manufg. operation. A supply of catalyst was made for the TVA plant and for one other NH_3 plant. Lab. tests showed that max. activity of the catalyst was obtained when Fe^{+2}/Fe^{+3} was 0.5. Pilot converter tests made under operating conditions indicated that catalysts having no significant differences in activity could be made from purified natural magnetite, synthetic magnetite or mixtures of the two.

10716. Grote, H. W. and Olsen, C. R. **Pilot-plant evaluation of fluid cracking catalysts.** *Oil Gas J.* 46, No. 28, 332-6; *Petroleum Refiner* 26, No. 11, 104 (736)-106 (738) (1947).—*C.A.* **42**, 1726*f*.

Lab. methods were given to evaluate fresh catalyst samples as well as samples that have seen service. Catalysts which appeared promising by lab. procedures should be evaluated in a pilot plant on a 3-4 barrel per day scale.

10717. Guiter, Henri. **The catalytic oxidation of ammonia.** *Bull. soc. chim. France* **1947**, 77-9.—*C.A.* **41**, 5007*i*.

Air bubbled through NH_4OH (sp. gr. 0.951) and dried was passed through heated catalysts at 15 liters/hr. Doubled 0.06-mm Pt gauze at 675°C gave 1590 ml N oxides. Pure CoO (1 cm bed depth) at 705°C gave as much oxide; CoO + 5% NiO gave 91% as much at 645-705°C; CoO + 5% Cr_2O_3 gave 93% as much at 655°C. The temp. of equil. of Ni oxides was too low for NH_3 oxidation, for Cr oxides too high.

10718. Gutyrya, V. S.; Goncharova, M. A., and Kabanova, M. F. **Mechanics of the aromatizing action of aluminosilicates.** *Azerbaidzhanskoe Neftyanoe Khoz.* 26, No. 7, 26-8 (1947).—*C.A.* **43**, 3998*g*.

Floridin, activated floridin, natural and activated bentonite, and synthetic aluminosilicate were tested as aromatizing catalysts at 400°-540°C for thermal cracking distillates; 60% of the olefins were converted into aromatics and naphthenes. As the reaction temp. increased, the quantity of naphthenes decreased and the quantity of aromatics increased.

10719. Hall, C. C. and Smith, S. L. **Hydrocarbon synthesis in the presence of cobalt catalysts at medium pressures.** *J. Inst. Petroleum* 33, 439-59 (1947).—*C.A.* **42**, 735*d*.

The effect of a pressure of 150 p.s.i. on the synthesis of hydrocarbons from H_2 and CO with a Co:ThO_2:MgO:kieselguhr catalyst was studied. Conversion with synthesis gas (H_2:CO = 2:1) was about

10% greater, and the rate of catalyst deterioration was 30-50% less than at atm. pressure.

10720. HALL, C. C. AND TAYLOR, A. H. **Chemical engineering aspects of the Fischer-Tropsch process.** *Trans. Inst. Chem. Engrs.* (London) *Advance Copy*, Jan. 7, 1947, 15 pp. *C.A.* **41**, 1827*b*.

A summary of chemical engineering data on the Fischer-Tropsch process was collected in Germany by Allied investigators. Synthesis catalyst was granular (1-3 mm in diam.), contg. in parts by wt: Co 100, ThO_2 5, MgO 8, kieselguhr 200. The reaction was exothermic (80 B.t.u. per ft^3 CO and H_2 converted) and was carried out at a temp. of 170-220°C, depending on catalyst age.

10721. HANSFORD, R. C. **A mechanism of catalytic cracking.** *Ind. Eng. Chem.* **39**, 849-52 (1947).—*C.A.* **41**, 6392*h*.

When n-C_4H_{10} was cracked at 482°C in the presence of dried com. $SiO_2.Al_2O_3$ catalyst, the conversion of the hydrocarbon in 30 sec. under stated conditions was 28-29%. Adsorption of water on the catalyst (0.15 to 0.29 wt % of the catalyst) increased the decompn. activity to 36-40%. By using D_2O instead of H_2O in preconditioning the catalyst, it could be proved that some reaction took place between the water and the hydrocarbon. The probable mechanism was that the hydrocarbon mol. gave up a proton to the water adsorbed on the catalyst particle and a neg. hydrocarbon ion was left.

10722. HENRIQUES, H. J. **Evaluation of vapor-phase reactions with solid catalysts.** *Ind. Eng. Chem.* **39**, 1564-70 (1947).—*C.A.* **42**, 2477*h*.

App., assemblies, and techniques were described useful for bench-scale studies of vapor-phase reactions over solid catalysts at pressures of 1 to 50 atm. and at elevated temps.

10723. HERINGTON, E. F. G. AND RIDEAL, E. K. **The catalytic dehydrogenation of naphthenes. I. Kinetic study.** *Proc. Roy. Soc.* (London) **A190**, 289-308 (1947).—*C.A.* **42**, 4036*g*.

The dehydrogenation of naphthenes was studied on a chromium oxide supported on alumina catalyst at 400°C and above. Cyclohexene was detected and estd. in the products from cyclohexane, and side reactions producing olefin other than cyclohexene proceeded at only 0.01 of the speed of the main reaction at 450°C. If the contact time was sufficiently long, a stationary concn. of olefin was established. The loss of the first pair of H atoms from cyclohexane was the slow step in the reaction, requiring an activation energy of 36 kcal/g mol.

10724. HERNANDEZ, L. AND NORD, F. F. **Mechanism of catalytic hydrogenation and dehydrogenation with rhodium.** *Experientia* **3**, 489-90 (1947).—*C.A.* **42**, 1793*e*.

A Rh catalyst prepd. with polyvinyl alc. as a supporting colloid differed from similarly prepd. Pd catalysts in being sensitive to pH and to the presence of functional groups. The reaction velocity consts., $k \times 10^6$, were (room temp.) 11.1, 10.8, 10.4, 10.1, 9.25, 9.02, 8.79, 6.25, and 1.85 for the hydrogenation of nitrobenzene para-substituted with CN, CHO, NO_2, COOH, I, Cl, Br, OCH_3 and NH_2 groups, resp., whereas the value for nitrobenzene was 8.33. Rh ionized the H_2 so that H^+ was the effective hydrogenating agent, whereas for Pd, H atoms were involved. S enhanced the activity of the Rh catalyst toward the dehydrogenation of formic acid and isopropyl alc. at 95°C.

10725. HORNADAY, GEORGE F. AND ARDERN, DAVID B. **Small-scale laboratory testing of cracking catalysts.** *Proc. Am. Petroleum Inst.* **27**, III, 100-7 (1947).—*C.A.* **42**, 6095*b*.

Cracking and aging studies were made in an app. consisting of a catalytic cracking case with charging and product-recovery equipment. The catalyst (600 ml) was placed in a stainless steel tube surrounded by a Pb bath, and tested at 800-950°F, up to 4 atm. pressure, space velocity 0.4-3.0 vol. of liquid oil per hr per apparent vol. of catalyst, and with or without steam included with the oil charged.

10726. HOUTMAN, J. P. W. **The polymerization of olefinic substances by Friedel-Crafts catalysts.** *J. Soc. Chem. Ind.* **66**, 102-3 (1947).—*C.A.* **41**, 5780*a*.

Extreme care was used to maintain anhyd. conditions. Isobutene was polymerized with BF_3 at -80°C, the polymerization beginning in the gas phase. When C_2H_4 was used as a solvent at -102°C, the polymerization took place in the liquid phase. With solid $AlCl_3$ polymerization was found both at room temp. when isobutene vapors were passed over the catalyst and at -80°C with isobutene in the liquid state. Isobutene formed a head-to-tail polymer. The fixation of the free electron pair initiated the chain reaction, and it occurred using substances that were able to take up electrons, e.g., protons, acids, and Friedel-Crafts catalysts. The halide itself took part in the reaction and not the acid that could be formed with the halide with small amts. of water.

10727. KARZHAVIN, V. A. **Heat transfer in apparatus for catalytic synthesis of hydrocarbons and water gas.** *Khim. Prom.* **1947**, No. 5, 14-19.—*C.A.* **43**, 2343*a*.

A method was given for calcg. the heat transfer in catalytic synthesis of hydrocarbons from CO and H_2. This method was applicable to both tubular and plate reactors. The temp. varied considerably along the catalyst and for best results the cooling should be adjusted to the conditions of each particular sector of the catalyst.

10728. KEǏER, N. P. AND ROGINSKIǏ, S. Z. **Effect of the free energy of preparation on the catalytic activity of pyrolytic nickel monoxide.** *J. Phys. Chem.* (U.S.S.R.) **21**, 539-43 (1947) (in Russian).—*C.A.* **41**, 6801*d*.

$NiCO_3$ was partly decompd. at 270°C (the CO_2 pressure was kept either below 9 mm Hg or between 10^{-2} and 10^{-6} mm Hg). The former gave a 30% decompn. within 230 min., and the latter within 17 min. Both procedures were followed by evacuation at 250°C for 1.5 hrs. The specimens obtained were tested as catalysts for the oxidation of CO by O_2 at 20°C and 1 mm Hg. The activity of a catalyst was greater, the greater the degree of supersatn.

during its prepn. The catalytic activity could be varied at will by varying the degree of supersatn.

10729. KODAMA, SHINJIRO; MURATA, YOSHIO, AND HARA, ISAO. **Gasoline synthesis from carbon monoxide and hydrogen. LXXI. Activity and deactivation of iron catalysts. LXXII. The composition of gases and flow velocity.** *J. Soc. Chem. Ind. Japan* **50**, 119-20, 120-1 (1947).—*C.A.* 44, 9135*c*.

Gasoline was synthesized 29 hrs from CO and H_2 in a mol. ratio of 1:1 at 250°C with (1) Fe + 12.8% Cu or (2) Fe + 25% Cu + 152% kieselguhr. The addn. of K_2CO_3 and H_3BO_3 increased the activity of these catalysts. The optimum amt. of K_2CO_3 was 1% for (1) and 2% for (2). In the synthesis of gasoline with Fe catalysts, carbides and free carbon were formed by the activation of CO.

10730. KOMAREWSKY, V. I. **High-frequency dielectric heating in heterogeneous catalysis.** *Science* **105**, 291 (1947).—*C.A.* 41, 3353*a*.

High-frequency dielec. heating was used in the dehydration of EtOH on alumina, and dehydrocyclization of heptane to toluene on Cr_2O_3-alumina. The exptl. results for the 2 reactions were given.

10731. KRICHEVSKAYA, E. L. **Kinetics of the oxidation of sulfur dioxide on vanadium pentoxide.** *J. Phys. Chem* (U.S.S.R.) **21**, 287-300 (1947) (in Russian).—*C.A.* 41, 6121*f*.

Mixts. of SO_2 (4-40%), O_2 (5-40%), and CO_2 (the rest) were forced through a bed of pure V_2O_5, and the SO_3 detd. The degree of transformation varied between 18 and 71%. The reaction consts. at 475°, 500°, amd 575°C were in the ratio 0.06:0.14:0.9. The decompn. of SO_2 on V_2O_5 was detd. at 575°C. The apparent heat of activation of the SO_3 formation was 34,000 cal. The rate of this reaction was detd. by that between adsorbed SO_2 and adsorbed O_2. The reaction on tech. catalysts was detd. by the rate of sorption of O_2 and by the diffusion within the pores of the catalyst.

10732. KRISHNA, BAL AND GHOSH, SATYESHWAR. **Heterogeneous catalytic activity of colloidal silver in the reduction of silver acetate.** *J. Phys. & Colloid Chem.* **51**, 1130-7 (1947).—*C.A.* 42, 1112*c*.

The reaction between resorcinol and AcOAg in aq. soln. at 35°C was first order with respect to each reactant. Colloidal Ag was a pos. catalyst, and hydrogen ions were neg. catalysts. Protective colloids enhanced the reaction rate by preventing the gradual pptn. of colloidal Ag.

10733. LAHUERTA CASAUS, PASCUAL. **Directly formed catalysts and polycatalysts. Investigation with respect to a selective polycatalyst of powerful bleaching action [for reducing oleaginous products.]** *Combustibles* 7, 151-62 (1947).—*C.A.* **42**, 7067*g*.

"Directly formed" catalysts prepd. by thermal decompn. of Ni formate were compared with other catalysts. Ni chromate and $Al_2O_3/Cr_2O_3/$ Ni possessed superior activity, absolutely satisfactory selectivity, and energetic bleaching action. A simple technique was given with diagram of app., for obtaining polycatalysts of this type.

10734. LEL'CHUK, S. L. **Fundamental questions of the genesis of skeleton catalysts.** *Doklady Akad. Nauk S.S.S.R.* **56**, 933-5 (1947).—*C.A.* 44, 7466*b*.

In the production of skeleton catalysts from readily volatile components, sufficient mixing was obtained in the kryptol furnace so that treatment in the high-frequency furnace was unnecessary. Rapid cooling of the melt gave a more active catalyst for the dehydration of alc. (to AcOEt) than cooling in the furnace. The degree of washing of the catalyst required depended on whether the sol. component activated or passivated the reaction. The activity of the Cu-Al-Cr catalyst investigated increased as the washing out of the Al was continued.

10735. LEL'CHUK, S. L.; VASKEVICH, D. N.; BELEN'KAYA, A. P., AND DASHKOVSKAYA, F. A. **Kinetics of the reaction or direct esterification of alcohol. III. Effect of the composition of polycomponent catalysts on the kinetics of the reaction.** *Bull. acad. sci. U.R.S.S., classe sci. chim.* **1947**, 235-8 (in Russian).—*C.A.* 42, 4436*b*.

The introduction of a 3rd component into a Cu-base binary catalyst was studied on the direct esterification reaction, assumed to proceed over the stages: (1) $RCH_2OH \rightarrow RCHO + H_2$, (2) $RCHO + H_2O \rightarrow RCOOH + H_2$, (2a) $RCH_2OH + H_2O \rightarrow RCOOH + 2H_2$, (3) $RCH_2OH + RCOOH \rightarrow RCH_2OCOR + H_2O$. At 275°C, space velocity 600 ml EtOH/liter catalyst/hr, the simple Cu catalyst gave an ester yield of $Y = 12.3\%$, the binary Cu + 2% Ce, 37%. Under the same conditions, the effects of a 3rd component (wt % relative to Cu) were BaO (10) $Y =$ 4.7%; Al_2O_3 (5) 19.8%; MnO (2) 3.82%; Ag (5) 0.58%; Ni (5) 11.3% (the last at 250°). Although CdO has but little effect on the activity and the activation energy of (3) was high (14.5 kcal), the Cr_2O_3, TiO_2, and ThO_2 ternary catalysts were clear instances of coactivation.

10736. LUKOVTSEV, P. AND LEVINA, S. **Hydrogen overvoltage on nickel in alkaline solutions.** *J. Phys. Chem.* (U.S.S.R.) **21**, 599-610 (1947) (in Russian).—*C.A.* 41, 6820*i*.

The slopes of the curves of overvoltage υ against c.d. were almost identical for Ni rods and plates in different positions. The υ on Ni, prepd. without contact with air, in x N NaOH + 0.2 N KCl at $i = 10^{-5}$ amp./cm² increased between $x = 1$ and $x = 10^{-2}$ by 88-92 mv., between $x = 10^{-2}$ and 10^{-3} by 22 mv., and between $x = 10^{-3}$ and 10^{-4} by 6-8 mv. The capacity of Ni electrode calcd. from the rate of decay of υ after switching off the current was greater in the later stages of the decay.

10737. MAMEDLI, M. G. **Catalytic desulfurization of gasoline. II.** *J. Applied Chem.* (U.S.S.R.) **20**, 115-19 (1947) (in Russian).—*C.A.* 41, 5705*g*.

Gas-phase desulfurization of straight-run gasoline with 0.06% S was studied at 300°C, vol. ratio catalyst/gasoline 1:1/hr, with over 12 different clays (SiO_2 45.58 to 56.89, Al_2O_3 12.41 to 18.40, CaO 2.91 to 12.53).. Ignition losses paralleled the CaO content. Very small amts. of FeS were found in the clay after the run, indicating that its formation played only a minor role in the fixation of S. The catalytic process consisted of two stages, decompn. of the org. S compds. with formation of H_2S followed by a fixation of the latter by the clay. The H_2S formed in the first phase of the process underwent mainly decompn. into H_2 and S, the latter being adsorbed by the clay.

10738. Margolis, L. Ya and Todes, O. M. **Kinetics of exothermal reactions in streaming gas. III. Kinetics of catalytic combustion of isoöctane and of cyclohexane.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* **1947**, 443-52 (in Russian).—*C.A.* **42**, 1794*b*.

Combustion of flowing mixts. of 2,2,4-trimethylpentane and of cyclohexane with air were carried out between 250° and 660°C over spinel-type catalysts (chromites, aluminates, manganites, etc.) on asbestos, at concns. varying between 0.1% and 67%, so as to ensure a convenient rate of combustion; chromites were prepd. by decompn. of the chromates, aluminates by fusing salts of Al and the desired metal; combustions were also carried out over Pt and Po (0.05-0.1%) on asbestos. In all cases, the combustions led to practically pure CO_2 and H_2O; in no case was a trace of CO detected; the H_2O contained no more than 0.01% aldehydes and 0.02% acids.

10739. Margolis, L. Ya. and Todes, O. M. **Poisoning and modification of catalysts.** *Doklady Akad. Nauk S.S.S.R.* **58**, 421-4 (1947).—*C.A.* **46**, 4342*e*.

$MgCr_2O_4$-MgO and $CuCr_2O_4$-CuO catalysts were treated with 0.5-10% poisons, H_3PO_4, H_3BO_3, H_2SO_4 (as $BaSO_4$), in catalytic oxidation with isoöctane. As the amt. of the poison increased, the order of the reaction of oxidation changed gradually from 2nd order to 1st or even to zero order. In the region of 1st-order reaction the temp. coeff. of reaction rate followed Arrhenius formulation, but activation energies varied depending on the concn. of the poison.

10740. Mathieu, Marcel. **Structure and catalytic activity.** *Bull. soc. chim. France* **1947**, 14-27.—*C.A.* **41**, 5007*d*.

Concepts of catalysis were reviewed with emphasis on the theory of Balandin and on its three-dimensional equiv. that crystal voids of proper shape were active. Montmorillonite clays were most active after being boiled with 30-45% H_2SO_4 until 2/3 of the metal atoms and some water of constitution were removed. X-ray studies showed that the crystal layers were intact though less regular. The vast gaps thus left might account for the isomerization catalysis of the clays.

10741. Maxted, E. B. **Detoxication of catalyst poisons. V. Thiophene.** *J. Chem. Soc.* **1947**, 624-7.—*C.A.* **41**, 6801*f*.

A hydrogenation system with crotonic acid as the unsatd. substance, thiophene in benzene and in tech. benzene, resp., was used. The substance was hydrogenated first to thiophane by virtue of its preferential adsorption on the catalyst. This in turn was oxidized to thiophane sulfone. In the latter, the toxic S-atom was shielded. The hydrogenation stage was effectively limited to the amt. originally adsorbed. Complete detoxication could be achieved by means of repeated hydrogenation-oxidation processes, the second stage offering no difficulties.

10742. McReynolds, Hubert. **Bench-scale method for determining activity of cracking catalysts in powdered form.** *Proc. Am. Petroleum Inst.* 27, III, 78-83 (1947); *Petroleum Refiner* **26**, No. 12, 790-4 (1947).—*C.A.* **42**, 6094*g*, 9138*i*.

A small reactor having a length to diam. ratio of 18 was immersed in a Pb bath maintained at 920°F. A standard gas oil was evapd. and passed through a fluidized catalyst bed contg. 400 g of catalyst at a normal wt space velocity of 2 for 30 min. The resulting liquid product was stabilized and fractionated to obtain a 400°F end-point gasoline. The gas and carbon producing tendencies of catalysts could also be detd. The reproducibility of the tests was good.

10743. Mills, Ivor W. **Prediction of activity of cracking catalysts from heat of wetting.** *Oil Gas J.* **46**, No. 28, 237-41 (1947).—*C.A.* **42**, 1727*c*.

Pelleted clay and synthetic silica-alumina catalysts in both the bead and pellet form were investigated. CH_3OH appeared to be the most favorable liquid as it gave a good temp. rise, could be obtained in a pure state, and was easy to handle. Free H_2O caused a decrease in the heat of wetting and the hydrate produced a high value. Carbon had little effect but iron oxide may be detrimental. Activities did not necessarily blend in a linear relationship.

10744. Nikolaev, L. A. **Catalase properties of complex copper compounds.** *Vestnik Moskov. Univ.* **1947**, No. 6, 115-18.—*C.A.* **42**, 3654*b*.

Complexes of Cu with simple alkyl amines activated the catalysis of the decompn. of H_2O_2 by Cu^{++} but to a lesser degree than $[Cu(NH_3)_4]^{++}$. Adsorption on graphite lowered somewhat the activities of all the complexes examd. to varying degrees.

10745. Nyman, C. J. and O'Brien, T. D. **Catalytic reduction of sodium sulfate.** *Ind. Eng. Chem.* 39, 1019-21 (1947).—*C.A.* **41**, 6029*d*.

At 550°-600°C and below, no reduction occurred. At 600°C, reduction by H_2 in the presence of an Fe catalyst was quite effective. At 650°C and above, the catalytic effect of Cu was equiv. to Fe. Above 800°C, CH_4 was quite reactive, perhaps as a result of cracking of the gas. The reduction product was mainly Na_2S. Only occasional, small amts. of $Na_2S_2O_3$ and Na_2SO_3 were found.

10746. Oblad, A. G.; Messenger, Joseph V., and Brown, H. Trueheart. **Isomerization of 1- and 2-pentenes.** *Ind. Eng. Chem.* **39**, 1462-6 (1947).—*C.A.* **42**, 857*f*.

The vapor-phase isomerization of 1-pentene and 2-pentene was studied over the range 177°-427°C and at liquid space velocities from 0.5-24 hr^{-1}. The catalysts employed were specially prepd. aluminas. Based on the apparent similarity between the nature of the solid catalysts studied and the acidic catalysts commonly used in liquid-phase hydrocarbon reactions, a mechanism involving carbonium ions was proposed to explain the vapor-phase isomerization of olefins.

10747. Obolentev, R. D. and Usov, Yu. N. **The additivity of the conversion of binary mixtures of aliphatic hydrocarbons in aromatization over a chrome catalyst.** *J. Gen. Chem.* (U.S.S.R.) 17, 897-906 (1947) (in Russian).—*C.A.* 42, 1570*i*.

The yields of aromatic compds. obtained over a Cr catalyst at 480°C, vol. rate 0.5, duration of runs 30-42 min., were detd. in pure *n*-heptane, isoöctane, 1-heptene, 2-methy-2-hexene, 3-methyl-3-heptene, and in binary mixts. thereof. The catalyst was activated in an air stream 4-5 hrs before each series and 1-1.5 hrs after each run and tested with *n*-heptane under the standard conditions adopted. Coking and resinification was on the whole more abundant with unsatd. compds., the more so the more branched the chain and the higher the mol. wt; additivity in binary mixts. was not strict.

10748. Oborin, V. I. **Elementary structure of alumina catalyst.** *Neftyanoe Khoz.* 25, No. 11, 50-4 (1947).—*C.A.* 42, 5750*d*.

The catalytic action was exerted by γ-alumina. Silica as a carrier supplied a large surface for the crystn. of alumina. On an arbitrary scale, the activity of alumina-silica cracking catalysts ranged in the order: $Al(OH)_3$ prepd. from $Al_2(SO_4)_3$ by pptn. with alkali and added while wet to silica gel, 1.00; same, but pptd. from Al NH_4 alum, 0.91; $Al(OH)_3$ pptd. from the sulfate with NH_3 and mixed with silica gel, 0.80; copptd. gel from $Al_2(SO_4)_3$ and Na_2SiO_3, 0.61; copptd., dense gel from Al NH_4 alum and Na_2SiO_3, 0.34; same, but friable, 0.17; the friable co-gel impregnated with $Al(NO_3)_3$ and calcined, 0.77; and silica gel impregnated with $Al_2(SO_4)_3$ to ppt. $Al(OH)_3$ on hydrolysis, 0.73.

10749. Ohtsuka, Hiroshi. **Studies on the solid phosphoric acid used as polymerization catalyst for olefin gases.** *Mem. Faculty Eng. Hokkaido Univ.* 8, No. 1, 11-57 (1947).—*C.A.* 42, 6997*i*.

Studies were made on the state of the phosphoric acid on the carrier surface, the kinds of carriers, and the methods of activation and reactivation of the catalyst. The mechanism proposed was that of proton exchange between the acid and the hydrocarbon.

10750. Panchenkov, G. M.; Topchieva, K. V.; Uspenskaya, E. A., and Frost, A. V. **The kinetics of catalytic disproportionation of hydrogen in gasolines in the presence of activated clay.** *Comp. rend. acad. sci. U.R.S.S.* 55, 319-21 (1947) (in English).—*C.A.* 41, 6459*d*.

A gasoline fraction (boiling up to 150°C and having an I_2 no. of 102) was passed at varying velocities and at 210°-400°C over an activated askanite catalyst. The disproportionation of H was a first-order reaction relative to the concn. of the reacting substance; the velocity was practically independent of the temp. The reaction proceeded in the diffusion area and the diffusion processes were slower than the conversion of the substances on the surface of the catalyst.

10751. Porter, Richard, W. **Sorbitol from corn sugar by catalytic reduction.** *Chem. Eng.* 54, No. 11, 114-17 (1947).—*C.A.* 42, 2578*i*.

High-pressure hydrogenation of corn sugar with Ni-clay catalyst was described.

10752. Pratt, Thomas W. **Aromatic adsorption index for the estimation of surface area and catalytic activity.** *Proc. Am. Petroleum Inst.* 27, III, 38-47 (1947).—*C.A.* 42, 5750*b*.

The aromatic adsorption index of dried cracking catalysts was detd. by shaking 3.50 g of catalyst intermittently for 2 hrs with 5 ml of 30% toluene in isooctane and subsequently detg. *n* of the soln. This index was directly related to the B. E. T. surface area, regardless of the history or source of the catalyst; but, the relation between the index area as detd. by butane adsorption depended on the prior treatment of the catalyst.

10753. Prettre, Marcel; Eichner, Charles, and Perrin, Marcel. **The participation of methane in reactions involving synthesis and transformation of aliphatic hydrocarbons.** *Compt. rend.* 224, 278-79 (1947).

In the presence of a catalyst of reduced nickel on kieselguhr under atmospheric pressure, it was shown that CH_4 participated in the chemical reactions involved in the catalyst.

10754. Pshezhetskiĭ, S. Ya. **Transitional kinetic states of catalytic reactions on porous catalysts.** *J. Phys. Chem.* (U.S.S.R.) 21, 1019-25 (1947) (in Russian).—*C.A.* 42, 2501*c*.

The measured rate of a gas reaction on a porous catalyst was detd., depending on the reaction temp., either by the rate of external gas diffusion, or by that of internal gas diffusion, or by the rate of the chem. reaction proper. The transitions between these 3 states were calcd. Because the transitions were gradual, the dependence of the over-all rate of reaction on temp. varied gradually. The apparent activation energy calcd. from temp. coeff. of the over-all rate may have any value between zero and that of the true activation energy.

10755. Rice, T. and Ivey, F. E., Jr. **Design and operation of a bench-scale automatic catalyst-aging unit.** *Petroleum Processing* 2, No. 12, 950-1; *Oil Gas J.* 46, No. 28, 227-8, 234 (1947).—*C.A.* 42, 1727*a*.

The product distribution obtainable from catalysts at various activity levels, the effect of operating variables on product distribution, and other information pertaining to the operation of com. catalytic cracking equipment could be detd. The fixed-bed pilot plant unit was designed to operated on a 30-min. cycle with an on-stream period of 10 min., a vacuum- and N_2-purge period of 5 min., a regeneration period of 10 min. and a N_2-purge period of 5 min.

10756. Rigamonti, R. and Agliardi, N. **Kinetics of the reaction of carbon monoxide with water vapor in the presence of a zinc oxide catalyst.** *Chimica e industria* 29, 145-9 (1947).—*C.A.* 44, 9784*g*.

The reaction of CO with H_2O in the presence of ZnO catalyst was studied. Within the range 270°-440°C, when the reaction tended to equil., the proportion of active centers in the surface, the proportion being detd. by a distribution function.

10762. Schwab, Walmar. **The catalytic replacement of bromine by hydrogen in the presence of Raney nickel.** *Experientia* 3, 28-9 (1947) (in French).—*C.A.* 41, 4366*c*.

In the debromination of 1-hydroxy-3-methyl-4-bromoanthraquinone, 1-methoxy-3-methyl-4-bromoanthraquinone, 1-hydroxy-6, 8-dimethoxy-3-methyl-4-bromoanthraquinone, and 1,6,8-trimethoxy-3-methyl-4-bromoanthraquinone by means of H_2 over Raney Ni, it was found that a HO— para to the Br caused a much more rapid removal of Br than a CH_3O— in the same position. However, methoxyl groups in the 6 and 8 positions only slightly retarded the speed of removal of Br.

10763. Shankland, Rodney V. and Schmitkons, George E. **Determination of activity and selectivity of cracking catalyst.** *Proc. Am Petroleum Inst.* 27, III, 57-77 (1947).—*C.A.* 42, 6095*c*.

A lab. test method was suitable for testing granular, powd., or pilled catalyst for cracking activity and selectivity. Cracking activity of a test catalyst was reported in terms of the relative wt of a reference catalyst required to give the same extent of cracking at otherwise identical conditions. The selectivity factors most commonly detd. were the coke-and-gas producing factors.

10764. Sidorov, I. P. and Livshits, V. D. **Kinetics of ammonia synthesis in isothermal conditions.** *J. Phys. Chem.* (U.S.S.R.) 21, 1177-81 (1947) (in Russian).—*C.A.* 42, 2495*h*.

The equation of Temkin and Pyzhev was valid for the synthesis of NH_3 at 300 atm. between 425 and 525°C, when the rate of flow of outgoing gas varied from 15,000 to 150,000 times the vol. of catalyst per hr. The catalyst was Fe promoted with Al_2O_3 and K_2O.

10765. Taylor, Hugh S. and Liang, Shou Chu. **The heterogeneity of catalyst surfaces for Chemisorption. I. Zinc oxide.** *J. Am. Chem. Soc.* 69, 1306-12 (1947).—*C.A.* 41, 5772*d*.

A new technique for detg. adsorption isobars was applied to the study of the adsorption of H_2 by ZnO over the temp. range 77-600°K. Desorption of chemisorbed H on raising the temp. was shown through certain temp. ranges, followed by re-adsorption at still higher temp. The data indicated a marked heterogeneity of the ZnO surface for the adsorption of H_2 that must be taken into consideration in attempting to evaluate energies of activation for adsorption and catalysis.

10766. Temkin, M. and Kiperman, S. **Kinetics of synthesis and decomposition of ammonia on various catalysts.** *J. Phys. Chem.* (U.S.R.R.) 21, 927-52 (1947) (in Russian).—*C.A.* 42, 2501*g*.

The equation for the rate v of reaction, $v = k_1P_1(P_2^3/P_3^2)^{\alpha} - k_2(P_3^2/P_2^3)^{1-\alpha}$ in which P_1, P_2, and P_3 were the partial pressures of N_2, H_2, and NH_3, resp., and k_1, k_2, and α were const., was integrated by assuming the total pressure to be const. The energy of activation was expressed as a function of α. The above equation was valid only when the system was not too far removed from the equil. speed of the inverse reaction was not markedly different from that of the direct reaction. With the catalyst investigated (obtained by decompn. of the basic carbonate) the speed const. was independent of the concn. of H_2O vapor (more intensely adsorbed by the catalyst), but depended on the concn. of CO. The apparent order of the reaction with respect to the latter may be from 0.5 to 1.

10757. Roginskiĭ, S. Z. **Poisoning and modifying catalysts.** *J. Phys. Chem.* (U.S.R.R.) 21, 1143-58 (1947) (in Russian).—*C.A.* 42, 2501*i*.

A definite impurity can either raise or lower the efficiency of a catalyst according to its amt. The effect of a definite amt. of an impurity can be pos. or neg. according to conditions. The increase of efficiency was not always due to a reduction in the activation energy, but may be assocd. with an increased energy of activation. Catalysts can be modified by addns., not only poisoned or promoted.

10758. Sato, Seibi and Oda, Ryohei. **Studies on ion-exchange synthetic resins. III. Catalytic reaction in esterification.** *Chem. High Polymers* (Japan) 4, 139-40 (1947).—*C.A.* 46, 2706*a*.

Resin obtained by condensation of sulfonated PhOH and HCHO was used as a catalyst in esterification of fatty acids with alc.

10759. Sborgi, U.; Giovanni, E., and Federico, L. **Thermal-fission of methane in the presence of a platinum catalyst.** *Ann. chim. applicata* 37, 106-14 (1947).—*C.A.* 41, 7214*f*.

The amt. of CH_4 decompd. in the presence of a catalyst consisting of 0.4% Pt black deposited on pumice was detd. in the range 500°-1100°C. The ratio H_2/CH_4 approached 2.0 at the higher temps.

10760. Scheumann, W. W. and Rescorla, A. R. **Aromatic adsorption index as rapid method for approximating catalyst activity.** *Petroleum Processing* 2, No. 12, 946-7; *Petroleum Refiner* 26, No. 12, 119 (815)-121 (817); *Oil Gas J.* 46, No. 28, 231-4 (1947).—*C.A.* 42, 1726*g*.

The catalyst sample was first heated at 850°F. A sample (3-1/2-g) was then weighed into an adsorption vessel and 5 ml of 30% toluene and 70% isoöctane was added. The adsorption vessel was shaken in a mech. shaker for 2 hrs. The aromatic adsorption index was the difference between the n of the original hydrocarbon mixt. and that of the hydrocarbon mixt. after contact with the catalyst multiplied by 10^4.

10761. Schwab, Georg-Maria. **The absolute reaction velocity of contact catalysis.** *Proc. Intern. Congr. Pure and Applied Chem.* (London) 11, 621-6 (1947) (in English).—*C.A.* 46, 2383*d*.

The Arrhenius equation, $k = k_0 \exp(-q/RT)$ or $\log k = B - (q/RT)$ was studied. A kinetic approach and the assumption of a smooth and fully activated surface permitted the calcn. of the upper limit of B within the limits of errors in the surface, the thickness, and the mol. frequency. The values of B for almost all catalysts were lower than the calcd. limit; consequently, B must depend on other factors. In general, the real activity of a given catalyst depended on the upper limit of B and the state. Variations of the adsorbed amt. of N_2 may cause the decompn. of NH_3 to be a zero-order reaction at very low NH_3 concns.

10767. TOPCHIEVA, K. V. AND PANCHENKOV, G. M. **The kinetics of the disproportionation of hydrogen in gasolines as depending on the composition of aluminum silicate catalysts.** *Compt. rend. acad. sci. U.R.S.S.* **55,** 505-8 (1947) (in English).—*C.A.* **41,** 7211*i*.

The H-enriching activities of a series of catalysts contg. different proportions of Al_2O_3 and SiO_2 were detd. using the 100°-150°C fraction from com. cracked gasoline. Pure silica was inactive, pure Al_2O_3 somewhat active, and the 30% Al_2O_3-70% of SiO_2 catalyst, corresponding to $Al_2O_3.4SiO_2$, was most active. The activity of the catalyst was a function of the no. of active $Al_2O_3.4SiO_2$ mols. on the surface.

10768. TSUTSUMI, SHIGERU AND SHIBAYAMA, KAZUO. **Polymerization of butylene by means of active clay.** *Mem. Inst. Sci. Ind. Research, Osaka Univ.* **5,** 162-5 (1947).—*C.A.* **46,** 8357*f*.

C_4H_8 was converted into polymerized oil at 170°C by active-clay catalyst. The durability of the catalyst was increased by adding 2% $Zn(NO_3)_2$ and heating to 300°C. C_4H_8 was polymerized also by SiO_2-Al_2O_3 gel. The catalyst with a ratio of SiO_2/Al_2O_3 of 40:60 was the most effective. Addn. of $ZnCl_2$ increased the catalytic activity.

10769. WEBB, G. M. AND EHRHARDT, C. H. **Properties of cracking catalysts.** *Petroleum Processing* **2,** 5-8 (1947).—*C.A.* **42,** 9138*i*.

The basic types of cracking catalysts were the natural catalysts, such as Super Filtrol; silica-base catalysts, such as silica-alumina, silica-magnesia, and silica-zirconia, and the alumina-base catalysts. Procedures were presented by which some important characteristics were detd.

10770. WEBB, G. M.; SMITH, M. A., AND EHRHARDT, C. H. **Chemical and physical properties of alumina-molybdenum oxide catalysts for hydroforming.** *Petroleum Processing* **2,** 836-40 (1947).—*C.A.* **42,** 9139*f*.

The conventional impregnated form of an alumina-molybdenum oxide catalyst for hydroforming was found to be of low activity, high in coke formation, and to have poor catalytic and strength stability. Catalysts made by pptn. of aluminum hydrogel in the presence of ammonium molybdate, followed by drying, calcining, and pelleting have high activity, greatly improved stability, and decreased coke formation.

10771. WICKE, E. **Importance of surface diffusion for the effectiveness of porous catalysts. II. Surface diffusion at low pressures.** *Angew. Chem.* **B19,** 94-6 (1947).—*C.A.* **42,** 442*d*.

The application of the Poiseuille and the Knudsen equations to combined streamline and mol. flow was discussed. Measurements were reported for fritted-glass filters, an activated carbon, and reduced Ni powder. Discrepancies between actual flow and calcd. flow were thought to be due to surface diffusion of the gas.

10772. WICKERT, K. **Corrosion and catalysis.** *Arch Metallkunde* **1,** 270-5 (1947).—*C.A.* **42,** 6302*g*.

In the presence of NaCl, Fe was attacked much more rapidly under otherwise identical conditions. NaCl did not enter into the final product, nor did the soln. suffer a change in concn. The observations were made on 200 ml of soln. with one calomel and one glass electrode. Any changes in potential would be caused by changes in the electrolyte. O_2 was admitted to the soln. through a glass tube; 98% pure Fe powder was selected. The potential, converted into pH values, plotted vs. time yielded 2 typical curve formations: the NaCl type and the $ZnCl_2$ type. In type NaCl reaction the Fe content dropped to 94.7% at the end of the test.

10773. YAMANAKA, TATSUO. **Center of catalysis of catalysts for hydrogenation.** *Bull. Inst. Phys. Chem. Research* (Tokyo); *Chem. Ed.* **23,** 440-64 (1947).—*C.A.* **42,** 6628*g*.

Reduced Cu lost its hydrogenating activity by the poisoning action of diethyl sulfide. When only a small amt. of ZnO was added, it gave rise to semifusion leading to decrease in the active portion, whereas its addn. in suitable amt. served to suppress semifusion and increased the active portion. Reducing activity of Cu was largely lost by the poisoning of diethyl sulfide. The case was similar to that when Ni was poisoned by H_2S, but as the active portion left unpoisoned was much smaller in case of Cu than Ni, Ni was preferred. Reduced Cu had the catalytic power of reducing the carbonyl group to OH in H_2 under pressure.

10774. YAMANAKA, TATSUO. **Catalytic center of hydrogenation catalysis.** *Bull. Inst. Phys. Chem. Research Chem. Ed.* **23,** 481-98 (1947).—*C.A.* **42,** 6629*e*.

The catalytic activity of Pd catalyst in the hydrogenation of acetylene increased when heat-insulating material was used as a supporter. However, the mechanism of polymerization of C_2H_2 was different from that of Ni catalyst. Pd had a dehydrating action because it lacked a strong adsorbing power for H_2. Therefore, even when the partial pressure of H_2 was not strong, a decrease in the amt. of C_2H_2 was not perceptible. Polymerization of C_2H_2 was caused only when H_2 was mixed with C_2H_2. Consequently, semifusion of the catalyst was not effective in decreasing this trouble.

10775. ADKINS, HOMER AND BILLICA, HARRY R. **Preparation of Raney nickel catalysts and their use under conditions comparable with those for platinum and palladium catalysts.** *J. Am. Chem. Soc.* **70,** 695-8(1948).—*C.A.* **42,** 3328*c*.

NaOH (160 g) in 600 ml H_2O at 50°C was treated (25-30 mm) with 125 g Raney Ni-Al alloy, the suspension was stirred 50 min. at 50°C, the catalyst (termed W-6) was washed 3 times by decantation, transferred to a special washing tube, and washed with 15 liters H_2O (about 250 liter/min) under H_2 pressure, and finally washed in a centrifuge tube with 150 ml 95% EtOH and then with abs. EtOH; the catalyst should be stored in a refrigerator in a closed vessel filled with abs. EtOH.

10776. ADKINS, HOMER; RAE, DOROTHY S.; DAVIS, JAMES W.; HAGER, GLENN F., AND HOYLE, KATHRYN. **Sulfur as a promoter for a nickel catalyst in dehydrogenation.** *J. Am. Chem. Soc.* 70, 381-2(1948).—*C.A.* 42, 2247*i*.

Thiophene-free C_6H_6 was not effective with a Ni catalyst in the oxidation (dehydrogenation) of bicyclohexyl to Ph_2. However, C_6H_6 contg. thiophene or Ph_2S in a suitable proportion to the wt of the catalyst present brought about an almost quant. conversion. With thiophene, the optimum quantity was about 10 mg per g of catalyst.

10777. ALCHUDZHAN, A. A. AND VVEDENSKII, A. A. **Kinetics and mechanism of the hydrogenation of hydrocarbons. V. Effect of benzene, cyclohexane, and nitrogen on the change of the activity of nickel catalysts in the hydrogenation of benzene.** *Zhur. Obshchei Khim.* **18**, 261-7(1948).—*C.A.* 42, 8596*f*.

Upon treatment of 0.33 mole C_6H_6 during 90 min. at 230°C, the hydrogenating activity, *a*, of the Ni catalyst fell from about 10 % hydrogenation of C_6H_6 at 230°C to zero; in subsequent operation in C_6H_6 + H_2, *a* rose slowly but attained a stationary value of only about 6% in 150 min. On another batch of Ni catalyst, a very slow attainment of *a* in operation in C_6H_6 + H_2 was observed after a 48-hr treatment with H_2, the stationary *a* (~11%) being attained only after 150 min. Subsequent treatment with N_2, 1 liter/hr, 85 min., caused the initial *a* to drop to about 3%; in operation, *a* rose rapidly to a stationary 8%. Although deactivation with H_2-free C_6H_6 was followed only by partial recovery of *a*, the recovery was complete after deactivation of C_6H_6 contg. a small amt. of H_2. Cyclohexane lowered *a* in the same way as C_6H_6; complete restoration of the former *a* required very prolonged treatment with H_2, of the order of hundreds of hrs.

10778. ALCHUDZHAN, A. A.; VVEDENSKII, A. A., AND FROST, A. V. **Kinetics and mechanisms of the hydrogenation of hydrocarbons. VI. Mechanism of the catalytic hydrogenation on nickel and palladium.** *Zhur. Obshchei Khim.* 18, 268-75(1948).—*C.A.* 42, 8597*c*.

Hydrogenation on Ni proceeded either through dissolved H_2, in analogy with the soln. of H_2 in Pd, and that establishment of a stationary concn. of H_2 required time, or by ascribing slow rates to the establishment of stationary concns. of C_6H_6 and of cyclohexane through adsorption and desorption on Ni. The activity of a catalyst could be restored to its original value by prolonged reactivation with H_2 which showed the phys. constancy of the adsorptive properties of the catalyst surface.

10779. AMAN, J.; FARKAS, L., AND FARKAS, A. **Some catalytic hydrogen exchange reactions of hydrocarbons.** *J. Am. Chem. Soc.* 70, 727-32 (1948).—*C.A.* 42, 4035*c*.

The following exchange reactions of H (D) atoms in Pd and Ni catalysts at pressures of 20-700 mm in the range of 80°-170°C were investigated by both circulatory and static methods: H_2O and ethylene, water and butene, water and butane, butene and butane, and butane and ethylene. Two mechanisms were proposed for the catalytic exchange of hydrocarbons with mol. H_2. It was not possible to decide whether those H atoms attached to the double bonded C atoms exchanged more readily than the remainder. Of particular significance was the absence of exchange between butane and water under conditions under which the exchange between butene and water took place rapidly.

10780. AMIEL, JEAN; BRENET, JEAN, AND RODIER, GEORGES. **Molecular structure of manganese dioxide.** *Compt. rend.* 227, 60-1(1948).—*C.A.* 42, 7587*d*.

The magnetic susceptibility of activated MnO_2 (37.9×10^{-6}) was greater than that of normal MnO_2 (28.9×10^{-6}) because of a diminution of the Mn-O distance.

10781. AMIEL, JEAN; RODIER, GEORGES, AND BRENET, JEAN. **The parallelism of the evolution of the catalytic, magnetic, and depolarizing properties of some samples of manganese dioxide.** *Compt. rend.* 227, 1356-8(1948).—*C.A.* 43, 7313*d*.

Nine samples of MnO_2 were examd. catalytically by measurement of the rate of decompn. of H_2O_2. In general, samples of comparable purity, the one normal and the other active, showed a simultaneous increase in catalytic power, depolarizing ability, and magnetic susceptibility.

10782. ANDERSON, ROBERT B.; HALL, W. KEITH, AND HOFER, L. J. E. **Fischer-Tropsch synthesis. IV. Properties of reduced cobalt catalysts.** *J. Am. Chem. Soc.* 70, 2465-72(1948).—*C.A.* 42, 8058*e*.

Reduced Co-ThO_2-MgO-kieselguhr and Co-ThO_2-kieselguhr catalysts and similar prepns. with one or more of the components omitted were studied. B.E.T. surface areas and CO chemisorptions at -195°C, Hg and He d., and x-ray diffraction were detd. The promotors prevented excessive decreases in surface area on reduction. Kieselguhr as a carrier was somewhat effective in preventing the decrease in surface area on reduction, but its most important function was to prevent the decrease in bulk vol. of the catalyst on reduction. The chemisorption studies with CO showed that an appreciable fraction of the surface was occupied by promoter.

10783. ANDERSON, ROBERT B.; KRIEG, ABRAHAM; SELIGMAN, BERNARD, AND TARN, WILLIAM. **Fischer-Tropsch cobalt catalysts. Influence of type of kieselguhrs.** *Ind. Eng. Chem.* 40, 2347-50 (1948).—*C.A.* 43, 3167*d*.

Catalysts of the Co-thoria-magnesia-kieselguhr (100:6:12:200) type, pelleted, were tested with 2:1 H_2 -CO synthesis gas at atm. pressure, const. space velocity, and temp. was varied to maintain const. contraction of 70%. Five American kieselguhrs were tested, in combination with several special treatments. The more active catalysts were prepd. with kieselguhrs having smaller concn. of removable Fe. No correlation was found with small amts. of other impurities present, with particle size, surface area, or structure of natural diatoms.

10784. ANISIMOV, S. R. AND KHAIDAROV, G. I. **Catalytic properties of hafnium zirconium**

oxides. *Zhur. Obshchei Khim.* 18, 40-2(1948).—*C.A.* 42, 8428*c*.

Catalysts of pure HfO_2 and ZrO_2 were tested with 95.5% EtOH flowing at 30 ml/hr, between 285 and 555°C, in N_2. The Hf catalyst was prepd. by fusing 99.5% pure HfO_2 with a 5-fold excess of Na_2CO_3 at 800°C, dissolving in H_2SO_4, pptg. Fe with NH_4CNS + ether, pptg. $Hf(OH)_4$ with NH_4OH, washing to remove all CNS^- and drying 5 hrs at 150°C; the ZrO_2 catalyst was prepd. in a similar way. Both catalysts caused both dehydration and dehydrogenation of EtOH and their activities were almost identical. Firing at above 500°C (8 hrs in air) destroyed almost completely the catalytic properties of both ZrO_2 and HfO_2.

10785. APEL'BAUM, L. AND TEMKIN, M. **Oxidation of ammonia on gauzes of platinum and platinum-rhodium, I, II.** *J. Phys. Chem.* (U.S.S.R.) 22, 179-94, 195-207(1948)(in Russian).—*C.A.* 42, 5321*a*.

A quartz tube contained *n* wire gauzes (wire diam. 0.09 mm) placed next to each other. The geometrical surface area, *S*, was 1.87 cm^2. The outgoing gas was oxidized by H_2O and the soln. titrated with NaOH; the result yielded $x - y$, x and y being the concns. of NO and NH_3, resp., in the gas. In some expts. x and y were measured separately. The inlet gas was mostly 10% NH_3, 90% air, the pressure was atm., and the temp. of the gauzes usually was 800-900°C. It was assumed that the highest value of $x - y$ obtained by increasing *n* represents x alone and that the relative yields of NO and the by-products (presumably NH_4NO_2 and NH_4NO_3) were independent of *n*. The concn. y could then be calcd. from the exptl. values of $x - y$. The rate of reaction was detd. by diffusion.

10786. AYERS, EUGENE; MONTGOMERY, C. W., AND HIRSCH, JOEL H. **Problems associated with Fischer-Tropsch process.** *Petroleum Engr.* 20, No. 3, 203-12(1948).—*C.A.* 43, 1550*c*.

The Fischer-Tropsch process produced 1 vol. of gasoline from approx. 2000 vols. gas (synthesis and recycle), and for this reason the equipment was especially large and expensive. Wax and carbon deposition and carbide formation on the catalyst, the great amt. of heat transfer involved, the high power requirements, and the large ratio of "oxygenated" by-products to fuel hydrocarbons were other difficulties encountered.

10787. AYRES, EUGENE; MONTGOMERY, C. W., AND HIRSCH, JOEL H. **Some problems associated with the Fischer-Tropsch process.** *Petroleum Refiner* 27, No. 11, 583-5(1948).—*C.A.* 43, 2401*g*.

The improvement of space-time yields in this process increased the prevalence of side reactions on the catalyst. The more important of these reactions discussed briefly were: (1) carbon deterioration of Fe, with a suggested mechanism for catalyst powdering and (2) formation of wax.

10788. BALANDIN, A. A. **The multiplet theory and the transition-state theory.** *Doklady Akad. Nauk S.S.S.R.* 63, 535-8(1948).—*C.A.* 43, 2852*a*.

If A_1 was the initial reactant, A_2 the product in the gas phase, A_{a_1} and A_{a_2}, resp., the adsorption complexes between A_1 and A_2 and the catalyst surface, A^* the intermediate activated complex, the heterogeneous reaction was written in the form $A_1 \rightleftharpoons A_{a_1} \rightleftharpoons A^* - A_{a_2} \rightleftharpoons A_2$. With f, f_a, and f_s designating, resp., the partition function of the reactant in the gas phase, of the adsorbed mols., and of the unoccupied active centers at the surface, the adsorption equil. const. $a = f_a/(f.f_s).\exp.\ (\Delta H_a/kT)$, where ΔH_a = heat of adsorption. The ratio f_a/f was evaluated by the usual factorization wherein, in the adsorbed state, the translational factor obviously disappeared; there were 3 rotational and 3 vibrational degrees of freedom, whereas the internal degrees of freedom remained unchanged.

10789. BALANDIN, A. A. AND KIPERMAN, S. L. **Reversible and complex-reversible poisoning of a nickel catalyst in dehydrogenation.** *Doklady Akad. Nauk. S.S.S.R.* 63, 387-90(1948).—*C.A.* 43, 2499*b*.

Rates of dehydrogenation were detd. in equimol. mixts. of cyclohexane with C_6H_6, toluene, m-$C_6H_4Me_2$, o-$C_6H_4Me_2$, mesitylene, PhEt, C_7H_{16}, C_8H_{18}, and 2,2,3-trimethylheptane, at 236°C (rate of flow 0.2 ml/min.) on a Ni-on-Al_2O_3 catalyst. The catalyst bed was 2.4 cm high (5 cm before reduction) in a 2.3 cm diam. tube. The H_2 evolved in 3 min. was corrected for const. activity of the catalyst by intermediate runs with cyclohexane. The vol. of H_2 plotted against the amt., in %, of cyclohexane in the mixt. gave displacement curves composed of rectilinear, convex, and concave portions. Complete linearity indicated equality of the relative adsorption coeffs. of cyclohexane and the other hydrocarbon.

10790. BEDNARS, C.; LUNTZ, D. M., AND BLAND, R. E. **A study of operating variables in thermofor catalytic cracking.** *Chem. Eng. Progress* 44, No. 4, *Trans. Am. Inst. Chem. Engrs.* 293-8(1948).—*C.A.* 42, 4335*f*.

Temp. was varied from 800° to 930°F, space velocity from 0.2 to 2.4 $V_o/hr/V_c$, and catalyst activity from 28 to 36 A.I., when a Mid-Continent heavy gas oil was cracked over activated clay catalysts. Max. gasoline yields were obtained from a combination of high-catalyst activity, low temp., and low-space velocity. An increase in reaction temp. improved the ASTM and Research octane values of the catalytic motor gasoline, with the greatest effect on Research octane.

10791. BLASCO, E.; DOBLAS, J., AND YZU, L. **Catalytic aromatization of paraffinic gasolines.** *Combustibles* 8, No. 42, 62-6(1948).—*C.A.* 43, 3997*d*.

Cr oxide catalyst on silica gel was used in aromatization of imported straight-run gasoline. A spiral of Cu wire in the preheater desulfurized the feed. At 550°C the yield of liquid products was 62%, contg. 100% aromatic hydrocarbons. At intermediate temps. formation of dienes necessitated refining of the products by washing with 84% H_2SO_4 to det. aromatic hydrocarbons by ultraviolet absorption. At 500°C, a 93% yield of gasoline contg. 30% aromatic hydrocarbons and of I_2 no. 4.5 resulted. For aviation gasoline this latter method was suitable; for production of pure aromatic hydrocarbons the lower space velocity at 550°C was suitable.

10792. Blesa, Antionio Ara. **The effect of micellar surface on the catalytic decomposition of hydrogen peroxide by platinum sols prepared by the electrolytic [Bredig] method.** *Rev. acad. cienc. exactas, fís.-quím. y nat. Zarogoza Ser.* 2A, 3, No. 2, 39-64(1948); *Anales real. soc. espan. fís. y quím.* 45B, 561-76(1949).—*C. A.* 44, 6712*c*.

Pt sols were prepd. by using various potentials and current ds. and the particles sizes were detd. ultramicroscopically. All had radii in the range 75-95 mμ. KCN by itself aided the decompn. of H_2O_2 to an extent roughly proportional to the KCN concn. Addn. of increasing amts. of KCN to the Pt sol first decreased and then increased the rate at which it decompd. H_2O_2. The amt. of KCN required to give min. velocity ("lethal dose") for a particular sol increased roughly with the total surface area of the sol particles. The specific lethal dose (wt of KCN per unit of surface) was nearly const. at 0.65 mg per cm^2 for all sols studied. Expts. with an aq. soln. of I_2 gave results similar to KCN.

10793. Bonét-Maury, Paul and Lefort, M. **The catalytic properties of element 84 (polonium 210).** *Compt. rend.* 226, 173-5(1948); *J. Chem. Soc., Suppl. Issue No.* 2, S322-3(1949).—*C. A.* 42, 2865*e*; 44, 7638*f*.

The relation between catalyst concn. and the rate of decompn. of H_2O_2 for Pt, Pd, and Po was studied. At concns. of the order of 10^{-2} to 10^{-3} γ/ml, the effectiveness of Po was somewhat less than that of Pt. The effect of Pt dropped to practically zero at 5×10^{-4} γ/ml, while Po had an observable effect at 10^{-7} γ/ml.

10794. Booth, N.; Wilkens, E. T.; Jolley, L. J., and Tebboth, J. A. **Catalytic synthesis of methane. Experimental work of the Fuel Research Station.** *Gas Research Board, Copyright Pub. No.* 21/11, 44 pp(1948).—*C. A.* 43, 3169*e*.

Ni catalysts supported on kieselguhr and promoted with ThO_2 and MgO were used with water-gas-H_2 mixts. of varied compns. In a lab.-scale app. at 250-350°C with a gas throughput of 1 ft^3/hr at atm. pressure, the catalysts enabled the conversion of over 99% of the CO for long periods with space velocities of 3700 vol. of gas per vol. catalysts space per hr. The deposition of carbon on the catalyst was controlled: (1) use of suitable conditions in the prepn. of the catalyst; (2) choice of suitable promoters and supports, (3) use of H_2:CO ratios of 3:1 in the process gas; (4) addns. of moderate proportions of water vapor to the process gas; and (5) effective removal of the exothermic heat of reaction to avoid high temps. in the catalyst bed.

10795. Bourns, A. N. and Nicholls, R. V. V. **The catalytic action of aluminum silicates. II. The dehydration of 1,3-butanediol, and 1,4-butanediol over activated Morden bentonite.** *Can. J. Research* 26B, 81-8(1948).—*C. A.* 42, 4928*i*.

1,3-Butanediol passed over activated Morden bentonite at 250-350°C yielded 2.2-27.5% PrCHO, 7.9-23.7% 3-buten-1-ol, b_{760} 113.5°, d_4^{20} 0.850, n_D^{20} 1.4210, 3.4-11.1% of the cyclic butyral of 1,3-butanediol, b_{760} 161.3-1.5°, d_4^{20} 0.915, n_D^{20} 1.4254, 16.2-29.0% 1,3-butadiene, and some propene, 2-butene, CH_2O, and carbon.

10796. Braude, G.; Shurmovskaya, N., and Bruns, B. **The kinetics and mechanism of the catalytic hydrogenation of carbon monoxide I. A method of preparation of metal catalysts from oxides and handling the catalysts without contact with the air.** *J. Phys. Chem.* (U.S.S.R.) 22, 483-6(1948)(in Russian).—*C. A.* 42, 7147*g*.

The reduced metal was kept in H_2 and the samples also withdrawn in H_2.

10797. Braude, G. and Bruns, B. **The kinetics and mechanism of the catalyst hydrogenation of carbon monoxide. II. Formation of iron carbide during hydrogenation of carbon monoxide on an iron catalyst.** *J. Phys. Chem.* (U.S.S.R.) 22, 487-94(1948)(in Russian).—*C. A.* 42, 7147*h*.

Mixts. of CO and H_2 in ratios 1:3 to 1:5 were circulated at 225-350°C over an Fe catalyst prepd. by H_2 reduction of Fe_2O_3. The main reaction occurring was $n\mathrm{Fe} + \mathrm{CO} + \mathrm{H_2} \rightarrow \mathrm{Fe_nC} + \mathrm{H_2O}$. When the catalyst was used for longer time, the concn. of carbon in it increased and its efficiency decreased; the catalytic activity almost disappeared when 0.24 atom C was deposited per 1 atom Fe. The slow drop of pressure was due to the reaction between this carbide and excess H_2.

10798. Bremner, J. G. M. **The mechanisms of contact catalytic reactions.** *Research* 1, 281-5 (1948).—*C. A.* 42, 4435*c*.

Hydration-dehydration, alkylation-dealkylation, isomerization, polymerization and hydrogenolysis reactions, in which carbonium ions were considered to be formed, involved electron transfer between the catalyst and reactant mols.

10799. Bridger, G. L.; Gernes, D. C., and Thompson, H. L. **Development, production, and performance of water-gas conversion catalyst.** *Chem. Eng. Progress* 44, No. 5, *Trans. Am. Inst. Chem. Engr.* 363-82(1948).—*C. A.* 42, 4723*d*.

The process comprised: (1) pptn. by addn. of Na_2CO_3 soln. to $FeSO_4$ soln., (2) washing the ppt. by multiple decantation and repulping, (3) addn. of MgO to the thickened ppt. immediately before filtration and partial drying, (4) mixing the partially dried filter cake with $K_2Cr_2O_7$ and freshly ppt. aluminum hydroxide (contg. $Mg(OH)_2$, which was used as a filter aid) in an edge runner, (5) extruding the mixt. into 5/16 in. diam. rods which were cut to approx. 1/2 in. lengths, and (6) drying and roasting the formed catalyst in a steam-heated screen drier and an electrically heated kiln, resp. The catalyst contained about Fe_2O_3 54, MgO 17, $K_2Cr_2O_7$ 6.8, Al_2O_3 0.3, Na_2O 0.3, SO_3 0.5, CO_2 14, and H_2O 7%. The catalyst possessed high activity, long life, and an exceptional ruggedness.

10800. Brodsky, Michel and Berquin, Yves. **Contact sulfuric acid: determination of water formed on the catalyst.** *Bull. soc. chim. France* 1948, 470-2.—*C. A.* 42, 6495*g*.

An app. which carefully reproduced conditions found in industrial contact process equipment was constructed and applied to the analysis of water formed during the catalysis. The method, based on an acidimetric titration of the H_2SO_4 formed by the action of SO_3 and H_2O, had a precision of about 3% and a sensitivity to an amt. of oxidizable H corresponding to 50 mg H_2O per m^3 of catalyzed gas.

10801. Brooks, Benjamin T. **Active-surface catalysts in formation of petroleum.** *Bull. Am. Assoc. Petroleum Geol.* 32, 2269-86(1948). —*C.A.* 43, 5929*g*.

Geol. and chem. evidence was given for a relatively low temp. history for all petroleums. Active-surface minerals included most clays. Pure limestone or dolomites had a neglible effect and oils suffered little change after migration to them. Absence of olefins and presence of aromatics was indicative of catalytic action.

10802. Burwell, Robert L. Jr. **Catalytic racemization and dehydrogenation of optically active sec-butyl alcohol by copper and by zinc chromite.** *J. Am. Chem. Soc.* 70, 2865-9(1948). —*C.A.* 43, 1249*d*.

Rates of catalytic dehydrogenation and racemization of l-sec-butyl alc. were measured simultaneously over Cu and Zn chromite catalysts. Racemization was far more extensive than could be accounted for by the production of inactive alc. by rehydrogenation of MeCOEt. Dehydrogenation on Cu was inhibited by the reaction products relative to the racemization. With Zn chromite, the reactions were poisoned, probably by adsorption of products of concurrent condensation reactions.

10803. Chalmers, B.; King, R., and Shuttleworth, R. **The thermal etching of silver.** *Proc. Roy. Soc.* (London) A193, 465-83(1948).—*C.A.* 43, 3758*f*.

Grain boundaries appeared as grooves when Ag was heated in air, O_2, H_2, N_2, and in a vacuum and the grooves were visible on specimens heated in air at temps. as low as 300°C. Striations appeared when O_2 was present in the heating atm. and could be caused to disappear by heating in N_2. The lowest temp. at which they were observed on heating in air was about 500°C. Both striations and grain-boundary grooves were formed at the high temp. and were not produced by the cooling process.

10804. Chrétien, André and Thomas, Albert. **The catalytic synthesis of hydrogen cyanide from methane and ammonia.** *Bull. soc. chim. France* 1948, 354-7.—*C.A.* 42, 6495*d*.

The catalytic reaction $2NH_3 + 2CH_4 + 3O_2 \rightarrow 2HCN + 6H_2O + 229{,}800$ cal was studied. The yields of HCN for different ratios of O_2 to NH_3 and CH_4 to NH_3 were detd. The yield of HCN reached a max. of about 55% when the ratio of O_2 to NH_3 was 1.5. With excess O_2, the yield dropped because of oxidation of HCN. The yield of HCN reached 62% when the ratio of CH_4 to NH_3 was 1.1. The max. temp. was about 1110°C when the CH_4 to NH_3 ratio was about 0.8%. The max. temp. was about 1200 when the O_2 to NH_3 ratio was 3.0. The addn. of Rh to the Pt catalyst increased the yield and the activity of the catalyst, while the loss during the run was decreased.

10805. Cornubert, Raymond and Phélisse, Jean. **Systematic study of Raney nickel. Selective hydrogenation of** α, β**-ethylenic ketones.** *Compt. rend.* 227, 1131-3(1948).—*C.A.* 43, 4651*i*.

The hydrogenation of PhCH:CHCOMe in pure EtOH with Raney Ni-Al alloy as catalyst gave $Ph(CH_2)_2CH(OH)Me$.

10806. Cremer, E. **The absolute calculation of the rates of heterogeneous reactions.** *Experientia* 4, 349-51(1948)(in German).—*C.A.* 43, 471*h*.

The results of an investigation of the decompn. of EtCl on various chlorides were presented. It was found that $\log A = q/a + \text{const.}$ The latter relation was explained by assuming quantum leakage of an electron as the rate-detg. step.

10807. Dart, J. C. and Oblad, A. G. **Heat of cracking and regeneration in catalytic cracking.** *Chem. Eng. Progress* 45, 110-18(1948).—*C.A.* 43, 3180*d*.

The heat of reaction in once-through catalytic cracking at 850°F of an East Texas gas oil varied from a heat of reaction of + 100 B.t.u./lb of charge at 35% conversion to a heat of reaction of + 118 B.t.u./lb at 55% conversion. Above 55% conversion the heat of cracking decreased with an increase in conversion to a heat of reaction of + 45 B.t.u./lb of charge at 80% conversion. An increase in av. reaction temp. from 860° to 900°F at const. conversion had substantially no effect on the heat of reaction. The heat of cracking was endothermic to the extent of + 280 B.t.u./lb of product at 35% conversion and decreased uniformly to about + 50 B.t.u./lb of product at 80% conversion.

10808. Daudel, Raymond and Sandorfy, Camille. **Application of the method of mesomeric molecular diagrams to the study of adsorption and heterogeneous catalysis.** *Bull. soc. chim. France* 1948, 358-61.—*C.A.* 42, 8058*d*.

When ethylene was adsorbed by a surface, a bond occurred between a mobile electron on the surface and one end of the ethylene chain, and a valence bond was liberated at the other extremity of the chain. In the hydrogenation of benzene, 2 H atoms were bonded to mobile electrons on the surface. A benzene mol. was bonded to the surface at one of its apexes, in between the 2 H atoms. An adjacent apex took on a charge and attached the nearest H. The bonded apex then attached the other H.

10809. Dibeler, Vernon H. and Taylor, T. Ivan. **Mass-spectrometric and infrared study of rates of deuterium exchange, isomerization, and hydrogenation of the n-butenes.** *J. Chem. Phys.* 16, 1008-9(1948).—*C.A.* 43, 24*f*.

The Ni-catalyzed D_2 exchange, isomerization, and hydrogenation of the *n*-butenes were studied. Mass-spectrometric and infrared analyses were used to det. rate consts. for the initial stages of these processes.

10810. Dilke, M. H.; Eley, D. D., and Maxted, E. B. **Catalytic poisons and magnetic suscep-**

tibility. *Nature* 161, 804(1948).—*C.A.* 42, 6184*h*.

A finely divided sample of Pd (prepd. by reduction of $PdCl_2$ in glycerol by H_2 at 150°C) was evacuated in an ampul at 150°C, sealed off, and its susceptibility measured by the Sucksmith method. The ampul was reattached to the vacuum app. and the Pd satd. with Me_2S gas at 20°C. The amt. adsorbed was measured, the ampul resealed and measured in the magnetic balance. Since Me_2S was an easily condensible gas, the adsorption corresponded to at least 2 monolayers; that is, a van der Waal's layer on top of a chemisorbed layer. Only the chemisorbed layer affected the susceptibility.

10811. Dowden, D. A. **Catalysis and the electronic structure of solids.** *Research* (London) 1, 239-40(1948).—*C.A.* 42, 3648*a*.

The rate of catalytic hydrogenation of double bonds at metal surfaces reached a max. with Group VIII metals and a min. with Group IB pure metals. There was a parallel between this and phys. properties that were functions of the no. of holes in the *d*-band at the top of the Fermi distribution. Catalytic activity must be a function of those characteristics that effect the rate and equil. of H_2 ionization at the metal surface. The ionization process and the rate of electron transfer depended upon factors such as differences between electron affinities, ionization potentials, and electron-level ds. of the solid and the substrate, and upon the shape of the potential barrier at the surface.

10812. Eastwood, S. C. and Potas, A. E. **Thermofor pyrolytic cracking process.** *Petroleum Engr.* 19, No. 12, 43-6(1948).—*C.A.* 42, 8451.

A modification of the Thermofor catalytic cracking process employed high temps. such as 950°C, low pressures (approx. atm.), and contact times of the order of 1 sec to produce high yields of C_2H_4. The process could be employed with a wide variety of charge stocks and produced 25-40% yields of C_2H_4, together with smaller amts. of C_3H_6, C_6H_6, PhMe, 8-13 carbon aromatic compds., and butadiene.

10813. Eischens, Robert P. and Selwood, Pierce W. **Structure and activity of the chromium-aluminum oxide catalyst system.** *J. Am. Chem. Soc.* 70, 2271-3(1948).—*C.A.* 42, 8598*b*.

Surface areas of catalysts (1.9% to 34.5% Cr), made by the impregnation of Al_2O_3 and boehmite, decreased linearly with increase in Cr. At the "*l*" point of the magnetic susceptibility curve, corresponding to the inflection point from a low to a high rate of change of the susceptibility with Cr diln., only 1/9 of the Al_2O_3 surface was covered with Cr_2O_3. Measurements of catalytic activity for the cyclization of heptane at 490°C showed a close relationship between activity and susceptibility. Susceptibility in this system was a measure of the dispersion of Cr atoms.

10814. Feachem, G. and Swallow, H. T. S. **Alumina catalysts for vapor-phase organic dehydrations, deaminations, etc.** *J. Chem. Soc.* 1948, 267-72.—*C.A.* 42, 5750*g*.

Catalytic activity of Al_2O_3 catalysts was detd. by the dehydration of EtOH to C_2H_4 as a function of liquid-feed space velocity. Catalytic activity was greatest on complete conversion of boehmite to γ-Al_2O_3 as detd. by diffraction patterns, and was inversely proportional to the Na_2O content. Samples of boehmite prepd. by different methods showed varying rates of dehydration to Al_2O_3, from 6 hrs at 350°C for boehmite derived from bayerite to over 5 days at 450°C for boehmite derived from pptd. gibbsite by heating under pressure.

10815. Fuzek, John F. and Smith, Hilton A. **Kinetics of heterogeneous reactions with special reference to catalytic hydrogenation.** *J. Am. Chem. Soc.* 70, 3743-5(1948).—*C.A.* 43, 2079e.

The usual method of applying kinetic equations for homogeneous reactions to heterogeneous reactions was inadequate. Whenever the vol. of a gaseous system was changed, conventional rate equations must be modified. The true rate consts. for such heterogeneous reactions differed from those for homogeneous reactions of the same order by the dimensions of vol.

10816. Gallaway, W. S. and Murray, M. J. **Isomerization of certain olefins by silica gel at room temperature.** *J. Am. Chem. Soc.* 70, 2584-6(1948).—*C.A.* 42, 8150*g*.

BuEtC:CH_2 isomerized almost completely (90%) when passed through a silica column at 25°C; Me_3CCH:CMe_2 and Me_3CCH_2CMe:CH_2 were isomerized approx. to the equil. mixt. of these olefins. BuCH:CH_2 was not appreciably isomerized. Reduction of the temp. of the adsorption column to about -20°C nearly halted the isomerization of the olefins studied.

10817. Ghosh, J. C. and Basak, N. G. **Chromium oxide as a catalyst promoter for Fischer-Tropsch synthesis at medium pressures.** *Petroleum* 11, 131-2, 146(1948).—*C.A.* 42, 5643*g*.

A Co-Cu-ThO_2-kieselguhr catalyst was compared to one contg. these elements and 4.6% Cr_2O_3. The latter gave high yields of hydrocarbons (160 g/m^3 synthesis gas) at 205°C, a pressure of 5 atm., and a space velocity of 570-600 ml/hr of catalyst. The ratio CO:H_2 was 1:1. A pressure increase to 9 atm. did not increase the yield of hydrocarbons, but increased formation of CH_4 and CO_2. The catalyst was reduced at 237-240°C.

10818. Glukhovskaya, L. and Bruns, B. **Formation of hydrates of manganese dioxide in the catalytic oxidation of hydrogen.** *Zhur. Fiz. Khim.* 22, 793-6(1948).—*C.A.* 42, 8598*f*.

The rate of oxidation of H_2 by O_2 in the presence of MnO_2 was independent of the small water content of the catalyst. The H_2O formed in this reaction was adsorbed by MnO_2. Hydrates were produced which were thermodynamically unstable; the energy necessary for their formation was supplied by the energy of oxidation of H_2.

10819. Goddui, C. S. and Thornton, D. P. Jr. **Low-temperature carbonization of coal produced most of Japan's synthetic oil.** *Petroleum Processing* 3, 121-31(1948).—*C.A.* 42, 9112*d*.

Production achieved in coal-hydrogenation, Fischer-Tropsch, and low-temp. coal-carbonization plants was less than 750,000 barrels in 1944, the greater part coming from coal carbonization. A mixt. of Fe_2O_3, S, and $Sn(OH)_2$ was chosen as a standard catalyst. A natural Fe catalyst was discovered, but yields were much lower than with Co catalysts.

10820. GOL'DANSKIĬ, V. I. **Dependence of the rate of heterogeneous catalytic reactions on the amount of the catalyst.** *Zhur. Fiz. Khim. (J. Phys. Chem.)* 22, 1374-80(1948).—*C.A.* 43, 2498*a*.

If the rate v of a uni-mol. reaction or a bimol. reaction was detd. by the rate of adsorption or by the rate of diffusion toward the catalyst surface, then $1/v$ was a linear function of $1/S$, S being the surface area of the catalyst. The v of bimol. reactions, both components of which were nearly equally adsorbed, passed through a max. when S increased.

10821. GORDON, ALVIN S. **Pyrolysis of methane flowing through a porcelain tube in the region 1000°.** *J. Am. Chem. Soc.* 70, 395-401 (1948).—*C.A.* 42, 3244*e*.

The decompn. of CH_4 in a porcelain tube at temps. between 1007° and 1075°C was studied. Within this range, the 1st-order consts. increased with increasing decompn. There was a catalytic effect of C_2H_2, probably homogeneous, since the percentage of C_2H_2 increased with increasing percentage of decompn. There was probably no effect of C_2H_4 on the decompn. of CH_4. There was a large catalytic effect of surface in the early stages of the reaction which disappeared by the time 30% of the CH_4 was decompd.

10822. GRACE, E. J. **Narrow range control improves "cat cracker" operation at Sun Oil Company.** *Instrumentation* 3, No. 4, 8-9(1948). —*C.A.* 42, 8452*a*.

Instrumentation for fixed-bed catalytic cracking was described.

10823. HEINEMANN, FELIX. **Catalysts in petroleum refining.** *Petroleum Refiner* 27, No. 5, 273-9(1948).—*C.A.* 42, 9139*e*.

Catalyst reaction and catalyst compns. for the use of hydrocarbon chemistry were discussed. It was concluded that catalyst activity cannot be predicted, but must be detd. experimentally.

10824. HEINEMANN, HEINZ; LALANDE, W. A. JR., AND MCCARTER, W. S. W. **Activated bauxite as a catalyst for polymerization of C_4 olefins.** *Ind. Eng. Chem.* 40, 1224-6(1948).—*C.A.* 42, 5650*c*.

Catalyst activity increased with bauxite dehydration and bauxite activation temp. up to 1400°F. Max. polymerization of isobutylene at atm. pressure was obtained at 200-350°F. Rates of polymerization of iso-and normal butylenes were sufficiently different to permit exclusive polymerization of isobutylene from C_4 olefin mixts. at 400°-600°F. In this range isobutylene conversion was still 31-45% while that of butylenes was zero. The polymerization of mixts. of satds. and unsatd. C_4 hydrocarbons in the presence of activated bauxite catalysts required employment of pressures of 300-500 p.s.i. and about 350°F.

10825. HERNANDEZ, L. AND NORD, F. F. **Interpretation of the mechanism of catalytic reductions with colloidal rhodium in the liquid phase.** *J. Colloid Sci.* 3, 363-75(1948).—*C.A.* 43, 27*e*.

A hydrogenation catalyst was prepd. by dissolving $RhCl_3$ in a 2% aq. soln. of polyvinyl alc., adding NaOH to form $Rh(OH)_3$, and reducing with H_2. The stable colloidal dispersion of Rh was used to catalyze the hydrogenation of aq. EtOH solns. of a no. of org. compds. at room temp. and 1 atm. The rate of hydrogenation of *p*-substituted nitrobenzenes increased as the *p*-substituent changed, the order being: $-NH_2$ (slowest), $-OCH_3$, -H, -Br, -Cl, -I, -COOH, $-NO_2$, -CHO, -CN (fastest). The catalytic activity of Rh involved the formation of an unstable intermediate complex involving ionic H.

10826. HERNANDEZ, L. AND NORD, F. F. **The influence of sulfur on catalytic dehydrogenations with rhodium.** *J. Colloid Sci.* 3, 377-82(1948).—*C.A.* 43, 27*i*.

The colloidally dispersed Rh dehydrogenated iso-PrOH to acetone at 95°C in an aq. soln. contg. sulfide ion. HCOOH was dehydrogenated to produce CO_2 and H_2 in alc. soln. at 95°C. The rate of dehydrogenation increased with the addn. of elementary S up to an at. ratio of Rh:S = 1:3. The rate of hydrogenation of maleic acid in the presence of this Rh catalyst was decreased by S up to an at. ratio of Rh:S = 8:3. However, the catalyst activity under these conditions increased slightly after 5-10 min. These observations suggested that S facilitated dehydrogenation by acting as a H acceptor.

10827. HORSFIELD, S. W. **The catalytic cracking process as a means of peak load shaving.** *Am. Gas J.* 169, No. 1, 11-14, 50(1948).—*C.A.* 42, 6515*b*.

The cracking operations were: (1) mixing the vapor from the liquefied petroleum gas with air and steam in the correct proportions, (2) cracking the mixt. in cracking tubes, (3) cooling the resulting, reformed gas, and (4) enriching this gas to produce a final gas with the desired heating value. The cracking-furnace temps. were maintained within close limits at 982°C. By controlling the proportions of air and steam, reformed gas ranging from 180 to 350 B.t.u. per ft^3 and from 0.52 to 0.65 d. may be produced.

10828. HORSFIELD, S. W. **Catalytic reforming.** *Am. Gas Assoc. Monthly* 30, No. 7/8, 9-11, 39 (1948).—*C.A.* 42, 8443*a*.

The catalytic reforming of propane gave an addnl. gas production and relieved the gas-transmission system during peak loads. The cracking plant consisted of 3 units, 2 of them originally designed for reforming natural gas. The nickel oxide catalyst was impregnated on 3/4 in. refractory cubes and occupied approx. 19 out of 26 ft of tube space; below this zone were small pieces of alundum. The main control of the plant was the flow of process vapor; the proportions of process air and steam were automatically controlled. Propane vapor and air were first mixed and heated to 350°F before steam was added, and the mixt. was then fed to the furnace. No appreciable carbon deposition was noted.

10829. Juliard, A.; Rayet, R., and Ludé, A. **Kinetic study of the dissociation of carbon monoxide accompanying the reduction of metallic oxides.** *Discussions Faraday Soc.* **1948**, No. 4, 193-6.—*C. A.* 43, 4933*b*.

The reduction of Fe_2O_3 and NiO was studied by recording the wt change of weighed (1.8 and 1.4 g, resp.) samples with time, and measuring and analyzing the CO-CO_2 stream at varying temps. Pure Ni did not catalyze the dissocn. of CO. Ordinarily the dissocn. commenced at the onset of the reduction reaction and increased approx. linearly once more when reduction was complete. It was stopped completely at 600°C by the addn. of 30% CO_2. Sponge Ni, in contrast to the sintered samples normally used, markedly catalyzed the CO dissocn. This material could be poisoned by exposure for 1 hr at 700°C in a CO_2 stream. In the Fe expts. CO did not undergo dissocn. as long as no metallic Fe was present.

10830. Kagan, Yu. B. and Bashkirov, A. N. **Use of the differential thermocouple for kinetic measurements.** *Izvest. Akad. Nauk. S.S.S.R. Otdel, Tekh. Nauk* **1948**, 349-58.—*C. A.* 42, 6626*b*.

The temp. difference between an active catalyst and an inert substance placed in the same tube was assumed proportional to the rate of evolution (or absorption) of heat of reaction, hence proportional to the rate of the reaction. This was tested experimentally on the oxidation of Cu on a Kieselguhr carrier. At 245°C oxidation was complete; at 80°C, calcd. on the assumption of a const. proportionality factor between 80° and 245°, oxidation was 27.37% compared to 26.79% by analytical detn. The thermocouple was placed between 5 ml of the catalyst and 5 ml of glass cylinders, sepd. by mica, placed in the same tube.

10831. Kastens, Merritt L. and Hutchinson, J. C. **Contact sulfuric acid from sulfur.** *Ind. Eng. Chem.* **40**, 1340-9(1948).—*C. A.* 42, 7495*f*.

A no. of old, Pt-catalyst plants were rebuilt for V catalyst. The raw material was S for 78% of the acid produced, pyrites for 12.2%, Zn and Cu ores 7.2%. High-purity acid was produced directly from S, and no Pb was necessary in the construction of the plant. New plants were almost completely exposed to the weather in all parts of the country.

10832. Kazanskii, B. A. and Liberman, A. L. **Cyclization of paraffin hydrocarbons with a quaternary carbon atom, and mechanism of the aromatization of paraffins on platinized carbon.** *Doklady Akad. Nauk S.S.S.R.* **61**, 67-70 (1948).—*C. A.* 42, 8448*h*.

The catalytic aromatization of 3,3-dimethylhexane proceeded with the intermediate formation of 1,1-dimethylcyclohexane. With a Pt-carbon catalyst, characterized by 92% dehydrogenation of cyclohexane at 300°C and space velocity 0.33, 23.1 g of 3,3-dimethylhexane at 300°C and space velocity 0.11, gave 850 ml gas (H_2 85.6%, CH_4 9.8%) and 21.2 g catalyzate. The catalyzate of the reaction at 290°C showed the Raman lines of 1,1-dimethylcyclohexane, 459, 705, 829, 963, and 1029 cm^{-1}; the 705 line was very distinct from the 715, 724, 732, triplet of 3,3-dimethylhexane.

10833. Kemball, Charles and Taylor, Hugh S. **The catalytic decomposition of ethane and ethane-hydrogen mixtures.** *J. Am. Chem. Soc.* **70**, 345-51(1948).—*C. A.* 42, 2849*h*.

The decompn. was followed by mass-spectrum analysis using the ratio of the "16 peak" to the "30 peak." The rate of C_2H_6-H_2 decompn. on a supported Ni catalyst = $kp^{0.7}_{C_2H_6} - p^{-1.2}_{H_2}$ over a wide range of compn. with an energy of activation of 52 kcal/mole. At low ratios of H_2/C_2H_6, abnormal kinetics set in. Ethane decomposed quantitatively over this catalyst to CH_4 and carbon with a rate dependent on $p^{0.7}_{C_2H_6}$ and an energy of activation of 40 kcal/mole. The carbon was reversibly deposited and was converted to CH_4 by H. The rate-detg. step of CH_4 formation was the breaking of the C—C bond.

10834. Kobe, Kenneth A. and Hosman, Paul D. **Catalytic oxidation of ammonia to nitrous oxide.** *Ind. Eng. Chem.* **40**, 397-9(1948).—*C. A.* 42, 6063*g*.

NH_3 was oxidized to NO over a manganese oxide-bismuth oxide catalyst. A max. yield of 71% was obtained at 200°C at a space velocity of 5 to 6 ml of gas per ml of catalyst per min., with a gas mixt. contg. approx. 10% NH_3 and 90% O_2. After about 40 hours of use, the catalyst activity decreased rapidly.

10835. Kodama, Shinjiro and Murata, Yoshio. **Studies on the water-gas reaction. I. The activities of catalysts made from natural ocher.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. **52**, 41-3(1948).—*C. A.* 45, 1749*h*.

Catalysts made from natural ocher (Fe_2O_3 64.8%, H_2O 6.4%, wt loss by calcination 20.7%, apparent sp. gr. 0.62), to which were added 5-15% Cr_2O_3 and 5-15% K_2CO_3, were found effective in the water-gas reaction. Cr_2O_3 might promote the activation of water vapor and inhibit the formation of free carbon.

10836. Kodama, Shinjiro; Tahara, Hideichi; Nakabayashi, Tadaaki, and Hongo, Masami. **Gaseous synthesis from carbon monoxide and hydrogen at elevated pressures. IX. The influence of the composition of the raw gas on the reaction.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, **51**, 23-4(1948).—*C. A.* 44, 9135*g*.

With H_2:CO ratios in the raw gas of 1.1, 2.0, or 2.7, oil yields were 61, 57, or $50 g/m^3$, resp., with a catalyst (Fe + Cu 25 + kieselguhr 125 + K_2CO_3 6% at 10 kg/cm^2 pressure and 210°C. Under similar conditions the addn. of 16% CO_2 (CO:H_2 = 1:1) decreased the oil yield, but 5% CO_2 did not.

10837. Kodama, Shinjiro; Tahara, Hideichi; Nakabayashi, Tadaaki, and Hongo, Masami. **Gaseous synthesis from carbon monoxide and hydrogen at elevated pressures. X. The dependence of the oil yields on the gas flow.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* **51**, 24-3(1948).—*C. A.* 44, 9135*h*.

With Fe catalyst contg. Cu 25 + kieselguhr 125 + K_2CO_3 6% at 10 kg/cm^2 an increase in the flow rate from a reference value, 4 liter (N.T.P.)/hr, decreased the yield/unit vol. and increased the yield/unit time at 210° and 230°C. A decrease of the flow rate decreased the yield/unit vol. only slightly at 190° and 210°C.

10838. KODAMA, SHINJIRO; TAHARA, HIDEICHI; HONGO, MASAMI, AND FUJITA, H. **Gaseous synthesis from carbon monoxide and hydrogen at elevated pressures. XI. Alkalies used in the preparation of the iron catalyst and chlorine as a poison.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, **51**, 24-5(1948).—*C.A.* 44, 9135*i*.

To conduct the reaction with an Fe catalyst contg. Cu 25 + kieselguhr 125% at 10 kg/cm^2 and 210°C with a gas ratio $CO:H_2 = 1:1$, Na_2CO_3 was the best pptg. agent, and addn. of 6% K_2CO_3 to the catalyst was necessary. Cl in large amts. lowered the yield.

10839. KOMAREWSKY, V. I.; BOS, L. B., AND COLEY, J. R. **Vanadium oxide, a hydrogenation catalyst.** *J. Am. Chem. Soc.* 70, 428-30(1948).—*C.A.* 42, 2500*f*.

The catalyst (35 V_2O_5—65% Al_2O_3) was prepd. by copptn. from solns. of Na_3VO_4 and $Al(NO_3)_3$. The optimum temp. for olefin hydrogenation was 400°C; the hydrogenation of iso-C_4H_8, 1-hexene, and 1-octene was in excess of 95%. The max. allowable space velocity was increased materially by increasing the pressure (0.25 at 21 atm.). At atm. pressure the hydrogenation of iso-C_4H_8 was 98.6, 60.2, and 15% at space velocities of 0.046, 0.150, and 0.345; with 1-octene a space velocity of 0.10 at 1 atm. gave 98.6%; at 21 atm., yields of 94.9, 82.2, and 58.9% resulted with space velocities of 0.25, 0.50, and 1.00. The new catalyst was resistant to S poisoning.

10840. KRAUSE, ALFONS. **Oxidation-reduction catalysts. LXVIII.** *Przegląd Chem.* 6, 129-35(1948).—*C.A.* 43, 2079*h*.

Mechanism of the action of oxidation-reduction catalysts was discussed in the light of current theories, special consideration being given to metallic hydroxides.

10841. KRAUSE, ALFONS. **Theory of catalytic decomposition of hydrogen peroxide.** *Poznan Towarz. Przyjaciol Nauk, Prace Komisji Mat. Przyrodniczej, Ser. A.* 5, No. 3, 163-80(1948).—*C.A.* 44, 7131*e*.

It was assumed that the aq. soln. of H_2O_2 contained 2 kinds of isomeric mols., one acting as oxidizing agent, the other as reducing agent. Catalytic decompn. of H_2O_2 occurred by metallic catalysts because one agent was the final acceptor, whereas the other molecule was dehydrogenated, the final product being O_2 and OH_2. In this reaction free radicals HO and HO_2 appeared, able to initiate an uninterrupted chain of catalytic reaction, accompanied by electronic resonance.

10842. KRISHNA, BAL AND GHOSH, S. **Calculation of velocity constant in presence of heterogeneous autocatalyst.** *Proc. Natl. Acad. Sci. India* **17A**, 65-8(1948).—*C.A.* 46, 4896*d*.

In the reaction $Fe^{++}+Ag^{+}\rightarrow Fe^{+++}+Ag$, the no. and size of the particles of the Ag autocatalyst constantly changed. The curve for velocity const. (k) *vs.* time (t) ascended first and then descended as the Ag coagulated. On the assumption that the colloidal Ag was a homogeneous catalyst and was proportional to the total amt. of Ag formed (x), and that the expression for the slow uncatalyzed reaction $k_1(a-x)^2$ was negligible, $dx/dt = k_1\ (a-x)^2 + k_2(a-x)^{2x}$ became the 3rd-order reaction, $dx/dt = k(a-x)^2x$, and by integration between t_2 and t_1, $k(t_2-t_1) = (1/a^2)\{\ln[x_2(a-x_1)/x_1(a-x_2)]\} + (1/a)\{[1/(a-x_2)] - [1/[a-x_1)]\}$.

10843. KUMMER, J. T.; BROWNING, L. C., AND EMMETT, P. H. **Thermodynamic calculations concerning the possible participation of the carbides of iron as intermediate in Fischer-Tropsch synthesis.** *J. Chem. Phys.* 16, 739-40 (1948).—*C.A.* 42, 6623*d*.

Equil. consts. for the synthesis of *n*-1-olefins (C_2-C_6) and of *n*-paraffins (C_1-C_8) were calcd. at 227° and 327°C. These products were not formed by the reduction of Fe_2C. In addn., it was unlikely that either Fe_3C or "hexagonal" Fe_2C was the intermediate at the temp. and pressure range commonly employed in the Fischer-Tropsch synthesis.

10844. KUMMER, J. T.; DEWITT, T. W., AND EMMETT, P. H. **Some mechanism studies on the Fischer-Tropsch synthesis using C^{14}.** *J. Am. Chem. Soc.* 70, 3632-43(1948).—*C.A.* 43, 2080*i*.

The greater part of the product was formed by some process other than by the reduction of carbide as an intermediate. Only about 10% of the hydrocarbon product appeared to have been formed through the carbide for Fe catalysts at or below 260°C and for Co at 200°C; at 300°C the part of the reaction occurring through the carbide reduction mechanism seemed to average about 16%. The percentage formed through the carbide phase was not critically dependent on the $H_2:CO$ ratio in the range 1:1 to 3:1, on the total pressure of the synthesis in the range 150-800 mm, or on the percentage Fe_2C initially present in the range 4-100%.

10845. KUMMER, J. T. AND EMMETT, P. H. **Use of C^{14}, N^{15}, and deuterium in studying catalytic reactions and adsorption processes on iron catalysts.** *Brookhaven Conf. Rept.*, BNL-C-8, *Isotopic Exchange Reactions and Chem. Kinetics, Chem. Conf.* No. 2, 1-26(1948).—*C.A.* 45, 5502*c*.

The use of C^{14} in studying the mechanism of Fischer-Tropsch synthesis over Fe catalysts was discussed, and also $C^{14}O$ in chemisorption measurements on Fe, $N^{15}N^{15}$ in detg. the extent of exchange of N isotopes at 450-500°C over Fe, and D_2 in measuring the amt. of H_2 remaining on promoted and on unpromoted Fe catalysts after an extended reduction and evacuation at 500°C.

10846. LAIDLER, KEITH J. **Mechanism of some elementary surface reactions.** *Pittsburgh Intern. Conf. on Surface Reactions* **1948**, 51-9; *J. Phys. & Colloid Chem.* 53, 712-32(1949).—*C.A.* 42, 8595*f*; 43, 6897*b*.

Basic rate and equil. equations for adsorption and desorption processes were developed and applied to the production and recombination of atoms and free radicals at surfaces. The calcns. agreed with exptl. data concerning (1) the production and recombination of H atoms on heated W filaments, and (2) recombination of H atoms on Pyrex.

10847. Leidheiser, Henry, Jr. and Gwathmey, Allan T. **The catalytic reaction of hydrogen and oxygen on plane faces of a single crystal of copper.** *J. Am. Chem. Soc.* 70, 1200-6(1948). —*C.A.* 42, 4435*g*.

Single crystals were used in the form of spheres exposing all possible faces and in the form of slices parallel to a particular face. The crystals were mechanically and electrolytically polished. With O_2 concns. of 1-20% at 400°C, regular rearrangements were found to take place in the surface of the metal, exposing certain facets on some faces, roughening others without the development of particular planes, whereas other faces remained quite smooth. Appreciable differences in rate existed between (100) and (111). These differences depended on both the differences in activity per unit of surface and on the differences in total surface area exposed.

10848. Leva, Max; Grummer, Milton; Weintraub, Murray, and Storch, H. H. **A study of fluidization of an iron Fischer-Tropsch catalyst.** *Chem. Eng. Progress* 44, No. 9, 707-16(1948).—*C.A.* 42, 7957*d*.

Typical mixts., comprising components varying in size from 32-to 325-mesh, were investigated by using air and He as fluids. The new data were in agreement with the correlations based on the exptl. work with sand beds when proper allowance was made for the greater irregularity of the particles. The application of the correlations to process design was discussed on the basis of typical Fischer-Tropsch operating data.

10849. Levesque, Charles L. and Craig, Andrew M. **Kinetics of an esterification with cation-exchange resin catalyst.** *Ind. Eng. Chem.* 40, 96-9(1948).—*C.A.* 42, 2165*b*.

A phenol-formaldehyde sulfonic-type resin (similar to Amberlite IR-100) catalyzed the esterification of butanol and oleic acid. Presumably only those acid groups near the surface of the resin were effective catalytically for such large reactant mols., whereas for smaller mols. all the acid groups in the particle were active.

10850. López-Rubio, Fernando Blasco and Pacheco, José de la Rubia. **The mechanism of the catalytic process for the synthesis of hydrocarbons by the Fischer-Tropsch process.** *Ion* 8, 86-9(1948).—*C.A.* 42, 6543*b*.

Fe was less active than Co or Ni, but it had the advantage of being effective over a wide range of temps., and was characterized by production of liquid hydrocarbons with CO_2 as by-product. Co gave a product rich in olefins. Ni tended to produce CH_4 along with liquid and solid paraffins. Carbonyls of the metals were assumed to be the primary active materials. $[Fe(CO)_5]_4$ was thought to be reduced to 2 mols of C_8H_{18} and a Fe carbonyl of much lower CO content; the lower carbonyl was reconverted to Fe.

10851. Margolis, L. Ya and Todes, O. M. **Kinetics of exothermal catalytic reactions in a flow system. IV. Investigation of the stationary and the nonstationary oxidation of isoöctane on a copper-chromium catalyst.** *Invest. Akad. Nauk S.S.S.R., Otdel Khim. Nauk* **1948**, 174-81.—*C.A.* 42, 7148*i*.

Measurements of the temp. established in the oxidation of isoöctane, (40 liters/hr) on Cu-Cr catalysts with 10,30, and 67% active contact substance on asbestos, were compared with theoretical expressions. Experimentally the loss of heat through convection by the gas stream was only 5-9% of the total heat balance; the main loss of heat occurred through the walls of the reaction tube. Exptl. data confirmed the linearity of log (ΔT) as a function of time for the nonstationary state, independently of the rate of flow (16,27,44 liters/hr).

10852. Margolis, L. Ya and Todes, O. M. **Catalytic oxidation of organic compounds in flow.** *Zhur. Obshchei Khim.* **18**, 1043-50(1948).—*C.A.* 43, 927*d*.

The kinetics in air mixts. were investigated on spinel-type catalysts (chromites, aluminates, etc.) on asbestos; the concn. of the catalyst on the carrier was gradually decreased as the temp. was raised. At a given temp., the rate const. of the oxidation was found to be proportional to the conc. of the catalyst. Oxidation of isoöctane, cyclohexane, and methyl-cyclohexane, on Cu-Cr and Mg-Cr catalysts, followed a 2nd-order law. The identity of the rate law, and the closeness of the sp. rate const. of isoöctane and cyclohexane may be linked with a cyclization of the former on Cr_2O_3. Normal C_5H_{12}, C_7H_{16}, C_8H_{18}, as well as C_2H_4 and C_6H_6, on the same catalysts, followed 1st order law.

10853. Maxted, E. B. **Some recent advances in catalysis.** *J. Soc. Chem. Ind.* 67, 93-7(1948). —*C.A.* 42, 7149*i*.

Naturally occurring catalyst poisons were converted to nontoxic derivs. Compds. contg. P, As, Sb, Bi, S, Se, and Te, elements inherently toxic to Ni, Pt, and similar catalysts, were non-toxic if all valence electrons were "shielded" and toxic if these electrons were free to make the poison a donor to the electron pool of the catalyst and thus selectively adsorbed on it. Piperidine and pyridine were self poisoning, but their hydrochlorides were readily hydrogenated. S compds. in coal gas were destructively hydrogenated at 400° to 500°C to H_2S when the thiomolybdates of Cu, Sn, Mn, Co, Ni, or Fe on bauxite carriers were used as catalysts; the H_2S was absorbed in an Fe oxide purifier.

10854. Maxted, E. B. and Walker, A. G. **Self-poisoning effect in the hydrogenation of pyridine.** *J. Chem. Soc.* **1948**, 1093-7.—*C.A.* 43, 1536*f*.

The slow rate of catalytic hydrogenation of free pyridine was considered to be the result of a self-poisoning effect. It was attributed to the possession of a free-electron pair by the N atom, which resulted in strong adsorption by the metallic catalyst. If the N atom structure was shielded by hydrogenating in acid soln., so that the pyridinium ion (non-toxic) was formed, the toxicity was inhibited.

10855. MILLETT, H. C. **Manufacture of contact sulfuric acid from arsenical pyrites.** *Chemistry & Industry* 38, 595-600(1948).—*C.A.* 43, 3153*i*.

Arsenical pyrite fines for the manuf. of H_2SO_4 should be 1/32 to 3/8 in. in size and have a max. of Cu 0.5, Zn 1.7, and As 0.15%. The pyrite was roasted in multi-hearth burners. The hot gases were then purified, dried, drawn into the converters contg. a catalyst which had 4% V_2O_5 and a bulk d. of 48-50 lb./ft^3, and finally into the absorption towers.

10856. MIYAKE, ROICHI. **Hydrogenation of fatty oils. XI. Adkins' catalyst. Characteristic of the catalyst and significance of addition of barium chromate.** *J. Pharm. Soc. Japan* 68, 38-9(1948)(English summary).—*C.A.* 44, 353*a*.

Adkins' catalyst and Cu-kieselguhr catalyst were similar in many respects, except superior uniformity of dispersion of Cu in the former. $BaCrO_4$ did not hamper the reduction of copper oxide, and might act as an increased carrier.

10857. MONTGOMERY, C. W. AND WEINBERGER, E. B. **Product distribution in the synthesis of hydrocarbons from carbon monoxide and hydrogen.** *J. Chem. Phys.* 16, 424-5(1948).—*C.A.* 42, 4437*f*.

An interesting feature of the Fischer-Tropsch synthesis was the peculiar distribution of the reaction products and the relatively small production of C_2, C_3, and C_4 hydrocarbons with Co catalysts at atm. pressure and 190°-200°C. It was shown mathematically that thermodynamic equil. among the n-paraffins produced a distribution that was qualitatively similar to that observed experimentally. The calcns. also indicated that the true catalyst temp. was higher than the measured temp.

10858. MONTGOMERY, C. W.; WEINBERGER, E. B., AND HOFFMAN, D. S. **Thermodynamics and stoichiometry of synthesis gas production by the partial oxidation of methane.** *Ind. Eng. Chem.* 40, 601-7(1948).—*C.A.* 42, 4329*a*.

The thermodynamics of the CH_4-steam-H_2-CO-CO_2-carbon system was studied and extended to cover detns. of the conditions of temp., pressure, and O_2-CH_4 ratio for max. yield of synthesis gas per mol. of O_2 and per mol. of CH_4. A detailed discussion was presented of the problem of carbon formation at equil. conditions and when the product gases were cooled.

10859. MORTON, MAURICE AND NICHOLLS, R. V. V. **Catalytic action of aluminum silicates. III. Conversion of 1,1-diphenylethane to styrene over Morden bentonite.** *Canadian J. Research* 26B, 581-91(1948).—*C.A.* 43, 1251c.

Finely powd. Morden bentonite was treated with H_2SO_4, filtered, dried, and broken into lumps; the 4-8 mesh material was electrically heated. Higher temps. resulted in increased conversions as well as increased styrene content in the converted products; the styrene content reached a max. at about 600°C. Faster feed rates resulted in decreased total conversion but increased styrene content in the products. The use of H_2O as a diluent greatly increased the conversion efficiency.

10860. MUKHERJEE, PHANINDRA NATH AND DASGUPTA, H. N. **Volatilization of phosphorus as halides (preliminary note).** *J. Indian Chem. Soc., Ind. & News Ed.* 11, 47-50(1948).—*C.A.* 43, 515*e*.

P halides were prepd. by passing a current of dry Cl_2 or HCl over an anhyd. mixt. of $Ca_3(PO_4)_2$, carbon, and SiO_2 at about 950°C. Bone ash, charcoal, and quartz powder were ground separately, throughly mixed, dried at 120°C and placed in a silica combustion tube in an elec. furnace. A const. flow of dry Cl_2 or HCl gas was passed through the tube for 2 hrs while the temp. of the furnace was kept at 950°C. The condensation product in the receiver was a mixt. of PCl_3, PCl_5, and $POCl_3$.

10861. NAGASAKO, NOBORU AND MIYAZAKI, SHOZO. **Studies on the catalytic decomposition of ammonia. The catalytic decomposition on tungsten and molybdenum.** *Bull. Tokyo Inst. Technol.* 13, 124-32(1948).—*C.A.* 44, 10552*f*.

The decompn. of NH_3 on electrically heated Mo and W filaments indicated adsorption of N_2 from the gas phase was negligible. The active surface was covered with H_2 and NH_3. The reaction rates gave activation energies of 42.7 kcal/mole for W and 45.6 kcal/mole for Mo.

10862. NAUMOV, A. I. **Kinetics of the catalytic isomerization of ethylene oxide into acetaldehyde.** *Zhur. Fiz. Khim* 22, 797-800(1948).—*C.A.* 42, 8598*d*.

Ethylene oxide was passed through a mixt. of silica gel and Al powder or through an Al silicate. When ethylene oxide passed at atm. pressure through the catalyst bed, the reaction took place in a narrow layer of the bed in which the temp. may be 100°C above that in the rest of the catalyst; this hot zone traveled along the bed at about 0.05 cm/min. At low pressures, p, (4 to 45 mm Hg) $\log m = a + \log p$, m being the amt. of acetaldehyde (g) produced within 1 ml of the catalyst per hr. When the time of contact was 0.015 sec, a was -2. Within the range 30° to 110°C, $\log m = b - (2080/T)$, T being abs. temp. and b about 7.5.

10863. NEIMAN, M. B. AND SHUSHUNOV, V. A. **A kinetic method of physiochemical analysis. II. Kinetics of the reaction between tin-sodium alloys and ethyl bromide vapors.** *J. Phys. Chem. (U.S.S.R.)* 22, 145-55(1948)(in Russian).—*C.A.* 42, 5315h.

The pressure of EtBr vapor brought into contact with a Sn-Na alloy remained nearly const. for a period t and then decreased first rapidly and then more and more slowly. The main reaction product below about 55°C apparently was $SnEt_4$; at higher temp. $SnEt_2Br_2$ seemed to form.

10864. NEIMAN, M. B. AND SHUSHUNOV, V. A. **A kinetic method of physiochemical analysis. III. Kinetics of the reaction between ternary alloys Na-Pb-Mg and ethyl chloride vapors.** *J. Phys. Chem. (U.S.S.R.)* 22, 157-60(1948)(in Russian).—*C.A.* 42, 5316b.

Addn. of 0.1 wt % Mg to the alloy Na-Pb slightly shortened the induction period *t* of the reaction with EtCl. Addn. of 0.3-2% greatly lengthened *t*, e.g., from 0.25 to 1.8 hrs by 1% Mg at 35°C. When the ratio Na:Pb was varied, with the Mg concn. kept equal to 0.1%, there was a sharp min. of *t* at 50 at. % Na as in the absence of Mg.

10865. NICOLAI, J.; MARTIN, R., AND JUNGERS, J. C. **Kinetics of the hydrogenation of benzene.** *Bull. soc. chim. belges* 57, 555-74(1948).—*C. A.* 44, 419*b*.

The catalyst was prepd. by reduction of $NiCO_3$ deposited on kieselguhr. At 70°-150°C the hydrogenation produced cyclohexene and had an activation energy of 11 kcal. At 150°-250°C it was complex. Above 250° the product was CH_4 and the activation energy was 45 kcal. In the region of formation of CH_4 the order was first in hydrogenation of C_6H_6 and neg. in H_2. The adsorption of CO was stronger than that of benzene, and CO was hydrogenated first. Adsorption of CO_2 was about the same as that of benzene. MeOH was not strongly adsorbed and below 160°C had no effect, whereas at high temps. it was decompd. and then converted to CH_4.

10866. OBORIN, V. I. **Cracking processes on alumina catalysts in the light of the multiplet theory of catalysis.** *Zhur. Obshchei Khim.* 18, 612-28(1948).—*C. A.* 43, 1250*d*.

The reactions that occurred in catalytic cracking were analyzed. If these reactions were written with the reacting groups facing each other and the bonds broken and those newly formed considered, the cracking of open-chain hydrocarbons, cracking isomerization, condensation of olefins, cyclization without dehydrogenation and chain opening of cycloparaffins had one type of doublet index; dehydrogenation, cyclization-dehydrogenation of diolefins, and hydrogenation had a second type of index. The role of O in the catalyst was solely in ionization of the metal atoms. Active double centers were constituted in SiO_2-Al_2O_3 catalysts by 2 Al ions in SiO_2-ZrO_2-Al_2O_3 catalysts, possibly by 1 Al and 1 Zr ion.

10867. OHTA, NOBUTO. **Method of measuring the proton-donating intensity or "PD-intensity" of solid catalysts of the proton-donor type.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* 51, 16-17(1948).—*C. A.* 44, 9224*h*.

The "PD-intensity", one of the factors detg. the activity of solid catalysts of the proton-donor type, was detd. from the % *n*-butene produced in the dehydration of iso-BuOH. The relative values obtained at 300°-400°C were: Al_2O_3 gel < $Al_2(SO_4)_3$ < SiO_2 gel < acid earth < SiO_2 gel + Al_2O_3 gel (1:1) < SiO_2 gel (B) < H_3PO_4 + SiO_2 (85:15) < H_3PO_4 + charcoal (20:80).

10868. OHTA, NOBUTO. **Nature of the active center of mixed silica-alumina catalysts.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, 51, 18-19 (1948).—*C. A.* 44, 9225*b*.

Both the catalytic dehydration of iso-BuOH at 350°C (10 ml/hr) with 0.50 g catalyst and isomerization of n-butene at 400° (1.50 g/hr) with 2.50 g catalyst increased when the amt. of silica was 30-70%, whereas the PD-intensity in the dehydration increased monotonically with % silica. The active centers newly produced in the region of coexistence of SiO_2 and Al_2O_3 were due to SiO_2, and their PD-intensity was weakened by the existence of Al_2O_3 gel.

10869. OHTA, NOBUTO. **Relation between the proton-donating intensity and the activity of butanol-dehydration on solid catalysts of the proton-donor type.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* 51, 20(1948).—*C. A.* 44, 9225*c*.

The dehydration of alcs. in the presence of proton-donor type catalysts belonged to a class of acid-base catalysis of Brønsted-Lowry. Dehydration of BuOH at 250°-450°C with H_3PO_4, SiO_2 gel, pure Al_2O_3 gel, and Al_2O_3 gel contg. basic Al sulfate confirmed this classification, if the 1st step was assumed to det. the rate for the entire reaction.

10870. OHTA, NOBUTO. **Relation between the proton-donating intensity and the activity of isobutylene polymerization on solid catalysts of the proton-donor type.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, 51, 20-1(1948).—*C. A.* 44, 9225*e*.

The isomerization of isobutylene (1.50 liter/hr) for 32 catalysts at 450°C with 2.50 g catalyst were compared with their PD-intensities. The catalytic polymerization of olefins was a type of acid-base catalysis. Seven catalysts incompletely freed from halogen ions showed deviations.

10871. OHTA, NOBUTO. **Relation between the proton-donating intensity and the activity of isobutylene polymerization on solid catalysts of the proton-donor type.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, 51, 21-3(1948).—*C. A.* 44, 9225*f*.

A comparison of 20 catalysts showed a parallel relation between their PD-intensity and polymerization of isobutene (20 liters/hr with 6.3 g catalysts at 150°C.) As long as the amt. of C_4H_8 polymerized was less than 80%, the oil produced at the same temp. always had the same compn., rich in dimer. When the PD-intensity of the catalyst was strong, a mechanism was proposed based on acid-base catalysis. More trimer was formed with catalysts with stronger PD-intensities.

10872. OHTA, NOBUTO. **Relation between the dehydration reaction of isopropyl alcohol, ethanol, or methanol and the proton-donor intensity of catalysts.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, 51, 138-9(1948).—*C. A.* 44, 9225*h*.

The catalytic dehydration of iso-PrOH and EtOH with $2H_3PO_4$ + silica and pure Al_2O_3 gel, (PD-intensities 70 and 10, resp.) proceeded similarly to BuOH. Both catalysts had the same activity at 400°C. The formation of ethers as secondary products was favored more with the pure Al_2O_3. The dehydration of MeOH gave Me_2O alone, the activity of pure Al_2O_3 being greater.

10873. OHTA, NOBUTO. **Alkylation of phenol and m-cresol with isopropyl alcohol in the vapor phase.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, 51, 141-3(1948)—*C. A.* 44, 9226*c*.

By a flow method PhOH was alkylated catalytically with gaseous iso-PrOH at 200°, 250°, and 300°C. The catalysts of large PD-intensity ($2H_3PO_4$-SiO_2 or active earth) produced $C_3H_7C_6H_4OH$ and $C_3H_7OC_3H_7$, while those of small PD-intensity ($Al_2(SO_4)_3$ or Al_2O_3) gave $C_6H_5OC_3H_7$ and $C_3H_7C_6H_4OC_3H_7$. At higher temps. production of C_3H_6 predominated. Iso-PrOH could be produced with the same catalyst from C_3H_6 and H_2O, suggesting that the propylation was performed by the decompn. of iso-PrOH into C_3H_6 and H_2O.

10874. Ohta, Nobuto. **Alkylation of phenol with methanol, ethanol, and isobutyl alcohol and the reaction mechanism of phenol with alcohols.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* 51, 143-4(1948).—*C.A.* 44, 9226*e*.

PhOH was alkylated with MeOH, EtOH, and iso-BuOH with $2H_3PO_4$-SiO_2 and Al_2O_3 gel catalysts. In these alkylations with catalysts of small PD-intensity the relative velocities were: MeOH-EtOH < iso-PrOH < iso-BuOH; with catalysts of large PD-intensity the relative velocities were: iso-PrOH < iso-BuOH < MeOH < EtOH.

10875. Ohta, Nobuto. **The effect of the proton-donating intensity of catalysts and production of methylcyclopentene in cyclohexene isomerization.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, 51, 145-6(1948).—*C.A.* 44, 9226*g*.

After passage of 20-30 ml gaseous cyclohexene over various catalysts, the amts. of methylcyclopentene, methylcyclopentane, and methylenecyclopentane were detd. Al_2O_3 gel (PD-intensity 10) gave no reaction at 350°C and a space velocity of 2, but produced 94% methylcyclopentene at 400°C, while $2H_3PO_4$-SiO_2 (PD-intensity 70) produced 91.5% at 350°C and a space velocity of 10. Cyclohexene could be isomerized more easily with catalysts of high PD-intensity, the secondary reactions occurring under more severe conditions.

10876. Parravano, G.; Hammel, E. F., and Taylor, Hugh S. **The exchange reaction between methane and deuteriomethanes on silica-alumina cracking catalysts.** *J. Am. Chem. Soc.* 70, 2269-70(1948).—*C.A.* 42, 7148*f*.

The exchange reaction between CH_4 and deuteriomethanes on SiO_2-Al_2O_3 cracking catalysts occurred measurably at 345°C and higher. The activation energy between 345° and 384°C was 13 kcal. A mechanism for the cracking process of hydrocarbons involved 2 steps: scission of C-H bonds, and then scission of C-C bonds. Ethylene hydrogenation took place on the same catalyst in the same temp. range.

10877. Pauw, F. de and Jungers, J. C. **Kinetics of hydrogenation of acetylene on nickel.** *Bull. soc. chim. belges* 57, 618-30(1948).—*C.A.* 44, 915*h*.

Catalyst A was prepd. by reducing $NiCO_3$ pptd. on kieselguhr; B was prepd. by reducing at 350°C oxide from the calcination of $Ni(NO_3)_2$. With catalyst A and equimolar H_2 and C_2H_2 there was no reaction at 29°-100°C, but if H_2 was admitted first, there was rapid reaction. Equimolar H_2 and C_2H_4 reacted. Acetylene poisoned the catalyst by forming polymers. The less active catalyst B was periodically regenerated with H_2 at 300°C. At 29°-30°C an initial reaction of steady rate continued until about one mole of H_2 was used per mole of C_2H_2; the rate then increased. The strong adsorption of C_2H_2 inhibited hydrogenation of C_2H_4 as long as C_2H_2 was present.

10878. Plant, J. H. C. and Newling, W. B. S. **Catalytic removal of organic sulfur compounds from coal gas.** *Inst. Gas Engr., Commun.* No. 344; *Gas World* 129, 807-8, 922-7; *Gas J.* 256, 654, 657, 659(1948).—*C.A.* 43, 3172*f*.

Operation of a plant for the treatment of 1.5 million ft^3 of purified, unstripped coal gas from horizontal retorts daily showed: (1) The practical min. limits for org. S compds. other than thiophene was 3 grains per 100 ft^3. (2) It is most unlikely that the continuous decompn. of thiophene in coal gas will ever be practical. (3) The most suitable industrial catalyst was Ni subsulfide on a china-clay support. (4) The optimum working range of a catalyst was 330° to 380°C. (5) Uniform distribution across the catalyst bed was essential. (6) The heat consumption depended only on the sensible heat of the outgoing treated gas and surface losses from the plant.

10879. Rabes, I. and Schenck, Rudolf. **Adkins' copper chromite catalysts and the mechanism of their action.** *Z. Elektrochem.* 52, 37-9 (1948).—*C.A.* 43, 6336*a*.

The active reducing agent in this catalyst was finely divided Cu suspended on Cr_2O_3. It was derived from the following reactions: $2\ CuO + Cr_2O_3 \rightarrow Cu_2Cr_2O_4 + 1/2\ O_2$; $Cu_2Cr_2O_4 + H_2 \rightarrow 2\ Cu + Cr_2O_3 + H_2O$, the latter taking place very readily in the presence of H_2 under pressure.

10880. Reed, R. M. and Eriksen, Arne. **Hydrogen and synthesis gas production.** *Calif. Oil World* 41, No. 16, 3, 5, 7, 9, 11(1948); *Gas* 24, No. 10, 53-6.—*C.A.* 42, 9097*g*.

H_2 for petroleum hydrogenation was made by reaction of natural gas with steam at about 1600°F in a furnace contg. vertical Cr-Ni alloy tubes. The resultant gas mixt. is passed over an iron oxide catalyst at about 850°F. to yield a gas contg. about 77% H_2, 18% CO_2, and the balance CO, CH_4, and N_2. H_2 for NH_3 synthesis was produced by a similar process, except that addnl. N_2 was introduced into the gas mixt. High-purity H_2 was made by using propane or butane in place of CH_4.

10881. Reitmeier, R. E.; Atwood, Kenton; Bennett, H. A., Jr., and Baugh, H. M. **Production of synthesis gas by reaction of light hydrocarbons with steam and carbon dioxide.** *Ind. Eng. Chem.* 40, 620-6(1948).—*C.A.* 42, 4328*f*.

Synthesis gas with a wide range of compns. was produced from properly selected reacting mixts. of light hydrocarbons, steam, and (or) CO_2, without deposition of carbon on the catalyst. The absence of carbon under the predicted conditions and the formation of the predicted synthesis gas compn. were confirmed by lab. tests on CH_4 and C_3H_8 over a wide range of compns.

10882. Rescorla, A. R.; Ottenweller, J. H., and Freeman, R. S. **Evaluation of catalysts for catalytic cracking.** *Anal. Chem.* 20, 196-202 (1948).—*C.A.* 42, 5215*e*.

Methods for detg. the following phys. properties were given: density (aerated, freely settled, compacted, and under pressure), volatility at 1750°F, and particle size (sieve analysis and Roller air elutriation methods). Routinely, only Al, Na, and Fe were detd. in the catalysts which were essentially Al silicates. The activity of catalysts was measured in the lab. either by a detn. of surface area or by using small-scale lab. cracking units which duplicated conditions encountered in the large com. units.

10883. Rienacker, Gunther and Sarry, Brigitte. **Catalytic research on alloys. XII. The parahydrogen conversion on Cu-Pt mixed crystals.** *Z. anorg. Chem.* 257, 41-58(1948).—*C.A.* 43, 4088*b*.

The high activity and low activation energy characteristic of pure Pt catalysts held for the para-H_2 conversion in alloys contg. as little as 16 at. % Pt. The activity fell off sharply for alloys richer in Cu. The fact that the catalytic activity of Pt for the dehydrogenation of HCOOH fell off rapidly in alloys contg. less than 44 % Pt showed that this process was more complex than the para-H_2 conversion; but since the alloys contg. a higher percentage of Pt showed similar catalytic activity for the two processes, it was likely that dehydrogenation involved adsorption and labilization of HCOOH followed by catalytically influenced desorption of split-off H_2.

10884. Riesz, C. H. **Catalytic cracking of hydrocarbons.** *Am. Gas Assoc., Proc.* 30, 505-16 (1948).—*C.A.* 43, 6814*b*.

The rapid development of catalytic hydrocarbon-cracking processes for peak-load gas-generating application was discussed. Further research was deemed necessary to explore application of the process to feeds other than propane and butane, to the generation of gas under pressure, and to the development of more active and possibly S-resistant catalysts.

10885. Riesz, C. H.; Batchelder, H. R., and Lurie, P. C. **Catalytic reforming of hydrocarbons.** *Am. Gas Assoc. Monthly* 30, No. 2, 17-22(1948).—*C.A.* 42, 2739*i*.

The catalytic reforming of propane was found suitable as a means of producing the low-gravity carrier gas. By appropriate selection of propane space velocity, steam-propane ratio, air-propane ratio, and temp., it was possible to increase the pilot-plant capacity by a factor of at least four in comparison to furnace atm. generation. A furnace temp. of 1850°F was required for best performance with the standard catalyst; below 1750°F there was considerable carbon deposition.

10886. Riesz, C. H.; Lister, Fred; Smith, L. G., and Komarewsky, V. I. **Catalysts for hydrocarbon synthesis.** *Ind. Eng. Chem.* 40, 718-22 (1948).—*C.A.* 42, 4325*d*.

Hydrocarbon synthesis catalysts were regarded as ''complex-action'' catalysts, combining the two functions of hydrogenation and polymerization. Two-component catalysts were prepared contg. Co, Ni, or Fe for the hydrogenating action; ThO_2, SiO_2, Al_2O_3, or ZnO as polymerization components. Co-ThO_2, Co-SiO_2, and Co-Al_2O_3 were particularly active catalysts, optimum liquid formation occurring when the metal content of the catalyst was 75% by wt.

10887. Roginskiĭ, S. Z. **Pressure and concentration isotherms of poisoning of catalysts through blocking.** *Izvest. Akad. Nauk S.S.S.R. Otdel, Khim. Nauk* **1948**, 383-90.—*C.A.* 44, 1314*i*.

A statistical theory of the dependence of the activity, A, of a catalyst on the equil. pressure p of the poison in the vol. was developed for a nonhomogeneous surface, and ordered distribution of the poison over the surface. Two cases were considered: blocking began at the most active points on the surface or at the least active points. For any nonexponential distribution, isobars and isosters of A were exponential functions of the temp. When blocking began at the least active points, and spread gradually in the direction of the controlling zone, A first remained unchanged over a wide range of p.

10888. Roginskiĭ, S. Z. **Poisoning of catalysts through blocking in uncorrelated adsorption of the poison.** *Izvest. Akad. Nauk S.S.S.R. Otdel. Khim. Nauk* **1948**, 493-502.—*C.A.* 44, 1315*d*.

In the case when the sequence of the adsorption was independent of the distributions $p(E)$ and $p(k)$, of the chem. reaction activation energy E and rate const. k over a nonhomogeneous catalyst surface, the integrated catalytic activity was expressed by a special function of the amt. of poison adsorbed. Comparison of the wt and concn. isotherms should permit the establishment of the character of the adsorption of the poison. The independence of the poison distribution of E leads to a distribution irrespective of the source of the linear poisoning law. Isobars of poisoning were derived from the isotherms, for the case of a homogeneous surface, and a nonhomogeneous surface with an exponential power, or uniform distribution of Q.

10889. Roginskiĭ, S. Z. and Tselinskaya, T. F. **Experimental test of the supersaturation theory. III. Low-temperature oxidation reactions on nickelous oxide.** *Zhur. Fiz. Khim. (J. Phys. Chem.)* 22, 1360-73(1948).—*C.A.* 43, 2498*h*.

NiO catalysts were prepd. by heating $NiCO_3$ at different CO_2 pressures. These catalysts accelerated the oxidation of CO by O_2 at room temp. below 2 mm Hg. For very active catalysts, the rate v of oxidation decreased during one expt. according to $v = v_0 \exp(-aq)$, q being the amt. of oxidized and v_0 and a consts. For less active catalysts, v decreased as in a reaction of the first order. At 160°C the catalysts worked indefinitely. Neither O_2 nor CO affected the activity at room temp. The rate of adsorption of CO was too slow to account for the rate of oxidation. $NiCO_3$, 33% of which was transformed into NiO, was as active as pure NiO.

10890. ROTINYAN, A. L.; DROZDOV, B. V., AND KOGAN, T. M. **Kinetics of the displacement reaction on Raney nickel and nature of the activity of a skeleton catalyst.** *Zhur. Priklad. Khim.* 21, 810-15(1948).—*C. A.* 43, 928*c*.

Rates of displacement by Raney Ni of Cu from a soln. similar to a Ni-refining bath were detd. with different prepns. of the Ni powder. An alloy of the compn. $NiAl_3$ was made by fusion of pure Ni and Al, cooled rapidly, and leached cold in alkali, changed several times. The resulting pyrophoric fine Ni powder contained up to 0.6% Al. Its high activity in the reaction $Ni + Cu^{++} \rightarrow Ni^{++} + Cu$ was not detd. significantly by its B.E.T. surface area (electrolytic Ni powder was 0.8 m^2/g). A decisive factor, was no doubt, presence of H_2 in the Raney Ni. In expts. at 70°C, with 2 equivs. Ni per equiv. Cu, samples rich in H_2 carried the reaction practically to completion.

10891. RUBINSHTEIN, A. M. AND PRIBYTKOVA, N. A. **Effect of thiophene on nickel catalysts for hydrogenation and dehydration of cyclic hydrocarbons.** *Doklady Akad. Nauk. S. S. S. R.* 61, 285-8(1948).—*C. A.* 42, 8452*b*.

Ni-MgO catalysts, prepd. by sintering of NiO+MgO mixts. under controlled conditions, were poisoned by treating 3-g portions of the catalyst with 10 mg C_4H_4S in cyclohexane soln., each treatment retaining 1.0 mg S per g of catalyst. The activity *A* was tested (batches of 3 g, height of catalyst layer 50 mm, diam. 12 mm) in hydrogenation of C_6H_6 with excess H_2 at 120°, 140°, and 160°C and in dehydrogenation of cyclohexane at 300°, 325°, and 350°C. In dehydrogenation, *A* changed little (~63%) up to about 3 mg S, then decreased with further increasing S down to about 20% with 7 mg S.

10892. RUSSELL, ALLEN S. AND STOKES, JOHN J. JR. **Heat stability of molybdena-alumina dehydrocyclization catalysts.** *Ind. Eng. Chem.* 40, 520-4(1948).—*C. A.* 42, 4437*h*.

Al_2O_3-MoO_3 catalysts were heated (500°-800°C) in air for 16 hrs or in steam for 6 hrs, and the effect on their activity was detd. as a function of type, area, and MoO_3 concn. The activity was estd. by degree of conversion of n-C_7H_{16} to PhMe under standardized conditions, and yields of coke, gases, and liquid olefins were also detd. Surface areas were detd. by adsorption of C_4H_{10} at 0°C. Activated Al_2O_3 of the "low-silica H" and "F" types showed catalytic activity stable towards loss of area on heating until the area was just sufficient to accommodate the MoO_3 in a surface monolayer; thereafter activity decreased linearly with loss in area.

10893. SAKHAROV, B. A. AND DURYNINA, L. I. **Catalytic oxidation of methanized city gas (mixture of methane and hydrogen).** *Doklady Akad. Nauk S. S. S. R.* 63, 289-91(1948).—*C. A.* 43, 2403*d*.

Degrees of oxidation of CH_4 and (CH_4 + H_2) were detd. for a mixt. dild. with air to a 3-5-fold excess of O_2, passed over a 8-cm length of catalyst (24 ml) (0.63-0.06 m/sec., between 300° and 800°C), with the following catalysts on grog of 0.5-0.7 in. grain size: Fe_2O_3 10 + MnO_2 2, Pd 2, K_2O 2, and CuO 4 + MnO_2. Complete oxidation of CH_4 + H_2 was reached only on the activated contacts between 750° and 770°C.

10894. SAKHAROV, B. A. AND NIKOLAEVA, T. N. **Catalytic combustion of the exhaust gases of internal combustion engines on refractories.** *Bull. acad. sci. U. R. S. S., Classe sci. tech.* **1948**, 79-86(in Russian).—*C. A.* 42, 6515*h*.

Exhaust gases contg. CO 2.5, H_2 1.5%, with the CO:H_2 ratio varying between 2:1 and 1.4:1 (av. 1.6:1), amt. of hydrocarbons not over a few 0.1%, ratio O_2:sum of combustible gases = 4, were passed on grog catalysts, at 300° and 500°C. The grog catalysts, grain size 5-7 mm, were activated with Fe, Mn, and Cu as nitrates, converted into oxides by firing at 500°C, and with Pd as chloride, reduced in H_2, then oxidized in O_2 and fired at 500°C. On nonactivated grog, the degree of combustion *y*, at low velocities was 17% at 300° and 37% at 500°C; *y* was nearly 100% with catalysts activated with either Fe + Mn, Cu + Mn, or Pd. Under conditions of complete inactivity of the carrier, the ratios of the catalytic activities of the activators themselves were: (Cu + Mn) : Pd: (Fe + Mn) = 1:0.88:0.03 at 300°, and 1:0.83:0.57 at 500°C.

10895. SAVAGE, ROBERT H. **Poisoning of platinum catalysts at high temperatures.** *J. Chem. Phys.* 16, 237-40(1948).—*C. A.* 42, 3649*b*.

Poisoning films of exceptional thermal stability were formed on a Pt catalyst when it was heated in hexamethyidisiloxane vapor at pressures of about 0.001 mm. These films prevented the combination of H_2 and O_2 at low pressures and were not removed until heated to about 1440°K in the presence of H_2 or to higher temps. in O_2.

10896. SCHAY, GEZA. **The catalytic decomposition of ammonia on copper and platinum surfaces.** *Hung. Acta Chim.* 1, No. 3, 1-6(1948).—*C. A.* 43, 8827*g*.

It was proposed that the NH_3 decompn. took place in the weakly adsorbed NH_3 layer and was retarded by the strongly ad-H_2, but the model must be completed by the following: Similarly to the adsorption of H_2, the NH_3 occupied 2 adjacent places when adsorbed, and became anchored by 2 of its H atoms, the remaining NH radical pointing away from the surface. The decompn. was the reaction of two such neighboring radicals forming N_2 and H_2 and leaving 4 adsorbed H atoms on the surface.

10897. SCHUMAN, S. C. **The role of the carbides of iron in the Fischer-Tropsch synthesis.** *J. Chem. Phys.* 16, 1175(1948).—*C. A.* 43, 1636*a*.

Equil. consts. were calcd. for the reactions: $Fe_2C + (2n-1)H_2 + (n-1)\ CO = C_nH_{2n} + 2Fe + (n-1)H_2O$, and $Fe_2C + 2nH_2 + (n-1)CO = C_nH_{2n+2} + 2Fe + (n-1)\ H_2O$, for n = 2 or 8, at 500°K and 600°K. The results indicated that the formation of hydrocarbons from Fe_2C was thermodynamically possible under the conditions of the Fischer-Tropsch synthesis.

10898. SCHWAB, GEORG-MARIA AND KARATZAS, ALEXANDER. **The catalytic action of salt pairs.**

J. Phys. & Colloid Chem. 52, 1053-60(1948).—*C. A.* 42, 6628*c*.

The catalytic decompn. of C_2H_5Cl was studied kinetically on surfaces of $BaCl_2$, $MnCl_2$, $PbCl_2$, and 3 binary systems of 2 of these components comprising a mixed crystal, a eutectic, and a compd., at atm. pressure and between 330° and 380°C. The log of the first term of the Arrhenius equation was a linear function of the activation energy. The eutectic $PbCl_2$-$MnCl_2$ (70 mol. % $PbCl_2$) gave results indicating an additive mixed catalyst; in the mixed crystal $BaCl_2$ slight promotion was observed.

10899. SCHWAB, GEORG-MARIA AND PESMATJOGLOU, SOTERIA. **Transitory poisoning of nickel catalysts.** *Festskr. J. Arvid Hedvall* 1948, 533-40.—*C. A.* 42, 6218*a*.

Expts. were run on the dehydrogenation of HCOOH vapor, detg. the activation energy *q*, and *B* (the activity const.) using NiS, NiSe, NiTe, NiAs, NiSb, and NiBi compds. all of which crystd. in the η phase. Comparative expts. were run with Ni compds. in the α-phase, contg. 1 atom % of S, Se, Te, As, Sb, and Bi. It was found that H_2S, H_2Se, etc. were evolved in the HCOOH vapor indicating that the catalysts did not remain unchanged. No systematic variation of *q*, with either the type or percentage of poison, was observed. Values of *B* plotted as a function of *q* for each poisoned catalyst and pure Ni showed in every case an approx. straight line.

10900. SCHWAB, GEORG-MARIA AND PESMATJOGLOU, SOTERIA. **Metal electrons and alloy catalysis. The system gold-cadmium.** *J. Phys. & Colloid Chem.* 52, 1046-53(1948).—*C. A.* 42, 6628*a*.

The two consts. of the Arrhenius equation were measured for the dehydrogenation of gaseous HCOOH with Au-Cd as catalyst. The activity increased with increasing activation energy, as did the Brinell hardness of the alloys. The true energy of activation increased with the α-phase with increasing electron concn. up to a limiting value; in the β-and ϵ-phases it was lower, but in the γ-phase there was a sharp max.

10901. SCHWARZKOPF, PAUL. **The theory of sintering.** *Powder Met. Bull.* 3, 74-87(1948).—*C. A.* 43, 982*b*.

Sintering progressed in 3 steps which may be partly overlapping: formation of point contact between adjacent powder particles, laterial growth to larger contact areas, and disappearance of disconnected pores. In all 3 stages, the observed changes were considered stabilization of the atom arrangement. The formation of point bonds resulted in the replacement of free surfaces with transition layers in which the atoms had lost their high mobility. Compact bond (green strength) was explained by crystn. taking place across the transition layers connecting the particles at the contact areas.

10902. SEELIG, HERMAN S. AND MARSCHNER, ROBERT F. **Production of synthesis gas by catalytic decomposition of methanol.** *Ind. Eng. Chem.* 40, No. 4, 583-6(1948).—*C. A.* 42, 4328*i*.

CH_3OH decompn. over a supported catalyst of Cu and NiO was employed to produce about 250 ft^3 per hr of a synthesis gas having a H_2:CO ratio of 2. The only by-products were traces of CO_2 and hydrocarbons, and carbon. The catalyst was regenerated by periodically burning off the deposited carbon. Operation of the service unit for 550 hrs did not impair the catalyst.

10903. SELWOOD, P. W. **Valence inductivity and catalytic action.** *Pittsburgh Intern. Conf. on Surface Reactions* 1948, 49-51.—*C. A.* 42, 7607*i*.

The supported oxides of the transition group followed the Curie-Weiss law and thus could be considered as magnetically dil. The oxides of Cr, Ni, and Mn, supported on γ alumina, were studied. The susceptibility per g of Cr greatly increased when the concn. of Cr decreased; the curve showed a crit. point in the neighborhood of 9%. The catalytic activity of the chromia-alumina system during decyclization of heptane depended on the dispersion state of Cr and the magnetic susceptibility was a quant. measure of dispersion. The susceptibility curve for supported Ni, although similar to that of Cr, had a less pronounced crit. point. In the case of Mn, the Weiss const. and the Curie const. changed rapidly.

10904. SELWOOD, P. W. AND DALLAS, NICK. S. **Susceptibility isotherms for supported copper oxide.** *J. Am. Chem. Soc.* 70, 2145-7(1948).—*C. A.* 42, 8597*h*.

Catalysts prepd. by the impregnation of γ Al_2O_3 (surface area 200 m^2/g) with $Cu(NO_3)_2$, ignition at 390°C for 24 hrs showed a marked increase in magnetic susceptibility at 10-11% Cu. The susceptibility of the reduced catalysts dropped substantially to zero, while that of the reoxidized samples was as high or higher than the original value. Catalytic activity of the catalysts, dild. with γ Al_2O_3 to a const. concn. of 3.2% Cu, was detd. for the dehydrogenation of iso-PrOH. At low concns. of Cu, the susceptibility followed the Curie-Weiss law. The catalyst with the more highly dispersed Cu showed the greater catalytic activity.

10905. SIROTKIN, G. D. **Deterioration in service of vanadium catalysts used for oxidation of sulfur dioxide.** *Zhur. Priklad, Khim. (J. Applied Chem.)* 21, 245-8(1948).—*C. A.* 43, 2744*e*.

Fe-Sb-V catalyst, from various shelves of a contact app. after prolonged service and fall of activity, was tested for bulk wt, vol. contraction, loss of V_2O_5, loss of Sb_2O_3, accumulation of Fe_2O_3, of SO_3, and of As_2O_3, the ratio V_2O_5/V_2O_4, the rate const. of oxidation of SO_2 (for each 10° between 420° and 480°C), and the apparent activation energy in that temp. range. Losses of activity ranged from 47 to 96%.

10906. STORCH, H. H. **Review of development of processes for synthesis of liquid fuels by hydrogenation of carbon monoxide.** *Chem. Eng. Progress* 44, No. 6, 469-80(1948).—*C. A.* 42, 5200*h*.

The salient features of all processes were collected in a single table, so as to facilitate comparisons of operating temps., pressures, space-time yields, product distributions, and steel requirements.

10907. Stowe, J.M.; Marshall, E.E.; Nickel, L.L., and Greenwood, R.S. **Alumina cracking catalysts.** *Petroleum Processing* 3, 317-24(1948).—*C.A.* 42, 9138*g*.

Kerosene was cracked over activated bauxite and activated alumina impregnated with compds. of Mg, B, Si, and F. Fe compds. in bauxite were deleterious, since they retarded the formation of aromatic compds., and used up the feed stock to produce gas and carbon deposit. Activated alumina, which contained practically no Fe, gave better yields of higher-quality gasoline than the best bauxites. Of the compds. added to the activated alumina, magnesia, chromium fluoride, and zinc fluoride gave high yields of liquid olefins; magnesium fluoride gave gas of increased density; boric acid, ammonium fluoborate and fluosilicic acid gave high conversion rates. Best results were obtained with an activated alumina contg. about 3% silica.

10908. Tatievskaya, E.P.; Chufarov, G.I., and Antonov, V.K. **Kinetics of reduction and of dissociation of manganese oxides.** *Izvest. Akad. Nauk S.S.S.R., Otdel, Tekh. Nauk* 1948, 371-83.—*C.A.* 42, 6624*h*.

Equil. and velocity of dissocn. and of reduction to MnO by H_2 were detd. for powders of MnO_2, Mn_2O_3, and Mn_3O_4, of B.E.T. surface areas 2.31, 0.444, and 0.444 m^2/g, resp. Exptl. equil. pressures for Mn_2O_3 at 1000°, 1050°, 1100°K, from the dissocn. and the oxidation side, gave 3.0 and 3.7, 10.0 and 14.5, 28.0 and 46.0, as against the calcd. 3.98, 10.98, 27.60 mm Hg; for MnO_2 at 700°K, from the dissocn. side (the reverse oxidation did not take place), 3.6 as against the calcd. 3.52. The apparent activation energies E_d were for MnO_2 38.3 kcal/mole, for Mn_2O_3~60 kcal/mole. The velocity of reduction of MnO_2 to MnO between 300° and 500°C at an initial p_{H_2} 200 mm, fell sharply with the progress of the reaction at its initial stages.

10909. Tebboth, J.A. **The decomposition of carbon monoxide by nickel catalysts. The reaction mechanism between 250° and 450°C.** *J. Soc. Chem. Ind.* 67, 62-6(1948).—*C.A.* 42, 5319*i*.

Unsupported and unpromoted Ni catalysts (from pptd. $NiCO_3$) showed little activity for the decompn. of CO between 250° and 450°C. The presence of thoria and kieselguhr in a Ni catalyst prepd. from the pptd. $NiCO_3$ caused a marked increase in the rate of decompn. of CO. Elementary carbon formation occurred in Ni catalysts at all temps., being least at 250° and greatest at 325° to 350°C. The Ni of such promoted and supported catalysts was converted almost quantitatively to Ni_3C at 250°C. Above this temp. carbide formation was incomplete. Decompn. of Ni_3C, in the presence of thoria and kieselguhr, occurred above 250°C and was rapid at 300°C.

10910. Teichner, Stanislas. **Development of the specific surface of Fischer catalysts during reduction.** *Compt. rend* 227, 478-80(1948).—*C.A.* 43, 27*b*.

Surface detns. were made (N_2 adsorption isotherms at - 195°C and C_4H_{10} adsorption isotherms at 0°C) on pptd. Ni-promoter-kieselguhr catalysts. The various treatments, wt loss (%) and surface (m^2/g) were, resp.: (1) evacuation at 20°C for 26 hrs, 4.3, 28; (2) evacuation at 180°C for 16 hrs, 11.0, 39; (3) reduction with H_2 at 450°C for 18 hrs and evacuation at 180°C for 48 hrs, 22.8, 87. The mean pore diam. of the unreduced catalyst was 18 A. The increase in specific surface was not due to a laminated structure, but to holes caused by the loss of volatiles.

10911. Tolley, I.G. **Catalytic oxidation of sulfur dioxide on metal surfaces. I.** *J. Soc. Chem. Ind.* 67, No. 10, 369-73 (1948).—*C.A.* 43, 5910*g*.

The metal surfaces studied were mild steel, Al-sprayed steel, and aluminized steel. The presence of water vapor inhibited catalytic oxidation on all 3 surfaces. Catalytic activity of mild steel increased considerably on exposure; Al-sprayed steel reached a max. in 12 hrs; aluminized steel showed const. activity throughout the test. Coating steel with Al considerably reduced the rate of catalytic oxidation of SO_2.

10912. Topse, Haldor F.A. and Nielsen, Anders. **The action of vanadium catalysts in the sulfur trioxide synthesis.** *Trans. Danish Acad. Tech. Sci. No.* 1, 3-17(1948)(in English).—*C.A.* 42, 7946*b*.

K, Rb, and Tl were far better activators than Na, Ba, and Cu, as the former produced compds. with a higher SO_3 content than pyrosulfates. These compds. of high SO_3-content melted at contact temps. and the V_2O_5 was dissolved in a highly viscous melt, which covered the carrier with a film. Addnl. activation resulted from the addn. of Fe and (or) Mn up to 15-20 mol % of the V.

10913. Trainer, R.P.; Alexander, N.W., and Kunreuther, Frederick. **Fluid-bed catalytic cracking plant.** *Ind. Eng. Chem.* 40, 175-82 (1948).—*C.A.* 42, 2750*g*.

Spent catalyst was freed from entrained and adsorbed hydrocarbons in an external stripper which permitted an exact measure of the stripping efficiency, avoided diln. of the oil vapors in the reactor with steam and permitted study of the stripping mechanism. Product vapors were freed from entrained catalyst by stone filters. The procedure for starting the unit was described in detail.

10914. Trambouze, Yves. **Chemical changes in Fischer catalysts during their preparation.** *Compt. rend.* 227, 971-2(1948).—*C.A.* 43, 2853*b*.

Catalysts were prepd. by several methods, and the chem. nature of the Ni was detd. by extn. with NH_4OH, with HNO_3, and by fusion.

10915. Tsutsumi, Shigeru. **Hydrogenation of saturated oil, and that of rice oil of high acid number with nickel oxide as catalyst. III. The mechanism of action of water and acid clay on nickel oxide.** *J. Nippon Oil Technol. Soc.* 1, No. 3, 17-18(1948).—*C.A.* 43, 5610*g*.

H_2O was adsorbed by the double bond of the C:O group to cause polarization. When acid clay and H_2O were used, the clay was electrically neg. and the polarization was still stronger. The presence of H_2O was unnecessary in an oil having a high acid no. The supply and demand of electrons between the C:O group and H_2O-acid clay cancel each other, and the effect at the double bond became less while the use of acid clay alone gave polarization at the double bond.

10916. Turkevich, John and Smith, Robert K. **Catalytic isomerization of 1-butene to 2-butene.** *J. Chem. Phys.* 16, 466-80 (1948).—*C.A.* 42, 5409*g*.

The interconversion of $H_2C:CHEt$ and $MeCH:CHMe$ was studied on the catalysts H_2SO_4, H_3PO_4, $Al_2(SO_4)_3$, $Cu_2P_2O_7$, $Al_2(SiO_3)_3$, $Ni_2(SO_4)_3$, Al_2O_3, Cr_2O_3 on alumina, ThO_2, silica gel, CaO, radioactive H_3PO_4, Na_2SO_4, $CuSO_4$, and $NaHSO_4$. This work was paralleled by the study of the exchange of H and T between C_4H_5, C_3H_6, and C_2H_4 and the catalyst H_2TPO_4.

10917. Viland, C.H. and Seth, James. **Catalytic cracking of heavy distillate.** *Oil Gas J.* 47, No. 3, 196-9(1948).—*C.A.* 42, 6094*d*.

The catalyst level was controlled at a low point in the stripper to prevent recirculation and thereby increase yields. Decreased coking and gas yields for a given level of conversion and a substantial decrease in the unit operating inventory of catalyst was accomplished. Test showed a decrease in the percentage of fines in the catalyst after long-time operation. Addn. of special fine-grind catalyst (0.20 μ particles) instead of replacement with regular grade was an advantage over the former procedure.

10918. Watt, George W. and Davies, Darwin D. **The catalytic activity of metals produced by the reduction of salts in liquid ammonia. I. Nickel.** *J. Am. Chem. Soc.* 70, 3753-5 (1948).—*C.A.* 43, 2536*a*.

Thermal decompn. of $Ni(NH_2)_2.2NH_3$ at 10^{-3}mm produced successively: $Ni(NH_2)_2$ (at 42.3°C), Ni_3N_2 (at 119.3°C), Ni_3N (at 362°C), and Ni and N_2 (at 585°C). The reduction of $NiBr_2$ and NiI_2 by solns. of K in liquid NH_3 at -33.5° yielded, resp., pyrophoric and nonpyrophoric Ni together with some $Ni(NH_2)_2.2NH_3$. Preliminary expts. on the catalytic activity of Ni from the reduction of Ni salts in NH_3 in the hydrogenation of allyl alc. were described.

10919. Weller, Sol; Hofer, L.J.E., and Anderson, R.B. **The role of bulk cobalt carbide in Fischer-Tropsch synthesis.** *J. Am. Chem. Soc.* 70, 799-801 (1948).—*C.A.* 42, 3550*f*.

Evidence showed that for Co catalysts, bulk Co_2C was neither an intermediate in the Fischer-Tropsch synthesis nor a catalytically active substrate for the synthesis. The presence of an extensive amt. of the carbide severely inhibited the reaction. Used catalysts showed no carbide by X-ray analysis, but samples carbided before synthesis showed carbide to be present after synthesis. The low-temperature unstable cubic Co produced by reduction of Co catalysts was not converted to hexagonal Co during the synthesis.

10920. Wenzel, Wilhelm. **The synol process. A new synthesis of aliphatic alcohols.** *Angew. Chem.* B20, 225-30 (1948).—*C.A.* 43, 994*d*.

The predominant production of alcs. from CO and H_2 was developed by using fused Fe catalysts permitting operating temps. as low as 180°C.

10921. Wilhelm, R.H.; Johnson, W.C.; Wynkoop, R., and Collier, D.W. **Reaction rate, heat transfer, and temperature distribution in fixed-bed catalytic converters. Solution by electrical network.** *Chem. Eng. Progress* 44, No. 2, *Trans. Am. Inst. Chem. Engrs.* 105-16 (1948).—*C.A.* 42, 2145*g*.

Fundamental heat-balance equations were presented. Data necessary for solution were discussed under the headings: (1) kinetics and thermo-dynamics of the reaction, (2) solid-gas convection heat and mass-transfer coeffs., and (3) thermal cond. of granular media. A semiempirical correlation for estg. the cond. of granular media was presented. A method for rapidly analyzing thermal problems in catalytic reactors by means of an elec. network is described. The network depended upon the math. analogy between Fourier's law of heat cond. and Ohm's law of elec. cond.

10922. Wocasek, Joseph J. and Koch, John R. **Fluoride catalysis at 175°C of the reaction: glycerol plus fatty acid.** *J. Am. Oil Chemists' Soc.* 25, 335-7 (1948).—*C.A.* 43, 4030*g*.

SbF_3, ZnF_2, and CoF_2 of the 15 metallic fluorides studied were outstanding. SbF_3 was the most active, but in large amt. it caused decompn. and charring. With ZnF_2 the reactions of stearic, oleic, and linolenic acids after 15 hrs were 95, 94, and 92% completed; at least 3/4 of the diglycerides were converted to triglycerides. ZnF_2 caused the monoglyceride to form at a rate approx. 4 times that of the uncatalyzed reaction and the diglyceride at a 6-fold rate. Unsatn. and viscosity were not affected seriously in the presence of the fluorides except SbF_3. In uncatalyzed reactions the esterification of stearic, oleic, and linolenic acid proceeded at the same general rate. After 15 hrs the reactions were 72, 83, and 84% completed. resp.

10923. Woodward, L.A. and Glover, A.T. **Molybdenum oxide catalysts for the reduction of phenol to benzene.** *Trans. Faraday Soc.* 44, 608-16(1948).—*C.A.* 43, 2081*c*.

When MoO_3 was used at atm. pressure, the activity - time curves from 325° to 440°C showed an initial rise from zero to a max., indicating that the effective catalyst was formed from the trioxide by reduction. Samples of MoO_2 prepd. by complete reduction of the trioxide at 300° or 350°C were active when tested at 350°C. Dioxide similarly prepd. by reduction at 450°C was almost inactive at 350°C. Active dioxide was pyrophoric; inactive dioxide was not. Considerable quantities of O_2 were taken up by active dioxide on exposure to air, but the x-ray diagram was still that of MoO_2 without any MoO_3, and the material remains catalytically active.

10924. Wright, S.R.; Dimock, W.R., and Davis, S.G. **Evaluation of catalysts used in the synthesis of hydrocarbons.** *Can. Chem. Process Inds.* 32, No. 1, 53-4, 57 (1948).—*C.A.* 42, 2417*e*.

The methods used in evaluating Fischer-Tropsch catalysts on a semi-pilot-plant scale were given.

10925. Zelinskiĭ, N.D. **New syntheses of hydrocarbons from carbon monoxide.** *Doklady Akad. Nauk S.S.S.R.* 60, 235-7 (1948).—*C.A.* 42, 6510*g*.

Comparative kinetic studies of the rates of formation of hydrocarbons from CO + H_2, of formation of carbide in the reaction between CO and the catalyst, and of the reduction of the carbides by H_2 demonstrated that intermediate carbide formation played a role only on Fe catalysts, not on Co and on Ni. The Fischer-Tropsch reaction proceeded by way of the intermediate radical CHOH (CHOH + H_2 → H_2O + CH_2). Closely related to this mechanism was the catalytic hydrocondensation of CO with olefins to satd. and unsatd. aliphatic hydrocarbons, and the catalytic hydropolymerization of olefins to satd. and unsatd. aliphatic hydrocarbons. These reactions were detd. by intermediate formation of CH_2 radicals.

10926. Amiel, J.; Brenet, J., and Rodier, G. **Parallelism between the magnetic, catalytic, and depolarizing properties of samples of manganese dioxide used in cells of the Leclanché type.** *Bull. soc. chim. France* 1949, D507-10; *Colloques intern. centre natl. recherche sci., Polarisation matiere No.* 17, 140-3(1949).—*C.A.* 44, 6690*g*.

Comparisons were presented between "normal" and "activated" MnO_2, i.e. the form useful as a depolarizer in cells of the Lechanché type. The activation, indicated by an increase in depolarizing properties, was accompanied by a change in the dimensions of the lattice. Magnetic measurements showed a marked increase in the susceptibility. Similarly the catalytic power measured by the velocity of decompn. of oxygenated water, increased.

10927. Anderson, Robert B.; Hall, W. Keith; Krieg, Abraham, and Seligman, Bernard. **Fischer-Tropsch synthesis. V. Activities and surface areas of reduced and carburized cobalt catalysts.** *J. Am. Chem. Soc.* 71, 183-8(1949).—*C.A.* 43, 3273*h*.

The surface of a catalyst used in the synthesis was found to be heavily covered with hydrocarbon. Hydrogenation at 200°C removed 90% of these adsorbed hydrocarbons, and reduction with H_2 at 400°C restored the catalyst to the same condition as after the initial reduction. There was no evidence of sintering of the catalyst or of carbon deposition. Activity data for operation at 1 and 7.8 atms. were related to the adsorbed hydrocarbon film. Decrease in the accessibility of the surface of these catalysts either by deposition of excessive quantities of wax or by reduction of av. pore diam. by pelleting caused an increase in the fraction of methane and other light hydrocarbons and in some cases a decrease in activity. The surface area did not change appreciably when the Co in the catalysts was converted to cobalt carbide.

10928. Anderson, Robert B.; Krieg, Abraham, and Friedel, R.A. **Fischer-Tropsch synthesis-differential reaction rate studies with cobalt catalyst.** *Ind. Eng. Chem.* 41, 2189-97(1949).—*C.A.* 44, 2358*a*.

A pelleted Co:ThO :kieselguhr (100:18:100) catalyst was studied in a fixed-bed reactor (90 cm long bed) at atm. pressure and 186-207°C. The reactor contained a special tube for the removal of gas samples at 9 points along the length of the bed. About 5% A was added to the feed gas as a reference component. With all gas compns. the synthesis rate was high in the first 10% of the bed and lower and essentially const. in the remainder of the bed until the reactants were nearly completely consumed. The gas compns. in the bed in the region of const. synthesis rate varied considerably. CH_4 was formed by primary reactions as well as by hydrocracking of higher hydrocarbons, the latter being favored by high H_2 and hydrocarbon partial pressures.

10929. Anon. **A report on Houdriflow.** *Petroleum Processing* 4, 137-8(1949); *Petroleum Refiner* 28, No. 1, 110-12 (1949).—*C.A.* 43, 7217*h*.

The Houdriflow moving-bed catalytic cracking process differed from the Thermofor catalytic cracking: (1) The catalyst was transported from the bottom to the top of the unit by a flue-gas lift, making available a wide range of circulation rates; (2) catalyst-to-oil ratios in the range of 4:1 to 8:1 were used; (3) a simplified regenerator; and (4) a superimposed, self-supporting circular reactor and regenerating section made it necessary to lift the catalyst only once per cycle.

10930. Badger, E.H.M.; Griffith, R.H., and Newling, W.B.S. **The catalytic decomposition of simple heterocyclic compounds. I. Preparation and properties of molybdenum sulfide and nickel sulfide catalysts.** *Proc. Roy. Soc.* (London) A197, 184-93 (1949).—*C.A.* 44, 2357*e*.

The prepn. and properties of Mo disulfide and Ni subsulfide catalysts, used for the decompn. of simple heterocyclic compds., were described. Equil. between Ni sulfide, Ni subsulfide and metallic Ni were also examd. by magnetic measurements. The adsorption of H_2 and of the heterocyclic compds. was detd. on the various catalysts over a wide temp. range. Data were given for adsorption on Ni_3S_2 of H_2, thiophene, furan, tetrahydrothiophene, and tetrahydrofuran.

10931. Balandin, A.A. and Isagulyants, G.V. **Orientation of decahydronaphthalene and of cyclohexane molecules in dehydrogenation on oxide and on metallic catalysts.** *Doklady Akad. Nauk S.S.S.R.* 64, 207-10 (1949).—*C.A.* 43, 4551*d*.

Equal rates were obtained on a Cr_2O_3 catalyst (1.5 g) on asbestos (20% CrO_3 by wt), at a flow rate of 0.0092 mole/10 min. for the dehydrogenation of decahydronaphthalene (approx. equimol. mixt. of *cis* and *trans*) and of cyclohexane, measured by the amt. of (97-98%) H_2 evolved and expressed by % conversion p in 10 min. The Arrhenius straight lines log p against $1/T$ for dehydrogenation of decahydronaphthalene and cyclohexane were parallel (equal activation energies) and almost coincided. Dehydrogenation expts. were detd. on a Ni catalyst (20 g, 20 cm), at approx. the same rate of flow as on Cr_2O_3. Between 200° and 300°C, the Arrhenius lines for dehydrogenation of decahydronaphthalene and for cyclohexane were parallel (activation energy of 12.5 kcal mole), but the rate of dehydrogenation of decahydronaphthalene was roughly twice that of cyclohexane.

10932. Balandin, A.A. and Kukina, A.I. **Dependence of the specificity of catalysts on their genesis.** *Doklady Akad. Nauk S.S.S.R.* 64, 65-8(1949).—*C.A.* 43, 4087*d*.

Seven different prepns. of Cr_2O_3 catalysts (treated with H_2 at 400°C for 6 hrs) were tested in simultaneous dehydrogenation and dehydration of iso-PrOH, resp., to Me_2CO and $CH_2{:}CHMe$, in flow expts. at 0.2 ml/min., catalyst 4.5 ml. at 200°-550°C. Plots of the log of the degree of conversion of both reactions against 1/T°K were Arrhenius straight lines, giving the activation energies for the 7 prepns. in dehydrogenation of: 3.0, 4.6, 5.4, 5.4, 5.3, 7.8, 10.0 kcal; for dehydration, 5.3, 6.4, 7.6, 9.4, 10.5, 16.3, 14.8 kcal. By x-ray diffraction, all Cr_2O_3 catalyst heat-treated at 400°C were cryst.

10933. Bartholomé, E. and Sachsse, H. **Catalytic phenomena with aerosols.** *Z. Elektrochem.* 53, 326-31(1949).—*C.A.* 44, 2355*c*.

A synthesis-gas generator contained a burner for coal gas to form $CO + H_2$ and a Ni/MgO catalyst to convert residual CH_4 with H_2O into $CO + H_2$. Soot particles in the flame (diams. of about 2 μ) were nearly completely removed by reaction with H_2O catalyzed by Ni vapor originating from the catalyst bed or also from Ni salt solns. injected into the generator. Injection of solns. of alkali and alk. earth salts likewise suppressed the formation of soot.

10934. Bashkirov, A.N.; Kryukov, Yu. B., and Kagan, Yu. B. **Mechanism of the synthesis of hydrocarbons from carbon monoxide and hydrogen.** *Doklady Akad. Nauk S.S.S.R.* 67, 1029-31(1949).—*C.A.* 43, 9415*h*.

The reaction observed on Fe catalysts, $2\ CO + H_2 \rightarrow {:}CH_2 + CO_2$, in contrast to the reaction $CO + 2\ H_2 \rightarrow {:}CH_2 + H_2O$ occurring on Ni and Co, was interpreted as the sum of the second reaction and the subsequent reaction $CO + H_2O \rightarrow CO_2 + H_2$. Analyses of the gaseous products obtained on pptd. Fe catalyst with mixts. $CO{:}H_2 = 1{:}1$ in the presence of added H_2O vapor at 220-50°C, under atm. pressure and at space velocity ~ 100/hr corroborated this reaction scheme.

10935. Beck, Roland A. **Evaluation of fluid catalyst—development of laboratory scale units.** *Ind. Eng. Chem.* 41, 1242-3 (1949).—*C.A.* 43, 7217*d*.

A stirred unit and a baffled nonstirred unit were developed for evaluation of fluidized catalysts on a lab. scale. The stirred units were used where great flexibility in regard to reactant flow rates was desired. The nonstirred unit was less subject to mech. difficulties.

10936. Boreskov, G.K.; Ritter, L.G., and Volkova, E.I. **The heating-up temperature of vanadium sulfuric acid catalysts.** *Zhur. Priklad. Khim. (J. Applied Chem.)* 22, 250-60(1949).—*C.A.* 43, 8251*f*.

The lowest temp., T, of the gas mixt. that caused the temp. of the contact catalyst to rise spontaneously by at least 10°C, was detd. for mixts. contg. 7-95% SO_2 and 5-75% O_2. At const. O_2, an increase of SO_2 did not affect T; an increase of O_2 from 5 to 75% lowered T by 50°C. Pyrite roasting gas (SO_2 7, O_2 11%) had T of 423°C; the gas produced from S (SO_2 8.5, O_2 12.5%), T = 420°C. For mixts. of SO_2 with air, the optimum compn. was SO_2 14, O_2 18%, T = 410°C. T could be calcd. from the equil. of the reaction $V_2O_5 + SO_2 + SO_3 = 2VOSO_4$, if T was linked with the bend point of the curve of the log of the rate const. of the reaction $SO_2 + 1/2\ O_2 \rightarrow SO_3$ as a function of 1/T°K.

10937. Brötz, Walter. **Systematics of the Fischer-Tropsch catalysis.** *Z. Elektrochem.* 53, 301-6 (1949).—*C.A.* 44, 2358*d*.

The Fischer-Tropsch reaction: $CO + 2H_2 \rightarrow CH_2 + H_2O$ at atm. and 5-20 atm. gage pressure between 160° and 186°C was discussed. On tech. catalysts at pressures up to 10 atm. gage pressure the reaction rate was: $d[CO]/dt = k[H_2]^2/[CO]$, where k at 7 atm. gage pressure varied from 7.8×10^{-3} at 173° to 18.8×10^{-3} at 186°C, yielding an activation energy of 31 kcal/mole. At high pressures the reaction rate was: $d[CO]/dt = k_3([H_2]/[CO])(k_1[H_2]/(1 + k_2[H_2]))$. The CH_2 radicals were combined at the catalyst surface under formation of double bonds at the chains ends which were subsequently shifted by H exchange towards the center of the chains.

10938. Burtis, T.A.; Dart, J.C.; Kirkbride, C.G., and Peavy, C.C. **Economics of moving-bed catalytic-cracking processes.** *Chem. Eng. Progress* 45, 97-101(1949).—*C.A.* 43, 3180*b*.

When compared with the conventional Thermofor catalytic cracking design, the Houdriflow design, which had high catalyst to oil ratio, showed savings in investment, utility, and maintenance costs. Although catalyst attrition rates may be lower in the Houdriflow design than in the Thermofor Catalytic Cracking design, actual catalytic losses may be somewhat higher, depending upon the catalyst to oil ratios chosen.

10939. Butyagin, P. Yu. and Margolis, L. Ya. **Catalytic oxidation of hydrocarbons.** *Doklady Akad. Nauk S.S.S.R.* 66, 405-8 (1949).—*C.A.* 43, 6565*h*.

The proportions of the homogeneous and the heterogeneous rates of oxidation of C_2H_6, C_2H_4, and C_3H_6 by pure O_2 were detd. by simultaneous measurements of the temp. rise indicated by a thermocouple placed along the axis of the reaction vessel and one in contact with the wall coated with the catalyst. At low initial pressures, 0.1-10 mm Hg, with catalysts leading to deep oxidation (to CO_2 and H_2O) such as Pt on $BaSO_4$, (at 97°C) of MgO-Cr_2O_3 (at 300°C), the temp.-time curves showed a steep rise to a max., followed by gradual decrease.

10940. Caesar, C.H. **Catalytic effects in suspensoid cracking.** *Petroleum Processing* 4, 887-90 (1949).—*C.A.* 44, 1682*f*.

Product distribution indicated that this process was primarily a thermal one modified by typical catalytic reactions such as isomerization, H-transfer, polymerization, and intermol. condensation. Although the catalyst concn. was low (0.1% of that used in fluid catalytic cracking), it was essential to the process. Failure of the catalyst injector resulted in almost immediate shut-down.

10941. ČECH, JOSEF. **The chemical uses of methane.** *Chemie* (Prague) 5, 23-4(1949).—*C.A.* 46, 2781*g*.

CH_4 from coke plants was cracked to C_2H_2 in an elec. arc under 1.5 atm. and 1600°C. The semicom. partial oxidation of CH_4 to CH_2O in the presence of BaO_2 and O enriched with O_3, the combustion of CH_4 with NH_3 to form HCN by means of the catalyst Pt or silica gel, and the formation of CH_2Cl_2 from CH_4 and Cl_2 under actinic rays were also described.

10942. CHIRKOV, N.M. AND VERESHCHINSKII, I.V. **Ionic mechanism of the heterogeneous catalysis in the region of unimolecular adsorption. Depolymerization of paraldehyde in the gas phase under the action of acids.** *Doklady Akad. Nauk S.S.S.R.* 67, 317-20 (1949).—*C.A.* 43, 7801*e*.

Paraldehyde was depolymerized completely, in a 1st-order reaction, in the presence of acids (HCl, HBr, H_2SO_4, H_3PO_4) on quartz as carrier in the range 45°- 85°C and in the pressure range 5-80 mm Hg. With HCl and HBr, the reaction velocity at a const. surface area of the carrier ($2200\ cm^2$) was proportional to the pressure of the catalyst in the vapor phase.

10943. CHIZHIKOV, D.M.; FRENTS, G.S., AND TRATSEVITSKAYA, B. YA. **Mechanism and kinetics of the oxidation of lead sulfide by oxygen.** *Izvest Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* **1949**, 1352-60.—*C.A.* 45, 4536*e*.

The reactions (1) $PbS + 2O_2 = PbSO_4$, (2) $PbS + 3/2\ O_2 = PbO + SO_2$, and (3) $PbS + O_2 = Pb + SO_2$, proceeded practically to completion between 600° and 1200°K. Expts. were run with natural galenite ground to 0.060-0.074 mm, heated to 700°, 800°, or 900°C in a 450 ml/min. stream of a $N_2 + O_2$ mixt. with 1, 5, 10, 20, and 100% O_2, with direct analyses of the solid phase for $PbSO_4$, Pb, PbS, and PbO by the difference. At 800° and 900°C, with 5% O_2, the amt. of PbS decreased, and the amt. of PbO increased with time; the amts. of metallic Pb and of $PbSO_4$ first increased, passed through a max. at about 10 min., then fell. Expts. were also made with mixts. of galenite with $PbSO_4$, and of galenite with PbO in pure N_2.

10944. CONN, A.L. AND BRACKIN, C.W. **Cracking of high-sulfur stocks. Use of steam with natural catalyst.** *Ind. Eng. Chem.* 41, 1717-22(1949).—*C.A.* 43, 8656*e*.

In catalytic cracking with natural catalyst, the addn. of steam at different points had a retarding influence on the degree of poisoning caused by high-S stocks. Sufficiently large quantities of steam made it possible to maintain catalyst selectivity equal to that of fresh catalyst. Control of water, concn. of S in the rehydration, cracking, stripping, and regeneration zones, detd. the net poisoning in a complete cycle of operation.

10945. CORNUBERT, RAYMOND AND PHÉLISSE, JEAN. **New studies on Raney nickel and hydrogenation of α, β-unsaturated ketones.** *Compt. rend.* **229**, 460-2(1949).—*C.A.* 44, 1063*a*.

Reproducible catalysts of high activity were prepd.; their activity depended on the Ni content, the state of division, and extent of washing during prepn., etc. The prepn. of 2 of these, X20 (20%Ni) and X50(50%Ni), was described. With 5 g Ni involved in each case, 4 g PhCH:CHCO$_2$H in 100 ml EtOH at 1 atm. was hydrogenated with X20 in 7 min.; with X50 in 30 min.

10946. CREMER, ERIKA AND BALDT, RUDOLF. **New measurements of the catalytic dissociation of ethyl chloride for investigation of the relation between activation energy and activity.** *Z. Naturforsch.* 4a, 337-41 (1949).—*C.A.* 44, 8215*i*.

EtCl was dissocd. at temps. T, on chloride catalysts activated at temps. T_2. The order of the reaction $C_2H_5Cl = C_2H_4 + HCl$ and the relation between activity A and activation energy q in the Arrhenius equation were detd. First order const. reproduced the data up to about half decompn. of EtCl. Thereafter, the rate fell off owing to reversibility of the reaction. The catalysts $PbCl_2$, $BaCl_2$, $CoCl_2$, $NiCl_2$, $CaCl_2$, and $CdCl_2$ were preheated between 600°-900°K. The activation energies varied between 12 and 42 kcal/mol. and for a given catalyst usually increased linearly with T_2. All data showed an exponential relation between A and q.

10947. CROATTO, UGO. **Heterogeneous catalysis and reticular disorder of the catalyst.** *Ricerca Sci.* 19, 541-3(1949).—*C.A.* 45, 4123*i*.

In the catalyst system $(1 - p)CeO_2 + pLa_2O_3$ the no. of unoccupied anionic positions in the crystal lattices increased in proportion to p, but in $(1 - p)SrF_3 + pLaF_3$, the no. of new anionic positions increased with p. With 85 mol % CeO_2 and 15% La_2O_3 the energy of activation found was 30.16 kcal; 90 mol. % SrF_3 and 10% LaF_3 gave an activation energy of 21.02. With pure CeO_2 and LaF_3 the values were 30.62 and 22.85 kcal, resp. in the ranges 480°-700°C and 565°-700°C.

10948. DELEO, E.; INDOVINA, R., AND PARLATO, A. **Effect of deuterium oxide on the catalysis of hydrogen peroxide with solutions of colloidal platinum.** *Gazz. chim. ital.* 79, 451-3(1949).—*C.A.* 43, 8829*a*.

D_2O reduced the rate of decompn. of H_2O_2 by colloidal Pt; the concn. of H_2O_2 was always 0.05 N at 25°C. The water was replaced progressively by D_2O so that the same total vol. of reaction mixt. contained 0, 2.5, 5, 10, 20, and 40% D_2O, and the same concn. of colloidal Pt. The rate of decompn. (O_2 evolved) decreased with increase in the percentage of D_2O according to the relation: $K = (1/t)\,2.302 \log (A/(A - x))$, where K is the rate of decompn., t the time in min., A the ml of O_2 corresponding to complete decompn. (5.6), and x the cc. (760 mm and 0°C) of O_2 evolved in time t.

10949. DENT, F.J. AND HEBDEN, D. **Catalytic synthesis of methane as a method of enrichment in town-gas manufacture: with an account of Semi-scale experiments.** *Gas Research Board, Copyright Pub.* No. GRB 51, 41 pp. (1949); *Gas World* **130**, 1938-9(1949); **131**, 69-75; *Gas J.* **261**, 160-2, 167-9.—*C.A.* 44, 3236*g*.

Operating at a space velocity of 2000 vol. per vol. of catalyst per hr at atm. pressure, a gas with a heating value of 500 B.t.u. per ft^3 was produced, and at 20 atm. a gas of 700 B.t.u. The semiscale expt. was continued for at least 4 months without any appreciable deterioration in catalytic activity. The occurrence of difficulty at the high space velocity could be prevented by controlling the temp. of the surface of the Ni catalyst, by admitting steam when necessary, and by using a catalyst of suitable compn.

10950. D'HONT, M. AND JUNGERS, J.C. **The mechanism of heterogeneous catalysis. The activation of nitrogen by iron and nickel.** *Bull. soc. chim. Belges* 58, 450-9(1949).—*C.A.* 44, 9784*i*.

The catalyst (Fe or Ni) was heated to 175°C in the presence of HCN; after 30 min. the residual gas was removed and varying amts. of H_2 added at continually increasing temps.; the equil. mixts. were then analyzed. With Ni at 140°C after 1.5 hrs, there was present 94% NH_3, 1% CH_4, and 5% H, but after 15 hrs these were 7, 93, and 0%, resp. As the temp. increased, NH_3 decreased and CH_4 increased. The activation of N_2 seems to be the difficult stage in the catalytic synthesis of NH_3.

10951. EĬDUS, YA, T.; ZELINSKIĬ, N.D., AND PUZITSKIĬ, K.V. **Catalytic hydrocondensation of carbon monoxide with olefins. I. Hydrocondensation of carbon monoxide with ethylene.** *Izvest. Akad. Nauk S.S.S.R., Otdel, Khim. Nauk* 1949, 110-14.—*C.A.* 43, 4829*f*.

Mixts. of CO, H_2, and C_2H_4 were passed over a catalyst under atm. pressure at 190°-200°C mainly aliphatic hydrocarbons were formed. On a particularly active catalyst, a mixt. $1CO{:}2H_2{:}3C_2H_4$ gave, at a space velocity of 114-135, in 49 hrs, total oil 333-465 ml/m^3 total gas passed, or 33-49 ml oil/liter catalyst/hr, with a max. of 465.2 ml/m^3 or 49.2 ml/liter/hr, at a space velocity of 118; the yield of H_2O was 55-96 ml/m^3; the vol. ratio of light to heavy oil decreased during the operation from 1.42 to 0.85.

10952. ERDEY-GRÚZ, TIBOR. **Rate of hydrogenation in solutions and the mass of the catalyst.** *Nature* 163, 256-7(1949).—*C.A.* 43, 4551*c*.

Crotonic acid and Na cinnamate were hydrogenated in aq. soln. in contact with H_2 in the presence of Pd pptd. on finely dispersed $BaSO_4$. With moderate stirring the rate of H_2 absorption vs. the mass of catalyst showed a max. and min.; with vigorous shaking the rate was proportional to the amt. of catalyst. At low surface-vol. ratios, the addn. of NH_4Cl eliminated the max. and min. even with slow stirring.

10953. ERDEY-GRÚZ, TIBOR AND SZABÓ, JANOS. **Change of velocity of catalytic hydrogenations by the amounts of catalysts applied.** *Magyar Kem. Lapja* 4, 101-9 (1949).—*C.A.* 43, 8819*b*.

Crotonic and cinnamic acids were hydrogenated in the presence of finely dispersed Pd catalyst under application of different amts. of the catalyst. The hydrogenation was autocatalysed by the reaction product. The curve of reaction velocity obtained seemed to show a max. and a min. and definite correlation with the applied amounts of catalyst. The shape of this curve was significantly influenced by the presence of foreign ions and by change of ratio of the surface of the soln. to its vol.

10954. FUNASAKA, WATARU; YOKOKAWA, CHIKAO; HAYASHI, KATSUHIRO; KAWAMURA, TARO; FUJITA, HIDEO, AND SUGA, SOHEI. **Conversion of low-temperature tar into fuel oil. III. Catalytic reduction of aniline, pyridine, ethoxybenzene, and furfural under atmospheric pressure.** *J. Chem. Soc. Japan*, Ind. Chem. Sect., 52, 148-9 (1949).—*C.A.* 45, 2176*e*.

The catalytic reductions or decompn. and simultaneous hydrogenation of basic constituents of low-temp. tar, ethoxybenzene, and furfural were studied in H_2 under the atm. pressure between 400° and 500°C, with oxides or hydroxides of Fe, Mo, Co, Ni, and Cr as catalyzers. Aniline was converted to benzene with max. yield 76% when Fe_2O_3 was used, pyridine gave only traces of neutral oil.

10955. FUNASAKA, WATARU; YOKOKAWA, CHIKAO; HAYASHI, KATSUHIRO; KAWAMURA, TARO; FUJITA, HIDEO, AND SUGA, SOHEI. **Conversion of low-temperature tar into fuel oil. IV. Durability and regeneration of catalyzers of the iron family.** *J. Chem. Soc. Japan*, Ind. Chem. Sect., 52, 149-51(1949).—*C.A.* 45, 2176*f*.

The low-temp. tar consisting of neutral and acidic oils was reduced under atm. pressure between 400°C and 500°C by using catalyzers prepd. from Fe-Cr-kieselguhr, yellow ocher, etc. When the reduction was performed at 480°C with the yellow ocher from Niwasaka, Fukushima Pref., Japan, the low-temp. tar was easily converted to neutral and light oils and the catalyzers could be regenerated by repeated baking and reduction.

10956. GIOVANNINI, E. **Catalytic sulfurization of methane; preparation of carbon disulfide.** *Ann chim. applicata* 39, 671-81(1949).—*C.A.* 45, 9815*b*.

A mixt. of CH_4 and vapor of S was heated in a quartz tube at various temps. in presence and absence of catalysts. Without catalyst the yield of CS_2 rose fairly regularly to 54.4% (calcd. on CH_4) at 1050°C. With a W catalyst peak production was 61.5% at 650°C, falling to 34.3% at 750°C, with a Mo catalyst the peak was 69.4% at 850°C; with a mixed W-Cr catalyst the peak was 79.3%, also at 850°C.

10957. HALL, R.E. AND SMITH, J.M. **Design of gas-solid catalytic reactors.** *Chem. Eng. Progress* 45, 459-70(1949).—*C.A.* 43, 6471*h*.

Over-all effective thermal conductivities (K values) were found to be about 0.2 B.t.u./(hr)(ft)(°F) for the conditions employed in the integral reactor; K decreased as the tube wall was approached. There was little radial mixing of the gas in the reactor.

10958. HASKELL, VERNON C. AND HAMMETT, LOUIS P. **Rates and temperature coefficients in the hydrolysis of some aliphatic esters with a cation-exchange resin as the catalyst.** *J. Am. Chem. Soc.* 71, 1284-8 (1949).—*C.A.* 43, 6064*h*.

Sulfonated coal and two synthetic cation-exchange resins were used. The kinetics of the hydrolysis of methyl acetate, ethyl acetate, ethyl butyrate, ethyl caproate in 70% acetone were studied. The free energy of activation relative to the HCl-catalyzed reaction in each case increased almost linearly with chain length of the ester. The rates were lower than those for the HCl-catalyzed reaction and were accompanied by lower heats and entropies of activation for both methyl acetate and ethyl butyrate.

10959. HERGLOTZ, H. AND LISSNER, A. **Raney metals as desulfurization catalysts. I.** *Z. anorg. chem.* 260, 141-53(1949).—*C.A.* 44, 10474*a*.

Raney catalysts of Co and Cu were studied for conversion of org. S compds. (p-sulfanilic acid decompn. products) to H_2S. Cu was inactive. Co was active, resembling Pt on asbestos. Below 400°C the Co retained the S; above 400°C H_2 stripped off S as H_2S.

10960. HILL, FRED N. AND SELWOOD, P.W. **Structure and activity of supported nickel catalysts.** *J. Am. Chem. Soc.* 71, 2522-9(1949).—*C.A.* 43, 8831*d*.

Susceptibility isotherms were detd. for NiO supported on high-area magnesia (138 m^2/g), γ-alumina (230m^2/g), and rutile (126 m^2/g). The quant. reduction of the supported NiO by H_2, the sp magnetization (ferromagnetism) of the reduced Ni, and the measurement of catalytic activity were reported. The phenomenon of valence inductivity was shown to apply in these systems, leading to Ni oxidation states of 2, 3, and 4. The structure of Ni-γ-alumina catalysts was discussed and related to activity for the hydrogenation of C_2H_6.

10961. HOOG, H. **Selection and development of catalysts in industrial chemistry.** *Chem. Weekblad* 45, 433-41 (1949).—*C.A.* 43, 8074*c*.

The tech. requirements of a satisfactory contact catalyst were analyzed, special emphasis being placed on selectivity. Examples were: the catalytic cracking process, NH_3 oxidation with the aid of Pt-Rh alloy catalysts, and MeOH oxidation with Cu or Ag gauze catalysts.

10962. HUGHES, E.C.; STINE, H.M., AND DARLING, S.M. **Coprecipitated chromia-alumina catalysts for naphtha reforming with hydrogen.** *Ind. Eng. Chem.* 41, 2184-8 (1949).—*C.A.* 44, 827*c*.

The performance of a copptd. chromia-alumina catalyst agreed with published results with molybdena-alumina catalysts. The catalyst was prepd. with careful control of pH during pptn. and of the chromia-alumina mole ratio. The catalyst was resistant to high temps. and to the presence of water vapor and org. S compds. The use of moderate H_2 pressures resulted in an appreciable increase in liquid yield, and a corresponding decrease in carbon laydown. The process proved to be self-sufficient in H_2. Increase in the H_2 pressure had a repressive effect on the reactions.

10963. JUSTAT, A. **Fluid catalysts and a forgotten Polish patent.** *Przemyst Chem.* 28, 16-19 (1949).—*C.A.* 43, 8074*d*.

A description was given of fluid catalysis and its application in U.S. industry. A summary was also given of prewar Polish patent 27,665 on fluid catalysis.

10964. KAGAN, M. YA. AND FRIDMAN, S.D. **Causes of the inactivity of copper and iron in the hydrogenation of benzene.** *Doklady Akad. Nauk S.S.S.R.* 68, 697-9(1949).—*C.A.* 44, 917*a*.

The contrast between the activity of Fe and Cu in the hydrogenation of olefins, and their inactivity for C_6H_6 was interpreted by energy considerations. Chemisorption of either an olefin or of C_6H_6 was accompanied by the rupture of a π -bond. Experimentally, pure Cu and Fe on Al_2O_3 proved inactive in the hydrogenation of C_6H_6 at 150°-250°C, and in the dehydrogenation of cyclohexane at 270°-320°C. The same catalysts were found active both in the hydrogenation and dehydrogenation of cyclohexene which differed from C_6H_6 by the absence of resonance. The inactivity of Cu and Fe towards C_6H_6 was due to the energetic improbability of formation of the intermediate adsorption complex.

10965. KAGAN, M. YA. AND SHACHEGLOVA, N.A. **Kinetics and mechanism of the reactions of catalytic hydro-dehydrogenation. III. Dehydrogenation of cyclohexane on a platinum catalyst.** *Zhur. Fiz. Khim.* 23, 1203-14 (1949).—*C.A.* 44, 1313*c*.

Cyclohexane or its mixts. with benzene, H_2, or N_2 were passed through plugs of the catalysts (3g 4% Pt on pumice) used for conversion of cyclohexene. The vol. of H_2 liberated and the ratio cyclohexane: benzene in the condensate were detd. The efficiency of the catalysts did not change at 260°C, but at 292°C it fell after each expt. and the catalyst had to be regenerated by $N_2 + 2\% O_2$ at 350°C and then by H_2 at 290°C. The rate of dehydrogenation was 1/4500 that of disproportionation of cyclohexane; hence, if cyclohexane was an intermediate in the reaction cyclohexane → benzene, it was consumed in the disproportionation rather than in the dehydrogenation reaction.

10966. KARPACHEVA, S.M. AND ROZEN, A.M. **Oxygen^{18} as indicator in heterogeneous catalysis.** *Doklady Akad. Nauk S.S.S.R.* 68, 1057-60 (1949).—*C.A.* 44, 917*e*.

The fate of O^{18} incorporated into the catalyst by the exchange $H_2O^{18} + MO^{16} \rightleftarrows H_2O^{16} + MO^{18}$ was studied: (1) surface combustion of H_2 on grog, Fe_2O_3, quartz, or dunite, (2) oxidation of CO on MnO_2, (3) dehydration of EtOH on Cr_2O_3 10% + Al_2O_3 90% or on kaolin. The amts. of O^{18} incorporated in the catalyst were: (1) in quartz, 5, in grog, Fe_2O_3, and dunite, 14-17 γ/g, (2) 157-250 γ/g. In all 3 reactions, significant amts. of O^{18} were found in the products. All 3 catalysts were found to promote the exchange (4) $H_2O^{18} + 1/2\ O_2{}^{16} \rightleftarrows H_2O^{16} + 1/2\ O_2{}^{18}$, in the same order of activities as in reactions (1), (2), and (3). Exchange by a purely adsorptive mechanism was observed with a CuO catalyst, inactivated for the $H_2O^{18} + MO^{16}$ exchange by repeated treatment with H_2O.

10967. KOCH, HERBERT AND FILFERT, WILHELM. **Breaking down and building up of hydrocarbons under hydrogenating conditions over the cobalt catalyst used in Fischer-Tropsch syntheses.** *Brennstoff-Chem.* 30, 213-18 (1949).—*C.A.* 43, 7664*i*.

Various pure hydrocarbons in vapor form mixed with H_2 and CH_4 were recirculated at 200°C over a reduced Co catalyst used for Fischer-Tropsch syntheses.

10968. KODAMA, SHINJIRO; FUKUI, KENICHI, AND TESHIMA, TATSURO. **Errors in the temperature determination of a catalyst layer with jacketed thermo-couples.** *Repts. Inst. Chem. Research Kyoto Univ.* 17, 105-8(1949).—*C.A.* 46, 9963*b*.

The temp. distribution of a thermojunction moved from one end to the other of its jacket along the central axis was theoretically developed from the heat conds. of the inner stuffing, jacket material, and external film as a function of the tube length. The postulate was verified by detg. with jacketed thermocouples the temp. of ZnO-CrO_3 catalyst stuffed in a glass tube through which C_2H_2 gas was passed.

10969. KÖLBEL, HERBERT AND ENGELHARDT, FRIEDRICH. **The reaction mechanism of the Fischer-Tropsch synthesis.** *Erdol u. Kohle* 2, 52-9 (1949).—*C.A.* 43, 4828*i*.

An Fe catalyst (100 Fe, 0.5 Cu, 0.25 K_2CO_3) was studied under 4 different contact conditions: carbidic, 24-hr treatment with CO at 270°C; metallic, subsequent 24-hr treatment with electrolytic H_2 at 270°C; oxidic, reduction of catalyst with H_2 at 270°C; synthesis, treatment for 100 hrs at 1 atm. at 230°C, $CO/H_2O = 1:2$, space velocity 100. The optimum synthesis for a Co catalyst was below 180°C, while that for Fe was considerably higher. Expts. with a Co catalyst showed that lowering the space velocity from 100 to 10 at 180°C and changing the H_2/CO ratio from 2:1 to 2:3.55, H_2O concn. decreased progressively and almost parallel increase of CO_2 resulted.

10970. KÖLBEL, HERBERT; ACKERMANN, PAUL; JUZA, ROBERT, AND TENTSCHERT, HANS. **Reaction mechanism of the Fischer-Tropsch synthesis. II. Investigation of iron catalysts in the hydrogenation of carbon monoxide.** *Erdöl u. Kohle* 2, 278-85 (1949).—*C.A.* 43, 8117*a*.

Fe catalysts prepd. from $Fe(NO_3)_3$ (initially α-Fe_2O_3), promoted with Cu (0.001 to 0.16%), K_2CO_3 (0.0 to 0.25%), and $BaCO_3$ were investigated analytically, catalytically, magnetically, thermomagnetically, by means of x-rays, and by adsorption measurements. After exposure to synthesis, the catalyst consisted principally of magnetite (Fe_3O_4) and always contained Fe carbide. No free Fe was present. After longer synthesis exposure a second thermally stable carbide either replaced the first or was formed in addn. High alkali content, higher gas pressures, and CO content in combination with longer synthesis exposure favored the formation of Fe_2C stable up to 400°C.

10971. KÖLBEL, HERBERT AND LANGHEIM, ROBERT. **Reaction mechanism of the Fischer-Tropsch synthesis. III. Carbide formation on iron catalysts during carbon monoxide hydrogenation.** *Erdöl u. Kohle* 2, 544-50 (1949).—*C.A.* 44, 3235*h*.

Fe_2C was formed by treating pure, paramagnetic α-Fe_2O_3 prepd. from $Fe(CO)_5$ and O_2 with CO at a rate of 4 liters/hr at 265°C. Some elementary carbon was also deposited. In another sample, carbidic carbon was hydrogenated for 20 hrs at 265°C and the remaining carbon burned in O_2. Cu acted as a reduction accelerator both in carbide formation and Fe catalysts. Presence of both Cu and alkali appreciably increased rate of formation of both carbide and elementary carbon. Alkali catalyzed both reactions directly, and Cu did it indirectly through accelerating the reduction of Fe_2O_3.

10972. KRASS, WALTHER. **The catalytic ammonia oxidation on oxide contacts.** *Z. Elektrochem.* 53, 320-5 (1949).—*C.A.* 44, 2711*d*.

The formation of N_2O at 300°C in NH_3-air-O_2 mixts. on CoO, MnO, and NiO catalysts contg. excess "active" O was studied as a function of the active-O content of the catalysts and as a function of the O_2-NH_3 ratio. The amount of N_2O formed was proportional to the active-O concn. Up to 90% of the NH_3 was converted into N_2O. Analogous results were obtained with Fe_2O_3, Bi_2O_3 + KOH, and BaO_2 + CuO as catalysts. The catalytic action was due to O atoms.

10973. KRAUSE, A. **Mystery of contact catalysts.** *Przemyst Chem.* 5(28), 558-63(1949).—*C.A.* 45, 10019*i*.

Contact catalysts were looked upon as transitory radical structures, typified by a marked increase of paramagnetism and by a large amt. of energy. Free radicals were very reactive because their outermost electronic group did not form a complete octet. To set a catalytic reaction in motion, it was necessary for the contact catalyst to react with a foreign mol. *A* to give an activated radical *KA*, which in turn deformed or activated another mol. *B*. The radicals *A* and *B* formed a new compd. (*AB*), which then separated from the catalyst *K*.

10974. KRAUSE, A.; APPELT, K., AND KOTKOWSKI, ST. **Use of the benzidine reaction in the study of catalytic properties of metallic oxides.** *Przemyst Chem.* 5(28), 351-6(1949).—*C.A.* 45, 10019*a*.

The catalytic oxidation of benzidine by H_2O_2 in the presence of ferromagnetic and diamagnetic ferric oxides was used to study the catalytic properties of a no. of metallic oxides. A close dependence was noted between the occurrence of a pos. benzidine reaction and the ferromagnetism of ferric oxides. Dry FeOOH heated above 240°C became strongly ferromagnetic γ-Fe_2O_3 which gave an intense benzidine reaction.

10975. LAHUERTA CASAUS, PASCUAL AND SANCHEZ MARCO, GODOFREDO. **Conditions for the preparation of mixed catalysts for hydrogenation.** *Rev. açad. cienc. exact. fis.-quim. y nat. Zaragoza (2A)*, 4, 71-80(1949).—*C.A.* 44, 10215*d*.

A $Ni/Al_2O_3/Cr_2O_3$ catalyst was prepd.: 100 ml of 100 g $K_2Cr_2O_7$/liter, 105 ml of 100 g $NiSO_4 \cdot 6H_2O$/liter, 75 ml of 103 g $Al_2(SO_4)_3$/liter, and 95 ml of 25% K_2CO_3 soln. The ppt. which formed (pH = 8) had Ni 29.8, Cr_2O_3 7.0, and Al_2O_3 14.2% on a dry basis.

10976. LEIDHEISER, HENRY JR. **The importance of interatomic spacing in catalysis. A correlation between hydrogen overvoltage on metals and the distance between atoms.** *J. Am. Chem. Soc.* 71, 3634-6 (1949).—*C.A.* 44, 2353*h*.

The spacing between atoms was an important factor in catalysis. Values of the H_2 overvoltage were a min. at a distance of closest approach of atoms of approx. 2.7 A. for both the body-centered cubic and face-centered cubic metals.

10977. LEVERING, DEWEY R. AND LIEBER, EUGENE. **The promoter effect of platinic chloride on Raney nickel.** *J. Am. Chem. Soc.* 71, 1515(1949).—*C.A.* 43, 6498*a*.

Extremely minute quantities of $PtCl_4$ greatly enhanced the activity of the most active Raney Ni. Further promoter action was observed with the combination of Et_2N and $PtCl_4$. The combination was especially effective in hydrogenation of the ketone group.

10978. Lewis, W.K.; Gilliland, E.R., and Reed, W.A. **Reaction of methane with copper oxide in a fluidized bed.** *Ind. Eng. Chem.* 41, 1227-37 (1949).—*C.A.* 43, 7199*i*.

The reaction of CH_4 with CuO was investigated in a fluidized solid bed. With a molal O/C ratio of 1.0 or slightly greater, the reaction gave CO and H_2 in a molal ratio of about 1 to 2. In a lab. unit with a 4-ft bed at 1640°F and 1 atm. pressure, CH_4 was 94% decompd. with 92% selectivity. Cu was rapidly reduced with the simultaneous complete oxidation of part of the CH_4. The remaining CH_4 was reformed (rate-controlling step) with CO_2 and H_2O (both from the first step) to produce CO and H_2.

10979. Losson, Felix J. and Bloodgood, Don E. **Cyanide waste treatment by ion-exchange methods.** *Proc. 4th Ind. Waste Utilization Conf.; Purdue Univ., Eng. Bull., Extension Ser.* No. 68, 314-26(1949).—*C.A.* 44, 10553*f*.

The H_2O from rinse tanks following plating tanks,(contg. CN^- and metal ions such as Cu or Zn) was passed through a cation exchanger bed to remove the metal ions. The remaining soln. was passed through an aerator unit to remove the CN^- as HCN. The allowable rate of flow over the porous tube aerator was directly proportional to the surface area of the aerator.

10980. Marczewska, Kazimiera. **Oxidation of ammonia at lower temperatures by means of air enriched with oxygen.** *Roczniki Chem.* 23, 406-17(1949).—*C.A.* 44, 10473*a*.

The ripening of catalyst at low temps. was investigated with regards to N_2O as product of reaction.

10981. Mathieu-Lévy, Lucile S. **Catalytic oxidation of carbon monoxide.** *Ann. mines.* 138, 23-40(1949).—*C.A.* 44, 4764*f*.

Hopcalite-type catalysts were prepd. from anhyd. $MnSO_4$, $CuSO_4$, H_2SO_4, and H_2O. The washed ppt. was treated with $CuSO_4$ and $(NH_4)_2SO_4$ in NH_4OH. Two such catalysts, contg. 8.4% and 31% CuO, resp., compared favorably with a com. prepn. Numerous expts. indicated that CO was oxidized upon contact with chemisorbed O_2, a mechanism proposed earlier for the same reaction with Ag as catalyst.

10982. Maxted, E.B. and Moon, K.L. **The nature of chemisorptive bonds. II. The catalytic toxicity of organometallic compounds.** *J. Chem. Soc.* 1949, 2171-4.—*C.A.* 44, 3778*b*.

Toxicity tests were conducted with compds. in which the *s* and *p* bands were involved in bond formation with another element. Data were obtained for $HgMe_2$ and $PbMe_4$ on hydrogenation of cyclohexene with Pt black, the poisons being added in cyclohexane soln. Graphs of effective (poisoning vs. total poison) and true (poisoning vs. amt. of poison actually adsorbed) toxicities of $HgMe_2$ and $PbMe_4$ were plotted alongside values for Hg, Pb, and In ions for comparison. $PbMe_4$ is less toxic than $HgMe_2$.

10983. McKim, F.L.W. and Cambron, A. **The catalytic oxidation of ethylene to ethylene oxide.** *Can. J. Research* 27B, 813-27(1949).—*C.A.* 44, 2836*g*.

With a finely divided Ag catalyst promoted with Ca oxalate and SnO and supported on a Ag sheet for close temp. control, the selectivity (% yield of ethylene oxide based on C_2H_4 reacted) increased from about 25% with C_2H_4 in large excess to about 55% with O_2 in excess. The rate of the reaction was proportional to the square root of the C_2H_4 concn. when air was in excess and to the O_2 concn. when C_2H_4 was in excess. With both promoted and unpromoted catalysts, the addn. of CH_4, C_2H_6, or propane depressed the rate of conversion to ethylene oxide but increased the rate of conversion to CO_2 and water.

10984. Melville, H.W. and Robb, J.C. **The kinetics of the interaction of atomic hydrogen with olefins. I. Apparatus and use of parahydrogen techniques.** *Proc. Roy. Soc.* (London) A-196, 445-65(1949).—*C.A.* 44, 1784*h*.

A special reaction vessel was described in which the path length offered to a H atom before removal on the oxide layer could be varied. A very sensitive colorimetric technique for measuring the rate of addn. of H atoms to the oxide surface was described. The addn. of a very small amt. of H atoms could be detected. The para-H conversion technique was applied to illustrate how the collision efficiency of a H atom with a satd. hydrocarbon mol. could be obtained. The para-conversion was used to demonstrate the efficiency of the removal of a H atom on the oxides of Mo and W.

10985. Miyazaki, Shozo. **Catalytic decomposition of ammonia. II. The decomposition on molybdenum.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, 70, 373-6(1949).—*C.A.* 45, 2759*b*.

The catalytic decompn. of NH_3 on a heated Mo filament was observed over the range 680° to 820°C. The behavior was entirely similar to the decompn. of NH_3 on W. The mechanism of the decompn. was identical in the 2 cases within the observed temp. range. The energy of activation accompanying the decompn. on the heated Mo was 45.6 kcal/mole.

10986. Miyazaki, Shozo. **Catalytic decomposition of ammonia. III. Decomposition on platinum.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, 70, 439-42(1949).—*C.A.* 45, 2759*c*.

The catalytic decompn. of NH_3 with Pt as a catalyst was studied over the range 650° to 750°C. In the initial stage of decompn., the velocity was independent of the partial pressure of NH_3, but as the decompn. products were formed, the velocity decreased very rapidly. The equal inhibition by H_2 and N_2 was confirmed by expts. with the addn. of these gases at the beginning. The heat of activation of the decompn. was calcd. as 47.0 kcal/mole.

10987. Nahin, P.G. and Huffman, H.C. **Alumina and alumina-supported catalysts.** *Ind. Eng. Chem.* 41, 2021-7(1949).—*C.A.* 44, 3342*f*.

Electron micrographs of hydrous Al_2O_3 gel, gibbsite, bayerite, boehmite, diaspore, γ-Al_2O_3, θ-Al_2O_3, and κ-Al_2O_3 showed individual characteristics. The active state in molybdena-alumina and cobaltia-molybdena-alumina catalysts for hydroforming and hydrodesulfurization was assocd. with γ-Al_2O_3 microcrystals, 50 to 200 A. in size. Catalytic activity decreased with loss of surface area and progressive metal-oxide-promoted destruction of the γ-phase in the crit ranges, 875°-900° and 925°-950°C, resp.

10988. NATTA, G. **Solid-state reactions in the formation and the aging of catalysts.** *Bull. soc. chim. France* 1949, D161-6.—*C.A.* 43, 6897*c*.

In catalysts of the same chem. compn., well-crystd. samples had a greater activity than those formed with very small grains. The best catalysts for gaseous reactions were obtained by decompn. or reduction in the solid state with a diminution of mol. vol. but without a change in the exterior vol. of each grain of the catalyst. In many cases the function of a promoter was to prevent recrystn. The importance of the aging of $MgO-SiO_2$ catalysts used for the manuf. of butadiene from alc. was discussed.

10989. NEĬMARK, I.E. AND SHEĬNFAĬN, R. YU. **Effect of the type of porosity of silica gel catalyst on the reaction of vapor-phase hydrolysis of chlorobenzene.** *Zhur. Fiz. Khim.* 23, 595-604(1949).—*C.A.* 43, 7313*e*.

Ten specimens of dry silica gel of different porosity were prepd. Mixts. of steam 1, and PhCl 0.8-1.1 parts were passed through 50 ml at a rate 25 g PhCl/hr. The yield of PhOH and HCl at 500°C was highest (about 5%) for the catalysts having the greatest apparent sp. gr., *p*, (in Hg, 1.4-1.5), the smallest pore vol., *v* (0.23-0.30), and no pores of medium size. At 550°C, specimens with $v = 0.6-0.7$, and at 600°C those with $v = 0.7-0.9$ were most active. Heating of silica gels below 600°C had little effect. Heating at 700°-900°C reduced the adsorption capacity for MeOH; it did not close the pores but caused formation of big pores at the expense of fine pores.

10990. OBOLENTSEV, R.D. **The "order" of the contact-catalytic reaction of aromatization of heptane on chromium catalysts.** *Doklady Akad. Nauk S.S.S.R.* 66, 215-18(1949).—*C.A.* 43, 6062*e*.

The dependence of the yield *M* on the time of contact *t* was represented by $M = D [1-exp(-a_t b)]$ Consts. (d,a,b, resp.) for the conversion of C_7H_{16} into aromatic products at 480°C were 17, 0.097, 1.20; for the concn. of aromatic products in the catalyzate, 20, 0.034, 1.41; for the concn. of unsatd. hydrocarbons in the catalyzate, 12, 0.290, 1.02. Exptl. data on aromatization of 2-methyl-2-hexene were described by the same kinetic equation, with 35, 0.303, 0.54. Variation of the activity of the catalyst did not alter the type of the kinetic curve; it only shifted the log [log D - log (D - M)] line, plotted as a function of log *t*, parallel to itself.

10991. OGG, CLYDE L. AND COPPER, FRANCES J. **Determination of unsaturation by microhydrogenation method and apparatus.** *Anal. Chem.* 21, 1400-2(1949).—*C.A.* 44, 2884*i*.

Place 4 ml HOAc, 20 mg Pd catalyst, and a stirring bar (Fe filings sealed in glass) in the 20-ml reaction flask. Weigh the sample equiv. to 3-5 ml H_2 into an Al cup 6 mm diam. and 8 mm long and suspend it above the reagents in the flask. Flush out the app. with H_2. Stir the catalyst and HOAc with a magnetic stirrer for 5 min. after diminution of gas vol. ceased, remove the stirrer, allow the app. to equilibrate for 15 min. and record the vol., temp., and pressure. Drop the sample into the mixt. and stir for 15 min. after the reaction ceased, keeping the pressure nearly const. throughout. Allow the app. to equilibrate and record the vol., temp., and pressure. A standard deviation of 0.6 was obtained for the H_2 no. of 10 samples of maleic acid.

10992. OHTA, NOBUTO. **Effect of proton-donating intensity of catalyst on the butanol-acetone (or acetaldehyde) reaction.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* 52, 161-2(1949).—*C.A.* 45, 1857*i*.

Catalysts chosen were: $H_3PO_4.SiO_2$(PD 70), $Al_2(SO_4)_3$, (PD 25) and Al_2O_3 (No. 410). An equimol. mixt. of BuOH with acetone or with AcH, when passed over Al_2O_3 No. 410 at 250-300°C, gave a condensation product consisting mostly of higher ketones in 25-32% yields along with some liquid unsatd. hydrocarbons as a by-product. With the first catalyst, only butylene was formed.

10993. OLSEN, C.R. AND STERBA, M.J. **Effect of reactor temperature on product distribution and product quality in fluid catalytic cracking.** *Chem. Eng. Progress* 45, 692-700(1949).—*C.A.* 44, 826*h*.

These tests were made at 3 temp. levels: 800°, 900°, and 950°F with synthetic catalyst. All the tests were once-through, and the conversions at each temp. level varied from approx. 45 to 75 vol. % gas-oil disappearance. Product distribution among individual light hydrocarbons through the C_4 fraction was shown, the C_5 fraction was split into olefins, and paraffins, and the depentanized gasoline was resolved into 3 groups of hydrocarbon types. The general effect of increasing reactor temp. at a given conversion was to produce less deposit on catalyst, less debutanized gasoline, and greater quantities of light hydrocarbon fractions having higher olefin contents.

10994. PALADINO, SALVATORE. **Fluid catalysts and catalytic cracking.** *Rend. ist. super. sanita* 12, 452-66 (1949); *Ann. chim. applicata* 39, 208-21(1949).—*C.A.* 44, 7050*g*; 45, 7781*i*.

The principles of fluid catalysts were applied to catalytic cracking. The types used, regeneration, effect of temps. employed and vapor velocities and types of deposits occurring in the petroleum industry were covered.

10995. PATRICK, T.M., JR. AND EMERSON, WILLIAM S. **Unsaturated long-chain aliphatic esters. Catalytic oxidation.** *Ind. Eng. Chem.* 41, 636-41 (1949).—*C.A.* 43, 3611*g*.

Catalytic liquid-phase air oxidation of oleic acid and its Me and Et esters was studied: (1) with air under pressure in the presence of 1% CrO_3 catalyst, and (2) with O_2 in AcOH soln. at atm. pressure with a mixt. of the acetates of Co, Mn, and Pb as catalysts. At 110°-120°C and 200 p.s.i. for 6 hrs, scission products 22.0, high-boiling products 40.2, tar 18.7, and recovered Et oleate 6.2% were obtained. At 105°-115°, O_2 was passed 1.5, 3, 6, or 9 hrs through equal wts of Et oleate and AcOH contg. 1% each of the acetates of Mn, Pb, and Co in a vertical tube. At the end of the reaction AcOH was removed in vacuo, the metal compds. were washed out as chlorides and the product was treated as in the pressure oxidation.

10996. PAVLYUCHENKO, M.M. **Reactions involving solids in the absence of any catalytic action of the reaction products.** *Zhur. Fiz. Khim.* 23, 800-8 (1949).—*C.A.* 43, 8820*c*.

The corners of a cube were its most reactive points. If the reaction started from the corners and proceeded along the diagonals of the cube, the area of the reactive surface increased; this explained the usual "autocatalytic" acceleration of reactions involving solids. The theory was applicable also to reactions starting at crystal edges.

10997. PAVLYUCHENKO, M.M. **The fundamental equation of topochemical reactions which are not catalyzed by the solid reaction product.** *Zhur. Fiz. Khim.* 23, 809-12 (1949).—*C.A.* 43, 8820*d*.

If a reaction that started on a crystal face were propagated at equal rates along the surface and normal to it, the rate v of reaction was proportional to t^2 (t = time). If the reaction spread over the surface more rapidly than it penetrated into the crystal, v was max. at $t = 0$.

10998. PICHLER, HELMUT AND ZIESECKE, KARL H. **High-pressure hydrogenation of carbon monoxide to predominantly isoparaffinic hydrocarbon compounds (isosynthesis). I.** *Brennstoff-Chem.* 30, 13-22(1949).—*C.A.* 44, 814*h*.

Hydrocarbon synthesis was carried out at 300-600 atm. at 450°C; ThO_2 was the best single catalyst, ZrO_2 and CeO_2 were suitable, Al_2O_3 was considerably poorer. Gaseous and liquid hydrocarbons were formed; of these the C_4 hydrocarbons were predominantly (80-90%) branched. At pressures over 600 atm. and temps. under 400°, significant quantities of O-compds. (especially isobutanol methanol, and Et_2O) were formed.

10999, PICHLER, HELMUT AND ZIESECKE, KARL H. **High-pressure hydrogenation of carbon monoxide to predominantly isoparaffinic hydrocarbon compounds (isosynthesis). II. Experiments with mixed catalysts and conversion of dimethyl ether.** *Brennstoff-Chem.* 30, 60-8, 81-4 (1949).—*C.A.* 44, 815*a*.

ZnO plus ThO_2 favored the yield of liquid hydrocarbons and the addn. of Al_2O_3 plus ThO_2 the formation of isobutane. The yield of isobutane was greatly increased when 3% K_2CO_3 was added to the ppt. of ThO_2 + 20% Al_2O_3, amounting to 57% of the hydrocarbons formed at 300 atm. and 450°C. A similar alkali-free catalyst at 600 atm. and 450°C yielded 130 g of liquid hydrocarbons and "gas oil" per m^3 of CO-H_2 mixt.

11000. PSHEZHETSKIĬ, S. YA. AND KAMENTSKAYA, S.A. **Kinetics of oxidation of isopropyl alcohol to acetone on a silver catalyst.** *Zhur. Fiz. Khim.* 23, 136-55 (1949).—*C.A.* 43, 5272*e*.

Mixts. of isopropyl alc., O_2, and N_2 were passed through a 1-cm-thick layer of pumice on which Ag (0.35 g per 10 ml) was deposited from $AgNO_3$. The concn. of acetone in the outgoing gas was detd. The main part of adsorbed O_2 was energetically uniform. Presumable isopropyl alc. and acetone were adsorbed on the O_2 film.

11001. QUARTAROLI, A. AND DEL CARRATORE, A. **The oxidizing action of hydroxides on ferrous hydroxide. The copper subgroup.** *Ann. chim. applicata* 39, 527-34(1949).—*C.A.* 45, 4121*g*.

The hydroxides or oxides of the Cu subgroup tended to form suboxides and to function as oxidants with respect to $Fe(OH)_2$. Evidence of this interaction was obtained by magnetic-susceptibility studies of ferrous-ferric hydroxides formed as intermediate oxidation products.

11002. RAMSER, J.H. AND HICKEY, J.W. **A catalyst loss recorder for catalytic cracking units.** *Ind. Eng. Chem.* 41, 1244-7 (1949).—*C.A.* 43, 7217*e*.

The instrument continuously indicated and recorded the amt. of catalyst carried away with the flue gas in fluid-catalytic cracking units. The catalyst concn. was measured by an optical device; the flue-gas velocity by a flowmeter, and a mechanism coupled these 2 devices, automatically multiplying catalyst concn. by rate of gas flow, and thus detg. the instantaneous loss of catalyst per unit time. Automatic integration gave the accumulative loss of catalyst.

11003. REITZ, O. **Effect of particle size and density of catalyst particles on the activity of commercial high-pressure catalysts.** *Chemie Ing. Tech.* 21, 413-17(1949).—*C.A.* 44, 2836*d*.

Mineral oils were hydrogenated in a 1-liter autoclave at 250 atm. H_2 and 350°-400°C over compressed WS_2 tablets and a compressed mixt. of WS_2 + NiS on activated clay. The reaction rates for both catalysts indicated that surface diffusion to the core was a contributing factor. In the case of the unsupported WS_2 catalyst, which had a pore vol. of less than 50%, it was possible that an increased diffusion of the smaller oil mols. took place to the core of the pellets. The supported catalyst which had a larger pore vol. of about 65% did not show any evidence of preferential diffusion of smaller mols. to the interior.

11004. RICHARDSON, C.B.; JOHNSON, F.B., AND ROBBINS, L.V. JR. **Fluid catalyst cracking with silica-magnesia.** *Ind. Eng. Chem.* 41, 1729-33 (1949).—*C.A.* 43, 8656*c*.

Over-all results with silica-magnesia in lab. and in large scale fluid catalyst pilot plants indicated that with respect to gasoline yield, this catalyst was superior to silica-alumina and natural clay catalysts. Carbon formation was equiv. to that with silica-alumina, but dry gas and butane-butene yields were lower; silica-magnesia was superior to silica-alumina from the standpoint of activity maintenance.

11005. RIDGE, D. AND EMBLEM, H.G. **A new method for the preparation of contact catalysts.** *Chemistry & Industry* 1949, 500.—*C.A.* 43, 8074*e*.

Sillimanite was incorporated with a mixt. of aq. EtOH, Et silicate, and piperdine and a slurry formed which set to a solid mass on standing. The catalytic agent, or a precursor which formed the catalyst on ignition, was added to this slurry. The mass was air-dried and fired at 700°-1000°C in order to form a hard bonded refractory material, not contaminated by inorg. bases. V_2O_5 and Pt catalysts prepd. in this manner were found to have excellent activity in the combustion of SO_2 to SO_3.

11006. RIENÄCKER, GÜNTHER. **The effect of additives on oxide catalysts. I. Oxidation of carbon monoxide over mixed catalysts of oxides of copper, cerium, and iron.** *Z. anorg. Chem.* 258, 280-95 (1949).—*C.A.* 44, 1314*d*.

The mixts. were prepd. by decompn. of nitrates and calcining 4-5 hrs at 700°C. Air contg. 5% CO was passed over 1 g of mixt. The amt. of CO_2 in the efflux gas was detd. by the elec. cond. of a suspension of $BaCO_3$ at 60°C. The conversion of CO, usually less than 65%, was used as a measure of rate. Data were obtained with $CuO\text{-}Al_2O_3$, $CuO\text{-}Cr_2O_3$, $Cu_2O.Cr_2O_3$, $CeO_2\text{-}Al_2O_3$, and $Fe_2O_3\text{-}Al_2O_3$.

11007. RIENER, THOMAS W. **An improved laboratory preparation of copper-chromium oxide catalyst.** *J. Am. Chem. Soc.* 71, 1130 (1949).—*C.A.* 43, 6062*i*.

A soln. (260 g of $Cu(NO_3)_2.3H_2O$ in 900 ml water) at 80°C was added with stirring to a soln. of 178 g of $Na_2Cr_2O_7.2H_2O$ and 225 ml of 28% NH_4OH made up to 900 ml at 25°C. The ppt. was filtered, washed by slurring in water 3 times, and dried at 75°-80°C overnight. The catalyst was powd., slowly added to a heated glass vessel over a period of 15 min., and heated at 350°C with stirring for 15 min. It was sifted through a 200-mesh screen.

11008. ROGINSKIĬ, S.Z. **Relation between the electronic properties of solids and their catalytic activity.** *Doklady Akad. Nauk S.S.S.R.* 67, 97-9 (1949).—*C.A.* 43, 8251*d*.

Reactions involving electronic transitions, such as deep oxidation by O_2, decompn. of O-compds., hydrogenation and dehydrogenation, and aromatization, were catalyzed by solids with mobile electrons and often characterized by strong absorption of visible light. A 2nd group of reactions, such as isomerizations, cracking, hydration and dehydration, were catalyzed by solid dielectrics, e.g., SiO_2, Al_2O_3, clays, and by homogeneous catalysts such as $AlCl_3$, BF_3, $ZnCl_2$, which had no variable valency but were capable of forming complexes. Catalysts of the 1st class, but not those of the 2nd class, were very sensitive to impurities and to lattice imperfections.

11009. RUBINSHTEIN, A.M. AND KULIKOV, S.G. **Polymorphism and catalytic properties of titanium dioxide.** *Doklady Akad. Nauk S.S.S.R.* 67, 1053-6(1949).—*C.A.* 43, 8828*a*.

Catalytic activities (in ml gas/ml EtOH) under identical conditions and selectivities (ratio of the amt. of H_2, both evolved and spent on hydrogenation of C_2H_4 to C_2H_6, and the sum of $H_2 + C_2H_4 + C_2H_6$) were detd. in the decompn. of EtOH at 360°, 380°, and 400°C for 12 TiO_2 catalysts. One of the catalysts was pure anatase, one obtained by heating anatase 20 hrs at 900°C, pure rutile, the rest mixts. of the 2 forms. All catalysts, mixts. of anatase and rutile, had a higher activity than either pure form, which indicated that active centers were preferably located at boundaries between the 2 phases.

11010. SANDERS, M.T. AND HALES, R.A. **Performance of electrolytic cells in the reduction of glucose.** *J. Electrochem. Soc.* 96, 241-53 (1949).—*C.A.* 44, 51*d*.

Effects of varying c.d., initial sugar concn., ratio of cathode area to vol. of catholyte, alky. of catholyte, and temp. were given. The first 3 variables were combined as wt of initial sugar/amp. The instantaneous rate of reduction was discussed and the limiting rate was proportional to the concn. of sugar in the catholyte. Mg behaved as a cathode poison.

11011. SCHALL, J.W.; DART, J.C., AND KIRKBRIDE, C.G. **Moving bed catalytic cracking correlations. Product distribution and process variables.** *Chem. Eng. Progress* 45, 746-54 (1949). —*C.A.* 44, 1682*c*.

A pilot-plant investigation gave the effect of space rate, catalyst-to-oil ratio, and temp. on product distribution, and product quality in moving bed catalytic cracking. Data were obtained from once-through cracking of an East Texas heavy gas oil over plant-aged-silica-Al_2O_3 bead catalyst.

11012. SCHENCK, RUDOLPH. **Catalytic activity and equilibrium.** *Z. anorg. Chem.* 260, 154-60(1949). —*C.A.* 44, 10473*e*.

Catalyst activity was detd. by equil. properties of the catalyst. Activation energies calcd. from published rate data for oxidation of CO over CuO and promoted $CuO\text{-}Cr_2O_3$ catalysts were found proportional to log O_2 pressure of these catalysts.

11013. SCHWAB, GEORG-MARIA. **Catalysts in theory and practice.** *Trans. Chalmers Univ. Technol., Gothenburg* No. 81, 35pp.(1949).—*C.A.* 44, 3777*e*.

Some metallographical problems were studied by means of catalytic measurements. The hardness of martensite was basically an electronic effect. In the system Au-Fe the electron concn. was first increased upon solution of small amts. of Fe, and subsequently decreased; the compd. $AuFe_3$ did not exist. In the system Au-Sb, the compd. $AuSb_2$ contained Sb anions with homopolar bonds; in the system Cu-Mg, the compd. Cu_2Mg had metallic bonds, the compd. $CuMg_2$ had a little-filled Brillouin zone.

11014. SCHWAB, GEORG-MARIA AND AGALLIDIS-SCHWAB, ELLY. **Selective catalysis.** *J. Am. Chem. Soc.* 71, 1806-16 (1949).—*C.A.* 43, 6497*h*.

Activation energies and frequency factors were given for the simultaneous dehydration and dehydrogenation of EtOH and HCOOH vapors on several prepns. of ZnO, TiO_2, Cr_2O_3, Al_2O_3, CaF_2, $Ca_3(PO_4)_2$, CeO_2, ThO_2, carbon, NaCl, $BaSO_4$, Na_2CO_3, Na_2SO_4, KI, FeS, and SiO_2. For EtOH, the energy of activation was greater for dehydration than for dehydrogenation; for HCOOH, the reverse was true. Variations in selectivity of catalysts were due mainly to differences in frequency factors.

11015. SEKERA, ALEŠ. **The Raney catalysts.** *Chemie* (Prague) 5, 5-7(1949).—*C.A.* 46, 2717*c*.

In hydrogenation the use of the catalysts Co, Fe, Cu instead of Ni did not permit uniform conclusions. These catalysts required a longer reaction time, higher temps., and higher pressures, but they produced fewer side reactions than Ni and consequently purer products.

11016. Selwood, P.W. **Magnetism and catalysis.** *Bull. soc. chim. France* 1949, D489-506; *Colloques intern. centre natl. recherche sci., Polarisation matière* No. 17, 122-39(1949).—*C.A.* 44, 6690*d*.

Catalytically active inorg. solids, such as supported oxides, were characterized by a great increase in susceptibility at low concn., especially at low temp. Information was obtained on (1) the oxidation state of the paramagnetic ion, (2) evidence for intercation covalence, and (3) effectiveness of dispersion of the paramagnetic ions.

11017. Selwood, P.W.; Moore, T.E.; Ellis, Marylinn, and Wethington, Kathryn. **Supported oxides of manganese.** *J. Am. Chem. Soc.* 71, 693-7 (1949).—*C.A.* 43, 5654*b*.

The susceptibility isotherm method was extended to supported oxides of Mn. It was found that in favorable cases supported transition group oxides may imitate the crystal structure of the support even to the extent of changing oxidation state.

11018. Shapiro, M. Ya. **New catalytic test for detecting copper and silver.** *Zhur. Anal. Khim.* 4, 199-200(1949).—*C.A.* 44, 2887*i*.

The reaction was based on the accelerated rate of oxidation of resorcinol induced by Cu and Ag: To 1 ml of soln. add 1 ml of 1% NaOH or KOH + 1 ml of 1% resorcinol soln. and shake. Run a blank with distd. H_2O. After 5-6 min. if the soln. contains Cu or Ag it will be colored more than the control soln. By this test 0.04 γ of Cu or Ag in a 1:25,000,000 diln. could be detected.

11019. Shcheglova, N.A. and Kagan, M. Ya. **Kinetics and mechanism of reaction of the catalytic hydro-dehydrogenation. II. Kinetics of disproportionation of hydrogen in cyclohexene on a platinum catalyst.** *Zhur. Fiz. Khim.* 23, 1083-94(1949).—*C.A.* 44, 916*b*.

Conversion of cyclohexene into benzene and cyclohexane (1:2 mol.) was studied. Mixts. of cyclohexene with x mol. N_2 were passed over 1 g of pumice stone contg. 4% Pt. A new portion of the catalyst was used for every expt. A catalyst regenerated by N_2 + 2% O_2 at 100°-250°C and then H_2 was more active than the original sample. Cyclohexene was adsorbed preferentially to benzene, and benzene to cyclohexane. The surface of the catalyst was permanently covered with cyclohexene mols. causing the reaction to be of zero order.

11020. Shekhter, A.B.; Echeistova, A.I., and Tret'yakov, I.I. **Role of the surface mobility of metal atoms in the preparation of contact catalysts supported by carriers.** *Doklady Akad. Nauk S.S.S.R.* 68, 1069-72(1949).—*C.A.* 44, 915*d*.

Electron-microscope photographs of asbestos fibers impregnated with a chloroplatinate soln. showed a sheath of nonuniform thickness, with occasional coarser aggregates. The picture changed very markedly after heating at 600°C. Similar shifts of distribution of the metal were observed after heating of Ag, Au, or Pd, deposited on asbestos, ZnO, or lamp black by vacuum evapn. The intensity of the creep over the surface increased with the temp. The distribution of the metal was very heterogeneous, grains up to 1000 A. diam., fairly distant from each other, being observed along with close fine grains unresolvable under the electron microscope (less than 50 A.).

11021. Shekhter, A.B. and Moshkovskii, Yu. Sh. **Catalytic properties and structure of active zinc oxide.** *Izvest. Akad. Nauk S.S.S.R., Otdel, Khim. Nauk,* 1949, 354-63.—*C.A.* 44, 25*i*.

ZnO was obtained by thermal decompn. of $ZnCO_3$ at 350°C and by combustion of Zn in an elec. arc (120 v., 5 amp.) in an air stream. The B.E.T. surface area of the first was not less than $80 m^2/g$ and the second approx. $12 m^2/g$. The catalytic activities in the decompn. of MeOH adsorbed on the outgassed catalysts at 180°C were 8.6×10^{-3} and 3.5×10^{-3}, resp. The kinetic curves were fairly well represented by $v = At^{0.8}$ (t = time and v = vol. gas evolved).

11022. Shimeha, Jiro and Suzuki, Kenji. **Organic silica resins.** *Bull. Research Inst. Teikoku Jinzo Kenshi Kaisha Ltd.* 1, No. 1, 54-9(1949).—*C.A.* 45, 383*h*.

$MeSiCl_3$ was synthesized from Si and MeCl with a Si-Cu alloy as the catalyst, and after mixing in various proportions with $MePhSiCl_2$ derived from it by Grignard's reaction, hydrolyzed by heating to polymerize to resins. Et was introduced into $SiCl_4$ by Grignard's reaction and the products were polymerized similarly to resins.

11023. Shushunov, V.A. and Aurov, A.P. **Kinetics of the reaction of magnesium with alkyl halide vapors.** *Doklady Akad. Nauk S.S.S.R.* 68, 713-16 (1949).—*C.A.* 44, 911*c*.

In the reaction between solid Mg and gaseous EtX(X = Cl, Br, or I), formation of Mg org. compds. accounted for 95-100% of the observed pressure drop Δp; with MeX, it accounted for only 40-50%; the remaining 60-50% of MeX was evidently consumed by the Wurtz reaction.

11024. Shushunov, V.A. and Fedyakova, K.G. **Kinetic method of physicochemical analysis. VI. Kinetics of the catalytic decomposition of hydrogen peroxide by alloys.** *Zhur. Fiz. Khim,* 23, 936-41(1949).—*C.A.* 44, 26*g*.

A metal cylinder (2 × 2 cm) was immersed in a H_2O_2 soln. (x%), and the vol., V, of O_2, liberated was detd. V increased with time and with x (5-25%) as for a first-order reaction. The activation energy, E, was independent of x. Between 30 and 60°C E was 15,600 cal/mol. for Bi, about 9000 for Sn, about 9200 for Cd, and 8200 for Sb. In Bi-Sn alloys E varied with concn. without any singular point.

11025. Smith, Hilton A.; Bedoit, Wm. C., Jr., and Fuzek, John F. **The preparation and aging of Raney nickel catalysts.** *J. Am. Chem. Soc.* 71, 3769-71 (1949).—*C.A.* 44, 2353*i*.

The method of prepn. of the catalyst from the alloy was studied. Different temps. of soln. of the alloy, different temps. and times of digestion, and different methods of washing had little effect on catalytic activity as measured by the rate of hydrogenation of d-limonene. Although the original specific surface of a catalyst had little effect on its initial activity, the change in surface with time was closely paralleled by the change in catalytic activity.

11026. SMITH, HILTON A. AND FUZEK, JOHN F. **Catalytic hydrogenation of furan and substituted furans on platinum.** *J. Am. Chem. Soc.* 71, 415-19 (1949).—*C.A.* 43, 5657*d*.

The kinetics of catalytic hydrogenation were studied for furan, 2-methylfuran, 2, 5-dimethylfuran, furfuryl alc., furoic acid, dibenzofuran, furfural benzyl alcohol, and benzoic acid. The reactions were carried out at pressures up to 5 atm. abs. in acetic acid soln. with Adams Pt catalyst. The rate consts., activation energies, and frequency factors were considerably higher for the furan compds. than for the corresponding benzene derivs.

11027. SMITH, HILTON A.; FUZEK, JOHN F., AND MERIWETHER, HENRY T. **The catalytic hydrogenation of terpenes.** *J. Am. Chem. Soc.* 71, 3765-9 (1949).—*C.A.* 44, 2480*a*.

Dipentene, *d*-limonene, terpinolene, *α*- and *β*-pinenes, and camphene were hydrogenated over Adams Pt or Raney Ni catalyst, and the results subjected to kinetic analysis.

11028. SMITH, HILTON A. AND MERIWETHER, HENRY T. **Catalytic hydrogenation of the benzene nucleus. V. Hydrogenation of benzene, the cyclohexadienes, and cyclohexene.** *J. Am. Chem. Soc.* 71, 413-15(1949).—*C.A.* 43, 5752*e*.

The catalytic hydrogenations of C_6H_6, the cyclohexadienes, and cyclohexene on Pt were studied from a kinetic viewpoint. Rate consts. and activation energies were detd. for each of these reactions. The low value for the activation energy of the hydrogenation of C_6H_6, when compared with the resonance energy of the mol., indicated the probability that such resonance was destroyed when the C_6H_6 was adsorbed on the catalyst.

11029. SMITH, HILTON A.; ALDERMAN, D.M., JR.; SHACKLETT, COMER D. AND WELCH, CLARK M. **The catalytic hydrogenation of the benzene nucleus. VI. The hydrogenation of compounds with two benzene rings.** *J. Am. Chem. Soc.* 71, 3772-6 (1949).—*C.A.* 44, 2354*h*.

The kinetics of the catalytic hydrogenation were investigated: Ph_2, Ph_2CH_2, Ph_2CHMe, $(PhCH_2)_2$, $(PhCH_2\text{-}CH_2CH_2)_2$, Ph_3CH, phenylcyclohexane, phenylcyclohexylmethane, 1-phenyl-1-cyclohexylethane, cyclohexyldiphenylmethane, $Ph_2CHCOOH$, di(phenylpropyl) acetic acid, benzilic acid, mandelic acid, phenylcyclohexylacetic acid, and phenylcyclohexylglycolic acid. All hydrogenations were made in HOAc soln. with Adams Pt catalyst; first-order rate consts. referred to 1 g of standard catalyst were obtained. In general, the rate of hydrogenation decreased with the number of Ph groups present.

11030. STEFFENS, JACK H.; ZIMMERMAN, MARLIN U., AND LAITURI, M. JOHN. **Correlation of operating variables in catalytic polymerization.** *Chem. Eng. Progress* 45, 269-78(1949).—*C.A.* 43, 4839*c*.

The polymerization of propylene and butylene streams in tubular-type catalytic polymerization units with Cu pyrophosphate catalyst showed that conversion of the olefins increased with: (1) increase in catalyst activity; (2) increase in reactor temp.; (3) decrease in olefin space velocity; (4) decrease in total space velocity; and (5) decrease in olefin compn. ratio (wt of propylene plus normal butylenes to isobutylene). A chart was given to predict the wt % conversion of the olefins in the total feed for a wide range of operating conditions.

11031. STRICKLAND-CONSTABLE, R.F. **The synthesis of methane from carbon monoxide and hydrogen on a nickel catalyst. Study of the mechanism of the reaction.** *Gas Research Board, Copyright Pub.* No. GRB46, 30 pp. (1949); *Gas World* 130, 626-31.—*C.A.* 43, 7666*h*.

The reaction of 3 H_2 + CO with a dehydrated catalyst (3 parts hydrated $Al(NO_3)_3$ and 1 part hydrated $Ni(NO_3)_3$, with a small quantity of china clay), began with measurable speeds at about 250°C. The reaction was slightly retarded by increasing the partial pressure of CO, but the products did not retard it. The first step in the reaction was instant adsorption of H_2 and CO in considerable amts. Balances on the products in the gas phase and on the surface of the catalyst were detd. throughout the course of the reaction.

11032. SUEHIRO, YOSHIYUKI; KUWABARA, MICHIO, AND AYUKAWA, YAICHI. **Preparation of alumina-silicate catalyst for the isomerization of butene.** *J. Chem. Soc. Japan.* Ind. Chem. Sect. 52, 43-4 (1949).—*C.A.* 45, 1704*c*.

Alumina-silicate catalysts of various compns. were prepd. and their catalytic action on the isomerization of butene into isobutene was studied. The deposited carbon was eliminated by igniting the catalyst at 550°C and passing in air. The aluminosilicate having the mol. ratio of 1:1 was the best with respect to isomerization activity as well as for reactivation.

11033. TATIEVSKAYA, E.P.; ZHURAVLEVA, M.G., AND CHUFAROV, G.I. **Kinetics of the reduction of copper oxides by carbon monoxide and by hydrogen.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* 1949, 1235-41.—*C.A.* 45, 4537*c*.

Finely powd. CuO and Cu_2O, (0.20 and 0.17 m^2/g, resp.) were reduced in a stream of H_2 or of CO circulating in a closed system. The reduction was autocatalytic. In the reduction of CuO with H_2 at 300°C, the rate, at all stages, increased with the initial pressure up to 400 mm. The apparent activation energies for the reduction of CuO by CO and by H_2 are 10.7 and 13.4 kcal/mole, resp. In contrast to CuO, reduction of Cu_2O was, at any temp. and initial pressure, faster with H_2 than with CO. The apparent activation energies for the reduction of Cu_2O by CO and H_2 were 10.0 and 13.7 kcal/mole, resp.

11034. THOMAS, ALBERT. **The synthesis of hydrogen cyanide gas from mixtures of ammonia, air, and methane.** *Ann. Chim.* [12], 4, 258-85(1949).—*C.A.* 43, 9391*h*.

A pure Pt mesh catalyst gave a max. yield of HCN at a 1.5 ratio of O_2/NH_3 and a 1.08 ratio of CH_4/NH_3. Max. yield of 65.1% was attained at a contact time of 1.22×10^{-3} sec. Essentially the same results were obtained with Pt-Rh catalysts of 2%, 5%, and 10% Rh content, and with an annealed Pt-Ir catalyst contg. 2% Ir. The reaction was not catalyzed by sponge Pt, or Pt black on asbestos, or pumice. Pt was lost from the catalyst during reaction, but the loss was retarded by up to 10% of Rh, thereby increasing the catalyst life 5-fold. Catalyst life was longer in the presence of C_2H_2 up to 3% of total gases.

11035. Thomas, Charles L. **Chemistry of cracking catalysts.** *Ind. Eng. Chem.* 41, 2564-73(1949).—*C.A.* 44, 2218*i*.

Catalytic activity was attributed to H^+ which served to balance the valence and coördination no. within an at. network contg. 2 different metals and O. The catalytic activity (*A*) and ability to neutralize KOH (*B*) was detd. for a series of SiO_2-Al_2O_3 gels prepd. by hydrolyzing graded solns. of Al isopropoxide in ethyl orthosilicate. *A* reached a max. at an Al/Si at. ratio of 1 to 2 and *B* reached a max. at Al/Si = 1. SiO_2-MgO, SiO_2-ZrO_2, Al_2O_3-boria, and titania-boria catalysts were briefly discussed and a carbonium ion mechanism for catalytic cracking presented.

11036. Tikkanen, Matti. **Theory of the reduction of magnetite with hydrogen.** *Valtion Tek. Tutkimuslaitos, Julkaisu* No. 12, 92 pp.(1949).—*C.A.* 46, 3379*a*.

The rate of reduction with H_2(320 liters/hr) was studied as a function of temp. on small disks pressed at 5 tons/cm². When log *V*(reaction velocity) was plotted as a function of 1/T°K, the heat of activation of 16.6 kcal/mol. was obtained from the slope of the straight line of the plot. The reduction rate followed this law up to 550 °C, but decreased above this temp., showing 2 distinct minima, one at 700°-750°C, and the other at 900°C. The diffusion of thoron was studied in the sample. The rate of diffusion of thoron decreased above 550 °C in the same manner as the reduction rate.

11037. Trambouze, Yves and Perrin, Marcel. **Preheating of nickel catalysts in the course of thermal reduction. Influence on efficiency in the Fischer synthesis.** *Compt. rend.* 228, 837-9 (1949).—*C.A.* 43, 8831*c*.

Preheating in N_2 for 48 hrs at 220 °C increased the activities of 2 Ni-Si-Al catalysts. A poor catalyst was improved to the extent that it was better than any unpreheated catalyst.

11038. Trambouze, Yves and Perrin, Marcel. **Influence of the state of combination of the constituents of nickel catalysts upon their activities in the Fischer synthesis.** *Compt. rend.* 228, 1015-17 (1949).—*C.A.* 43, 2853*b*.

The properties of Ni-Si-Al catalysts were measured by the initial hydrogenation activity and the Fischer activity. Both were defined, and the factors affecting them discussed.

11039. Tsutsumi, Shigeru. **Catalytic hydrogenation in the presence of water. II. Unsaturated fatty oil and rice-bran oil having high acid numbers.** *J. Chem. Soc. Japan*, Ind. Chem. Sect., 52, 191-3(1949).—*C.A.* 45, 4063*b*.

Satisfactory hydrogenation of chrysalis oil (I_2 no. 124.5, acid no. 1.6) could not be obtained with a catalyst contg. Ni oxide + H_2O, or Ni oxide + Japanese acid clay. The reaction went smoothly with a catalyst contg. H_2O, Japanese acid clay, and Ni oxide. The best catalyst contained 2% Ni oxide + 2.5% H_2O + 3% Japanese acid clay. The hydrogenation of rice-bran oil was complete within 1.5 hrs with a catalyst contg. Ni oxide and the clay. The resulting oil had an I_2 no. 2.0 and acid no. 175.3.

11040. Tuszynski, Kazimierz. **Nitrous oxide as a product of oxidation of ammonia on platinum catalyst.** *Roczniki Chem.* 23, 397-405(1949).—*C.A.* 44, 10472*i*.

Investigations were made in the range 218°-555°C and under various times of contact with the catalyst. The formation of N_2O was favored by low temp. and low rate of flow of gases. The yield of NO rose with increasing rate of flow and increasing temp. The free N_2 at const. temp. fell as the rate of flow increased, and also with increasing temp.

11041. Watson, Roger, W. and Tom, Theodore B. **Relation of structure and effectiveness in copper deactivators.** *Ind. Eng. Chem.* 41, 918-23 (1949).—*C.A.* 43, 6063*c*.

Cu deactivators served to protect against the catalytic action of Cu (sol. or metallic) in the oxidation of hydrocarbons. Their effectiveness depended to a large extent on chelation, ring size, inner complex salt formation, electron-donating tendency of hetero atoms, and tendency to coplanar configuration. Some effective Cu deactivators were N,N' -disalicylidene-1,2-propanediamine, and dimethyldithioöxamide.

11042. Weller, Sol. **Effect of operating variables upon the Fischer-Tropsch synthesis.** *U.S. Bur. Mines, Repts. Invest.* No. 4405, 8 pp(1949).—*C.A.* 43, 3167*c*.

The operating variables and the role of metal carbides as intermediates in the synthesis were discussed.

11043. Wendlandt, R. **New experiences with the catalytic ammonia combustion. The catalytic processes of ammonia oxidation and hydrocyanic acid production from ammonia and methane.** *Z. Eletrochem.* 53, 307-19(1949).—*C.A.* 44, 2711*b*.

The technical experiences in Germany since 1930 support the hydroxylamine theory of the NH_3 oxidation modified to exclude an intermediate formation of peroxynitric acid. The following reactions in technical operations yielded 97% NO, 3% N_2, and traces of N_2O: (1) $NH_3 + O \rightarrow NH_3O$; $NH_3O + O_2 \rightarrow HNO_2 + H_2O$; $4HNO_2 \rightarrow 4NO + 2H_2O + O_2$; (2) $NH_3O + NH_3 + O_2 \rightarrow N_2 + 3H_2O$; $HNO_2 + NH_3 \rightarrow N_2 + 2H_2O$; (3) $NH_3O + HNO_2 \rightarrow N_2O + 2H_2O$. HCN was formed from NH_3, CH_4, and air in the following way: $NH_3O + CH_4 \rightarrow H_2NCH_3 + H_2O$; $H_2NCH_3 \rightarrow HNCH_2 + H_2$; $HNCH_2 \rightarrow HCN + H_2$.

11044. Wicke, E. and Brötz, W. **Diffusion, fluid flow, and reaction velocity in the interior of porous catalyst bodies.** *Chem. Ing. Tech.* 21, 219-26(1949).—*C.A.* 43, 7313*i*.

The gas entrance was limited to the upper end section of porous cylindrical bodies. The efficiency was detd. as a function of the total pressure, the temp., and inert gas content. The efficiency of the para-ortho H_2 conversion with Ni was inversely proportional to the square root of the total pressure below efficiencies of 37.5%. Inert gases reduced the efficiency and a factor that took this effect into account was developed. The temp. dependence of the velocity of conversion corresponded to the true activation energy of the reaction only at low temps.

11045. WINNICKI, WITOLD. **Nitrous oxide as a product of oxidation of ammonia on oxide catalysts.** *Roczniki Chem.* 23, 388-96(1949).—*C.A.* 45, 55*h*.

NH_3 was oxidized on CuO 32.58 plus MnO_2 65.62%, and Fe_2O_3 79.45, Bi_2O_3, 11.53, and MnO_2 7.21%. The first gave higher yields of NO than did the second, which gave N_2O as the main product. With increase of temp. the yield of N_2O rose, passed a max., and decreased on both catalysts. Increase in rate of flow increased constantly the yield of N_2O on the second catalyst; on the first with increasing rate of flow. The yield of N_2O reached a max. at higher temps.

11046. WRIGHT, MAURICE M. AND TAYLOR, HUGH S. **The interaction of methane and methane-d_4 on nickel and the state of the catalyst surface.** *Can. J. Research* 27B, 303-17(1949).—*C.A.* 43, 7802*f*.

Mass-spectrometer studies of the exchange reaction and the reaction of H_2 with catalyst surface residues supported the concept of dissociative adsorption. Evidence of fragments such as CX_3, CX_2, CX, C (X = H or D) was obtained. Temp. increased the concn. of the more hydrogenated fragments and equil. between the fragments depended on the heats of adsorption of the fragments and H on the catalyst surface, and also on the strength of CH bonds formed.

11047. YAMANAKA, TATSUO. **Active center of hydrogenating catalysts. II.** *Repts. Sci. Research Inst.* (Japan) 25, 329-36 (1949).—*C.A.* 45, 1857*d*.

Pd-Kieselguhr (1:500) kneaded with Hg and dried in air and then in a stream of H_2 at 100°C showed its extremely active centers inhibited. C_2H_2 mixed with H_2 (1:2) passed over it at 170°C and the rate 5 liter/hr was hydrogenated to 86.3% C_2H_4 and 11.8% C_2H_6 (11.7 and 85.9%, resp., without the inhibition) with little accompaniment of polymerization yielding unwanted products. $HgCl_2$ gave a similar effect, but inhibited the activity totally when added beyond a certain amt. Particularly $Pb(AcO)_2$ made a mild and uniformly active catalyst.

11048. ADKINS, HOMER; BURGOYNE, EDWARD E., AND SCHNEIDER, HENRY J. **The copper-chromium catalyst for hydrogenation.** *J. Am. Chem. Soc.* 72, 2626-9(1950).—*C.A.* 44, 8564*g*.

The $CuCr_2O_4$ catalyst produced by the thermal decompn. of basic Cu ammonium chromate (contg. also Ba from $Ba(NO_3)_2$) contained CuO and $CuCr_2O_4$, but neither alone was the effective catalyst. By increasing the ratio of Cr to Cu in the catalyst, its activity was enhanced in the reduction of Me laurate and Me palmitate at 6000 p.s.i. and 175°C.

11049. AKHMEDLI, M. K. AND NEGRETOV, B. P. **Products of the thermal decomposition of chromium formate.** *Zhur. Obshchei Khim* (J. Gen. Chem.) 20, 1974-80(1950).—*C.A.* 45, 3745*b*.

Evolution of gas on heating dried $(HCO_2)_3Cr$ in a stream of N_2 began at about 300°, and was practically completed at 300-320°, 320-330°, and 330-340°C, within ~ 38, 30-31, and 22-23 min., resp. Analysis of the gaseous and the solid products corresponded closely to $2(HCO_2)_3Cr \rightarrow 2CrO_2 + 2\ CO_2 + 4CO + 3H_2$; however, the ratio CO/CO_2 was only ~ 1, instead of the expected 2. When heated to 600°C in a stream of N_2, the solid product ignited; $2CrO_2 \rightarrow Cr_2O_3 + O$.

11050. AMEMIYA, T.; SAITO, H., AND SAKAMOTO, S. **Pine-root oil and α-pinene. I. Catalytic reforming of the gasoline fraction of pine-root oil.** *Repts. Fuel Research Inst., Japan* No. 64, 1-33(1950)—*C.A.* 45, 6397*b*.

In order to obtain a high-grade gasoline from the Japanese pine-root oil, the fraction boiling below 200°C was catalytically treated in the vapor phase in the presence of acid clay, activated acid clay, Kanuma earth, etc., and also hydrogenated in the presence of Ni. When treated with H_2 in the vapor phase in the presence of active yellow earth (a Japanese göthite, $Fe_2O_3.H_2O$), the same reforming effect was obtained. The catalytic hydrogenation under atm. pressure was not a preferable method.

11051. ANDERS, HEINZ. **The individualities of the catalysts for the Fischer-Tropsch synthesis in regard to the composition and properties of the reaction product.** *Chem. Tech.* 2, 27-9(1950).—*C.A.* 44, 5566*f*.

11052. ANDERSON, ROBERT B.; SHULTZ, J. F.; SELIGMAN, BERNARD; HALL, W. KEITH, AND STORCH, H. H. **The Fischer-Tropsch synthesis. VII. Nitrides of iron as catalysts.** *J. Am. Chem. Soc.* 72, 3502-8(1950).—*C.A.* 44, 10299e.

The conversion of Fe in reduced synthetic-NH_3-type catalysts to nitrides by NH_3 treatment greatly increased their activity in the Fischer-Tropsch synthesis. Catalysts converted to ε-phase nitrides yielded a product of lower av. mol. wt contg. greater yields of gaseous hydrocarbons and oxygenated mols. than those products obtained from corresponding reduced catalysts.

11053. APEL'BAUM, L. AND TEMKIN, M. I. **Oxidation of ammonia on platinum under low pressures.** *Doklady Akad. Nauk S.S.S.R.* 74, 963-6 (1950).—*C.A.* 45, 1856*h*.

The reaction was carried out on a Pt wire 0.1 mm in diam., 10 cm long, heated to 820°C, in a static system under const. supply of NH_3 from solid NH_3 kept at -140°C. The over-all reactions were: $4\ NH_3 + 5\ O_2 = 4\ NO + 6\ H_2O$ and $4\ NH_3 + 3\ O_2 = 2\ N_2 + 6\ H_2O$. No NH_2OH was formed at 820°C. The oxidation of NH_3 occurred through collisions of NH_3 mols. with a Pt surface practically entirely covered with O_2 mols., with approx. one in 20 collisions effective.

11054. ATWOOD, KENTON; ARNOLD, M. R., AND APPEL, E. G. **Water-gas shift reaction. Effect of pressure on rate over an iron oxide-chromium oxide catalyst.** *Ind. Eng. Chem.* 42, 1600-2 (1950).—*C.A.* 44, 9137*a*.

The influence of pressure on the rate of the water-gas shift reaction over a com. Fe oxide-Cr oxide catalyst was studied in the pressure range

1-30 atm. at 346° and 404°C. The activity of the catalyst approx. doubled as the pressure was raised to 10 atm., and increased only slightly as the pressure was increased further. Plots of catalyst activity vs. pressure gave curves similar in shape to Langmuir isotherms.

11055. BAUKLOH, W.; CHATTERJEE, B., AND DAS, P. P. **Decomposition of carbon monoxide in the presence of iron, cobalt, and nickel as catalysts.** *Trans. Indian Inst. Metals* 4, 271-8 (1950).—*C. A.* 46, 7415*c*.

The max. decompn. of CO by Fe, Co, and Ni as catalysts took place at 550°, 700°, and 350°C, resp. The speed of the decompn. reaction increased up to an hr and then decreased. The decrease in reaction speed was due to the formation of metal carbides which had a lower activity than the pure metal. Decompn. of the metal carbide by H_2 restored the activity of the metal.

11056. BEECK, OTTO. **Hydrogenation catalysts.** *Discussions Faraday Soc.* **1950**, No. 8, 118-28. —*C. A.* 45, 9986*h*.

The rate of hydrogenation of C_2H_4 over evapd. porous metal films of the transition elements depended strongly on the heat of adsorption of C_2H_4, which, except for much higher abs. values, paralleled that of H_2. Smooth curves were obtained when the *d*-character of the metallic single bond was plotted against both the heats of adsorption and the rates of hydrogenation. Depending on the heat of adsorption for C_2H_4, the initial irreversible poisoning by acetylenic adsorption complexes formed by self-hydrogenation of C_2H_4 rendered the surface more or less inactive for hydrogenation. A 3rd type of fast reaction with low *E* appeared not to necessitate empty crystallographic sites for the sep. adsorption of C_2H_4, but resulted from the activated state on a surface already covered with H_2.

11057. BEECK, OTTO AND RITCHIE, A. W. **The effect of crystal parameter on hydrogenation and dehydrogenation.** *Discussions Faraday Soc.* **1950**, No. 8, 159-66.

The surfaces of oriented and unoriented evaporated porous Ni films were detd. by the B.E.T. method, using Ne, Kr, CH_4 and C_4H_{10}. By measuring the number of crystallographic sites through the adsorption of H_2 at 78°K, direct proof was obtained that (110) oriented Ni films also exposed (110) planes to the gas phase. The hydrogenation of C_6H_6 over oriented and unoriented Ni and Fe films showed no difference in rate. The dehydrogenation of cyclohexane over unoriented Pt was found to be 10 times faster than over partially (110) oriented Pt films.

11058. BELCHER, R. AND GOULDEN, R. **Analysis for industry. Determination of carbon monoxide.** *Ind. Chemist* 26, 320-2(1950).—*C. A.* 46, 7937*h*.

CO was detd. by (1) the rise in temp. of a Hopcalite catalyst (MnO_2 50-60, CuO 30-40%, with or without Co_2O_3 and Ag_2O) during oxidation of the CO to CO_2, (2) oxidation by (*a*) Hopcalite at 100°C and absorption in aq. $Ba(OH)_2$, (*b*) $AgMnO_4$, and (*c*) Pt black, and (3) absorption by hemoglobin,

11059. BINDER, GEORGE G. AND WHITE, ROBERT R. **Synthesis of methane from carbon dioxide and hydrogen.** *Chem. Eng. Progress* 46, 563-74 (1950).—*C. A.* 45, 331*b*.

Rate of formation of CH_4 from CO_2 and H_2 was measured by passing feed gas ranging in compn. from 80% H_2 and 20% CO_2 to 30% H_2 and 70% CO_2 over a reduced Ni catalyst in a continuous app. Several runs were made in which the feed gas contained CH_4. The space time was varied from 0 to 8×10^{-5} hr and temp. from 500-750°F; the pressure was one atm. in all runs. Av. rates of CH_4 formation obtained by differentiation of the data vary from 0 to 5.60 lb-moles/(day) (lb-catalyst). The major resistance to the over-all process was offered by the reaction of one adsorbed CO_2 with at least two adsorbed H_2.

11060. BORESKOV, G. K. AND DZIS'KO, V. A. **Porosity and activity of catalysts. I. Hydrolysis of chlorobenzene on silica gels of various structures.** *Zhur. Fiz. Khim.* 24, 1135-46(1950).—*C. A.* 45, 2759*g*.

Catalytic activity and catalyst porosity was studied on various silica gels (wt of unit vol. of catalyst, pore vol., surface area, av. pore radii): (I) 0.83g/ml, 0.31 ml/g, 350 m^2/g, 10 A; (II) 0.64 g/ml, 0.51 ml/g, 640 m^2/g, 15-20 A; (III) 0.49 g/ml, 0.8 ml/g, 400 m^2/g, 35-40 A. The pressure was maintained const. between 100 and 150 mm in a flow system. Before each run, lasting 4-6 hrs, fresh catalyst was used. PhOH and HCl was sampled and titrated at 20-min. intervals. The activity decrease was due to stopping of the pores by carbonaceous material. The higher activation energy E corresponded to the kinetic range, the lower E to the diffusion range. The activity per unit surface was the same for all catalysts in the kinetic range, but varied from catalyst to catalyst in the diffusion range owing to different pore structures.

11061. BOSE, R. AND ROY, D. K. **Palladinized nickel as a hydrogenation catalyst.** *Science and Culture* 16, 164(1950).—*C. A.* 45, 4377*e*.

The catalyst was prepd. by the addn. of a 1% aq. soln. of Pd chloride to a suspension of freshly prepd. Raney Ni and pptd. chalk. H_2 was bubbled through the mixt. for 10-15 min. before use. A soln. contg. 60% dextrose could be hydrogenated to *d*-sorbitol in 98-100% yield within 2-2.5 hrs at 140°C and 250 lb H_2 pressure.

11062. BOUDART, MICHEL. **The mechanism of the decomposition of nitrous oxide on zinc oxide as catalyst.** *J. Chem. Phys.* 18, 571-2(1950). —*C. A.* 44, 6250*a*.

The activation energy of the adsorption process was required by the solid adsorbent. The important factor was not the sp cond. but rather the energy necessary to send a bound electron into the conduction layer.

11063. BOUDART, MICHEL. **Pauling's theory of metals in catalysis.** *J. Am. Chem. Soc.* 72, 1040(1950).—*C. A.* 45, 2297*i*.

Metallic radii were correlated with the percentage of *d*-character of the metallic bond. The log of the activity was found to be a steadily increasing function of the percentage *d*-character for all data, including Cr, with the exception of W.

11064. BROTZ, WALTER AND SPENGLER, HERBERT. **The physicochemical behavior of the Fischer-Tropsch catalysts.** *Brennstoff-Chem.* 31, 97-102(1950).—*C.A.* 44, 6249*f*.

The particle vol. and the skeleton vol. of the unreduced catalyst were detd. and the pore vol. and the porosity calcd. The mean pore radius of the macropores was detd. by means of a flow method. The excess flow found with CO and H_2, attributed to surface diffusion explained the complete utilization of the catalyst particle. The internal surface was detd. from an adsorption isotherm and the heats of adsorption of CO and H_2 calcd. from the adsorption isotherms.

11065. BROWN, F. E.; MENZEL, RALPH E.; STEWART, MEREDITH M., AND LEFRANCOIS, PHILIP A. **Cuprous oxide as a catalyst. I. Preparation and promotion by metallic oxides.** *J. Am. Chem. Soc.* 72, 5602-5(1950).—*C.A.* 45, 3529*i*.

Cu_2O prepd. by reduction in soln. and dried below 85°C was a hydrogenation catalyst for furfural. This catalyst was promoted by alk. earth oxides, especially CaO, and Cu_2O + CaO was further promoted by the addn. of Cr_2O_3, or V_2O_5 reduced by glucose. The catalysts were made by prepg. the oxides separately and grinding them together in a mortar at room temp.

11066. BROWNING, L. C.; DEWITT, T. W., AND EMMETT, P. H. **Equilibria in the systems Fe_2C-Fe-CH_4-H_2 and Fe_3C-Fe-CH_4-H_2.** *J. Am. Chem. Soc.* 72, 4211-17(1950).—*C.A.* 45, 1861*d*.

Equil. consts. for the reaction $CH_4 + 2Fe(\alpha) = Fe_2C + 2H_2$ were reported in the range 295°-350°C and for the reaction $CH_4 + 3Fe(\alpha) = Fe_3C(\beta) + 2H_2$ in the range 320-468°C. Free energies of formation of Fe_2C and Fe_3C calcd. from the data led to the conclusion that the formation of all monoölefins and of satd. hydrocarbons contg. more than 6 C atoms by the direct reduction of Fe_2C and Fe_3C in the temp. range 450-650°K was thermodynamically unfavorable.

11067. BRUIJN, H. DE. **The kinetics of catalytic reactions on inhomogeneous surfaces.** *Discussions Faraday Soc.* **1950**, No. 8, 69-79; *Chem. Weekblad* 46, 818-21(1950).—*C.A.* 45, 9986*d*.

By use of the NH_3 synthesis as a model process, a theory was developed starting from an entirely arbitrary distribution of the more or less active sites on the surface. The adsorption of the velocity-detg. reactant, *N*, was of an at. character and unrestricted migration occurred on the surface. An inhomogeneity factor in the reaction-rate relation, whose value was detd. by the frequency of those sites active under synthesis conditions, was essential. These sites, characterized by their heats of adsorption, depended on the temp., total pressure, and gas compn. The testing of activity of catalysts for high-pressure processes indicated that the synthesis test at 1 atm. might in many cases lead to wrong conclusions, whereas the decompn. test at 1 atm. will frequently yield a more accurate result.

11068. BUTYAGIN, P. YU. AND ELOVICH, S. YU. **Mechanism of the catalytic oxidation of propylene.** *Doklady Akad. Nauk S.S.S.R.* 75, 711-14(1950).—*C.A.* 45, 3229*e*.

On Pt (on $BaSO_4$) between 0°-200°C, C_3H_6 was oxidized completely to CO_2 and H_2O in the pressure range 0.01 to 1 mm. If Pt was first treated with O_2, and then, after short pumping, C_3H_6 was admitted alone, the 1st stage of the reaction, characterized by a very rapid fall of the pressure *p*, corresponded to an adsorption of C_3H_6 by the "oxidized" Pt. That stage of oxidation of the *surface* compd. of C_3H_6 by the *surface* O_2 was also governed by the exponential rate law. The sequence of processes was (1) activated adsorption of O_2, (2) formation of a surface compd. between the adsorbed O_2 and C_3H_6, (3) formation of a more highly oxidized intermediate product; from here, the process may branch out either into (4) complete oxidation to CO_2 and H_2O at the surface, of (4′) escape of peroxide-intermediates into space and completion of the oxidation in space.

11069. COLETTE, F. AND SCHEEPERS, L. **Catalytic oxidation of sulfur dioxide with vanadic anhydride.** *Chimie & industrie* 63, 246-51(1950).—*C.A.* 44, 7636*e*.

The exptl. arrangement and the detn. of SO_2 in the gas mixts. between 425° and 727°C was described. The gas mixt. contained SO_2 5.4, O_2 19.9, and N_2 74% by vol. With a gas flow of 100 ml/min. and a catalyst wt of 6.58 g (4.45% V deposited as V_2O_5 on porous SiO_2) the max. yield was 98.78% at 442°C. When the catalyst wt was reduced to 0.845 g at the same gas-flow rate (contact period 7.8 times shorter than the 1st), the max. yield was 83.6% at 537°C. With porcelain in place of the V catalyst, but under otherwise identical conditions, max. transformation was 36% at 690°C. The most favorable gas compn. was probably independent of the nature of the catalyst.

11070. COUSSEMANT, F. AND JUNGERS, J. C. **Kinetics of the catalytic hydrogenation of phenols.** *Bull. soc. chim. Belges* 59, 295-326(1950).—*C.A.* 45, 4124*b*.

A theoretical and exptl. study of the catalytic hydrogenation of PhOH on Ni showed that the reaction proceeded in 2 steps with the intermediate formation of cyclohexanone. The reaction was studied with H_2 and H donors (secondary alcs.). The activation energy for the formation of PhOH was 8500 cal/mol.; for cyclohexanol from cyclohexanone, 6500 cal/mol.

11071. CREMER, E. **Relation between the energy and the entropy factor of the Arrhenius equation for heterogeneous reactions.** *J. chim. phys.* 47, 439-45(1950).—*C.A.* 44, 9783*d*.

For catalytic reactions, the const. *A* in the equation $k = A \exp(-q/RT)$ frequently increased exponentially with *q*, where *k* was the sp. reaction velocity const. and *q* the measured energy of activation. Frequently, *q* was a linear function of the temp. of prepn. of the catalyst. The leak of electrons by a tunnel effect on the catalyst surface may account for the exponential relation between *A* and *q*.

11072. CREMER, E. AND KULLICH, E. **Catalytic surface activity of burned magnesite.** *Radex Rundschau* **1950**, 176-9—*C.A.* 45, 5011*e*.

The catalytic surface activity was detd. for the decompn. of HCOOH from 310° to 450°C over MgO (made from magnesite at temps. from 370° to 900°C). The pressure increase due to H_2 and CO_2 was detd. The activation energies of the reaction depended on the temp. at which the preliminary treatment was made and ranged between 15 and 52 kcal/mol. The catalytic effect increased gradually with temp. up to a max, at 800°C; above 800°C it decreased sharply.

11073. CROWELL, J. H.; BENSON, H. E.; FIELD, J. H., AND STORCH, H. H. **Fischer-Tropsch oil circulation processes.** *Ind. Eng. Chem.* **42**, 2376-84(1950).

Catalyst cementing was circumvented by employing a moving bed of catalyst in which lifting action of the circulating oil was used to expand the catalyst bed and keep the particles in motion. Details of induction and synthesis operations, operating data, analyses of gas and liquid streams, calcd. yields, and a typical product distribution were given for various expts.

11074. DELEO, E.; INDOVINA, R., AND PARLATO, A. **Catalytic decomposition of hydrogen peroxide in the presence of deuterium oxide.** *Ann. chim.* (Rome) 40, 251-6(1950).—*C.A.* 45, 10019*c*.

The catalytic effect of colloidal Pt and of KI on H_2O_2 in presence of 20% D_2O was studied at 14°-40°C where the following reactions were stipulated: $H_2O_2 + D_2O = HDO_2 + HDO$; $H_2O_2 + D_2O = D_2O_2 + H_2O$; $H_2O_2 + HDO = HDO_2 + H_2O$. D_2O inhibited the catalytic action of colloidal Pt and the observed effect on the rate was due to D_2O_2 formation.

11075. DOWDEN, D. A. **Heterogeneous catalysis. II. Hydrogenation by binary alloys.** *J. Chem. Soc.* **1950**, 265-71.—*C.A.* 44, 7635*b*.

The activity of the Ni in Ni-Cu catalysts declined in parallel with the filling of the holes in its 3d-band by the valency electrons of the Cu. This occurred while the crystal lattice was expanding slightly in the direction of increased activity on the simple geometric view. Magnetic susceptibilities of the catalysts were measured at a field strength of 4000 oersteds.

11076. DOWDEN, D. A. AND REYNOLDS, P. W. **Some reactions over alloy catalysts.** *Discussions Faraday Soc.* **1950**, No. 8, 184-8, discussion 189-90.—*C.A.* 45, 9988*c*.

Activity of Ni-Fe alloys in multiple-bond hydrogenation should increase rapidly in the region where the energy density of electron levels at the Fermi surfaces rises. Moreover, reactions controlled by the rate of transfer of an electron from metal to substrate should, in the Ni-Cu alloys, decrease in rate as the *3d*-band begins to empty. Results on *styrene hydrogenation over Ni-Fe catalysts* and *H_2O_2 decompn. on Ni-Cu alloy foils* confirmed the predictions. Methanol and formic acid decompns. on the Ni-Cu alloys decreased in speed as the *3d*-band holes were filled.

11077. ECKSTROM, HARTLEY C. AND ADCOCK, WILLIS A. **A new iron carbide in hydrocarbon synthesis catalysts.** *J. Am. Chem. Soc.* 72, 1042-3(1950).—*C.A.* 45, 2649*c*.

The new Fe carbide appeared along with Fe_3O_4 and Fe_2C during the course of a fluidized synthesis run at 27 atm. pressure and 360°C. Eventually it constituted approx. 90% of the total catalyst charge and was ferromagnetic.

11078. EĬDUS, YA. T. AND GUSEVA, I. V. **Effect of ammonia in the incoming gas on the catalytic hydrogenation of carbon monoxide to higher hydrocarbons.** *Izvest. Akad. Nauk, Otdel. Khim. Nauk* **1950**, 287-90.—*C.A.* 44, 8087*d*.

Addn. of NH_3 to a mixt. of 1 $CO:2H_2$ flowing 5 hrs at 80-90 liters/liter catalyst/hr at 190°C under atm. pressure over a Co catalyst (5g metal over 35 cm) resulted in marked decrease of the yield of higher hydrocarbons. The percentage of CO reacted decreased in the same degree as the yield of hydrocarbons. A ppt. of $(NH_4)_2CO_3$ was formed at the end of the reactor. As soon as the NH_3 was shut off, the yield reverted to its original high level. The inhibition by NH_3 was not due to a reaction $NH_3 + CH_2 \rightarrow MeNH_2$.

11079. EĬDUS, YA. T.; ZELINSKII, N. D., AND PUZITSKII, K. V. **Catalytic hydrocondensation of carbon monoxide with olefins. III. Polymerization and hydropolymerization of ethylene under the conditions of hydrocondensation catalysis.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1950**, 98-109.—*C.A.* 44, 6100*g*.

C_2H_4 alone and in mixt. with H_2 was passed at 190°C, under atm. pressure, over the catalyst after it had been used for 120 hrs in hydrocondensation of 1 $CO:2\ H_2:3\ C_2H_4$. Passage of H_2 alone over a catalyst having been used in runs with $CO + H_2 = C_2H_4$, produced no significant amts. of liquid, and no light oil. Passage of 1 $H_2:1\ C_2H_4$ on a fresh catalyst produced practically no oil, only hydrocarbons C_4. The main mass of the C_2H_4 was hydrogenated to C_2H_6. These results were thought due to the presence of CH_2 radicals at certain points of the lattice of the metallic catalyst surface having been used with $CO + H_2 + C_2H_4$.

11080. EPSHTEĬN, D. A. **Mechanism of the catalytic oxidation of ammonia.** *Doklady Akad. Nauk. S.S.S.R.* 74, 1101-4(1950).—*C.A.* 45, 1856*d*.

A 100-fold increase of the time of stay of the $NH_3 + O_2$ reaction mixt. in the catalyst zone did not change the relative rates of the reactions $4\ NH_3 + 5\ O_2 = 4\ NO + 6H_2O$ and $4\ NH_3 + 3\ O_2 = 2\ N_2 + 6\ H_2O$. Catalysts for the oxidation of NH_3 were good chemisorbents for O_2, and oxidation of NH_3 to NO required a 1.3-1.4-fold excess of O_2 over the amt. given by the 1st stoichiometric equation; this was evidence that the oxidation took place on O_2 adsorbed on the catalyst surface. NH_3 reacted with the adsorbed O_2 forming an activated complex in which O was bound directly with the N atom, and which decompd. directly into NO and H_2 which, in turn was oxidized to H_2O.

11081. EUCKEN, A. **The hydrogenation of unsaturated hydrocarbons on nickel contacts. II. Kinetic investigations.** *Z. Elektrochem.* 54, 108-20(1950).—*C. A.* 44, 9785*g*.

The hydrogenation of cyclohexene and of ethylene was studied on Ni at 0°C and total pressures below 0.2 tor in a static system. The catalysts used were Ni foil, Ni powder prepd. by reduction of $NiCO_3$ or Ni formate, Raney Ni, and Ni films prepd. by evapn. The surface of the powder catalysts was detd. by A adsorption measurements at 90°K: Ni-powder, 2 m^2/g, and Raney Ni about 20 m^2/g. The catalytic activity remained fairly const. upon heating the catalysts in H_2 with or without preceding oxidation up to 280°C. Cyclohexene was chemisorbed on Ni and cyclohexane by van der Waals forces only.

11082. EUCKEN, A. AND HEUER, K. **Catalytic dehydrogenation and dehydrogenation of alcohol on oxides.** *Z. physik. Chem.* 196, 40-55(1950). —*C. A.* 45, 8864*b*.

The oxides, followed by % dehydrogenation of EtOH at 300-400°C (the remainder was dehydrated), were: Cu_2O 100, CuO 100, MgO 69, MnO (fresh) 67, MnO (incipient reduction) 95, CdO 52, FeO 50, SnO 57, ZnO 92, BeO 56, TiO_2 31, SnO_2 46, UO_2 45, ZrO_2 45, La_2O_3 45, Cr_2O_3 5, V_2O_3 3, Fe_2O_3 (fresh) 1, Fe_2O_3 (incipient reduction) 9, Fe_2O_3 (strongly reduced) 32, α-Al_2O_3 2, γ-Al_2O_3 2, $ZnAl_2O_4$ 17, WO_3 0. Expts. were also made with ZnO, BeO, and La_2O_3, coated with H_2O, acetone, Cl^-, H_2, and K^+. Adsorption isobars were detd. for H_2 on free and on H_2O-coated ZnO and La_2O_3; isotherms were detd. for H_2 on free and on H_2O-coated BeO at 175°C. Adsorption of polar mols. on the catalyst surface decreased the dehydrogenating activity.

11083. FENIMORE, CHARLES P. AND KELSO, JOHN R. **Chemiluminescence of the sodium- or sodium halide-catalyzed oxidation of carbon monoxide by nitrous oxide.** *J. Am. Chem. Soc.* 72, 5045-8(1950).—*C. A.* 45, 2780*e*.

At 550°-600°C in reaction vessels coated with NaCl or NaBr and possessing temp. inequalities, the slow reaction of CO and N_2O was catalyzed by the alkali halide with simultaneous emission of the Na resonance lines. The mechanism of the formation of Na atoms from NaCl or NaBr was uncertain. The slow N_2O- CO reaction did not excite the metal lines in KCl- or NaI-coated vessels. It did, however, briefly excite the red Li line in a LiCl-coated vessel.

11084. FILIPPOV, YU. V.; LEBEDEV, V. P.; ZALAMAN, V. V., AND KOBOZEV, N. I. **Synthesis and decomposition of ammonia in electrical discharges. II. Sensitized synthesis of ammonia in a glow discharge.** *Zhur. Fiz. Khim.* 24, 1009-15(1950).—*C. A.* 45, 1882*f*.

The synthesis of NH_3 in the presence of vapors of Hg, Zn, and Cd in a glow discharge was studied. The effect of Hg was pos., while Zn and Cd gave neg. effects. An explanation of the observed phenomena was offered on the basis of the energies of the reacting mol. and radicals. A mechanism, occurring by means of excited N and at. H, was proposed for the electrosynthesis of NH_3.

11085. FLAMME, M. L. R. **Detailed study of a Raney nickel reduction.** *Chimie & industrie* 63, No. 3bis, 489-91(1950).—*C. A.* 47, 392*h*.

The optimum conditions for the hydrogenation of $PhNO_2$ with Raney Ni were detd. by variation of the H_2 pressure, temp., quantity of catalyst, batch size, and storage conditions for the catalyst. The optimum quantity of Raney Ni for the reduction of $PhNO_2$ was 0.5 ml apparent vol. at 25 atm. pressure. The reaction had to be initiated by heating to 150°C and proceeded best at 200-20°C and a const. pressure of 20-25 atm. in 40-50 min. to completion to yield at least 97% $PhNH_2$.

11086. FLID, P. M. AND KAGAN, M. YA. **Kinetics and mechanism of catalytic (de)hydrogenation. IV. Kinetics of cyclohexane dehydrogenation on nickel and chromium oxide.** *Zhur. Fiz. Khim.* 24, 1409-15(1950).—*C. A.* 45, 4124*c*.

The prepn. of a Ni catalyst on Al_2O_3 (23.6% Ni) was described. An Fe-free silica gel was also impregnated with a soln. of CrO_3, dried, heated up to 480°C during 7-8 hrs in H_2. The catalyst contained 20% Cr_2O_3. The reaction was studied in a flow system (±0.5°). The Ni catalyst was reduced by H_2 at 10-15° above the temp. of the run during 1.5 hrs, and the chromia catalyst was first treated with O_2 during 3 hrs at up to 500°C, then reduced by H_2 at 400-420°C during 2 hrs. The findings were explained on the basis of a retardation of the reaction by adsorption of C_6H_6 for the Ni catalyst and H_2 for the Cr_2O_3 catalyst.

11087. FOLKINS, HILLIS O.; MILLER, ELMER, AND HENNIG, HARVEY. **Carbon disulfide from natural gas and sulfur. Reaction of methane and sulfur over a silica gel catalyst.** *Ind. Eng. Chem.* 42, 2202-7(1950).—*C. A.* 45, 1309*i*.

The formation of CS_2 by the reaction of CH_4 and S vapor over a silica gel catalyst was studied at 500°-650°C. The CH_4-S system, the thermodynamics of the reaction, the effect of varying reactant ratio, the life of the catalyst, and the quality of the CS_2 produced were discussed.

11088. FØRLAND, KATRINE S. **Final surface structures and surface effects.** *Tids. Kjemi, Bergvesen Met.* 10, 260-3(1950).—*C. A.* 45, 2298*b*.

Surface structures and surface effects during and after catalysis were illustrated by the adsorption of Ag^+ on metal and glass surfaces, by the surface action of SiO_2 and Al_2O_3 or SiO_2 and $Mg(OH)_2$ as cracking catalysts, and by the oxidation of hexamethyltriaminotriphenylmethane over TiO_2 contg. Ta_2O_5.

11089. GIRELLI, A. AND SINIRAMER, C. **Catalytic desulfurization of gasoline from Middle Eastern crude oils.** *Riv. combustibili* 4, 152-63(1950).—*C. A.* 44, 9664*a*.

Removal of all (0.03 to 0.11%) but the cyclic S compds. from two gasolines was accomplished by passing the vapors over bauxite at 300°-550°C (350°-400°C optimum) at atm. pressure. An improvement in octane number of 1-2 units resulted in the unleaded gasolines; of 5-8 units in the leaded product.

11090. Givaudon, J.; Nagelstein, E., and Leygonie, R. **Thermal and chemical effects observed with chromium oxide catalyst on alumina.** *J. chim. phys.* 47, 304-9(1950).—*C.A.* 44, 7636c.

A catalyst consisting of 10% Cr_2O_3 on Al_2O_3 was subjected to cycles of H_2, N_2, and air at 250°-550°C. Temp. rises in the catalyst were observed when either H_2 or air was passed over the catalyst; the rise was greater in the case of H_2. CrO_3 was formed in air and this compd. was reduced to Cr_2O_3 by H_2. A pilot plant using a fluidized Cr_2O_3-Al_2O_3 catalyst was described for the formation of toluene from heptane.

11091. Gross, H. W. **Gas detoxification.** *Gas- u. Wasserfach* 91, No. 3 *(Gas)*, 44(1950).—*C.A.* 44, 5079*h*.

The CO content (20%) of gas from the Lurgi pressure producer was reduced by passage over a Ni, Co, or Fe catalyst, with accompanying increase in CH_4 content, production of solid and liquid hydrocarbons, and increase in heating value. The original gas had a heating value of 4200 kcal/m^3; use of a Ni or Co catalyst increased this to 7200 kcal/m^3 and an Fe catalyst to 4800 kcal/m^3. It was not economical to remove all of the CO in one step. Careful removal of S compds. and gum formers by means of an active carbon filter was necessary before conversion.

11092. Gross, H. W. **Production of detoxicated pipe-line gas through pressure gasification and synthesis over iron catalysts.** *Erdol u. Kohle* 3, 218-22(1950).—*C.A.* 44, 7513*g*.

Fe catalysts rather than Ni or Co were preferred because the heating value and burning properties of the final gas was not changed appreciably. In practice a two-step conversion was advocated. A modern synthesis unit had a daily capacity of 40 tons of liquid products and 640,000 m^3 of detoxicated gas. Gases of higher heating value may be obtained by introducing a second synthesis step.

11093. Gryaznov, V. M.; Frost, A. V., and Yufit, S. S. **Temperature dependence of the degree of hydrogenation of benzene on palladium catalysts.** *Vestnik Moskov. Univ.* 5, No. 6, *Ser. Fiz.-mat. i Estest. Nauk* No. 4, 35-9(1950).—*C.A.* 45, 4540*h*.

Two catalysts (Pd 1.48% and 0.18%) were prepd. by impregnating silica gel with $Pd(NH_3)_4Cl_2$ and reduction with H_2. On both catalysts, the reaction was zero-order with respect to C_6H_6 in the presence of excess H_2. On the first catalyst (column 11 cm long) at const. feed rate of C_6H_6 = 18, H_2 = 56 millimole/hr, the degree of hydrogenation remained const. and temp.-independent, ~60%, between 120° and 220°C, then fell to 26% at 267°C. On the second catalyst at the const. feed rate C_6H_6 = 9, H_2 = 27 millimole/hr, the degree of conversion increased (3.3, 5, 7.5, and 9.2%, at 145°, 168°, 192°, and 208°C, resp.). In this range, the activation energy was 6.4 kcal/mole.

11094. Guillemin, A. and Vincent-Genod, J. **Catalytic effects observed in the aromatization of paraffinic cuts.** *J. chim. phys.* 47, 483-8(1950).—*C.A.* 44, 10307*d*.

The activities of 10% Cr_2O_3-90% Al_2O_3 and 12% MoO_3-88% Al_2O_3 catalysts were detd. for the aromatization of paraffinic petroleum-cuts at about 500°C. In a few expts., 1% V_2O_5 or 1% KVO_3 was added as a promoter. Fixed-bed and fluid-bed techniques were both employed. The MoO_3-Al_2O_3 catalyst proved to be the more satisfactory. A total liquid yield of 70 wt-% with an aromatic content of 75% to 85% was obtained. A German Al_2O_3 with an area of 222 m^2/g was slightly more effective as a catalyst support than a French sample having an area of 80 m^2/g.

11095. Hays, Harrison L. and Dolezal, Edward. **The commercial dehydrogenation of normal butane.** *Quart. Colo. School of Mines* 45, No. 2A, 31-58(1950).—*C.A.* 44, 5086*b*.

Preheated feedstock contg. 98% butane was dehydrogenated over a chromia-alumina catalyst in reactors at 1100°F and 20 p.s.i. The product was a mixt. of 1- and 2-butenes in approx. equil. concn. The ultimate yields averaged 82% at conversions of 31% and space velocities of 600-700 standard ft^3 per hr of butane vapor per ft^3 of catalyst. To regenerate the catalyst, a mixt. of N_2, CO_2, and 2.5% O_2 at 800°F and 130 p.s.i. was blown through the tubes at a space velocity of 2500-3000 vols. gas/vol. catalyst/hr to burn off the accumulated carbon. The catalyst life was 200-250 days.

11096. Herbo, Cl. **The mechanism of catalytic hydrogenation and dehydrogenation over solid catalysts.** *J. chim. phys.* 47, 454-73(1950).—*C.A.* 44, 9785*b*.

The initial rate of hydrogenation of Me_2CO over a 50:10:40 Ni:ZnO:Cr_2O_3 catalyst as detd. in a flow system was independent of the partial pressure of Me_2CO and H_2. The energy of activation was 12 kcals between 140° and 170°C. The apparent temp. coeff. became neg. above 200°C. At 246°C the rate of reaction was proportional to the product of the partial pressures of Me_2CO and H_2. The hydrogenation of C_6H_6 to cyclohexane gave similar results to those obtained for Me_2CO hydrogenation except that the energy of activation was 11 kcals.

11097. Herglotz, H. **Relation between the constants of the Arrhenius equation for heterogeneous catalysis.** *Monatsh.* 81, 1162-4(1950).—*C.A.* 46, 1854*a*.

A Raney-Co catalyst was studied for conversion of organically bound S to H_2S. On contact, the heterogeneous equil. $mCoS_x + nH_2 \rightleftharpoons nH_2S + mCo$, where $mx = n$, showed a measurable H_2S pressure above 400°C. Measurements made using Raney Co having different contents of active component showed that the slope of the log k line as a function of $1/T$ was greater, the larger the amt. of active component in the catalyst.

11098. Holman, Orlo B. **Cyclic catalytic reforming.** *Gas* 36, No. 12, 36-7(1950).—*C.A.* 45, 1323*d*.

The superheater of a water-gas set was modified for catalytic reforming of natural gas by blanking off from the rest of the set and installing a combustion chamber, preheat bed, and catalyst bed. The output gas could be varied as regards inert and H_2 content as desired, and was mixed with natural gas, etc. to give the desired heating value.

11099. Kagan, M. Ya. **Some foundations of the multiplet theory of catalysis.** *Doklady Akad. Nauk S.S.S.R.* 74, 61-3(1950).—*C.A.* 45, 426*f*.

The multiplet theory of heterogeneous catalysis was in conflict with the principle of microscopic reversibility. As an example, the dehydrogenation of EtOH to AcH and the reverse hydrogenation of AcH to EtOH, as represented by the doublet theory, must occur on different pairs of points of the catalyst, and, consequently, the 2 reverse processes on the same catalyst proceed over different intermediate states, in contradiction of the activated-complex theory. The decisive factor was not the geometry, but the energy factor due to the nonlocalized double bonds.

11100. Karpacheva, S. M. and Rozen, A. M. **Oxygen exchange between oxide catalysts and water vapor.** *Doklady Akad. Nauk S.S.S.R.* 75, 55-8(1950).—*C.A.* 45, 1855*b*.

Rates of exchange of O^{18} between metal oxides, MO, and H_2O vapor were detd. both in the forward direction, $MO^{16} + H_2O^{18} \rightarrow MO^{18} + H_2O^{16}$, and in the reverse direction by measurements of the O^{18} content in the initial and the reacted H_2O. On a Cr_2O_3 10% + Al_2O_3 90% contact, on active Al_2O_3, on MnO_2, and on granulated CuO, the exchange was characterized by a sharp slowing down with progressing satn. The analogy between the isotopic exchange and activated adsorption was plausible on account of the large surface area of the oxides (100-300 m^2/g). On the other hand, activated adsorption involved also some amt. of bulk sorption.

11101. Karpacheva, S. M. and Rozen, A. M. **Exchange between some oxides and liquid water, alcohol, and gaseous oxygen.** *Doklady Akad. Nauk S.S.S.R.* 75, 239-42(1950).—*C.A.* 45, 3228*i*.

Effective forward ($MO^{16} + H_2O^{18} \rightarrow MO^{18} + H_2O^{16}$) and back exchange ($MO^{18} + H_2O^{16} \rightarrow MO^{16} + H_2O^{18}$) between liquid H_2O and metal oxides MO, at room temp., were observed with a $Cr_2O_3.Al_2O_3$ catalyst, active Al_2O_3 (a dehydration catalyst), active ZnO (also a dehydration catalyst), and SiO_2 gel. The rates of exchange were lower than with H_2O vapor at higher temps. Back exchange between a tagged oxide and gaseous O_2 was observed, with MnO_2 at as low as 70-80°C, $CaCO_3$ at 350°C. V_2O_5 at 450°C, and with natural dunite at 800°C. If the catalytic activity of an oxide was characterized by the lowest temp. at which it was able to catalyze an oxidation, the order of activities of MnO_2 (room temp.), V_2O_5 (350°-450°C), and CuO (600°-800°C), coincided with the order of ease of exchange of O^{18} with O_2.

11102. Kastens, Merritt L. and Sutherland, Robert. **Platinum reforming of gasoline.** *Ind. Eng. Chem.* 42, 582-93(1950).—*C.A.* 44, 5085*f*.

Hydrocracking can be considered as a simultaneous cracking-isomerization-hydrogenation reaction which produced fragments from a parent mol. of higher mol. wt in general than the products of thermal or catalytic cracking. Isomerization proceeded faster than hydrocracking and reached a max. at a space velocity of 5.0; lower space velocities giving excessive amts. of C_3 and C_4 gases. The S removal was predominantly as H_2S. Catalyst temps. of 800-900°F and pressures of 500-900 p.s.i.g. were employed.

11103. Katz, Morris; Grant, G. A., and Riberdy, R. **Oxidation of carbon monoxide by solid silver permanganate reagents. II. Kinetic studies with silver permanganate-zinc oxide.** *Can. J. Research* 28B, 799-814(1950).—*C.A.* 45, 3695*g*.

The kinetic equations of the adsorption wave were applied to the oxidation of CO in an air stream by granular $AgMnO_4$-ZnO reagent. The relations between concn. of escaping gas and time, column length and breakdown time, and flow rate and breakdown time agreed with the theory; but the predicted linear relations between the crit. column length and the reciprocal of the crit. flow time with the log of the initial concn. were not confirmed. Diffusion of gas mols. to the surface of the granules detd. the rate, since the rate const. varied directly with the flow rate.

11104. Katz, Morris and Halpern, Sophie. **Oxidation of carbon monoxide in air by silver permanganate.** *Ind. Eng. Chem.* 42, 345-52 (1950).—*C.A.* 44, 3341*i*.

Flow system and prepn. of $AgMnO_4$-metallic oxide catalysts were described. For an initial CO concn. of approx. 0.50 in air, the mole % and breakdown time (to 90% efficiency) were: MoO_2 59.5, 106; MnO_2 71.0, 89 (here given to 92% efficiency); Fe_2O_3 48.3, 122; TiO_2 65.3, 100; ZrO_2 63.2, 92.5; CeO_2 57.0, 88; SiO_2 71.0, 53; SnO_2 50.0, 117; $Al_2O_3.2SiO_2.2H_2O$ 36.5, 112; Co_2O_3 56.0, 99; CuO 80.8, 73; Sb_2O_3 33.5, 82; CdO 54.0, 43; Pb_3O_4 35.0, 51; V_2O_5 54.0, 41; Al_2O_3 54.0, 29. $AgMnO_4$-ZnO catalyst (oxide mol. compn. 69%) was outstanding. Life of a granular bed of a $AgMnO_4$-kaolin catalyst increased from 76.5 min. at 1.5° to 126 min. at 24°C.

11105. Kearby, K. K. **Catalytic dehydrogenation of butenes.** *Ind. Eng. Chem.* 42, 295-300 (1950).—*C.A.* 44, 3874*d*.

A catalyst having the compn. 72.4% MgO, 18.4% Fe_2O_3, 4.6% CuO, 4.6% K_2O was selected as promising for the steam-diln. butene dehydrogenation process for the production of butadiene. The catalyst combined a K promoter with a satisfactory dehydrogenating compd. The stability of the catalyst to heating at high temps. varied considerably with its method of prepn. The performance characteristics were compared with other catalysts contg. the active oxides of Cr, Co, Mn, Cu, Ni, V, Mo, and W, and as the promoter, oxides of Li, Na, Rb, Cs, Ca, Sr, and Ba.

11106. KOIKE, DENZO. **Vanadium-phosphoric acid catalyst. I. Polymerization of 1-butene by phosphoric acid-vanadium oxide-kieselguhr catalyst.** *J. Chem. Soc. Japan.*, Pure Chem. Sect. 71, 595-6(1950).—*C.A.* 45, 6774*f*.

The catalyst employed was prepd. by heating at 200°C a mixt. of 90% H_3PO_4 (82 g) and 1 g of V_2O_5, obtained by heating ammonium metavanadate at 440-450°C for 20.5 hrs, and by heating further the resulting mixt. with addn. of 18 g of kieselguhr. Another catalyst without the addn. of V_2O_5 was similarly prepd. Polymerization took place with the first catalyst to 92%, the optimum temp. being 150-170°C, and with the second catalyst to 52%, the optimum temp. being 200°C.

11107. KOIZUMI, MASAO. **Catalytic isotopic exchange reaction of hydrogen between different olefinic hydrocarbons. II.** *J. Inst. Polytech., Osaka City Univ.* 1, No. 2, 1-9(1950) (in English).—*C.A.* 46, 1339*f*.

The exchange reaction of D between heavy ethylene and C_3H_6 over 1.8 g Ni catalyst at 45°C was studied. The methylene H atoms were most easily exchanged, followed by the single H on the central C atom which exchanged several times more slowly; the total time required was about 100 hrs. The H atoms of the Me group were also replaced, but extremely slowly.

11108. KÖLBEL, HERBERT AND ACKERMANN, PAUL. **Reaction mechanism of the Fischer-Tropsch synthesis. IV. The molecular size of the aliphatic hydrocarbons from the catalytic hydrogenation of carbon monoxide.** *Brennstoff-Chem.* 31, 10-14(1950).—*C.A.* 44, 3697*a*.

When higher mol. liquid aliphatic hydrocarbons (C_{15} to C_{19} hydrocarbons from Kogasin) were introduced into the Fischer-Tropsch synthesis, they formed solid hydrocarbons by chain lengthening under synthesis conditions that normally led to the predominant formation of high mol. hydrocarbons, solid at normal temps. The rate of this chain lengthening was directly related to the building up activity of the catalyst.

11109. KÖLBEL, HERBERT AND ENGELHARDT, FRIEDRICH. **Reaction mechanism of the Fischer-Tropsch synthesis.** *Chemie-Ing. Tech.* 22, 97-104(1950).—*C.A.* 44, 5566*g*.

In place of Franz Fischer's carbide theory, a working hypothesis for the mechanism of CO hydrogenation was presented based on chemisorption concepts.

11110. KÖLBEL, HERBERT AND ENGELHARDT, FRIEDRICH. **Reaction mechanism of the Fischer-Tropsch synthesis. VI. The function of water vapor in the carbon monoxide hydrogenation.** *Erdol u. Kohle* 3, 529-33(1950).—*C.A.* 45, 2177*a*.

Curves of CO conversion in per cent *vs.* space velocity (Fe-Cu-kieselguhr catalyst aged for 100 hrs, $CO/H_2O = 1:1$, atm. pressure) showed a rapid reduction of conversion with increasing space velocity at 180°-200°C. At 240°C and space velocity 100 (Fe-Cu catalyst) was completely inactivated at $CO/H_2O = 4:4$ while at 4:2 and 4:1 remained active for more than 1000 hrs. Fe-Cu catalyst became inactive in 9-16 hrs between 200 and 240°C while a Co-Th-Mg-kieselguhr catalyst was not affected below 190°C. The oxidized Fe catalyst could not be reactivated by means of H_2, CO, or a mixt. of the two. A large portion of the Fe catalyst became permanently deactivated at normal space velocities and at high H_2 concn. The mechanism of the synthesis was explained as chemisorption.

11111. KRASNOVSKIĬ, A. A. AND GUREVICH, T. N. **Photocatalytic action of some metal oxides.** *Doklady Akad. Nauk S.S.S.R.* 75, 715-18(1950). —*C.A.* 45, 2782*b*.

The rate of oxidation by O_2 of linseed oil and of linoleic acid in toluene or EtOH soln., heterogeneously catalyzed by metal oxides was accelerated by simultaneous illumination with long-wave ultraviolet (400-410 mμ or shorter) absorbed by the solid oxide but not by the reactant and solvent. The effects of illumination on the rate of the catalytic decompn. of H_2O_2 at 40°C were given by the following oxides: ZnO, TiO_2, Fe_2O_3, Cr_2O_3, Pb_3O_4, PbO. The photocatalytic effect was pronounced with TiO_2 and Pb_3O_4 and PbO, to a lesser extent on ZnO.

11112. KRAUSS, WALTHER. **The catalytic oxidation of ammonia. I. The kinetics of the primary reaction and the contact lifetime of hydroxylamine.** *Z. Elektrochem.* 54, 264-72 (1950).—*C.A.* 45, 29*h*.

The oxidation of NH_3 on Pt and Pt-10% Rh catalysts was studied in a flow system at pressures of the order of 10^{-2}mm and at 740° to 1250°C. The primary reaction was the combination of NH_3 with O atoms dissocd. on the catalyst surface ($NH_3 + O \rightarrow NH_2OH$). The heat of adsorption of NH_2OH on Pt was 23 kcal and the mean lifetime of NH_2OH was 3×10^{-12} exp. (5000/RT) sec. The rate of NO formation was given.

11113. LESOKHIN, I. G. AND MUKHLENOV, I. P. **Arsenic poisoning of vanadium catalysts in the production of sulfuric acid.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 23, 449-59 (1950).—*C.A.* 47, 276*i*.

The degree of oxidation of SO_2 to SO_3 was detd. in SO_2 + air mixts. contg. known concns. *c* of As_2O_3, flowing at a space velocity of 185-200 ml (S.T.P.)/ml catalyst/hr, at 485 and 500°C. At any given *c*, the catalyst retained only a fraction of the As_2O_3 passed until a satn. amt. was reached. On further prolonged poisoning, absorption of As_2O_3 by the catalyst decreased and stopped at 11-12% As_2O_3 (of the wt of the satd. catalyst). Catalysts poisoned with small amts. of As_2O_3 could not be regenerated by an air blast at 450-575°C; only the As_2O_3 retained at higher *c* and over longer times could be removed in a hot-air stream.

11114. LESOKHIN, I. G.; TRABER, D. G., AND MUKHLENOV, I. P. **Influence of iron sulfates on vanadium catalysts in the production of contact sulfuric acid.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 23, 345-9(1950); *Chem. Tech.* (Berlin) 3, 145-7(1951).—*C.A.* 44, 7030*h*; 45, 10517*f*.

Mech. deposition of $FeSO_4$, up to 7%, on the catalyst caused some lowering of its activity only at 450°C, none at 485° and 500°C. The formation of rings at points of contact of the catalyst with the heat-exchange pipes was due to condensation of H_2SO_4 which, at lower temps., dissolved the active components of the catalyst. At higher temps., H_2SO_4 evapd. and left a solid ring of catalyst granules cemented by sulfates. If $FeSO_4$ or $Fe_2(SO_4)_3$ was incorporated into the catalyst at its prepn., its activity was lowered proportionally to the Fe content.

11115. LEVERING, DEWEY R.; MORRITZ, FRED L., AND LIEBER, EUGENE. **The promoter effect of platinic chloride on Raney nickel. I. General effects on type W-6 catalyst.** *J. Am. Chem. Soc.* 72, 1190-4(1950).—*C.A.* 44, 5199g.

The activating effects of $PtCl_4$, Et_3N and $PtCl_4$, and $(Et_3NH)_2PtCl_6$ on the more active forms of Raney Ni in the hydrogenation of several functional groups were studied. A rapid method was described for estg. the amt. of Ni in wet Raney Ni catalyst.

11116. LÖPMANN, B. **Gas detoxification.** *Gas- u. Wasserfach* 91, No. 3 *(Gas)*, 44(1950).—*C.A.* 44, 5079*i*.

The larger part of the CO from coke-oven gas was removed by passing the S-free gas over a Co catalyst at 120°-130°C. Little CH_4 was formed; the products were predominantly higher hydrocarbons (40 g per liter of gas), consisting largely of liquid and solid paraffin hydrocarbons. CO_2 removal was not necessary; the residual CO content was 1-1.5%, but this could be further reduced by a two-step process. The vol. contraction was about 15% and the increase in gas heating value about 200 kcal per m^3 per hr.

11117. MARGOLIS, L. YA. AND TODES, O. M. **Modification of catalysts for complete oxidation. I.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 20, 1981-90(1950); *J. Gen. Chem. U.S.S.R.* 20, 2053-62(1950)(Engl. translation).—*C.A.* 45, 2758*c*; 46, 5414*a*.

The kinetics of isoöctane oxidation on $MgCr_2O_4$-MgO (65 m^2/g), $CuCr_2O_4$-CuO and V_2O_5 was studied. The catalysts were impregnated with known amts. of impurities (0.5-10%), supported on asbestos and dried at 100°C. The impurities on the first two catalysts were H_3PO_4, H_3BO_3, $BaSO_4$, Na_2SiO_3, $Ba(NO_3)_2$, and HF. Up to 20% of these impurities failed to catalyze when supported directly on asbestos. The order and the activity changed abruptly at some crit. concn. of the impurity. A given "modifier" may be either a promoter or a poison according to its concn. It may change the order of the catalyzed reaction.

11118. MARGOLIS, L. YA. AND KRYLOV, O. V. **Modification of catalysts for complete oxidation. II.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 20, 1991-8(1950); *J. Gen. Chem. U.S.S.R.* 20, 2063-70(1950)(Engl. translation).—*C.A.* 45, 2758*f*; 46, 5414*a*.

The complete oxidation of C_2H_4 on $MgCr_2O_4$ + MgO contg. various amts. of Na_2SiO_3 was investigated between 260° and 470°C. The concn. of Na_2SiO_3 was varied between 1.5 and 5% of $MgCr_2O_4$ + MgO; the concn. of the catalyst on the asbestos (3g), between 1 and 3%. The rate const. was proportional to the catalyst concn. on the support. The complete oxidation of isoöctane on WO_3 on asbestos (50%) was also studied, with NaOH as an impurity. Pure H_2WO_4 was put into soln. by means of an excess of a concd. soln. of NH_4OH. The soln. was evapd. to dryness in a porcelain crucible; the resulting white crystals were decompd. by heating 2 hrs in air at 450°C. The yellow catalyst was supported on asbestos (50%). The following catalysts were inactive: (a) asbestos 50, WO_3 50, NaOH 17.3; (b) asbestos 50, NaOH 50; (c) asbestos 99, NaOH 1%.

11119. MARIANI, EUGENIO AND BALDASS, FELIX V. **Effect of the anionic ion-exchange resins in the hydrolysis of ethyl acetate.** *Ricerca sci.* 20, 324-5(1950).—*C.A.* 45, 3222*b*.

At 25 and 35°C Amberlite IR4B 1 g and 1, 2, and 3 g, resp., in 25 ml of 0.2 and 0.4 *N* EtOAc, resp., rapidly hydrolyzed EtOAc to a small nearly const. amt. per amt. of resin, namely 0.33, 0.37 mg/g. The same value applied to Amberlite IRA-400, and was not changed by letting the mixt. stand 25-35 hrs.

11120. MAY, D. R.; SAUNDERS, K. W.; KROPA, E. L., AND DIXON, J. K. **The mechanism of the catalytic cracking of unsymmetrical diarylethanes.** *Discussions Faraday Soc.* 1950, No. 8, 290-5, discussion 295-6.—*C.A.* 45, 9990*e*.

The catalytic cracking of substituted 1, 1-diarylethanes on siliceous catalysts to form a substituted styrene was studied as a function of temp., contact time, diluent, catalyst particle size and area. At low contact times of 0.001-0.1 sec at 500°C the reaction was essentially without side reactions and had a low temp. coeff. The rate of cracking was dependent on the no. of collisions of the diarylethane with the external area of the particles. The rate of cracking decreased as the electronegativity of the substituents increased. A carbonium-ion mechanism seemed to be involved in this fast reaction. About 0.1% of the collisions with the catalyst surface were effective.

11121. MERKEL, HEINRICH. **Iron catalysts for Fischer-Tropsch syntheses.** *Brennstoff-Chem.* 31, 208-12(1950).—*C.A.* 44, 8564*i*.

Fe catalysts with and without the addn. of Cu were investigated thermomagnetically after pptn. and in different stages of drying at 105°C. The pptn. was strongly ferromagnetic immediately after pptn., but the temp.-magnetization curve was irregular. After drying for many hours, the Cu-contg. Fe catalyst uniformly gave magnetization curves with a Curie point of 470-475°C. The magnetization intensity was as great as when the catalyst was first formed. Drying (and oxidation) for 29 hrs failed to change the Curie point. However, this Curie point was not maintained at synthesis temps. Heating for 3.5 hrs at 220°C caused the complete decompn. of the compd.; a magnetically equiv. amt. of Fe_3O_4 was formed. In contrast with the behavior of the Cu-Fe catalyst, a copper ferrite prepd. by a different method showed a strong increase in magnetization after heating to 800°C.

11122. Milliken, T. H. Jr.; Mills, G. A., and Oblad, A. G. **The chemical characteristics and structure of cracking catalysts.** *Discussions Faraday Soc.* 1950, No. 8, 279-90.—*C.A.* 45, 9990*b*.

The silica-alumina gel catalyst had a surface containing ions which were disposed to move to a certain extent. Certain substances were able to induce a structural shift in the component atoms or ions of the surface, creating, thereby, complexes which undergo reaction. The decompn. of the complex involved a reverse of the previous reaction. These structural shifts involved coordination changes of strategically located ions. The apparent heterogeneity of a surface was real because the ions active for adsorption were not all exactly predisposed in the same way. It was more difficult to cause coordination shifts of some of the surface ions than others.

11123. Mills, G. A. **Aging of cracking catalysts. Loss of selectivity.** *Ind. Eng. Chem.* 42, 182-7(1950).—*C.A.* 44, 3244*b*.

Petroleum-cracking catalysts may lose selectivity for the max. production of gasoline owing to the presence of min. amts. of heavy metals in active form, especially Fe, Ni, V, and Cu. These metals may be present in charge stocks and accumulate in the catalyst, poisoning either clay or synthetic type. Com. clay catalyst usually contained Fe which was made catalytically active by reaction with S compds. in the charge, thus poisoning the catalyst. The presence of steam retarded this reaction.

11124. Mills, G. A.; Boedeker, E. R., and Oblad, A. G. **Chemical characterization of catalysts. I. Poisoning of cracking catalysts by nitrogen compounds and potassium ion.** *J. Am. Chem. Soc.* 72, 1554-60(1950).—*C.A.* 44, 6611*f*.

Organic N compds., such as quinoline, were adsorbed on SiO_2-Al_2O_3 (-MgO,-ZrO_2) catalysts. At 250°-500°C the physically held quinoline could be distinguished from that chemically held. At a given temp. the amt. of physically-held N compd. increased with an increase in its partial pressure; the amt. chemisorbed decreased with an increase in temp. The cracking activity of the catalysts studied was proportional to their capacity to chemisorb quinoline at cracking temps. Catalysts which had basic N compds. chemisorbed or which had K added by base exchange were poisoned for cracking. A relatively small fraction of the total surface of silica-metal oxide cracking catalysts was responsible for catalytic activity.

11125. Miyazaki, Shozo. **The catalytic decomposition of ammonia. IV. Decomposition by means of nickel.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 77-80(1950).—*C.A.* 45, 5011*d*.

The decompn. of NH_3 gas on Ni metal was studied at 700°-775°C. The NH_3 pressure was 150-350 mm Hg. The reaction was retarded by H_2 produced in the reaction. The calcd. activation energy from these initial reaction velocities was 47.2 kcal per mol.

11126. Miyazaki, Shozo. **Catalytic decomposition of ammonia gas. VI. The equation of reaction rates.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 71, 372-5(1950).—*C.A.* 45, 6473*a*.

The theoretical relation between the NH_3 pressure and the reaction rates was derived by statistical mechanics. The structure of the adsorbed or activated NH_3 gas mol. was examd.

11127. Miyazaki, Shozo. **The catalytic decomposition of ammonia gas. IX. Decomposition on platinum.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 549-51(1950).—*C.A.* 45, 7864*i*.

The thermal decompn. of NH_3 on Pt from 670° to 740°C was observed in the NH_3 pressure range of 3-15 mm Hg. The relations between the observed reaction rates and the reaction gas pressures were expressed theoretically. The activation energy of NH_3 and the heat of adsorption of the retarding gas were calcd. to be 28.4 kcal/mol. and 30.0 kcal/mol.

11128. Monrow, G. S. and Fischer, L. E. **Low-temperature hydrogen production.** *Ind. Eng. Chem.* 42, 92-4(1950).—*C.A.* 44, 3221*i*.

Expts. were conducted on the direct catalytic conversion of CH_4 and H_2O to H_2 and CO_2 at about 500-800°C, and at atm. and 250 p.s.i. Space velocities of CH_4 of about 120 per hr and mole ratios of H_2O:CH_4 of about 5 at atm. pressure and 32 at high pressure were used. The most effective catalysts were NiO or NiO and CuO on kieselguhr, and the optimum concns. about 7% CuO, 70% NiO, and 23% kieselguhr. This gave 55-92% conversion of CH_4. Increase of temp. increased H_2 yield and formation of CO. Increase of pressure decreased CO formation and H_2 yield, but the latter effect was nullified by increasing the H_2O:CH_4 mole ratio.

11129. Mooi, John and Selwood, Pierce W. **Catalytic decomposition of hydrogen peroxide over supported oxides of manganese.** *J. Am. Chem. Soc.* 72, 4333-4(1950).—*C.A.* 45, 2298*c*.

The mechanism of the heterogeneous catalysis of H_2O_2 over high-area γ-Al_2O_3-supported Mn oxides was studied by suspending the catalyst in H_2O contg. H_2O_2 and measuring the rate of O_2 evolution. The catalysts were prepd. by impregnating Al_2O_3 with $Mn(NO_3)_2$, drying, and igniting at 200°C. Each catalyst contained 4.60 mg of Mn. A max. activity of the catalyst was observed between 3 and 4 wt-% Mn and at an av. Mn oxidation state of 3.6.

11130. Moritani, Ichiro. **Contact cracking power of synthetic alumina-silicate catalyst for acetone. I. Composition of catalysts and the methods of preparation.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 53, 353-5(1950).—*C.A.* 46, 11505*c*.

The contact decompn. of acetone was studied at 300°C in the presence of Al_2O_3-SiO_2 catalyst prepd. by various methods. The catalyst with the compn. Al_2O_3:SiO_2 = 1:5 had the best activity.

11131. Murata, Yoshio; Matsumoto, Eiichiro, and Hoshino, Shohei. **Gasoline synthesis from carbon monoxide and hydrogen. LXXIII. Action of carbon monoxide on iron catalysts.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 53, 298-300(1950).—*C.A.* 46, 11632*e*.

The influence of the pretreatment with pure CO on the activity of Fe catalysts was studied. The longer the time of pretreatment, the smaller the gas velocity and the higher the temp. The effect of pretreatment could be enhanced by adding alc.

11132. Murata, Yoshio and Hara, Isao. **Gasoline synthesis from carbon monoxide and hydrogen. LXXIV. The influence of water vapor on iron catalysts.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 53, 338-40(1950).—*C.A.* 46, 11632*e*.

The influence of water vapor on the activity of Fe catalysts was studied under various conditions. Moisture contained in reacting component gases, however small the quantity may be, spoiled the activity of Fe catalysts in almost all cases.

11133. Naragon, E. A. **Catalytic isomerization of 1-hexene.** *Ind. Eng. Chem.* 42, 2490-3 (1950).—*C.A.* 45, 2185*g*.

The vapor phase isomerization of 1-hexene over several fixed-bed catalysts was reported. Activated alumina (low soda content), boria-alumina, phosphoric acid, acid-treated Doucil, and Universal Oil Products cracking catalyst (Type B) were the most active catalysts tested. Isomerization and hydrogenation both occurred when 1-hexene was treated over molybdena-boria-alumina at 600° to 775°F in the presence of H_2.

11134. Niclause, Michel and Duval, Xavier. **Thermal decomposition of acetaldehyde in the presence of a platinum filament at 1250°K.** *J. chim. phys.* 47, 850-65(1950).—*C.A.* 45, 9350*a*.

The decompn. of AcH at 1200-1300°K occurred only above pressures of 10 mm Hg. The reaction order was 3/2 at 100 mm Hg, and increased slightly at lower pressures. The energy of activation was 53 kcal. At higher pressures the filament acted only as a source of heat and not as a catalyst.

11135. Niclause, Michel; Duval, Xavier, and Letort, Maurice. **Thermal decomposition of acetaldehyde in the presence of a platinum filament at 1250°K.** *Compt. rend.* 231, 491-3 (1950).—*C.A.* 45, 3226*h*.

The pyrolysis of CH_3CHO took place in the gas phase in the heated zone near the filament, and was independent of any catalytic process.

11136. Nobori, Hiroso; Anzo, Hideo; Kobashi, Tokuo, and Tahira, Tsuyoshi. **Preparation of higher fatty alcohols from sperm blubber oil by catalytic hydrogenation.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 53, 74-7(1950).—*C.A.* 46, 8877*e*.

Among various hydrogenation catalysts, CuO-diatomaceous earth contg. ZnO was found to be effective. At max. pressure of 190 atm., a product of hydroxyl value 203.7 was obtained. Addn. of a small amt. of Cr_2O_3 or NiO increased the activity and durability of the catalyst.

11137. Obolentsev, R. D. and Gryazev, N. N. **Dealkylation of isopropylbenzene on an aluminosilicate catalyst.** *Doklady Akad. Nauk S.S.S.R.* 73, 121-4(1950).—*C.A.* 44, 9224*d*.

In a flow system at 350°C (space velocities 0.5-4.0 liter/liter catalyst/hr), 400°C (1.0-12.0), and 450°C (1.0-15.0), iso-PrPh formed gaseous products consisting mainly of C_3H_6 with some admixt. of C_3H_8. At 350°C, there was also some amt. of CH_4, increasing with the contact time (up to 4.4 vol. %); at 400-50°, the gas also included small amts. of H_2, C_2H_4, C_2H_6, C_4H_8, and C_4H_{10}. The rate of the dealkylation was described by: $\mathrm{In}(D/(D - x)) = at^h$, where D = max. degree of dealkylation, in %, at the given temp.; x = observed degree of dealkylation; t = contact time in sec.

11138. Ohta, Nobuto. **Solid catalyst of the proton-donating type. II. Intensity of the catalyst.** *Bull. Govt. Chem. Ind. Research Inst. Tokyo* Spec. No., 14-18(Mar., 1950).—*C.A.* 46, 7859*b*.

The intensity of the catalyst was detd. by passing *n*-BuOH or iso-BuOH at 350°C fairly rapidly over the catalyst and analyzing (in %) the isomerized butylene in the primarily produced gas. If such a content was below 37%, *n*-butylene from iso-BuOH, and if above 37%, isobutylene from *n*-BuOH gave accurate values. The intensity was weakened by adding an inert substance or carrier.

11139. Olson, R. W.; Schuler, R. W., and Smith, J. M. **Catalytic oxidation of sulfur dioxide. Effect of diffusion.** *Chem. Eng. Progress* 46, 614-24(1950).—*C.A.* 45, 937*h*.

The importance of diffusion in the catalytic oxidation of SO_2 was detd. by measuring the rate of oxidation in a flow reactor operated at various mass velocities. The catalyst consisted of Pt, coated on 1/8-in. cylindrical pellets. The mass velocity was varied from 147 to 514 lb/hr-ft^2 and the temp. from 350° to 480°C. Use of available data for the diffusion rates to the catalyst surface gave a satisfactory method of accounting for the effect of diffusion.

11140. Owen, L. W. **Removal of oxygen from commercial cylinder hydrogen by means of palladized asbestos.** *J. Soc. Chem. Ind.* (London) 69, 272-5(1950).—*C.A.* 45, 2735*c*.

The optimum temp. for the removal of O_2 from cylinder H_2 with 5% palladized asbestos was 650°C. Twelve g of catalyst in a 6-in. length removed 90% of the O_2 from 50 liters of H_2 per hr. Efficiencies of 70-75% were obtained at room temp.

11141. Parravano, Giuseppe. **Polymerization induced by catalytic decomposition of hydrazine at palladium surfaces.** *J. Am. Chem. Soc.* 72, 3856-60(1950).—*C.A.* 45, 1858*d*.

The catalyzed decompn. of N_2H_4 salt solns. at the surface of Pd black in the presence of Me methacrylate initiated polymerization of the monomer. Polymerization was proportional to the

Pd, to the N_2H_4 and monomer concns. at low values of these, becoming independent of these at higher concns. The degree of polymerization was proportional to the monomer concn. and insensitive to N_2H_4 concn. and amt. of Pd used. Chain initiation of polymerization occurred in only a very small fraction of the processes of catalyzed N_2H_4 decompn.

11142. Parravano, Giuseppe. **Polymerization induced by catalytic decomposition of formic acid at platinum surfaces.** *J. Am. Chem. Soc.* 72, 5546-9(1950).—*C. A.* 45, 5501*e*.

The initiation of the polymerization of monomer Me methacrylate by the decompn. of formic acid solns. was studied in presence of O_2, and of a Pt sol as a catalyst. No decompn. of acrylonitrile was observed, under the same conditions. The rate of polymerization of the methacrylate was proportional to (1) amt. of the Pt sol, (2) concn. of formic acid, and (3) concn. of monomer. The av. degree of polymerization increased linearly with the concn. of the monomer, decreased linearly with the formic acid concn., and was independent of the amt. of the Pt sol.

11143. Pattison, John N. and Degering, E. F. **Some factors influencing the activity of Raney nickel catalyst. I. Preparation of Raney nickel from nickel-magnesium alloy.** *J. Am. Chem. Soc.* 72, 5756(1950)—*C. A.* 45, 3530*i*.

Raney Ni showed an activity comparable to W-4 catalyst based on the rate of reduction of styrene at ambient temp. in an Adams reductor. Variation in the mesh size of the alloy and the amt. of acid used in the activation step had little effect on the activity. Decrease in Ni content from 50% to 30% decreased the activity by one-half.

11144. Perrin, Marcel. **The thermal reduction treatment of Fischer catalysts.** *J. chim. phys.* 47, 262-8(1950).—*C. A.* 44, 7638*h*.

A catalyst contg. 26.3% Ni, small amts. of Mn and Al, and using kieselguhr as a support was studied. The total loss in wt, and the amts. of water and CO_2 formed were detd. during successive reductions at 120°, 225°, 360°, and 450°C. The total loss in wt (32.50%) consisted of water 26.36, CO_2 3.24, and presumably CH_4 2.90%. All the CO_2 evolved was formed at or below 225°C.

11145. Plate, A. F. and Tarasova, G. A. **Mechanism of catalytic reactions of hydrocarbons on a vanadium catalyst. VI. Comparison of the behavior of 1-heptene and 3-heptene.** *Zhur. Obshchei Khim.* 20, 1092-1101(1950); *J. Gen. Chem. U.S.S.R.* 20, 1133-42(1950)(Engl. translation).—*C. A.* 44, 8215*d*; 46, 1854*e*.

Expts. were made in a flow system on 20 ml of a V_2O_3 catalyst on Al_2O_3 (1:10), length of column 220 mm in a tube (11 mm diam.). Under the conditions of the expts., PhMe was not hydrogenated. Dehydrocyclization of 1-heptene and 3-heptene, measured by the evolution of gas, proceeded at a const. rate at a given temp. in the range 400°-480°C. Plots of the log of the rate of evolution of gas against 1/T were straight lines, giving for the apparent activation energies of the total dehydrocyclization 39.5 and 40.0 kcal/mole, resp.

11146. Postovskaya, A. F. **The kinetics of the hydrogenation of ethylene over platinized silica gel.** *Zhur. Fiz. Khim.* 24, 1083-9 (1950).—*C. A.* 45, 1414*a*.

The kinetics over various structures of platinized silica gels were studied at 100°C and a surface concn. of Pt of 0.1%. The rate of the reaction was proportional to the concn. of H_2, and not relative to the C_2H_4 concn. as long as that concn. was above 3%, nor to the C_2H_6 concn. The energy of activation of the reaction in the range 44°-138°C was 4300 ± 300 cal/mol. Varying the Pt concn. in the range 0.1-0.01% and the silica gel structure did not change the energy of activation.

11147. Pshezhetskiĭ, S. Ya. and Vlodavets, M. L. **Kinetics of the oxidation of hydrogen at a silver catalyst.** *Zhur. Fiz. Khim.* 24, 353-65 (1950).—*C. A.* 44, 6712*f*.

Mixts. of H_2 and O_2 were passed through a silica gel (particle size 2-3 mm) charged with 1.1% Ag (from $AgNO_3$). The degree a of transformation was detd. by measuring the air current behind the catalyst and the amt. of O_2 in it. The following equation was valid: $a - \ln(1 - a) = 3kSX/v$, SX was the vol. of voids in the catalyst (about 5 ml) and v the rate of gas flow (ml/sec). The const. k was independent of v (0.5-1.8) and increased with temp. of 0.0032 at 98° to 0.02 and 0.08 at 145° and 192°C, resp.; hence, the energy of activation was 11,700 cal. No poisoning by H_2O appeared in the present expts. because of high temp.

11148. Rabó, Gyula. **Aromatization of petroleum distillates with tungstic acid catalyst.** *Magyar Kem. Folyóirat* 56, 31-6(1950).—*C. A.* 45, 3584*f*.

Catalysts (A contg. 0.001, B contg. 0.01, and C contg. 0.05 atom W for each Al atom of the carrier, Alcoa F. 10) were used at 550°, 565°, and 580°C; the activity was very low below 550°C. Yields diminished quickly above 580°C; rapid coke formation seemed to inhibit activity considerably. In the case of catalyst C the increase of output of aromatic products was 11% at 550-65°C and 5% at 565-80°C at a contact interval of 58 sec. Further increase of W concn. caused only slight increases of output.

11149. Rienacker, Gunther; Birckenstaedt, Margarete, and Burmann, R. **The effect of additives on oxide catalysts. II. Catalytic oxidation of carbon monoxide and hydrogen on thoria-ceria mixtures.** *Z. anorg. Chem.* 262, 81-94(1950).—*C. A.* 44, 10473*g*.

H_2 or CO, mixed with excess air, was passed over $ThO_2.CeO_2$, made by calcining oxalate mixts. As a function of oxide compn., the activation energy for CO oxidation showed a pronounced min. (11 kcal) at 1.0% CeO_2, a max. (22.8) at 5%, then remained nearly const. at 16-17 over the range 10-100%; for H_2 oxidation, the values were 24 kcal for 0% CeO_2, a very sharp min. (2 kcal) at 1.0%, a max. (15) at 3%, another min. (2.6) at 5%, and values of 7.1-7.8 over the range 10-100%.

Pure H_2 reduced CeO_2 (pure or mixed with ThO_2) at 300°C, in contradiction to published data.

11150. Rigamonti, Rolando and Spaccamela, Elena. **Catalytic oxidation of alkaline chromites to chromates with oxygen at low temperature.** *Atti accad. sci. Torino, Classe sci. fis. mat. e nat.* 85, 364-79(1950-51).—*C. A.* 46, 4411*b*.

The oxidation, with gaseous O_2 of $Cr(OH)_3$ in alk. media, represented by $Cr(OH)_3 + 3NaOH \rightleftarrows Cr(ONa)_3 + 3H_2O$, and $2Cr(ONa)_3 + H_2O + 1.5\ O_2 \rightarrow 2Na_2CrO_4 + 2NaOH$, was studied with several metallic hydroxides present as catalysts. The behavior as catalysts of Mn, Fe, Ag, Cu, Co, and Ni hydroxides with respect to the method of pptn. either separately or in binary mixt. was investigated.

11151. Rodier, Georges Mme. and Rodier, Georges. **Study of diamagnetic catalysts through deposits of paramagnetic oxides.** *Compt. rend.* 230, 93-5(1950).—*C. A.* 44, 4764*e*.

Two samples of Al_2O_3 differing in catalytic activity were exposed for 15 hrs to solns. of $Mn(NO_3)_2$ that varied in compn. from 0.5 to about 4 *M*. The samples were then dried, powd., and heated at 200°C. The magnetic susceptibility of the resulting powders was much higher when the adsorber was the more active catalyst. Graphs of the specific susceptibility of the manganese oxide deposited on the Al_2O_3 vs. the % of Mn in the sample showed min. at 8% and at 19% Mn for the less and more active catalysts, resp.

11152. Rubinshteĭn, A. M. and Kulikov, S. G. **Selective action in the catalysis of ethyl alcohol and its relation with the phase transition of titanium dioxide.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1950, 84-97. —*C. A.* 44, 7632*g*.

Dehydrogenation and dehydration of EtOH were investigated in flow expts. at 360°, 380°, and 400°C (0.3 ml liquid EtOH/min.) with 12 different prepns. of the TiO_2 catalyst (2.5 g each): $TiCl_4$ hydrolyzed with NH_4OH, fine fraction, $TiCl_3$ (15% aq. soln.) hydrolyzed with NH_4OH, fine fraction, $Ti(OMe)_4$ hydrolyzed with humid air, $Ti(OEt)_4$, in the same way, $Ti(isoPr)_4$, in the same way, $TiCl_3$, in the same way, coarse fraction, $Ti(OBu)_4$, in the same way, $TiCl_4$, with NH_4OH, coarse fraction, Na_2TiO_3, with boiling H_2O, $Ti(OMe)_4$, hydrolyzed by humid air in mixt. with NaCl, $Ti(OMe)_4$, pure ester, isolated by extn., hydrolyzed in humid air, first catalyst heated 20 hrs at 900°C. All catalysts were dried at 110-20°C and heated in an air stream 3 hrs at 300°C.

11153. Russell, W. Walker and Miller, Glenn H. **Catalytic hydrogenation of carbon dioxide to higher hydrocarbons.** *J. Am. Chem. Soc.* 72, 2446-54(1950).—*C. A.* 44, 8616*b*.

Several types of Cu-activated, Co catalysts for the synthesis of higher hydrocarbons from CO_2 and H_2 were studied at atm. pressure and from 175° to 300°C. Catalysts contg. no alkali produced no liquid hydrocarbons or only traces, but did yield small amts. of liquid hydrocarbons after a suitable poisoning. Alkalizing with K_2CO_3 or K_3PO_4 was necessary in order to produce catalysts active for liquid hydrocarbon synthesis. Small addns. of Ce oxides to the alkalized catalysts were very effective in increasing synthesis life and catalyst stability. Raising synthesis temp. some 25° to 100°C for several hrs produced a selective poisoning of catalyst hydrogenation centers. The apparent activation energy for the over-all synthesis was 23.1 kcal.

11154. Saito, Hirotaro. **Catalytic oxidation reaction of ethanol vapor with various metal oxides as catalysts. I. Copper oxide catalyst.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 71, 133-5 (1950).—*C. A.* 45, 4541*e*.

Two kinds of Cu oxide catalysts were prepd. by adding KOH to $Cu(NO_3)_2$ soln. and drying the ppt. at 120°C and by decompg. the $Cu_2(NO_3)_2$ crystal adhering to the surface of silica grains at 310°C. The catalytic oxidation of EtOH vapor was investigated at 181°-360°C from the measurements of both the vol. O_2 consumed and the yield of AcH and AcOH.

11155. Saito, Hirotaro. **Catalytic oxidation reaction of ethanol vapor with various metal oxides as catalysts. II. Comparison of the activities of various metal oxide catalysts.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 257-8(1950).—*C. A.* 45, 4541*f*.

The activities of the oxides of Mn, Fe, Co, Ni, V, Ag, Mo, and Al for the catalytic oxidation of EtOH vapor were studied by measuring the O_2 consumed. The reactions were classified into the following 3 groups according to the kinds of the catalysts used: (1) violent reaction by direct oxidation of EtOH in the case of Mn, Co, Ni, V, and Fe oxides, (2) comparatively rapid reaction via dehydrogenation of EtOH in the case of Ag, Cu, and Cd oxides, and (3) slow reaction via dehydration of EtOH in the case of Al and Mo oxides.

11156. Sakikawa, Noriyuki. **Organic geochemical reactions. IV. The reciprocal reactions between humic acid and rocks, soils, and mineral waters.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 356-8(1950).—*C. A.* 45, 5082*d*.

The mechanism of fireclay formation in contact with coal seams by the corrosive action of humic acid on rocks was discussed. The origin of dispersed carbonaceous matter or graphite in shales, black soils, and other soils or rocks were supposed to be the same.

11157. Sarge, T. W. **Apparatus for turbidimetric study of polymerization activators.** *Anal. Chem.* 22, 1435-8(1950).—*C. A.* 45, 1824*d*.

The app. was used to study the effect of catalyst concn., effect of inhibitors, or influence of comonomers on polymerization rate. The over-all polymerization rate was related to the turbidimetric data as follows: rate of polymerization (observed) $= k \times 1/P_1 \times dI/dt(T_1$, catalyst) where dI/dt was the change of intensity of light transmission which was proportional to the rate of polymerization at the interval under examn.

11158. Sasaki, Kazuo. **Oxidizing catalyst of ammonia. VII. Relation between the ammonia concentration and the catalytic activity. VIII. Relation between abnormally high tem-**

perature and the catalytic activity of cobalt oxide. IX. Industrial test of the cobalt catalyst and the appraisal of the operation from an economic viewpoint. *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 172-7, 178-80, 181-90(1950).—*C.A.* 46, 2246*g*.

The activity of the best catalyst, Co_3O_4, for the reaction $4NH_3 + 5O_2 = 4NO + 6H_2O$ was max. (oxidation 93%) with 11% NH_3 in air and decreased with higher concn. of NH_3. The spent catalyst contained CoO. Co_3O_4 lost no catalytic action when the reaction temp. was kept below 830°C. Above 980°C, it sintered and changed to CoO, thus losing its activity. On a semi-industrial scale 9.57-10.27% NH_3 in air passed through a layer of granular Co_3O_4 in a converter at 680°-750°C was oxidized 92-4%.

11159. Schmid, Gerhard and Keller, Norwin. **Cobalt oxide as catalyst for decomposition of nitrous oxide.** *Naturwissenschaften* 37, 42-3 (1950).—*C.A.* 44, 8214*c*.

Catalysts were prepd. by mixing the powder with 50% MeOH, pressing through a 1-mm screen, drying, and heating to 600° to 900°C. With the catalyst in a 25-mm quartz glass tube, 8 cm high, N_2O (99.0% N_2O, 0.86% N_2, 0.1% O_2, 0.04% H_2O) was passed over at a 30 ml per min. rate. With CoO the gas formed at 265°C and contained 50% permanent gases; with CuO 370°C was required. Other oxides tested such as MgO, CeO_2, CaO, BeO, Al_2O_3, ZnO, Fe_2O_3 required 510° to 740°C for 50% decompn. of N_2O.

11160. Schwab, Georg Maria. **Alloy catalysts in dehydrogenation.** *Discussions Faraday Soc.* 1950, No. 8, 166-71.—*C.A.* 45, 9987*h*.

In homogeneous Hume-Rothery alloys, the activation energy, *E*, of the formic acid dehydrogenation increased in proportion to the square of the increase of the electron concn. caused by the multivalent solute metal. In general, *E* and electric resistance ran parallel. The catalytic activation involved an entrance of substrate electrons into empty levels of the first Brillouin zone of the metal. The frequency factors of the dehydrogenation on different catalysts increased logarithmically with increasing *E*.

11161. Selwood, Pierce W. and Schroyer, F. K. **Proton relaxation and catalyst accessibility.** *Discussions Faraday Soc.* 1950, No. 8, 337-44. —*C.A.* 45, 9991*c*.

The accessibility of a solid catalyst was the ratio of activity shown by a fixed wt to that of the same wt of catalyst in true soln. in the reacting medium. The proton relaxation time in H_2O was detd. for supported iron oxide on alumina and then the catalytic accessibility, *a*, found by relating the measured relaxation time to that observed in aq. solns. of $Fe_2(SO_4)_3$. The nuclear induction expt. gave the same kind of information as obtained from magnetic-susceptibility measurements on the same systems, but the effects were related to the surface ions rather than to the whole mass of paramagnetic ions.

11162. Shalya, V. V.; Piontkovskaya, M. A., and Polyakov, M. V. **Mechanism of the "mild" catalysis.** *Doklady Akad. Nauk S.S.S.R.* 74, 1113-15(1950).—*C.A.* 45, 1855*h*.

Oxidation of $C_3H_8 + C_4H_{10}$ with the vol. ratio gas to O_2 = 1 to 1, in a static system, was followed by detns. of the intermediate peroxides and aldehydes produced by incomplete oxidation. The temp. rise produced in the center of the reaction bulb was also measured with the capillary carrying the thermocouple coated on the outside with NaCl to ensure a catalytically inactive surface. Both methods gave, in all cases, practically coinciding curves of the rate of pressure increase against time, characterized by an initially slow rise of the rate of the incomplete oxidation, passage through a max., and subsequent fall. If all of the glass wall was coated with Pt, no intermediate peroxides and no temp. rise in the center of the bulb was observed with an initial pressure of 200 mm and an initial temp. of 300°C. Coating of the wall with V_2O_5 had the same effect as coating with Pt.

11163. Shima, Goro and Uchida, Hiroshi. **Catalysts for synthesis of ammonia. II. Examination of the catalysts in current use and a procedure of preparing a good catalyst.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 369-77(1950)(English summary).—*C.A.* 46, 2245*f*.

The catalytic activity of 4 Japanese and 2 German com. Fe_2O_3-Al_2O_3 catalysts in synthesizing NH_3 from N_2 and H_2 (1:3) at 350-550°C/50 kg/cm^2 and at 700°C/atm. was lowered by impurities and imperfect diffusion of the promoters. A catalyst prepd. from powd. Fe_2O_3 and Al_2O_3 by thoroughly mixing, sintering into porous rods in a stream of H_2, and after adding aq. KNO_3, burning in O_2 was highly catalytic and thermostable.

11164. Sittig, Marshall. **Catalytic cracking. IV.** *Petroleum Refiner* 29, No. 11, 125-32 (1950).—*C.A.* 45, 1755*i*.

The following subjects were reviewed: (1) suspensoid cracking, (2) hydroforming, (3) fixed-bed *vs.* moving-bed processes, (4) effect of process variables on conversion, (5) product distribution and quality, (6) catalytically cracked gasolines, (7) compn., properties, and manuf. of natural and synthetic cracking catalysts, and (8) lab. work on catalytic cracking.

11165. Sliepcevich, C. M. and Brown, G. G. **Catalytic reactions at high pressures and temperatures.** *Chem. Eng. Progress* 46, 556-62 (1950).—*C.A.* 45, 394*h*.

Continuous operation at 1200°F and 10,000 p.s.i. confirmed the applicability of this equipment for studying chem. reactions. The decompn. of 1-butanol over an alumina-silicate catalyst was investigated at 760°F, at pressures of 1 atm., 750, 2500, and 9000 p.s.i., and a feed rate of 0.2 to 1.5 lb moles of feed/(hr)(lb of catalyst). The decompn. of 1-butanol first increased with increasing pressures and thereafter decreased with increasing pressures. The results indicated that the major decompn. reaction was the direct dehydration of 1-butanol to mixed butenes and water.

11166. Smith, Hilton A. and Fuzek, John F. **The influence of certain additives on the rate of catalytic hydrogenation of terpenes on nickel.** *J. Am. Chem. Soc.* 72, 3454-8(1950).—*C.A.* 45, 1857*f*.

The effect of the following compds. on the rate of hydrogenation on Raney Ni catalyst of *d*-limonene, α-pinene, β-pinene, terpinolene, camphene, and dipentene was investigated: butyl, heptyl, and ceryl alcs. and 1-tetradecanol and 1-octadecanol; palmitic acid, phenyl-ethylacetic acid, normal carboxylic acids in the 1 to 26 C-atom range; ω-phenyl-substituted and ω-cyclohexyl-substituted carboxylic acids in the 7-13 C-atom range. The Ni was an active catalyst for hydrogenation under conditions such that the metallic surface was covered with a unimol. layer of adsorbed material that took no apparent part in the reaction.

11167. Sokol'skii, D. V. and Druz, V. A. **Potentiometric method of investigation of catalytic hydrogenation reactions.** *Doklady Akad. Nauk S.S.S.R.* 73, 949-52(1950).—*C.A.* 44, 10467*c*.

Liquid-phase hydrogenation in an electrolyte soln. on a metallic catalyst was followed by measurements of e.m.f., *E*, between the catalyst-electrolyte electrode and a 0.1 *N* calomel half-cell. In the hydrogenation of $Me_2(CH:C)COH$ at room temp. on a H_2-satd. Raney Ni catalyst, in 0.1 *N* NaOH, the initial *E* = 1080 mv. fell, in the very beginning of the reaction, to 960 mv., and remained const. until the triple bond was completely satd. With beginning hydrogenation of the double bond, *E* rose by 20 mv. and remained const. as long as a double bond was left in the reaction mixt.; at the final stages of the satn. of the double bond, *E* rose slowly until, at the end of the hydrogenation, it reached the equil. value of 1080 mv.

11168. Tamaru, Kenzi. **Selective catalysis. The catalytic reaction between acetylene and hydrogen.** *Bull. Chem. Soc. Japan* 23, 64-6 (1950).—*C.A.* 45, 2298*e*.

The hydrogenation of C_2H_2 on a $Pd\text{-}Al_2O_3$ catalyst was studied in a static system from 30° to 74°C. Reaction occurred in two steps: (1) production of ethylene and acetylene polymers, and (2) hydrogenation of ethylene. Setp (2) did not occur until all acetylene was consumed; this was attributed to difference in adsorbability of C_2H_2 and C_2H_4. Step (2) was first order with activation *E* of 9 kcal.

11169. Tamaru, Kenzi. **The retardation of catalysis. The catalytic reaction between acetylene and hydrogen.** *Bull. Chem. Soc. Japan* 23, 180-4(1950)(in English).—*C.A.* 46, 2384*h*.

Hydrogenation of C_2H_2 on a $Pd\text{-}Al_2O_3$ (1:100) catalyst was retarded by the deposition of polymers formed during reaction and by poisons such as $Pb(OAc)_2$ and $HgCl_2$. Washing the catalyst with $Pb(OAc)_2$ solns. retarded ethane formation much more than ethylene formation. Solns. of $HgCl_2$ poisoned the catalyst approx. equally for both reactions.

11170. Tamaru, Kenzi. **Dispersity of catalyst and catalytic activity. Catalytic hydrogenation of acetylene on the palladium-kieselguhr catalyst.** *Bull. Chem. Soc. Japan* 23, 184-6 (1950)(in English).—*C.A.* 46, 2384*f*.

Catalysts having ratios of Pd/kieselguhr of 1:50 to 1:750 were prepd. by addn. of $PdCl_2$ solns. to the kieselguhr and reduction to metal with HCHO. Reactions were carried on in a static system at 30° and 74°C. The reaction-rate const. for the formation of ethylene decreased linearly with increase in Pd content. The reaction-rate const. for the formation of ethane exhibited a max. at a ratio of 1:100.

11171. Tarama, Kimio and Kubota, Toshiaki. **Catalytic action of aluminum chloride.** *Bull. Inst. Chem. Research, Kyoto Univ.* 20, 59 (1950).—*C.A.* 47, 3493*c*.

The conductivities of the catalyst layers in isomerization, decompn., and alkylation of heptane catalyzed by $AlCl_3$ were measured. They did not change under anhyd. condition, but changed remarkably with an increase of water content of $AlCl_3$. The greatest change took place when the mol. ratio of $H_2O/AlCl_3$ was 0.015, where $AlCl_3$ was most active for isomerization.

11172. Teǐs, R. V. **Isotopic composition of the oxygen of carbonates and its temperature dependence.** *Doklady Akad. Nauk S.S.S.R.* 72, 73-6(1950).—*C.A.* 45, 2275*e*.

H_2CO_3 liberated by HCl from a mineral (calcite, dolomite, limestone) was changed to water over a Ni catalyst with H_2 (Zn + HCl). The water was frozen out with a mixt. of solid CO_2 and acetone and, after purification customary in isotopic analysis, its d. was detd. by the method of detn. of flotation temp. of a quartz float in relation to standard water. Data were given of isotopic compn. of O_2 of carbonates with temps. of formation not over 25°, 180-300°, and over 300°C.

11173. Temkin, M. I. **Kinetics of ammonia synthesis under high pressures.** *Zhur. Fiz. Khim.* 24, 1312-25(1950).—*C.A.* 45, 3699*d*.

Departure from gas ideality was taken into account, but not the possible effect of diffusion. The rate consts. at 100 and 300 atm. (475°C) were then equal, resp., to 0.91 and 0.75 times the value at 1 atm. Diffusion may be neglected at 300 atm. and the rate const. changed by a factor less than 2 for pressures in the ratio 300:1. A simplified expression for the rate was also given with the purpose of simplifying calcns.

11174. Temkin, M. I.; Kiperman, S. L., and Luk'yanova, L. I. **Flow-circulation method of investigation of the kinetics of heterogeneous catalytic reactions.** *Doklady Akad. Nauk S.S.S.R.* 74, 763-6(1950).—*C.A.* 45, 1854*f*.

The reacting gas was admitted to the catalyst zone at a const. velocity *v*, circulated through the reaction zone, and led out at exactly the velocity *v*. The method was applied to the synthesis of NH_3 from a stoichiometric N_2 + 3 H_2 gas mixt. on 1 ml of a synthetic-ammonia catalyst at 451°C, with rates of circulation of 360-500 liters gas/hr, and *v* varied between about 9 and 110 liters gas (STP)/hr.

11175. Ternisien, J. **Catalytic oxidation and combustion without flame.** *Tech. moderne* 42, 291-3(1950).—*C.A.* 46, 330*f*.

Highly refractory combustion catalysts, suitable for use as wall material for combustion chambers in rocket or jet engines, was made by ignition of appropriate ZrO_2-base refractories that had been soaked in solns. contg. salts of Ni and Pt.

11176. Thomas, Charles L.; Hickey, John, and Stecker, Glen. **Chemistry of clay cracking catalysts.** *Ind. Eng. Chem.* 42, 866-71(1950).—*C.A.* 44, 7050*h*.

Raw montmorillonite clays had some petroleum-cracking catalytic activity. Cold acid treatment removed Ca, Na, K, and part of the Mg from the clays without increasing the catalytic activity. Regulated hot-acid treatment removed Al from the central layer of the montmorillonite crystals, and as the Al was progressively removed, the catalytic activity increased to a max. and then decreased. The remaining Al atom was left in tetrahedral coordination and the change from octahedral to tetrahedral coordination left the crystal lattice with a neg. change which was balanced by a H ion. Catalysts with greater acidity were more active.

11177. Thomas, E. Jackson. **Fluid catalytic cracking of high-sulfur stocks with natural catalysts.** *Oil Gas J.* 48, No. 46, 221, 224, 228(1950).—*C.A.* 44, 6611*e*.

Ordinary natural catalyst deteriorated rapidly when used for stocks contg. about 2.0% S. Steam added to the regenerated catalyst sandpipe lessened this effect, but operating difficulties prevented adding enough steam. A S-resistant natural catalyst, low in Fe, was used, and made a satisfactory product at a makeup rate comparable with those of available synthetic catalysts.

11178. Thornton, D. P. Jr. **Atomic energy applied to measurement of catalyst level in cracking units.** *Petroleum Processing* 5, 941-5(1950).—*C.A.* 45, 338*e*.

The catalyst level in a Houdriflow catalytic cracking unit was recorded and controlled by variations in the intensity of γ-rays emitted by fixed $RaCl_2$ sources located in the catalyst surge tank. The γ-rays were recorded by means of a fixed Geiger counter having a Cu cathode and a W anode and filled with chemically pure H_2. The useful life of this tube under variations to 1100°F was much longer than the conventional tube. The impulses from the Geiger counter were amplified and fed into the recorder-controller unit, a modified com. pyrometer.

11179. Topchieva, K. V. and Panchenkov, G. M. **Cracking of cumene on aluminosilicate catalysts of different compositions.** *Doklady Akad. Nauk S.S.S.R.* 74, 1109-12(1950).—*C.A.* 45, 1858*g*.

In a flow system at 400°C with space velocities varying from 0.5 to 2.0 liter/liter catalyst/hr the rate of cracking of iso-PrPh (to C_6H_6 as final product) was given by: $k = n[-\ln(1 - x) - x]$, where n = moles fed per hr, x = fraction converted. The plots of nx against $-n \ln(1 - x)$, were linear and showed the same slope for different compns. of the $Al_2O_3 + SiO_2$ mixt. used as catalyst, and the intercept gave k. The surface area of the various mixed catalysts was approx. 375 m^2/g, = 15%, whereas for the pure SiO_2 it was 550, and for the pure Al_2O_3, 255 m^2/g.

11180. Trambouze, Yves. **Chemical changes in Fischer catalysts during their preparation.** *J. chim. phys.* 47, 258-60, discussion, 260-1 (1950).—*C.A.* 44, 7638*g*.

Ni, Al, Mn, kieselguhr catalysts were prepd. The prepn. and the % Ni removed by ammoniacal treatment, extn. with HNO_3, and extn. with HCl, resp., were: pptn. at low temp., 100, —, —; boiling of the ppt. 63, 37, —; desorption under vacuum at 150°C to const. wt, 63, 37, —; heating for 2 hrs at 220°C in N_2, 59, 13, 28; heating at 320°C to const. wt in N_2, 18, 46, 36; heating at 450°C to const. wt in N_2, 16, 40, 44; heating for 48 hrs at 220°C in N_2, 33, 59, 8; heating at 450°C after the preceding treatment 20.5, 59.5, 20. X-ray diffraction results were summarized.

11181. Trambouze, Yves and Perrin, Marcel. **Effect of the chemical composition of Fischer catalysts and their constituents on the synthesis activity.** *J. chim. phys.* 47, 474-82 (1950).—*C.A.* 44, 9783e.

A Ni-Al_2O_3-kieselguhr catalyst was shown to contain Ni aluminate and Ni silicate after being heat-treated to 450°C. The aluminate was active in synthesizing higher hydrocarbons; the silicate formed CH_4 primarily. The distance between the Ni atoms accounted for the specificity of their catalytic properties.

11182. Troesch, André. **The dissociation of methane in the presence of a nickel catalyst.** *J. chim. phys.* 47, 274-83, discussion, 283-5 (1950).—*C.A.* 44, 7637*c*.

Studies made in the absence and presence of a Ni catalyst indicated that no reaction took place between CH_4 and Ni at 112°-287°C. No intermediate carbide was necessary to explain the decompn.

11183. Tsyskovskiĭ, V. K. **The influence of the cation that is part of quasi-heterogeneous catalysts upon the oxidation of kerosine.** *Zhur. Priklad. Khim.* 23, 754-8; *J. Applied Chem. U.S.S.R.* 23, 797-801(1950)(Engl. translation).—*C.A.* 46, 4207*c*.

The catalytic oxidation of kerosine to produce internal esters of hydroxycarboxylic acids as the desired by-product was carried out in the presence of naphthenates of Mn, Fe, Co, Cu, Ba, and Pb as catalysts. The naphthenates were obtained from pure naphthenic acids of 218.4 acid no. and dissolved in the kerosine. Manganese naphthenate and Pb naphthenate gave the best results.

11184. Tsyskovskiĭ, V. K. and Kiseleva, N. A. **Mechanism of the action of colloidal quasi-heterogeneous catalyst in the process of liquid-phase oxidation of kerosine fractions.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 23, 1001-6(1950).—*C.A.* 46, 4777*g*.

A colloidal Mn naphthenate catalyst in kerosine was prepd. by exchange of $MnSO_4$ with an equiv. amt. of Na salts of a redistd. naphthenic-acid fraction of acidity 231.3 mg/KOH/g, free from hydrocarbons and mineral impurities. A const. stream of air was passed through 250g of the substrate with 0.16, 0.12, 0.08, and 0.04% catalyst, and the change of color was recorded with a photoelec. cell. The max. of absorption of light was shown to correspond to a transition of the catalyst from the colloidal to the cryst. state.

11185. Twigg, G. H. **The mechanism of the catalytic hydrogenation of ethylene.** *Discussions Faraday Soc.* **1950**, No. 8, 152-9.—*C. A.* 45, 9987*d*.

Ethylene was hydrogenated on Ni at -78°C with: (*a*) a mixt. of $H_2 + D_2$, and (*b*) the equil. mixt. of $H_2 + HD + D_2$. Infrared spectra of the ethanes showed that the mixts. from (*a*) and (*b*) were identical and different from an equimol. mixt. of C_2H_6 and $C_2H_4D_2$. In the mechanism H_2 was not adsorbed directly on the catalyst, but through reaction with chemisorbed C_2H_4 to form an adsorbed ethyl radical, an adsorbed H atom resulted.

11186. Uchida, Hiroshi. **Catalysts for synthesis of ammonia. I. Change of the catalytic activity of mixed powder of ferric oxide and alumina with the progress of its sintering.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 355-68(1950)(English summary).—*C. A.* 46, 2245*f*.

A mixt. of powd. Fe_2O_3 and Al_2O_3 upon sintering showed microscopically at 1200°C nearly complete mutual diffusion and formed at 1400° a solid soln. It was sufficiently catalytic for synthesizing NH_3 from N_2 and H_2. Above 1400°C a solid soln. was formed both catalytic and thermostable.

11187. Uchida, Hiroshi and Sato, Toshio. **Catalysts for synthesis of ammonia. V. Adsorption of hydrogen by the catalysts in current use and that of carbon dioxide and hydrogen by the catalysts containing alumina, potassium, and calcium oxides.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 103-13(1950).—*C. A.* 46, 2245*i*.

In 4 com. catalysts and 4 others contg. Al_2O_3, K_2O, and CaO, the activity was higher with more H_2 adsorption at lower temp. (the max. H_2 isobars above 0°C tended to shift toward lower temp.). The CaO increased the B.E.T. surface area. The activity thus heightened was counteracted when the area became coated by K_2O.

11188. Uchida, Hiroshi and Ogawa, Kiyoshi. **Catalysts for synthesis of ammonia. VI. Relation between the conversion efficiency and the promoter.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 114-24(1950).—*C. A.* 46, 2246*e*.

The conversion efficiency (NH_3 formed from N_2 and H_2 at 300-550°C under 50-200 kg/cm^2 passed at the space velocity 5000 and 10,000) was lowered under higher pressure in 1 of 3 com. catalysts tested. In 7 catalysts contg. promoters the efficiency was not much affected by increasing pressure when K_2O seemed to accumulate on the surface, but was lowered under higher pressure when K_2O was absent or prevented from accumulating.

11189. Uchida, Hiroshi and Todo, Naoyuki. **Catalysts for synthesis of ammonia. VIII. Resistance of the catalysts containing various promoters to carbon monoxide poisoning.** *Repts. Govt. chem. Ind. Research Inst. Tokyo* 45, 213-24(1950).—*C. A.* 46, 2246*g*.

At 350°-450°C under 100 kg/cm^2, the mixts. of Fe_2O_3 with $5Al_2O_3$, $4Al_2O_3 + 1CaO$, and $2Al_2O_3 + 2SiO + 1\%\ K_2O$ showed less lowering of the activity when exposed to CO than the mixts. of Fe_2O_3 with $5Al_2O_3 + 1K_2O, 4Al_2O_3 + 1CaO + 1K_2O$, $4Al_2O_3 + 1MgO + 1K_2O$, and $4Al_2O_3 + 1SiO_2 + 1\%\ K_2O$.

11190. Uzumasa, Yasumitsu and Okura, Takeshi. **Catalytic action of adsorbed ions. I. The catalytic behavior of the adsorbed ions on some oxidation-reduction reactions.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, 71, 48-52(1950).—*C. A.* 45, 4540*d*.

Reactions studied were: (1) effect of Cu^{++} adsorbed in filter paper or silica gel on the reaction $2Fe^{3+} + 2S_2O_3{}^{2+} = 2Fe^{2+} + S_4O_6{}^{2+}$, (2) I_2 adsorbed in filter paper or starch on the oxidation of $S_2O_3{}^{--}$ by H_2O_2 soln. at 60°C. The adsorbed ion shows its catalytic activity only after being set free into the homogeneous reacting system.

11191. Uzumasa, Yasumitsu and Okura, Takeshi. **Catalytic action of adsorbed ions. II. The catalytic behavior of the adsorbed ions on the reaction between sodium azide and iodine and on the oxidation of sulfite ion by air.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 71, 112-14(1950).—*C. A.* 45, 4540*e*.

The catalytic behavior of the minute quantity of adsorbed ion in various reactions was studied: (1) thiosulfate ion adsorbed in pptd. $CaCO_3$ on the reaction $2NaN_3 + I_2 + 3N_2 + 2NaI$, (2) Cu^{++} adsorbed in filter paper on the oxidation of sulfite by air bubbles, (3) vanadate adsorbed in filter paper or silica gel on the color reaction of $KBrO_3$ with HCl soln. of *p*-phenetidine. The adsorbed ion showed its catalytic activity after being liberated from the adsorbent into the homogeneous reaction system.

11192. Vaĭnshteĭn, F. M. and Turovskiĭ, G. Ya. **Isotopic study of the mechanism of oxidation of carbon monoxide on manganese dioxide.** *Doklady Akad. Nauk S.S.S.R.* 72, 297-9(1950).—*C. A.* 44, 7129*c*.

With 2 types of MnO_2 contg. $MnO_2{}^{18}$, no O^{18}-O^{16} exchange was observed in a stream of air, but there was some exchange in the catalytic oxidation of CO at 90-97°C. The observed exchange was due solely to some H_2O retained by the catalyst. The reaction involved not merely a small fraction of the surface of the MnO_2, but its main mass, and failure to detect isotopic exchange was not simply due to the smallness of the amts. involved.

11193. Valentin, F. H. H. **Equilibrium and thermodynamic relation in the vapor-phase catalytic dehydration of ethyl alcohol to ethyl ether.** *J. Chem. Soc.* **1950**, 498-500.—*C. A.* 44, 7133*d*.

Equil. consts. were detd. for the dehydration of EtOH in the range 392° to 509°K in a steel autoclave at about 3 atm. pressure. An alum catalyst and a new catalyst consisting of H_2SO_4 promoted by $CuSO_4$ and supported on a silica gel carrier were used. Thermodynamic functions for both the reaction and ether were derived.

11194. VARGA, JÓZSEF AND FREUND, MIHÁLY. **Catalytic dehydrogenation of butane.** *Magyar Kém. Folyóirat* 56, 21-4(1950).—*C.A.* 45, 1332*b*.

An exptl. tube furnace was constructed from Cr steel with inner vol. of 1000 ml; a spiral Cu tube served as the preheater. Both tubes were located vertically and heated by an elec. current to 525-75°C (pre-heater), 560-80°C (furnace). Butane 83.9, isobutane 15.6, and propane 0.5 vol. % was introduced at the lower end of the vertical system. Various amts. of a catalyst were used, with Cr_2O_3 as the active substance and γ-Al_2O_3 as the carrier. A medium amt. of catalyst gave the best results; the dehydrogenated gas after 45 min. treatment contained butylene and propylene 23.0, ethylene 0.8 vol. %.

11195. VILAND, C. K. **Selection of cracking catalysts with aid of laboratory aging.** *Petroleum Processing* 5, 830-4(1950).—*C.A.* 45, 339*b*.

Data were given for the design and operation of a lab. app. for studying the change in the activity of cracking catalysts with continued use.

11196. VISSER, G. H. **Chromium oxide-aluminum oxide-base aromatization.** *Bull. assoc. franc. tech. petrole* No. 80, 3-15(1950).—*C.A.* 44, 7636*a*.

In a catalyst consisting of 70% Cr_2O_3 and 30% Al_2O_3, which was the most active one used in the aromatization of n-heptane, the mixed crystals formed were slightly lower in Cr, namely about 65:35. Possibly Al_2O_3 slowed down crystn. into the hexagonal form, so that Cr_2O_3 may be present in the active γ-cubic form as mixed crystals with γ-Al_2O_3. In ternary Cr_2O_3-Al_2O_3-K_2O catalysts, max. improvement in activity was observed with 12 atoms of K per 100 atoms of Cr, regardless of the Cr_2O_3:Al_2O_3 ratio.

11197. VOLKENSHTEĬN, F. F. **Effect of small quantities of impurities on the catalytic activity of ionic catalysts.** *Zhur. Fiz. Khim.* 24, 1068-82(1950).—*C.A.* 45, 2297*e*.

Chemisorbed atoms or mols. and promoters or poisons were characterized by impurity levels lying between the valence and the conduction band. They were ionized to a certain extent depending on the Fermi level of the system. The latter depended on the no. of impurities of both kinds, donors and acceptors, and on the temp. When increasing amts. of a donor were adsorbed on the surface, the degree of ionization of the donor decreased with coverage. This decrease corresponded to the interaction between adsorbed species. These principles lead to the computation of the rate of a catalyzed reaction as a function of the no. of electrons in the conduction band and of the various parameters defining the spectrum of the semiconductor.

11198. WAGNER, CARL. **The mechanism of the decomposition of nitrous oxide on zinc oxide as catalyst.** *J. Chem. Phys.* 18, 69-71(1950).—*C.A.* 44, 5674*d*.

For the decompn. of N_2O on metals and oxides, a tentative mechanism was in accordance with exptl. facts such as retardation by adsorbed O, a fractional order of the reaction with respect to N_2O in the case of indium oxide as catalyst, and the decrease of the elec. cond. of ZnO due to the presence of N_2O. A mixt. of ZnO and Ga oxide, however, had about the same catalytic activity as pure ZnO, although the elec. cond. of the mixed catalyst was about 50 times that of pure ZnO.

11199. WYNKOOP, RAYMOND AND WILHELM, RICHARD H. **Kinetics in tubular flow reactor. Hydrogenation of ethylene over copper-magnesia catalyst.** *Chem. Eng. Progress* 46, No. 6, 300-10 (1950).—*C.A.* 44, 6712*i*.

The catalytic hydrogenation of C_2H_4 over Cu-magnesia catalyst was studied experimentally and theoretically in a continuous-flow tubular reactor. Exptl. conditions were varied over the following ranges; H_2 32.6 to 95.2%; temp. 9° to 79°C; space velocity: 0.20×10^{-4} to 32.0×10^{-4} total moles/ml sec; catalyst particle size; 0.108 to 0.279 cm diam. Because of small conversions, a high-precision analysis for H_2 by means of thermal cond. cells was developed. An effect of reversible poisoning of the catalyst by water vapor was encountered.

11200. YANG, E. H. AND HOUGEN, O. A. **Determination of mechanism of catalyzed gaseous reactions.** *Chem. Eng. Progress* 46, No. 3, 146-57(1950).—*C.A.* 44, 3746*f*.

Methods were given for eliminating, minimizing, or evaluating the temp. and concn. gradients in gas films and in catalyst pellets. The selection of reaction mechanism from the effects of pressure, feed compn., and extent conversion and temp. was discussed, especially with reference to the visual appearance of rate curves. After the mechanism of a reaction was established, the various consts. in the appropriate rate equations could be obtained from the exptl. data by graphical and statistical methods.

11201. ZAWADZKI, J. **The mechanism of ammonia oxidation and certain analogous reactions.** *Discussions Faraday Soc.* 1950, No. 8, 140-52. —*C.A.* 45, 9987*c*.

The high efficiency of the oxidation depended on the velocities of a no. of successive and simultaneous reactions, which took place in the system NH_3-O_2-catalyst, as well as on the suppressing of the reactions between reagents, intermediates and final products of reactions before and after the catalyst. The roles of N_2O and chemisorbed O were discussed.

11202. AGRONOMOV, A. E. **Kinetics of the dehydrogenation of isopropyl alcohol on zinc oxide catalysts prepared by different methods.** *Vestnik Moskov. Univ.* 6, No. 2, *Ser. Fiz.-Mat. i Estestven. Nauk* No. 1, 109-23(1951).—*C.A.* 46, 4341*g*.

Different ZnO catalysts were prepd. by decompn. of pptd. $ZnCO_3$ at 400°C, kneading the preceding with MeOH and drying at 110°C, kneading catalyst *1* with H_2O and drying at 110°C, dehydration at 400°C of $Zn(OH)_2$ obtained by pptn. with NH_4OH and drying at 110°C, as the foregoing, but from $Zn(OH)_2$ pptd. with KOH, decompn. of Zn oxalate at 400°C, decompn. of $Zn(NO_3)_2$ at 450°C. All these catalysts dehydrogenate iso-PrOH smoothly at 320-90°C, to the extent of 92-97% dehydrogenation with respect to the amt. reacted, with no carbonization below 390°C, and only 2-5% unsatd. products and a very small amt. of CO_2 (but no CO) in the gas, in addn. to H_2.

11203. AGRONOMOV, A. E. **Kinetics of dehydrogenation of isopropyl alcohol on zinc oxide catalysts prepared by different methods. II. Causes of the dependence of the catalytic activity on the method of preparation.** *Vestnik Moskov. Univ.* 6, No. 11, *Ser. Fiz.-Mat. i Estestven. Nauk* No. 7, 41-50(1951).—*C.A.* 46, 8488*d*.

ZnO catalysts [(1) decompn. of $ZnCO_3$, (2) the foregoing with MeOH, (3) catalyst 1 with H_2O, (4) decompn. of $Zn(OH)_2$ pptd. with NH_4OH, (5) decompn. of $Zn(OH)_2$ pptd. with KOH, (6) decompn. of ZnC_2O_4, (7) decompn. of $Zn(NO_3)_2$] differed in their catalytic activity *A* in dehydrogenation of iso-PrOH at 370°C; in the above order, $A = 44.5$, —, 50.0, 39.0, 38.0, 43.0, 21.0. By adsorption of MeOH vapor, the surface areas *S* of catalysts 1, 3, 6, 7, were detd. to be 9.22, 14.91, 7.52, 0.28 m^2/g. There was a definite parallelism between *A* and *S*, but no simple proportionality. The adsorption detns. of *S* were confirmed by electron microscopy.

11204. ANDERSON, R. B.; FRIEDEL, R. A., AND STORCH, H. H. **Fischer-Tropsch reaction mechanism involving stepwise growth of the carbon chain.** *J. Chem. Phys.* 19, 313-19(1951).—*C.A.* 45, 9241*b*.

The observed isomer and C no. distribution of products from Fe and Co catalysts in the Fischer-Tropsch synthesis were predicted. The expressions were based on three schemes; (a) addn. at only one end of the growing chain on only one end C atom if two were present or on the adjacent-to-end C; (b) at only one end of the growing chain on any end or adjacent-to-end C; (c) at either end of the growing chain on any end or adjacent-to-end C. Scheme (a) was in closest agreement with exptl. facts.

11205. ANDERSON, ROBERT B.; HOFER, L. J. E.; COHN, ERNST M., AND SELIGMAN, BERNARD. **The Fischer-Tropsch synthesis. IX. Phase changes of iron catalysts in the synthesis.** *J. Am. Chem. Soc.* 73, 944-6(1951).—*C.A.* 45, 6032*h*.

Phase changes in a reduced fused-Fe catalyst were studied during the Fischer-Tropsch synthesis with 1 H_2 and 1 CO gas at 7.8 atms. In the first few days of the synthesis, α-Fe was converted to Hagg carbide (Fe_2C) which increased to a max. of 29% at 200 hrs of synthesis, and then decreased slowly throughout the remainder of the test. Magnetite increased at a slower rate than Hagg carbide, apparently chiefly at the expense of the α-Fe phase.

11206. ANDRUSSOW, LÉONID. **Catalytic oxidation of sulfur dioxide to sulfur trioxide and the theory of rapid catalytic processes. I. Oxidation of sulfur dioxide with excess oxygen.** *Z. Elektrochem.* 55, 428-37(1951).—*C.A.* 46, 2893*b*.

The kinetics and yields of fast, surface-catalyzed, reversible and irreversible reactions were discussed. Equations for dil. systems and corrections for concd. systems were given and the reaction $2\ SO_2 + O_2 \rightleftharpoons 2SO_3$ used as an illustration.

11207. ANDRUSSOW, LÉONID. **The catalytic oxidation of ammonia and the rapid catalytic processes. XII.** *Angew Chem.* 63, 21-7(1951). —*C.A.* 45, 4413*g*.

A comprehensive review of available information covering the mechanism of the oxidation and reaction processes, reduction of NO, expts. on Pt screens, explosive range, and catalytic oxidation at low temp.

Catalytic oxidation of ammonia, hydrocyanic acid, and cyanogen and the theory of very rapid catalytic processes.** *Bull. soc. chim. France* 1951, 45-50, 51-9.—*C.A.* 45, 6353*b*.

In the reaction between NH_3, CH_4, and air at 1020°C, 60% of the NH_3 was converted to HCN, 10% lost as N_2H_4, and 30% was unreacted. The oxidation mechanisms for NH_3, HCN, and C_2N_2 were very similar and based upon the intermediate formation of HNO, HNO, and CNNO, resp.

11209. ANDRUSSOW, LÉONID. **The catalytic oxidation of ammonia and the rapid catalytic processes. XV. Calculation of conversion in gases flowing through tubes and networks.** *Angew. Chem.* 63, 350-5(1951).—*C.A.* 45, 10517*b*.

It was assumed that the gas reaction catalyzed by the metal wall took place instantaneously and that equil. resulted in a complete reaction. Equations related conversion, gas velocity, dimensions of tubes, and the diffusion coeff. of the smaller reaction component. Catalysts in honeycomb shapes and screens placed in series were treated. The NH_3 oxidation on fine-mesh screens with insufficient O_2 showed that the oxidation of NH_3 was predominantly effected by O_2.

11210. ANDRUSSOW, LÉONID. **The catalytic oxidation of ammonia and the rapid catalytic processes. XVI. Influence of pressure and vacuum.** *Bull. soc. chim. France* 1951, 981-3 —*C.A.* 46, 5273*c*.

Catalysts which gave a high yield of NO must be capable of activating O_2 and dehydrogenating HNO which formed as the result of reduction of NO by NH_3.

11211. ANTIPINA, T. V. AND FROST, A. V. **Relation between the kinetics of heterogeneous reactions and adsorption on catalysts. II. Determination of the adsorption coefficient of ethylene on aluminum oxide and its temperature dependence from kinetic data.** *Vestnik*

Moskov. Univ. 6, No. 8, *Ser. Fiz.-Mat. i Estestven. Nauk* No. 5, 69-78(1951).—*C.A.* 46, 3382*e*.

The flow-system dehydration of EtOH to H_2O + C_2H_4, undild. or dild. with C_2H_4 or with A, obeyed the kinetic law: $v_0 \ln [1/(1 - y)] = \alpha + \beta v_0 y$, where v_0 = feed rate in millimoles/min./ml catalyst, y = degree of conversion in millimoles C_2H_4 produced/millimole EtOH passed, $1/\alpha$ was proportional to the surface reaction rate const., and $\beta = 1.0$ (empirically). In all cases, $1/\alpha$ increased linearly with δ. From the kinetic data, the adsorption coeffs. for C_2H_4, at 380°, 415°, 450°C, were calcd. to 16.0, 12.2, 11.0 atm.$^{-1}$, resp.

11212. AUDRIETH, L. F. AND JOLLY, WM. L. **Catalytic decomposition of highly concentrated hydrazine by Raney nickel.** *J. Phys. & Colloid Chem.* 55, 524-31(1951).—*C.A.* 45, 6029*b*.

Com. Raney Ni catalyst decompd. 90-5% NH_2NH_2 at an av. rate of 8.6 ml/min./g catalyst at 25°C. The activation energy for NH_2NH_2 decompn. was 17.1 kcal/mol. Diln. with H_2O increased the decompn., the max. rate being observed with 6-10 *M* solns. The primary decompn. reaction was dehydrogenation, N_2 and H_2 being the chief products. Pt increased the activity of the Ni catalyst. Sulfides and cyanides had a poisoning effect on the catalyst.

11213. BALLOD, A. P.; GURVICH, L. V.; KOROBOV, V. V., AND FROST, A. V. **Kinetics of hydrocarbon conversions in a broad range of space velocities.** *Vestnik Moskov. Univ.* 6, No. 2, *Ser. Fiz.-Mat. i Estestven. Nauk* No. 1, 57-66 (1951).—*C.A.* 46, 4340*h*.

Cracking of decahydronaphthalene on activated Askan clay (30 min. runs) was found to obey a specified rate equation at 300°C; the apparent activation energy was 5.0 kcal/mole. The first reaction was an isomerization to products contg. cyclopentane rings. The subsequent cracking yielded in the gaseous cracking products more isobutane than butane. The isomerization products suffered cracking only at sufficiently low space velocity and then the reaction was inhibited by the cracking products. The amt. of deposit on the catalyst with respect to the unreacted decahydronaphthalene increased with decreasing space velocity 3 times as fast as the amt. of deposit relative to the amt. of the liquid decompn. products. The rate of the redistribution of H in the unsatd. gasoline fraction remained independent of space velocity at high space velocity, but inhibition appeared at low space velocity.

11214. BALLOD, A. P.; PATSEVICH, I. V.; FEL'DMAN, A. S., AND FROST, A. V. **Catalytic activity and selectivity of aluminosilicates.** *Doklady Akad. Nauk S.S.S.R.* 78, 509-12(1951).—*C.A.* 45, 7861*a*.

The reaction was to C_6H_6 and C_3H_6, followed by hydrogenation of C_3H_6 to C_3H_8 through redistribution of H; the cracking gas at 500°C was 94% C_3H_8 + C_3H_6. The catalyst, Al_2O_3 33.9 + SiO_2 66.1%, was heated to 500°C, treated with 0.01-0.5 *N* solns. of alkali, dried and again heated at 500°C. Poisoning was not selective with respect to either of the 2 consecutive reactions, dealkylation and hydrogenation. The sp surface area played a relatively minor role in the poisoning. The poisoning by Na^+ and Ca^{++} ions was due only to replacement of the H^+ ions by the metal ions.

11215. BAL'YAN, KH. V. **Action of inhibitors in the catalytic hydrogenation of some acetylenic and ethylenic alcohols. II.** *Zhur. Obshcheĭ Khim.* 21, 720-9(1951); *J. Gen. Chem. U.S.S.R.* 21, 793-802(1951)(English translation).—*C.A.* 46, 8945*i*.

In the presence of colloidal Pd, acetylenic γ-glycols added only 2 H atoms, whereas acetylenic alcs. added 4 H atoms and were rapidly hydrogenated to satd. alcs. Inhibition of the hydrogenation of acetylenic alcs. was, therefore, attributed to an action of the inhibitor, not on the catalyst but on the alc. It was expected that an inhibiting effect would be exerted by compds. contg. atoms with unshared electron pairs, susceptible of assocn. with the substrate. Expts. with a no. of unsatd. alcs., in a stream of H_2, were made at 20°C with 0.01 mole of the alc., 50 ml solvent (mainly EtOH), and 3 or 5 mg Pd. Generally, the same inhibitor was more effective in slowing down the hydrogenation of the ethylenic than of the acetylenic alc.

11216. BAL'YAN, KH. V. **Action of inhibitors in the catalytic hydrogenation of some acetylenic and ethylenic alcohols. III.** *Zhur. Obshcheĭ Khim.* 21, 729-34(1951).—*C.A.* 46, 8946*g*.

The ethers $Me_2C(OMe)C \equiv CH$ and $Me_2C(OMe)CH{:}CH_2$ were synthesized. Hydrogenation of these ethers in the presence of Pd was much slower than the corresponding alcs. At 57.6% hydrogenation of $Me_2C(OMe)C \equiv CH$, the reaction for the triple bond was neg., i.e. the triple bond was hydrogenated first.

11217. BAL'YAN, KH. V. **The action of inhibitors in catalytic hydrogenation with palladium. III.** *J. Gen. Chem. U.S.S.R.* 21, 803-7(1951) (Engl. translation).—*C.A.* 46, 6476*a*.

The Me ethers, $MeOC(Me)_2C \equiv CH$, and $MeOC(Me)_2$-$CH{:}CH_2$ were synthesized for the first time. The hydrogenation with colloidal Pd was much slower than that of their alcs., owing to the Me group's screening of the triple or double bond. The inhibitory effect of phenyl mustard oil, *p*-thiocyanoaniline, and *p*-thiocyanochlorobenzene on the hydrogenation of these ethers with colloidal Pd was established.

11218. BASHKIROV, A. N.; KAGAN, YU. B., AND KRYUKOV, YU. B. **Mechanism of the synthesis of hydrocarbons from carbon monoxide and hydrogen.** *Doklady Akad. Nauk S.S.S.R.* 78, 275-6(1951).—*C.A.* 45, 7861*g*.

The primary act in the Fischer-Tropsch synthesis was $CO + 2\ H_2 \rightarrow CH_2 + H_2O$, and not $2CO + H_2 \rightarrow CH_2 + CO_2$. CO_2 was formed only as a result of the secondary reaction $CO + H_2O \rightarrow CO_2 + H_2$. A very short contact time prevented the secondary reaction from taking place to any appreciable extent in one single pass, and the H_2O formed in each pass was removed by condensation between passes in repeated recirculation. The expts. were conducted with a CO:H_2 = 1:2 mixt. at 300°C under 20 atm., at a gaseous space velocity of 150,000 liters/liter catalyst/hr; practically complete conversion was ensured by repeated recycling, with the fresh gas admitted at the rate of 44 liters/hr.

11219. BEEK, JOHN JR. AND SINGER, EMANUEL. **A procedure for scaling-up a catalytic reactor.** *Chem. Eng. Progress* 47, 534-40(1951).—*C.A.* 46, 299*e*.

Toluene was produced by the dehydrogenation of methylcyclohexane, and toluene and recycle H_2 preheated to 860°F, were passed through tubes contg. catalyst pellets. The tubes were heated on the outside by flue gas at 1200°F. Variables considered were: tube size, ratio of H_2 to hydrocarbons, and toluene in the feed. Final working charts were in terms of volumetric production rate *vs.* conversion for various tube sizes, recycle ratios and feed compns., and tube lengths *vs.* space velocity for various pressure drops.

11220. BLOCH, F. **Nuclear relaxation in gases by surface catalysis.** *Phys. Rev.* 83, 1062-3(1951). —*C.A.* 45, 10057*b*.

To obtain a nuclear relaxation time near 1 sec, the O_2 must have a partial pressure of 10 atm. A fine powder of a paramagnetic substance with O_2 + He filling the spaces will act as a catalyst. Finely powd. Fe_2O_3 used with Xe was calcd. to have an "equiv. O_2 pressure" of 10 atm. The exptl. value was 30 atm.

11221. BRAUMAN, PIERRE AND TSANGARAKIS, CONSTANTIN. **An apparatus for measuring the catalytic activity of nickel.** *Mém. services chim. état* (Paris) 36, No. 2, 195-200(1951).—*C.A.* 47, 4140*d*.

The activity of a Ni catalyst, used for hydrogenation, was detd. by measuring the flow of H_2 into and out of the reaction vessel. The H_2 was dried over $CaCl_2$ and traces of O_2 burned over Pd at 300°C. After a second drying over $CaCl_2$ and P_2O_5 the H_2 was satd. with vapors of the substance to be hydrogenated (e.g. benzene) in a glass spiral, kept at const. temp. The accuracy of the flow measurements was to ± 2%.

11222. BRENET, JEAN AND BRIOT, ANNE MARIE. **State of valence of the manganese atom in so-called "manganese dioxide" compounds.** *Compt. rend.* 232, 726-7(1951).—*C.A.* 45, 5502*f*.

Magnetochem. and crystallographic results indicated that the formula MnO_2 could not be applied to all the O compds. supposed to have this compn. The interpretation of reactions catalyzed by these oxides or of reactions with isotopic exchange must be revised.

11223. BRENET, JEAN AND BRIOT, ANNE MARIE. **Mechanism of the depolarizing and catalytic activity of manganese dioxide.** *Compt. rend.* 232, 1300-2(1951).—*C.A.* 45, 7859*i*.

A cryst. phase other than pyrolusite was responsible for the depolarizing and catalytic activity of MnO_2.

11224. BRILL, R. **The rate equation of ammonia synthesis on iron-type catalysts of different composition.** *J. Chem. Phys.* 19, 1047-50(1951). —*C.A.* 46, 812*i*.

The results agreed in a general way with the rate equation of Temkin and Pyzhev. An improvement of this equation led to a better agreement between observed and calcd. synthesis rates. Expts. at low temps. showed that the rate equation was the same for the 3 catalysts that were investigated: (1) pure Fe, (2) Fe contg. 3% Al_2O_3, and (3) Fe contg. 3% Al_2O_3 and 2% K_2O.

11225. BRITTON, E. C.; DIETZLER, A. J., AND NODDINGS, C. R. **A calcium-nickel phosphate dehydrogenation catalyst.** *Ind. Eng. Chem.* 43, 2871-4(1951).—*C.A.* 46, 1668*d*.

An effective catalyst for dehydrogenation of *n*-butenes to 1,3-butadiene with superheated steam was a calcium-nickel-phosphate catalyst [$Ca_8Ni(PO_4)_6$], promoted with Cr oxide. Ultimate 93 to 97% yields were obtained in lab. units at conversion levels of 20 to 45%. In plant operations, ultimate yields of 86 to 88% were obtained at 35% *n*-butene conversion. PhEt was selectively dehydrogenated to PhC_2H_3 over this catalyst. The selectivity of the catalyst did not change during 3.5 months of continuous operation in the lab. unit.

11226. BRUNS, B. P. **Effect of reactions on catalysts.** *Doklady Akad. Nauk S.S.S.R.* 78, 79-82(1951).—*C.A.* 45, 6912*a*.

The proportions of areas of different crystal faces may vary in the course of a catalytic gas reaction. The fact that the habit of a crystal was not const., but varied with the medium, was linked with the dependence of the surface energy of each crystal face on the adjoining medium. If the distribution of the areas of different crystal faces was variable, the concept of a const. no. of "active centers" on a catalyst lost its meaning.

11227. CLARK, IRA T.; HICKS, JAMES R., AND HARRIS, ELWIN E. **Hydrogenation of Douglas fir lignin.** *Tappi* 34, 6-11(1951).—*C.A.* 45, 4445*f*.

Douglas fir lignin was hydrogenated in decahydronaphthalene suspension at 300°C with Raney Ni, Cu chromite, and CaO as catalysts. The H_2 absorbed amounted to 1 mole/32.5 g lignin. Products recovered were: neutral oils 26.3; low-boiling acids and phenols 3.8; H_2O-sol. materials 1.2; low-boiling tars 7.3; and pitch 11.6; H_2O 4.8; gas and loss 15.7; and unreacted residue 29.3%.

11228. CORNUBERT, RAYMOND; KAZIS, CLAUDE, AND THOMAS, PHILIPPE. **New studies on the selective hydrogenation of ethylenic ketones by means of Raney nickel.** *Compt. rend.* 232, 1166-8(1951).—*C.A.* 46, 442c.

The selectivity of the catalyst remained practically const. after repeated use; only the velocity of the hydrogenation decreased (18 min. in the 1st and 123 min. in the 8th run). HCOOH retarded the hydrogenation to the same degree as HCl, whereas HOAc was less effective; Et_3N retarded slightly the hydrogenation of the double bond, but increased the reduction of the CO.

11229. Cremer, E. and Marschall, E. **Heterogeneous decomposition of nitrous oxide on catalysts with varying activities.** *Monatsh.* 82, 840-6(1951).—*C. A.* 46, 3383*e*.

With CuO or La_2O_3, the reaction was of 1st order during its early stages. Preheating of CuO between 450° and 700°C resulted in a linear increase of the activation energy from 11 to 42 kcals. The results were not so conclusive for La_2O_3. If A = const. in the Arrhenius equation and q = activation energy, log A = const. + q/a, where $a = 3200$ and $a/2.3R = 710$°K for both catalysts. The elec. cond. of pressed catalyst powders decreased linearly with temp. of prepg. the catalysts.

11230. Csuros, Zoltán; Géczy, István, and Nógrádi, Tamás. **Investigation on catalysts. VII. The role of the hydrogen pressure in the kinetics and mechanism of catalytic hydrogenation.** *Acta. Chim. Hung.* 1, 168-81(1951).—*C. A.* 45, 10023*c*.

When maleic and fumaric acids were hydrogenated in proportions of 1 mol. substrate to 1 mol. H_2, the reaction order and the rate const. as functions of the amt. of catalyst showed fluctuations following max.-min. curves. The overall order varied from 1.0 to 6 except where very small amts. of catalyst were used. The order with reference to H_2 was detd. by hydrogenating 6.7 mol. substrate with 1 mol. H_2, in which case the distance between the extreme points on the curve became less.

11231. Dixon, Joseph A. and Schiessler, Robert W. **The exchange of deuterium for hydrogen in heptane.** *J. Am. Chem. Soc.* 73, 5452-3(1951).—*C. A.* 46, 9396*i*.

Ni and Pt catalysts were ineffective for the catalysis of H exchange between water and a straight-chain paraffin in the liquid phase. Vapor-phase interchange of H isotopes between D_2O and a normal paraffin took place readily over a kieselguhr-supported Ni catalyst. Exchange proceeded at 135°C in the vapor and did not take place at 150°C in the liquid. The exchange was accompanied by scission of the C—C bonds, and therefore was not practical for the prepn. of perdeuteriated compds.

11232. Egerton, Alfred C. and Warren, D. R. **Kinetics of the hydrogen-oxygen reaction. I. The explosion region in boric acid-coated vessels.** *Proc. Roy. Soc.* (London) A204, 465-76(1951).—*C. A.* 46, 4897*d*.

The region of low-pressure (up to 250 mm) explosion of H_2 and O_2 mixts. in B_2O_3-coated vessels was observed over the range from 400° to 550°C in various sizes of vessels and at varied mixing ratios. An analysis of the kinetic data led to the postulation of the following 2nd-order chain-branching process: $H + HO_2 \rightarrow OH + OH$, which did not occur in salt-coated vessels. B_2O_3 coatings preserved peroxidic substances. A mechanism was outlined that accounted for the observed results.

11233. Foresti, Bruno. **The effect of the pH on the velocity of the hydrogenation of benzene in the presence of platinum progressively poisoned with thiophene.** *Ann. chim.* (Rome) 41, 425-37 (1951).—*C. A.* 46, 330*g*.

The velocity of the hydrogenation of C_6H_6 and of cyclohexene in aq. medium in the presence of platinized Pt depended on the pH of the medium. The velocity of the hydrogenation of C_6H_6 decreased with increasing pH to about 1/10 of the initial value at pH 7. An increase of the pH had the same effect as a selective and reversible catalyst poison. This effect was attributed to the increase of the potential difference between the Pt and the soln. with increasing pH (owing to an increase of the cation d. at the metal-soln. interface) and the blocking of the most active centers of the heterogeneous catalyst surface. The Pt showed the same behavior as in the blocking of the C_6H_6 hydrogenation with thiophene, which did not affect its activity for the olefin hydrogenation.

11234. Forney, R. C. and Smith, J. M. **Kinetics of catalytic sulfurization of methane.** *Ind. Eng. Chem.* 43, 1841-8(1951).—*C. A.* 45, 10013*i*.

Kinetics of reaction $CH_4 + 4S = CS_2 + 2H_2S$ were correlated by the equation $r = kp_{CH_4}p_{S_2}$, where $k = 0.26$ g mole of CS_2/(g of catalyst)(hr) (atm.)^2 at 600° and 1 atm. pressure over 6-8-mesh silica gel catalyst. Bed depth, mol. ratio, and feed rate were varied. Diffusional resistances had only a negligible effect at the mass velocities employed (0.1-0.9 g mole/(hr)(30 mm outside diam. cylindrical reactor); the reaction was simple second order involving CH_4 and S_2.

11235. Frampton, Vernon L.; Edwards, Joseph D. Jr., and Henze, Henry R. **The preparation of a platinum oxide catalyst of reproducible activity.** *J. Am. Chem. Soc.* 73, 4432-4(1951).—*C. A.* 46, 6776*a*.

The prepn. depended upon the instantaneous heating of $PtCl_4$ to 520°C in the presence of $NaNO_3$. Add 10 ml of a 10% soln. of $H_2PtCl_6.6H_2O$ to 9 g of $NaNO_3$ and evap. to dryness with const. stirring over an open flame. The mixt. was then added all at once to 100 g of $NaNO_3$ heated to 500-40°C. The cooled magma was dissolved in 2 liters water, and the catalyst filtered, washed with water without allowing it to dry, and then stored *in vacuo* over $CaCl_2$.

11236. Francis, W. and Lepper, G. H. **Recovery of sulfur from flue gases.** *Engineering* 172, 36-7(1951).—*C. A.* 46, 708*g*.

At least 92% of the S oxides contained in flue gases were removed by noneffluent-type gas-washing plants: (1) $CaSO_4$ in sludge resulting from washing flue gases with lime or chalk was converted to $(NH_4)_2SO_4$ by digesting it with a soln. of the $(NH_4)_2CO_3$ produced as a by-product of the gas and coke-oven industries, (2) $CaSO_4$ and $CaSO_3$ in sludge were roasted in a kiln with coal ash, clay, or a mixt. of both, (3) $(NH_4)_2SO_4$ and S were recovered by scrubbing with $(NH_4)_2CO_3$ solns., (4) Na_2SO_3 and Na_2SO_4 were produced by scrubbing with Na_2CO_3.

11237. Freĭdlin, L. Kh. and Levit, A. M. **Kinetics of dehydration of formic acid on phosphate catalysts and on aluminum oxide.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1951**, 625-30.—*C. A.* 46, 3840*f*.

Flow expts. were made at a feed rate of 0.16 ml HCO_2H (82 or 100%)/min., on 20 ml catalyst (wt 9-11 g, length of column 6 cm). The gas evolved in all cases was 100% CO. The activation energies *E* (kcal/mole) and preëxponential factors k_0 were (with 82% HCO_2H), on $Ca(H_2PO_4)_2$, 17.6 and 4.8×10^9, and on $Ca_3(PO_4)_2$, 15.2 and 5.2×10^8. These catalysts were, consequently, highly selective in the sense of dehydration of HCO_2H as against dehydrogenation, and highly active. The activity of Al_2O_3 was both lower and less selective than that of the Ca phosphates. Treatment of Al_2O_3 by impregnation with K_2O lowered the selectivity still further; with 7% K_2O, at 263°C, the activity was decreased by 30%, and the amt. of CO in the gas from 93 to 73%.

11238. FREĬDLIN, L. KH.; NEIMARK, I. E.; FRIDMAN, G. A., AND SHEINFAIN, R. YU. **Promotion of silica gels of different porosities.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1951**, 86-94.—*C.A.* 45, 5502*i*.

The catalytic activity of a silica gel in the gas-phase hydrolysis of $PhCl + H_2O \rightarrow PhOH + HCl$ was linked with the presence of medium-size pores. Promotion by $CuCl_2$, resulting in increased thermal stability, greater selectivity, and regeneration of poisoned silica gel, was attributed to an action on readily accessible portions of the surface, not normally active in the unpromoted gel. The 6 samples of silica gel had the characteristics (total pore vol. in ml/g, micropore vol. in ml/g, vol. of C_6H_6 sorbed in the liquid state at $p/p_s = 1$, vol. of intermediate pores in ml/g, B.E.T. area in m^2/g): (1) 0.60, 0.23, 0.60, 0.39, 390; (2) 0.46, 0.26, 0.45, 0.19, 450; (3) 0.45, 0.32, 0.46, 0.14, 560; (4) 1.23, 0.25, 1.19, 0.94, 490; (5) 0.93, 0.23, 0.95, 0.72, 420; (6) 0.93, 0.18, 0.94, 0.76, 325.

11239. FREĬDLIN, L. KH. AND RUDNEVA, K. G. **Kinetics of depromotion of a skeleton nickel catalyst and relative velocity of activation of hydrogen.** *Doklady Akad. Nauk S.S.S.R.* **81**, 59-62(1951).—*C.A.* 46, 1854*g*.

Depromotion of a hydrogenation catalyst through extn. of the dissolved H_2 from the catalyst by the reactant, with the activation of the H_2 of the gas phase lagging behind the deactivation, was illustrated by liquid-phase hydrogenation of *p*-$C_6H_4O_2$ in dioxane soln. Ni was preliminarily satd. with H_2. At room temp., with 0.3112 g *p*-$C_6H_4O_2$ in 10 ml dioxane, and 1.04 g Ni paste, absorption of H_2 came to a stop when 37.6 ml H_2 had been absorbed, instead of the 64.5 ml H_2 necessary for complete reduction to *p*-$C_6H_4(OH)_2$; however, *p*-$C_6H_4O_2$ was reduced completely. The balance of H_2 necessary for the complete reduction was drawn from the catalyst.

11240. FREĬDLIN, L. KH. AND ZIMINOVA, N. I. **Poisoning of hydrogenation-dehydrogenation catalysts in the light of the theory of their active structure.** *Doklady Akad. Nauk S.S.S.R.* 76, 551-4(1951).—*C.A.* 45, 3698*g*.

The poisoning of a great variety of hydrogenation-dehydrogenation catalysts (Pd, Pt, Ni, Co) with a great variety of catalyst "poisons" (O, S, Se, Te, P, As, Sb, Bi, Cl_2, Br_2, I_2, and their compds.) did not consist in adsorptive "blocking" of active centers. It was due to removal of dissolved H_2 that was an essential promoter of the catalysts. The poisons listed were all highly reactive towards H_2. The very strong poisoning effect of H_2S was explained by a chain reaction of the type $H_2S + H \rightarrow H_2 + HS$; $2HS \rightarrow H_2 + 2S$; $S + H \rightarrow HS$, etc. Superficially adsorbed H_2 was only loosely bound and, being consumed first, protected active centers against depromotion, as long as H_2 was supplied from without.

11241. FRIDMAN, S. D. AND KAGAN, M. YA. **Kinetics and reaction mechanism of catalytic hydrogenation-dehydrogenation. V. Catalytic reactions of cyclohexene in the presence of copper and iron.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 21, 874-84(1951); *J. Gen. Chem. U.S.S.R.* 21, 959-69(1951)(Engl. translation).—*C.A.* 45, 9347e; 46, 7415*e*.

The thermodynamic functions were calcd. for the 3 possible reactions of cyclohexene. All 3 reactions were probable: the hydrogenation predominated at low temps., dehydrogenation at higher temps., and disproportionation being very nearly temp. independent. Pure Cu catalysts were prepd. by deposition on activated Al_2O_3. In flow expts. on 25 ml of the Cu catalyst, with 1.3-1.5 moles H_2/mole cyclohexene, the degree of conversion at 152°C was 22.5% (exclusively by hydrogenation), increasing to 98% at 233°C. Disproportionation became increasingly noticeable with increasing temp. Dehydrogenation became distinct (23.6%) at 280°C.

11242. GABRIELSON, C. O. **Heat transfer from catalyst surfaces. I. Heat transfer during ethylene hydrogenation on a platinum wire.** *Svensk Kem. Tid.* 63, 145-66(1951).—*C.A.* 46, 29*c*.

The heat transfer from a catalyst surface (Pt-wire) was found to be 14% higher than normal during hydrogenation of C_2H_4. Heat transfer was measured both during hydrogenation of ethylene and during passage of ethane over the Pt wire, the temp. being kept the same in both cases, as measured by the cond. of the wire. C_2H_6 was chosen for the noncatalytic expts. The increase in heat transfer during the hydrogenation showed that the newly formed C_2H_6 mols. were desorbed from the catalyst surface with an energy in excess of that corresponding to the av. catalyst temp.

11243. GALLAK, V. M. **Method for the separate catalytic preparation of oxygen and chlorine from calcium hypochlorite.** *J. App. Chem. U.S.S.R.* 24, 909-17(1951)(Engl. translation); *Zhur. Priklad. Khim.* 24, 798-806(1951).—*C.A.* 47, 4233*e*.

Co and Fe salts contg. about 0.8 g of metal and giving a final Co:Fe ratio of 3:2 were dissolved in 10 ml of H_2O, 10 g of dry powd. $Ca(ClO)_2$ was stirred in, and, after completion of the reaction, the mass was dried and ground. A mixt. of $Ca(ClO)_2$ 25, catalyst 1-5 g, and H_2O 15 ml was heated at 70-100°C, giving about 2200 ml of O_2. When CaO was added in 20:25 ratio with the $Ca(ClO)_2$, the external heating could be eliminated, the heat from the slaking of CaO being sufficient.

11244. Gellner, O. H. and Richardson, F. D. **Reduction of ferrous oxide.** *Nature* 168, 23-4 (1951).—*C.A.* 46, 326*c*.

$Fe_{0.95}O$ was prepd. by the passage of a mixt. of H_2 and H_2O vapor over strips of Fe at 900° and 950°C and reduction by H_2. At 700°C the reduction proceeded from the surface inwards. At 900°C and above a very thin film of Fe formed on the oxide surface, but this formation soon ceased. The reduction then proceeded outwards from the metal-oxide interphase. At intermediate temps., reduction proceeded simultaneously inwards from the surface and outwards from the metal.

11245. Giovannini, Erminio. **The catalytic preparation of hydrocyanic acid.** *Chimica e industria* (Milan) 33, 480-3(1951).—*C.A.* 46, 3225*e*.

The reaction of CH_4, NH_3, and O_2 (air) was studied over Mn-Al and Fe-Al oxide catalysts supported on silica. The latter catalyst was better. Optimum conditions were 600°C, a contact time of 5-6 sec, and vol. ratios of CH_4:NH_3:air = 5.5:1:14. The yield of HCN, based on NH_3, was 36%. Advantages of this process were the relatively low temp. and the low concn. of CO_2 in the product.

11246. Goss, Alexander E. **Catalytic combustion of atmospheric contaminants in effluent from wire-enameling ovens.** *Wire and Wire Products* 26, 1051-5,1089, 1090(1951).—*C.A.* 46, 1267*e*.

Oleo-resin, a natural base enamel, Form-var, a synthetic enamel of the PhOH-CH_2O type, and nylon were the enamels used in the test. The principle of catalytic combustion, a description of the installation, and the collection and analysis of effluent gases were discussed. The general method of catalytic combustion should have possibilities for use in the field of atm.-pollution control wherever the contaminants were combustible or readily oxidized to less irritant compds.

11247. Greensfelder, B. S. **Process in petroleum technology. The mechanism of catalytic cracking.** *Advances Chem. Ser.* No. 5, 3-12(1951).—*C.A.* 45, 10556*i*.

The catalytic cracking of the 4 major types of hydrocarbons was surveyed in terms of cracked gas compn. to establish a basic pattern of the mode of cracking which in the case of aromatics was different from that of *n*-paraffins, *n*-olefins, and cyclohexane-type naphthenes. This pattern was correlated with the acid-catalyzed low temp. reverse reactions of olefin polymerization and aromatic alkylation. The Whitmore carbonium-ion mechanism was applied.

11248. Grote, H. W.; Hoekstra, J., and Tobiasson, G. T. **Midget fluid catalytic cracking units.** *Ind. Eng. Chem.* 43, 545-50(1951).—*C.A.* 45, 3586*d*.

Bench-scale, fluid, catalytic-cracking units permitted continuous operation with full catalyst circulation on approx. 1 liter of catalyst, and employed continuous debutanization and automatic batch fractionation. Essential operating conditions of the larger-scale units were duplicated.

11249. Heilmann, René and Gaudemaris, Gabriel de. **General kinetics of catalytic liquid-phase hydrogenation on Raney nickel.** *Compt. rend.* 233, 166-8(1951).—*C.A.* 46, 1854*f*.

The role of pressure and solvents in the catalytic liquid-phase hydrogenation of 1-heptene, acetone, 2-butanone, and isobutyraldehyde was investigated. The solvents were EtOH, MeOH, dioxane, and cyclohexane. The rate of hydrogenation was proportional to the mass of the catalyst but independent of the quantity of acceptor.

11250. Heinemann, Heinz. **Dehydrogenation of methylcyclopentane over chromia-alumina catalyst.** *Ind. Eng. Chem.* 43, 2098-2101(1951).—*C.A.* 46, 6369*h*.

The dehydrogenation at atm. pressure of methylcyclopentane over Cr_2O_3-Al_2O_3 catalyst in the presence of H_2 and small amts. of C_6H_6 gave better yields of mono-olefins and lower coke deposits than either dehydrogenation at reduced pressure in the absence of H_2 and C_6H_6 or dehydrogenation in the presence of H_2 or C_6H_6 individually. Pretreating of the catalyst with C_6H_6 with the feed gave larger yields of desired products. At conversions of 30.5%, coke was reduced by the addn. of small amts. of C_6H_6 from 7 to 3%, and at a conversion level of 35% the coke was reduced from 6.5 to 3.8%.

11251. Heinemann, H.; Schall, J. W., and Stevenson, D. H. **Houdriforming for aromatics.** *Petroleum Engr.* 23, No. 12, C40-2(1951).—*C.A.* 46, 1238*a*.

Houdriforming was a continuous catalytic reforming process for producing both aromatic concentrates and high-octane gasolines from low-octane straight-run naphthas. The reactions involved were selective and consist predominately of dehydrogenation, isomerization, aromatization, hydrocracking, and desulfurization. Dehydrogenation and dehydroisomerization of naphthenes formed aromatic concentrates such as benzene, toluene, and xylenes from fractions rich in naphthenes.

11252. Hofer, L. J. E.; Anderson, R. B.; Peebles, W. C., and Stein, K. C. **Chloride poisoning of iron-copper Fischer-Tropsch catalysts.** *J. Phys. & Colloid Chem.* 55, 1201-6 (1951).—*C.A.* 46, 233*b*.

Catalysts prepd. from Fe^{+2}, Fe^{+3}, and Cu^{+2} solns. were active only when they contained sizeable amounts of Fe^{+2}. The β-$Fe_2O_3.H_2O$ catalysts contained up to 0.92% Cl, the poisoning effect of which accounted for the inactivity of this catalyst.

11253. Horsfield, S. W. **Reforming natural gas by the continuous catalytic cracking process.** *Am. Gas Assoc., Proc.* 33, 591-601(1951).—*C.A.* 47, 2458*c*.

The equipment and operation of a continuous catalytic cracking process for the conversion of natural gas into a gas completely interchangeable with carbureted water gas were discussed.

11254. Horsfield, S. W. **Continuous catalytic cracking process used to reform natural gas.** *Am. Gas J.* 175, No. 4, 17-20(1951).—*C.A.* 46, 235*h*.

The Glenwood Landing plant was initially designed to convert 20 million ft^3 of natural gas into 37 million ft^3 of interchangeable 540 B.t.u. gas/day. A change in the type of catalyst made it possible to convert 25 million ft^3 of natural gas/day, and further increase in production was expected. Three Surface Combustion cracker furnaces were used, each contg. 32 vertical tubes completely filled with small pieces of alundum rock impregnated with Ni oxide catalyst.

11255. HUTTIG, G.F.; ZAGAR, L., AND HONAK, E.R. **Catalytic capacity of sintered iron material.** *Monatsh.* 82, 183-6(1951).—*C.A.* 45, 5502*d*.

The energy of activation for the decompn. of NH_3 by Fe was 23,600 cal for Hametag Fe (reduced and sintered in H_2) and 15,700 cal for carbonyl Fe. It was independent of the degree of sintering and the sintering temp. The activity of the catalyzing centers in carbonyl Fe was superior, but Hametag Fe had more such centers. If Hametag Fe was reduced and sintered in a stream of NH_3, its catalytic activity was improved considerably.

11256. IRVIN, H.B.; OLSON, R.W., AND SMITH, J.M. **Design of fixed-bed catalytic reactors. II.** *Chem. Eng. Progress* 47, 287-94(1951).—*C.A.* 45, 6437*c*.

Temps. were measured at various catalyst bed depths and radial positions in a 2-in. inner-diam. reactor through which SO_2 and air were passed. The catalyst consisted of 1/8-in. Al_2O_3 pellets coated with 0.2% Pt. The reactor was cooled by boiling water in a surrounding jacket in order to induce large radial temp. gradients. The conversion of SO_2 to SO_3 was detd. Good agreement with the observed temp. and conversion data was obtained when this method was applied to the SO_2 reaction, despite the fact that mass transfer in the radial direction was neglected.

11257. ISHIBASHI, SATORU. **The recovery of nickel oxide and molybdenum oxide from the waste catalyzer. I. The recovery of nickel oxide.** *J. Electrochem. Soc. Japan* 19, 185-9 (1951).—*C.A.* 46, 1725*b*.

The roasted powder of the waste mixed catalyzer composed of NiO, MoO_3, and clay, used for hydrocracking of petroleum, was treated first with 40% HNO_3 at 80°C. By adding $Fe(NO_3)_3$ at pH 4.0-4.2, a small quantity of molybdic acid which was dissolved in this $Ni(NO_3)_2$ soln. was removed. The ammonium nickel nitrate complex salt soln. was formed by adding excess NH_4OH. More than 98% of $Ni(OH)_2$ was obtained from the boiling mixt. About 92% of NiO in the waste catalyzer was recovered, including only 0.05% Fe_2O_3 + Al_2O_3, 0.03% MoO_3, and a trace of SO_3.

11258. JANZ, G.J. AND HAWKINS, P.J. **Activity of the chromium-aluminum oxide catalyst system in the nitrile-diene and heptane cyclizations.** *Nature* 168, 387-8(1951).—*C.A.* 46, 7859*c*.

The activity-compn. relation of the Cr oxide-Al oxide catalyst, over the range 0.34-34.2 wt % of Cr, found in the more complex reaction of benzonitrile + butadiene → 2 phenylpyridine + H_2 was very similar to that observed in the simple case of heptane → toluene + H_2. In each case there was a noticeable change of slope at about 6% Cr.

11259. KANDINER, H.J.; HITESHUE, R.W., AND CLARK, E.L. **Catalyst evaluation and middle-oil preparation in an experimental high-pressure coal-hydrogenation plant. I.** *Chem. Eng. Progress* 47, 392-6(1951).—*C.A.* 45, 8737*c*.

The coal hydrogenation pilot plant of the Bureau of Mines was described. Five operating runs at 460°C and 3500 p.s.i. with 35% coal paste were reported. Results produced in liquid-phase hydrogenation of bituminous coal by Sn, Zn, Ni, and Fe catalysts and also in the absence of any added catalyst were compared. The exceptional activity of Sn catalysts could be closely duplicated in regard to liquefaction and "asphalt" formation by $NiCl_2$ catalyst impregnated on the raw coal from aq. soln.

11260. KARPACHEVA, S.M. AND ROZEN, A.M. **Oxygen exchange between alcohol vapor and dehydration catalysts.** *Doklady Akad. Nauk S.S.S.R.* **81**, 425-6 (1951).—*C.A.* 46, 3382*b*.

EtOH vapor was led at 200° and at 400°C over active Al_2O_3 tagged with 150-300 γ/g of heavy O^{18} by way of exchange with H_2O vapor contg. O^{18}. Dehydration of the EtOH took place at 400°, not at 200°C. At both temps., there was exchange of O between the solid and the EtOH vapor, at a rate governed by the exponential law $dq/dt = \exp(-aq)$, where q = amt. of O^{18} exchanged. The exchange of Al_2O_3 with H_2O was 2-3 times as fast as with EtOH vapor. Exchange of O^{18} between the EtOH and the catalyst was observed at 300°C on kaolin, Al_2O_3 + Cr_2O_3 (10%), and ZnO; the reaction on the first two catalysts was dehydration, and on ZnO, dehydrogenation.

11261. KATZ, MORRIS; WILSON, L.G., AND RIBERDY, R. **The oxidation of carbon monoxide by solid silver permanganate reagents. IV. Chemical composition in relation to activity.** *Can. J. Chem.* 29, 1059-62, 1065-8(1951).—*C.A.* 47, 5306*f*.

The activity after progressive aging and thermal treatment of $AgMnO_4$ supported on ZnO and BeO was found to be closely related to the extent of decompn. of the cryst. $AgMnO_4$. The Ag salt decompd., with loss of active O. From a mass balance of solid-gas reactants in a reacting column, it was demonstrated that in the most active stage, during which the efficiency of oxidation did not fall below 90%, the course of the reaction was about evenly divided between stoichiometric and catalytic processes.

11262. KIPERMAN, S.L. AND GRANOVSKAYA, V. SH. **Change in reaction order for ammonia synthesis. I. Reaction kinetics on an osmium catalyst.** *Zhur. Fiz. Khim.* 25, 557-64 (1951).—*C.A.* 45, 9346*h*.

The kinetics of NH_3 synthesis at atm. pressure was studied between 420° and 600°C in a dynamic system on an osmium-on-silica gel catalyst. The catalyst (2 ml; 1.63 g) was reduced at 450°C in the synthesis gas; reduction was completed at 475°C until const. activity was reached. Three sets of data were reported. The 1st and the 2nd set were obtained with a $p_{H_2}:p_{N_2}/= 3:2$ mixt. The data of the 3rd set gave a straight line passing through the origin in a plot p_{NH_3}, p_{N_2}. The change in reaction order was not observed on other catalysts because the values of $x = [p_{NH_3}/(p_{NH_3})_{equil.}]$ were too high.

11263. KIRKBRIDE, C.G. **The new process of catalytic reforming (hydroforming).** *Riv. combustibili* 5, 317-28(1951).—*C.A.* 46, 4775*g*.
Houdriforming was a catalytic process to obtain aromatics and benzenes of high octane no. from naphthas. The catalysts developed for this process were highly selective for the hydrogenation of C_6-ring naphthenes, the hydroisomerization of alkyl cyclopentanes, and the isomerization of straight-chain paraffins. The catalysts were not poisoned by S compds., thiophenes included, and were usually not regenerated. The feed was preheated before combination with a recycle gas stream rich in H_2. The combined streams went to the catalyst chamber where reforming took place. The effuent was cooled and flowed to a separator from which excess gas was vented and the remainder recycled. The partial pressure of H_2 in the reaction chamber greatly influenced the effuent compn.

11264. KISTIAKOWSKY, G.B. AND NICKLE, A. GORDON. **Ethane-ethylene and propane-propylene equilibria.** *Discussions Faraday Soc.* 1951, No. 10, 175-87.—*C.A.* 46, 3380*f*.
The equil. were approached from both sides on a reduced chromic hydroxide catalyst. For $C_2H_6 \rightarrow C_2H_4 + H_2$, the equil. consts. were $5.13 \pm 0.13 \times 10^{-4}$ atm. at 723.2°K and $4.04 \pm 0.17 \times 10^{-5}$ atm. at 653.2°K; for $C_3H_8 \rightarrow C_3H_6 + H_2$, the consts were $5.17 \pm 0.15 \times 10^{-4}$ atm. at 648.2°K and $3.67 \pm 0.17 \times 10^{-5}$ atm. at 583.2°K.

11265. KLINKENBERG, A. **Choices among the types of catalytic reactors.** *Chem. Weekblad* 47, 472-8(1951).—*C.A.* 46, 1305*c*.
The difficulties of scaling up lab. app. were enumerated. The direct calcn. of reactor design, without reference to smaller-scale app., was discussed for fixed- and fluid-bed reactors.

11266. KOCH, HERBERT AND RAAY, HANS VAN. **Individual branched hexenes and their isomerization equilibria.** *Brennstoff-Chem.* 32, 161-74 (1951).—*C.A.* 45, 8238*f*.
A Co gasoline-synthesis catalyst permitted equilibrium to take place smoothly in an autoclave at 190°C between 2,3-dimethyl-1-butene and 2,3-dimethyl-2-butene while the isomerization of the 2-methylpentenes did not progress under similar conditions. However, starting from 2-methyl-1-pentene and 2-pentene using a circulating apparatus (in part also using Al_2O_3 catalysts,) it was possible to approx. the equil. of the 2-methylpentene. The dehydration of pinacolone over activated Al_2O_3 at 330°C led directly to the equil. mixt. of the three dimethylbutenes. A silica gel catalyst apparently permitted the equil. isomerization reaction to take place between the tertiary olefin pairs.

11267. KODAMA, SHINJIRO; FUKUI, KENICHI, AND MAZUME, AKIRA. **Optimum gas ratio in ammonia synthesis.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 157-9(1951).—*C.A.* 47, 1905*b*.
Based on the kinetic equation for the ammonia synthesis from H_2 and N_2, a math. method was developed to calc. the optimim ratio of H_2 and N_2 for the max. ammonia yield.

11268. KODAMA, SHINJIRO; FUKUI, KENICHI; TANAKA, HIDEO, AND MAZUME, AKIRA. **The optimum temperature distribution in catalyst beds for the maximum yield.** *Chem. Eng.* (Japan) 15, 85-7 (1951).—*C.A.* 45, 5464*c*.
The optimum temp. distribution was based on the assumption that rate equation, rate const., and equil. const. were known at any temp. An example for the NH_3 synthesis was calcd.

11269. KOIZUMI, MASAO. **Catalytic polymerization reaction of olefins.** *Chem. Researches* (Japan) 9, 1-51(1951)(English summary, 52).—*C.A.* 45, 7421*h*.
Nickel oxide adsorbed on kielselguhr or SiO_2-Al_2O_3 gel was an excellent catalyst for polymerization at room temp. The polymerization proceeded step by step between 2, 3, 4 mols. and so on. Lower olefins polymerized more readily than did higher ones; the ratio of reaction velocities of ethylene, propylene, and butylene was approx. 100:10:1. Olefin mols. were adsorbed on the definite positions on the catalyst and then reached active spots, where polymerization took place. Finally the polymerization products removed to other places on the catalyst. The rate-detg. step was the process in which olefin mols. arrived at the active spots.

11270. KOK, W.J.C. DE AND WATERMAN, H.I. **Preparation of metals in a finely divided state for use as catalysts.** *J. Applied Chem.* (London) 1, 196-8(1951).—*C.A.* 45, 7726*i*.
Ni, Ni-Cr alloy, Monel, and V_4A steel were each prepd. in a finely divided state by atomizing the melted material. The catalyst particles had to be activated after prepn., and for this purpose treatment with 5% NaClO soln. acidified with dil. HCl was found best. Tests showed a difference in activity of these catalysts in the hydrogenation of several materials.

11271. KOLAROV, NIKOLA. **The catalytic decomposition of hydrogen peroxide by a solid catalyst.** *Bulgar. Akad. Nauk., Otdel, Geol.-Geograf. i Khim. Nauki, Izvest. Khim. Inst.* 1, 185-203(1951)(German Summary).—*C.A.* 46, 7858*f*.
The rate of decompn. of H_2O_2 in the presence of different salts and catalysts was detd. Catalysts (salts) were: MnO_2 (Na_2SO_4, NaOAc, NaCl, $NaNO_3$, NaBr, K_2SO_4, KOAc, KCl, KNO_3, KBr); charcoal (Na tartrate, NaOAc, Na_2SO_4, NaCl, NaBr, K tartate, KOAc, KNO_3, KCl, KBr) and Ag powder (NaOAc, $NaSO_4$, $NaNO_3$, NaCl, NaBr, KOAc, K_2SO_4, KNO_3, KCl, KBr). A previous irradiation of the Ag powder and the MnO_2 by ultraviolet caused a rapid aging of these catalysts. The activity of the charcoal was increased by ultraviolet radiation.

11272. KÖLBEL, HERBERT; ACKERMANN, PAUL; RUSCHENBURG, ERNST; LANGHEIM, ROBERT, AND ENGELHARDT, FRIEDRICH. **The Fischer-Tropsch synthesis with iron catalysts. II. Conditioning and starting-up of iron catalysts, behavior during synthesis, and results obtained in various synthesis processes.** *Chem. Ing. Tech.* 23, 183-9 (1951).—*C.A.* 45, 6365*e*.

The catalyst prepn. and effect of operating conditions upon the catalyst efficiency were described. Hydrocarbon synthesis for fixed bed vapor phase and liquid phase operation was discussed.

11273. Kotelkov, N.Z. **Compound helix as a catalyst carrier.** *J. Applied Chem. U.S.S.R.* 24, 223-6(1951)(Engl. translation).—*C.A.* 46, 6292*b*.

Compd. helixes of Cu, Fe, Al, and nichrome were coated with Pt, Pd, Al_2O_3, and various clays in an effort to increase the active area of the catalyst per unit mass. The efficiency of dehydrogenation of cyclohexane, oxidation of H_2, dehydration of isopropyl alc. were increased many fold over the same catalyst in pelleted form or deposited on asbestos.

11274. Kotelkov, N.Z. **Dehydrating properties of some clays and opokas.** *Zhur. Priklad. Khim.* 24, 576-82; *J. Appl. Chem. U.S.S.R.* 24, 641-7 (1951)(Engl. translation).—*C.A.* 46, 7859*d*; 47, 2568*h*.

Alc. dehydration over clay and opoka (rock consisting of SiO_2 and plastic material) catalysts were studied at 250°-450°C, with alc. flow of 0.05-0.3 ml/min. The extent of dehydration varied directly with the amt. of catalyst; it was nearly 100% for 14 g catalyst. The rate of reaction followed the Arrhenius equation. The energy of activation was about 4150 cal/mole. The process proceeded without side reactions. A temp. of 350°C was about the optimum. The catalysts were easily regenerated with air.

11275. Kummer, J.T.; Podgurski, H.H.; Spencer, W.B., and Emmett, P.H. **Mechanism studies of the Fischer-Tropsch synthesis. The addition of radioactive alcohol.** *J. Am. Chem. Soc.* 73, 564-9(1951).—*C.A.* 45, 4907*i*.

Methyl-labeled and methylene-labeled radioactive EtOH were added to a 1:1 CO-H_2 synthesis gas being passed at 1 atm. pressure over an Fe catalyst at about 230°C. Measurement of the radioactivity of the hydrocarbon products showed negligibly small activity for CH_4 formed and an approx. const. activity of 2150 ± 100 counts per min. per ml S.T.P. for the C_5 to C_{10} hydrocarbons. Either EtOH or some surface complex formed by the adsorption of EtOH behaved like an intermediate in hydrocarbon synthesis over Fe Fischer-Tropsch catalysts and at least the first of the added C atoms attached itself principally to the α-C atom of the surface complex.

11276. Lavrovskaya, G.K. and Voevodskii, V.V. **Reactions of hydrogen and oxygen atoms on solid surfaces.** *Zhur. Fiz. Khim.* 25, 1050-8 (1951).—*C.A.* 46, 2893*c*.

Partially dissocd. H_2 or O_2 from a discharge tube (3000 v.) flowed toward a capillary contg. a thermocouple (temp. T), coated with a catalyst and surrounded by walls kept at a temp. T_0. The probability of at. recombination was obtained from the heat-balance equation. MgO (from combustion of Mg) recombined with O but not H. When fresh, MoO_3 was inefficient but it became blue, active, and stable after some use. For $ZnO.Cr_2O_3$ in particular the true surface was much larger (~100-fold) than the geometrical surface.

11277. Lund, Vibeke. **Corrosion of silver by potassium cyanide solutions and oxygen.** *Acta Chem. Scand.* 5, 555-67(1951)(in English).—*C.A.* 46, 3373*h*.

In the initial stage of the soln., H_2O_2 was formed as an intermediate. When the CN^- concn. becomes sufficiently low, the H_2O_2 decompd. on the Ag surface. The Ag dissolved in an amt. equiv. to the CN present and formed $Ag(CN)_2^-$. The rate of O_2 consumption was independent of initial CN^- concn. within the range 0.05 to 0.2 *M*. The activation energy was 3.2 kcal from 15° to 25°C. The velocity was detd. by rate of diffusion in the soln.

11278. Mackenzie, H.A.E. and Milner, A.M. **Isotopes. IV. Catalysis of isotopic exchange between gaseous oxygen and liquid water.** *J. S. African Chem. Inst.* [N.S.] 4, 79-82(1951).—*C.A.* 47, 5742*f*.

No appreciable isotopic exchange took place between oxygen (O^{18}) and liquid water in the presence of metallic oxides, hydroxides, or org. substances. Introduction of H_2O_2, or of substances capable of catalyzing the decompn. of H_2O_2, such as finely divided Pt or catalase, catalyzed the exchange.

11279. Maeda, Shiro and Kawazoe, Kenjiro. **Heat transfer in granular beds. VII. Temperature distribution in the catalyst beds for sulfur dioxide oxidation.** *Chem. Eng.* (Japan) 15, 312-16(1951).—*C.A.* 46, 7377*c*.

Theoretical equations regarding the temp. distribution in catalyst beds were satisfactorily checked by the data obtained in the oxidation of SO_2(V_2O_5 catalyst) under conditions (low rates of gas flow and low degree of conversion) that were not realized in the former expts. on the oxidation of NH_3.

11280. Mastagli, Pierre; Austerweil, Geza, and Dubois, Edith. **Chemical action of cation exchangers.** *Compt. rend.* 232, 1848-9 (1951).—*C.A.* 46, 2874*e*.

Formation from an org. acid and alc. by cation exchange in the presence of an acid and a dehydrating agent was extended to include ether oxides. By heating an aryl alc. in a hydrocarbon soln. in the presence of an ion-exchange resin (phenol-HCHO sulfonic acid resin), $(C_6H_5CH_2)_2O$ was formed followed by $C_6H_5CH_3$ + C_6H_5CHO.

11281. Maxted, E.B. **Catalysis and the poisoning of catalysts.** *Chemistry & Industry* 1951, 242-6.—*C.A.* 45, 5340*e*.

Spent Ni catalyst used for hydrogenation of phenol contg. thiophenol was regenerated completely by washing with dil. soln. of Na permolybdate followed by water wash and reduction by H_2. Applicability to industrial use was discussed.

11282. McGeer, James Peter and Taylor, Hugh S. **Ammonia decomposition and related phenomena on rhenium catalysts.** *J. Am. Chem. Soc.* 73, 2743-51(1951).—*C.A.* 45, 8337*c*.

Kinetic measurements between 380° and 440°C showed that NH_3 decompd. over Re at a rate proportional to $(NH_3)^{0.53}$and $(H_2)^{-0.89}$ with an energy of activation of 32 ± 3 kcals. Adsorption of H_2 was measurable between - 196° and 330°C and resembled adsorption on Fe. Dissociative adsorption of N_2 on Re begins at about 250°C as with Fe. N_2 adsorbed in the range — 196°to — 154°C was slow in equilibrating and, in contrast to A, was not readily desorbed. Isotopic exchange between NH_3 and D_2, H_2 and D_2, and H_2O and D_2 occurred over Re between 0° and 100°C. Isotopes of N_2 exchanged readily over Re only above 500°C.

11283. Miyazaki, Shozo. **The catalytic decomposition of ammonia gas. X. Decomposition on nickel.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 605-6(1951).—*C.A.* 45, 7865*a*.

The thermal decompn. of NH_3 gas on Ni at 650°-750°C was observed in the NH_3 pressure range 3-15 mm Hg. The retarding action of H_2 was lost and a linear relation held between pressure and vol. at the temp. range. The heat of activation was calcd. to be 31.0 kcal/mol.

11284. Miyazaki, Shozo. **The thermal decomposition of ammonia gas. XI. Decomposition of ammonia gas on various metals at low pressure.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 1-3(1951).—*C.A.* 46, 3383*d*.

The decompn. of NH_3 on W, Mo, Pt, and Ni was studied at 650°-800°C in the range $0.5\text{-}1.0 \times 10^{-1}$ mm Hg. In each case the retarding action disappeared and the relation between pressure and vol. was represented as the 1st-order reaction with the lowering of pressure.

11285. Miyazaki, Shozo. **Thermal decomposition of nitrous oxide gas on platinum.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 723-6(1951). —*C.A.* 46, 5944*h*.

The thermal decompn. of N_2O gas on Pt was studied at 850°-875°C. The reaction was retarded by O_2 formed as decompn. product. From the exptl. results the heat of activation of N_2O gas on Pt was calcd. to be 31.8 kcal $mol.^{-1}$.

11286. Moritani, Ichiro. **Contact cracking power of synthetic alumina-silicate catalyst. II. Influence of addition compounds on catalysts and reaction temperature. III. Life and regeneration of catalysts.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 18-21;21-3(1951).—*C.A.* 47, 1309*b*.

The influence of various metallic oxides upon the catalytic activity of $Al_2O_3\text{-}SiO_2$ was studied for the formation of isobutylene from acetone. At 400°C, the presence of SnO_2 and Cr_2O_3 gave a yield of 28.5%.

11287. Murray, Christopher A. **Thermofor catalytic cracking gas plant corrosion survey.** *Corrosion* 7, 98-108(1951).—*C.A.* 45, 3579*c*.

Severe corrosion was experienced in a Thermofor catalytic cracking gas plant over several years. Some NH_4 acid salts were present which dissocd. at reboiler temps. to give acid conditions which caused rapid attack of reboiler tubes. Measures were suggested to remove water, which would also remove the principal corrosive constituents at appropiate points in the system.

11288. Nagiev, M.F. **Kinetics of catalytic cracking.** *Zhur. Fiz. Khim.* 25, 29-40(1951).—*C.A.* 46, 2898*g*.

The general equations expressing the kinetics of the catalytic conversion of a complex mixt. in a flow system were derived on the assumption that the contact reactions were unimol.

11289. Nakatani, Fumitada. **Free carbon precipitation from carbon monoxide gas in the presence of iron oxide.** *Tech.-nol. Repts. Osaka Univ.* 1, 261-77(1951)(in English).—*C.A.* 46, 4339*f*.

When CO was passed over Fe_2O_3 at 600°-800°C, carbon deposits were formed. The catalytic decomp. of CO into CO_2 + C may take place only when Fe_2O_3 was reduced to lower oxides which corresponded to a certain concn. of CO in CO + CO_2 mixt.

11290. Norman, Noel E. and Johnstone, H.F. **Catalysis in fused-salt systems.** *Ind. Eng. Chem.* 43, 1553-8(1951).—*C.A.* 45, 9349*e*.

The decompn. of C_2H_2 and the dehydrogenation of EtOH were investigated. The effects of molten chlorides on the decompn. of C_2H_2 agreed with the effects of the corresponding metals. All expts. were made at 600°C, and the metals were used in the compact state except Pt and Pd. Those active in the decompn. were Li, Na, Fe, Co, Ni, Cu, Mn, and finely divided Pt and Pd. C_2H_2 was bubbled through the melt for 5 min., after which it was examd. for carbon. The results with $ZnCl_2$ were unique; at 400°C slight decompn. occurred, at 450°C the reaction was vigorous, and at 600°C it had again subsided. No melt was found that catalyzed the synthesis of hydrocarbons from CO and H_2.

11291. Obolentsev, R.D. **Kinetics of the isomerization of normal butane in the liquid phase on aluminum chloride.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 21, 73-7(1951).—*C.A.* 45, 3697*h*.

Isomerization of C_4H_{10} to iso-C_4H_{10} was followed in sealed tubes with C_4H_{10} (20-21g), $AlCl_3$ (4 g), and HCl (1 mole/7 moles C_4H_{10}). With M = amt. of C_4H_{10} reacted, expressed in % of the initial amt. of C_4H_{10}, D = limit of M at the given temp. (highest degree of isomerization attainable, and τ = time in min., the law $\ln [D/(D-M)] = a\tau^b$ was verified, b was dimensionless, and a had the dimension τ^{-b}. The rate of polymerization $w = (dM/d\tau)(100/D) = d\xi/d\tau$ (where ξ = amt. of C_4H_{10} reacted up to the time τ, expressed in percentage of the completed reaction) was $w = (100 - \xi)ab\tau^{b-1}$. The isomerization of C_4H_{10} did not obey Semenov's 2nd law. It was assumed that the isomerization in the range 55°-100°C involved a neg. chain interaction, in the sense of Semenov.

11292. Obolentsev, R.D. and Gryazev, N.N. **Kinetics of dealkylation of isopropylbenzene on an aluminosilicate catalyst.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 21, 860-8(1951); *J. Gen. Chem. U.S.S.R.* 21, 943-50(1951)(Engl. translation).—*C.A.* 46, 32*c*; 7413*i*.

The reaction of iso-PrPh at 300°, 350°, 400°C was studied on a com. catalyst activated at 480°-500°C in air passing at 200-300 liter/liter catalyst/hr and then flushed with N_2, at space velocities s ranging from 0.125 to 15 liter/liter catalyst/hr. Coke formation varied between 2 and 3.8%, The formation of satd. hydrocarbons was attributed to disproportionation of H_2. Dismutation accompanied the dealkylation, iso-PrPh = C_3H_6 + C_6H_6. In the range of 350°-400°C, the extent of the dismutation increased with increasing contact time. With the temp. rising to 450°C, the curve of the extent of dismutation as a function of the contact time passed through a max. With the C_6H_6 formed by dismutation deducted, the amts. of C_3H_6 and C_6H_6 corresponded to each other.

11293. OBOLENTSEV, R.D.; VERSHININA, K.A., AND SKVORTSOVA, E.V. **Reactions of hydrocarbons in the presence of oxide catalysts. IV. Dehydrogenation of butanes on a chromia catalyst.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 21, 1800-6 (1951).—*C.A.* 46, 10816*e*.

On a Cr_2O_3-Al_2O_3 catalyst prepd. by simultaneous pptn., C_4H_{10} and iso-C_4H_{10} underwent both dehydrogenation and some isomerization. Flow expts. were run with the same total amt. of reactant (4.5 liters), the 1st half-hr's products were discarded. The Cr_2O_3 + Al_2O_3 catalyst had a "dehydroisomerizing" action. Whether the C_4H_{10} obtained from iso-C_4H_{10}, and the iso-C_4H_{10}, obtained from C_4H_{10}, were primary or secondary products was not yet settled. This partial isomerization could be accounted for by an intermediate formation of a 3-membered ring.

11294. OHASHI, KUMAO AND SUZUKI, SHIGENARI. **Uhde catalyst. I.** *J. Chem. Soc. Japan.* Ind. Chem. Sect. 54, 353-5(1951).—*C.A.* 47, 5045*c*.

Fe introduced into the catalyst as an impurity during the prepn. gave rise to catalytic activity. An effective catalyst was prepd. from $K_4Fe(CN)_6$, $AlCl_3$, and $FeCl_3$.

11295. OHTA, NOBUTO. **Catalytic hydrolysis of chlorobenzene to phenol in the vapor phase. I. Relationship between the method of preparing the silica gel-cupric chloride catalyst and its catalytic activity.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 46, 163-72(1951) (English summary).—*C.A.* 46, 1855*e*.

The catalytic action of silica gel in the hydrolysis of PhCl to PhOH in the vapor phase increased with its larger proton-supplying power. SiO_2 dried first at 110°-250°C and then impregnated with 1-5% (in wt) of $CuCl_2$ was 3 to 4 times as effective as silica gel loaded on acid clay.

11296. OHTA, NOBUTO AND TEZUKA, TAKASHI. **The catalytic hydrolysis of chlorobenzene in the gas phase. I. Relation between the method of preparation of catalyst silica gel-cupric chloride and the catalytic activity.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 297-9(1951).—*C.A.* 47, 2910*c*.

Prepn. of the proper catalyst for the catalytic hydrolysis of chlorobenzene into phenol was studied. Newly pptd. silica gel, dried at 100~300°C, cooled, and soaked with $CuCl_2$ and then dried at 300°C was very active.

11297. OHTA, NOBUTO AND TEZUKA, TAKASHI. **Catalytic hydrolysis of chlorobenzene to phenol in the vapor phase. II. Influence of temperature, space velocity. The reaction between chlorobenzene and ammonia water.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 328-30(1951).—*C.A.* 47, 3100*f*.

By use of silica gels contg. $CuCl_2$, the gas-phase hydrolysis of chlorobenzene was studied under various conditions. The reaction velocity increased rapidly with temp. As hydrolysis agent NH_4OH was better than water below 500°C when the space velocity of reactants was small.

11298. OHTA, NOBUTO AND TEZUKA, TAKASHI. **The catalytic hydrolysis of chlorobenzene in the gas phase. IV. The method of addition of the copper component to the catalyst.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 509-11 (1951). —*C.A.* 47, 6070*f*.

$Cu(OH)_2$ hydroxide was added to silica gel in order to prevent aging. When the silica gel dried at 120°C was mixed with wet $Cu(OH)_2$, the resulting catalyst showed a superior activity in the range 5-20% CuO.

11299. PARTINGTON, J.R. AND NEVILLE, H.H. **Thermal decomposition of carbonyl sulfide.** *J. Chem. Soc.* **1951**, 1230-7.—*C.A.* 45, 7461*c*.

The rate of the reaction $2\ COS \rightleftharpoons CO_2 + CS_2$ at 450°C was sensitive to the nature of the wall, being faster when the vessel was filled with silica. The activation energy was 28,450 cals for the silica surface. By prior addn. of CO_2 the above reaction was repressed and the reactions $COS \rightleftharpoons CO + S$, $2\ COS \rightleftharpoons 2\ CO + S_2$, or $2\ CO + S_2 \rightleftharpoons 2\ COS$ could be studied.

11300. PATTISON, JOHN N. AND DEGERING, E.F. **Some factors influencing the activity of Raney nickel catalyst. II. The role of oxygen in the aging of Raney nickel catalyst.** *J. Am. Chem. Soc.* 73, 486-7(1951).—*C.A.* 46, 4144*g*.

O_2 was responsible for the major part of the loss of activity of Raney nickel catalyst. The catalyst was suspended in hardened cottonseed oil so that it could be handled dry and weighed out accurately. The activities of 2 samples of W-4 type catalyst were approx. 0.093 and 0.056 p.s.i./min. 2 days after prepn. and the activities fell to approx. 0.027 at 12 days after prepn. A sample stored in N_2 retained its original activity whereas a sample stored in air was much less active after the same period of time. Storage in O_2 was even more harmful to the catalyst.

11301. PATTISON, JOHN N. AND DEGERING, E.F. **Some factors influencing the activity of Raney nickel catalyst. III. The poisoning of Raney nickel by halogen compounds.** *J. Am. Chem. Soc.* 73, 611-13(1951).—*C.A.* 45, 10188*d*.

Raney Ni was poisoned by HCl and by Am, *sec*-Am, *tert*-Am, Bu, *sec*-Bu, *tert*-Bu, Pr, Et, Ph, and $ClCH_2CH_2$, chlorides, bromides, and iodides; *m*-$ClC_6H_4NH_2$, 6,2-$Cl(H_2N)C_6H_3Me$, *m*-ClC_6H_4Me, CCl_4, $CHCl_3$, CCl_3CH_2OH, $ClCH_2CO_2H$, Cl_2CHCO_2H, Cl_3CCO_2H, AcCl, $CH_2{:}CHCH_2Cl$, BzCl, $(ClCH_2CH_2)_2O$, and $CCl_3CHO.H_2O$ indicated that there were at least 2 distinct types of active surface present on this catalyst.

11302. PAUL, RAYMOND; BUISSON, PAUL, AND JOSEPH, NICOLE. **Alkaline borohydrides in the preparation of hydrogenation catalysts.** *Compt. rend.* 232, 627-9 (1951).—*C.A.* 45, 10436*h*.

An aq. 5% $NiCl_2.6H_2O$ soln. (121 ml) was added with stirring to a 10% soln. of NaH_4B (27 ml); the black ppt. was filtered, washed, dried, and preserved under abs. EtOH; 7.7% B was found (theoretical for BNi_2 = 8.5%). $NiSO_4$ may be used, and MeOH may replace H_2O. The catalyst was only slightly less active than Raney Ni, but if the chloride or sulfate was replaced by $Ni(AcO)_2$, the catalyst was as active as Raney Ni. With Co a similar black ppt. contg. 7.9% B was obtained, but it was less active than the previous catalyst. Complex Ni-Cr catalysts were much more active than Raney Ni. Co-Cr and Co-W complexes contg. 2% Cr and W, resp., were more active than the simple Co catalyst.

11303. Pavlyuchenko, M.M. and Gurevich, E. **Kinetics of the decomposition of silver oxide.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 21, 467-73 (1951)—*C.A.* 45, 5006*f*.

The rate of decompn. of Ag_2O powder, measured by the rate of change of the pressure of the O_2 evolved, in a preliminarily evacuated vessel, at 118°, 150°, 160°, and 170°C, was greatest at the initial stage and fell with the progress of the decompn. With progressing decompn., and increasing surface coverage, the adsorbed Ag atoms interacted to form cryst. Ag, and the adsorbed O atoms formed O_2 which was desorbed. To some extent, adsorbed Ag and O will interact to reform Ag_2O (s), and adsorbed O will react according to $Ag_2O + O \rightarrow 2\ Ag\ (\text{adsorbed}) + O_2$. With the heats of adsorption of Ag and O atoms assumed equal, this latter reaction was exothermal by 47.5 kcal.

11304. Riesz, C.H.; Dirksen, H.A., and Kirkpatrick, W.J. **Sulfur poisoning of nickel catalysts.** *Inst. Gas Technol. Research Bull.* No. 10, 23 pp. (1951).—*C.A.* 46, 2780*g*.

The catalyst life (capacity before regeneration became necessary) and the catalyst conversion efficiency varied widely and independently with the kind and amt. of S compd. present. The performance of Ni catalysts in the presence of S could be improved considerably by appropriate selection of feed rates, steam concns., and operating temps. It was always possible to restore the catalyst to its original effectiveness if excessive temps. during regeneration were avoided.

11305. Rigamonti, Rolando and Spaccamela, Elena. **Catalytic oxidation of alkaline chromites to chromates with oxygen at low temperature. II. Experiments with silver oxide.** *Atti. accad. sci. Torino, Classe sci. fis. mat. e nat.* **86**, 129-37 (1951-52).—*C.A.* 47, 3739*h*.

The efficiency of Ag_2O as a catalyst was detd. Unlike Mn, Fe, Co, and Cu hydroxides examd. previously, Ag_2O accelerated the process with smaller concns. of catalyst. It not only affected the oxidation of $Cr(ONa)_3$, but it favored the transition of $Cr(OH)_3$ to $Cr(ONa)_3$.

11306. Roginskiĭ, S.Z. and Element, N.I. **Experimental verification of the statistical theory of poisoning. I. Poisoning of nickel oxide by boric acid.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1951, 350-60.—*C.A.* 45, 9934*h*.

Complete combustion of iso-C_8H_{18} vapor was studied in the range 370-550°C in a flow mixt. with O_2 on a NiO catalyst supported on asbestos. The catalyst was partially poisoned by impregnation with an aq. soln. of B_2O_3 and dried. The rate of the oxidation (decrease of the concn. c of iso-C_8H_{18}) was 0.5-order in iso-C_8H_{18}, and zero-order in O_2. The rate decreased with increasing B_2O_3 (0.1 to 1.5 wt %). The linear dependence of E on the B_2O_3 corresponded to uniform distribution of active portions over activation energies, with a possible narrowing at highest E. Uniform distribution should give a relation of the form $k = ae^{-a\gamma}$. The poisoning action of B_2O_3 consisted in selective blocking.

11307. Rohrer, C.S.; Rooley, J., and Brown, O.W. **Catalytic activity of reduced nickel tungstate.** *J. Phys. & Colloid Chem.* 55, No. 2, 211-14 (1951). —*C.A.* 45, 4540*g*.

$NiWO_4$ was prepd. by pptn. from aq. $NiNO_3$ with Na_2WO_4 and reduced as 1/4 in. granules in H_2 at 375°C. This material, packed in a vertical column, was used at 212°C to hydrogenate 1-nitropropane to *n*-propylamine. A yeild of 94.5% of *n*-propylamine was obtained.

11308. Rubinshteĭn, A.M. and Pribytkova, N.A. **Hydrogenation and dehydrogenation reactions on α- and β- cobalt.** *Izvest Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1951, 70-80.—*C.A.* 45, 5010*b*.

Catalysts without carrier were prepd. by decompn. of pure $Co(NO_3)_2$ at 300°C, and reduction of the CoO in H_2, 10 hrs at 350°, 375°, 420°, 450°, 600°, and 800°C. Catalysts on activated charcoal (washed with HCl) were made by impregnation with $Co(NO_3)_2$, drying at 200°C (accompanied by spontaneous heating-up), and reduction with H_2, 8 hrs at 350°, 600°, and 800°C. All expts. were made in a flow system with 1 g Co. In the hydrogenation of C_6H_6 in excess H_2 (space velocity of 4 ml/g Co/hr) the catalytic activity remained const. with time in all expts. at 140° and 160°C. In hydrogenation of cyclohexene (3.2 ml/g Co/hr) using catalysts on charcoal, the degrees of conversion in 12 min. at 120°, 140°, 160°, were: α, 92, 48, 44.5%; β, 9, 0, 0%. Hydrogenation of Me_2CO to Me_2CHOH, C_2H_4 (gas compn. C_2H_4 30.6, H_2 69, CO_2, 0.2, CO 0.6%), CO (gas compn. CO 25, H_2 62.8, CH_4 7.8, N_2 4%) and dehydrogenation of cyclohexane, and EtOH were studied.

11309. Ruff, R.J. **Catalytic combustion of hydrocarbon vapors.** *Org. Finishing* 12, No. 1, 20-3 (1951).—*C.A.* 45, 3532*b*.

The construction was intended to provide a high catalyst-surface exposure, turbulence in passage through the element, and reasonable min. resistance to flow. Combustion-sustaining temps. at the entry side of the catalyst varied inversely as the fume concn., so that combustion could be maintained with 70°F fume entry temp. providing the energy equiv. was at least 15 B.t.u./ft^3. Use of the catalyst was limited to fumes substantially free of unburnable solids. The catalytic element became deactivated after about 4000 hrs of service, but could be reactivated for a reasonable cost.

11310. Ruff, R.J. **Catalytic combustion in wire enameling.** *Wire and Wire Products* 26, 936-9, 987, 988 (1951).—*C.A.* 46, 1267*d*.

The catalytic combustion and the application to wire-enameling ovens were reviewed. The catalyst elements exceeded expectations in active life and freedom from necessity for service. When activity of the catalyst declined, elements could be reactivated.

11311. Saito, Hirotaro. **The manganese oxide catalysts. II. Catalytic oxidation of carbon monoxide by several kinds of oxides of manganese.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 72, 333-6 (1951).—*C.A.* 46, 812*h*.

Manganous oxides were prepd. by the reduction of MnO_2 and Mn_2O_3 and their catalytic activities for the oxidation of CO were detd. The relation between the structure and catalytic activity was discussed. The chemisorption of O_2 by the catalyst was a dominant factor for reaction.

11312. Sakaki, Tomohiko. **Catalytic hydration by metal oxides in gaseous systems. III. Catalytic hydration of hydrogen cyanide.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 165-6 (1951).—*C.A.* 46, 3383*g*.

Biuret was among the products of hydration of HCN catalyzed by ZnO at 200°C. Its occurrence was attributed to the thermal condensation of urea. The hydration took place as follows: (1) $HCN + H_2O = NH_2CHO$, (2) $2NH_2CHO + H_2O = (NH_2)_2CO + CO_2 + 2H_2$, (3) $2(NH_2)_2CO = (NH_2CO)_2NH + NH_3$.

11313. Sakikawa, Noriyuki. **Organic geochemical reactions. VIII. Catalytic dehydration and polymerization of butanol by clays under high pressure.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 227-30(1951).—*C.A.* 46, 1238*g*.

BuOH was treated with Japanese acid clay in an autoclave at 100-200 atm. and 300°-400°C. The product was mainly olefin hydrocarbons when alumina was used as a catalyst, while acid clay produced olefins and about 17% aromatic hydrocarbons; activated clay prepd. from acid clay produced about 70% aromatic hydrocarbons with about 30% olefins.

11314. Schlesinger, M.D.; Crowell, J.H.; Leva, Max, and Storch, H.H. **Fischer-Tropsch synthesis in slurry phase.** *Ind. Eng. Chem.* 43, 1474-9(1951).—*C.A.* 45, 8227*f*.

Pilot-plant studies were made in which the finely divided catalyst was suspended in oil and synthesis gas (equal parts CO and H_2) passed through the slurry. Gas velocities of 0.1-0.2 ft/sec were used, and the catalyst consisted of Fe promoted with Cu and alkali (100 Fe, 10 Cu, 1 K_2O). The catalyst was activated by treatment with synthesis gas at gradually increasing temp. until a gas contraction of 65%, equiv. to 70% H_2 and CO conversion, was reached. Synthesis was conducted at 255-76°C and pressures from 200 to 250 p.s.i. at a space velocity of 300. Increase in temp. resulted in an increase in C_3-C_5 hydrocarbons from 25 to 33%, while the gasoline (400°F end point) yield remained approx. const.

11315. Scipioni, Andrea. **The activities of copper and chromium in hydrogenation catalysts.** *Chimica e industria* (Milan) 33, 285-7(1951).—*C.A.* 46, 7252*d*.

The hydrogenation of furfural (300g) at 175°C and 25 atm. with Cu chromite catalyst (6g) was studied. Excessive heat treatment of the catalyst reduced its activity greatly. The catalyst activity was directly proportional to the content of CuO of the catalyst which could be reduced by CO. The stabilizing effect of Cr_2O_3 on CuO or on the active Cu centers formed during reduction was the active principle.

11316. Sherburne, R.K. and Farnsworth, H.E. **Activation of a solid nickel catalyst for the hydrogenation of ethylene by heat-treatment in a high vacuum.** *J. Chem. Phys.* 19, 387-8 (1951).—*C.A.* 45, 6912*c*.

Electropolished sheet Ni was heated *in vacuo* and then used as a catalyst for hydrogenating C_2H_4. The highest activity was obtained after heating 3.5 hrs at dull redness; the activity was higher, the lower the pressure at which the heating occurred. A clean gas-free surface was necessary for highest catalytic activity per unit area. This could be obtained only by heating at temps. considerably above the usual baking temp.

11317. Shur, A.S. and Demenev, N.V. **Catalytic activity of platinum films prepared from solutions of platinum salts by means of a gaseous reducing agent.** *Zhur. Fiz. Khim.* 25, 136-42 (1951).—*C.A.* 45, 5501*h*.

The catalytic hydrogenation of C_2H_4 was used to det. the activity of Pt films prepd. from aq. solns. of Pt salts reduced with H_2. A film (600 cm^2 surface) absorbed up to 1.24 ml of H_2 and 1.55 ml of C_2H_4. The catalytic activity depended on the film thickness. The effect of temp. was studied for 2 films (75 A. and 150 A.) with initial pressure of 50 mm. In both cases, the % conversion/min. first was const. up to 50°C, then increased, reached a plateau at 175°C, and finally dropped to very low values at 275°-280°C. The electron microscope revealed that the films were extremely porous.

11318. Shushunov, V.A. and Aurov, A.P. **Kinetics of the reaction between magnesium and ethyl bromide.** *Zhur. Fiz. Khim.* 25, 13-19 (1951).—*C.A.* 45, 5009*f*.

An evapd. film of 99.99% pure Mg reacted with gaseous halides (MeCl, MeBr, MeI, EtCl, EtBr, EtI) in a static glass system. Kinetic data were obtained for EtBr and EtCl. The pressure drop (Δp) changed with time t in the manner characteristic of autocatalytic topochem. processes. During the 1st stages of the reaction, $-\Delta p = at^3$. An induction period τ was defined as the time required for $-\Delta p = 0.2$ mm Hg. At 40° and 60°C, the relation τp = const. was verified for $2<p<30$ mm Hg.

11319. Shushunov, V.A.; Aurov, A.P., and Gorinov, V.A. **Catalysis by ethers of the reaction between magnesium and ethyl bromide.** *Zhur. Fiz. Khim.* 25, 20-3 (1951).—*C.A.* 45, 5009*h*.

The effects of Et_2O, MeEtO, and iso-Pr_2O on the reaction between Mg and gaseous EtBr were investigated. The induction period decreased with increasing amts. of ethers. The energy of activatio E became very low: values of E (kcal/mole) for the EtBr + Mg reaction were 13, 12, 12, 2.5, 1.9, 1.5, <1.5, <1.5, <1.5 when one added, resp., 0.0, 0.5, 1.5,, 2.6, 6.1, 12, 18, 26, 100 mol. % of MeEtO to EtBr. The low values of E indicated that diffusion through the layer of product became the rate-detg. step.

11320. SLOVOKHOTOVA, T.A. AND IVANOV, A.P. **Catalytic reactions of cyclohexane in the presence of water on nickel.** *Vestnik Moskov. Univ.* 6, No. 2, *Ser. Fiz.-Mat. i Estestven. Nauk* No. 1, 125-35(1951).—*C.A.* 46, 4340*a*.

Expts. were run with a Ni/Al_2O_3 catalyst (3 g) at a feed rate of cyclohexane of 0.2 ml/min., without or with H_2O (vol. ratio H_2O/cyclohexane = 7), at 250, 275, 300, 325, and 350°C. The rate of evolution of gas was const. in all expts., which indicated no poisoning of the catalyst. Presence of H_2O inhibited dehydrogenation and the rate was reduced by a factor of 5. Dehydrogenation and hydrogeno-cracking involved different orientations of the adsorbed cyclohexane mols. H_2O inhibited the C—C bond rupture much more strongly than the rupture of the C—H bond. Nevertheless, the over all rate of hydrogeno-cracking was increased in the presence of H_2O by a factor of 1.6-2.4.

11321. SMITH, DONALD P. **Catalysis by metal powders.** *J. Applied Phys.* 22, 1291-2(1951).—*C.A.* 46, 1854*d*.

Finely divided metals were regarded as strained metals in small masses, and owed certain characteristics to their dis-structure or rifted condition. Their activity as catalysts was ascribed to the presence of widened lattice intervals.

11322. SMITH, HILTON A. AND BEDOIT, WILLIAM C. JR. **Kinetics of the catalytic hydrogenation of the nitro group on platinum.** *J. Phys. & Colloid Chem.* 55, 1085-1104 (1951).—*C.A.* 46, 31*e*.

The kinetics of catalytic hydrogenation of the nitro group were studied. All of the reduction were accomplished in AcOH as solvent with the Adams Pt catalyst. The hydrogenations were performed in a modified Parr, low-pressure catalytic reduction app. The hydrogenation of $EtNO_2$ proceeded smoothly to the amine. For both $PhNO_2$ and $NO_2C_6H_2Me_3$, the nitro group was first reduced, and then the benzene ring was subsequently hydrogenated. The hydrogenation of $NO_2C_6H_4C_2H_3$ was interrupted after 1.5 mols. of H_2 had been consumed, and the intermediates were isolated.

11323. SMITH, N.L. AND AMUNDSON, N.R. **Intraparticle diffusion in catalytic heterogeneous systems.** *Ind. Eng. Chem.* 43, 2156-67 (1951).

Intraparticle diffusion was postulated to be the controlling factor. Equations were derived which related the physical and chemical parameters of the system to the operating variable. The hydrolysis of ethyl formate was studied, using a strongly acidic cation exchange resin as catalyst. Batch and continuous operation studies were performed with various resin particle sizes. The equations developed were useful in theoretical kinetic studies as well as in the design of commercial reactors.

11324. SOKOL'SKIĬ, D.V. **Active carriers in hydrogenation.** *Doklady Akad. Nauk S.S.S.R.* 79, 823-6 (1951).—*C.A.* 46, 1958*h*.

Rates of hydrogenation of $Me_2C(OH)C:CH$ in 90% alc. were detd. in 30-min. expts., by the amt. of H_2 adsorbed on Pt supported on $BaSO_4$, Pt supported on Os-Coated $BaSO_4$, Pd supported on $BaSO_4$, and Pd supported on Ru-coated $BaSO_4$; the carriers without Pt or Pd had no catalytic activity of their own. The presence of Os evidently promoted [illegible] the hydrogenation of the double bond. Potentiometric detns. showed that in the hydrogenation of the triple bond the potential of Pt fell sharply, and H_2 was desorbed from the surface.

11325. SOKOL'SKIĬ, D.V. AND SHMONINA, V.P. **Catalytic reduction of nitrobenzene.** *Doklady Akad. Nauk S.S.S.R.* 78, 721-4 (1951).—*C.A.* 45, 8337*f*.

The uptake of H_2 by $PhNO_2$ in 0.1 *N* soln. of NaOH and in neutral alc., in the presence of a skeleton Ni catalyst, unpromoted and promoted with Rh, was followed along with measurements of the potential *E* of the catalyst against a 0.1 *N* calomel electrode. Both the inhibition of the reduction and the fall of *E* were due to strong adsorption of $PhNO_2$ on the Ni. On a catalyst promoted with 0.0019 g Rh (introduced in the form of $RhCl_3$), in alk. alc. soln., the rate curve became smoother and more nearly zero-order. Alkali poisoned the unpromoted catalyst, but with the Rh-promoted catalyst it increased the rate. Reduction of $PhNO_2$ formed PhNO which underwent no further reduction as long as $PhNO_2$ was still present in the soln., there was no evidence of an intermediate formation of PhNHOH in alk. soln.

11326. SUZUKI, SHIGENARI AND HASEGAWA, MASAHARU. **Uhde catalyst. II.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 437-9(1951).—*C.A.* 47, 5581*b*.

An active catalyst was prepd. by the combination of 1 mole $K_4Fe(CN)_6$, 0.8 mole $AlCl_3$, and 0.2 mole $FeCl_3$.

11327. SUZUKI, SHIGENARI AND SUZUKI, HIROSHI. **Uhde catalyst. III.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 487-9(1951).—*C.A.* 47, 6070*c*.

By means of chem. analysis, it was found that the principal constituents of the active Uhde catalyst were $KAl[Fe(CN)_6]$ and a proper amt. of $KFe[Fe(CN)_6]$.

11328. SZABO, ZOLTAN G. AND BARTHA, LAJOS. **Catalysis in analytical chemistry. I. Silver catalysts in the reduction of nitrates by ferrous hydroxide.** *Acta Chim. Hung.* 1, 116-23 (1951)(in German).—*C.A.* 45, 10123*c*.

The reduction process was in 2 steps: (1) nitrates reacted with $Fe(OH)_2$ to form $Fe(OH)_3$ and nitrite, and (2) the nitrite and $Fe(OH)_2$ reacted to give $Fe(OH)_3$, NH_3, and alkali hydroxide. The 1st reaction was accelerated by Ag catalysts. In the presence of I^-, IO^-, or IO_3^-, AgI formed, and in the presence of S^{2-} and $S_2O_3{}^{2-}$, Ag_2S formed, both of which adsorbed Ag^+ and reduced the catalytic activity. The mechanism of the catalysis was the formation of metallic Ag pptg. from homogeneous soln. in a colloidal form and reacting with the nitrate instantaneously.

11329. TAYLOR, T.I. AND DIBELER, V.H. **Catalyzed reactions of unsaturated hydrocarbons with hydrogen and deuterium.** *J. Phys. & Colloid Chem.* 55, 1036-65, discussion 1065-6 (1951).—*C.A.* 46, 30*g*.

Ni-catalyzed hydrogenation, the isomerization, and the D-exchange with the butenes were discussed. The 2-butene was 99% pure and 85% *cis* isomer. The catalyst consisted of 0.25-mm Ni wire, activated by 1st heating to 600°C in 100 mm air for 5 min., air removed, H_2 admitted, and the Ni again heated to 500°C for 5 min. This cycle was repeated 8 times. The H_2 was removed, C_4H_8 admitted and then condensed with liquid N_2, H_2 again admitted, the reactor quickly warmed to room temp. and immersed in a thermostat at desired temp. H_2 or D_2 must be added to the reaction vessel before the C_4H_8 to obtain reproducible results. The rate of double-bond shift from 1-butene with D was equal to the rate of D-exchange.

11330. Thompson, Sydney O.; Turkevich, John, and Irsa, Adolph P. **Reaction of deuterium with hydrocarbons over a cobalt-thoria Fischer-Tropsch catalyst.** *J. Am. Chem. Soc.* 73, 5213-15 (1951).—*C.A.* 46, 1850*h*.

H-exchange reactions were observed between D_2, C_2H_6, C_3H_8, and *n*- and *iso*-C_4H_{10} when a mixt. of 6 vols. of D_2 and 1 vol. of each of the hydrocarbons was passed over the catalyst with conditions of temp. and flow rate similar to those for hydrocarbon synthesis. The exchanged products were extremely deuteriated. Cracking of the hydrocarbons to produce deuteriated methane was observed.

11331. Tiratsoo, E.N. **Europe's first modern catalytic cracker is completed.** *Petroleum Refiner* 30, No. 10, 155-6 (1951).—*C.A.* 46, 243*g*.

Data were given for various units at the Shell Pernis refinery near Rotterdam, Holland, including the new 28,000-barrel-per-day catalytic cracking plant.

11332. Tolstopyatova, A.A. **Catalytic properties of fluorides of alkali and alkaline-earth metals.** *Vestnik Moskov. Univ.* 6, No. 3, *Ser. Fiz.-Nat. i Estestven. Nauk* No. 2, 49-57 (1951).—*C.A.* 46, 3382*g*.

Dehydrogenation-dehydration of EtOH passed at the rate of 0.2 ml/min. over 15 g of ThO_2 gave the following % decompn. and gas (% CO_2, C_nH_{2n}, CO, H_2): at 287°C, 4.1% (1.5, 11.5, 3.1, 84.2); at 338°C, 5.8 (3.6, 24.5, 6.8, 65.1); at 348°C, 10.4 (4.6, 27.3, 10.9, 57.5); at 360°C, 14.8 (5.2, 31.3, 9.1, 54.4); at 420°C, 43.3 (9.2, 39.1, 6.9, 44.8). Dehydrogenation to AcH predominated at lower temps.; dehydration to C_2H_4 increased with the temp. The apparent activation energies E_{H_2} and E_{H_2O}, for dehydrogenation and dehydration, resp., were 14.7 and 21.8 kcal/ mole. Despite its identical structure with ThO_2, and the near equality of the cation and anion radii, the catalytic activity of CaF_2 was considerably lower, and the part of dehydration was very much smaller.

11333. Tolstopyatova, A.A.; Kheĭfits, L.A., and Patrikeev, V.V. **Pressure dependence of the rate of dehydrogenation of methylcyclohexane.** *Vestnik Moskov. Univ.* 6, No. 2, *Ser. Fis-Mat. i Estestven. Nauk* No. 1, 47-56(1951).—*C.A.* 46, 4339*i*.

On a 28% Pt catalyst, the rate of evolution of H_2 from methylcyclohexane (0.08 ml/min.) did not vary with the pressure between 27 mm Hg and 1 atm. With 0.05 g catalyst, the rates were, at 289° and 304°C, resp., 9.5 and 13.0 ml (S.T.P.)H_2/3 min. This independence of the pressure indicated probably complete surface coverage.

11334. Tomita, Akira. **Zinc catalysts for methanol synthesis. IV. Catalytic activity of bare zinc oxide with no combined water molecules.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 367-8(1951).—*C.A.* 47, 5045*a*.

ZnO without hydrated water mols., prepd. by the thermal decompn. of $Zn(NO_3)_2$ or by the combustion of Zn, had smaller catalytic activity. The hydrated water mol. played an important part as a promoter in the catalytic decompn. of MeOH.

11335. Tomita, Akira. **The zinc catalyst for methanol synthesis. VIII. The promoter action of copper to zinc catalyst. IX. Methanol synthesis with the catalyst ZnO-CuO-ThO$_2$.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 504-5; 505-7(1951).—*C.A.* 47, 6070*d*.

The catalysts were prepd. by adding K_2CO_3 to the mixt. of *N* $Zn(NO_3)_2$ and *N* $CuSO_4$. The compn. (Zn:Cu = 75:25) was found excellent. Addn. of a certain amt. of ThO_2 to the catalyst was found effective. The addn. of Al_2O_3 or Cr_2O_3 gave no particular effect. The methanol synthesis from the gas mixt. consisting of water gas and H_2 was studied by using the catalyst ZnO-CuO-ThO_2.

11336. Topchieva, K.V. **Absolute rate constants of reactions of hydrocarbons on aluminosilicates of different compositions.** *Doklady Akad. Nauk S.S.S.R.* 80, 635-8 (1951).—*C.A.* 46, 813*a*.

Surface areas of aluminosilicates of the compns. Al_2O_3:SiO_2 = 0:100, 10:90, 16:84, 30:70, 50:50, 72:28, and 100:0 were detd. both by the B.E.T. method of adsorption of MeOH, C_6H_6, and Me_2CHPh, and by the "CC" method of capillary condensation of MeOH and C_6H_6; the B.E.T. detns. gave the total surface area of the catalyst skeleton, including the fine pores which were not included in the sp surface detd. by the CC method and corresponding to the adsorption film formed at the beginning of sorption hysteresis. These characteristics were compared with the catalytic activities in cracking of hydrocarbons.

11337. Topchieva, K.V.; Battalova, Sh., and Panchenkov, G.M. **Reactions of hydrocarbons on alumino-silicates of different compositions.** *Doklady Akad. Nauk S.S.S.R.* 78, 501-4 (1951).—*C.A.* 45, 7860*f*.

Cracking of decahydronaphthalene, cetane, and gas oil was investigated at 400°, 470°, and 400°C, resp., in a flow system at liquid space velocities *v* from 0.5 to 3.0 liters/liter catalyst/hr, on catalysts made by heating mixtures of Al_2O_3 + SiO_2 in the proportions 10:90, 16:84, 30:70, 50:50, 72:28, 100:0, 0:100%. Decahydronaphthalene (at v = 1.0) gave the degrees of conversion 0.13, 0.20, 0.44, 0.48, 0.34, 0, 0; cetane (at $v = 0.7$) 0.13, 0.19, 0.56, 0.46, 0.29, 0.09, 0; gas oil (at v = 0.7) 0.37, 0.43, 0.49, 0.41, —, 0.08, 0. The surface area, detd. by adsorption of MeOH, did not change with the Al_2O_3:SiO_2 ratio.

11338. Treszczanowicz, Edward. **Iron-zinc catalysts in the dehydrogenation process of cyclohexanol.** *Prace Głównego Inst. Chem. Przemysł.* No. 4, 1-51 1951(English summary).—*C.A.* 46, 9398*i*.

An increase in the Fe content of the Fe-Zn catalyst increased the optimum temp. of the reaction. In the presence of 86.9% Fe at about 420°C, there was an appreciable decompn. of cyclohexane. The best range was 10-20% Fe because of the heat stability of the catalyst and low order of side reactions. The rate of reaction of the dehydrogenation of cyclohexanol was somewhat greater when 12.5% Fe, rather than 18.6% Fe, was present in Fe-Zn catalyst.

11339. Treszczanowicz, Edward and Jaworska, I. **Activity of zinc-manganese catalysts in the production of acetone.** *Przemysł Chem.* 30, 686-90(1951).—*C.A.* 46, 10825*b*.

The activity of Zn-Mn catalyst used in the prepn. of acetone from C_2H_2 was investigated. The activating component (MnO) should be pptd. first and the ZnO after it. Masses with good mech. and catalytic properties were obtained when $Mn(OH)_2$ was pptd. from a 5% soln. of $Mn(NO_3)_2$ with NH_4OH at room temp. and pH 9. After washing, the ppt. was then immersed in a soln. of $Zn(NO_3)_2$, and the $Zn(OH)_2$ was pptd. at 70°C and pH 7.5. Activation with H_2 at 500°C increased the life of the catalyst.

11340. Tsyskovskiĭ, V.K. and Kiseleva, N.A. **Passage of the catalyst into the heterogeneous state and the causes underlying that phenomenon.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 24, 527-31 (1951); *J. Applied Chem. U.S.S.R.* 24, 577-81 (1951)(Engl. translation).—*C.A.* 46, 5414*f*, 7415*a*.

Kerosine fractions of different group compns. were oxidized in the presence of the same catalyst (acid Mn naphthenate) at the same concn., and the period (τ) of primary state of the catalyst was detd. photo-colorimetrically. The length of τ depended on the group compn. of the substrate; it was longer, the greater was the amt. of aromatic compds. in the kerosine. Passage of the catalyst from the primary to the heterogeneous state was observed also with naphthenates of Co, Fe, and Ni. The change in the nature of the catalyst was the result of the formation, in the 1st stages of the oxidation of low-mol. org. acids which then reacted with the catalyst.

11341. Tsyskovskiĭ, V.K. and Kiseleva, N.A. **Development of the oxidation process after removal of the catalyst from the reaction sphere.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 24, 672-4 (1951); *J. Appl. Chem. U.S.S.R.* 24, 759-62 (1951)(Engl. translation).—*C.A.* 47, 31*b*, 2583*g*,

In catalytic liquid-phase oxidation of a petroleum fraction by air, practically the same yields of oxidation products were obtained when the catalyst was left in the reacting system all the time, and when the catalyst was removed by filtration, and the system allowed to complete the reaction without catalyst; at equal total lengths of time, there were only very minor differences in the yields. The continued development of the oxidation reaction, after removal of the catalyst, was not due to accumulated acidity. It took place also if the acid was neutralized. The catalytic oxidation process was thus shown to consist of 2 periods, one catalytic, the other autocatalytic and independent of the presence of the catalyst.

11342. Turovskiĭ, G. Ya. and Vaĭnshteĭn, F.M. **Use of heavy oxygen in the study of the mechanism of oxidation catalysis.** *Doklady Akad. Nauk S.S.S.R.* 78, 1173-5(1951).—*C.A.* 45, 8336*a*.

In the flow-system oxidation of CO by O_2 on CuO tagged with O^{18} (109 γ/g) at 300°C, no isotopic exchange was found between the solid CuO and O_2; after 28 hrs, during which the amt. of O bound in the CuO increased from 0.2 to 1.4 g, the O^{18} content of the solid remained unchanged. A mixt. of CO with N_2, in the absence of O_2, reduced the CuO rapidly. Subsequent admission of air reoxidized it as rapidly to CuO. After these operations, analysis of the solid showed absence of excess O^{18}. The mobility of O atoms on the solid was proved by oxidizing metallic Cu at 300°C first with O_2 tagged with O^{18} (126 γ), then with ordinary O_2. The CuO thus produced was then reduced with H_2 in 2 steps, and the 2 fractions of H_2O formed showed only a minor difference of isotopic compn.

11343. Tutumi, Shigeru, and Nagao, Shiro. **The alloy catalysts for hydrogenation. I. Activity tests of some alloys.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 165-7 (1951).—*C.A.* 47, 1569*a*.

The Ni-Al alloy, which was used as the material for Raney Ni, had a noticeable catalytic activity. Nitrobenzene could easily be hydrogenated with Ni-Al (1:1) and CuAl (57:43) alloys even in the absence of water. The hydrogenation of acetone, phenol, o-nitrotoluene, and BzH could be easily carried out with Ni-Al (1:1) alloy in the presence of water.

11344. Uchida, Hiroshi. **Catalysts for synthesis of ammonia. III. Effect of the addition of lime and magnesia on the catalytic activity.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 46, 1-10(1951).—*C.A.* 46, 2245*f*.

Addn. of K_2O to Fe_2O_3 and Al_2O_3 dispersed the 2nd more homogeneously in the 1st, increasing the catalytic activity. Further addn. of MgO or CaO increased the activity still more, but CaO produced a less homogeneous and less thermostable catalyst.

11345. Uchida, Hiroshi; Todo, Naoyuki, and Ogawa, Kiyoshi. **Catalysts for synthesis of ammonia. IV. Effect of the addition of silica on the catalytic activity.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 46, 11-19(1951).—*C.A.* 46, 2245*f*.

Addn. of SiO_2 along with Al_2O_3 along with Al_2O_3 and K_2O to Fe_2O_3 decreased the activity by interfering with the accumulation of K_2O on the catalyst surface. Further addn. of MgO or CaO increased the activity still more.

11346. Uenaka, M. **Sugars and polysaccharides. V. Cleavage of benzyl radical by catalytic reduction.** *Sci. Papers Osaka Univ. No.* 27, 17-19 (1951).—*C.A.* 46, 8883*d*.

Catalytic cleavage of benzyl sugars by hydrogenation with Pt-black and Pd-black catalysts showed that the latter was preferable. Hydrogenation of the benzyl radical occurred irregularly when the former was used.

11347. Varga, József; Rabó, Gyula, and Steingaszner, Pál. **Comparative examination of the contact surfaces and activities of three dehydrogenation catalysts.** *Acta Chim. Hung.* 1, 94-102 (1951)(in English).—*C.A.* 45, 10019*e*.

The catalytic activities (various amounts of MoO_3, Cr_2O_3, and WO_3 on a carrier of Al_2O_3) were detd. at atm. pressure in aromatization reactions. The B.E.T. area of the catalyst varied with each metallic oxide in a different manner. MoO_3 and WO_3 covered the carrier surface more uniformly than did Cr_2O_3. The diminution of the active surface of Cr_2O_3 was due to the formation of large crystal aggregates. The various catalysts satd. in the same manner promoted the formation of aromatic hydrocarbons in the order: MoO_3, Cr_2O_3, and WO_3. When, however, these values were referred to the active surface, the promoting effect of Cr_2O_3 was 6.5% lower, and of WO_3 25% lower, than that of the MoO_3 catalyst.

11348. VARGA, JÓZSEF; RABÓ, GYULA, AND STEINGASZNER, PÁL. **The arrangement of the active centers of chromium oxide alumina catalysts.** *Acta Chim. Hung.* 1, 146-8(1951).—*C.A.* 45, 10022*e*.

Expts. were conducted with catalysts contg. Cr oxide and Mo oxide on an Al_2O_3 carrier. The catalysts were prepd.; one in the usual way from chromic acid soln., and the other from an alk. soln. of NH_4 chromate. The surface ratios for various amounts of Cr_2O_3 were almost alike for Cr oxide catalysts prepd. by both methods. The no. of MoO_3 mols. formed by drying and igniting the product obtained from solns. of $(NH_4)_6Mo_7O_{24}$ was nearly equal to the no. of mols. forming a pile in Cr oxide catalysts.

11349. VARGA, JÓZSEF; RABÓ, GYULA, AND ZALAI, A. **Comparative study of the promotors for dehydrogenation catalysts.** *Acta Chim. Hung.* 1, 137-45(1951).—*C.A.* 45, 10022*a*.

Al_2O_3 was the carrier with various amounts of Cr_2O_3 activated with K_2O, with oxides of K and Ce, with Th oxide, and with oxides of K and Th. A catalyst contg. Mo oxide was also tested. The selectivity, indicated by a decrease in the extent of cracking reactions and the efficiency of production of mainly toluene, increased with the amount of Cr_2O_3, up to an optimum proportion. Catalysts contg. Cr_2O_3 were sensitive to variations of temp. or of space velocity. Catalysts contg. Cr_2O_3 became less sensitive against influences of temp. and space velocity when the Th oxide was used as the promoter. Catalysts contg. Mo were the most suitable of all of the 10 catalyst types tested.

11350. VERESHCHAGIN, L.F.; FREIDLIN, L. KH.; RUBINSHTEIN, A.M., AND NUMANOV, I.U. **Effect of very high pressures on the catalytic properties of aluminum oxide.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1951, 809-18.—*C.A.* 46, 3839*h*.

Dehydration runs of EtOH to C_2H_4 were made in a flow system on 12 ml of catalyst (tube diam. 15 mm) in the range 283-320°C, at a feed rate of 0.16 ml/min. Stability of the catalysts was tested by the constancy of the gas evolution. Fresh Al_2O_3 pptd. from $Al(NO_3)_3$ with NH_4OH, washed, and dried at 100°C showed a low initial activity; after activation with air, (2 hrs at 525°C), the activity rose, E falling to 16.0. There was no deactivation if the products were removed quickly; after 48-hrs stay under N_2, the catalyst showed almost the original activity, with $E = 17.5$. With Al_2O_3 dehydrated 10-11 hrs at 360°C and then compressed under 20,000 atm., activation at 525°C doubled the activity. Further regeneration produced no further change.

11351. VLODAVETS, I.N. AND PSHEZHETSKII, S. YA. **Kinetics of methanol oxidation to formaldehyde on a silver catalyst.** *Zhur. Fiz. Khim.* 25, 612-23 (1951).—*C.A.* 45, 10013*a*.

The kinetics of the oxidation of H_2 and of iso-PrOH on a Ag catalyst suggested that the oxidation of MeOH on the same catalyst proceeded through direct oxidation by adsorbed O_2. This was verified by a kinetic investigation in a flow system using small Ag spheres (2 mm diam.), between 321° and 517°C, at various flow rates and with different initial concns. The reaction products were: CH_2O, CO_2, H_2, and H_2O (small amts. of CO). No CH_4 was formed. The apparent activation energy was about 16 kcal/mole.

11352. VOL'KENSHTEĬN, F.F. **Modification of catalysts.** *Zhur. Fiz. Khim.* 25, 1214-27(1951).—*C.A.* 46, 5944*f*.

By introducing the rule of Meyer and Neldel exchanging activation energy for cond. ϵ and a preëxponential factor G $[\sigma = G \exp.(-\epsilon/RT)]$, $\log G = c + b\epsilon$, where b was an empirical const. (0.15 to 0.30 mole/kcal). This relation immediately led to the well-known relation: $\log k_0 = a + bE$ between activation energy E and preëxponential factor k_0 for the catalytic reaction. The meaning of b was the same as in the rule for cond. For a variety of catalysts and reactions, $b = 0.2$ to 0.5 mole/kcal., in good agreement with the theoretical value.

11353. WARD, C.C.; SCHWARTZ, F.G., AND ADAMS, N.G. **Composition of Fischer-Tropsch Diesel fuel. Cobalt catalyst.** *Ind. Eng. Chem.* 43, 1117-19 (1951).—*C.A.* 45, 5903*e*.

A Fischer-Tropsch Diesel fuel (from a Co catalyst) having a cetane no. of 80 was analyzed: paraffins 88% by vol.; polar compds. 2; α-type olefins 1.5; internal-type olefins 8.5.

11354. WATANABE, SHIRO. **Bench-scale studies of the Fischer-Tropsch synthesis over iron, nickel, and nickel-cobalt catalysts.** *U.S. Bur. Mines, Inform. Circ.* No. 7611, 26 pp.(1951).—*C.A.* 45, 8227*i*.

The max. oil yields obtained in bench-scale equipment were: with 100 Ni: 20 Mn: 100 kaolin: 200 diatomaceous earth catalyst, a max. yield of 133.8 ml/m³ of pure $CO + 2H_2$ was obtained from 1 pass of the feed gas. With a Ni:Co mixed catalyst (Ni:Co = 3:7) having the compn. 100 (Ni + Co): 8MgO:$5ThO_2$: 200 diatomaceous earth, a max. of 172.2 ml/m³ of pure $CO + 2H_2$ was obtained. In continuous tests with Fe catalysts carried out in semiindustrial scale app. single-pass operation over a period of 20 days resulted in virtually no decrease in catalytic activity.

11355. WATT, GEORGE W.; ROPER, WILBUR F., AND PARKER, SIDNEY G. **The catalytic activity of metals produced by the reduction of salts in liquid ammonia. II. Nickel.** *J. Am. Chem. Soc.* 73, 5791-3(1951).—*C.A.* 46, 2384*d*.

Hydrogenation catalysts prepd. by reduction of $NiBr_2$ with K in liquid NH_3, W-6 Raney Ni, and Ni from the reduction of NiO with H_2 were compared in terms of surface areas, adsorbed H_2, and rate of hydrogenation of allyl alc. Studies of the compn. and activity of the catalysts prepd. in liquid NH_3 indicated that the NH_3-insol. reduction products included Ni, Ni amide, and a K-contg. substance of unknown compn.

11356. WEBB, MAURICE. **Production of sulfur from hydrogen sulfide.** *Oil Gas J.* 49, No. 36, 71-2 (1951).—*C.A.* 45, 2639*d*.

In a S recovery plant the feed (22 CO_2, 70 H_2S, and 8% H_2O) was mixed with air and burned to convert 1/3 of the H_2S to SO_2. This mixt. reacted over bauxite at 430-655°F (in admixt. with more or less unoxidized feed gas) to produce elemental S. The S was condensed out at 290°F; the residual gas was reheated to 460°F and entered a second reactor. About 85% of the coversion occurred in the first reactor.

11357. WEBER, JOSEPH AND LAIDLER, KEITH J. **Kinetics of the ammonia-deuterium exchange by a micro-wave method.** *J. Chem. Phys.* 19, 381-2 (1951).—*C.A.* 45, 6911*f*.

NH_3 and D_2 were brought into contact with a singly-promoted Fe catalyst and the rate of disappearance of NH_3 was followed by detg. the microwave spectrum of the gases. For D_2 pressures up to 150 mm.Hg the rate of exchange was proportional to $p_{D_2}{}^{1/2}$, but above 300 mm the dependence was almost linear. The variation of rate with p_{NH_3} was small, but there was a definite max. that moved toward lower pressures as the temp. increased. The activation energy of the exchange reaction was approx. 13 kcal/mole.

11358. WHEELER, H.K. JR. **New design features in catalytic cracker.** *Petroleum Engr.* 23, No. 11, C-5-10(1951).—*C.A.* 46, 243*h*.

A new fluid catalytic cracking unit was described.

11359. YÜ, T.H. **Preparation of vanadium catalyst.** *Chinese Chem. Ind. Eng.* 2, No. 2, 3-9 (1951)(English summary).—*C.A.* 47, 1344*g*.

A catalyst for H_2SO_4 manuf. was prepd.: 13.1 parts of V_2O_5 (contg. 84% V_2O_5) moistened with 10 parts of H_2O, was dissolved in a KOH soln. contg. 8.0 parts of 85% KOH in 10 parts of H_2O. To this soln. were added in succession 6.4 parts of 93% H_2SO_4 and a soln. contg. 25.8 parts of 95% KNO_3 in 10 parts of H_2O. Six parts of S and 115.0 parts of kieselguhr were then added to this mixt. together with enough water to give a consistency suitable to be extruded. The wet pellets which were about 5 mm in diam. and 5-8 mm in length were dried at 700°C for one hr.

11360. ZAĬDENMAN, I.A. AND KHOMYAKOV, K.G. **The initial stages of the interaction of carbon monoxide and hydrogen with the nickel catalyst at the temperatures of synthesis of gasoline.** *Doklady Akad. Nauk S.S.S.R.* 78, 901-4 (1951).—*C.A.* 45, 8336*f*.

The heat evolved on contact between CO or a mixt. 1 CO:1 H_2 and a skeleton Ni catalyst (by leaching Ni-Al) reduced by H_2 2-4 hrs at 190-200°C was detd. in an Al calorimeter. First contact of CO with a freshly prepd. Ni catalyst evolved over 85 kcal/mole gas disappeared. This was attributed only to a change within the catalyst itself, specifically to partial recalescence. On consecutive admissions of CO, each time after reduction of the catalyst with H_2, the heat effect dropped to and remained const. at about 34 kcal/mole gas disappeared. The same heat effect was found in contact with a 1 CO:1 H_2 mixt., on a catalyst previously exposed to CO.

11361. ZAWADZKI, J.; JURECKA, J., AND TRESZCZANOWICZ, E. **Use of zinc-vanadium catalysts in the production of acetone.** *Przemysł Chem.* 30, 731-3(1951).—*C.A.* 46, 10825*c*.

The influence of the method of prepn. on the activity and the life of Zn-V catalysts for the prepn. of acetone from C_2H_2 was investigated. Best results were obtained with catalysts prepd. by simultaneously pptg. the components with NH_4OH from a soln. of NH_4 vanadate and Zn acetate. The Zn-V catalysts were found superior to the Zn-Mn catalysts reported earlier.

11362. ACONE, G. **Methane: hydrogen and carbon monoxide.** *Riv. combustibili* 6, 697-707(1952).—*C.A.* 47, 4581*g*.

The steam, CO_2, and O_2 processes for the conversion of CH_4 to synthesis gases were reviewed. C_2H_6 and C_3H_8 could be tolerated in CH_4 only with an excess of steam; C_4H_{10} and higher hydrocarbons must be excluded altogether. Propylene and butylene were limited to a max. of 2-3%. Diolefins and ethylene should be eliminated. H_2S and the org. sulfides were the main contaminants, owing to formation of NiS. Org. S should be below 14 mg/m^3. H_2, CO_2, CO, and N_2 should not be grouped as inerts.

11363. ALCHUDZHAN, A.A. AND FROST, A.V. **Kinetics and mechanism of catalytic hydrogenation of hydrocarbons. VII. Study of the palladium-hydrogen system as a hydrogenation catalyst.** *Zhur. Fiz. Khim.* 26, 1007-13(1952).—*C.A.* 47, 956*i*.

The hydrogenation of benzene on Pd black was studied (H_2:C_6H_6 = 4:1). The % conversion was 12, 21, 29, 31, 39, 49, 38, 24, and 16 at 153°, 168°, 184°, 200°, 216°, 228°, 247°, 262°, and 276°C, resp. The first 3 data gave an activation energy E = 11,660 cal/mole on the assumption of zero-order kinetics from an Arrhenius plot. The next 3 values gave E = 6970, and the last 3 gave a neg. value of "E" = 19,850. Thus the rate passed through a max. between 228° and 247°C.

11364. ALCHUDZHAN, A.A. AND FROST, A.V. **Kinetics and mechanism of catalytic hydrogenation of hydrocarbons. VIII. Study of the solid system palladium-hydrogen as a hydrogenation catalyst.** *Zhur. Fiz. Khim.* 26, 1015-23(1952).—*C.A.* 47, 957*b*.

Benzene was hydrogenated on 3 different Pd black catalysts pretreated in H_2 at 276°, 303°, and 350°C, resp. In general, const. rates were reached rapidly when the temp. was changed. However, around 200°C, the rate decreased continuously during a long time (about 100 min.) at const. temp. On one sample, the rate did not change between 168° and 220°C. This did not mean that the activation energy E was zero in this temp. interval, but that a transformation took place in the Pd-H_2 system.

11365. ALCHUDZHAN, A.A. **Kinetics and mechanism of catalytic hydrogenation of hydrocarbons. IX. The solid system Pd-H_2 as hydrogenating catalyst.** *Zhur. Fiz. Khim.* 26, 1591-9(1952).—*C.A.* 47, 6235*e*.

The activity, *A*, of Pd sponge (1 g) was expressed in % conversion in the hydrogenation of C_6H_6, in a mixt. C_6H_6:H_2 = 1:4, under 1 atm. at a feed rate of H_2 of 1 liter/hr at the stated temp. Pd having attained *A* = 22.7% and then kept in H_2 86 hrs at room temp., showed practically no *A* at the beginning of hydrogenation at 200°C; *A* rose with time, attained a const. *A* of about 35%, and then remained at that level. A catalyst (*A* = 16%) was exposed first 10 min. to a stream of air, and then 36 hrs to H_2; *A* at 224°C rose from an initial 6% to about 27%, and then decreased slowly to a const. value of about 21%. The effect of air did not consist in a combustion of the H_2 dissolved in the Pd. The smallness of the effects of either C_6H_6 or cyclohexane on *A* of Pd contrasted with their strong depressing effects on *A* of Ni.

11366. ALCHUDZHAN, A.A. **Kinetics and mechanism of catalytic hydrogenation of hydrocarbons. X. Effect of the treatment with hydrogen or nitrogen at 300-350°C on the catalytic activity of Pd-H.** *Zhur. Fiz. Khim.* 26, 1600-9 (1952).—*C.A.* 47, 6236*d*.

One-hr treatment of Pd of const. activity (*A* = 12%) with H_2 at 350°C resulted in a sharp fall of the initial *A* in hydrogenation of C_6H_6 at 224°C, followed by a steady, almost linear recovery with time, ending in const. *A* somewhat higher than the original. If, after the deactivation with H_2 at 350°C, the catalyst was treated with H_2 90 min. at room temp., subsequent hydrogenation at 224°C began at once with *A* = 7, and rose again to the original level, or higher. Fresh Pd black (0.75 g) showed *A* = 76.4% at 200°C. This catalyst was converted to Pd sponge by 1 hr treatment with H_2 at 350°C followed by 18 hrs rest in H_2 at room temp., and then showed at 200°C a very low initial *A* of about 3%. The deactivation by H_2 was due to an interaction with H_2, and not merely to the high temp. of 350°C.

11367. ALCHUDZHAN, A.A. **Kinetics and mechanism of catalytic hydrogenation of hydrocarbons. XI. Palladium black.** *Zhur. Fiz. Khim.* 26, 1730-5(1952).—*C.A.* 47, 6236*i*.

Fresh Pd black (0.75 g) showed a high and const. activity (*A*) of 87% in the hydrogenation of C_6H_6 at 200°C from the very start. This fell only to 83.4 and 78%, resp., after 40 and 90 hrs standing in H_2 at room temp. The slight deactivating effect of H_2 at room temp. was attributed to the very fine and highly imperfect crystallinity of Pd black as compared with spongy Pd, and more difficult conversion of the α into the β phase. In further contrast to spongy Pd, the rates of hydrogenation of C_6H_6 on Pd black at different temps. were reproducible on going from higher to lower temps. and vice versa. Plots of log *A* as a function of $(1/T)$ were not linear. With Pd black, the max. rate of hydrogenation was around 190°C, whereas with the less active Pd sponge it was markedly higher.

11368. AMEMIYA, TŌZŌ; SUZUKI, MASOAMI, AND KOGUCHI, KATSUYA. **Preparation of pyridine by the catalytic decomposition of higher bases.** *Coal Tar* (Japan) 4, 183-7(1952).—*C.A.* 46, 8830*b*.

Higher tar bases, such as α-, β- and γ-picoline, 2,6-lutidine, and collidine mixt., were decompd. by flowing into H_2 contg. a little H_2S at 800°C. The catalytic treatment in the presence of Ni, Se, etc., at the lower temps. was not promising.

11369. ANDERSON, ROBERT B.; SELIGMAN, B.; SHULTZ, J.F.; KELLY, R., AND ELLIOTT, M.A. **Fischer-Tropsch synthesis. Some important variables of the synthesis on iron catalysts.** *Ind. Eng. Chem.* 44, 391-7(1952).—*C.A.* 46, 5291*a*.

The activity and selectivity of 4 different types of Fe catalysts was studied as a function of total gas pressure, particle size of the catalyst, alkali content of the catalyst, temp. and space velocity of the 50-50 CO:H_2 mixt. The ratio of H_2 to CO consumed during the synthesis was independent of particle size and varied between a value of 1 to 1.5 for low conversions to a value of about 0.75 for medium conversions and up again to a value of about 0.85 for higher conversions. Fused Fe catalyst D-3001 contg. MgO 6.8, SiO_2 1.05, Cr_2O_3 0.96, and K_2O 0.85% as promoters showed an increase in activity with increasing external area per g of catalyst particles.

11370. ANNABLE, D. **Application of the Temkin kinetic equation to ammonia synthesis in large-scale reactors.** *Chem. Eng. Sci.* 1, 145-54(1952).—*C.A.* 46, 10807*i*.

The Temkin kinetic equation was applied to plant data obtained at 370-550°C and at pressures of 245 and 300 atm. The apparent activation energy for NH_3 decompn. was 45,800 cal/mol. at 245 atm. and 47,900 cal/mol. at 300 atm.

11371. ANON. **Platforming and Udex.** *Chem. Eng.* 59, No. 5, 242-5(1952).—*C.A.* 46, 6817*c*.

A description was presented of the Platformer-Udex plant at Houston, Texas. Platforming was a method for catalytic (Pt) reforming of selected petroleum naphthas to produce aromatics. Udex was a process for sepn. of the aromatic products by extn. with diethylene glycol and water.

11372. ARNOLD, M.R.; ATWOOD, KENTON; BAUGH, H.M., AND SMYSER, H.D. **Nickel catalysts for hydrocarbon-steam reaction.** *Ind. Eng. Chem.* 44, 999-1003 (1952).—*C.A.* 46, 9746*i*.

The semimicro reactor was constructed of 1/4-in. Ascoloy pipe, mounted vertically in an electrically heated furnace. A bundle of 6 reactors could be placed in each furnace. Catalysts were reduced for 18 hrs at 1500°F with H_2 entering the saturator at a rate of 5 liters per hr. After reduction H_2 was replaced with CH_4 and gas samples were taken after CH_4 had flowed for 3 hrs. Above 1500°F percentages reaction and theoretical reaction were essentially equal. The effect of high temp. was studied in reactors of ceramic tubes 33 in. long and 1 in. inside diam. In general, the catalysts with higher Ni contents had higher activities. Rapid inactivation of the com. catalyst took place above 1900°F.

11373. ASTLE, M.J.; ZASLOWSKY, J.A., AND ETHERINGTON, R.W. **Reactions catalyzed by anion exchange resins.** *Ind. Eng. Chem.* 44, 2867-72 (1952).

Anion exchange resins (Amberlite IR-4B, Deacidite, and Amberlite IRA-400) were excellent catalysts at 15°-45°C for promoting Knoevenagel condensations between aldehydes and esters. Weakly basic anion exchangers in the free base or acetate form were found to be quite effective. Strongly basic resins were readily inactivated. The same resins were also effective in the catalysis of aldol type condensations. The cyanoethylation of alcs. by a strongly basic anion exchanger was also performed.

11374. BAKER, R.W.; WONG, H.N., AND HOUGEN, O.A. **Catalytic oxidation of nitric oxide on silica gel.** *Chem. Eng. Progress Symposium Ser.* 48, *No. 4, Reaction Kinetics and Transfer Processes*, 103-9(1952).—*C.A.* 47, 2025*h*.

The rate of the forward reaction in the oxidation of NO diminished with increase in temp. for the reaction catalyzed by silica gel. The surface reaction between the complex nitric oxide $(NO)_2$ with unadsorbed O_2 was rate-controlling. The complex $(NO)_2$ in the gas phase was assumed to be in equil. with the NO in the gas phase. The adsorption of the product, NO_2, was negligible.

11375. BALACEANU, J.C. AND JUNGERS, J.C. **Dehydration of alcohols with alumina.** *Bull. soc. chim. belges* 60, 476-511 (1952).—*C.A.* 47, 2683*b*.

In the interval 260°-400°C, the dehydration of EtOH took place in 2 steps: formation of Et_2O, and decompn. of Et_2O to C_2H_4 and EtOH. Direct formation of C_2H_4 from EtOH took place only to a minor degree. The same held true for the dehydration of MeOH, iso-PrOH, and BuOH.

11376. BATTALOVA, SH.; PANCHENKOV, G.M., AND TOPCHIEVA, K.V. **Kinetics of the cracking of cetane by aluminosilicate catalysts of various compositions.** *Zhur. Fiz. Khim.* 26, 903-9(1952). —*C.A.* 46, 10811*f*.

The catalyst was prepd. by mixing fresh ppts. of $Al(OH)_3$ and $Si(OH)_4$. At 470°C for 0, 10, 30, 50, 72, and 100 wt % Al_2O_3, 0, 13, 56, 46, 29, and 9%, resp., of cetane were cracked. The apparent activation energy was 29.1-30.5 cal/mol. The difference between various catalysts could not be attributed to their surface areas, *S*, detd. from the adsorption of palmitic acid from heptane. It was 151, 163, 169, and 163 m^2/g for 16%, 30%, 50%, and 72% Al_2O_3 in $Si(OH)_4$, i.e. almost independent of the ratio Al:Si.

11377. BÉNARD, JACQUES. **The causes of catalytic power in certain metallic oxides.** *Ind. chim. belge* 17, 553-9(1952).—*C.A.* 46, 8944*d*,

The catalytic activities of oxides of Ni, Cd, Zn, Fe, Co, etc., were traced to defects in the crystal lattice. A given defect may be due to the absence of an ion or the insertion of a supplemental or foreign ion. The resultant abnormal charge on these ions caused perturbations which accounted for the catalytic activity of the crystal. NiO prepd. from the carbonate in the presence of O_2 contained Ni(III) defects which accounted for its catalytic activity.

11378. BERTIL HAMMAR, C.G. **Reaction kinetics of the catalytic vapor-phase oxidation of benzene to maleic anhydride.** *Svensk Kem. Tid.* 64, 165-76(1952)(in English).—*C.A.* 46, 8945*d*.

The oxidation of C_6H_6 to maleic anhydride was detd. by a flow method with air over the catalyst which occupied the annular space between 2 concentric tubes, both temp.-controlled with Dowtherm. The V-Mo catalysts (1:0.3 ratio) were supported in various percentages on metallic Al. The first reaction to form maleic anhydride was extremely fast, being limited only by the mass-transfer rate. The reaction rate had a high temp. coeff. The reaction rate for the complete combustion was almost independent of mass transfer, the rate-detg. step being either the readsorption of maleic anhydride or the surface reaction.

11379. BLUE, R.W.; HOLM, V.C.F.; REGIER, R.B.; FAST, EDWIN, AND HECKELSBERG, L.F. **Effect of granule size in dehydrogenation of butane and in a hydrogen-transfer reaction.** *Ind. Eng. Chem.* 44, 2710-16(1952).—*C.A.* 47, 852*b*.

In the dehydrogenation of butane and the H-transfer from decahydronaphthalene to isobutene, mass transfer rate rather than "intrinsic" activity was the limiting factor for granule sizes greater than 0.02 in. The inner portions of the catalyst granules were less effective than the outer portions. Reaction- and diffusion-rate constants were calcd. and compared to each other.

11380. BOND, G.C. AND SHERIDAN, J. **Heterogeneous catalysis. I. Hydrogenation of methyl-acetylene.** *Trans. Faraday Soc.* 48, 651-8(1952).—*C.A.* 47, 393*a*.

The reaction was largely simple hydrogenation with the production of propene. The over-all apparent activation energies per mole were 14.2 kcal, 16.5 kcal, and 17.3 kcal over Ni, Pd, and Pt, resp. The activation energies for hydrogenation and hydropolymerization were roughly equal over Pd, but over Ni they were about 14 kcal and 16 kcal, resp. There were indications that a van der Waals layer of MeC≡CH, above the chemisorbed layer, played a part in the polymerization.

11381. BOND, G.C. AND SHERIDAN, J. **Heterogeneous catalysis. II. Hydrogenation of allene.** *Trans. Faraday Soc.* 48, 658-63 (1952).—*C.A.* 47, 393*d*.

The reaction was principally hydrogenation, but reduced polymers of allene, were also formed, especially over Pd. The main reaction was selective propene formation, which was slower than the hydrogenation of propene to propane which occurred over Ni and Pt when almost all allene was removed. The apparent activation energies for initial reaction were 12.9, 12.3, and 17.1 kcal/mole over Ni, Pd, and Pt, resp.

11382. BOND, G.C. AND SHERIDAN, J. **Heterogeneous catalysis. III. Hydrogenation of mixtures of hydrocarbons.** *Trans. Faraday Soc.* 48, 664-8 (1952).—*C.A.* 47, 393*e*.

Added propene was a diluent in the hydrogenation of MeC≡CH or allene over Ni, Pd, or Pt. Mixts. of pairs of the hydrocarbons, C_2H_2, MeC≡CH, and allene, were simultaneously hydrogenated, which indicated that these substances were adsorbed in comparable quantities.

11383. Bond, G.C. and Sheridan, J. **Heterogeneous catalysis. IV. Hydrogenation of cyclopropane.** *Trans. Faraday Soc.* 48, 713-15(1952).—*C.A.* 47, 2583*h*.

The reaction over Ni, Pd, and Pt differed fundamentally from normal olefin hydrogenation in being of 1st order with respect to the hydrocarbon and of zero order with respect to H_2. The surface was covered with chemisorbed H_2 and the rate-detg. step of the reaction involved physically adsorbed (or gaseous) cyclopropane. Two alternative mechanisms were: (1) addn. of 2 H atoms in one step; (2) successive addns. of 2 H atoms singly.

11384. Bond, G.C.; Sheridan, J., and Whiffen, D.H. **Heterogeneous catalysis. V. Exchange reactions involving dideuterioacetylene.** *Trans. Faraday Soc.* 48, 715-23 (1952).—*C.A.* 47, 2583*i*.

The reaction $C_2H_2 + C_2D_2 = 2C_2HD$ proceeded to equil. over a Ni catalyst in a few hrs at 60°C. The expts. gave $K = 3.58$ (350°K) and 3.62 (400°K) which may be expressed as a temp.-independent value of 3.6 ± 0.3 in the range 80°-130°C. The rate varied as the 0.65 power of the total pressure, and the activation energy was 10.7 kcal.

11385. Boreskov, G.K. and Slin'ko, M.G. **Kinetics of reversible catalytic reactions in the internal diffusion range.** *Zhur. Fiz. Khim.* 26, 235-8(1952).—*C.A.* 47, 4714*e*.

On porous catalysts, the observed rate of reaction, *W*, was related to the true rate. For the oxidation of SO_2 on a V catalyst, in a mixt. of the initial compn. SO_2 7, O_2 11, N_2 82%, the optimum temp. for a degree of conversion of 0.7 and 0.5, was, in the kinetic region, 572° and 636°C, resp., and in the diffusional region, 552° and 600°C, resp.

11386. Browning, L.C. and Emmett, P.H. **Equilibrium measurements in the Ni_3C-Ni-CH_4-H_2 and Co_2C-Co-CH_4-H_2 systems.** *J. Am. Chem. Soc.* 74, 1680-2(1952).—*C.A.* 46, 6908*b*.

Equil. consts. were detd. for the reaction $3Ni + CH_4 = Ni_3C + 2H_2$ in the range 226°-285°C and for the reaction $2Co + CH_4 = Co_2C + 2H_2$ in the range 190°-444°C. The amts. of satd. hydrocarbons and normal monoölefins that could be formed by the direct reduction of bulk Ni_3C by H_2 were large at 500°K and increased with increasing mol. wt of the hydrocarbon. In the reduction of bulk Co_2C by H_2 to form hydrocarbons, the amts. of hydrocarbons having more than six C atoms and of all monoölefins at both 500° and 600°K, were small at equil.

11387. Calderbank, P.H. **Catalytic oxidation of naphthalene.** *Ind. Chemist* 28, 291-5 (1952).—*C.A.* 47, 3549*f*.

The oxidation with O_2 of naphthalene to α-naphthoquinone and to phthalic anhydride by using a com. V_2O_5 catalyst, was investigated over the range of 310-360°C and up to 10% conversion of naphthalene. The rate-detg. step under the conditions chosen was the chemisorption of O_2; the energy of activation was 26 kcal.

11388. Campbell, W.M. and Johnstone, H.F. **Reactions of hydrogen and carbon monoxide in a tubular reactor with iron-copper catalyst.** *Ind. Eng. Chem.* 44, 1570-5(1952).—*C.A.* 46, 8349*f*.

The Fischer-Tropsch reactions were studied under highly simplified conditions with a porous tube impregnated with Fe-Cu catalyst. Most of the catalysts used produced CO_2 and were active for the water-gas shift reaction. Heating the catalysts to 310°C in the presence of H_2 and CO destroyed the synthesis reaction activity, but did not affect the shift-reaction activity. H_2S destroyed the activity for both reactions.

11389. Chamberlain, G.H.N. and Walsh, A.D. **The inhibiting effect of tetraethyllead. I. The effect of lead compounds on the vapor-phase slow oxidation of diisopropyl ether and on the ignition of diethyl ether.** *Proc. Roy. Soc.* (London) A215, 175-86(1952).—*C.A.* 47, 4588*f*.

The inhibiting effect was found to persist after prolonged evacuation, owing to the deposition of Pb oxide. PbO gave an inhibiting effect profound, persistent and in every way similar to that of tetraethyllead. It did this by a surface destruction of chain centers. On oxidation, tetraethyllead gave rise to a fog of particles (probably PbO). Its inhibiting effect was then exerted either by these colloidal particles or by the film of PbO to which they gave rise on the walls of the vessel.

11390. Collier, Donald W. **Flow-system kinetics; continuous catalytic conversion of ethylene to ethane.** *Univ. Microfilms* (Ann Arbor, Mich.), *Pub.* No. 2929, 72 pp. (microfilm $1.00, paper enlargements $7.20); *Dissertation Abstracts* (formerly *Microfilm Abstracts*) 12, 248(1952).—*C.A.* 46, 8944*b*.

11391. Dart, J.C.; Oblad, A.G., and Scholl, J.W. **Houdriforming at low pressure.** *Petroleum Engr.* 24, No. 9, C-32-3(1952).—*C.A.* 46, 11655*a*.

West Texas sweet mixed-base naphtha was reformed at 275 p.s.i. and essentially 100% conversion of all naphthenes to aromatic hydrocarbons was achieved. No adverse effect on the catalyst was noted.

11392. Dart, J.C.; Oblad, A.G., and Scholl, J.W. **Houdriforming at low pressure.** *Oil and Gas J.* 51, No. 28, 386, 388, 391-2(1952).—*C.A.* 47, 1919*i*.

Houdriforming catalyst was used to reform com. available naphthas at low pressure. Very high yields of aromatics were produced by conversion of naphthene hydrocarbons and by substantial conversion of paraffin hydrocarbons to aromatic hydrocarbons.

11393. Dean, John G. **Nickel compounds as catalyst raw materials.** *Ind. Eng. Chem.* 44, 985-90 (1952).—*C.A.* 46, 9747*g*.

Several million pounds of Ni compds. were used yearly in the U.S. in the production of catalysts, largely for hydrogenation reactions. $Ni(NO_3)_2$ was particularly suited for the prepn. of impregnated catalysts, while $(HCO_2)_2Ni$ was used in making liquid-process catalysts. Raney Ni was unique in that intermetallic compds. were involved.

11394. Dijk, J.A. van and Voogd, J.G. de. **Catalytic conversion of heavy oil with steam to town gas at Cahors (France); Onia-Gegi process.** *Het Gas* 72, 209-15 (1952).—*C.A.* 47, 6116*h*.

The process was a cycle of blow and run through a catalyst bed downward. During the blow the bed was heated with oil-combustion gases and excess air to 730°C top temp. and 830°C bottom temp. During the run, steam and an oil spray were introduced above the bed to give final temps. of 520° and 770°C, resp., taking 5 min. with 8.5 liters of oil per. min. The Ni in the catalyst oxidized during the blow, giving a high CO_2 content during the first 1/2 min. of run; this gas was wasted.

11395. Dole, Malcolm; Rudd, DeForest P.; Muchow, Gordon R., and Comte, Charles. **Isotopic composition of oxygen in the catalytic decomposition of hydrogen peroxide.** *J. Chem. Phys.* 20, 961-8(1952).—*C.A.* 47, 2025*c*.

The isotopic compn. of O_2 liberated in the catalytic decompn. of H_2O_2, in which MnO_2, Fe_2O_3, colloidal Au, metallic Pt, and sol. catalase were used as catalysts, was measured. A few rate expts. were also detd., and the kinetics studied from the standpoint of isotope sepn. as a function of fraction of H_2O_2 decompd. None of the liberated O_2 came from the substrate H_2O or from the $KMnO_4$ when H_2O_2 was oxidized.

11396. Druz, V. A. and Sokol'skiĭ, D. V. **Potentiometric study of hydrogenation reactions. Effect of additives on the activity of nickel skeleton catalysts.** *Zhur. Fiz. Khim.* 26, 484-91(1952).—*C.A.* 47, 5779*b*.

The rate of hydrogenation of dimethylethynylcarbinol, maleic acid, and Na fumarate was measured on Ni skeleton catalyst contg. increasing amts. of additives: these were Pd, Pt, and benzylmercaptan. At the same time, the equil. e.m.f. of the catalyst relative to the 0.1 *N* calomel electrode was measured. The latter data gave a measure of the strength of H_2 chemisorption. The addn. of Pt to Ni increased considerably the energy of H_2 chemisorption and decreased markedly the catalytic activity.

11397. Duffy, B. J. Jr. and Hart, H. M. **Metal poisoning of fluid cracking catalyst.** *Chem. Eng. Progress* 48, 344-8(1952).—*C.A.* 46, 8838*a*.

The detn. of optimum operation for each feed required only an economic balance between catalyst costs to maintain a low C factor and the yield penalty that was incurred if the C factor rose. An evaluation of the relative economics in sending the 3 different feeds to the catalytic cracking unit was possible by a comparison of the optimum points of operation for each.

11398. Erivanskaya, L. A. and Kagan, M. Ya. **Kinetics of dehydrogenation of methyl-cyclohexane on a chromia-alumina catalyst.** *Zhur. Fiz. Khim.* 26, 1159-63(1952).—*C.A.* 47, 957*d*.

The catalyst was: Cr_2O_3 13, K_2O 2, Al_2O_3 85%. Dehydrogenation of methylcyclohexane was studied at 383°C (contact time τ between 3.7 and 43.6 sec), 397°C ($4 < \tau < 51.8$), 411°C ($15.1 < \tau < 38$), and 436°C ($10 < \tau < 24.3$). The rate const. k was calcd. on the assumption that the rate was inversely proportional to the concn. of H_2 in the gas phase. The apparent energy of activation was 33,500 cal/mole. Expts. were made with H_2-methylcyclohexane mixts., and good rate consts. were obtained.

11399. Fal'kovskiĭ, V. B. **Change in degree of conversion and temperature along the length of a catalytic bed.** *Zhur. Fiz. Khim.* 26, 942-8(1952)—*C.A.* 47, 5776*c*.

Approx. equations were derived for the variation of degree of conversion α and of temp. T along the length l of a catalytic bed of section σ to which n_1 moles of reactant were fed per unit time. This was done for exothermic or endothermic reactions in 3 different cases: adiabatic regime, const. wall temp. T_w and variable T_w, and for zero-order as well as 1st-order reactions. In the adiabatic case: $T = T_0 + (n_1 q/Gc_p)\alpha$ (2), where T_0 was the initial temp. of the gas, q the heat of reaction, G the mass velocity, c_p the heat capacity.

11400. Farbar, Leonard. **Metering of powdered solids in gas-solids mixtures.** *Ind. Eng. Chem.* 44, 2947-55(1952).—*C.A.* 47, 3049*b*.

At fixed gas rates (0.0077 to 0.0152 lb/sec) and vol. (ambient pressure and temp.), solids (Al-Si catalysts) flow rates were measured by converging nozzles. Standard nozzles could be used.

11401. Fleureau, Bernard and Sancelme, André. **Catalytic decomposition of carbon monoxide on iron reduced electrolytically at low temperature.** *Compt. rend.* 235, 801-3(1952).—*C.A.* 47, 2077*f*.

The progress of the reaction $2CO \rightarrow CO_2 + C$ was followed in a circulating system by measuring pressure drop with time at a const. rate of heating. CO_2 was absorbed in KOH. Electrolytic Fe was an excellent catalyst below about 600°C.

11402. Fowle, M. J.; Bent, R. D.; Milner, B. E., and Masologites, G. P. **In reforming it's the catalyst that counts.** *Oil Gas J.* 51, No. 3, 181, 183-5(1952).—*C.A.* 46, 7749*f*.

The Atlantic catalytic reforming process, a continuous, normally nonregenerative process utilizing multiple fixed-bed reactors, was described. The catalyst used was selective and maximized dehydrogenation of naphthenes and isomerization of paraffins and naphthenes while controlling the undesirable cracking reactions. S was a temporary catalyst poison at concns. of 0.1% or higher.

11403. Freĭdlin, L. Kh. and Levit, A. M. **Kinetics of the dehydration of alcohols in the presence of trisubstituted calcium phosphate.** *Izvest. Akad. Nauk S.S.S.R., Otdel Khim. Nauk* 1952, 163-71.—*C.A.* 46, 5409*c*.

Expts. with a feed rate of 0.16 ml/min., on 20 ml (9 g) $Ca_3(PO_4)_2$, were described with EtOH, PrOH, *sec*-PrOH, BuOH, and *iso*-BuOH. The activity of the catalyst remained undiminished for hrs with EtOH. On the same catalyst, the rate of dehydration of Et_2O proved to be twice as slow as that of EtOH, at the same mol. feed rate. On silica gel, dehydration of EtOH was slower and less selective than on $Ca_3(PO_4)_2$. The life of the silica gel catalyst was shorter; 5 hrs heating at 800°C lowered its activity by a factor of 4.

11404. Freĭdlin, L. Kh. and Rudneva, K. G. **Promotion of dehydrogenated skeleton nickel**

Doklady Akad. Nauk S.S.S.R. 83, 105-8(1952).—*C.A.* 46, 8489*h*.

The Ni catalyst, prepd. by 2 hrs-leaching of a 50-50% Ni-Al alloy at 100°C, was dehydrogenated by 1-hr treatment with a 2% soln. of benzoquinone at 60°C under N_2 and then again satd. with H_2. At 60°C, the dehydrogenated catalyst was able to take up an amt. of H_2 up to about 45% of the amt. present in the original catalyst prior to its dehydrogenation. At 90°C, the amt. of H_2 taken up remained about the same, only the time necessary for it was shorter. The rehydrogenated catalyst reduced benzoquinone; consequently, the H_2 taken up was active.

11405. FUKUSHIMA, SHOUZOW; HORIBE, YOSHIO, AND TITANI, TOSHIZO. **A study of the mechanism of the catalytic action of manganese dioxide on the decomposition of potassium chlorate by use of heavy oxygen as an isotopic tracer.** *Bull. Chem. Soc. Japan* 25, 245-8(1952)(in English).—*C.A.* 47, 5781*i*.

$KClO_3$ labeled with heavy O was decompd. by heating in the presence of ordinary MnO_2, using a variety of conditions. The evolved O_2 was converted into H_2O with tank H_2 and Cu catalyst. At the same time a part of the heavy $KClO_3$ was noncatalytically decompd. by heating at 650°C, and evolved O_2 was similarly converted into H_2O. H_2O was also prepd. by reducing a part of the MnO_2 with the same H_2. At the catalytic decompn. of $KClO_3$ in the presence of MnO_2, an unstable compd. was formed between $KClO_3$ and MnO_2, and O_2 was liberated by the decompn. of this intermediate compd.

11406. GRANT, G. A.; KATZ, MORRIS, AND RIBERDY, R. **Oxidation of carbon monoxide by solid silver permanganate reagents. III. Effect of method of preparation on activity.** *Can. J. Technol.* 29, 511-19(1952).—*C.A.* 46, 7937*f*.

The reactivity of reagents prepd. from $AgMnO_4$ and ZnO varied greatly. The best way to ppt. the $AgMnO_4$ on powd. ZnO carrier, was described.

11407. GRIFFITH, ROLAND H. **Catalytic oxidation of organic sulfur compounds in coal gas.** *Ind. Eng. Chem.* 44, 1011-14(1952).—*C.A.* 46, 9284*h*.

A Ni subsulfide catalyst was used in the range 220°-370°C. A plant treating 1,500,000 ft^3 per day, which had been in operation for 14 years was described. It was operated by automatic air addn. controlled from a magnetic O_2 analyzer. Thiophene was not decompd., but other S compds. were reduced to about 2 grains per 100 ft^3.

11408. HALL, C. C.; GALL, D., AND SMITH, S. L. **A comparison of the fixed-bed, liquid-phase ("slurry") and fluidized-bed techniques in the Fischer-Tropsch synthesis.** *J. Inst. Petroleum* 38, 845-76(1952).—*C.A.* 47, 846*g*.

Synthesis expts. were made with fused and sintered Fe catalysts in lab.-scale, fixed-bed, liquid-phase (slurry), and fluidized-bed reactors. By allowing for the increase in activity which accompanied reduction in particle size of fused and sintered Fe catalysts, the reaction rate in a fixed bed was the same as or somewhat greater than that in a fluidized bed, but in a slurry system the rate was appreciably less. With a particular catalyst and reaction temp., carbon formation was controlled by the partial pressure of H_2. The rate of the synthesis reaction was a linear function of operating pressure (300-675 p.s.i.) in all 3 processes.

11409. HAMILTON, W. W.; EASTWOOD, S. C.; POTAS, E. A., AND SCHRAISHUHN, E. A. **Catalytic cracking in Airlift Thermofor catalytic cracking (TCC) units.** *Petroleum Engr.* 24, No. 9, C-5-16(1952).—*C.A.* 46, 11658*g*.

The Airlift Thermofor catalytic cracking unit had many improvements over the bucket-elevator unit. The com. units operated with low catalyst attrition rates and were exceeding design conditions with respect to both yields and carbon-burning capacity.

11410. HANCOCK, C. KINNEY. **Raney nickel-catalyzed hydrogenation of commercial aldol.** *Ind. Eng. Chem.* 44, 1003-6(1952).

Commercial aldol appeared to be largely the condensation product between aldol and acetaldehyde. Under optimum hydrogenation conditions, the aldol yielded about 70% butylene glycol, alcohol being the main by-product. At higher temps., increased dehydration of aldol preceded hydrogenation and led to an increase in yield of BuOH. Raney nickel could be re-used if it was protected properly.

11411. HANSFORD, R. C.; WALDO, P. G.; DRAKE, L. C., AND HONIG, R. E. **Hydrogen exchange between deuterium oxide and hydrocarbons on silica-alumina catalyst.** *Ind. Eng. Chem.* 44, 1108-13(1952).—*C.A.* 46, 9292*g*.

The hydrocarbons investigated were benzene, cyclohexane, methylcyclohexane, neopentane, isobutane, butane, 2-butene, heptane, and isobutylene. The silica-alumina catalyst was hydrated with D_2O, 0.25% by wt, and then brought into contact with the hydrocarbon. Following the reaction period (1 hr) at the desired temp., a sample was removed and analyzed by a mass spectrometer. For a given rate of conversion, satd. hydrocarbons contg. only primary or both primary and secondary H required the highest temp. for exchange, and olefins required the lowest temp. for exchange. Olefins were found to accelerate the reaction rate.

11412. HEIN, L. B. **Synthesis of ammonia at 350 atmospheres.** *Chem. Eng. Progress* 48, 412-18 (1952).—*C.A.* 46, 9809*i*.

Synthesis catalyst, materials of construction, energy requirements, and synthesis converters were reviewed.

11413. HOARE, D. E. AND WALSH, A. D. **The inhibiting effect of lead tetraethyl. II. The effect of lead monoxide on the slow oxidation of methane.** *Proc. Roy. Soc.* (London) 215A, 454-66(1952).—*C.A.* 47, 4716*i*.

Expts. described the slow oxidation of CH_4 in PbO-coated vessels. The PbO coating caused: (1) comparatively little effect on the induction period to the onset of a marked rate of pressure rise, but a very marked diminution of the max. rate of pressure rise; (2) near 500°C, a rise in over-all activation energy from about 25 to about 58 kcal/mole; (3) a small increase in the dependence of the max. rate of pressure rise on the total initial pressure. H and O atoms and OH radicals did not play an important role in the secondary, HCHO-oxidation, chains.

11414. HOLM, V. C. F. AND BLUE, R. W. **Hydrogen-deuterium exchange activity of catalysts.** *Ind. Eng. Chem.* 44, 107-13(1952).—*C. A.* 46, 3381*c*.

Six catalysts, TiO_2, ZrO_2, CeO_2, TiO_2, Al_2O_3, and ZnO, were prepd. (except ZnO) by pptn. of the hydrous oxide from solns. of the nitrates. ZnO was pptd. from the oxalate. Seven Fe catalysts were prepd. by fusion of Armco wire and burning in a stream of O_2 and adding KNO_3 or K_2CO_3; or carbonyl Fe powder was intimately mixed with K_2CO_3, heated at 150-200°C with an oxy-gas flame, cooled, crushed, and screened for size. B.E.T. surface areas were detd. Twelve com. catalysts were also used. H_2 and D_2 was passed over the catalyst at a const. rate of atm. pressure and reaction temp. from —78° to 300°C. The catalysts were pretreated with H_2. Rate consts. were calcd. on the assumption that the exchange reaction was 1st order; 1st-order rate consts. could be used safely for comparison of the several catalysts. Activities for H_2-D_2 exchange were of the same order as for the hydrogenation of C_2H_4, and C_4H_{10} dehydrogenation.

11415. HUGHES, E. C.; STINE, H. M.; STRECKER, H. A.; EASTWOOD, S. C.; GUTZEIT, C. L.; STOVER, W. A., AND WANTUCK, S. J. **Cogelled chromia-alumina catalyst for naphtha reforming. Evaluation of hydrocarbon types and naphthas.** *Ind. Eng. Chem.* 44, 572-5(1952).—*C. A.* 46, 4777*d*.

The yield-octane relationship of naphthas correlated well with $K = (T_B/S)^{1/3}$ where T_B = molal av. b.p., °R and S = sp. gr. at 60°F. Reforming thermally cracked stocks and the production of benzene, toluene, and aviation blending stock were also feasible. From 86 to 97% of the S in the feed stock was removed, mostly as H_2S.

11416. ISHIWARA, TORAJIRO; NIWA, KICHIZO, AND KOIZUMI, KOICHI. **The utilization of pyrrhotite principally composed of iron and sulfur. II. Making of sulfuric acid from the roasting gases of pyrrhotite.** *Science Repts., Research Insts., Tohoku Univ. Japan, Ser.* A. 277-80 (1952).—*C. A.* 47, 2441*i*.

Pyrrhotite (28 to 32 mesh) was roasted in a rotary furnace at 700°C and H_2SO_4 was made from the roasting gases by the contact process with a V catalyst at approx. 440°C.

11417. IZGARYSHEV, N. A. AND ARYAMOVA, I. I. **Influence of the nature of the cathode and of catalysts on the electrolytic reduction of acetone.** *Doklady Akad. Nauk S.S.S.R.* 84, 313-15(1952).—*C. A.* 46, 9453*a*.

The products of the reduction of Me_2CO were pinacone, iso-PrOH, and C_3H_8. On Cu coated with Pb as cathode, best yields were obtained with a c.d. of 1 amp./dm^2. The reduction came to a stop as soon as the Pb coating of the cathode was consumed, but set in again when the cathode was coated anew. With Ni^{++} ions in the soln., no reduction products were obtained (only H_2 evolution).

11418. JACOBS, WILLIAM O. **First "packaged" Thermofor Catalytic Cracking unit now on stream.** *Oil and Gas J.* 50, No. 37, 92-4 (1952).—*C. A.* 46, 3740*i*.

Design and operating details were given for the Artesia, New Mexico, refinery of the New Mexico Asphalt and Refining Co.

11419. KASTENS, M. L.; HIRST, L. L., AND DRESSLER, R. G. **An American Fischer-Tropsch plant.** *Ind. Eng. Chem.* 44, 450-66(1952).—*C. A.* 46, 5292*a*.

Liquid fuels were produced by the Fischer-Tropsch process with a jiggling-catalyst bed which was similar to the fluid-catalyst system found in petroleum cracking. Purified synthesis gas was converted to hydrocarbons, oxygenated org. compds., CO_2, and H_2O at 450-525°F with a reduced Fe catalyst at 300-350 p.s.i.

11420. KATZ, MORRIS; RIBERDY, R., AND GRANT, G.A. **The oxidation of carbon monoxide by solid silver permanganate reagents. V. Determination of low concentration of carbon monoxide by use of thermistors in a thermal cell.** *Can. J. Technol.* 30, 303-10(1952).—*C. A.* 47, 3183*a*.

Physiologically significant concns. of CO in air may be detd. by measuring the temp. within a thermal cell with a thermistor as the air was passed through a Ag-$KMnO_4$-ZnO reagent. A pair of balanced thermistors, one in the active section and the other in inactive pumice, were made part of a Wheatstone bridge circuit.

11421. KAZANSKIĬ, B. A. AND GRUSHKO, I. E. **Catalytic hydrogenation of some trisubstituted ethylenes in the presence of nickel.** *Doklady Akad. Nauk S.S.S.R.* 87, 767-70(1952).—*C. A.* 47, 3098*a*.

On Pt black in alc. soln., the most rapidly hydrogenated deriv. of the type R'R''C:CR'''H was Et_2C = CHMe, followed by derivs. with 1, 2, and 3 phenyl groups. On Pd, the rate of hydrogenation of Et_2C = CHMe was about the same as on Pt. Hydrogenation of 4-nonane was slowed down considerably by addn. of C_6H_6; substituted aromatic compds., such as iso-BuPh, had an even stronger inhibiting action. The skeleton Ni catalyst showed a behavior similar to that of Pd.

11422. KHOMUTOV, N. E. **Electrochemical oxidation of aniline in the presence of catalysts.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 22, 563-6(1952).—*C. A.* 46, 7908*h*.

$PhNH_2$ soln. in 1.5 *M* H_2SO_4 was electrolytically oxidized with either a Pt wire gauze anode or a perforated Pb anode (Pb cathode plate). The process was carried out in the presence of compds. of Mn, Cr, V, or Ce. The polarization curves in all cases had 2 portions. In the region of about 0.9-1.8 v. the curve became almost flat, then rose rapidly again as formation of O_2 began simultaneously with oxidation of $PhNH_2$, and a dark oxidation product appeared in the anode space.

11423. KIPERMAN, S. L. AND GRANOVSKAYA, V. SH. **Change of the order of reaction of the synthesis of ammonia. II. Kinetics of the reaction on an iron catalyst at a distance from equilibrium.** *Zhur. Fiz. Khim.* 26, 1615-18 (1952).—*C. A.* 47, 6749*a*.

A mixt., H_2:N_2 = 3:1 was passed at 1 atm. on an Fe catalyst at 475°C, at space velocities V = 90,500-13,550 liter/liter catalyst/hr. NH_3 yields were 0.047-0.110 vol. %, i.e. relative yields (in fractions of the equil. amt. of NH_3) 0.288-0.669. The catalyst, made by deposition on silica gel of an amt. of Fe sufficient to form a monolayer, was no more active than Fe catalysts with a surface area 1/50 to 1/100 the size of the gel. The Fe was not spread out over the surface in a monolayer, but formed discrete cryst. aggregates.

11424. KOBOZEV, N. I.; EVDOKIMOV, V. B.; ZUBOVICH, I. A., AND MAL'TSEV, A. N. **Magnetochemistry of active centers. I. Magnetic and catalytic properties of dilute layers.** *Zhur. Fiz. Khim.* 26, 1349-73(1952).—*C.A.* 47, 5745*a*.

The susceptibility, χ_a, per 1 g of adsorbed substance was detd. With $CoCl_2.6H_2O$ adsorbed on silica gel, χ_a was practically equal to the susceptibility of the pure salt. The increase of χ_a with the diln. was particularly marked with $Ni(NO_3)_2.6H_2O$ on carbon. Adsorbed Fe in dil. adsorbed layers behaved in qual. and quant. analogy with Pt. Paramagnetism of dil. adsorbed layers were found not only with paramagnetic and ferromagnetic salts and metals, but also with the normally diamagnetic Ag, only the isolated atom of which was paramagnetic. The sp catalytic activity of Pt on silica or Al_2O_3 gels in hydrogenation of ethylenic compds., was greatest as the surface coverage → 0.

11425. KONISHI, OSAMU. **Design of a catalytic reactor.** *Chem. Eng. Japan* 16, 335-7(1952).—*C.A.* 46, 10698*e*.

The method was illustrated by SO_2 oxidation reactor with V_2O_5 catalyst.

11426. KOTELKOV, N. Z. **Space velocity in heterogeneous catalysis.** *Zhur. Priklad. Khim.* 25, 168-73(1952).—*C.A.* 47, 4716*c*.

Dehydration of iso-PrOH in a flow system, at 250°, 300°, 350°, and 400°C on a clay catalyst taken in equal amts. by vol. but of different grain size showed the yield to be proportional to the surface area of the catalyst and not to its vol. The same surface area of catalyst was obtained on a carrier with 1/8 the amt. necessary to give the same surface area without carrier. Further expts. were done on flow dehydrogenation of iso-PrOH and of cyclohexane, at 300, 350, and 400°C, on Pt deposited on 2 different Ni-Cr wire spirals, of equal vol. and equal mass of the Pt, but with surface areas differing by a factor of 0.6; the yields obtained were found to stand in the ratio of the surface areas.

11427. KUCZYNSKI, WIENCZYSTAW AND HOFFMANN, PRZEMYSTAW. **The catalytic activity of a special type of aluminum gel.** *Roczniki Chem.* 26, 98-105(1952)(English summary).—*C.A.* 46, 10820*d*.

Kinetic measurements of catalytic dehydration of EtOH were made with 3 types of active hydrates of Al_2O_3 (contg. 1.23% SO_4^{--} at pH 7.0, 18.36% SO_4^{--} at pH 5.5, and 4.66% SO_4^{--} at pH 6.5). The studies were made at 330°C and at 380°C, the velocity of instillation equalling 0.00685 *M*/min.

11428. KUMMER, J. T. AND EMMETT, P. H. **Hydrogen-exchange reactions over iron synthetic ammonia catalysts at -195°C.** *J. Phys. Chem.* 56, 258-61(1952).—*C.A.* 46, 8488*i*.

Ortho-para exchange occurred rapidly on doubly-promoted catalyst at -195°C, but was very strongly poisoned by the presence of H_2 chemisorbed at or above 100°C. The H_2-D_2 exchange was very slow at -195°C. Singly-promoted Fe catalysts rapidly catalyze the H_2-D_2 exchange at -195°C as well as the ortho-para H_2 conversion. Furthermore, the latter reaction was not poisoned by H_2 put on the catalyst at 100°C. The existence of a 3rd type of activated adsorption of H_2 on a singly-promoted catalyst was suggested by the high velocity for the H_2-D_2 exchange and by the appearance of the low-temp. adsorption isotherms and the adsorption isobar.

11429. LIHL, F.; WAGNER, H., AND ZEMSCH, P. **Catalytic properties of nickel and cobalt powders for hydrogenation as a function of conditions of preparation.** *Z. Elektrochem.* 56, 612-19(1952).—*C.A.* 47, 2584*b*.

The hydrogenation of benzene was studied in a flow system, at const. flow rate (140°C), and mixt. compn. (C_6H_6:H_2 = 1:5.8) over a series of Ni and Co powders prepd. in different conditions from a variety of reagents. Several runs were made with each catalyst. A single run included preliminary reduction at 140°C during 10 min. followed by reaction during 10 min. The product was analyzed for C_6H_{12}.

11430. LIHL, F.; WAGNER, H., AND ZEMSCH, P. **Catalytic properties of alloy powders in the systems cobalt-nickel and cobalt-iron.** *Z. Elektrochem.* 56, 619-24(1952).—*C.A.* 47, 2584*c*.

Powders of Co-Ni and Co-Fe alloys were prepd. from formate mixed crystals. The phases were detd. by x-ray analysis and the catalytic activity for benzene hydrogenation was measured. With Co-Ni alloys, the activity fell approx. linearly from the value for pure Co to that for Ni. In the Co-Fe system, small addns. of Fe to Co reduced the activity very strongly in the ϵ-phase region. With further addn. of Fe (about 4%) the activity increased, then dropped again.

11431. LIHL, F. AND ZEMSCH, P. **Effect of reduction temperature of nickel and cobalt compounds on the catalytic properties of the metallic catalysts.** *Z. Elektrochem.* 56, 979-85(1952).—*C.A.* 47, 5779*d*.

Ni catalysts were prepd. by reduction in H_2 at 250°-350°C. Co catalysts were prepd. by reduction in H_2 at 250°-700°C of $Co(HCOO)_2$. Each was tested for its activity in the hydrogenation of C_6H_6 to cyclohexane at 130-140°C. The yield in 10 min. was taken as a measure of catalytic activity. The initial activity of Ni catalysts depended on the compd. reduced (NiO and $Ni(HCOO)_2$ being highest) and was higher at lower reduction temps. and increased with grinding. The activity of the Co catalysts was independent of reduction temp. up to 500°C and increased rapidly with time to a const. value giving 96-97% yields.

11432. LIHL, F. AND ZEMSCH, P. **Catalytic properties of nickel and cobalt prepared from amalgams by distillation of the mercury or de-**

composition in air. *Z. Elektrochem.* 56, 985-7(1952).—*C.A.* 47, 5779*h*.

Amalgams of the highest concn. obtainable, 6.88% Ni and 12% Co, were used. The Ni-Hg was heated in inert or reducing atm. to distil off Hg, finally for 2 hrs at 320°C in H_2. The finely powd. Ni obtained was completely inactive for the hydrogenation of C_6H_6 to cyclohexane. The Co-Hg was allowed to decomp. spontaneously in air for 8-12 hrs. The finely powd. Co was the most active catalyst tested so far, giving 98-99% yields, independently to the duration of the expt. The Co-Hg could also be treated to distil off the Hg, a coarse granular product being left; this gave 90% yields at first, but these continually decreased with the duration of the expt.

11433. LIVSHITS, V. D. AND SIDOROV, I. P. **Kinetics of ammonia synthesis in isothermal conditions.** *Zhur. Fiz. Khim.* 26, 538-41(1952). —*C.A.* 47, 398*g*.

Kinetics of NH_3 synthesis at 500°C from pure stoichiometric N_2-H_2 mixts. was studied in an app. that insured strictly isothermal conditions. The rate const. calcd. from these data fell with increasing pressure. If departure from ideal gas behavior was taken into account, the following values ($\times 10^{-4}$) for the rate const. were obtained: 6.60, 7.08, 6.97, 6.93, 6.45, 5.50 at 10, 100, 200, 300, 400, 500 atm., resp.

11434. MAFFEZZONI, UMBERTO. **The manufacture of hydrocyanic acid from methane, ammonia, and air.** *Chimica e industria* (Milan) 34, 460-5 (1952).—*C.A.* 47, 2440*g*.

Many different catalyst were effective for the reaction $CH_4 + NH_3 = HCN + 3\ H_2$: Pt, Rh, Ir, Ru, Os, Au, Al_2O_3, ThO_2, TiO_2, and SiO_2. Pt was preferred, either pure or alloyed with Rh or Ir, supported on porous porcelain, pumice, Al_2O_3, etc. Service of more than 2000 hrs could be obtained without appreciable lowering of yields. A pilot plant producing 100 kg of 100% HCN per day was operated and the detailed conditions were given.

11435. MARGOLIS, L. YA. AND TODES, O. M. **Catalytic oxidation of ethylene on magnesium chromite.** *Izvest. Akad. Nauk S.S.S.R., Otdel, Khim. Nauk* 1952, 52-63.—*C.A.* 46, 5413*e*.

The oxidation was studied in a static system (0.1-2 mm Hg) on a spinel $MgCr_2O_4$ with excess MgO and a surface area of 70 m^2/g. The oxidation was complete, to CO_2 and H_2O. In a stoichiometric $C_2H_4 + O_2$ mixt., under an initial pressure of 0.17-0.18 mm Hg, at 275°C, the rate of the reaction fell off with its progress. The surface contaminated by adsorption of C_2H_4 was regenerated by O_2 (99 mm Hg) and the original activity restored. Addn. of 1, 2, or 3% Na silicate to the catalyst changed the rates, but not the kinetic law. Different SiO_2 contents in the catalysts altered the part of adsorption in the oxidation.

11436. MARSH, J. D. F.; NEWLING, W. B. S., AND RICH, J. **The catalytic hydrolysis of hydrogen cyanide to ammonia.** *J. Appl. Chem.* (London) 2, 681-4(1952).—*C.A.* 47, 6747*i*.

HCN was removed from H_2S concentrates by catalytic hydrolysis. Of the oxides of Al, Ce, Th, Ti, Zr, Mo, V, Mn, Co, Fe, and Ni studied as catalysts, alumina was the most suitable. Compared with N_2, neither H_2S nor CO had any significant effect on the rate of reaction. The reaction was not retarded by the products NH_3 or CO, and the rate was nearly independent of the H_2O concn. if present in excess. The apparent activation energy of the zero-order reaction was 20 kcal/mole.

11437. MASTAGLI, PIERRE; FLOC'H, ANGÈLE, AND DURR, GEORGES. **Action of anion exchangers on the condensation of furfural with aldehydes or with acetone.** *Compt. rend.* 235, 1402-3 (1952).—*C.A.* 47, 3610*g*.

Use of anion-exchange resins instead of KOH or NaOH in aldol-type condensations resulted in selective action. While linear products were formed as a side reaction in the NaOH-catalyzed condensation of aldehydes with furfural, α-furfurylidenealdehydes of higher purity were formed selectively and in better yields in the presence of Amberlite IRA-400.

11438. MAURER, JOHN F. **The effect of pressure on the dehydration of 1-butanol over an alumina-silica catalyst.** *Univ. Microfilm* (Ann Arbor, Mich.), *Pub.* No. 3532, 62 pp. (microfilm $1.00, paper enlargements $6.20); *Dissertation Abstracts* (formerly *Microfilm Abstracts*) 12, 168(1952).—*C.A.* 46, 7415*f*.

11439. MAURER, JOHN F. AND SLIEPCEVICH, C. M. **The effect of pressure on the catalytic dehydration of 1-butanol.** *Chem. Eng. Progress Symposium Ser.* 48, No. 4, *Reaction Kinetics and Transfer Processes*, 31-7(1952)—*C.A.* 47, 2026*d*.

The effect of pressure was detd. on the initial rate of dehydration of 1-butanol over an Al_2O_3-SiO_2 catalyst at 750°F and at pressures up to 7500 p.s.i.g. The initial rate of dehydration increased with pressure up to about 2500 p.s.i.g., which corresponded to a fugacity of 1-butanol of 85 atm., and thereafter decreased.

11440. MAXTED, E. B. AND BALL, G. T. **Reversibility of the adsorption of catalyst poisons. I. The revival of poisoned catalysts by simple washing.** *J. Chem. Soc.* 1952, 4284-8.—*C.A.* 47, 2909*g*.

The catalyst poisons (thiophene, $(CH_3)_2S$, Hg^{2+}, and Zn^{2+}) were removed from Pt catalyst by washing with AcOH. One washing restored the catalyst to its original activity in hydrogenation of cyclohexene, except in the case of Hg^{2+}, where 3 washings were required. Raney Ni catalyst, poisoned with thiophene or Cd^{2+} towards the hydrogenation of crotonic acid, were washed free of poison by 2 or 3 washings with water satd. with H_2. Ni was more difficult to wash free of poisons than Pt.

11441. MCCABE, CHARLES L. AND HALSEY, G.D. JR. **The hydrogenation of ethylene over copper. I. Reproducing the activity of the catalyst.** *J. Am. Chem. Soc.* 74, 2732-4(1952).—*C.A.* 46, 9397*a*.

H_2 chemisorbed near 120°C had a marked effect on the activity of a reduced Cu catalyst. Once this H_2 was adsorbed, activity was maintained by treating the catalyst with H_2 at 0°C. Three methods of placing varying amts. of chemisorbed H_2 on the surface were used, and the activity of the catalyst was reported as a function of the parameter governing the amt. of chemisorbed H_2.

11442. McKinley, Clyde. **Nickel catalysts in acetylene and carbon monoxide chemistry.** *Ind. Eng. Chem.* 44, 995-9(1952).—*C.A.* 46, 9747*h*.

In certain salts, such as $Ni(CN)_2$, Ni served uniquely in the polymerization of C_2H_2 to form cyclooctatetraene. Other Ni catalysts will effect the combination of 3 C_2H_2 mols. to form a C_6H_6 or substituted C_6H_6 structure. Examples mentioned were the formation of trimethylol- and hexamethylol-benzene, C_6H_6, and styrene. Ni served, not uniquely, but as do other strong hydrogenation catalysts, in the reduction of double and triple bonds. Bivalent Ni salts catalyzed the reaction of C_2H_2 and also of olefins with CO and various reactive H-compds.

11443. Miesserov, K.G. **Acidity of aluminosilicates and its relation with catalytic activity.** *Doklady Akad. Nauk S.S.S.R.* 87, 627-30(1952).—*C.A.* 47, 3675*b*.

The acidity of a synthetic aluminosilicate was varied by incorporation of known amts. of Na^+ ions through treatment with solns. of NaCl or AcONa. The catalytic activity of the various samples was detd. by the iodine no. and the paraffin content of the product disproportionation of cyclohexene. The catalytic activity fell linearly with increasing amt. of Na^+ ions absorbed by the catalyst. Pure Al_2O_3 had no exchangeable or hydrolytic acidity, and no catalytic activity. Pure SiO_2 had only a very slight exchangeable acidity, but SiO_2 activated with Al_2O_3 had a catalytic activity of 44.7%, with an exchangeable acidity of 9.6, and a hydrolytic acidity of 33.6.

11444. Mooi, John and Selwood, P.W. **Catalytic activity of supported manganese oxides for the hydrogen peroxide decomposition.** *J. Am. Chem. Soc.* 74, 1750-4(1952).—*C.A.* 46, 6916*c*.

The catalytic decompn. of H_2O_2 in dil. water soln. on various supported Mn oxides was studied. The activity of these catalysts as a function of the concn. of Mn on the support showed an increase with decreasing Mn concn., followed by a sudden decrease for very low Mn concns. The effects of oxidation state, pH, support phase modification, and temp. were studied also.

11445. Mooi, John and Selwood, P.W. **Structure and catalytic activity of supported manganese, copper, and iron oxides.** *J. Am. Chem. Soc.* 74, 2461-4(1952).—*C.A.* 46, 8489*b*.

The catalytic oxidation of CO by air over supported oxides of Mn, Fe, and Cu was studied. The sp activity increased with decreasing concn. of the supported oxide, except for samples of low concn., on which the activity decreased.

11446. Nenniger, Emile Jr. **Fluidone catalytic cracking process of petroleum oils.** *Chemistry & Industry* 1952, 320-8.—*C.A.* 46, 7750*e*.

Excess kerosine, light Diesel fuels, and heavy and visbreaker gas oils were brought into contact with a fine (40 μ) powder catalyst (87% silica and 13% alumina) at 1070 to 1100°F at the base of a reactor. The vaporized hydrocarbons and catalyst passed up the reactor at approx. 925°F and 9.2 p.s.i. The spent catalyst was drawn off near the bottom of the reactor and passed through a steam stripper which drove the entrained hydrocarbons back to the reactor.

11447. Niwa, Makoto and Yamaguchi, Mitsuo. **Sintering of catalysts. II. Relations between sintering and catalytic action of copper catalysts.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 73, 162-4 (1952).—*C.A.* 46, 10488*b*.

Dehydration of EtOH in vapor phase at 200°C was studied by the catalyst reduced at 100°-150°C by H_2 and sintered at 225°C. Catalytic activity after sintering of the catalyst contg. 0.08% Ni was greater than pure Cu. Though $NaNO_3$ prevented sintering, the activity of the catalyst contg. it was poor. The activity of the catalyst pptd. by NaOH was greater than that by $(NH_4)_2CO_3$.

11448. Oborin, V.I. **Mechanisms of catalytic cracking of hydrocarbons.** *Zhur. Fiz. Khim.* 26, 461-8(1952).—*C.A.* 47, 957*g*.

Cracking activity of a $MgO\text{-}SiO_2$ catalyst did not depend uniquely on its acidity. The following activities: 0.214, 0.501, 0.581, 0.856, 1.050, 0.738 correspond to the resp. acidities (mg equiv./g): 1.250, 1.460, 1.396, 1.396, 1.330, 1.330. The mechanism of cracking was discussed on the basis of American and especially Soviet data.

11449. Ohta, Nobuto. **Catalytic hydrolysis of chlorobenzene to phenol in the vapor phase. II. Relationship between the method of preparing the silica gel-cupric chloride catalyst and the catalytic activity. III. Effects of temperature, space velocity, and chlorobenzene-water ratio, and the use of ammonia water in place of plain water.** *Repts. Govt. Chem. Ind. Research Inst., Tokyo* 46, 327-32; 333-9(1952).—*C.A.* 47, 2129*f*.

Silica gel, when molded with 2% $CuCl_2$, became a very active catalyst for the hydrolysis. With the molded catalyst (silica gel 80, acid clay 20, and 2% $CuCl_2$) PhCl dild. with 3 times its vol. of H_2O was hydrolyzed to PhOH most at 450-600°C and a space velocity (cc./hr) 0.064-0.51. Addn. of NH_4OH prolonged the life of the catalyst, but near 500°C, at a low space velocity, the PhOH yield was higher with a higher partial pres. of NH_3, the effect being the reverse at a high space velocity.

11450. Ohta, Nobuto. **Catalytic hydrolysis of chlorobenzene to phenol in the vapor phase. V. Life and regeneration of silica-cupric chloride catalyst.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 47, 55-62 (1952).—*C.A.* 47, 3100*i*.

The catalytic activity of silica gel contg. 2-3% $CuCl_2$ used continuously at 525°C in the conversion of $PhCl\text{-}H_2O$ to PhOH and aerated every 10-20 hrs (to burn out carbon deposited) decreased rapidly in the initial 20-40 hrs to a low level. This remained unchanged for the next 100-250 hrs, when the residual $CuCl_2$ was down to about 0.5% (yield of PhOH 95-100 with the conversion rate

15% or below; 80-90 with the rate 20% or above; dropped for a while immediately after the regenerative aeration). Since the silica gel was extremely thermostable, the loss of the activity seemed solely due to the vaporization of $CuCl_2$.

11451. ÔKI, KÔSUKE. **Action of d-electrons of transition metals in catalysis.** *Kagaku* (Science) 22, 42-3(1952).—*C.A.* 46, 2408*i*.
Reactions for org. synthesis were classified by the no. of d-electrons of transition metals acting as catalysts in the reactions: (1) oxidation-reduction occurred when an electron was taken away from, or added to, a hole in d-orbitals in which there were 9 electrons when the atom was in an active state, (2) if d-orbitals could not be filled by electrons, the metal atom assumed an active state by forming a complex with a reactant, and (3) the reactant underwent the oxidation-reduction by its triplet state of π-electrons.

11452. PACK, F.C.; PLANCK, R.W., AND DOLLEAR, F.G. **Determination of the total unsaturation of tung oil by catalytic hydrogenation.** *J. Am. Oil Chemists' Soc.* 29, 227-8(1952).—*C.A.* 46, 7788*e*.
The weighed sample and Pt catalyst were suspended in HOAc during hydrogenation. Data on pure compds., some fatty acids, and many tung-oil samples were recorded.

11453. PANCHENKOV, G.M. AND KUZNETSOVA, E.P. **Kinetics of the catalytic cracking of gas oil.** *Doklady Akad. Nauk S.S.S.R.* 87, 65-8(1952).—*C.A.* 47, 4065*i*.
The amts. of gas, gasoline coke, and unreacted oil were detd. in flow runs with a paraffin gas oil at different feed rates on 2 aluminosilicate aerogel catalysts: Al_2O_3 5, SiO_2 95%, at 450°, 475°, and 490°C and Al_2O_3 30, SiO_2 70%, at 400°, 450°, and 490°C.

11454. PANCHENKOV, G.M. AND TRET'YAKOVA, V.S. **Catalytic cracking as a consecutive chemical reaction.** *Doklady Akad. Nauk S.S.S.R.* 87, 237-40(1952).—*C.A.* 47, 6640*g*.
The cracking of a gas oil A to gas (A_1), gasoline (A_3), and "coke" was assumed to proceed by steps, $A \rightarrow n_iA_i + n_2A_2 + n_3A_3 \rightarrow n_1A_1 + n_5A_2$, each step being a 1st-order reaction. In the case when all products, except the "coke", were adsorbed weakly, and the coke adsorbed strongly, solution of the differential rate equation was obtained. The conclusions were verified with data on cracking Al_2O_3 30-SiO_2 70%.

11455. PARRAVANO, G. **Ferroelectric transitions and heterogeneous catalysis.** *J. Chem. Phys.* 20, 342-3 (1952).—*C.A.* 46, 8944*h*.
The rate of oxidation of CO was detd. as a function of temp. on the surface of $NaNbO_3$, $KNbO_3$, and $LaFeO_3$. For $NaNbO_3$ the oxidation rate first decreased and then increased above the normal rate as the temp. was raised; for the other 2 compds. the increase preceded the decrease. Increase in the rate of heating of $KNbO_3$ shifted the anomaly to higher temps.

11456. PAUL, RAYMOND; BUISSON, PAUL, AND JOSEPH, NICOLE. **Catalytic activity of nickel borides.** *Ind. Eng. Chem.* 44, 1006-10 (1952).—*C.A.* 46, 9960*e*.
By reaction of $NaBH_4$ or KBH_4 with various Ni salts under various conditions of temp., pH, and solvents, voluminous black ppts. were produced which contained one atom of B to two atoms of Ni. Their catalytic activity was studied in comparison with that of Raney Ni in the hydrogenation of safrole, furfural, and benzonitrile. When prepd. from $(AcO)_2Ni$ or $NiCl_2$, these catalysts had an activity equal to or slightly inferior to that of Raney Ni. Their resistance to fatigue appeared particularly high.

11457. PAYNE, J.W.; EVANS, L.P.; BERGSTROM, E.V., AND BOWLES, V.O. **Thermofor catalytic reforming —an answer to demand for higher octane numbers.** *Oil Gas J.* 51, No. 28, 357, 360-2, 364-5, 367-8 (1952).—*C.A.* 47, 1369*h*.
The thermofor catalytic reforming process selectively reformed petroleum naphthas by using a synthetic chromia-alumina gel catalyst. Optimum pressures ranged between 100 and 200 p.s.i. As the gas-recycle ratio increased, the quantity of coke produced decreased and gasoline yield increased slightly, while H-content of the recycle gas remained fairly const. Reactor temps. ranged from 950° to 1000°F. Catalyst-to-naphtha ratio could be varied over a wide range with no marked effect on product yields and quality.

11458. PETERS, KURT AND KAPPELMACHER, ELISABETH. **Conversion of hydrocarbons to carbon monoxide-hydrogen mixtures.** *Brennstoff-Chem.* 33, 296-307 (1952).—*C.A.* 47, 290*h*.
Ni catalysts were prepd. and the reactions studied on a lab. scale with good agreement between theoretical and exptl. results. Catalytic splitting of CH_4 was more rapid with air or O_2 than with CO_2 and steam. Soot formation was reduced by lowering the partial pressure of the hydrocarbons by adding an excess of steam, diln. with inert gases, etc., or by the use of a catalyst of higher activity and selectivity.

11459. PLATE, A.F. AND TARASOVA, G.A. **Mechanism of contact reactions of hydrocarbons on a vanadium catalyst. VII. Comparative behaviors of binary mixtures of heptane, heptene, and toluene.** *Zhur. Obshcheĭ Khim.* 22, 765-71 (1952). —*C.A.* 47, 3096*h*.
C_7H_{16} + C_7H_{14} mixts. of different compns. (0, 5, 10, 50, 75, 90, and 100 mole % C_7H_{14}) were passed over the catalyst (V oxide on Al_2O_3, reduced in H_2) at a space velocity of 0.5 liter/liter catalyst X hr, at 480°C. The toluene content of the catalyzate increased linearly with the C_7H_{14} content of the reacting mixt. The amt. of newly produced toluene was proportional to the amt. of C_7H_{16} in the mixt., i.e., the yield of toluene with respect to C_7H_{16} was const. In a mixt. C_7H_{16} + C_7H_{14} each hydrocarbon was aromatized proportionally to its concn., but in mixts. with toluene the degree of aromatization of C_7H_{16} increased, but that of C_7H_{14} decreased with its concn.

11460. PURSLEY, JOHN A. **An investigation of the reaction between carbon monoxide and hydrogen on a nickel catalyst at pressures above one atmosphere.** *Univ. Microfilms* (Ann Arbor, Mich.), *Pub.* No. 3793, 154 pp. (microfilm $1.93, paper enlargements $15.40); *Dissertation Abstracts* 12, 463-4(1952).—*C.A.* 47, 1917*g*.

11461. PURSLEY, JOHN A.; WHITE, ROBERT R., AND SLIEPCEVICH, CEDOMIR. **The rate of formation of methane from carbon monoxide and hydrogen with a nickel catalyst at elevated pressures.** *Chem. Eng. Progress Symposium Ser.*, 48, No. 4, *Reaction Kinetics and Transfer Processes*, 51-8(1952). —*C.A.* 47, 1917*i*.

The effect of the partial pressures of the reactants on the initial rate of reaction $CO + 3H_2 \rightarrow CH_4 + H_2O$ was studied on a specific Ni catalyst at elevated pressures. The reactor was a 2-ft by 3/4-in. mild-steel pipe with a jacket contg. pressurized boiling fluids for temp. control. This was operated as a differential reaction system, and the initial reaction rates were derived from data obtained at low conversions over a range of temps., pressures, and gas concns.

11462. RADANČEVIĆ, M. **Synthesis-gas production by partial oxidation of methane.** *Nafta* (Yugoslavia) 3, No. 12, 5-11(1952).—*C.A.* 46, 11636*e*.

Catalysts were prepd. by impregnating silica gel of 2-mm size with $Ni(NO_3)_2.6H_2O$ solns., drying several hrs, calcining 1 hr at 500°C in an air stream, and reducing in pure H_2 30 min. at 500°C. Catalytic conversions were carried out in an elec.-tube reactor contg. 25.4-9.4 ml catalyst. The optimum amt. of Ni on the carrier was 3.2%, a further increase of Ni on the carrier giving no better yields of synthesis gas.

11463. RAPOPORT, I.B. AND LEVKOVICH, M.M. **Mechanism of the synthesis of hydrocarbons from carbon monoxide and hydrogen on iron catalysts.** *Doklady Akad. Nauk S.S.S.R.* 84, 725-7 (1952).—*C.A.* 46, 9828*a*.

$CO:H_2$ mixts. (1:1, 1:4, and 1:7) on a Fe-Cu catalyst were studied at 225°C, in a flow system. With the H_2 spent on hydrogenation of alkenes to alkanes subtracted, the ratios of $CO:H_2$ entering the reaction were, resp., 1:0.5, 1:0.8, 1:1. The Fe-Cu catalyst was intimately mixed with finely ground Ca_2C as adsorbent of H_2O. With fresh Ca_2C, CO_2 was entirely absent in the outgoing gas and the contraction was max. CO_2 was formed only as a result of the conversion reaction $H_2O + CO \rightarrow CO_2 + H_2$.

11464. REITLINGER, O. **Increasing the efficiency of catalysts for gas reactions.** *Chem. Ing.-Tech.* 24, 1-2(1952).—*C.A.* 46, 3681*c*.

The catalysts were prepd. by the deposition of powdered active catalytic materials on catalyst carrier by means of hydrated bonds. The prepn. of an Fe_2O_3 catalyst was described in detail.

11465. RIESZ, C.H.; DIRKSEN, H.A., AND PLETICKA, W.J. **Improvement of catalysts and catalyst supports.** *Petroleum Engr.* 24, No. 13, C17-20 (1952).—*C.A.* 47, 5096*b*.

Catalytic cracking initially developed for peak-load gas production has become an important base-load gas-production operation in the catalytic conversion of natural gas. A lab. and pilot-plant study of supports for Ni cracking catalysts revealed periclase (fused MgO) to be particularly effective; certain alumina prepns. and selected refractory compns. were also useful.

11466. ROHRER, C.S.; CHRISTENA, R.C., AND BROWN, O.W. **The catalytic activity of some reduced vanadate salts.** *J. Phys. Chem.* 56, 662-4(1952). —*C.A.* 46, 8945*f*.

The optimum operating conditions for the catalysts, Cu, $Ni_3(VO_4)_2$, $Cu_3(VO_4)_2$, $Pb_3(VO_4)_2$, and V_2O_5 were investigated for the reduction of nitronaphthalene to 1-naphthylamine. Ten g of each catalyst in turn was evenly distributed in a 10-in. bed in the cold furnace and then reduced with 14.5 liters H_2 per hr. Of the catalysts studied, Cu gave the highest yields of the amine. Reduced $Ni_3(VO_4)_2$ was too active for reduction to the amine, but gave appreciable amts. of the overreduction product, naphthalene.

11467. ROHRER, C.S.; KING, P.F., AND BROWN, O.W. **The catalytic activity of the reduced vanadates of nickel, copper, and lead.** *Proc. Indiana Acad. Sci.* 61, 135-9 (1952).—*C.A.* 47, 3096*d*.

The vapor-phase reduction of org. nitro compds. to their resp. amines with H_2 was studied. The catalysts were prepd. by the reduction of 15 g of each salt supported on enough asbestos fiber to give a 12-in. catalyst bed. Ni vanadate was reduced at 300°C for 1 hr, Cu vanadate at 340°C for 2 hrs and 4 min., and Pb vanadate at 360°C, 3 hrs and 15 min. The optimum conditions for the reduced catalysts were temps. from 325 to 385°C, H_2 flowing at a rate of 408% of theory, and $PhNO_2$ flowing at a rate of 5-9 g/hr, giving a yield of 100% $PbNH_2$.

11468. ROOLEY, J.; ROHRER, C.S., AND BROWN, O.W. **The catalytic activity of reduced nickel molybdate and reduced nickel chromate.** *J. Phys. Chem.* 56, 1082-4(1952).—*C.A.* 47, 4715*d*.

Reduced $NiMoO_4$ was an excellent catalyst for the vapor-phase reduction of $1\text{-}C_3H_7NO_2$ at 145°C at a feed rate of 10 ml/hr; yields were obtained of $C_3H_7NH_2$ as high as 94.8%. Reduced $NiCrO_4$ as catalyst gave yields of 70.6% $C_3H_7NH_2$. The activity of the latter catalyst was very sensitive to time and temp. of reduction in H_2. The reduced catalyst consisted partially of metallic Ni with the Mo or Cr present in some partially reduced state.

11469. RUBINSHTEIN, A. M.; KULIKOV, S.G., AND PRIBYTKOVA, N.A. **Deformation of the crystal lattice and the dehydrogenating properties of chromic oxide.** *Doklady Akad. Nauk S.S.S.R.* 85, 121-4(1952).—*C.A.* 46, 9399*b*.

The activity *A* of 11 catalysts was detd. with EtOH at 400° and 430°C, and was expressed in ml $H_2 + C_2H_4$ evolved per ml EtOH; the selectivity *S* was defined by $H_2/(H_2 + C_2H_4)$. There was no relation between *A* and the surface area. The main factor affecting the catalytic activity was the deformation of the lattice; greatest catalytic activity was with the least lattice compression.

11470. RUBINSHTEIN, A.M. AND PRIBYTKOVA, N.A. **Dehydrogenation on copper-chromia catalysts.** *Doklady Akad. Nauk S.S.S.R.* 85, 353-5 (1952).—*C.A.* 46, 9962*e*.

Known amts. of Cu were introduced by impregnating $Cr(OH)_3$ with a $Cu(NO_3)_2$ soln. and thermal decompn. to Cr_2O_3 and CuO. Catalysts prepd. by simultaneous pptn. of $Cr(OH)_3$ and $Cu(OH)_2$ gave results very close to those obtained with the impregnated catalysts. The increased activity with EtOH could be due to partial or total reduction of the CuO to Cu metal which was a more energetic dehydrogenation catalyst than Cr_2O_3.

11471. Saletan, David I. **Synthetic cation-exchange resin as an acid catalyst in continuous liquid-phase esterification.** *Univ. Microfilms* (Ann Arbor, Mich.), *Pub.* No. 3549, 134 pp. (microfilm $1.68, paper enlargements $13.40); *Dissertation Abstracts* (formerly *Microfilm Abstracts*) 12, 275-6(1952).—*C.A.* 46, 8944*c*.

11472. Salsas-Serra, Francisco. **The catalytic oxidation of sulfur dioxide. A study of the catalyst chamber.** *Chimie & industrie* 68, 695-9 (1952).—*C.A.* 47, 5776*f*.

Values of k_1 and k_2 in the integral of the expression $dx/dt = k_1(a - x)^2(b - x) - k_2x^2$ for the 3rd-order reaction $2\ SO_2 + O_2 \rightleftharpoons 2SO_3$, with a Pt catalyst were detd. in the range 420° — 620°C. At 535°C $k_1 \times 10^3$ was max. at 265°, falling to 95 at 620°C; $k_2 \times 10^3$ rose sharply from 0 at 450° to 98 at 610°C. The area under any isotherm between limits x_1 and x_2, detd. by graphic integration, was a function of the min. time required or of the min. amt. of catalyst needed.

11473. Sancelme, André. **The cathodic reduction in aqueous phase of solid insoluble inorganic compounds.** *J. chim. phys.* 49, No. 7-8, C117-22 (1952).—*C.A.* 47, 979*h*.

The yield was determined by comparison of the vol. of H_2 collected with that collected in a water coulometer. CuO in dil. H_2SO_4 was easily reduced, the yield decreasing with c.d. and increasing with H_2SO_4 concn. Under some conditions, Cu_2O was formed. PbO and PbO_2 were reduced in 100% yield in acid or basic media, regardless of temp., concn., or c.d. Ag_2O was completely reduced in dil. NaOH, as was $PbCl_2$ and AgCl in dil. HCl. The reduction of ZnO and Fe_2O_3 in dil. NaOH was incomplete. $PbSO_4$ was not reduced in dil. H_2SO_4, but was reduced in dil. HCl or NaOH, owing to the intermediate formation of $PbCl_2$ and PbO.

11474. Sato, Toshio. **Zinc-chromium oxide catalyst, especially its structural and activity changes with the chromium content.** *Repts. Govt. Chem. Ind. Research Inst., Tokyo* 46, 433-44(1952).—*C.A.* 47, 2909*e*.

The ZnO-Cr_2O_3(1:1 mol.) catalyst from baking $ZnCrO_3.NH_4OH$ pptd. from aq. $Zn(NO_3)_2$-H_2CrO_4 with NH_4OH (1:1:3 mols.) increased in activity, surface area, and porosity with higher Cr contents (max. activity at about 40% Cr). The catalyst pptd. from aq. $Zn(NO_3)_2$-$Cr(NO_3)_3$(1:2) atoms with NH_4OH and baked 10 hrs at-400°C was crystd. microscopically into a spinel structure. It was more active than ZnO or Cr_2O_3.

11475. Sauer, R.W. and Krieger, K.A. **Catalytic surfaces and the hydrolysis of diethyl carbonate.** *J. Am. Chem. Soc.* 74, 3116-20(1952).—*C.A.* 46, 10816*b*.

The heterogeneous catalysis of the hydrolysis of $(EtO)_2CO$ was studied as a method for the characterization of solid surfaces. With the unsupported catalysts, BeO, ZnO, PbO, and NiO, and catalysts NaCl, NaI, KCl, $CdSO_4$, PbO, and CdO, supported on carbon the reaction was substantially zero order with respect to H_2O vapor and was unaffected by changes in the partial pressures of EtOH and CO_2. Evidence of poisoning was found for NiO, CdO, and PbO catalysts. With Cr_2O_3 catalyst the reaction was nearly 1st-order with respect to water.

11476. Schultze, Gg. R. and Theile, H. **Oxidation of ethylene in the gas phase over silver catalysts.** *Erdöl u. Kohle* 5, 552-60 (1952).—*C.A.* 47, 291*a*.

Ethylene was oxidized to ethylene oxide and to H_2O and CO_2. Results indicated that the surface temp. of the catalyst was the detg. factor and not the temp. of the gas stream. The use of N_2O as source of O was inconclusive. The second attempt consisted of passing first O_2, then N_2, followed by N_2 and C_2H_4, and finally again by N_2. Results indicated that C_2H_4 did not react preferentially with adsorbed at. O but with another form of O.

11477. Selwood, P.W. and Lyon, Lorraine. **Supported oxides of manganese: influence of support modification.** *J. Am. Chem. Soc.* 74, 1051-3 (1952).—*C.A.* 46, 5944*d*.

The susceptibility-isotherm method was extended to a series of modified alumina supports; the supported oxides were those of Mn. The support-phase modification had a negligible effect on the oxidation state or dispersion of the supported Mn when the specific surface area was maintained large and no appreciable amts. of alkali were present. The presence of alkali in the support caused a large change in the susceptibility isotherm, reflecting substantial changes in oxidation state and degree of dispersion of the Mn.

11478. Shekhobalova, V.I.; Krylova, I.V., and Kobozev, N.I. **Active centers and mechanism of oxidation of sulfur dioxide.** *Zhur. Fiz. Khim.* 26, 703-18 (1952).—*C.A.* 47, 5233*c*.

The rates of catalytic oxidation of SO_2 on supported Pt and Pd catalysts were detd. in a flow system between 300° and 450°C. Supports were silica gel and 2 samples of alumina gel. In all cases, the active ensemble contained only one metallic atom. The following one-Pt-atom mechanism was given:

$$Pt + O_2 \rightarrow PtO_2 \xrightarrow{SO_2} PtO + SO_3;\ PtO + SO_2 \rightarrow Pt + SO_3.$$

11479. Shuĭkin, N.I. and Levitskiĭ, II. **Preparation of styrene by catalytic dehydrogenation of ethylcyclohexane fraction of Maikop gasoline.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1952, 498-504.—*C.A.* 46, 11656*b*.

Passage over Pt-carbon at 300°C and space velocity 0.3 gave a catalyzate with 47% aromatic compds. Azeotropic distn. with MeOH and washing of the fractions with H_2O gave purely aromatic ethylbenzene-xylene concentrate. This fraction was dehydrogenated over V-alumina catalyst best at 600°C, yielding a catalyzate with 22-3% styrene. The catalyzate from the Pt-carbon dehydrogenation at 300°C contained only 11-14% styrene.

11480. Shultz, J.F.; Seligman, B.; Shaw, L., and Anderson, R.B. **Fischer-Tropsch synthesis. Effect of nitriding on three types of iron**

catalysts. *Ind. Eng. Chem.* 44, 397-401(1952).—*C.A.* 46, 5291*f*.

The activities of a fused Fe catalyst at 100 p.s.i. contg. MgO, K_2O, SiO_2, and Cr_2O_3 as promoters, and another contg. Al_2O_3 and K_2O as promoters, were increased by a factor of more than 2 by converting the α-Fe to an ϵ-nitride. For the pptd. catalyst, the product distribution varied extensively with the initial pretreatment of the catalyst. The sample inducted with a H_2-CO mixt. yielded a high mol. wt product; the reduced sample yielded a lower mol. wt product. The nitrided catalysts yielded a mol. wt of still lower av. value than either the reduced sample or the one that had been inducted with a H_2-CO mixt.

11481. Širola, Josip and Plavšić, Nikola. **Catalytic properties of some domestic clays. Optimum conditions of acid activation.** *Nafta* (Yugoslavia) 4, 95-102(1952).—*C.A.* 47, 6126*g*.

Chem. analyses, base-exchange capacities, and x-ray diffraction patterns of clay samples of seven localities in Yugoslavia were given. Optimum conditions of acid activation of the montmorillonite clays were detd. Samples were activated by hot H_2SO_4 and the catalytic cracking activity was tested by cracking gas oil in a lab. cracking equipment.

11482. Sokol'skiĭ, D.V. **Active carriers in hydrogenation.** *Zhur. Obshcheĭ Khim.* 22, 1934-41 (1952).—*C.A.* 47, 3097*e*.

Hydrogenation of dimethylethynylcarbinol with H_2 was effected in soln. in 25 ml 96% alc. With Pt (0.001-0.002 g) on $BaSO_4$ (0.2 g) as catalyst, at 25° and 40°C, the rate of absorption of H_2 remained approx. const. until about 70-75% of the theoretical amt. was absorbed, and then rose sharply. The const.-rate portion corresponded to hydrogenation of the triple bond, and the sharp rise of the rate to complete exhaustion of triple bonds. With a Pd on $BaSO_4$ catalyst, the triple bond was hydrogenated more rapidly than the double bond. Os (20%) on $BaSO_4$, and Ru (20%) on $BaSO_4$ catalysts proved to be completely inactive for the hydrogenation, but they became active when promoted by Pt or Pd.

11483. Sokol'skiĭ, D.V.; Buvalkina, L.A., and Bukhman, A. **Kinetics of hydrogenation of cinnamic acid.** *Zhur. Obshcheĭ Khim.* (J. Gen. Chem.) 22, 558-63 (1952).—*C.A.* 46, 7415*g*.

Hydrogenation of cinnamic acid, over the catalyst prepd. from 50-50 alloy of Ni and Al (by alk. treatment) in 96% EtOH, was studied. The rate of agitation (rocking of the vessel) had no effect on the reaction rate. The 1st order rate was proportional to the amt. of catalyst used.

11484. Sokol'skiĭ, D.V. and Druz, V.A. **Potentiometric investigation of liquid-phase hydrogenation reactions on a skeletal nickel catalyst.** *Zhur. Fiz. Khim.* 26, 364-70 (1952).—*C.A.* 47, 4715*f*.

In the hydrogenation of $Me_2C(OH)C:CH$(0.344 g) in a 0.1 *N* aq. soln. of NaOH (80 ml), on a catalyst (prepd. by leaching 2 g of a Ni 50-Al 50% alloy with 20% alkali for 2 hrs) at 24°C, the rate of absorption of H_2 was const. (about 20 ml/min.) over the stage of the hydrogenation of the triple bond. The potential change of the catalyst, 120 mv., also remained const. A considerable amt. of H_2 remained on the surface during the reaction, despite the adsorptive competition of the unsatd. org. compd., and of desorption as a result of the hydrogenation. Hydrogenation on the same catalysts of Na maleate (0.725 g) and of Na fumarate (0.725 g) in 0.1 *N* NaOH proceeded at a const. rate, i.e. was zero-order over the course of the reaction, and the potential over that range remained approx. const.

11485. Sokol'skiĭ, D.V. and Popov, O.S. **Catalytic hydrogenation under constant pressure.** *Doklady Akad. Nauk S.S.S.R.* 83, 873-5(1952).—*C.A.* 46, 8490*c*.

The rate of hydrogenation of methylethylethynylcarbinol (0.5 ml) on a skeleton Ni catalyst (0.33) in an aq. 0.1 *N* NaOH soln. was investigated at 0°, 20°, 40°, and 50°C, under 2.0, 2.5, and 3.0 atm., at const. rate of agitation (500 oscillations/min.), Up to removal of 3/4 of the total H_2, the reaction was of the zeroth order, the rate of absorption of H_2 remaining independent of the total amt. of H_2 absorbed. At any temp., the e.m.f. (relative to the normal calomel electrode) was 0-20 mv. lower than the reversible H_2-potential and remained const. in the course of the hydrogenation, the change of pressure notwithstanding.

11486. Sourirajan, S. and Bhattacharyya, S.K. **Synthesis of acetic acid from methanol and carbon monoxide in the vapor phase in presence of cobalt catalysts at high pressures.** *J. Sci. Ind. Research* (India) 11B, 263(1952).—*C.A.* 47, 5093*g*.

Co iodide (84%) on silica gel was the most active catalyst tested for vapor-phase operation, but gave a lower yield of AcOH and a higher yield of gaseous decompn. products than a similar Ni iodide catalyst under the same conditions. The % conversion of MeOH was increased with increasing diln. to a max. value after which there was no effect. The temp. range was 150-250°C; pressure range, 80-400 atm.

11487. Stolyarov, E.A. and Todes, O.M. **Kinetics of hydrogenation of styrene and determination of adsorption from solutions.** *Zhur. Fiz. Khim.* 26, 80-7 (1952).—*C.A.* 47, 390*f*.

The rate of hydrogenation of the ethylenic double bond of styrene in soln. at 20°C was studied on a variety of catalysts: Pt black (B.E.T. surface 34.4 m^2/g), Pt black (63.4 m^2/g), Ni prepd. by decompn. of Ni formate in N_2 at 270°C (86 m^2/g; completely poisoned by air); Raney Ni (32.4 m^2/g). In all cases, the order was zero with respect to styrene concn. In the kinetic range, the rate was proportional to H_2 pressure. The quantity of styrene adsorbed on the catalyst from AcOH or benzene solns. was detd. by measuring the vol. of H_2 required to hydrogenate styrene preadsorbed on the catalyst.

11488. Swabb, L.E. Jr. and Hoelscher, H.E. **Kinetics of the catalytic vapor-phase addition of hydrogen chloride to propylene.** *Chem. Eng. Progress* 48, 564-9(1952).—*C.A.* 47, 393*h*.

A kinetic study was made of the vapor-phase addn. of HCl to propylene with Al_2O_3 as a catalyst; iso-PrCl was the only product formed at 80°C or less when this catalyst was used. The catalyst activity decreased with time. The reaction was not controlled by either the adsorption of HCl or the adsorption of propylene. The reaction was controlled by the desorption of iso-PrCl or by the surface reaction.

11489. Thompson, H.L.; Guillaumeron, Pierre, and Updegraff, Norman C. **Ammonia synthesis at 1000 atmospheres. The present-day Claude process.** *Chem. Eng. Progress* 48, 468-76(1952).—*C.A.* 46, 10558^{e}.

Certain aspects of the Claude system were compared with those of the 300-atm. NH_3-synthesis processes. The Claude process comprised final purification of synthesis gas by catalytic conversion of CO to methane (methanation) and conversion of the H_2 and N_2 to NH_3 in a circulatory synthesis system usually contg. 2 synthesis converters in series, with the necessary cooling, condensing, and sepg. equipment for NH_3 recovery, and a gas-circulating compressor.

11490. Thompson, Sydney O.; Turkevich, John, and Irsa, A.P. **Study of the Fischer-Tropsch reaction using deuterium gas.** *J. Phys. Chem.* 56, 243-50(1952).—*C.A.* 46, 7415^{b}.

The app. consisted of a gas-mixing chamber, a reactor contg. the cobalt-thoria-magnesia-kieselguhr catalyst, a series of cold traps at temps. down to the liquid-air b.p. and a circulating system for recycling including a pump and before and after ballast tanks. The reaction temps. were 192° and 227°C. The main product was CD_4 (90%) and 4-6% C_2, 4-6% C_3, and 0.3-0.5% C_4. The C_2 and C_3 fractions contained 20-30% unsatd. compds.

11491, Timofeeva, E.A.; Shuikin, N.I., and Kleimenova, V.M. **Desulfurizing action of Troshkov kaolin.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1952, 489-94.—*C.A.* 46, 11647^{g}.

The S content was dropped at 400°C to 0.031%. Artificial mixts. of purified gasoline with PrSH, diisoamyl sulfide, thiophene, and thiophane gave similar results. The catalyst (clay without acid pretreatment) was regenerated by air-blowing at 500°C for 3.3 hrs. After regeneration the desulfurizing action was greatly improved. The removal of thiophene or thiophane to the level of 0.03-0.04% usually required recycling over the catalyst.

11492. Tramm, Heinrich. **Technology of carbon monoxide hydrogenation.** *Brennstoff-Chem.* 33, 21-30 (1952).—*C.A.* 46, 3731^{b}.

The improvement was due to the modern high-capacity Fe catalyst as compared with the older Co catalyst. For max. gas utilization (96-97% conversion with low CH_4 formation) multiple-step conversion was required. The gas for synthesis purposes should have a low CO_2 and H_2O content, but N_2 was not as objectionable. CO_2 was chemisorbed on the catalyst, but N_2 was only physically adsorbed, and was readily displaced.

11493. Uchida, Hiroshi; Kurita, Minoru, and Ogawa, Kiyoshi. **Catalyst for the water-gas shift conversion. I. Macrostructure and catalytic activity of ferric oxides.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 46, 403-15 (1952).—*C.A.* 47, 2955^{e}.

By passing CO-H_2O (mole ratio 3) at 300-500°C with 10 liters/hr flow over the catalyst, the Fe_2O_3 was reduced to more active Fe_3O_4. The activity increased with the expanding apparent vol./g, enlarging micropores and diminishing surface area. The Fe_3O_4 thus reduced from the ordinary or α-Fe_2O_3 was less active than Fe_3O_4 reduced from γ-Fe_2O_3 obtained by oxidizing the 1st Fe_3O_4 in a current of air at 500°C.

11494. Uchida, Hiroshi; Kurita, Minoru, and Ogawa, Kiyoshi. **Catalyst for the water-gas shift conversion. II. Changes of the catalytic activity and macrostructure by the addition of chromium trioxide and potassium bichromate.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 47, 83-94 (1952).—*C.A.* 47, 2955^{f}.

The activity of the Fe_2O_3 catalyst increased with the increasing addn. of CrO_3 (pptd. as Cr_2O_3 on the microcryst. surface from various CrO_3 concns.). With similar addn. of $K_2Cr_2O_7$ the activity increased first and decreased later, while the macrostructure changed less. The decrease seemed due to the Cr_2O_3 covering up the surface on which it was easily transported by the diffusible K, and also adsorbing CO_2 formed.

11495. Ueno, Keihei and Yamaguchi, Yasuto. **The Catalytic action of synthetic ion exchangers. I. Aldol condensation catalyzed by anion exchangers.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 55, 234-5 (1952).—*C.A.* 47, 10767^{b}.

Strongly basic anion exchangers showed catalytic action in aldol condensation. The catalytic ability, as detd. by the yield of aldol, was in the order, cyanide > hydroxyl >> chloride. Acetate had no activity.

11496. Wagner, C.D.; Wilson, J.N.; Otvos, J.W., and Stevenson, D.P. **Hydrogen redistribution during olefin hydrogenation.** *J. Chem. Phys.* 20, 338-9, 1331 (1952).—*C.A.* 47, 2680^{f}.

Migrations of H atoms took place among hydrocarbon residues adsorbed on a Ni catalyst. The product of a reaction between an olefin and D contained several deuteriated paraffin species with more than 2 D atoms/mol; this occurred even under conditions such that no exchange took place between H and olefin or H and paraffin.

11497. Weber, George. **Greater heat recovery from catalytic flue gas.** *Oil Gas J.* 51, No. 23, 346-7, 349(1952).—*C.A.* 47, 852^{e}.

The flue gas (775°F) was led over the catalyst, a film of Pt alloy deposited on a bundle of porcelain rods, past heat-exchange tubes filled with molten salt and thence to a gas turbine. The process was tested on a Houdry catalytic cracking unit. Results indicated that a single such reactor receiving 20,000 ft^3 of flue gas per min. at 40 p.s.i., contg. 2% CO, produced 7.5 million B.t.u. per hr.

11498. Wideqvist, Sigvard. **Use of ion exchangers for the determination of the velocity of the alkali-catalyzed hydrolysis of amides.** *Arkiv Kemi* 4, 429-32 (1952)(in English).—*C.A.* 47, 1477^{b}.

Solns. of mixts. of the amide, NaOH, and their reaction products (NH_3 and the Na salt) were allowed to flow through an exchanger contg. Amberlite IR-120. The cations were exchanged for H ions. The acid liberated from the Na salt was titrated.

11499. Zaĭdenman, I.A. and Khomyakov, K.G. **The initial stages of the interaction of carbon monoxide and hydrogen with a cobalt catalyst at the temperature of gasoline synthesis.** *Doklady Akad. Nauk S.S.S.R.* 84, 705-7 (1952).—*C.A.* 46, 9398*c*.

The interaction between $1CO{:}2H_2$ mixt. and a catalyst $Co{:}ThO_2{:}Mg = 100{:}18{:}2$ (by wt) on a carrier, was studied by the kinetic- calorimetric method at 178-186°C. Interaction of CO with the freshly prepd. catalyst was accompanied by evolution of about 92 kcal/mole gas consumed. This effect was reproduced time and again after the catalyst had been regenerated by reduction with H_2. Interaction between the $1CO{:}2H_2$ mixt. and the Co catalyst in a flow system was accompanied by the evolution of 13.6 ± 0.3 kcal/mole gas consumed. Interaction between the pptd. and reduced Co catalyst and a $1CO{:}2H_2$ mixt. at 180°C began with reactions involving both gaseous reactants, and not only CO as with the Ni skeleton catalyst.

11500. Albareda Herrera, Jose M^{A}.; Aleixandre Ferrandis, Vicente, and Fernandez, Teofilo **Effect of the mineralogical composition of clays and the exchange cations on the catalytic oxidation of ethanol in the vapor phase. I.** *Anales edafol. y fisiol. vegetal* (Madrid) 12, 89-140(1953).—*C.A.* 47, 6748*e*.

The transformation of the alc. to the aldehyde was noticeably affected by temp. With bentonite the max. yield was reached at 375°C, whereas the yield in the case of kaolin increased up to 400°C. Below 375°C, no difference existed between the yields of aldehyde with the different clays.

11501. Argo, W.B. and Smith, J.M. **Activity of solid catalysts.** *Ind. Eng. Chem.* 45, 298-302 (1953).—*C.A.* 47, 4180*e*.

Exptl. rate data were given for two Pt catalysts in the oxidation of SO_2. Rates of the reaction, r_1 and r_0 for two sizes of catalysts, were correlated by the equation, $r_1 = r_0F_{10}(a_1\ a_0)$, where activity factor F was independent of temp., compn., and gas velocity.

11502. Atwood, Kenton and Arnold, M.R. **Activity of an iron oxide-chromium oxide water-gas shift catalyst.** *Ind. Eng. Chem.* 45, 424-6 (1953).—*C.A.* 47, 4523*a*.

No effective promoters for the Fe_2O_3-Cr_2O_3 water-gas shift catalyst were found among 33 elements considered. B and P reduced catalyst activity to a considerable extent. Because of these small effects, the method of prepn. was considered more important than minor changes in compn.

11503. Cain, D.G.; Weitkamp, A.W., and Bowman, Norman J. **Products of the hydrogenation of carbon monoxide over an iron catalyst. Oil-soluble oxygenated compounds.** *Ind. Eng. Chem.* 45, 359-62(1953).—*C.A.* 47, 4589*g*.

Oxygenated compds. in the oil stream produced by hydrogenation of CO over an Fe catalyst were higher homologs of those in the water stream. The main components were acids, alcs., and carbonyl compds. of the aliphatic series. At a given C no., the ratio of the molar quantities of each of the main components to the total molar quantity of oxygenated compds. and hydrocarbons was approx. const.

11504. Ciapetta, F.G. **Isomerization of saturated hydrocarbons: cycloalkanes.** *Ind. Eng. Chem.* 45, 159-62(1953).—*C.A.* 47, 4068*a*.

Isomerization of methylcyclopentane, cyclohexane, methylcyclohexane, and ethylcyclohexane over a Ni-SiO_2-Al_2O_3 catalyst showed that cycloalkanes contg. a quaternary C atom were the normal products. At higher temps. dehydrogenation to aromatics took place.

11505. Ciapetta, F.G. **Isomerization of saturated hydrocarbons: nature of the catalyst and mechanism of the reaction.** *Ind. Eng. Chem.* 45, 162-5(1953).—*C.A.* 47, 4067*i*.

The Ni-SiO_2-Al_2O_3 catalyst used for isomerization of satd. hydrocarbons was poisoned by alkali metals. The more rapid isomerization of 1-pentene and 1-hexene compared to *n*-pentane and *n*-hexane indicated that the rate-controlling step was the dissocn. of a C—H bond at the dehydrogenation active surfaces of the catalyst to form an alkene or potential alkene.

11506. Ciapetta, F.G. and Hunter, J.B. **Isomerization of saturated hydrocarbons in presence of hydrogenation-cracking catalysts. Normal hexane..** *Ind. Eng. Chem.* 45, 147-55(1953).—*C.A.* 47, 4067*f*.

With 4-6% of Ni deposited on a SiO_2-Al_2O_3 cracking catalyst, the reduced catalyst in the presence of H_2 selectively isomerized hexane to isohexanes. The activity of the catalyst resulted from compd. formation between Ni and hydrous Al silicate. H_2 was necessary for the reaction, but its function appeared to be to keep the catalyst surface free from hydrocarbon residues. Co and Pt catalysts also showed high isomerization selectivity, while Fe and Cu were poor. Mo oxide and W oxide deposited on SiO_2-Al_2O_3 also had high isomerization ability.

11507. Ciapetta, F.G. and Hunter, J.B. **Isomerization of saturated hydrocarbons: normal pentane, isohexanes, heptanes, and octanes.** *Ind. Eng. Chem.* 45, 155-9(1953).—*C.A.* 47, 4067*g*.

The isomerization of pentane, 2-methylpentane, 2,3- and 2,2-dimethylbutanes, heptane, 2,3- and 2,4-dimethylpentanes, 2,3,3,-trimethylbutane, octane, and 2,2,4-trimethylpentane over a Ni-SiO_2-Al_2O_3 catalyst showed the catalyst to be quite active and highly selective for the isomerization of all except 2,2,4-trimethylpentane.

11508. Clark, Alfred; Matuszak, M.P.; Carter, N.C., and Cromeans, J.S. **Isomerization of pentane—in presence of molybdena-alumina catalysts at low hydrogen-hydrocarbon ratios.** *Ind. Eng. Chem.* 45, 803-6(1953).—*C.A.* 47, 6127*a*.

The isomerization of pentane to isopentane in bench-scale hydroforming type equipment with molybdena-alumina catalysts gave ultimate yields of isopentane of 80-95% and yields per pass of 40-55%. Ratios from 0.3 to 0.8 gave efficient isomerization and minimized by-product formation. The adsorbed H functioned as part of the catalyst.

11509. Cohn, Ernst N. and Hofer, L.J.E. **Some thermal reactions of the higher iron carbides.** *J. Chem. Phys.* 21, 354-9(1953).—*C.A.* 47, 4234*f*.
Hägg carbide was approx. $Fe_{2.4}C$. The synthesis of cementite from metallic Fe and higher Fe carbide proceeded via Hägg carbide and only above about 320°C. Above that temp. decompn. of Hägg carbide into cementite and free carbon was sufficiently rapid to prevent completion of the synthesis. The deposition of carbon on Fe catalysts during the Fischer-Tropsch synthesis was not caused by thermal reactions of Fe carbides, unless hexagonal carbide should contain more carbon than Hägg carbide.

11510. Evering, B.L.; D'Ouville, E.L.; Lien, A.P., and Waugh, R.C. **Isomerization of pentanes and hexanes. Nature and control of side reactions.** *Ind. Eng. Chem.* 45, 582-9(1953).—*C.A.* 47, 5671*d*.
The inhibiting effect of H_2, aromatic hydrocarbons, naphthenes, and isobutane and their effect on catalyst life in disproportionation and cracking of pentanes and hexanes was studied. Hexanes need H_2 for successful isomerization. Olefins nullified the effect of inhibitors and accelerated the disproportionation and cracking reactions.

11511. Eyring, Henry and Wallenstein, Merrill. **Kinetic treatment of saturation and condensation statistics.** *Proc. Natl. Acad. Sci. U.S.* 39, 138-45 (1953).—*C.A.* 47, 7297*e*.
The final equation contained two sp. rate consts., the nos. of free and adsorbed atoms, mols., or other particles, the no. of available adsorption sites, the probability that a site will become satd., and the no. of particles required to sat. a site. The results were used to derive Bose-Einstein, Fermi-Dirac, and classical statistics, the Langmuir adsorption isotherm and multilayer condensation, the Richardson equation for the current leaving a metal surface, and satn. phenomena in homogeneous systems of enzymes.

11512. Grummitt, Oliver and Marsh, Dean. **Alternative methods for dehydrating castor oil.** *J. Am. Oil Chemists' Soc.* 30, 21-5(1953).—*C.A.* 47, 2506*e*, 5133*d*.
Dehydration of castor oil with oil-maleic anhydride adducts seemed advantageous over the conventional catalyst method because products of the former could be combined in a usual step for making paint or varnish products. Dehydration of the castor oil acids with Al_2O_3 catalyst showed 60% conjugation of the diene acids. Acidic ion-exchange resins had some catalytic effect, but the oil so made was inferior in color and film properties.

11513. Heinemann, Heinz; Mills, G.A.; Hattman, J.B., and Kirsch, F.W. **Houdriforming reactions: studies with pure hydrocarbons.** *Ind. Eng. Chem.* 45, 130-4(1953).—*C.A.* 47, 4067*a*.
Cyclohexane and methylcyclohexane were dehydrogenated to benzene and toluene in equil. yields at 800-950°F at 300 or 600 p.s.i. and a liquid space velocity of only 3 vols./vol./hr. Methylcyclopentane was dehydroisomerized to benzene in increasing yields with decreasing space rate and increasing contact time since thermal equil. favored methylcyclopentane. The isomerization of heptane to isoparaffins was favored by increasing temp. until hydrocracking predominated. If benzene was present, hydrocracking was inhibited and yields of isomers increased.

11514. Heinemann, Heinz; Shalit, Harold, and Briggs, W.S. **Houdriforming reactions studies with sulfur compounds.** *Ind. Eng. Chem.* 45, 800-2 (1953).—*C.A.* 47, 5671*e*.
S compds., such as those occurring in petroleum naphthas, were passed over the catalysts in the reforming range and the extents to which dehydrogenation and isomerization reactions occurred were observed. Complete conversion of S compds. occurred even though its dehydrogenation and isomerization functions were severely deactivated. Sulfides and mercaptans were found to be especially detrimental. Catalysts which had been employed for 2000 hrs in the Houdriforming of a low S naphtha suffered some deactivation during 4 hrs exposure to 0.5% S, but recovered when the S was removed from the feed.

11515. Johnson, Paul H. and Stark, Christopher P. **Testing powdered cracking catalysts.** *Ind. Eng. Chem.* 45, 849-55(1953).—*C.A.* 47, 5670*h*.
The confined fluidized bed as the lab. test method was described: a critically designed tapered reactor; a catalyst contg. particles 12% finer than 20 μ (new montmorillonite clay); and a min. vapor velocity of 55 cm per sec. Standard reference catalysts were used as a basis for comparison with test catalysts, and activity and selectivity were reported in terms of activity index and C and H factors.

11516. Langenbeck, Wolfgang and Giller, Arnold. **Mixed formate catalysts.** *Z. anorg. u. allgem. chem.* 272, 64-8(1953).—*C.A.* 47, 6069*h*.
Reduction of the mixed crystals of Ni-Mg formate by H_2 at 280°-350°C gave catalysts as good as Raney nickel for the hydrogenation of cyclohexene.

11517. Lihl, F. and Zemsch, P. **The catalytic activity of nickel and cobalt powders as a function of the hydrogenation temperature.** *Z. Elektrochem.* 57, 58-69 (1953).—*C.A.* 47, 6748*g*.
C_6H_6 to C_6H_{12} was hydrogenated over Ni or Co catalysts. The initial reaction was zero order, but later showed dependence on C_6H_6 and H_2. The highest temp. at which side reactions did not interfere was 160°C. The consts. of the Arrhenius equation were detd. for Ni catalysts prepd. from $Ni(HCOO)_2$, NiO, and $Ni(OH)_2$ for the initial reaction. With Co catalysts, prepd. from $Co(HCOO)_2$ and $Co(COO)_2$, the Arrhenius consts. for the initial reaction could not be detd. The difference between Ni and Co catalysts was ascribed to the fact that the former were one-phase, the latter 2-phase.

11518. Mills, G.A.; Heinemann, Heinz; Milliken, T.H., and Oblad, A.G. **Houdriforming reactions-catalytic mechanism.** *Ind. Eng. Chem.* 45, 134-7 (1953).—*C.A.* 47, 4067*d*.
The reactions of cyclohexane, cyclohexene, methylcyclopentane, and methylcyclopentene over an isomerization catalyst, a dehydrogenation catalyst, and a dual-function Houdriforming catalyst were studied at 950°F, 300 p.s.i., a liquid hourly space velocity of 3 vol. per vol. per hr, and a H to hydrocarbon mole ratio of 4 to 1. Cyclohexane was not changed by an isomerization catalyst, but

gave equil. yields of aromatics with the other two catalysts.

11519. PARRAVANO, G. **Catalytic oxidation of carbon monoxide on nickel oxide. I. Pure nickel oxide. II. Nickel oxide containing foreign ions.** *J. Am. Chem. Soc.* 75, 1448-51, 1452-4 (1953).—*C.A.* 47, 10979*b*.

The reaction between CO and O_2 was investigated on Ni oxide catalysts at various partial pressures of CO and O_2 up to 222°C. After an initial stage characterized by high rates and rapidly diminishing activity, the catalyst showed a min. const. value of activity. The activation energy was not affected in the range 100°-180°C by addn. of foreign ions to Ni oxide lattice.

11520. PODGURSKI, H.H. AND EMMETT, P.H. **The adsorption of hydrogen and carbon monoxide on iron surfaces.** *J. Phys. Chem.* 57, 159-64 (1953). —*C.A.* 47, 7303*i*.

The adsorption was evaluated from 10^{-2} to 700 mm between -195° and 200°C. For singly promoted Fe catalysts (2 to 10% Al_2O_3), the rapid adsorption of H_2 at -195°C was equiv. to adsorption as atoms on about 2/3 of the "free Fe surface." Type-B activated adsorption of H_2 on promoted Fe catalysts at and above 100°C was very pressure-sensitive, and, at a pressure of 10^{-2} mm, apparently became very small relative to type-A adsorption (chemisorbed at -78°C). The chemisorption of CO at -195° or -78°C covered only about 10% of the surface of very pure Fe wire or Fe powder from Fe carbonyl.

11521. RIENÄCKER, GÜNTHER AND BREMER, HEINRICH **Catalytic properties of copper and silver powders as affected by thermal pretreatment.** *Z. anorg. u. allgem. Chem.* 272, 126-46(1953).—*C.A.* 47, 5778*f*.

The decompn. of HCOOH vapor to H_2 + CO_2 by Cu or Ag was zero order at 140°-160°C. The activities of powders of these metals at 140°C varied with the temp. of pretreatment (150° up to 1050°C).

11522. SÁNCHEZ DELGADO, RAMÓN. **Nickel and copper catalysts in the hydrogenation of glycerides and fatty acids. I. Preparation, activity, and half life of catalysts made exclusively from one or both of these metals.** *Rev. cienc. apl.* (Madrid) 7, 39-50 (1953).—*C.A.* 47, 6577*h*.

Ni catalysts used for comparison were of German make prepd. by reduction of the formate. The influence of time and temp. of the reducing operation on final activity (measured by detg. residual I_2 nos. of the oil) were studied, also the ratios of Ni and Cu employed. The best effects were obtained with Ni:Cu ratios of approx. one, reduced from carbonates heated to a max. temp. of 180°C at the rate of 18°/min. Temp. and concn. of solns. from which the carbonates were pptd. had little effect on activity.

11523. SCHLEICHER, MARTIN E. **"Cat" catches fume for McDougall-Butler.** *Paint, Oil & Chem. Rev.* 116, No. 6, 13-14, 50, 52(1953).—*C.A.* 47, 5134*g*.

Fumes were heated to 500°F by a preheater and passed through a catalyst grid coated with Pt-type metals. Complete oxidation occurred and the heated products were conducted to the exhaust through the outer duct of the manifold, giving up heat to prevent condensation of vapors from the kettle. Catalyst life was estd. at 5000-15,000 hrs before regeneration.

11524. SHERWOOD, PETER W. **Autofining: a new solution of an old problem.** *Erdöl u. Kohle* 6, 73-4 (1953).—*C.A.* 47, 5671*c*.

In the desulfurization process developed jointly by the Anglo-Iranian Oil Co. and the Union Oil Co. S was hydrogenated over Co-Mo catalysts.

11525. SHUĬKIN, N.I.; MINACHEV, KH. M., AND FEOFANOVA, L.M. **Hydrogenating and dehydrogenating activity of nickel catalysts on different carriers.** *Izvest. Akad. Nauk S.S.S.R., Otdel, Khim. Nauk* 1953, 96-9.—*C.A.* 47, 6234*c*.

All catalysts were made by reduction of the Ni in a H_2 stream at 350-60°C. Catalytic activities were expressed by the degree of conversion, at 160-70°C on 50 ml catalyst, in the dehydrogenation of cyclohexane at the space velocity of 0.3 liter/liter catalyst/hr, and in the hydrogenation of C_6H_6 at the space velocity of 0.06. Ni on Cr_2O_3 or MgO had a lower activity, and Ni on Fe_2O_3 was unsuitable for dehydrogenation of cyclohexane.

11526. STEITZ, ALFRED JR. AND BARNES, DAVID K. **Products of the hydrogenation of carbon monoxide over an iron catalyst. Water-soluble oxygenated compounds.** *Ind. Eng. Chem.* 45, 353-8 (1953). —*C.A.* 47, 4589*f*.

Seven acids and 32 nonacid chem. compds. were identified in the water stream produced by hydrogenation of CO over an Fe catalyst. These compds. were principally straight-chain alcs., acids, aldehydes, and Ketones. Esters, cyclic ketones, and branched-chain alcs., aldehydes, and acids were present in minor proportions.

11527. STERLIGOV, O.D.; GOMIKBERG, M.G.; RUBINSHTEIN, A.M., AND KAZANSKIĬ, B.A. **Effect of pressing on the activity and structure of alumina-molybdena catalysts.** *Izvest Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1953, 28-36.—*C.A.* 47, 5781*e*.

The catalyst, Al_2O_3 80 + MoO_3 20 wt %, was reduced in a stream of H_2 3 hrs at 350°C and 2 hrs at 500°C, then powd. and pressed under 2000-20,000 atm. The catalytic activities were detd. in 4-hr flow expts. of dehydrogenation of C_7H_{16} and of cyclohexane, with 6 ml of catalyst, preliminarily stabilized by 2 hrs activation in H_2 at 500°C, 2 hrs dehydrogenation of C_7H_{16} at 489-91°C, followed by 30 min. regeneration with N_2 and 1 hr with air at 500°C, and repeated 1-2-hr reductions with H_2 at 500°C.

11528. TODES, O.M. AND ANDRIANOVA, T.I. **Oxidation of ethylene and of ethylene oxide on different catalysts.** *Doklady Akad. Nauk S.S.S.R.* 88, 515-18 (1953).—*C.A.* 47, 5782*c*.

On MgO-Cr_2O_3 (on asbestos), C_2H_4 was oxidized to CO_2 and H_2O, with only traces of aldehyde. Kinetic curves in flow expts. with different contact times, at 287°, 300°, and 350°C, with a mixt. of 2.6% C_2H_4 with air showed rates of consumption of C_2H_4 and of production of CO_2 decreasing with the progress of the reaction. Analogous results were found with C_2H_4 and with ethylene oxide on CuO-Cr_2O_3 on asbestos. The fact that ethylene oxide appeared in the oxidation of C_2H_4 on Ag, but did not on MgO-Cr_2O_3, was due simply to the more rapid oxidation of ethylene oxide, as compared with the velocity of oxidation of C_2H_4, on the MgO-Cr_2O_3 catalyst.

11529. TOPCHIEV, A.V.; ANDREEV, L.N., AND KRENTSEL, B.A. **Chlorination of normal butane in the presence of catalysts.** *Doklady Akad. Nauk S.S.S.R.* **88**, 285-7 (1953).—*C.A.* 47, 4716*f*.

A mixt. $C_4H_{10}:Cl_2 = 4.5:1$ (by vol.) was passed at a space velocity of ~ 300 over Al_2O_3 treated with N_2 2 hrs at 400°C and satd. with Cl_2 at 200°C. The product was 50% C_4H_9Cl and 50% $C_4H_8Cl_2$. On silica gel (treated with boiling concd. HNO_3, washed, and dried at 110°C) the product compn. the same as on Al_2O_3. Stainless steel (18-8) in the form of a spiral was a very active catalyst. An iron ore showed similar catalytic action, giving 100% utilization of Cl_2 even at room temp. The Fe catalysts underwent no corrosion in the process.

11530. TURNBULL, DAVID. **Theory of catalysis of nucleation by surface patches.** *Acta Met.* **1**, No. 1, 8-14(1953).—*C.A.* 47, 3674*i*.

A plausible distribution of units for crystal nucleation with respect to size, and a unit size of the order of the crit. size for growth of a nucleus into a supercooled liquid were assumed. The multiplicity in crystal nucleation frequency sometimes observed for the isothermal solidification of small droplets was accounted for with the use of no more than 2 fundamental frequencies.

11531. TYUTYUNNIKOV, B.N. AND FRAĬER, B. **Simplified method of characterization of catalyst activity.** *Masloboĭno Zhirovaya Prom.* **18**, No. 3, 10-11 (1953).—*C.A.* 47, 7241*f*.

The app. consisted of 2 gas burets, fixed vertically on a stand, and 2 equilibrating vessels that were vertically movable. The stationary vessels were connected with a 3-way stopcock and used to measure the H_2 consumed in hydrogenation of a test sample. Another method made use of a test-tube contg. the fat sample, the catalyst being initially contained in a side-arm of the test tube.

11532. WEITKAMP, A.W. AND FRYE, C.G. **Products of the hydrogenation of carbon monoxide over an iron catalyst. Relation of product composition to reaction mechanism.** *Ind. Eng. Chem.* 45, 363-7 (1953).—*C.A.* 47, 4589*i*.

The hydrocarbon synthesis process consisted of many competing and concurrent reactions. The chem. steps in the formation of primary product mols. were initiation, chain extension, and termination. The initiator of chain growth may be an adsorbed radical, possibly formed by hydrogenation of surface carbide. The adsorbed radical was enlarged by repeated addn. and hydrogenation of adsorbed CO mols. The termination reaction produced mainly alcs. or aldehydes and olefins. Competition between growth and termination was responsible for the exponential decrease in yields of successive C-no. fractions.

11533. WEITKAMP, A.W.; SEELIG, HERMAN S.; BOWMAN, NORMAN J., AND CADY, WILLIAM E. **Products of the hydrogenation of carbon monoxide over an iron catalyst. Aliphatic and alicyclic hydrocarbons.** *Ind. Eng. Chem.* 45, 343-9(1953). —*C.A.* 47, 4589*b*.

The hydrogenation of CO over an Fe catalyst formed hydrocarbons and oxygenated compds. of a broad mol. wt range. The hydrocarbons were analyzed by distn., chromatography, spectrometric methods, and other means. Relations among the structures and distributions of the open-chain and ring compds. reflected the mechanism of formation. Significant deviations from thermodynamic equil. indicated that competing reaction rates controlled product compn.

Chapter VI. GENERAL INFORMATION ON ADSORBENTS AND SPECIAL METHODS OF INVESTIGATION

VI-1. Reviews, Histories, and General Discussions

11534. Taylor, Hugh S. **Catalysis and catalytic agents in chemical processes.** *J. Frank Inst.* 194, 1-27 (1922).

11535. Dubosc, André. **Adsorption, absorption and diffusion of gases in contact with raw and vulcanized rubber and balloon fabrics.** *Caoutchouc & gutta-percha* 20, 12009-10 (1923).—*C.A.* 18, 1066.

11536. Armstrong, E.F. and Hilditch, T.P. **Catalysis at solid surfaces.** *Chemistry & Industry* 44, 701(1925).—*C.A.* 19, 3055.

The status of knowledge of catalysis at solid surfaces, with special reference to hydrogenation and dehydrogenation at the surface of metallic catalysts, was given.

11537. Daynes, H.A. **The permeability of rubber and methods of testing it.** *Trans. Inst. Rubber Industry* 3, 428-53 (1928).—*C.A.* 22, 3802.

The influence of various factors on permeation, diffusion and the time to reach equil., was discussed including the nature of the gas, the pressure, the thickness, the temp., the state of vulcanization, and the presence of compounding ingredients.

11538. Franklenburger, Walter. **Recent investigations in the field of heterogeneous catalysis.** *Z. angew. Chem.* 41, 523-31, 561-7 (1928).—*C.A.* 22, 4038.

The review covered homogeneous and heterogeneous catalysis, adsorption of gases and chemisorption and catalytic activity.

11540. Willstatter, R. **Our knowledge of catalysis.** *Z. Ver. deut. Ing.* 72, 901-5 (1928).—*C.A.* 22, 4332.

The history of catalysis was briefly discussed. Examples were the NH_3 synthesis, acid and basic catalysis in org. reactions, the use of mixed catalysts in the methanol and hydrocarbon synthesis, and enzymes in biological processes.

11541. Astrom, A. **Adsorption of aerosols.** *Svensk Kem. Tid.* 41, 190-203 (1929).—*C.A.* 24, 1780.

The literature on particle size of smokes and fogs and their adsorption by cotton and woolen filters was reviewed.

11542. Fritzman, E. **Palladium hydride and its catalytic properties.** *Zhur. Prikladnoi Khim.* 3, 455-500(1930).—*C.A.* 24, 5209.

The subject was reviewed in detail.

11543. Gehring, A. **Adsorption by soil and base exchange to fertility.** *Handbuch der Bodenlehre* 8, 183-317(1931).

The historical background of exchange and adsorption was reviewed. Sections were devoted to adsorption complexes and the kinetics and equil. involved.

11544. Wiegner, Georg. **Ion exchange and structure.** *Trans. 3rd. Intern. Congr. Soil Sci. Oxford,* 3, 5-28 (1935).—*C.A.* 32, 5550^8.

Theories and laws of ionic exchange were reviewed, with the conclusion that the configuration of the micelle was more important than the chem. compn. in respect to exchange properties.

11545. Schenck, Rudolph. **Is the contact question an equilibrium problem?** *Angew. Chem.* 49, 649-53(1936).—*C.A.* 30, 7986^5.

The science of catalysts involved to a large extent the application of heterogeneous equilibria and was closely related to the phys. and chem. aspects of alloy chemistry.

11546. Sihvonen, V. **The reaction mechanism in carbon oxidation.** *Svensk Kem. Tids.* 48, 185-202(1936).—*C.A.* 30, 7790^8.

11547. Adkins, Homer. **Hydrogenation: role of the catalyst.** *Ind. Eng. Chem.* 32, 1189-92 (1940).—*C.A.* 34, 7551^2.

A review, with several specific examples, was presented.

11548. Ipatieff, Vladimir N. **Mixed catalysts.** *Natl. Petroleum News* 32, No. 32, R-280-2; *Refiner Natural Gasoline Mfr.* 19, 250-5; *Science* 91, 605-8(1940).—*C.A.* 34, 6512^6.

Work on promoted Cu hydrogenation catalysts was reviewed which supported the interpretation of catalysis in terms of chem. reaction.

11549. Kostir, Josef. **Chromatographic adsorption methods and their application to analytical and preparative chemistry.** *Casopis Ceskoslov Lekarnictva* 20, 227-35, 246-57 (1940).—*C.A.* 38, 1701^4.

11550. Neurath, F. **Bleaching earth-natural and activated.** *Chem. Age* (London) 43 (1121) 287-88 (1940).

Fuller's earth for bleaching oils, fats, and waxes was discovered in England and dominated all markets until about 1800 when bleaching earths of equivalent qualities were found in the United States. In 1907 the Pfirsching Mineral Works placed an activated Bavarian earth on the market under the trade name Frankonit. Shortly afterward, the Moosburg Clay Works introduced another activated Bavarian earth under the name of Tonsil.

11551. Paul, R. **Raney nickel.** *Bull. soc. chim.* 7, 296-346 (1940).—*C.A.* 36, 4294^{8}.
The method of prepn. and catalytic activity of Ni prepd. by the Raney method was reviewed.

11552. Portillo, R. **Adsorption indicators in volumetric analysis.** *Anales real acad. farm.* (Madrid) 1, 22-39 (1940).—*C.A.* 37, 4321^{3}.
The theoretical principles involved in the titrations in the presence of adsorption indicators, based on the work of Fajans, Kolthoff and others were reviewed.

11553. Samesima, Z. and Sano, I. **Sorption of gases by promoted catalyst.** *J. Chem. Soc. Japan* 61, 799-802 (1940).—*C.A.* 34, 7711^{6}.

11554. Bertrand, Andre. **A technical review of the industrial recovery of vapors by adsorbent solids and in particular active carbon.** *Chemistry & Industry* 1941, 171-5.—*C.A.* 35, 3734^{1}.

11555. Fast, J.D. **Diffusion of gases through metals.** *Chem. Weekblad* 38, 2-8, 19-23 (1941). —*C.A.* 36, 5399^{3}.

11556. Fuchs, Hugo. **The development of the German "Ersatz" for carbon black.** *India Rubber World* 105, 147-9 (1941).—*C.A.* 37, 5223^{1}.
The history and development of the manuf. of carbon black in Germany and Czechoslovakia since 1922 were traced.

11557. Harkins, William D. **A general thermodynamic theory of the spreading of liquids to form duplex films and of liquids or solids to form multilayers.** *J. Chem. Phys.* 9, 552-68 (1941).—*C.A.* 35, 6172^{5}.
A comprehensive thermodynamic theory was developed for the spreading of any liquid or solid over the surface of any liquid.

11558. Krischer, Otto. **Theoretical principles of dehydrating hygroscopic substances.** *Vorratspflege u. Lebensmittelforsch.* 4, 117-25 (1941); *Chem. Zentr.* 1941, II, 3005.—*C.A.* 38, 4490^{9}.
The various means of binding water in hygroscopic substances such as absorption, adsorption and capillary condensation were explained. The laws governing the movement of capillary water and vapor diffusion were given.

11559. Lindsay, F.K. **Ion exchangers.** *Trans. Am. Inst. Chem. Engrs.* 37, 547-57 (1941).—*C.A.* 35, 7600^{5}.

11560. Matagrin, Am. **Colloidal clays and the decolorization of printed papers.** *Rev. chim. ind.* (Paris) 50, 22-46(1941); *Chem. Zentr.* 1942, II, 1867.—*C.A.* 38, 2204^{8}.
A historical review was given of the de-inking of paper, dealing with phys. and chem. methods used. Substances used in the decolorization of paper were kaolin, Fuller's earth, natural bentonites and activated clays.

11561. Myers, F.J. **Synthetic-resin exchangers and their application.** *Proc. Ann. Water Conf., Eng. Soc. Western Penna.* 2, 133-43(1941).—*C.A.* 38, 6425^{1}.

11562. Schröer, E. and Schumacher, H.J. **Observations upon catalysis.** *Naturwissenschaften* 29, 411-16(1941).—*C.A.* 38, 1941^{2}.
The original conception of catalysis according to Berzelius was contrasted with the kinetic concept of Ostwald. An unequivocal definition, which would be generally acceptable, has not yet been devised.

11563. Trapeznikov, A.A. **Methods of measurement of surface viscosity. Viscosity of unimolecular and adsorption layers in solutions.** *Akad. Nauk. S.S.S.R., Otdel. Tekh. Nauk, Inst. Mashinóvedeniya, Sóveshchanie Vyazkosti Zhidkosteĭ i Kolloid Rastvoróv* (Conf. on Viscosity of Liquids and Colloidal Solns.) 1, 67-86, 87-115 (1941).—*C.A.* 41, 1518e.
Methods, theories, and results were critically reviewed.

11564. Waeser, B. **Materials resistant to hydrochloric acid.** *Chem.-Ztg.* 65, 253-5 (1941).—*C.A.* 37, 479^{8}.
The resistance of metals, carbons, ceramic ware, quartz, rubber, synthetic resins, and wood to the action of dry and moist HCl, and aqueous HCl of various strengths was discussed.

11565. Walton, Harold Frederic. **Ion exchange between solids and solutions.** *J. Franklin Inst.* 232, 305-37(1941).—*C.A.* 36, 19^{1}.

11566. Aten, A.H.W. Jr. **Gas adsorption.** *Chem. Weekblad* 39, 562-3(1942); *Chem. Zentr.* 1943, I, 376.—*C.A.* 38, 2867^{7}.
Sorption on solids was reviewed.

11567. Charlot, G. **Adsorption reagents and indicators.** *Ann. chim. anal.* 24, 198-200(1942).—*C.A.* 38, 2897^{9}.

11568. Devaux, Pierre. **The unimolecular layers and the investigations of Prof. Henri Devaux.** *Peintures, pigments, vernis* 17, 726-32, 769-72 (1942).—*C.A.* 40, 6316^{9}.

11569. Herrmann, Fr. E. **Bauxite and other aluminum ores (one hundred years of bauxite).** *Wehrtechn. Monatsh.* 46, 40-2 (1942).—*C.A.* 37, 3529^{6}.

11570. Hofmann, Ulrich. **Recent developments in the chemistry of clay.** *Die Chemie* 55, 283-9 (1942).—*C.A.* 37, 4991^{3}; 38, 2290^{9}.
The kaolinite group, micaceous clays, the montmorillonite group, Mg silicate gels of two-dimensional orientation, electron-microscope examns. on clays, the inner-cryst. swelling of montmorillonite, and suspension vols. of bentonites were reviewed.

11571. Martí, Fernando Burriel. **Adsorption indicators in volumetric analysis by precipitation.** *Afinidad* 19, 389-96(1942); 20, 49-59 (1943).—*C.A.* 39, 1817^{1}.

11572. Menafra, Maria Mercedes R.R. de. **Theory of adsorption indicators.** *Anales asoc. quim. farm. Uruguay* 45, 28-35 (1942); *Ph* 1942, No. 3, 21-5.—*C.A.* 37, 1667^{6}.

11573. MYERS, ROBERT J. **Synthetic-resin ion exchanges.** *Advances in Colloid Sci.* 1, 317-51 (1942).—*C.A.* 36, 3414^{3}.

11574. OLLILA, OLLI. **Activated carbon.** *Suomen Kemistilehti* 15A, 81-6(1942).—*C.A.* 40, 4498^{5}.

11575. STOURDZE, YVONNE F. **Decolorizing earths and their activation.** *Rév. brasil. quim.* (Sao Paulo) 14, 109-16 (1942).—*C.A.* 37, 733^{9}.

11576. SULLIVAN, R.R. AND HERTEL, K.L. **The permeability method for determining specific surface of fibers and powders.** *Advances in Colloid Sci.* 1, 37-80 (1942).—*C.A.* 36, 3414^{2}.

11577. TAKEI, FUMIO AND KAWAMURA, SHIN'ICHIRO. **Properties of colloidal clay, bentonite.** *J. Agr. Chem. Soc. Japan* 18A, 113-22(1942).—*C.A.* 44, 9650*h*.

11578. WISLICENUS, H. **Alumina "wool" and its use as adsorbent for adsorbimetry and chromatoscopy.** *Kolloid-Z.* 100, 66-82 (1942).—*C.A.* 37, 4950^{3}.

The prepn., structure and physicochem. properties of this material and analytical technique for its use were described.

11579. ABBOTT, HAROLD E. **Catalysis and the chemical industry.** *Field & Lab.* 11, 1-9 (1943).—*C.A.* 38, 179^{7}.

Recent applications of catalysis were discussed.

11580. ANDERSON, J.S. **The imperfect crystal.** *J. Proc. Roy. Soc. N.S. Wales* 76, 345-58 (1943).—*C.A.* 38, 904^{3}.

A lecture on lattice defects in heteropolar binary compds., involving lattice disorder only and those giving rise to nonstoichiometric crystals was reported.

11581. BACCAREDDA, MARIO. **The phenomena of poisoning in heterogeneous catalysis.** *Chimica e industria* (Milan) 25, 103-13 (1943).—*C.A.* 43, 6498*b*.

11582. BANGHAM, D.H. **Physical chemistry of coal and carbonaceous materials.** *Ann. Reports Progress of Chem.* 40, 29-43 (1943).

The detn. of surface area by the B.E.T. method, heats of wetting detns., and the Harkins and Jura method were critically reviewed.

11583. BORESKOV, G.K. AND SLIN'KO, M.G. **The basis for calculation of catalyst apparatus for reversible exothermic processes.** *J. Applied Chem.* (U.S.S.R.) 16, No. 9/10 377-96(1943)(English summary).—*C.A.* 38, 6135^{6}.

For calcn. of optimum temp. it was sufficient to know the apparent activation energy of the forward reaction. Graphical and analytical methods of detn. of optimum temp. were presented.

11584. BRICHER, LOUIS J. **Wetting and spreading. Laboratory experiment.** *J. Chem. Education* 20, 428-30(1943).—*C.A.* 37, 6517^{6}.

Surface tension of solns. contg. varying mol. ratios of NaOH and lauric acid were detd. and also the interfacial tensions of each of these solns. against a drop of paraffin oil.

11585. CARRINGTON, J.H. **Carbon black and synthetic rubbers.** *Rubber Age* (London) 24, 104, 107 (1943).—*C.A.* 37, 6493^{2}.

11586. COPLEY, G.N. **Adsorption in chemical analysis.** *Ind. Chemist* 19, 142-8, 169 (1943).—*C.A.* 37, 3005^{9}.

11587. CRANE, E.J. **Nomenclature, spelling and pronunciation committee (adsorbate and adsorption complex).** *Chem. Eng. News* 21, 673 (1943).—*C.A.* 37, 3645^{3}.

The A.C.S. Nomenclature, Spelling and Pronunciation Committee definitions were offered for "adsorbate" and "adsorption complex."

11588. DAVIDSON, R.C.; EWING, F.J., AND SHUTE, R.S. **Catalysts of the activated montmorillonite type.** *Natl. Petroleum News* 35, No. 27, R 318-21 (1943).—*C.A.* 37, 5227^{8}.

Natural catalysts and their application to petroleum cracking were discussed. The theories of catalytic mechanisms as applied to activity were reviewed, as well as possible applications in heterogeneous catalysis.

11589. D'OR, L. **Catalysis.** *Rev. universelle mines* 19, 109-11 (1943).—*C.A.* 38, 5718^{9}.

The joint action of active adsorption (in contrast to the van der Waals adsorption) and heterogeneous catalysis of chem. reactions was reviewed. The bromination of ethylene in glass vessels with pure and coated inner surface, resp. was discussed.

11590. DÖRING, R. **Hysteresis.** *Forschung Gebiete Ingenieurw.* 14B, No. 6, 148-58(1943).—*C.A.* 40, 1378^{4}.

Mech., thermal (allotropy), and phys.-chem. (water absorption by coal and cement, swelling of gels, and sol-gel transformations) hysteresis were discussed.

11591. GROSSE, ARISTID V. **Concept of catalytic chemistry.** *Ind. Eng. Chem.* 35, 762-7 (1943).—*C.A.* 37, 4294^{4}.

11592. GUEDRAS, MARCEL. **The colloidal clays-bentonites.** *Rev. ind. minérale* 23, 241-54(1943).—*C.A.* 44, 5767*i*.

11593. HARKINS, WILLIAM D. **Intermolecular forces and two-dimensional systems.** *Pub. Am. Assoc. Advancement Sci.* No. 21, 40-87(1943).—*C.A.* 38, 3888^{7}.

A review of Harkins' work in the field of surface chemistry.

11594. HOPU, ALEXANDRINA. **Adsorption phenomena.** *Rev. Stiintifica "V. Adamachi"* 29, 194-6 (1943).—*C.A.* 38, 4175^{3}.

11595. HOUGEN, O.A. AND WATSON, K.M. **Solid catalysts and reaction rates - general principles.** *Ind. Eng. Chem.* 35, 529-41 (1943).—*C.A.* 37, 4294^{5}.

The effect of solid catalysts on the reaction rates of liquid-or gas-phase chem. reactions was discussed. Equations were derived for the effects of adsorption, catalyst activity, particle size, porosity, flow conditions, poisons and diluents as well as pressure, temp. and concn.

11596. KAINER, FRANZ. **Recent processes for the preparation of surface-active contact catalysts and carriers.** *Kolloid-Z.* 102, 106-12, 210-16, 315-20 (1943).—*C.A.* 38, 839^8.
A review of patents was presented.

11597. KAINER, FRANZ. **Preparation and use of technical adsorbents.** *Kolloid-Z.* 103, 84-8, 252-5; 104, 129-36 (1943).—*C.A.* 38, 1612^9.
A review of patents was presented.

11598. KOLTHOFF, I.M. **Aging of crystalline precipitates.** *Suomen Kemistilehti* 16A, 89-96 (1943) (in English).—*C.A.* 40, 4582^8.

11599. MYERS, F.J. **Ion-exchange resins-new tools for the process industries.** *Ind. Eng. Chem.* 35, 858-63 (1943).—*C.A.* 37, 5514^5.

11600. NUTTING, P.G. **Adsorbent clays, their distribution, properties, productions and use.** *U.S. Geol. Survey, Bull,* 928-C, 127-221(1943).—*C.A.* 38, 1329^5.
The adsorbent clays had a SiO_2-Al_2O_3 ratio of 1:2 to 1:8, but the chem. compn. had no apparent relation to activity or activatability. Base-exchange properties were pronounced. Activatable bentonites attained max. bleaching efficiency on removal of about half their bases on leaching in strong acid. Time of storage affected the bleaching efficiency of some clays. Water was assocd. with adsorbent clays in at least 4 different ways.

11601. RAO, K.S. **Investigations on the phenomenon of hysteresis in sorption.** *J. Mysore Univ.*, Sect. B, 4, 1-15 (1943)(Contrib. 8 in Chem.).—*C.A.* 37, 5298^9.

11602. RUBINSHSTEIN, A.M. **The uses of palladium and platinum as catalysts.** *Ann. secteur platine, Inst. chim. gen.* (U.S.S.R.) No. 19, 61-102 (1943).—*C.A.* 38, 1941^9.

11603. SANTOS, MARIA SERPA DOS. **Chromatographic analysis.** *Notícias farm.* (Portugal) 10, 242-61 (1943-4).—*C.A.* 39, 236^7.

11604. TISELIUS, ARNE. **Studies on adsorption analysis. I.** *Kolloid-Z,* 105, 101-9(1943).—*C.A.* 38, 2895^6.
A summarization of previous work was given together with some improvements in the technique.

11605. TISELIUS, ARNE. **Displacement development in adsorption analysis.** *Arkiv. Kemi, Mineral. Geol.* 16A, No. 18, 11 pp. (1943) (in English). —*C.A.* 38, 2895^7.

11606. TRUSTY, A.W. **Catalysts have important role in war industry.** *World Petroleum, Thirteenth Ann. Refinery Issue* 1943, 74-5, 78.—*C.A.* 38, 179^7.

11607. WIELAND, THEODOR. **Recent methods in preparative organic chemistry. II. Chromatographic methods for the separation of amino acids.** *Die Chemie* 56, 213-15 (1943).—*C.A.* 38, 334^9.
A procedure was outlined for the analysis of the products of hydrolysis of proteins.

11608. ZDICHYNEC, TOMÁŠ. **The evaluation of catalysts.** *Chem. Listy* 37, 257-8(1943).—*C.A.* 44, 5497*i*.
The following terms were defined and correlated: Selectivity (yield), effectiveness (conversion), efficiency (capacity), resistance (duration), and cost of a catalyst.

11609. ACKERMANN, ARTHUR. **Fields of application of adsorbents in industry.** *Chimie & industrie* 52, 44-51(1944).—*C.A.* 40, 2595^4.
An address was given enumerating the different classes of adsorbents, the chief methods of production, and industrial uses in gaseous mediums and in liquid mediums.

11610. BALLESTEROS, RAFAEL BLASCO AND MARTÍNEZ, MANUEL CABANZÓN. **Active carbon and its importance in industry.** *Ion* 4, 234-41(1944).—*C.A.* 38, 4778^3.

11611. BALLESTEROS, RAFAEL BLASCO AND MARTÍNEZ, MANUEL CABAZÓN. **The processes of adsorption in active carbons.** *Ion* 4, 526-30(1944).—*C.A.* 39, 2021^3.
A review was presented showing the great irregularity in the behavior of various activated carbons depending both on the prepn. of the carbons and the character of the material decolorized or adsorbed.

11612. BRDIČKA, RUDOLF. **Polarographic evaluation of adsorption.** *Chem. Listy* 38, 252-9(1944).—*C.A.* 44, 5676*d*.

11613. CLARKE, BEVERLY L. **Some applications of selective adsorption and differential diffusion in chemical analysis.** *Colloid Chem.* 5, 457-71 (1944).—*C.A.* 38, 2862^9.
A discussion was presented of adsorption and diffusion, capillary effects, chromatographic analysis (theory, technique, adsorbents, solvents, eluants), electrophoresis and the moving boundary method.

11614. FARMER, F.R. **Dryers—heat and mechanical.** *Manufg. Chemist* 15, 7-11(1944).—*C.A.* 39, 4535^3.
A brief review was given of available drying methods and app. for (a) liquids, (b) pastes, filter-press cakes, etc., and (c) crystals and powders, and the relative merits of steam, gas, electricity, direct firing, and hot flue gas were discussed.

11615. FRANCE, WESLEY G. **Adsorption and crystal habit modification.** *Colloid Chem.* 5, 443-57 (1944).—*C.A.* 38, 2862^9.
Results of late expts. were given with consideration of mol. structure effects based on modern concepts.

11616. GALLIE, JOHN F. **Carbon black.** *Petroleum Refiner* 23, 93-104(1944).—*C.A.* 38, 2809^4.
The manuf., properties, and uses of carbon black were discussed.

11617. GIL QUINZÁ, P. SALVADOR. **Chromatographic adsorption and its use in chemistry.** *Afinidad* 21, 289-301 (1944).—*C.A.* 41, 4021*d*.
The history, theory, and practical applications of selective chromatographic adsorption in org. and inorg. chemistry were discussed.

11618. HARKINS, WILLIAM D. **The surfaces of solids and liquids and the films that form upon them.** *Colloid Chem.*, 5, 12-102(1944).—*C.A.* 38, 2861^3.

11619. Harwood, J. and Davies, W. Cule. **Activated alumina. Its properties and industrial applications.** *Chem. Age* (London) 50, 223-8(1944).—*C.A.* 38, 2457^{4}.

11620. King, H.L. Jr.; Laughlin, C.D., and Gwyn, H.M. Jr. **Bauxite as an adsorbent, catalyst and catalyst carrier.** *Oil Gas J.* 42, No. 49, 236, 239, 241, 244, No. 50, 71-74 (1944).—*C.A.* 38, 4416^{7}.
The prepn. and use of bauxite were discussed for decolorization, carrier for isomerization catalyst as well as catalyst uses for desulfurization, cracking and reforming.

11621. Mathieu, Marcel. **Structure of catalytically active solid phases.** *Mém. services chim. état (Paris)* 31, 316-20(1944).—*C.A.* 40, 5986^{1}.
Catalysts forming a definite compd., surface catalysts, and catalysts in 3 dimensions were reviewed.

11622. Rienäcker, Günther. **Heterogeneous catalysis and atomic structure.** *Die Chemie* 57, 84-90 (1944).—*C.A.* 40, 4593^{5}.

11623. Thau, A. **The removal of sulfur from industrial gases.** *Oel u. Kohle* 40, 208-20 (1944).—*C.A.* 38, 6428^{6}.

11624. Travers, A. **"Physical" adsorption and chemical adsorption.** *Chimie & industrie* 52, 35-43 (1944).—*C.A.* 40, 2371^{4}.
Phys. adsorption brought into action orienting forces due to permanent or induced dipoles. Chem. adsorption corresponded to binding forces of the covalence type, and consequently involved much greater energies.

11625. Wiegand, W.B. **Recent developments in colloidal carbons.** *Can. Chem. Process Inds.* 28, 151-62(1944).—*C.A.* 38, 2797^{2}.

11626. Zimens, K.E. **Porous materials—characterization, preparation, and properties.** *Trans. Chalmers Univ. Technol., Gothenburg, Sweden* No. 40, 5-178(1944).—*C.A.* 40, 2372^{9}.
The measurement of pore volumes, surface areas, diffusion through capillaries, and the relation to catalytic activity were reviewed.

11627. Adam, N.K. **Surface chemistry.** *Nature* 156, 284 (1945).
Recent progress in the U.S.S.R. was reviewed. Included were promoting effect of small amts. of adsorbed metals on gases (S.Z.Roginsky), and the effect of adsorbed films on hardness (P.A. Rehbinder).

11628. Aleixandre, V. **The preparation and uses of kieselguhr.** *Ion* 5, 445-50, 466; 526-31 (1945).—*C.A.* 39, 5418^{8}; 40, 1638^{6}.

11629. Beeck, Otto. **Catalysis—a challenge to the physicist.** *Rev. Modern Phys.* 17, 61-71 (1945).—*C.A.* 40, 4593^{2}.

11630. Bishop, John A. **Chromatographic adsorption in undergraduate qualitative analysis.** *J. Chem. Education* 22, 524-5(1945).—*C.A.* 40, 509^{6}.

11631. Cohan, Leonard H. **Carbon black in war and peace. A review of recent developments in the carbon black industry.** *Chem. Eng. News* 23, 2078-85, 2145(1945).—*C.A.* 40, 697^{1}.

11632. Hamoir, G. **The use of inorganic precipitates in aqueous chromatography.** *Bull. soc. roy. sci. Liège* 14, 451-9(1945).—*C.A.* 42, 6603*d*.

11633. Harkins, William D. **Surfaces of solids in science and industry.** *Science* 102, 263-8, 292-5 (1945).—*C.A.* 39, 5139^{7}.
The topics included surface energy, the area of a finely divided solid, the area occupied by mols., the surfaces of liquids, polar and nonpolar solids and mol. attraction, the distance to which the attractive energy of a solid extends into a liquid or a film, and phases and phase changes in adsorbed films on solids.

11634. Harvey, Edmund N., Jr. **Survey of sorption chemistry.** *Interchem. Rev.* 4, 95-110(1945).—*C.A.* 40, 3322^{5}.

11635. Hauser, Ernst A. **Colloid chemistry of clays.** *Chem. Rev.* 37, 287-321(1945).—*C.A.* 40, 787^{2}.

11636. Howat, D.D. **Clays.** *Mine & Quarry Eng.* 10, 55-61(1945).—*C.A.* 39, 2183^{2}.
Investigations discussed were with emphasis on clay lattice structure, ion-exchange reactions, base-exchange capacity, water of osmotic imbibition, nature and properties of naturally occurring clay, and factors in deflocculation.

11637. Ljunggren, G. **Some phenomena of adsorption and catalysis with porous materials.** *Finska Kemistsamfundets Medd.* 54, No. 1/2, 12-26 (1945).—*C.A.* 41, 3684*f*.
Cu-Mn impregnated charcoal appeared promising for protection against HCN, converting it in moist air into NH_3 and CO_2. Carene from pine turpentine was dehydrogenated with Ni to cymene, which could then be split to toluene and propylene by an Al_2O_3.SiO_2 catalyst.

11638. Lott, F.S. **Carbon black. Current and postwar outlook.** *Chem. Eng. News* 23, 1338(1945).—*C.A.* 40, 2343^{3}.

11639. Maxwell, Donald H. **Historic filter plant adapted for softening equipment.** *Water Works Eng.* 98, 1024-27, 1070, 1072, 1074, 1076 (1945)
Steps taken to adapt the existing plant to the water softening process were outlined.

11640. Ribeiro, Guimarães Luiz. **Chromatographic adsorption and its importance in organic chemistry.** *Rev. Quím. ind.* (Rio de Janeiro) 14, No. 160, 18-20(298-300) (1945).—*C.A.* 40, 1375^{9}.

11641. Rideal, E.K. **Reactions in monolayers.** *J. Chem. Soc.* 1945, 423-8.—*C.A.* 39, 4539^{8}.

11642. Storch, H.H. **Catalysis in synthetic liquid-fuel processes.** *Ind. Eng. Chem.* 37, 340-51 (1945).—*C.A.* 39, 2189^{9}.
Data were reviewed relating to the kinetics of (1) the Fischer-Tropsch synthesis; (2) the hydrogenolysis of coal and coal tar; (3) the hydrogenation and cracking of gas oil from petroleum or middle oils from process (2).

11643. TAYLOR, HUGH S. **Applications of isotopes in catalytic reactions at surfaces.** *Frontiers in Chemistry* 3, 43-61 (1945).—*C.A.* 39, 4281^3.

11644. WEST, JAMES R. **Some industrial aspects of adsorption.** *J. Chem. Education* 22, 398-401 (1945).—*C.A.* 39, 4703^9.

11645. BERSIN, THEODOR. **The significance of exchange adsorption for biochemical processes.** *Naturwissenschaften* 33, 108-11(1946).—*C.A.* 41, 7425*f*.
Ion-exchange reactions were reviewed.

11646. BRANDENBERGER, E. **The constitution of amorphous solids.** *Schweiz, Arch. angew. Wiss. Tech.* 12, 338-58(1946)-*Schweiz. Verband Materialprufung Tech.*, Ber. No. 41, 9-31(1946).—*C.A.* 41, 4020*b*.
The detailed review included: (1) nature and structure, (2) constitution in the light of general stereo-chemistry, (3) cryst. compds. and their constitution, (4) survey of reaction mechanisms of cryst. compds., and (5) constitution and properties of amorphous solids.

11647. CADMAN, W.H. **Colloidal carbon.** *J. Roy. Soc. Arts* 94, 646-63; *Petroleum Times* 50, 898-9, 927(1946).—*C.A.* 41, 638*c*.
The manuf. and uses of carbon black were reviewed.

11648. CANNAN, R. KEITH. **Amino acid analysis of proteins. Chromatographic and ion-exchange methods of amino acid analysis.** *Ann. N.Y. Acad. Sci.* 47, 135-59 (1946).—*C.A.* 40, 7257^1.

11649. CORREIA, ALICE. **Adsorption indicators.** *Rev. soc. brasil quim.* 15, 103-50(1946).—*C.A.* 41, 6834*h*.

11650. DROGIN, ISAAC. **Ten years of progress in the carbon-black industry.** *Rev. gén. caoutchouc* 23, 34-7, 47-52 (1946).—*C.A.* 40, 6788^7.

11651. EMMETT, PAUL H. **Catalysis and its industrial applications.** *Colloid Chem.* 6, 214-42; *Record Chem. Progress* 7, 41-9(1946).—*C.A.* 40 2377^8, 6325^8.
The concept of contact catalysis, mechanism, promotor action, catalyst poisons, and selection of catalysts were discussed. In studying catalyst mechanisms use is made of the ortho-para hydrogen conversion and of isotopes, mol. beams, metal films, the electron microscope, and surface-area measurements.

11652. EVANS, U.R. **Recent work on corrosion and oxidation.** *J. Chem. Soc.* 1946, 207-14.—*C.A.* 40, 4016^7.

11653. FRARY, FRANCIS C. **Adventures with alumina.** *Chemistry & Industry* 1946, 14-16; *Ind. Eng. Chem.* 38, 129-31 (1946).—*C.A.* 40, 1364^2.

11654. HARKINS, WILLIAM D. **The surface of solids and liquids and the films that form on them. II. Solids and adsorption at the surface of solids or liquids.** *Colloid Chemistry* 6, 1-76 (1946).—*C.A.* 40, 2371^7.
A résumé of fifteen years work: classes of solids, effect of subphase on metallic films; calcn. and detn. of surface energy values; adsorption at interfaces in solid, liquid, and gaseous systems, water/oil; Gibbs equation applied to solid surfaces; exptl. procedures; areas of solids from adsorption isotherm.

11655. HARWOOD, J.H. **Recent developements in the technology of activated alumina. II.** *Ind. Chemist* 22, 721-5 (1946).—*C.A.* 41, 1399*e*.

11656. HELBIG, W.A. **Adsorption from solution by activated carbon.** *Colloid Chem.* 6, 814-39(1946).—*C.A.* 40, 2039^4.

11657. JHA, SHACHEENATHA AND DUBE, G.P. **The variation of the accommodation coefficient as an indicator of the adsorption of gases by the solid surfaces.** *Bull. Patna Sci. Coll. Phil. Soc.* No. 16, 83-91 (1946).—*C.A.* 40, 5316^5.

11658. LAHUERTA CASAUS, PASCUAL. **The Fischer-Tropsch synthesis-a bibliographic study.** *Combustibles* (Zaragoza) 6, 62-75, 120-34 (1946).—*C.A.* 42, 6510*f*.

11659. LONG, ROBERT H. **An apparatus for demonstrating adsorption by charcoal.** *School Sci. and Math.* 46, 423-4(1946).—*C.A.* 40, 6899^7.

11660. MARTINEZ, MANUEL CABANZÓN. **Evaluation of active carbons.** *Ion* 6, 476-9 (1946).—*C.A.* 41, 2558*f*.

11661. McCULLOCH, LEON. **Demonstration of combustion by catalysis.** *J. Chem. Education* 23, 524 (1946).—*C.A.* 41, 904*e*.
A piece of thick Cu wire, preheated to redness, was hung from the top of an open beaker so that its lower end was just above the surface of a layer of acetone about 2 cm deep. At contact with the vapor, the oxidized surface of the Cu was reduced, and catalyzed combustion began.

11662. MINTON, A.S. **Catalysis and its relation to fire extinction.** *Quart. Inst. Fire Engrs.* 6, 67-73 (1946).—*C.A.* 41, 1841*d*.
The combination of many inflammable vapors, including CO with O_2 was promoted by the addn. of small amts. of water. Traces of N_2O materially assisted in the spontaneous ignition of all inflammable air mixts.

11663. MOOIJ, H.H. **Physical-technical aspects of the development of heterogeneous catalytic processes.** *Chem. Weekblad* 42, 28-34(1946).—*C.A.* 40, 3334^9.

11664. MYERS, FREDERICK J. **Ion-exchange resins.** *Colloid Chem.* 6, 1107-12(1946).—*C.A.* 40, 2352^1.
Theory and use of resinous exchangers, application to water conditioning, sugar refining, etc., were reviewed.

11665. POWERS, T.C. **The physical properties of hardened portland cement paste. I. A review of methods that have been used for studying the physical properties of hardened portland cement paste.** *J. Am. Concrete Inst.* 18, 101-32 (1946).—*C.A.* 40, 7551^5.

11666. ROBINSON, F.A. **General principles of chromatographic analysis.** *Analyst* 71, 251-5 (1946).—*C.A.* 40, 4971^9.

11667. SAMUELSON, OLOF. **Organic ion exchange and its use in analytical chemistry.** *Tek. Tid.* 76, 561-71(1946).—*C.A.* 40, 5657^9.

11668. SELWOOD, P.W. **Magnetism and catalysis.** *Chem. Rev.* 38, 41-82(1946).—*C.A.* 40, 2723^9.

11669. SYNGE, R.L.M. **Partition chromatography.** *Analyst* 71, 256-8(1946).—*C.A.* 40, 4971^9.

11670. TAYLOR, HUGH S. **Contact catalysis between two world wars.** *Am. Scientist* 34, 553-72 (1946). —*C.A.* 41, 644*b*.

11671. THIELE, E.W. **Material or heat transfer between a granular solid and flowing fluid. Present status of the theory.** *Ind. Eng. Chem.* 38, 646-50 (1946).—*C.A.* 40, 4284^7.

A review of the work so far reported on the computation of the transfer of material (or heat) when a fluid (liquid or gas) was passed through a bed of granular solid, as in the decolorization of liquids, the recovery of volatile solvents, etc.

11672. VAHRMAN, M. **Chromatographic adsorption analysis.** *Bull. Brit. Coal Utilisation Research Assoc.* 10, 305-14 (1946).—*C.A.* 41, 1524*h*.

Advances in technique, application to coal chemistry, and the theory of chromatography were reviewed.

11673. WARTH, A.H. **Purifying water by ion exchange.** *The Crown* 36, No. 1, 13(1946).—*C.A.* 41, 2512*f*.

The ion-exchange process and the use of Amberlites in water purification were described.

11674. AKAMATSU, HIDEO. **Amorphous carbon.** *Kagaku-no-Ryoiki* 1, 7-13(1947).—*C.A.* 44, 9842*i*.

11675. ATEN, W.H.W. JR. AND HEYN, F.A. **Use of isotopes as tracers.** *Philips Tech. Rev.* 8, 296-303 (1947).—*C.A.* 41, 4703*a*.

Examples were given illustrating the use of isotopes as tracers; P in steel; Hg in Hg poisoning; soly. of Pb. in Sn; activation of metal surfaces.

11676. AUSTERWEIL, G.V. **Some aspects of ionic exchange and its applications.** *Proc. Intern. Congr. Pure and Applied Chem.* (London) 11, 323(1947)(in English).—*C.A.* 44, 7466*i*.

11677. BOGNÁR, REZSÖ. **Role of catalysis in organic chemistry.** *Magyar Kém. Lapja* 2, 181-8, 201-6, 225-30 (1947).—*C.A.* 41, 7214*a*.

11678. BOGOYAVLENSKY, B.A. **The eightieth anniversary of a pioneer in catalysis. Vladimir N. Ipatieff.** *Chimie & industrie* 58, 600-2(1947).—*C.A.* 42, 2145*i*.

11679. BRAUNBEK, WERNER, **Diffusion in solid substances.** *Naturforsch. u. Med.* 1939-1946, 8, Pt. 1, 221-8(1947); *Chem. Zentr.* (Russian Zone Ed.) 1948, II, 1268.—*C.A.* 45, 7402*g*.

A comprehensive review was presented.

11680. BROCKMANN, HANS. **New findings in the field of chromatographic adsorption.** *Angew. Chem.* A59, 199-206 (1947).—*C.A.* 42, 4019*i*.

The adsorption process, variations in the adsorption medium, adsorbents with different adsorption activities, the "eluotrope" series of solvents, constitution and adsorption, chromatographic sepn. of colorless substances, and the distribution chromatogram were reviewed.

11681. CASSIDY, HAROLD G. **Chromatography, a method of separating mixtures of substances.** *Science Counselor* 10, 107-9, 136 (1947).—*C.A.* 42, 3236*i*.

Adsorption, demonstration expts., and principles of the chromatographic methods were discussed.

11682. CORSON, B.B. **Industrial catalysis.** *J. Chem. Ed.* 24, 99-103, 150-5 (1947).—*C.A.* 41, 3888*d*..

11683. DAUBY, R. **Chromatography.** *Ind. Chim. belge* 12, 155-60 (1947).—*C.A.* 43, 1625*a*.

11684. FILLINGER, HARRIETT H. **Chromatographic adsorption in qualitative analysis.** *J. Chem. Education* 24, 444-5 (1947).—*C.A.* 41, 6833*g*.

11685. GAY, R. **Contribution to the study of periodic precipitation.** *Bull. soc. franc. mineral.* 70, 251-87 (1947).—*C.A.* 42, 8588*b*.

New experiments in support of Ostwald's explanation were given.

11686. GEE, GEOFFREY. **Some thermodynamic properties of high polymers and their molecular interpretation.** *Quart. Revs.* (London) 1, 265-98 (1947).—*C.A.* 42, 2491*i*.

The review covered polymer crystn., second-order transitions, rubberlike elasticity, stretch polymer crystn., absorption of gases and vapors, soly. in liquids, and swelling in liquids.

11687. GRAHAME, DAVID C. **The electrical double layer and the theory of electrocapillarity.** *Chem. Revs.* 41, 441-501 (1947).—*C.A.* 42, 1105*a*.

11688. KERMACK, W.O. **Partition chromatography.** *J. Incorp. Brewers' Guild* 33, 81-4(1947).—*C.A.* 42, 7600*a*.

The silica-gel column, filter-paper chromatography, two-dimensional partition chromatography, and some applications of partition chromatography were reviewed.

11689. LANTZ, ROBERT. **The mechanism of dyeing.** *Teintex* 12, 189 (1947).—*C.A.* 41, 6051*d*.

The chemical and adsorption theories of the mechanism of dyeing were reviewed.

11690. LEWANDOWSKI, ANZELM. **Chemical properties and classification of natural ferric hydroxides.** *Arch. mineral. soc. sci. Varsovie* 17, 179-90 (in Eng. 190) (1947).—*C.A.* 43, 1291*c*.

The hydrous Fe oxides were classified on the basis of their reactions with Ag salts to form ferrites, and by their catalytic effect on the oxidation of org. matter by H_2O_2.

11691. LOWRY, H.H. AND ROSE, H.J. **Some observations on German coal research and developments.** *U.S. Bur. Mines Inform. Circ. No.* 7422, 27 pp. (1947).

11692. RAETHER, HEINZ. **The structure of thin films.** *Naturforsch. u. Med. Deutschland* 1939-1946 8, No. 1, 102-8(1947).—*C.A.* 44, 8722*f*.

Both amorphous and cryst. films were reviewed.

11693. Ray, Arthur B. **Unit-operation review. Adsorption.** *Ind. Eng. Chem.* 39, 12-13, 32-5 (1947).—*C.A.* 41, 1135*b*.

11694. Riley, H.L. **Amorphous carbon and graphite.** *Quart. Revs.* (London) 1, No. 1, 59-72 (1947).—*C.A.* 42, 805*d*.

11695. Robinson, F.A. **Recent developments in chromatography.** *Pharm. J.* 158, 46-8(1947).—*C.A.* 41, 2626*a*.

Adsorbents, solvents, partition chromatography, analyses of antibiotics, and sepn. processes were reviewed.

11696. Robinson, F.A. **Recent developments in chromatography.** *Chemist Druggist* 147, 121-4 (1947).—*C.A.* 41, 3677*e*.

11697. Sanchez Marco, Godofredo. **Spontaneous oxidation of coal.** *Combustibles* 7, 124-32, 163-70(1947).—*C.A.* 42, 7043*f*.

11698. Schay, Géze. **Catalysis. III. Adsorption in catalysis. IV. Heterogeneous catalysis.** *Magyar Kem. Lapja* 2, 139-41, 154-7, 167-72(1947). —*C.A.* 41, 7214*e*.

11699. Strong, Frederick C. **Trends in quantitative analysis.** *Anal. Chem.* 19, 968-71 (1947).—*C.A.* 42, 835*i*.

11700. Ternisien, Jean. **Oxidation catalysis and the effect of the condition of the catalyzing surface.** *Chimie & industrie* 58, 234-7(1947).—*C.A.* 42, 442*c*.

The review included: nature of oxidation catalysis, catalytic properties of metals that favored the combustion reaction of a gas, causes of the deterioration of catalysts, theory of the catalysis of combustible gases, and electron-microscope examn. of the surface of metal catalysts.

11701. Tiselius, Arne. **Adsorption analysis of amino acid mixtures.** *Advances in Protein Chemistry* 3, 67-93 (1947).—*C.A.* 41, 4178*g*.

11702. Titov, E.M. **Chromatographic adsorption analysis under increased pressure.** *Zavodskaya Lab.* 13, 1359-64 (1947).—*C.A.* 43, 8790*f*.

The advantages of operation under moderate pressure (up to 450 cm Hg above atm.) were stressed as used by Tsvet in his pioneer work.

11703. Van Horn, H.T. **Base exchange and its application in ceramics.** *Ceram. Age* 50, 330-2(1947). —*C.A.* 42, 8432*h*.

11704. Zerban, F.W. **The color problem in sucrose manufacture.** *Sugar Research Foundation* (N.Y.) *Technol. Rept. Ser. No.* 2, 31 pp. (1947).—*C.A.* 41, 7143*f*.

A review of the literature on (1) the nature of caramel substances, melanoidins, and polyphenol Fe compds. occurring in sucrose products, (2) their role in the color changes during operations, (3) their detrimental effect on the marketability of the products, (4) methods for minimizing color increase and for the removal of coloring matters.

11705. Zettlemoyer, A.C. **Adsorption as a research tool.** *Trans. N.Y. Acad. Sci.* 10, 56-8(1947).—*C.A.* 42, 2155*f*.

11706. Akeroyd, E.I.; Kressman, T.R.E., and Cooper, A.T. **Ion exchange in research and industry. I. Removal of ions from solutions.** *Mfg. Chemist* 19, 344-50, 394-8(1948).—*C.A.* 43, 331*f*, 1881*c*.

11707. Beebe, Ralph A. **Dr. Stephen Brunauer's contributions in the field of adsorption.** *J. Wash. Acad. Sci.* 38, 117-22 (1948).—*C.A.* 42, 4019*g*.

11708. Beeck, Otto. **Surface catalysis.** *Revs. Modern Phys.* 20, 127-30(1948).—*C.A.* 42, 4435*b*.

The effect of traces of H_2O and H_2S in lowering the decompn. temp. of hydrocarbons was discussed. Mol. ray expts. indicated the decompn. of CH_4 into CH_3 and H and ethane into CH_3 radicals. The adsorption step was the crucial step in surface catalysis and the reaction of ethylene and H_2 was an example.

11709. Bernaerts, M.J. **Recent progress in chromatographic analysis.** *Mededel. Vlaam. Chem. Ver.* 10, 215-23(1948).—*C.A.* 43, 3307*g*.

11710. Blanc, Georges. **Gases in copper alloys.** *Fonderie* 1948, 1163-71; *Chem. Zentr.* (Russian Zone Ed.) 1949, I, 1412.—*C.A.* 46, 7974*b*.

The soly. of individual gases and of several gases simultaneously present were discussed, also the reactions between metal and molding sand, and the influence of the dissolved gases on the casting.

11711. Brooks, J.D. **The catalytic oxidation of coal and petroleum products with air.** *Bull. Brit. Coal Utilisation Research Assoc.* 12, 393-400(1948).—*C.A.* 43, 5133*e*.

Catalysts, oxidation of aliphatic and aromatic hydrocarbons, and industrial oxidation products were reviewed.

11712. Consden, R. **Partition chromatography on paper, its scope and application.** *Nature* 162, 359-61(1948).—*C.A.* 42, 8571*a*.

11713. Csuros, Zoltán. **New principles in catalysis. Selectivity.** *Magyar Kém. Lapja* 3, 29-37(1948).—*C.A.* 43, 8832*a*.

Selective hydrogenation of cinnamic aldehyde with colloidal Pd as catalyst and of BzH and *o*-, *p*-, and *m*-hydroxybenzaldehyde in the presence of Pd catalyst pptd. on animal charcoal was reviewed.

11714. Davies, C.W. **Ion-exchange resins.** *Chemistry & Industry* 1948, 51-4.—*C.A.* 42, 3107*d*.

11715. Descamps, M. **Chromatographic analysis.** *Bull. assoc. anciens étude brass.* 44, 125-44, 171-90 (1948).—*C.A.* 44, 2325*f*.

11716. Dickel, G. **Adsorption and desorption.** *FIAT Rév. German Sci., 1939-1946, Phys. Chem.* 1948, 199-204.—*C.A.* 43, 1623*d*.

11717. Endell, K. and Hofmann, U. **The adhesion of inorganic binders and the plasticity and thixotropy of clay.** *Angew Chem.* A60, 237-42 (1948).—*C.A.* 43, 828*h*.

11718. Erbring, H. **Colloid chemistry.** *FIAT Rev. German Sci. 1939-1946, Phys. Chem.* 1948, 113-50. —*C.A.* 43, 1625*b*.

11719. Freund, Mihály. **Application of liquid catalysts in the industry of mineral oils.** *Magyar Tech.* 3, No. 8, 70-3 (1948).—*C.A.* 43, 8122*i*.

11720. Fricke, R. **What are active solid substances and what is the significance for science and technology?** *Festskr J. Arvid Hedvall* 1948, 189-202.—*C.A.* 42, 5737*b*.
The reason for the activity of a solid substance was reviewed: (1) existence in the amorphous state; (2) derangement of the lattice, such as alterations in the lattice distances, straining of the crystals, etc. (3) existence as an unstable allotrope; and (4) occurrence of a very large surface area.

11721. Fricke, R. **Active states and reaction properties in solids.** *Iva* 19, 192-8(1948).—*C.A.* 43, 5250*g*.
Ideal crystal structures with regard to the classical theory and real crystal structures were discussed with regard to solid body reactions. The active states were characterized by large surface development and lattice disorder.

11722. Fuks, N.A. **Distributive chromatography and its application to analytical chemistry.** *Uspekhi Khim.* 17, 45-54(1948).—*C.A.* 42, 4863*h*.
Typical examples of the use of chromatography in the analysis of complex compds.were given.

11723. Gapon, E.N. and Gapon, T.B. **Chromatographic analysis of ions.** *Uspekhi Khim.* 17, 452-67 (1948).—*C.A.* 43, 7859*e*.

11724. Gapon, T.B. and Gapon, E.N. **Chromatographic analysis of ions. I. Chromatographic exchange adsorption of ions.** *Zhur. Anal. Khim.* 3, 203-12 (1948).—*C.A.* 43, 8971*f*.

11725. Godel, A. **Fluidization used in making activated carbon.** *Chem. Eng.* 55, No. 7, 110-11 (1948).—*C.A.* 42, 6964*a*.

11726. Guitton, L. **Passivation of nonoxidizing steels and adsorption phenomena.** *Metaux & Corrosion* 23, 29-33 (1948).—*C.A.* 43, 1699*c*.
The mechanism of pure passivation, effect of heat on the surface, adsorption, and structure of oxide film were reviewed.

11727. Hais, I.M. **Paper chromatography.** *Chem. Listy* 42, 125-37(1948).—*C.A.* 44, 9210*h*.

11728. Inoue, Katsuya. **Colloid chemistry of clay.** *Kagaku no Ryôiki* (J. Japan Chem.) 2, 308-12(1948).—*C.A.* 45, 4526*e*.

11729. Jungers, J.C. **The present situation in heterogeneous catalysis.** *Soc. roy. belge ing. et ind., Ser. B., Mem.* 6, 14-25 (1948).
In heterogeneous catalysis, 5 steps were apparent: appearance of the catalyst at the surface, adsorption of the catalyst on the surface, transformation of the adsorbed substances, desorption, elimination of the products formed.

11730. Keenan, A.G. **Relation between the Brunauer-Emmett-Teller and Langmuir multilayer adsorption equations.** *J. Chem. Education* 25, 666-7(1948).—*C.A.* 43, 2485*a*.

11731. Konstantinova-Shlezinger, M.A. and Gorbacheva, N.A. **Theory of chromatographic analysis.** *Zhur. Anal. Khim.* 3, 213-19 (1948).—*C.A.* 43, 8945*h*.

11732. Kreshkov, A.P. **New silicate products, based on silicoörganic compounds.** *Doklady Akad. Nauk S.S.S.R.* 59, 723-6(1948).—*C.A.* 46, 3681*d*.
General reaction schemes were given for partial hydrolysis of esters of orthosilicic acid and condensation of the products, and for Grignard-like reactions of silicon aryl and alkyl halides. The similarity of silicones to silicates and SiO_2 glass was discussed.

11733. Kunin, Robert. **Unit operations. Ion exchange.** *Ind. Eng. Chem.* 40, 41-45 (1948).—*C.A.* 42, 1088*e*.

11734. Levin, V.I. **Statistical theories of active surfaces.** *Uspekhi Khim.* 17, 174-203(1948).—*C.A.* 42, 5298*b*.
Theories of heterogeneous surfaces, adsorption equil., kinetics of adsorption, kinetics of heterogeneous catalysis, and interaction of adsorbed particles were reviewed.

11735. MacEwan, D.M.C. **Adsorption by montmorillonite, and its relation to surface adsorption.** *Nature* 162, 935-6 (1948).—*C.A.* 43, 7774*c*.

11736. Moore, Stanford and Stein, William H. **Partition chromatography of amino acids on starch.** *Ann. N.Y. Acad. Sci.* 49, 265-78 (1948).—*C.A.* 42, 5488*e*.
Starch acted both as an adsorbent and a liquid support.

11737. Mukaibo, Takashi. **Graphitization of amorphous carbon.** *Kagaku no Ryoiki* (J. Japan Chem.) 2, 301-7(1948).—*C.A.* 45, 4912*a*.

11738. Nowak, Lucjan. **Catalysis in polymerization processes.** *Przemysl Chem.* 27, 578-86 (1948).—*C.A.* 43, 8199*c*.
The mechanism of catalysis and the various types of catalysts and inhibitors used in the manuf. of plastics were reviewed.

11739. Palacios, J. **Adsorption as an origin of electromotive force.** *Scientia* 83, 123-6(1948).—*C.A.* 42, 8680*e*.
When a carbon electrode was placed in a soln. of $ZnSO_4$ a difference in potential was produced by adsorption of Zn^{++}.

11740. Peck, Robert L. **Chromatography in the streptomycin problem.** *Ann. N.Y. Acad. Sci.* 49, 235-48 (1948).—*C.A.* 42, 5619*c*.

11741. Rabek, Tadeusz. **Ion exchangers.** *Przemysł Chem.* 27, 678-87 (1948).—*C.A.* 43, 7757*c*.
The theory of ion exchange was reviewed and the general characteristics and applications of inorg. and org. cation and anion exchangers were described.

11742. Tiselius, Arne. **Electrophoresis and adsorption analysis as aids in investigations of large-molecular-weight substances and their breakdown products.** *Prix Nobel* 1948, 102-21; *Naturwissenschaften* 37, 25-33 (1950).—*C.A.* 44, 5678*f*.

11743. Treszczanowicz, E. **The physical approach to contact catalysis.** *Research* 1, 304-10(1948).—*C.A.* 42, 4434*i*.

11744. Velasco, Fernando. **Methods of analysis by adsorption - chromatography.** *Ion* 8, 591-600 (1948).—*C.A.* 43, 1679*c*.

11745. Williams, A.E. **Fuller's earth. Some notes on its mining, preparation, and properties.** *Mining J.* (London) 230, 238-42(1948).—*C.A.* 42, 5623*g*.

11746. Williams, Trevor I. **Recent advances in chromatographic sorption analysis.** *Research* 1, 400-6(1948).—*C.A.* 42, 5792*c*.

11747. Williams, Trevor I. **Chromatography: recent developments and future possibilities.** *Anal. Chim. Acta* 2, 635-48 (1948) (in English). —*C.A.* 43, 7775*b*.

Partition chromatography, inorg. chromatography, and the theory of chromatography were discussed.

11748. Williamson, W.O. **The clay/water relation.** *Research* (London) 1, 363-8 (1948).—*C.A.* 42, 4829*a*.

11749. Winters, James C. **Ion exchange develops as a unit process.** *Chem. Inds.* 62, 754-8(1948).

11750. Zechmeister, L. **History, scope, and methods of chromatography.** *Ann. N.Y. Acad. Sci.* 49, 145-60(1948).—*C.A.* 42, 5371*d*.

11751. Ackermann, A. **Absorbent earth industry.** *Chimie & industrie* 61, 29-37(1949).—*C.A.* 43, 7159*g*.

11752. Appell, F. **Chromatography in the examination of tanning principles.** *Rev. tech. ind. cuir* 41, 1-6(1949).—*C.A.* 46, 9333*b*.

11753. Arthur, J.R. **Recent investigation on the combustion and gasification of beds of solid fuels.** *Bull. Brit. Coal Utilisation Research Assoc.* 13, 297-304(1949).—*C.A.* 44, 5563*c*.

The 1944-48 period was reviewed.

11754. Barrer, R.M. **Molecular-sieve action of solids.** *Quart. Revs.* 3, 293-320(1949).—*C.A.* 44, 4306*b*.

Molecular-sieve action of porous sorbents and permeable crystals on gases, of metallic, vitreous, and org. membranes on gases, and of various materials on ions in soln. were discussed.

11755. Barrer, R.M. **Separations with zeolitic materials.** *Disc. Faraday Soc.* 1949, No. 7, 135-41.—*C.A.* 45, 18*h*.

Most natural cryst. zeolites fell into 3 classes of mol. sieve sorbent, each capable of sepg. mixts. by selective occlusion if there are sufficient differences in shape and dimensions between the mols. in the mixt. The mols. removed by occlusion must always be comparatively small. A diversity of modified mol.-sieve sorbents could be produced by cation exchange and by burning out interstital NH_4^+.

11756. Blankenship, Forrest and Donaldson, Paul. **Improved demonstration experiment on gas adsorption.** *J. Chem. Education* 26, 105-6 (1949). —*C.A.* 43, 3686*d*.

Me_3BO_3 was adsorbed and then eluted.

11757. Boelhouwer, C. **Catalysis and the surface structure of metals.** *Chem. Weekblad* 45, 590-6 (1949).—*C.A.* 44, 25*i*.

11758. Bognár, Rezso. **Valency in modern chemistry. VII. Valency, adsorption, chemisorption.** *Magyar Kém. Lapja* 4, 6-14(1949); *Magyar Tech.* 4, No. 1, 51-8(1949).—*C.A.* 45, 924*g*.

11759. Boutaric, A. **Adsorption phenomena.** *Scientia* (Italy) 84, 159-65 (1949) (in French). —*C.A.* 44, 402*a*.

The various types of adsorption were discussed.

11760. Braidy, H. **Characteristics and uses of porous materials. III.** *Industrie chimique* 36, 69-74(1949).—*C.A.* 46, 9377*b*.

Surface phenomena, mol. orientation and adsorption, heterogeneous catalysis, electrolysis, and other elec. phenomena were discussed.

11761. Brusset, H. **Graphite formation.** *Bull. Soc. chim.* 1949, D49-52.—*C.A.* 43, 4546*i*.

The mechanism of the change of amorphous carbon to graphite was reviewed.

11762. Campbell, Neil. **Adsorption chromatography.** *Pharm. J.* 162, 197-9(1949).—*C.A.* 43, 5255*d*.

11763. Cano Marotta, C.R. **The Fajans procedure: use of adsorption indicators.** *Ph (Montevideo)* 1949, No. 3, 25-35.—*C.A.* 44, 9858*c*.

11764. Cavallini, Doriano; Frontali, Nora, and Toschi, Giovanni. **Partition chromatography on filter paper.** *Ricerca sci.* 19, 208-19(1949).—*C.A.* 45, 4169*e*.

App. and technique, detn. of amino acids, keto acids, sugars, pyrimidines, and purines were reviewed.

11765. Coussens, R. **Adsorption analysis.** *Mededel. Vlaam. Chem. Ver.* 11, 125-48, 163-71 (1949).—*C.A.* 44, 2403*d*; 47, 5839*g*.

Description and use of a no. of adsorbents for analytical work were reviewed.

11766. Dubinin, M.M. **Advances in adsorption studies.** *Vestnik Akad. Nauk S.S.S.R.* 19, No. 3, 19-36 (1949).—*C.A.* 43, 7774*a*.

11767. Eley, D.D. **Mechanisms of hydrogen catalysis.** *Quart. Revs.* (London) 3, 209-25(1949).—*C.A.* 44, 26*f*.

A review with 74 references.

11768. Eucken, A. **Contact catalysis.** *Naturwissenschaften* 36, 48-53, 74-81 (1949).—*C.A.* 44, 3777*d*.

General principles, dehydration and dehydrogenation of alcs. on metal oxides, hydrogenation of unsatd. hydrocarbons on metals were reviewed.

11769. Fleisher, Harry. **Ion exchangers-their naval application.** *J. Am. Soc. Naval Engrs.* 61, 845-63 (1949).—*C.A.* 44, 878*f*.

11770. Fricke, Robert. **Active states (and catalytic activity) of solid surfaces.** *Z. Elektrochem.* 53, 264-8 (1949).—*C.A.* 44, 2353*i*.

11771. Fricke, Robert; Huttig, Gustav F.; Grubitsch, Heribert; Kohlschütter, Hans W.; Beischer, Dietrich; Tiede, Erich, and Remy, HEINRICH. **Active states and reactions in the solid state.** *FIAT Rev. German Sci. 1939-1946, Inorg. Chem., Pt. VI,* 1949, 1-221.—*C.A.* 45, 1411*d*.

11772. FRUMKIN, A.N. **Adsorption and oxidative processes.** *Uspekhi Khim.* 18, 9-21 (1949).—*C.A.* 43, 7774*b*.

11773. FUTTERKNECHT, ANDRÉ. **Bibliographic study of ion exchange and its applications.** *Ind. Chim.* 36, 219-21(1949).—*C.A.* 44, 4748*i*.

11774. GALECKI, A. **Physical chemistry of catalysts.** *Przemyst Chem.* 5(28), 564-6(1949).—*C.A.* 45, 10022*i*.
The mechanisms of catalysts were reviewed.

11775. GLEMSER. **Active solid materials.** *Eisen- u. Metall-Verarb.* 1, 50-1, 78-9(1949).—*C.A.* 46, 10487*i*.
The structure, properties, and uses of activated carbon, activated Fe$_2$O$_3$, Al$_2$O$_3$, Cu, Ca, ZnO, and a ZnO-Cr$_2$O$_3$ catalyst were discussed.

11776. GOGGI, G. **Selective adsorption of gases by activated charcoal. Theoretical principles.** *Riv. combustibili* 3, 157-69 (1949).—*C.A.* 43, 8789*d*.
The use of activated charcoal for the sepn. of ethylene from higher olefins in cracking gas, the hypersorption for the sepn. of light gases, and adsorption and capillary condensation in porous media were reviewed.

11777. GORDON, A.H. **Partition chromatography on paper with special reference to quantitative separations.** *Discussions Faraday Soc.* 1949, No. 7, 128-34.—*C.A.* 44, 9856*a*.
Recent improvements in the method of partition chromatography on paper were reviewed.

11778. GRUNER, ERHARD. **Results of the colloid-chemical investigation of bentonite in the foreign literature from 1940-1947.** *Kolloid-Z.* 114, 49-54 (1949).—*C.A.* 44, 1304*a*.

11779. GUGGENHEIM, E.A. **Surface thermodynamics—progress since Willard Gibbs.** *Research* (London), Suppl., *Surface Chemistry* 1949, 11-13 (in English), 13-15 (in French).—*C.A.* 43, 8789*c*.
Modern developments in the thermodynamics, both classical and statistical, of interfaces were reviewed.

11780. HAIS, I.M. AND RABEK, V. **Paper chromatography.** *Chem. Listy* 43, 80-94(1949).—*C.A.* 44, 9210*h*.

11781. HARRIS, B.L. **Chemical engineering unit operations review. Adsorption.** *Ind. Eng. Chem.* 41, 15-19 (1949).—*C.A.* 43, 1227*g*.

11782. HEDVALL, J. ARVID. **The development and application of the reaction theory of the solid state.** *Z. anorg. Chem.* 258, 180-7(1949).—*C.A.* 44, 25*i*.
The important developments in the present state of knowledge of reactions in the solid state were discussed.

11783. HEINEMANN, FELIX. **The Fischer-Tropsch hydrocarbon synthesis. Its first development.** *Petroleum Refiner* 28, No. 1, 126-7(1949).—*C.A.* 43, 3167*c*.

11784. HILFIGER, J.P. **Ion exchangers.** *Chimie & industrie* 61, 559-63; 62, 29-34 (1949).—*C.A.* 43, 8577*i*.

11785. HONDA, MASATAKE. **Ion-exchange resins and inorganic chemistry.** *Kagaku no Ryoiki, Extra Ed. No.* 1, 19-66 (May 1949) *No.* 2, (July 1949).—*C.A.* 44, 6753*g*.

11786. HONDA, MASATAKE. **Ion-exchange resins in analytical chemistry. I. Exchange capacity of cation exchangers.** *J. Chem. Soc. Japan,* Pure Chem. Sect., 70, 52-5(1949).—*C.A.* 45, 4169*g*.

11787. IL'IN, B.V. **The nature of van der Waals' forces on the interphase of various phases.** *Izvest. Sektora Fiz.-Khim. Anal., Inst. Obshcheĭ i Neorg. Khim., Akad. Nauk S.S.S.R.* 17, 15-32(1949).—*C.A.* 45, 2760*f*.

11788. JACOBS, PH. **Fractional chromatography.** *Pharm. Weekblad* 84, 717-25, 734-9 (1949).—*C.A.* 44, 2325*g*.

11789. JONES, TUDOR S.G. **The application of chromatography to amino acids and peptides.** *Disc. Faraday Soc. No.* 7, 285-96 (1949).—*C.A.* 44, 7921*f*.
An account was given of the application of the chromatographic methods, adsorption, ion exchange, and partition chromatography in its various forms to amino acids and peptides. Paper chromatography and newer applications were discussed in greater detail.

11790. KISELEV, A.V. **Basic structural types of adsorbents and their effect on adsorptive properties.** *Zhur. Fiz. Khim.* 23, 452-68 (1949).—*C.A.* 43, 6033*i*.
Typical kinds of rigid adsorbents were: nonporous, coarsely porous and uniform, finely porous and uniform, and mixed. Adsorption isotherms and adsorption hysteresis of these types were discussed.

11791. KRAUSE, A. **Chemistry of catalysts.** *Przemysl Chem.* 5(28), 267-72(1949).—*C.A.* 45, 10022*h*.
The chemistry of catalysts was reviewed in the light of current theories, and the mechanisms of a no. of typical reactions were discussed in detail.

11792. KUNIN, ROBERT. **First annual review of analytical chemistry. Ion exchange.** *Anal. Chem.* 21, 87-96 (1949).

11793. LUNDBERG, LISE. **Ion exchange and its application.** *Dansk Tids. Farm.* 23, 227-44, 265-89 (1949).—*C.A.* 44, 380*h*.

11794. MCLAUGHLIN, R.R. AND AZIZ, D. **A lecture experiment to demonstrate the adsorption of gases by solids.** *J. Chem. Education* 26, 325-6 (1949).—*C.A.* 43, 8232*i*.
The adsorption of ether by silica gel was made visible by the use of a column of Hg to measure pressure.

11795. MITTELMAN, NAUM. **Adsorption and partition chromatography.** *Chemia* (Buenos Aires) 15, 73-92 (1949).—*C.A.* 44, 2820*i*.

11796. Nebel. **Basic concepts and their interaction in crystallization processes in sugar solutions in sugar refining.** *Zucker* 2, 200-4 (1949).—*C.A.* 44, 2267^{d}.

11797. Pallai, Iván and Kormendy, Károly. **Distribution paper chromatography.** *Magyar Kém. Lapja* 4, 398-403(1949).—*C.A.* 45, 971^{c}.
Its use in qual. and quant. analysis of org. compds. was reviewed.

11798. Pearce, J.G. **Development stages in the study of the graphite structure.** *Giesserei* 1, 17-21(1949).—*C.A.* 44, 4744^{i}.

11799. Reis, Thomas. **The investigation of catalysts.** *Magyar Kém. Lapja* 4, 445-54 (1949).—*C.A.* 44, 1627^{c}.
Methods available for the testing of catalysts generally used for industrial purposes were reviewed.

11800. Rideal, Eric K. **Solvation of colloids.** *Science Progress* 37, 193-201 (1949).—*C.A.* 43, 6490^{g}.

11801. Roudier, A. **Chromatographic analysis.** *Chim. anal.* 31, 220-5, 247-52, 277-82 (1949).—*C.A.* 44, 475^{c}, 2883^{e}.
The procedure was explained, suitable app. shown, and the advantages of the methods, especially for biol. chemists, outlined.

11802. Sanghavi, M.K.D. and Shah, S.M. **Catalytic vapor-phase dehydrocyclization of toluene to anthracene.** *Trans. Indian Inst. Chem. Engrs.* 3, 67-78(1949-50).—*C.A.* 46, 10820^{b}.
The reactions resulting in the formation of C_6H_6, $C_{10}H_8$, CH_4, C_2H_6, C, and H_2 were all serious thermodynamic competitors of the anthracene formation reactions. The choice of the reaction path could not be affected by a shift of temp. but only by a proper choice of catalyst.

11803. Sarry, Brigitte; Rienäcker, Günther and Fricke, Robert. **Chemical constitution and catalysis.** *FIAT Rev. German Sci. 1939-1946, Inorg. Chem.*, Pt. VI, 1949, 223-53.—*C.A.* 45, 1413^{g}.

11804. Schwab, Georg-Maria. **Alloy-catalysts for dehydrogenation.** *Z. Elektrochem.* 53, 274-8 (1949).—*C.A.* 44, 2144^{h}.

11805. Senyavin, M.M. **Chromatographic adsorption analysis.** *Uspekhi Khim.* 18, 183-205 (1949).—*C.A.* 43, 7859^{d}.

11806. Srikantan, B.S. **Physical structure of metals in relation to their catalytic behavior. I. Langmuir surfaces.** *J. Indian Chem. Soc.* 26, 561-4(1949).—*C.A.* 44, 7636^{h}.
Metals with face-centered cubic lattice structure and high vibrational energy at their m.p. were good catalysts.

11807. Strain, Harold H. **First annual review of analytical chemistry. Chromatographic separations.** *Anal. Chem.* 21, 75-81(1949).—*C.A.* 43, 2113^{g}.

11808. Tolley, G. **Paper partition chromatography.** *Mfg. Chemist* 20, 215-18(1949).—*C.A.* 43, 6489^{h}.

11809. Tompkins, Edward R. **Laboratory applications of ion-exchange techniques.** *J. Chem. Education* 26, 32-8, 92-100 (1949).—*C.A.* 43, 3264^{e}.
The properties and uses of ion-exchange resins in analytical sepns. were reviewed.

11810. Waksmundzki, Andrzej. **Chromatographic adsorption.** *Wiadomosci Chem.* 3, 169-83(1949).—*C.A.* 45, 9334^{h}.

11811. Warabioka, Kotaro. **Filter-paper chromatography.** *Yakugaku* (Science of Drugs) 3, 115-29 (1949).—*C.A.* 46, 7460^{g}.

11812. Weil, Herbert. **Industrial chromatography. I. Column chromatography and radial chromatography.** *Can. Chem. Process Inds.* 33, 956-9 (1949).—*C.A.* 44, 1357^{g}.
New developments in radial and column chromatography were noted. A new mech. isolation equipment and a new separator in radial chromatography were discussed. Fractions could be isolated by elution or by sectioning the adsorbent bed.

11813. Weil, Herbert. **Industrial chromatography II. Industrial chromatography of the rare earths.** *Can. Chem. Process Inds.* 33, 1036-42 (1949).—*C.A.* 44, 1357^{h}.
The evolution of chromatographic technique from analytical methods to unit operation in industry was traced.

11814. Winkler, G.F. **Clays and their properties - interpretation.** *Research* (London) 2, 175-83 (1949).—*C.A.* 43, 5559^{g}.

11815. Yoneda, Yukio. **Oxygen-anode reaction.** *J. Electrochem. Soc. Japan* 17, 247-51 (1949).—*C.A.* 44, 5230^{i}.
The methods of measurement of O_2 overvoltage and the effects of electrodes, temp., and electrolytes on the overvoltage were discussed.

11816. Antipina, T.V. and Frost, A.V. **Kinetics of catalytic reactions on a uniform surface.** *Uspekhi Khim.* 19, 342-60 (1950).—*C.A.* 45, 4123^{e}.

11817. Bénard, J. **The role of diffusion in surface oxidation of metals.** *Métaux & corrosion* 25, 241-7(1950).—*C.A.* 45, 9439^{i}.

11818. Block, Richard J. and Sober, Herbert A. **Paper chromatography of amino acids.** *Colloid Chem.* 7, 181-200 (1950).—*C.A.* 44, 10019^{d}.

11819. Bonch-Bruevich, V.L. **Quantum theories of adsorption.** *Uspekhi Fiz. Nauk* 40, 369-405 (1950).—*C.A.* 47, 1999^{a}.

11820. Boulanger, Paul and Biserte, Gérard. **Partition chromatography.** *Exposés anuels biochim. méd.* 11, 53-121(1950).—*C.A.* 46, 6897^{f}.
Theory and applications to specific sepns. were reviewed.

11821. Bratzler, K. **Connection between depolarizability and catalytic activity of activated carbons. Mechanism of the carbon-oxygen electrode.** *Z. Elektrochem.* 54, 81-8 (1950).—*C.A.* 44, 8214^{b}.

11822. Brooks, Benjamin T. **Catalysis and carbonium ions in petroleum formation.** *Science* 111, 648-50(1950).—*C.A.* 44, 10623*f*.
Natural petroleum was formed through a carbonium-ion mechanism at relatively low temps., catalyzed by clays and other acid silicate minerals in adjoining strata.

11823. Burstall, F.H. and Kember, N.F. **Inorganic chromatography.** *Ind. Chemist.* 26, 400-4(1950).—*C.A.* 46, 7927*b*.
Sepn. of inorg. compds. by use of paper strips or columns of cellulose pulp and org. solvents as eluents was described.

11824. Cassidy, Harold G. **The nature of separation processes.** *J. Chem. Education* 27, 241-4 (1950).—*C.A.* 44, 8705*f*.

11825. Castka, Joseph F. and Crane, Joseph. **Classroom demonstrations of ion-exchange resins.** *J. Chem. Education* 27, 673 (1950).—*C.A.* 45, 7833*d*.
Amberlite resins were used to demonstrate cation and anion removal and demineralization of H_2O.

11826. Clegg, Doris L. **Second annual review of analytical chemistry; fundamental analysis. Paper chromatography.** *Anal. Chem.* 22, 48-59, 742 (1950).—*C.A.* 44, 1843*d*, 6759*i*.

11827. Cremer, E. **Fundamental laws of adsorption historical survey.** *Z. physik. Chem.* 196, 196-204 (1950).—*C.A.* 45, 8845*i*.

11828. Davies, C.W. **Ion-exchange resins in chromatography.** *Research* 3, 447-52(1950).—*C.A.* 45, 60*c*.

11829. Deuel, H. and Hostettler, F. **History of ion exchange.** *Experientia* 6, 445-56(1950)(in English).—*C.A.* 45, 2272*f*.
A historical development of the field of ion exchange, 1850-1949 was presented.

11830. Feigl, F. **Chemistry of specific, selective, and sensitive reactions.** *Research* (London) 3, 550-7(1950).—*C.A.* 45, 3749*i*.
Reactions leading to metallo-org. compds., catalytic reactions, fluorescence effects, capillary analysis and chromatography, masking and demasking of effects by the control of exptl. variables, and topochem. reactions were reviewed.

11831. Fink, Colin G. **Theory of the electrodeposition of metals from aqueous solutions.** *Science* 112, 12(1950).—*C.A.* 44, 7678*b*.
The reactions actually taking place at the surface of the cathode were discussed. The importance of H in its varying forms was stressed.

11832. Fuks, N.A. **Advances and practical achievements in the field of aerosols.** *Uspekhi Khim.* 19, 175-201(1950).—*C.A.* 45, 4113*e*.

11833. Gilliland, E.R. **Techniques of contacting fluids and solids.** *Can. Chem. Process Inds.* 34, 632-9(1950).—*C.A.* 44, 9194*e*.
The techniques of fixed, moving, and fluidized beds in industrial operations were discussed. Applications of the fluidized powder system were to the hydrocarbon synthesis process based on the Fischer-Tropsch method and possible applications included gasification of coal and distn. of shale oil.

11834. Hagenmuller, P. **Heterogeneous catalysis.** *Bull. soc. chim. France* 1950, D123-30.—*C.A.* 45, 6029*d*.
The history and definition of heterogeneous catalysis, the role of adsorption and chemisorption, thermodynamic conditions, the theory of active centers, the action of promoters and poisons, the effect of porosity, and the correlation with magnetism were reviewed.

11835. Harris, B.L. **Chemical engineering unit operations review. Adsorption.** *Ind. Eng. Chem.* 42, 20-4 (1950).—*C.A.* 44, 1289*i*.

11836. Haul, R. **Molecular physical model considerations of wetting.** *Z. Elektrochem.* 54, 152-9(1950).—*C.A.* 44, 7120*d*.

11837. Hauser, Ernst A. **Organophilic clays.** *Colloid Chem.* 7, 431-41(1950).—*C.A.* 44, 10214*h*.
The development of organophilic clays by base-exchange reactions or by esterification was discussed.

11838. Heinrich, Kurt. **New developments in ion exchange.** *Vom Wasser* 18, 360-79(1950-51).—*C.A.* 46, 7252*c*.
New resins, techniques, and theory of industrial ion exchange were discussed, especially as to economy of operation, efficient exchange, and the useful life of the resins.

11839. Hesse, Gerhard. **Chromatographic analysis in its present form.** *Chem.-Ztg.* 74, 634-6, 647-9(1950).—*C.A.* 45, 418*f*.

11840. Hoge, G.F. Hornday and Walls, C.O. Jr. **Measurement and control problems in typical fixed-bed catalytic processes.** *Instruments* 23, 132-5, 174, 176, 178(1950).—*C.A.* 44, 5085*e*.
A description was given of a Houdry fixed-bed catalytic cracking plant.

11841. Keĭer, N.P. **Use of tagged atoms in the study of phenomena of adsorption and catalysis.** *Uspekhi Khim.* 19, 59-87(1950).—*C.A.* 45, 4123*e*.

11842. Khitrin, L.N. and Tsukhanova, O.A. **Combustion of carbon.** *Uspekhi Fiz. Nauk* 41, 311-30(1950).—*C.A.* 45, 6022*c*.

11843. Kunin, Robert. **Second annual review of analytical chemistry; fundamental analysis. Ion Exchange.** *Anal. Chem.* 22, 64-5(1950).—*C.A.* 44, 1843*e*.

11844. Lesser, Milton A. **Ion-exchange resins.** *Drug & Cosmetic Ind.* 67, 770-2, 854-7, 860-2 (1950).—*C.A.* 45, 4377*f*.

11845. Lindner, Roland. **Radiometric adsorption analysis.** *Z. Elektrochem.* 54, 421-3(1950).—*C.A.* 45, 4996*i*.
The sepn. of radio-active isotopes by adsorption on Al_2O_3 in Germany and on resins in the U.S. was reviewed.

11846. Loosjes, R. **Measurement of pH in suspensions.** *Chem. Weekblad* 46, 902-6(1950).—*C.A.* 45, 4116*a*.

11847. MacEwan, Douglas M.C. **Solvation of clay minerals in relation to crystal structure: Interlamellar adsorption by clay minerals.** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam 1950,* I, 107-8; IV, 57.—*C.A.* 46, 1198*g*.

11848. Mantell, J.C. **Moisture control with solid adsorbents.** *Chem. Products* 13, 271-3 (1950).—*C.A.* 45, 9199*b*.

11849. Mathieu, Marcel. **Structure and texture of catalytically active metallic phases.** *J. chim. phys.* 47, 223-8(1950).—*C.A.* 44, 7636*h*.

11850. Miwa, Mitsuo; Mamiya, Shôichi; Igarashi, Tatsuo, and Ouchi, Yoshio. **Structure of amorphous carbon.** *Science* (Japan) 20, 129-30 (1950).—*C.A.* 45, 9980*f*.

11851. Mulcahy, M.F.R. **The kinetics of decomposition of gases at metal surfaces.** *Trans. Australian Inst. Metals* 3, 67-70(1950); *Australasian Engr.* Dec. 7, 1950, 53-6.—*C.A.* 46, 8480*i*.

The theory of metal-gas surface reactions, the results of published expts. on the rate of deposition of carbon from CH_4 and of N_2 from NH_3 were reviewed.

11852. Muto, Toshio. **Paper partition chromatography. Its method and application. I.** *Nogaku* 4, 373-80(1950).—*C.A.* 45, 2287*a*.

11853. Nys, J. **Organic chromatography.** *Mededel. Vlaam. Chem. Ver.* 12, 109-19(1950).—*C.A.* 44, 10447*d*.

Adsorbents, methods and applications, and an outline of the effect of structure on adsorbability were reviewed.

11854. Otosai, Kiyoteru. **Paper chromatography of alkali salts.** *J. Japan. Chem.* 4, 411-19 (1950).—*C.A.* 44, 9295*i*.

11855. Palasi, Vicente Villar. **Analytical possibilities of filter paper chromatography.** *Anales real. acad. farm.* 16, 227-46 (1950).—*C.A.* 45, 2361*f*.

The general and quant. technique, along with various applications in physiology, medicine, biochemistry, etc., were reviewed.

11856. Patton, A.R. **Student experiments with paper chromatography.** *J. Chem. Education* 27, 574(1950).—*C.A.* 45, 1839*g*.

Hydrolysis products of sucrose, raffinose, and rutin were identified, and the presence of various types of plant pigment in spinach and carrots and of aureomycin and streptomycin in the proper animal protein factor supplements was shown.

11857. Pedinelli, Mario and Bovelacci, Franco. **Ion exchange and ion exchangers.** *Chimica e industria* (Milan) 32, 271-6, 341-5(1950).—*C.A.* 45, 9994*b*.

11858. Pepper, K.W. **Ion-exchange resins.** *School Sci. Rev.* 31, 164-75(1950).—*C.A.* 44, 10393*f*.

Constitution of resins, the equilibria and kinetics of ion-exchange processes, and their applications were discussed.

11859. Pizarro, Agustín Vioque. **Filter paper chromatography applied to inorganic analysis.** *Inform. quím. anal.* (Madrid) 4, 127-39(1950).—*C.A.* 45, 2814*c*.

11860. Rabó, Gyula. **Aromatization of the distillates of mineral oils.** *Magyar Kém. Lapja* 5, 8-12(1950).—*C.A.* 45, 1329*i*.

Various industrial methods were discussed, including suitability and effect of catalysts.

11861. Rachinskiĭ, V.V. **Paper chromatography.** *Uspekhi Khim.* 19, 445-65(1950).—*C.A.* 45, 4113*c*.

11862. Rienäcker, G. **Problems and findings in the field of catalysts and mixed catalysts.** *Chem. Tech.* 2, 1-7(1950).—*C.A.* 44, 5497*i*.

11863. Ruess, Gerardo L. **Microcrystalline carbon.** *Ciencia e invest.* 6, 257-67(1950).—*C.A.* 44, 9762*g*.

Graphite and several com. carbon blacks, including cryst. structure and size, chem. properties and adsorption, type of aggregation, and uses were discussed.

11864. Ryabchikov, D.I. and Terent'eva, E.A. **Ionites [ion-exchange resins] and their uses.** *Uspekhi Khim.* 19, 220-51(1950).—*C.A.* 45, 3683*i*.

11865. Safina, Giuseppe. **Chromatography and applications.** *Ann. facoltà sci. agrar. univ. Palermo* 1, 289-305(1950).—*C.A.* 46, 1841*d*.

11866. Schubert, Jack. **Analytical applications of ion-exchange separations.** *Anal. Chem.* 22, 1359-68(1950).—*C.A.* 45, 1458*i*.

Fundamental principles, removal of interfering substances, sepn. of cations from anions, purification of inorg. and biol. compds., detn. of trace impurities, complex ion stabilities, and evaluation of mol. structure were reviewed.

11867. Shishakov, N.A. **Electronography as a method for the physical chemistry of surface films.** *Zhur. Fiz. Khim.* 24, 1026-9(1950).—*C.A.* 45, 1405*e*.

11868. Silverman, Leslie. **Filtration through porous materials.** *Am. Ind. Hyg. Assoc. Quart.* 11, 11-20 (1950); *Heating and Ventilating* 47, No. 7, 68-74 (1950).—*C.A.* 45, 2270*c*, 2721*b*.

Types of filters applicable to the cleaning of air and gases released from industrial processes were reviewed.

11869. Sittig, Marshall. **Catalytic cracking. II.** *Petroleum Refiner* 29, No. 8, 99-104 (1950).—*C.A.* 45, 338*h*.

The Thermofor catalytic cracking process was considered, including a discussion of the process, control problems, catalyst development, transfer and regeneration, and recent development such as the Houdriflow process.

11870. Sollner, Karl. **Recent advances in the electrochemistry of membranes of high ionic selectivity.** *J. Electrochem. Soc.* 97, 139-51C (1950).—*C.A.* 44, 7678*c*.

11871. Steiner, H. **Some notes on oxide catalysts for dehydrogenation.** *Discussions Faraday Soc.* 1950, No. 8, 264-70.—*C.A.* 45, 9989*h*.

The active centers catalyzing the three steps which form the reaction sequence, viz., dehydrogenation, cyclization, and isomerization, were largely identical.

11872. STRAIN, HAROLD H. **Second annual review of analytical chemistry; fundamental analysis. Chromatography.** *Anal. Chem.* 22, 41-8 (1950).—*C.A.* 44, 1843*d*.

11873. SZYBALSKI, W. **Determination of amino acids by filter-paper chromatography.** *Przemysl Chem.* 6(29), 32-7 (1950).—*C.A.* 45, 10141*b*.

The principles underlying partition chromatography and its use in the detn. of amino acids were described.

11874. TACHIBANA, TARÔ. **Particles and surfaces. A lecture on colloid science.** *Nôgaku* (Sci. of Agr.) 4, 32-6, 150-4, 210-14, 276-9, 395-400 (1950).—*C.A.* 45, 2285*d*.

11875. TAYLOR, H.D. **Radioactive isotopes in chemical and industrial research.** *Bull. Brit. Coal Utilisation Research Assoc.* 14, 293-303 (1950).—*C.A.* 45, 3251*g*.

The principles, methods, and techniques with applications to chem. analysis, soly., vapor pressure, adsorption, surface area, diffusion, reaction kinetics, and industry were reviewed.

11876. TAYLOR, HUGH S. **The role of adsorption in colloid science.** *Frontiers in Chem.* 8, *Frontiers in Colloid Chem.* 1-28(1950).—*C.A.* 44, 5676*b*.

11877. TEREM, HALDUN NÜZHET. **Reactions in the solid state.** *Kimya ve Sanayi* 5, 22-31(1950).—*C.A.* 45, 1411*d*.

11878. TOMPKINS, EDWARD R. **Ion-exchange separations.** *Anal. Chem.* 22, 1352-9(1950).—*C.A.* 45, 912*d*.

Properties and uses of com. ion exchangers were discussed. Some current lab. procedures for equil. expts. and for column sepns. were described.

11879. UEMURA, TAKU AND SHIBATA, MURAJI. **Inorganic paper chromatography.** *J. Japan. Chem.* 4, 406-11 (1950).—*C.A.* 44, 9295*i*.

11880. VALENTIN, H. **New fields of application of chromatographic adsorption analysis in pharmacy.** *Suddeut. Apoth. Ztg.* 90, 500-3(1950).—*C.A.* 44, 9116*i*.

11881. WEIL, HERBERT. **Application of partition chromatography in industry.** *Chimie & industrie* 64, 432-8(1950).—*C.A.* 45, 913*a*.

11882. WEISS, D.E. **A novel method of using ion-exchange resins.** *Nature* 166, 66(1950).—*C.A.* 44, 9770*h*.

A chromatographic method was described for using ion-exchange resins under conditions that allow only one of two possible adsorption mechanisms (electrostatic and van der Waals forces). Both adsorption mechanisms were demonstrated.

11883. WESLY, W. **The use of synthetic resin ion-exchange systems.** *Melliand Textilber.* 31, 62-5, 127-30(1950).—*C.A.* 47, 4523*a*.

The properties, uses, and methods of operation of ion-exchange filters, known in Germany by Wofatit, were described.

11884. WEYL, W.A. **Role of ionic deformation in surface chemistry.** *Trans. N.Y. Acad. Sci.* 12, 245-56(1950).—*C.A.* 44, 9774*c*.

The polarizing effect of the asymmetric field was expected to alter the electron d. distribution of the ions so that the chem. behavior of the ions had directional properties. The rules were applied to the explanation of heterogeneous catalysis and other surface phenomena.

11885. WIELAND, TH. **The separation of amino acids through paper chromatography.** *Z. Electrochem.* 54, 412-13(1950).—*C.A.* 45, 10141*b*.

11886. AMERO, R.C. **Fuller's earth, a general review.** *Trans. Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 3024-H *Mining Eng.* 3, 441-6(1951). —*C.A.* 45, 6354*e*.

11887. ANON. **Research on the use of solid fuels.** *Coke and Gas* 13, 215-23(1951).—*C.A.* 46, 2775*h*.

A review of research in progress on fuel utilization at the British Coal Utilisation Research Station at Leatherhead was presented.

11888. ARNOLD, WILLIAM P. JR. **Medical uses of ion-exchange resins.** *New Engl. J. Med.* 245, 331-6(1951).—*C.A.* 46, 688*e*.

11889. BARTOS, L.H. **Control tests for the gel-forming properties of bentonites.** *Ceram. Age* 57, No. 5, 20-2(1951).—*C.A.* 45, 7760*d*.

11890. BASIŃSKI, ANTONI. **The characteristics and importance of ion-exchange resins.** *Wiadomości Chem.* 5, 133-52(1951).—*C.A.* 45, 9994*e*.

11891. BERG, CLYDE. **Hypersorption design. Modern advancements.** *Chem. Eng. Progress* 47, 585-91(1951).—*C.A.* 46, 296*e*.

Design factors and new applications were reviewed.

11892. BERKOWITZ, N. **The colloidal structure of coal.** *Brennstoff-Chem.* 32, 225-32(1951).—*C.A.* 45, 10542*a*.

It was possible, by briquetting under carefully controlled conditions, to impart the colloidal structure characteristic of natural coking coals to relatively soft lignites.

11893. BOULANGER, PAUL; BISERTE, GÉRARD, AND SCRIBAN, RENÉ. **Paper chromatography of amino acids as applied to plant chemistry and food chemistry.** *Ann. nutrition et aliment.* 5, 149-71 (1951).—*C.A.* 45 9423*b*.

11894. BÜCHI, J. **Ion exchanger in pharmacy and medicine.** *Arzneimittel-Forsch.* 1, 247-57(1951). —*C.A.* 46, 1715*a*.

Special uses in pharmacy and medicine were the deionization of water, and the prepn., purification, and analysis of alkaloids, of amino acids from protein hydrolyzates, of vitamins B_1 and B_2, and of antibiotics and various other pharmaceutical-chemical substances.

11895. Catoggio, José, A. **Chromatographic analysis.** *Anales direc. nacl. quím.* (Buenos Aires) 4, 98-123(1951).—*C.A.* 47, 2625*g*.

11896. Cramer, Fr. **Paper chromatography.** *Angew. Chem.* 63, 449-50(1951); *Monograph* No. 64, 81 pp.—*C.A.* 46, 804*d*.

Comprehensive directions were presented for paper chromatographic methods. The specific treatment covered sepn. of individual groups of substances such as the amino acids, sugars, purines, etc.

11897. d'Ans, Jean and Blasius, E. **Chromatography of electrolytes. II.** *Naturwissenschaften* 38, 236 (1951).—*C.A.* 46, 2242*b*.

Work with Dowex 2 as anion-exchange resin and Dowex 50 and Permutit RS as cation exchangers was reviewed in the analysis and synthesis of various complex inorg. salts such as Co-NH_3 complexes and Cr-aquo compds.

11898. Davis, Lannes E. **Cation-exchange equilibria.** *J. Am. Chem. Soc.* 73, 5006(1951).—*C.A.* 46, 8460*i*.

11899. Deibner, Léonce. **History of chromatography.** *Chim. anal.* 33, 135(1951).—*C.A.* 45, 5485*c*.

11900. Dickel, G. and Titzmann, K. **Ion exchangers as laboratory aids.** *Angew. Chem.* 63, 450-7 (1951).—*C.A.* 46, 804*c*.

Types of exchange compds., the laws of ion exchange, sepns. with ion exchangers, use of exchangers in chem. analysis and for preparative and general chem. purposes were reviewed.

11901. Dryden, I.G.C. **The physical structure and chemical nature of glance coals.** *Brennstoff-Chem.* 32, 321-4(1951).—*C.A.* 46, 1227*a*.

11902. Egloff, G. **Catalysis in petroleum refining.** *Riv. combustibili* 5, 269-95(1951).—*C.A.* 46, 1237*b*.

11903. Elving, Philip J. **Role of heterogeneous equilibria in analytical chemistry.** *Anal. Chem.* 23, 1202-9(1951).—*C.A.* 46, 847*e*.

11904. Farradane, J. **History of chromatography.** *Nature* 167, 120(1951).—*C.A.* 45, 4113*d*.

The real start of chromatographic analysis was credited to Goppelsroeder.

11905. Fuhrmeister, Charles Jr. **Improving filtration and filtration rates. Chemical and mechanical preparation of filter feed slurries.** *Chem. Eng. Progress* 47, 550-4(1951).—*C.A.* 46, 295*a*.

11906. Garner, W.E. **Catalysis and solid reactions.** *Chemistry & Industry* 1951, 1010-15.—*C.A.* 46, 1855*f*.

11907. Gilchrist, J.D. and Taylor, J. **Marco-pore size analysis of metallurgical coke.** *J. Inst. Fuel* 24, 207-11(1951).—*C.A.* 45, 9835*h*.

11908. Glueckauf, E. **The nature of ion exchangers.** *Endeavour* 10, 40-5(1951).—*C.A.* 46, 318*h*.

Cation and anion exchangers and the phys. chemistry of distribution equilibria were reviewed. A schematic representation was given of cross-linked sulfonated styrene exchangers involving styrene and divinylbenzene.

11909. Govindarajan, V.S. **Chromatography in the analysis of fatty oils and fatty acids.** *Proc. Symposium Indian Oils Fats Natl. Chem. Lab. India Poona* 1951, 242-7.—*C.A.* 47, 4631*e*.

11910. Grubitsch, H. **Surface films on metals.** *Finska Kemistsamfundets Medd.* 60, No. 1, 4-19 (1951).—*C.A.* 46, 7486*f*.

11911. Haensel, Vladimir. **Catalytic cracking of pure hydrocarbons.** *Advances in Catalysis* 2, 171-97(1951).—*C.A.* 45, 8337*a*.

11912. Harris, B.L. **Chemical engineering unit operations. Adsorption.** *Ind. Eng. Chem.* 43, 46-55 (1951).—*C.A.* 45, 1825*e*.

11913. Heide, R. von der. **Filtration with the aid of kieselguhr.** *Chem.-Ztg.* 75, 516-19, 539-41(1951).—*C.A.* 46, 1817*i*.

11914. Hellmann, Heinrich. **Paper chromatographic analysis.** *Z. ges. inn. Med.* 6, 577-89(1951).—*C.A.* 46, 11011*h*.

An app. employing a glass cylinder with a desiccator cover was described and recommended for either one or two-dimensional, ascending or descending paper chromatography.

11915. Hoog, H. **Catalysts. Choosing a catalyst. Catalyst manufacture. Recent applications.** *Chem. Eng.* 58, No. 12, 157-68(1951).—*C.A.* 46, 3183*a*.

A comprehensive review of selection, manuf., and industrial applications for catalysts.

11916. Hoog, H. and Verschoor, H. **The importance of catalysis in industry.** *Chem. Weekblad* 47, 479-87(1951).—*C.A.* 46, 1668*c*.

A review dealing with H_2SO_4, NH_3, MeOH, EtOH, phthalic anhydride, acetone, aviation gasoline, and synthetic rubber was presented.

11917. Hoy, H.R. and Whittingham, G. **Fundamental work on the combustion of small coal particles.** *Bull. Brit. Coal Utilisation Research Assoc.* 15, 69-78(1951).—*C.A.* 46, 1734*c*.

11918. Jasmund, K. **The silicate clay minerals.** *Monograph. "Angew. Chem." u. "Chem.-Ing. Tech."* No. 60, 7-142(1951).—*C.A.* 45, 6130*e*.

The properties, structure, and behavior of clay minerals were described and discussed.

11919. Jiménez de Abeledo, María E. **The study of clays.** *Ciencia e invest.* (Buenos Aires) 7, 487-99(1951).—*C.A.* 46, 1396*a*.

11920. Jones, W. Idris. **Recent developments in the thermal treatment of coal.** *J. Inst. Fuel* 24, 69-75(1951).—*C.A.* 45, 4426*e*.

The phys. and chem. changes occurring during coal heating and various products were discussed, including coke, carbon, coal plastics and briquets.

11921. Kipling, J.J. **Adsorption of nonelectrolytes from solution.** *Quart. Revs.* (London) 5, 60-74(1951).—*C.A.* 46, 2372*h*.

11922. Kirkpatrick, William J. **Nickel sulfide catalysts.** *Advances in Catalysis* 2, 329-39 (1951).—*C.A.* 45, 8337*a*.

11923. Kölbel, Herbert; Ackermann, Paul; Ruschenburg, Ernst; Langheim, Robert, and Engelhardt, Friedrich. **The Fischer-Tropsch synthesis with iron catalysts. I.** *Chem. Ing.-Tech.* 23, 153-7(1951).—*C.A.* 45, 6365*d*.

The subjects discussed were: improvement of catalyst surface, compn. of catalysts after use, Fe carbides, the reaction mechanism, catalyst compn. and promoters, and prepn. of precipitated catalysts.

11924. Lang, Walter. **Analysis of plant preparations by means of paper chromatography.** *Deut. Apoth.-Ztg.* 91, 125-9(1951).—*C.A.* 45, 10488*f*.

11925. Lee, Donald E. **Bentonite and bleaching clay in Japan.** *Gen. Headquarters Supreme Commander Allied Powers, Nat. Resources Sect., Rept.* No. 139, 28 pp.(1951).—*C.A.* 45, 3772*i*.

11926. Martin, S.L. **Catalysis.** *Intern. Chem. Eng. & Process Inds.* 32, 119-23(1951).—*C.A.* 46, 4338*a*.

The polymerization process, modern views on acids and bases, the Brönsted-Loury theory, the Lewis theory, and low-temp. catalytic polymerizations were reviewed.

11927. Maxted, E.B. **The poisoning of metallic catalysts.** *Advances in Catalysis* 2, 129-78 (1951).—*C.A.* 45, 8337*a*.

11928. McLaren, A.D. and Rowen, John W. **Sorption of water vapor by proteins and polymers: a review.** *J. Polymer Sci.* 7, 289-324(1951).—*C.A.* 45, 9992*g*.

11929. Miller, Shelby A. **Recent advances in filtration theory.** *Chem. Eng. Progress* 47, 497-501(1951).—*C.A.* 46, 294*f*.

11930. Möhler, Klement. **Chromatographic analysis on filter paper. A comprehensive review.** *Z. Lebensm.-Untersuch. u.-Forsch*, 92, 338-42 (1951).—*C.A.* 45, 6528*c*.

11931. Moralli, G. **Ion exchangers and their uses.** *J. recherches centre natl. recherche sci., Labs. Bellevue (Paris)* 1951, 332-6.—*C.A.* 46, 5*c*.

11932. Moring-Claesson, Ingrid. **Chromatography.** *Tek. Tid.* 81, 253-60(1951).—*C.A.* 45, 5559*c*.

11933. Muus, L.T. **The water sorption of textiles.** *Tids. Textiltek.* 9, 29-33(1951).—*C.A.* 45, 5932*h*.

The relation between the relative humidity of the atm. in textile mills and the moisture absorbed by the textiles, the sorption isotherms, electrostatic charge, and thermostatic effect of wool, cotton, and nylon were reviewed.

11934. Nachod, F.C. **Chromatography.** *Drug Standards* 19, 173-82(1951).—*C.A.* 46, 1330*e*.

11935. Oblad, A.G.; Milliken, T.H. Jr., and Mills, G.A. **Chemical chracteristics and structure of cracking catalysts.** *Advances in Catalysis* 2, 199-247(1951).—*C.A.* 45, 8337*a*.

11936. Ohlweiler, Otto Alcides. **Ion exchanges in analytic chemistry.** *Rev. brasil. quim.* (São Paulo) 31, 125-7(1951).—*C.A.* 45, 6525*h*.

11937. Oosterhoff, L.J. **Fundamentals of the theory of heterogeneous catalysis.** *Chem. Weekblad* 47, 406-15(1951).—*C.A.* 46, 1339*a*.

The theory of the activated complex was reviewed. If adsorption occurred directly in the activated state, adsorption of unactivated reactants was equiv. to a poisoning.

11938. Pacault, A. **Magnetic method of structural investigation of catalysts.** *Research* (London) 4, 548-55(1951).—*C.A.* 46, 2893*a*.

Examples were given of the application of the magnetic method to the detn. of the state of oxidation of a cation on a support and to studies of the state of dispersion of a catalyst on a support.

11939. Patton, A.R. **Quantitative paper chromatography for students.** *J. Chem. Education* 28, 629(1951).—*C.A.* 46, 1312*e*.

11940. Peterson, Sigfred. **Student experiments on ion exchange.** *J. Chem. Education* 28, 22-3 (1951).—*C.A.* 45, 4523*h*.

Water softening, recovery of La from dil. soln., and sepn. of Cu and Cd were covered.

11941. Pollard, F.H. and McOmie, J.F.W. **Analysis of inorganic compounds by paper chromatography.** *Endeavour* 10, 213-21(1951).—*C.A.* 46, 374*b*.

Historical survey of paper chromatography techniques developed for cations was presented.

11942. Primo Yúfera, Eduardo. **Ion-exchange resins. I. Theory and methods.** *Rev. cienc. aplicada* (Madrid) 5, 216-34(1951).—*C.A.* 46, 662*c*.

11943. Ransford, J.E. **Demonstration of ozone from bottle oxygen.** *J. Chem. Education* 28, 477(1951).—*C.A.* 46, 1317*c*.

Ozone was prepd. by passing O_2 through a U-tube packed with coarse steel wool, toward which an induction coil was being discharged.

11944. Reitema, K. **Survey of theories of filtration.** *Ingenieur* 63, CH, 1-7(1951).—*C.A.* 45, 4970*e*.

General laws could not be given since cake formation always took place.

11945. Rideal, E.K. **Concepts in catalysis. The contributions of Paul Sabatier and of Max Bodenstein.** *J. Chem. Soc.* 1951, 1640-7.—*C.A.* 45, 7833*e*.

11946, Rijnders, G.W.A. **Heterogeneous acid-base catalysis.** *Chem. Weekblad* 47, 621-8, 641-50 (1951).—*C.A.* 46, 2384*c*.

11947. Roudier, A. **Application of paper partition chromatography to qualitative and quantitative sugar analysis.** *Bull. assoc. tech. ind. papatiere* 5, 56-61(1951).—*C.A.* 45, 6119*d*.

11948. Rushton, J. Henry. **Catalytic oxidation of acetylene in air for oxygen manufacture.** *Advances in Catalysis* 2, 107-28(1951).—*C.A.* 45, 8337*a*.

11949. SAMUELSON, OLOF. **Investigations of complex salt solutions with the use of ion exchangers.** *Svensk Kem. Tid.* 63, 183-93 (1951) (in English).—*C.A.* 46, 848a.

11950. SAUNDERS, L. **Surface and colloid chemistry.** *J. Pharm. Pharmacol.* 3, 865-82(1951).—*C.A.* 46, 2372a.

11951. SCHEICHL, LUDWIG. **Chromatography- a recent method for the separation of complicated mixtures of substances.** *Seifen-Ole-Fette-Wachse* 77, 109-11, 135-7, 157-8(1951).—*C.A.* 45, 6456g.
Adsorption and partition chromatography were reviewed.

11952. SCHON, JÁNOS. **The chemistry of ion-exchange resins.** *Magyar Kem. Lapja* 6, 51-8(1951).—*C.A.* 45, 8677e.

11953. SCHUIT, G.C.A. **Theories of the catalytic activity of metals.** *Chem. Weekblad* 47, 569-78, 585-92, 601-7(1951).—*C.A.* 46, 2384d.

11954. SCHULER, ROBERT H.; BOYD, ALFRED C. JR., AND KAY, DANIEL J. **Experiments with ion exchange resins.** *J. Chem. Educ.* 28, 192-194(1951).
The separation of Cu^{++} from Ag^{+} by means of ion exchange was suggested as an experiment suitable for advanced undergraduate work.

11955. SELWOOD, PIERCE W. **Magnetism and the structure of catalytically active solids.** *Advances in Catalysis* 2, 27-106(1951).—*C.A.* 45, 8337a.

11956. SHOTT, JOHN III AND HEINE, HAROLD W. **A chromatographic separation of some dyes.** *J. Chem. Education* 28, 39-40(1951).—*C.A.* 45, 4457a.
The sepn. of fluorescein-methylene blue, methyl orange-methylene blue, and methyl orange-Victoria Blue B mixts. were covered.

11957. SILVERMAN, LESLIE. **Performance of industrial aerosol filters.** *Chem. Eng. Progress* 47, 462-8(1951).—*C.A.* 45, 9309b.

11958. SMITH, TORE H. **Chromatographic methods and their use in cellulose chemistry.** *Norsk Skogind.* 5, 141-8(1951).—*C.A.* 45, 10573i.
The principles and techniques of chromatography particularly as applied to sugars and sugar derivs. were reviewed.

11959. SPAUSTA, FRANZ. **Magnesium silicates or hydrosilicates.** *Radex Rundschau* 1951, 87-101.—*C.A.* 45, 10113e.
Mg silicates and hydrosilicates, including their formation and properties, synthetic production, hydrothermal synthesis, and transformations were reviewed.

11960. STORCH, H.H. **Process in petroleum technology. Liquid fuels from coal and oil shale.** *Advances Chem. Ser. No.* 5, 138-50(1951).—*C.A.* 45, 10558f.
The basic chem. and engineering problems involved in coal gasification, coal hydrogenation, hydrogenation of CO, retorting of oil shale, and refining of shale oil were presented.

11961. STRAIN, HAROLD H. **Chromatographic systems.** *Anal. Chem.* 23, 25-38(1951).—*C.A.* 45, 1897g.

11962. TOPP, N.E. **Ion-exchange resins.** *Science Progress* 39, 640-57 (1951).—*C.A.* 45, 10436d.
Kinetics of the exchange reactions, distribution of ions between soln. and ion-exchanger, theories of the process, deionization by such resins, and ion-exchange sepn. techniques were reviewed.

11963. TRAPNELL, B.M.W. **Balandin's contribution to heterogeneous catalysis.** *Advances in Catalysis* 2, 1-25(1951).—*C.A.* 45, 8337a.

11964. TRAWINSKI, H. **Hydrodynamics of fluidized particle beds.** *Chem.-Ing.-Tech.* 23, 416-19 (1951).—*C.A.* 46, 5c.

11965. VEGA, J. ALEMÁN. **Mechanism of catalytic oxidation.** *Rev. cienc. aplicada* (Madrid) 5, 408-18(1951).—*C.A.* 46, 3839e.

11966. WAESER, V. **Filtration of liquids.** *Kolloid-Z.* 121, 165-8(1951).—*C.A.* 45, 4970e.

11967. WEIDENHAGEN, R. **Paper chromatography of sugars.** *Zucker* 4, 275-80(1951).—*C.A.* 45, 8789h.

11968. WEIL, HERBERT. **Continuous and discontinuous ion exchange.** *Chimica e industria* (Milan) 33, 287-94 (1951).—*C.A.* 46, 6866i.
Principles, methods, and equipment were reviewed.

11969. WEST, PHILIP W. **Microchemical applications of catalytic and induced reactions.** *Anal. Chem.* 23, 176-80(1951).—*C.A.* 45, 3751f.
The status of catalytic and induced reactions in quant. and qual. micro-work, especially in spot tests were reviewed.

11970. WEYL, W.A. **A new approach to surface chemistry and to heterogeneous catalysts.** *Penna. State Coll. Mineral Inds. Expt. Sta. Bull.* No. 57, 118 pp. (1951).—*C.A.* 46, 330f.

11971. WHEELER, AHLBORN. **Reaction rates and selectivity in catalyst pores.** *Advances in Catalysis* 2, 250-327(1951).—*C.A.* 45, 8337a.

11972. WICKE, E. **Heat transfer and reactions in fluidized particle beds.** *Chem.-Ing.-Tech.* 23, 405-8(1951).—*C.A.* 46, 6b.

11973. WICKE, E. **Mass and heat transfer in gas-solid system.** *Chimia* (Switz.) 5, 173-81(1951) (in German).—*C.A.* 46, 3333d.
Heat transfer in empty tubes, packed tubes and pebble heaters was discussed generally.

11974. YANOVSKIĬ, M.I. **Chromatographic method of determination of adsorption isotherms, isobars, and isosteres.** *J. Appl. Chem. U.S.S.R.* 24, 745-50(1951)(Engl. translation).—*C.A.* 47, 2568f.

11975. ANDERSON, J. WILLIAM. **Engineering for ion exchange. II.** *Chemistry in Can.* 4, No. 10, 41-4(1952).—*C.A.* 47, 921b.

11976. ANDERSON, ROBERT B.; FELDMAN, JULIAN, AND STORCH, HENRY H. **Synthesis of alcohols by hydrogenation of carbon monoxide.** *Ind. Eng. Chem.* 44, 2418-24(1952).—*C.A.* 47, 291e.
Processes for the hydrogenation of CO to alcs. (Fischer-Tropsch synthesis) were divided into

groups: (1) catalysts difficultly reducible oxides, including the MeOH synthesis, the higher-alc. synthesis, and the iso synthesis, (2) variations of the Fischer-Tropsch synthesis over Fe catalysts.

11977. ANDO, TOSHIO AND ISHII, SHINICHI. **Identifications of halogens in organic compounds by means of paper chromatography.** *Bull. Chem. Soc. Japan* 25, 106-9(1952)(in English).—*C.A.* 47, 1538*c*.

11978. ANON. **Adsorption. Introduction.** *Chem. Eng.* 59, No.10, 149(1952).—*C.A.* 47, 7*a*.

11979. BARDENHEUER, P. **Gases in metals.** *Metall* 6, 351-6(1952).—*C.A.* 46, 8919*g*.
The absorption and behavior of gases in metals were discussed.

11980. BAUER, LEOPOLD. **Separation of carotenoids and chlorophylls by paper chromatography.** *Naturwissenschaften* 39, 88(1952).—*C.A.* 47, 446*e*.
The sepn. obtained with different solvents was illustrated for one- and for two-dimensional chromatography of leaf exts.

11981. BENDER, MAX. **The use of light scattering for determining particle size and molecular weight and shape.** *J. Chem. Education* 29, 15-23 (1952).—*C.A.* 46, 1825*b*.

11982. BEYER, ERNST. **Chromatographic procedures.** *Arch. Pharm.* 285, 129-50(1952).—*C.A.* 46, 10531*f*.

11983. BLOOIS, F.I. VAN. **Chromatography.** *Rubber* 8, 75-6(1952).—*C.A.* 47, 4641*b*.
The technique was used in the rubber lab. for identifying accelerators, softeners, and antioxidants.

11984. BOLDINGH, J. **Various forms of chromatography and some of their technical aspects. I. II.** *Chem. Weekblad* 48, 1-11 17-22(1952).—*C.A.* 46, 9462*a*.

11985. BÖSWART, J. AND JINDRA, A. **Paper chromatography.** *Československ farm.* 1, 667-81(1952).—*C.A.* 47, 5071*a*.
Methods and uses were reviewed.

11986. BRACE, A.W. **Gas removal from molten aluminum alloys.** *Foundry Trade J.* 93, 3-11 (1952).—*C.A.* 46, 8594*c*.
An investigation of the use of Cl_2 and volatile chlorides to eliminate gases was reported.

11987. BRAENDLE, H.A. **A midcentury review of rubber carbons.** *Rubber India* 4, 15-27; *Rubber Age* (N.Y.) 70, 609-16(1952).—*C.A.* 46, 5351*f*, 11750*e*.
The importance of specific surface area, pH, and structure, the part played by the electron microscope, anomalies (roughness, unsatn., and gel), and new types of carbon black, were reviewed.

11988. BRITTON, J. BOYD AND SMITH, W.R. **Carbon black, black but useful.** *Kautschuk Anwendungen* 2, 122-4(1952).—*C.A.* 47, 1914*f*.

11989. BROOKS, J.D. **Fractionation of coal extracts by partition chromatography.** *Research* (London) 5, 93-4(1952).—*C.A.* 46, 7731*e*.
An ethylenediamine soln. of a low-rank coal was fractionated by using paper partition chromatography.

11990. BROWN, C.O. AND WAINWRIGHT, R.B. **Cat cracker catalysts. How they work best.** *Chem. Eng.* 59, No. 11, 148-9, 362-4, 366-8, 370-2 (1952).—*C.A.* 47, 1920*e*.
In fluid catalytic cracking units, best results were attained if the catalyst contained the optimum mixt. of particle sizes and if the operation of the units was smoothly controlled.

11991. BROWNING, FRANK M. **Vapor-phase processes serve industry well.** *Chem. Eng.* 59, No. 10, 158-61(1952).—*C.A.* 47, 7*a*.

11992. BUSCHE, ROBERT M.; BATCHELDER, HOWARD R., AND ARMSTRONG, WILLIAM P. **A selected bibliography of coal gasification.** *U. S. Bur. Mines, Rept. Invest.* No. 4926, 28 pp.(1952).—*C.A.* 47, 1356*c*.
The subjects were: thermodynamics of gasification, reaction kinetics, math, analysis of gasification, reaction of O_2 with carbon, reaction of O_2 with CO, reaction of O_2 with H_2, reaction of carbon with steam, reaction of carbon with CO_2, water-gas shift reaction, reactivity, heat-transfer considerations, gasifier design and operation, and particle size, dynamics, and compn.

11993. CREMER, E. **Study of surface structure by means of adsorption and catalysis.** *Z. Elektrochem.* 56, 439-46(1952).—*C.A.* 47, 392*h*.

11994. CROWELL, ALBERT D. **The adsorption of gases on metal filaments, films, and single crystals.** *Am. J. Phys.* 20, 89-98(1952).—*C.A.* 47, 20*i*.
The concepts involved in the study of adsorption of gases on solids, especially on uniform surfaces, were reviewed.

11995. DEDONDER, R. **Sugars and related compounds.** *Bull. soc. chim. France* 1952, 874-83.—*C.A.* 47, 1958*c*.
Paper chromatographic techniques for sugars, alcs., and phosphoric acid esters derived from them, and heterosides were reviewed.

11996. DESIKACHAR, N.; RAO, T.V. SUBBA; VENUGOPAL, T., AND NAMBIAR, P.S.R. **Utilization of wastes in the refining, bleaching, and hydrogenation of vegetable oils.** *Indian Soap J.* 17, 289-93(1952).—*C.A.* 47, 3009*e*.

11997. DEVEY, JAMES D. **Paper chromatography in the food industry.** *Food Manuf.* 27, 416-17 (1952).—*C.A.* 47, 1866*a*.

11998. DEVIENNE, MARCEL. **Condensation and adsorption of molecules on a surface in rarefied atmosphere.** *Mem. sci. phys.* No. 53, 1-86(1952).—*C.A.* 47, 2010*h*.
The review included binding and reflection of mols. on a surface, vaporization of mols. or atoms constituting a thin film on a surface, theories of condensation, adsorption, and vaporization of mols., and field of forces in the vicinity of a surface.

11999. DRAKE, BIRGER. **Partition chromatography.** *Svensk Kem. Tidskr.* 64, 335-40 (1952).—*C.A.* 47, 4145*h*.

The work in the field of partition chromatography by the Nobel prize winners Archer J. P. Martin and Richard L. M. Synge was described.

12000. DUBININ, M.M. **Adsorption of gases and vapors and the structure of adsorbents.** *Uspekhi Khim.* 21, 513-33(1952).—*C.A.* 47, 2012*h*.

12001. DUBININ, M.M. **Porous structure of adsorbents.** *Compt. rend. réunion ann. avec comm. thermodynam., Union intern. phys.* (Paris) 1952, Changements de phases 437-41—*C.A.* 47, 6734*h*.

12002. ENGEL, CHR. **Reaction chromatography.** *Chem. Weekblad* 48, 766-7(1952).—*C.A.* 47, 1460*c*.
Chem. reactions occurring in chromatography that may be used with advantage to perform sepns. were surveyed.

12003. FISCHER, J. AND BECHTEL, H. **Methods for determining oxygen in metals.** *Z. Erzbergbau u. Metallhüttenw.* 5, 14-19(1952).—*C.A.* 46, 3902*e*.
The detn. of O_2 in Cu, Pb, Al and Zn was reviewed.

12004. FUCHS, WALTER. **Chemistry of coals.** *Industrie chim. Belge* 17, 944-8(1952).—*C.A.* 47, 2956*f*.
Microörganisms of variable reducing power were responsible for increased carbonization of carbonaceous deposits.

12005. GRASSMANN, W. AND DEFFNER, G. **Chromatography.** *Chem.-Ztg.* 76, 623-6(1952).—*C.A.* 47, 4689*a*.
Columnar chromatography was especially suitable for the sepn. of large quantities to be analyzed.

12006. GROSSE, ARISTID V. **Catalytic chemistry of hydrocarbons.** *Record Chem. Progress* 13, 55-64 (1952).—*C.A.* 46, 10593*g*.

12007. GUIBOT, A. **The problem of "combined" water in biological colloids.** *Inds. agr. et aliment.* (Paris) 69, 7-13(1952).—*C.A.* 47, 2570*b*.

12008. HAIS, I.M. **Paper chromatography of radioactive substances.** *Českoslov. farm.* 1, 681-704(1952).—*C.A.* 47, 4781*f*.

12009. HALSEY, GEORGE D. JR. **The role of surface heterogeneity in adsorption.** *Advances in Catalysis* 4, 259-69 (1952).—*C.A.* 46, 7749*d*.

12010. HARRIS, B.L. **Chemical engineering unit operations. Adsorption.** *Ind. Eng. Chem.* 44, 30-8 (1952).—*C.A.* 46, 1822*a*.

12011. HAUSER, ERNST, A. AND JORDAN, J.W. **"Organophilic" clays.** *Silicates ind.* 17, 9-10 (1952).—*C.A.* 46, 3722*b*.

12012. HEERTJES, P.M. **Technical filtration.** *Chem. Weekblad* 48, 573-8(1952).—*C.A.* 47, 6190*c*.
The effects of filtercake compaction and grain configuration required addnl. research.

12013. HELBIG, WALTER A. **Liquid-phase processes are important.** *Chem. Eng.* 59, No. 10, 153-7 (1952).—*C.A.* 47, 7*a*.

12014. HILL, TERRELL L. **Theory of physical adsorption.** *Advances in Catalysis* 4, 211-58 (1952).—*C.A.* 46, 7749*d*.

12015. HOFMANN, U. **New knowledge in the field of thixotropy, especially clay gels.** *Kolloid-Z.* 125, 86-99(1952).—*C.A.* 46, 5936*e*.

12016. HONDA, MASATAKE. **Ion-exchange resins.** *Kagaku* (Science) 22, 285-94(1952).—*C.A.* 46, 10777*g*.

12017. JAQUES, T.A.J. **Vacuum coating by sputtering and thermal evaporation methods.** *Ministry of Supply, Harwell, Berks. (Engl.) At. Energy Research Estab., Unclassified* C/R 861, 22-6 (1952).—*C.A.* 46, 11079*d*.

12018. JONES, W. IDRIS. **Recent researches on and developments in the carbonization of coal.** *Gas World* 135, No. 3520, Coking Sect., 15-18 (1952).—*C.A.* 46, 3236*c*.

12019. KAINER, FRANZ. **Alumina gel-metal oxide contact catalysts.** *Kolloid-Z.* 128, 37-43(1952).—*C.A.* 46, 9962*i*.
Patents were reviewed.

12020. KIRCHHOF, F. **Technical carbon black and its use in the rubber industry. IV.** *Gummi u. Asbest* 5, 435-9(1952).—*C.A.* 47, 1914*f*.

12021. KOLTHOFF, I.M. **Aging of crystalline precipitates.** *Analyst* 77, 1000-11(1952).—*C.A.* 47, 2014*e*.

12022. KRESSMAN, T.R.E. **The practical possibilities of ion exchange. I. The separation of ions. II. Ion exchangers in chemical analysis. III. Ion exchange in the organic biochemical, and medical fields. IV. New processes and materials.** *Mfg. Chemist* 23, 93-5, 98, 149-51, 160, 194-7, 241-3(1952).—*C.A.* 46, 8903*e*.

12023. LAPIDUS, LEON. **Theory and practice are converging.** *Chem. Eng.* 59, No. 10, 164-6(1952).—*C.A.* 47, 7*a*.

12024. LEDERER, EDGAR. **Theoretical and practical aspects of paper chromatography.** *Bull. soc. chim. France* 1952, 815-21—*C.A.* 47, 1460*d*.
The limitations, technique, and mechanism of paper chromatography, factors affecting R_F values, and some applications of the method. were reviewed.

12025. LÓPEZ PECIÑA, DARIÓ. **The combustion of carbon in cement kilns.** *Cemento-Hormigón* (Barcelona) 20, 266-72, 300-8, 330-6, 363-9 (1952).—*C.A.* 47, 4057*d*.
The thermochemistry and stoichiometry of carbon combustion were reviewed in detail.

12026. MACEK, K. **Adsorption chromatography and its use in pharmacy.** *Českoslov. farm.* 1, 657-66 (1952).—*C.A.* 47, 5071*f*.

12027. MANTELL, C.L. **Bigger role lies ahead.** *Chem. Eng.* 59, No. 10, 166-8(1952).—*C.A.* 47, 7*a*.

12028. MARINI-BETTÓLO, G.B. **The methods and new developments of chromatography.** *Chimica e industria* (Milan) 34, 269-81(1952).—*C.A.* 46, 11011*e*.

Examples were given of the use in medicine, in the analysis of explosives and biol. secretions, and in toxicological and inorg. analyses.

12029. Martinez Cordon, Jose Luis. **Chromatography and its applications to fuels.** *Combustibles* (Zaragoza) 12, 243-58, 333-51(1952).—*C.A.* 47, 6113*c*.

12030. Mathey, M.P. **The importance of pH control in the dyeing of wool.** *Tinctoria* 49, 21-3, 57-9(1952).—*C.A.* 46, 5847*g*.

12031. Merims, Robert. **Fixed-bed design more empirical than moving bed.** *Chem. Eng.* 59, No. 10, 161-3(1952).—*C.A.* 47, 7*a*.

12032. Moore, S. and Stein, W.H. **Chromatography.** *Ann. Rev. Biochem.* 21, 521-46(1952).—*C.A.* 46, 10039*e*.
The innovations in principles and practice of partition, paper, and column chromatography for the past 2 years were reviewed.

12033. Partridge, M.W. **Applications of chromatography in pharmacy.** *J. Pharm. and Pharmacol.* 4, 217-30(1952).—*C.A.* 46, 7283*i*.

12034. Patel, S.M. **Principles and application of chromatography.** *Indian J. Pharm.* 14, 27-34 (1952).—*C.A.* 46, 8564*h*.

12035. Pepper, K.W. **Ion-exchange resins.** *Plastics Inst.* (London), *Trans.* 20, No. 41, 68-84 (1952).—*C.A.* 47, 796*h*.
Applications for recovery of metals, removal of Fe from H_3PO_4 pickle solns., the prepn. of silicic acid solns., and medical applications were discussed.

12036. Plavšić, N. and Zamberlin, I. **Synthetic silica-alumina cracking catalysts.** *Nafta* (Yugoslavia) 3, 274-81(1952).—*C.A.* 47, 6127*a*.

12037. Preston, J.M. **Removal of water from textiles.** *Bull. inst. textile France* No.30, 467-75(1952).—*C.A.* 47, 2494*f*.
The ways in which H_2O was mechanically held by fabrics, as contrasted to that chemically bound were reviewed.

12038. Prettre, Marcel. **Silica and alumina gels.** *Bull. assoc. franc techniciens pétrole* No. 91, 23-41(1952).—*C.A.* 47, 5581*b*.

12039. Quastel, J.H. **Synthetic soil conditioners and soil structure.** *Science Progress* 40, 385-402(1952).—*C.A.* 46, 8792*i*.
The effect was reviewed of polyuronides, polysaccharides, cellulose esters, and synthetic soil conditioners upon soil aggregation and aeration.

12040. Ries, Herman E., Jr. **Structure and sintering properties of cracking catalysts and related materials.** *Advances in Catalysis* 4, 87-149 (1952).—*C.A.* 46, 7749*d*.

12041. Roberts, Thomas H.; Willeford, B.R. Jr., and Alberty, Robert A. **An ion-exchange experiment for physical chemistry.** *J. Chem. Education* 29, 545-8(1952).—*C.A.* 47, 2553*d*.
Ni and Co ions were adsorbed in an ion-exchange column filled with Dowex 50 W resin. These ions were eluted at a rate of 5 ml/cm^2/min. with a 5% citric acid soln. adjusted to a pH of 3.24 with NH_4OH.

12042. Sadek, Hussein. **Adsorption on nonuniform surfaces.** *Euclides* (Madrid) 12, 133-40(1952). —*C.A.* 46, 9930*f*.

12043. Schaeffler, A.L.; Campbell, H.C., and Thielsch, H. **Hydrogen in mild-steel weld metal.** *Welding J.* (N.Y.) 31, 283-309 (1952). —*C.A.* 46, 7493*c*.

12044. Schulman, J.H. and Smith, T.D. **Selective flotation of metals and minerals.** *Kolloid.-Z.* 126, 20-35(1952).—*C.A.* 46, 7827*c*.

12045. Sherwood, Peter W. **Hydroforming with fluid-bed catalysts.** *Erdöl u. Kohle* 5, 295-6 (1952).—*C.A.* 46, 7749*h*.
Industrial application of the hydroforming process was reviewed.

12046. Sherwood, Peter W. **The aging of cracking catalysts.** *Erdöl u. Kohle* 5, 488-9(1952).—*C.A.* 47, 298*i*.

12047. Smith, James Boyd. **A lecture demonstration of ion exchange.** *J. Chem. Education* 29, 292-4 (1952).—*C.A.* 46, 7381*a*.

12048. Srinivasan, M. and Subramanian, N. **Chromatography and food analysis.** *Bull. Central Food Technol. Research Inst. Mysore* 2, 44-7, 75-9(1952).—*C.A.* 47, 7125*d*.

12049. Stokes, C.A. and Friedenstein, Hanna. **Physical and chemical properties of commercial charcoals in relation to industrial use.** *Northeastern Wood Utilization Council Bull.* No. 37, 7-19(1952).—*C.A.* 46, 4200*c*.
Charcoal was seldom made to exact specifications. However, its characteristics included low ash, 1.5-3.5%; low-S compds., 0.02-0.03%; and low d. The chief industrial use for charcoal was in the production of CS_2.

12050. Surak, John G. and Schlueter, Donald P. **Introductory experiments in inorganic paper chromatography.** *J. Chem. Education* 29, 144-5 (1952).—*C.A.* 46, 8564*i*.
A drop of soln., placed on a strip of filter paper 35 × 1.5 cm and allowed to dry, was developed with a soln. contg. H_2O 15, acetoacetic ester 10, and *n-* or *tert-*BuOH 75% (contg. enough HOAc to give pH 3.5-4.0) in a corked 300-mm test tube. After 20 hrs the paper was dried and the cations identified by spraying with KI or $K_2Cr_2O_7$ (for Group I cations) or by exposure to H_2S (for Group II or IIa ions).

12051. Tompkins, Edward R. **Application of ion exchange to analytical chemistry.** *Analyst* 77, 970-82(1952).—*C.A.* 47, 1529*d*.

12052. Treybal, Robert E. **Techniques are ideal for difficult separations.** *Chem. Eng.* 59, No. 10, 150-2(1952).—*C.A.* 47, 7*a*.

12053. Trumbore, Conrad N. and Rogers, Horace E. **Experiments in paper partition chromatography.** *J. Chem. Educ.* 29, 404-5(1952).—*C.A.* 47, 3652*g*.

Chromatographic sepns. of the group I cations were studied as a function of pH and compn. of the BuOH-glacial AcOH solvent.

12054. ULLRICH, W. **Ion exchangers and their application.** *Österr. Apoth.-Ztg.* 6, 77-8(1952).—*C.A.* 46, 3330*g*.

12055. VEERSCHOOR, H. **Some chemical engineering problems concerned with catalytic processes in the liquid-fuel industry.** *Chem. Eng. Sci.* 1, 216-19(1952).—*C.A.* 47, 1915*i*.

Chem. engineering problems involved in the design of catalytic processes (various methods for carrying out catalytic reactions, fixed bed, trickle, slurry, moving bed, and fluidized bed were reviewed.

12056. VLIES, G.S. VAN DER. **The development and applications of technical ion exchangers.** *Chem. Weekblad* 48, 350-5(1952).—*C.A.* 46, 7680*g*.

12057. VOITURET, KARL. **Ion exchangers and their applications in technology.** *Seifen-Öle-Fette-Wachse* 78, 67-70, 91-3, 146(1952).—*C.A.* 47, 6069*g*.

12058. VOŠAHLÍK, B.; KOŠTÍŘ, J.V., AND JINDRA, A. **Paper chromatography in pharmaceutical analysis.** *Československ. farm.* 1, 204-6(1952).—*C.A.* 46, 10533*i*.

12059. WEIL, HERBERT. **Fifty years of petroleum chromatography. II. Technological era.** *Petroleum Processing* 7, 973-6(1952).—*C.A.* 46, 10593*f*.

12060. WILLIAMS, A.F. **Application of chromatography to the paper industry.** *Proc. Tech. Sect., Brit. Paper and Board Makers' Assoc.* 33, 85-101 (1952).—*C.A.* 46, 8369*e*.

The use of paper and columns of cellulose for the sepn. of metal ions was reviewed.

12061. YASUMURA, JIRO. **Raney nickel catalyst.** *Kagaku no Ryoiki* (J. Japan Chem.) 6, 733-40 (1952).—*C.A.* 47, 6234*a*.

12062. YLSTRA, J. **Principles of chromatography.** *Chem. Weekblad* 48, 793-8, 813-20(1952).—*C.A.* 47, 1529*d*.

12063. ZIMMERMANN, G. **New methods for paper chromatography.** *Chem. Tech.* 4, 149-52 (1952).—*C.A.* 46, 9010*i*.

12064. ALLISON, C.L.; READ, DAVIS; HOGE, A.W.; SHAMBAUGH, J.P.; FISCHBECK, A.D.; ZIMA, A.G.; PENISTEN, J.R.; CARLTON, RICHARD, AND MORRISON, MELVIN. **Catalyst poisons—and what to do about them.** *Petroleum Refiner* 32, No. 2, 125-7(1953). —*C.A.* 47, 5670*g*.

A panel discussion of poisoning of cracking catalysts was presented.

12065. EGLOFF, GUSTAV. **Catalysis in the refining of petroleum.** *Bull. assoc. franc. techniciens petrole* No. 97, 31-55(1953).—*C.A.* 47, 5671*a*.

12066. ERNE, KURT. **Developments in the field of paper chromatography.** *Farm. Revy* 52, 35-9, 53-64(1953).—*C.A.* 47, 4240*d*.

12067. GENIE, GUY. **Introduction to chromatography.** *Sucr. belge* 72, 221-30(1953).—*C.A.* 47, 4239*h*.

12068. GRIESSBACH, R. **Development and study of ion exchange adsorbents.** *Z. Elektrochem.* 57, 147-162(1953).

The general properties of exchangers as well as recent applications were reviewed. Numerous photomicrographs are included in the paper.

12069. HARRIS, B.L. **Chemical engineering unit operations. Adsorption.** *Ind. Eng. Chem.* 45, 24-31(1953).—*C.A.* 47, 1985*b*.

12070. JENNEN, J.J. **Hydrogen bridges and chromatographic separability.** *Mededel. Vlaam. Chem. Ver.* 15, 29-60 (1953).—*C.A.* 47, 6735*g*.

12071. JUHOLA, A.J. **Physical chemistry of hydrocarbons. Separation and purification of hydrocarbons by selective adsorption.** *Phys. Chemistry of Hydrocarbons* 2, 319-89 (1953).—*C.A.* 47, 6125*f*.

12072. KRESSMAN, T.R.E. **Ion-exchange resins: what they are and how they work.** *Chem. Products* 16, 3-7(1953).—*C.A.* 47, 5581*a*.

12073. PEPPER, K. AND REICHENBERG, R. **The influence of the degree of cross linking on certain fundamental properties of cation exchange resins of the sulfonated cross linked polystyrene type.** *Z. Elektrochem.* 57, 183-188 (1953).

Theories of ion exchange employed to justify the variation of resin volume and degree of hydration with change in cross-linkage were reviewed.

12074. RUSSELL, ALLEN S. **Alumina properties.** *Aluminum Co. of America, Research Labs., Tech. Paper* No. 10, 35 pp. (1953).—*C.A.* 47, 4562*h*.

12075. THOMPSON, JOSEPH; MCGARVEY, FRANCIS X.; WANTZ, JOHN F.; ALLING, S.F.; GILWOOD, M.E., AND BABB, DAVID R. **Mixed-bed ion exchange. A symposium covering theory, design of production units, and production results. II. Production results.** *Chem. Eng. Prog.* 49, 341-8, 437-42 (1953).—*C.A.* 47, 8929*e*, 9673*i*.

Theory, chem. basis, phys. considerations, design of production units, operation, construction materials, operational factors, and construction influences were discussed.

12076. WEIL, HERBERT. **Industrial petroleum chromatography. III. The work of the U.S. National Bureau of Standards.** *Petroleum* (London) 16, 40-3, 54(1953).—*C.A.* 47, 5101*h*.

The work done in conjunction with the American Petroleum Inst. Project No. 6 on the chromatographic sepn. of hydrocarbons was reviewed.

12077. WEIL, HERBERT. **Chromatographic techniques for petroleum.** *Can. Chem. Processing* 37, No. 3, 92-4(1953).—*C.A.* 47, 6125*a*.

12078. WEIL, HERBERT. **Color chromatography.** *Farbe u. Lack* 59, 128-37(1953).—*C.A.* 47, 6302*b*.

12079. WEIL, HERBERT AND WILLIAMS, T.I. **Problems of chromatographic technology.** *Research* (London) 6, 16-20(1953).—*C.A.* 47, 3080*i*.

12080. Willard, J.E. **Applications of radiotracers to the study of surfaces.** *J. Phys. Chem.* 57, 129-34(1953).—*C.A.* 47, 6736*c*.

This review of recent radiotracer studies of reactions of surfaces included the following examples: (1) reactions of glass with aq. solns., (2) reactions of glass with Br_2 vapor, (3) detn. of striking coeffs., (4) surface reactions with low-vapor-pressure compds., (5) adsorption at soln.-air interfaces, (6) depth of surface penetration by adsorbed layer, (7) mechanism of Fischer-Tropsch synthesis, (8) surface exchange reactions of Al halides.

VI-2. Chemical Composition, Sampling

12081. Annetts, May and Newman, Lorne. **Spectroscopic estimation of adsorbed ions.** *J. Phys. Chem.* 40, 187-93(1936).—*C.A.* 30, 3297⁷.

The adsorptions of various ions on a Au and a Cu sol were detd. by spectroscopic methods. When Au sols stabilized by NaOH were pptd. by $AlCl_3$, at least 90% of the Al ions were adsorbed by the Au and at least 98% of the Na ions remained in the supernatant liquid. When Cu sols, positively charged, were pptd. by the min. necessary quantity of $MgCrO_4$, at least 90% of the CrO_4 ions were adsorbed by the Cu and at least 95% of the Mg ions remained in the supernatant liquid.

12082. Schütze, Max. **New method for the direct determination of oxygen in organic substances.** *Z. anal. Chem.* 118, 245-58(1939).—*C.A.* 34, 2286².

The method consisted in decompg. the substance and leading the "cracked" products over charcoal which was heated to 1000°C in a stream of pure N_2. Then, at room temp., the CO was oxidized with I_2O_5 and the CO_2 collected in an absorption tube contg. P_2O_5, pumice, and soda-asbestos.

12083. Aĭzenshtadt, E.I. **Microdetermination of carbon and hydrogen in an apparatus with ground stopcocks.** *Zavodskaya Lab.* 9, 360 (1940); *Khim. Referat. Zhur.* 1940, No. 9, 58. —*C.A.* 37, 554³.

The side arms of the absorption tubes were equipped with stopcocks and connected with each other by means of glass tubing with stopcocks at both ends. This construction prevented the lubricant from reaching the absorption tubes.

12084. Koshurnikov, M.N. **The physical characteristics of the principal substances composing clays.** *Ogneupory* 1940, No. 7, 320-4; *Khim. Referat. Zhur.* 4, No. 4, 38 (1941).—*C.A.* 37, 4991⁷.

Montmorillonite was dehydrated in 2 phases. The liberation of approx. 75% of the water content, which was of the adsorbed or zeolitic character, occurred in the 1st phase on heating to 300°C. The 2nd phase, occurring on heating to 450-600°C, liberated 5-7% of water, which was not taken up after the liberation of the zeolitic water. Heating to above 800°C resulted in the decompn. of the mineral into mullite and sillimanite.

12085. Neĭland, K.K. **The application of the carbometer for the determination of carbon in steel.** *Zavodskaya Lab.* 9, 1139-44 (1940); *Khim. Referat. Zhur.* 4, No. 4, 85 (1941).—*C.A.* 37, 4934⁸.

The app. was suitable for the analysis of open-hearth steels contg. C 0.35-1.50%. The samples were taken, and the test made in 2 min. for the tempered and 3 min. for the untempered samples. The accuracy of the detns. was equal to that of rapid chem. analysis.

12086. Caillere, Simonne. **An adsorbing clay from the rhyolitic cinerite of Bourboule (Puy-de-Dome).** *Compt. rend.* 213, 489-91(1941). —*C.A.* 37, 3371³.

The compn. of the cinerite was SiO_2 63.53, Al_2O_3 14.81, Fe_2O_3 4.46, FeO 0.03, CaO 1.10, MgO 0.51, K_2O 4.57, Na_2O 1.04, H_2O^- 2.93, H_2O^+ 6.54 and sum 99.52%. After standing a month in storage in contact with air, the compn. becomes SiO_2 14.72, Al_2O_3 4.20, Fe_2O_3 6.19, MgO 0.32, H_2O^- 72.02, H_2O^+ 2.55, and sum 100.00%.

12087. Dobine, Mathieu. **Purification of blood charcoal; method of determination of the HCl contained in the carbon.** *Compt. rend.* 212, 790-3(1941).—*C.A.* 39, 602⁷.

The best method for the purification of the charcoal was to treat first with HCl, then with with soda in the cold and then wash with water. HCl was detd. by igniting the charcoal in a stream of dry CO_2-free air and absorption of the HCl in $AgNO_3$ or alkali. The HCl content reached a min. during the washing process, then increased.

12088. Polanco, Luis Pombo. **The electrical apparatus "Trub-Tauber" for the determination of carbon dioxide and of combined carbon monoxide and hydrogen in combustion gases.** *Cemento* (Barcelona) 9, 231-6 (1941).—*C.A.* 37, 3640⁴.

The app. and explanation of the method was described for the detn. of CO + H_2 by the heat generated due to combustion and the detn. of CO_2 by the thermal cond. compared to air.

12089. Siegfried, H. **Wood charcoal analyses.** *Schweiz, Brau. Rundschau* 52, 67-8 (1941); *Chem. Zentr.* 1942, I, 829.—*C.A.* 37, 2913⁷.

Twenty-four samples of wood charcoal were analyzed for moisture, ash, and pure carbon. A relationship between pure carbon content and heating value was detd.

12090. Grangaud, Rene. **Microdetermination of volatile substances by diffusion. A new apparatus and its application to determination of carbonates, especially those in bone.** *Compt. rend. soc. biol.* 136, 529-31 (1942).—*C.A.* 37, 4027².

By means of a special dropping funnel, acid was added to the sample in a container suspended in the upper part of a stoppered Erlenmeyer flask. The evolved CO_2 diffused into 0.05 *N* $Ba(OH)_2$ placed in the bottom of the flask; 5-6 hrs were allowed for complete absorption.

12091. KLEMENT, R.; HÜTER, F., AND KÖHRER, K. **Do carbonate apatites form in aqueous systems?** *Z. Elektrochem.* 48, 334-6(1942).—*C.A.* 37, 5669^9.

Prepns. of Ca phosphate pptd. in the presence of carbonate were interpreted as being mixts. of hydroxyapatite and $CaCO_3$.

12092. PEYRONEL, GIORGIO. **Vanadates of zirconium. II. The existence and structure of the pyrovanadate, ZrV_2O_7.** *Gazz. chim. ital.* 72, 83-9 (1942).—*C.A.* 37, 573^4.

When NH_4VO_3 and $ZrO(NO_3)_2$ react in the presence of H_2O_2, the only products were adsorption compounds of HVO_3 on $3ZrO_2.2V_2O_5.9H_2O$. After heating at 260-70°C, these adsorption products gave x-ray patterns identical with that of ZrV_2O_7. Between 670° and 760°C, ZrV_2O_7 decomposed into ZrO_2 and $Zr(VO_3)_4$. In the presence of H_2O_2, Ti vanadate and Sn vanadate formed adsorption compounds with HVO_3.

12093. PIRLOT, FRÉDÉRIC J. **Primary sampling of granular materials and mineral pulps.** *Rev. universelle mines* 18, 401-11(1942).—*C.A.* 38, 2238^8.

The principal factors affecting sampling, theories, app. and methods were discussed.

12094. ZEIDLER, G. AND BRISKE, H. **The detection of lampblack in the presence of aniline black in black paints.** *Farben-Ztg.* 47, 189-90 (1942).—*C.A.* 41, 295*h*.

A procedure was outlined whereby aniline black in the presence of lampblack could be detected and removed. According to this procedure, aniline black, but not lampblack was destroyed by HNO_3 and transformed to a brown oxidation product.

12095. FENTON, G.W. **Development in the method for the rapid determination of carbon and hydrogen in coal.** *J. Soc. Chem. Ind.* 62, 160-3 (1943).—*C.A.* 38, 631^5.

The combustion-tube method was modified so that by using 250-300 ml of O_2 per min., combustion was completed in about 10 min., although the furnace was operated at the usual temp. of 800°C. $Mg(ClO_4)_2$ and soda-asbestos were used in the absorption train.

12096. HOFMANN, ULRICH. **The formula of graphitic acid.** *Kolloid-Z.* 104, 112-14(1943).—*C.A.* 38, 4494^8.

The formula $C_6(OH)_3$ proposed by Thiele did not hold for all prepns. of graphitic acid. Well-washed and dried prepns. showed a lowered H-content.

12097. KAUTSKY, H. **Permutoids.** *Kolloid-Z.* 102, 1-14(1943).—*C.A.* 37, 5895^2.

Permutoid structures were illustrated with siloxenes. The siloxene ring was a chromophore and groups such as OH or NH_2 acted as auxochromes. The silicones had numerous active centers, which gave individual chem. reactions; this accounted for catalytic activity.

12098. PROKOF'EV, V.K. **Electrodes from wood charcoal for qualitative and quantitative spectrochemical analysis.** *Doklady Akad. Nauk S.S.S.R.* 38, 232-4; *Compt. rend acad. sci. U.R.S.S.* 38, 206-8(1943).—*C.A.* 37, 6554^9.

Electrodes having suitable elec. cond. and d. were obtained by heating cylindrical wood sticks (length 100-150 mm, diam. 15 mm) for 2 hrs to 800°C in an electrically heated tube. Operation at lower temps. produced charcoal of insufficient elec. cond. Linden and birch yielded the most dense and suitable electrodes.

12099. SANDERA, K. **Orientation analyses of activated charcoal.** *Listy Cukrovar* 61, 85-6(1943). —*C.A.* 42, 2889*g*.

Detailed analyses were given for moisture, sol. salts, wt per liter, active reaction, decolorizing capacity, and resistance to flow.

12100. SIEGEL, O. **The sorption complex of agricultural soils of Africa.** *Bodenkunde u. Pflanzenernahr.* 29, 100-7(1943); *Chem. Zentr.* 1943, *I*, 2719.—*C.A.* 38, 6450^3.

Soil samples from Dutch Southwest, Dutch East and Portuguese East Africa were examd. for total C, C stable in acetyl bromide, N, N-C ratio and humic acid. To characterize the org. materials, the total sorption capacity was detd. as well as that of the minerals.

12101. VANDONI, R. **Gas analysis. II. Direct determination of hydrogen in a hydrogen-methane mixture by passage over platinized asbestos heated to 300°-400°C.** *Mém. services chim. état* (Paris) 30, 272-4(1943).—*C.A.* 40, 7078^3.

The catalytic effect of platinized asbestos was insufficient in itself to effect the combustion of the H_2 alone without touching the CH_4 in a H_2-CH_4 mixt. A slightly higher quantity of O_2 was used than that corresponding theoretically to the H_2. The reaction began at about 320°C, and the mixt. progressively heated so as to reach the max. temp. of 400°C only after about 1-1/2 hrs. The O_2 acted selectively on the H_2 with none going to the CH_4.

12102. WETTERHOLM, ALLAN. **The determination of the degree of carbonization of charcoal.** *Svensk. Kem. Tid.* 55, 80-98(1943).—*C.A.* 38, 5384^3.

The ratio of volatile matter of wood-volatile matter of charcoal to the volatile matter of wood was used as the degree of carbonization; a value of 100 was assumed for a charcoal prepd. at 1000°C. The analytical detn. was made with 1 g each of charcoal and original wood in a Pt crucible which was heated in a quartz crucible filled with charcoal.

12103. ARDENNE, MANFRED VON AND BERNHARD, FRITZ. **Nuclear physical method for determining small amounts of carbon in iron.** *Z. Physik* 122, 740-8 (1944).—*C.A.* 42, 2866*a*.

The sample to be analyzed was bombarded by a beam of 1-m.e.v. protons or deuterons; these convert C atoms to radioactive $_7N^{13}$, whose measured activity was a function of the C content of the sample. The limit of detectibility was about 0.05%.

12104. Dutton, Herbert J. **Adsorption analysis of colorless compounds: method and application to the resolution of stearic and oleic acids.** *J. Phys. Chem.* 48, 179-86(1944).—*C.A.* 38, 5127^{1}.
A modification of a highly sensitive differential refractometer was described by means of which measurements of changes of *n* could be continuously made upon the percolate from adsorption columns during continuous flow.

12105. Gurry, R.W. and Trigg, Hastings. **Determination of carbon in low-carbon steel. Precision and accuracy of the low-pressure combustion method.** *Ind. Eng. Chem., Anal. Ed.* 16, 248-50 (1944).—*C.A.* 38, 2584^{6}.
Results obtained were accurate to within 0.0007% C, which corresponded to about 1/3 the error of the standard combustion method.

12106. Murray, William M. Jr. and Ashley, S.E.Q. **Determination of carbon by the low-pressure combustion method.** *Ind. Eng. Chem., Anal. Ed.* 16, 242-8(1944).—*C.A.* 38, 2584^{5}.
Over 5000 detns. were made with samples consisting chiefly of Fe and Si. Experiences resulted in modifications which increased the speed but maintained the accuracy. Thus, 3 different labs. reported values for a standard sample ranging from 0.0108 to 0.116% C. The results were obtained by measuring the vol. of purified CO_2 formed.

12107. Murray, William M. Jr. and Niedrach, Leonard W. **Determination of carbon. Simplification of the low-pressure combustion apparatus.** *Ind. Eng. Chem., Anal. Ed.* 16, 634-6(1944).—*C.A.* 39, 38^{5}.
The procedure was modified so that 10-15 samples could be handled, with 2 measuring systems, by 1 operator in an 8-hr day. The compn. of the blank gases was studied and found to be mostly H_2O that escaped condensation in the dry-ice trap.

12108. Pierron, Paul. **The precipitation of barium sulfate in the presence of phosphoric ions.** *Bull. soc. chim.* 11, 323-7(1944).—*C.A.* 40, 2081^{8}.
$BaSO_4$ pptd. in the presence of H_3PO_4 contained complexes which were not present in the original soln. and which could not therefore be held by adsorption. If excess $BaCl_2$ was used for pptn., complexes of the type $-Ba-SO_4-Ba-SO_4-Ba-PO_4$: Ba were formed; if less $BaCl_2$ was used, the complexes were $-SO_4-Ba-SO_4-Ba-PO_4H_2$. These complexes hydrolyzed after long boiling, but hydrolysis was never complete.

12109. Sengoku, Tadashi; Imanishi, Yoshiichi; Ikisu, Taro, and Nishizawa, Shingo. **Studies of carbon blacks. I. Properties of various types of carbon black.** *J. Soc. Rubber Ind. Japan.* 17, 39-47(1944).—*C.A.* 44, 9718*f*.
Analyses and vulcanization tests were made of various types of carbon black, and the blacks compared with respect to their effects.

12110. Shishido, Keiichi and Onishi, Akira. **A semi-microanalysis apparatus for carbon and hydrogen.** *J. Soc. Chem. Ind. Japan* 47, 899(1944). —*C.A.* 42, 6170*b*.
A simple combustion app. capable of detg. H and C to within 0.3% in a 20 mg sample was described. The combustion tube was electrically heated.

12111. Wagman, Donald D. and Rossini, Frederick D. **Macroanalysis of carbon and hydrogen by combustion.** *J. Research Natl. Bur. Standards* 32, 95-100(1944).—*C.A.* 38, 3167^{5}.
A combustion app. for accurate macroanalysis of C and H in hydrocarbons, or in compds. contg. C, H and O, was described. Its precision and accuracy were detd. on 5 expts. on highly purified C_6H_5COOH.

12112. Bray, Roger H. and Kurtz, L.T. **Determination of total, organic and available forms of P in soils.** *Soil Sci.* 59, 39-45 (1945).—*C.A.* 39, 1951^{8}.

12113. Clark, Ralph O. and Stillson, Gordon H. **Microdetermination of carbon and hydrogen.** *Ind. Eng. Chem., Anal. Ed.* 17, 520-2(1945).—*C.A.* 39, 4562^{6}.
The results of experience and of comparative expts. were summarized.

12114. Cline, Marlin G. **Methods of collecting and preparing soil samples.** *Soil Sci.* 59, 3-5 (1945).—*C.A.* 39, 1951^{6}.

12115. Cotton, J.B. **Determination of carbon in ferrous materials.** *Analyst* 70, 466-8(1945).—*C.A.* 40, 1420^{5}.
The combustion of carbon in a stream of O_2 and absorption of the resulting CO_2 in a $Ba(OH)_2$ + NaOH soln. and titration of the excess alkali with standard mineral acid in the presence of phenolphthalein was described. The CO_2 was absorbed in an evacuated bottle; at the other end, O_2 was bubbled through Hg. The stream was kept const. during the combustion so that little supervision was necessary. Results obtained with irons and steel were excellent.

12116. Feigl, Fritz. **Spot-reaction experiments. X. Topochemical reactions.** *J. Chem. Education* 22, 342-7(1945).—*C.A.* 39, 4539^{7}.
The following spot-reactions were described: topochem. detection of the volatilization of Hg at room temp.; charring of carbohydrates by adsorbed aq. HCl; topochem. effect with amorphous Si; topochem. reactions on surface of metallic Ag and Cu; a topochem. reaction of magnesite that depends on its free surface; a temp.-dependent topochem. effect with calcite; topochem. detection of Zn in ZnO; and nuclear effects in the reduction of Ag salts.

12117. Gates, A.O. **Moisture determination in solid materials.** *Chem. & Met. Eng.* 52, No. 12, 119-120(1945).—*C.A.* 40, 1755^{2}.
Moisture in a nonporous solid was detd. by measuring the sp. vol. by displacement of water before and after drying.

12118. Holmes, R.S. **Determination of total copper, zinc, cobalt and lead in soils and soil solutions.** *Soil Sci.* 59, 77-84(1945).—*C.A.* 39, 1952^{3}.

12119. Lacourt, A. and Crets, Liliane. **Microdetermination of carbon and of hydrogen.** *Bull. soc. chim. Belg.* 54, 96-100(1945).—*C.A.* 40, 6020^1.

It was not feasible to base a microchem. detn. of C and H in an org. compd. by causing the H_2O formed to react with an acid chloride whereby HCl was liberated.

12120. Langer, Alois. **Closed absorption tube for microdetermination of carbon and hydrogen.** *Ind. Eng. Chem., Anal. Ed.* 17, 266 (1945).—*C.A.* 39, 2233^5.

A new type of absorption tube for microdetn. of C and H was designed.

12121. MacIntire, W.H. **Soil content of fluorine and its determination.** *Soil Sci.* 59, 105-9 (1945).—*C.A.* 39, 1952^8.

12122. Magistad, O.C.; Reitemeier, R.F., and Wilcox, L.V. **Determination of soluble salts in soils.** *Soil Sci.* 59, 65-75 (1945).—*C.A.* 39, 1952^2.

12123. Peech, Michael. **Determination of exchangeable cations and exchange capacity of soils—rapid micro-methods utilizing centrifuge and spectrophotometer.** *Soil Sci.* 59, 25-38 (1945).—*C.A.* 39, 1951^7.

12125. Reed, J. Fielding and Cummings, R.W. **Soil reaction—glass-electrode and colorimetric methods for determining pH values of soils.** *Soil Sci.* 59, 97-104 (1945).—*C.A.* 39, 1952^7.

12126. Robinson, W.O. **The fusion analysis of soils. Determination of Si, Ti, Al, Fe, Mn, Ca, Mg, K, Na and S. Determination of V and Mo in soils. Determination of total Se and As in soils.** *Soil Sci.* 59, 7-11, 91-2, 93-5 (1945).—*C.A.* 39, 1951^6, 1952^6.

12127. Schollenberger, C.J. **Determination of soil organic matter. Determination of carbonates in soil.** *Soil Sci.* 59, 59, 53-6, 57-63, (1945).—*C.A.* 39, 1952^1.

12128. Schollenberger, C.J. and Simon, R.H. **Determination of exchange capacity and exchangeable bases in soil—the ammonium acetate method.** *Soil Sci.* 59, 13-24 (1945).—*C.A.* 39, 1951^7.

12129. Steyermark, Al. **Microdetermination of carbon and hydrogen. A modern industrial setup.** *Ind. Eng. Chem., Anal. Ed.* 17, 523-6(1945).—*C.A.* 39, 4562^6.

The general layout of the microchem. lab. of Hoffmann-LaRoche, Inc., with special attention to the balance room, was described.

12130. Truog, Emil. **Determination of total and available boron in soils.** *Soil Sci.* 59, 85-90 (1945).—*C.A.* 39, 1952^5.

12131. Étienne, André and Mileur, Roger. **Semimicrodetermination of carbon and hydrogen in organic compounds containing nitrogen without the use of lead dioxide.** *Ann. chim. anal.* 28, 215-18 (1946).—*C.A.* 41, 925*g*.

Excellent results for C and slightly high values for H were obtained by burning the sample at 650°-700°C in O_2 with the combustion tube contg. considerable Ag wool and Ni wool, made of very fine wire. The exit gases were passed through a weighed tube contg. Anhydrone, to absorb H_2O, then through H_2SO_4 to absorb N oxides and finally through a weighed ascarite tube to absorb CO_2.

12132. Field, Edmund and Oldach, C.S. **Determination of hydrogen sulfide in gases.** *Ind. Eng. Chem., Anal. Ed.* 18, 665-7 (1946).—*C.A.* 41, 54*a*.

In a gas which contains no O_2, but which may contain H_2, N_2, CO, CH_4, C_2H_4 and as much as 2% CO_2, as little as 7 γ of H_2S could be detected and detd. within 10%. The H_2S was absorbed in 6% NaOH soln. and black Bi_2S_3 was formed by adding a reagent prepd. from 42.8 g $Bi(NO_3)_3$ in 3 liters of AcOH and dild. with 15 liters of water, or yellow CdS was formed by adding a soln. prepd. from 44 g of $UO_2(NO_3)_2.6H_2O$ + 31.4 g $Cd(OAc)_2.2H_2O$ + 20 liters of water + 4 liter of AcOH. The Bi reagent was the more sensitive.

12133. Field, Edmund and Oldach, C.S. **Conversion of organic sulfur to hydrogen sulfide for analysis.** *Ind. Eng. Chem. Anal. Ed.* 18, 668-9 (1946).—*C.A.* 41, 54*f*.

Gas contg. S present in C compds. together with excess H_2 was passed over 6 ml of 14-20-mesh Al_2O_3 (desulfurized Alorco Grade A or gel prepd. from $Al(NO_3)_3$ soln. and NH_4OH) in quartz tubes of 10-mm inside diam. or in a Vycor tube. When the Al_2O_3 was at 900°C, all COS, CS_2, CH_3SH, C_4H_4S, CH_3CNS, and SO_2 were completely changed to H_2S which was absorbed by a suitable scrubbing agent, such as NaOH soln. The presence of aq. vapor was helpful but not necessary.

12134. Gand, E. **Rapid determination of carbonates by measurement of the volume of gas evolved on treatment with acid.** *Bull. soc. chim.* 1946, 683-5.—*C.A.* 41, 2658*h*.

When a carbonate was treated with excess HCl in a simple app., the vol. of CO_2 over dil. HCl was always a little low. It was convenient, to det. the vol. of gas evolved (about 100 ml) by treatment of a known wt of marble with 6 *N* HCl and then carry out a test under the same conditions with a sample of wt sufficient to furnish about the same vol of CO_2.

12135. Grace, R.J. and Gauger, A.W. **Study of Millin technique for determination of carbon and hydrogen in coal.** *Ind. Eng. Chem., Anal. Ed.* 18, 563-5 (1946).—*C.A.* 40, 6236^8.

Excellent results were obtained with samples of coal and with other org. materials. The Nesbitt ascarite tubes, which had 4 times the capacity of the Fisher type, were recommended.

12136. Hale, Cecil H. **Rapid analysis of Fischer synthesis catalyst.** *Petroleum Refiner* 25, No. 6, 265-8 (1946).—*C.A.* 43, 60*a*.

Rapid methods for the detn. of Co and Th in Fischer catalysts were described. Co was detd. by titrating with ferricyanide to a "dead stop" end point. Th was pptd. as the iodate and detd. volumetrically.

12137. KENNEY, EDWARD F. **Raw sugar—sampling, mixing and testing.** *Ind. Eng. Chem., Anal. Ed.* 18, 684-8 (1946).—*C.A.* 41, 301*g*.

The U.S. Customs 1943 modifications reduced the sampling of undamaged bags of raw sugars to one bag in seven. The older hand-mixing method was still permitted, as well as a new box-and-screen method. This latter consisted of a thrice-repeated screening through a 3/8-inch-mesh wire screen, and quartering. The data and statistical analyses upon which these new practices were based were discussed.

12138. KORSHUN, M.O. AND HEL'MAN, N.E. **An apparatus for quantitative organic microanalysis. I.** *Zavodskaya Lab.* 12, 109-14 (1946).—*C.A.* 40, 6894^9.

The sample was burned in a current of O_2 in a tube of transparent quartz or of high-melting glass. The combustion products passed over a Pt catalyst and into absorption tubes through a part of the combustion tube filled with metallic Ag and PbO_2. CO_2 and water formed in the combustion were absorbed and weighed on a microbalance.

12139. KURCHATOV, M.S. **A new method for the determination of the inorganic (ash) sulfur in coal and coke.** *Annuaire univ. Sofia, Faculte phys.-mat.* 43, Livre 2, 229-34(1946-1947)(German Summary).—*C.A.* 44, 306*b*.

Samples of ash (15 g) were placed in a 250 ml Erlenmeyer flask, mixed with 20 ml of 3% H_2O_2, and heated a few min. with a low flame. Concd. HCl (1 ml) was added to the mixt. and heating continued a few min. The mixt. was dild. with 80 ml H_2O and 6 g $(NH_4)_2CO_3$ added. The covered flask was again heated until the $(NH_4)_2CO_3$ was completely decompd. The contents of the flask were dild. with 100 ml boiling H_2O, filtered, and washed. The filtrate which contained $(NH_4)_2SO_4$ was neutralized with HCl, decompd. with 4-5 ml concd. HCl, and pptd. at boiling temp. with 10 ml 10% $BaCl_2$; $BaSO_4$ was obtained as a ppt.

12140. KURCHATOV, M.S. **A rapid method for the determination of inorganic (ash) sulfur in coal and coke.** *Annuaire univ. Sofia, Faculte phys.-mat.* 43, Livre 2, 235-42(1946-1947) (German summary).—*C.A.* 44, 306*e*.

Samples of ash (0.2 to 0.5 g) from coal or coke were mixed with Zn powder (1g) and $HgCl_2$ (1g), and placed in a porcelain crucible. The mixt. was covered with Zn powder, the crucible covered, and heated 20-25 min. over a Bunsen burner. The cooled crucible was placed in a wide-neck flask where the contents of the crucible were decompd. with HCl in a stream of pure CO_2. The H_2S was collected in a mixt. of solns. of $Cd(CH_3CO_2)_2$ and CH_3CO_2H and titrated with I_2.

12141. TUNNICLIFF, D.D.; PETERS, EDWARD D.; LYKKEN, LOUIS, AND TUEMMLER, F.D. **Determination of carbon and hydrogen by combustion. Unitized dual apparatus and improved procedure.** *Ind. Eng. Chem., Anal. Ed.* 18, 710-18 (1946).—*C.A.* 41, 51*e*.

During 5 yrs about 6500 analyses were made with one dual unit. The results, as shown by repeated analyses of pure org. compds., justified weighing to 0.01 mg with the readings adjusted to a vacuum basis and allowance made for vol. changes of ascarite and drierite as a result of absorption of CO_2 and H_2O. Rubber connections were abolished, the rate of gas flow controlled, the heating temp. controlled, and the operating conditions were greatly improved.

12142. BARTON, KAREL AND TAMPA, JAROSLAV. **Determination of different forms of sulfur in solid fuels.** *Paliva a voda* 27, 261-6(1947).—*C.A.* 42, 2741*e*.

Total S was detd.: (a) heat a sample for approx. 1 hr at 750°C in O_2 and absorb the products of combustion in 3% H_2O_2, acidified with HCl, (b) fuse the ash from (a) with Na_2CO_3, leach with water, combine the soln. with that obtained in (a), remove SiO_2 and R_2O_3, and det. S as $BaSO_4$. Methods for sulfate and pyrite S were also given.

12143. CHARRIN, V. **French kieselguhr.** *Rév. matériaux construction trav. publ.* C, 1947, 387-9.—*C.A.* 42, 4723*c*.

The analyses of several minerals were given.

12144. CLARK, RALPH O. AND STILLSON, GORDON H. **Automatic microdetermination of carbon and hydrogen.** *Anal. Chem.* 19, 423-6(1947).—*C.A.* 41, 5053*h*.

A semiautomatic combustion unit was described which, with the exception of a motor-driven vaporization furnace and modified Abrahamczik absorption tubes, did not differ much from the manually operated equipment commonly used for microchem. work.

12145. DUVAL, CLÉMENT. **The thermogravimetry of analytical precipitates I. Generalities.** *Anal. Chim. Acta.* 1, 341-4(1947).—*C.A.* 42, 8696*i*.

The optimum temp. limits were studied for the ignition of about 600 substances encountered most often in gravimetric analysis.

12146. GROSSE, A.V.; KIRSHENBAUM, A.D., AND HINDIN, S.G. **Elementary isotopic analyses: determination of carbon.** *Science* 105, 100-1 (1947).—*C.A.* 41, 2349*d*.

The method for detg. O with the mass spectrograph and heavy O was applied to the detn. of C with heavy carbon.

12147. GUR'YANOVA, E.N. **Determination of moisture by a dielectric method.** *Zavodskaya Lab.* 13, 163-8(1947).—*C.A.* 42, 486*g*.

The moisture content of powders was detd. from the dielec. const. measured in a specially constructed condenser consisting of 2 concentric brass cylinders. The powder must be finely ground and sifted to a definite grain size to insure uniformly close packing which was made reproducible by the use of a known load on a piston attached to the condenser. Variation of 1°C corresponded to a change in the dielec. const. by 0.05-0.07.

12148. HOREISCHY, KURT; DREHER, INGEBORG, AND HOFFMANN-OSTENHOF, OTTO. **Automatic microchemical determination of carbon and hydrogen in organic substances.** *Mikrochemie ver. Mikrochim. Acta* 33, 221-30(1947) (in German).—*C.A.* 42, 1457*h*.

All heating was electrical and the movable burner was activated by means of a synchronized motor. The combustion tube contained a Pt contact, CuO, Ag wool, and PbO_2. The heating of the PbO_2 was controlled by an Fe-H_2 resistance. The absorption tubes contd. $Mg(ClO_4)_2$ and Ascarite.

12149. KHANNA, K.L.; PRASAD, S.N., AND BHATTACHARYA, P.B. **An improved rapid chemical method for the estimation of calcium in calcareous soils.** *Proc. Indian Acad. Sci.* **25A**, 51-4(1947).—*C.A.* **41**, 4263*a*.

The soil (1 g) was stirred in a 100-ml beaker with 20 ml of *N* HCl until effervescence ceased and filtered through paper. Ten drops of the filtrate was transferred to test tubes (4-mm tubing), treated with 1 drop NH_4OH, then with enough (2 to 3 drops) of glacial HOAc to clear and then with 20 drops satd. $Na_2C_2O_4$. After 15 min. the height of the column of pptd. CaC_2O_4 was compared with a graph made by analyzing in the same manner a series of soils whose Ca content was known.

12150. KITAĬGORODSKIĬ, I.I.; SENTYURIN, G.G., AND RISHINA, V.A. **Combination reducing mixtures for sulfate charges.** *Stekol'naya i Keram. Prom.* 4, No. 4, 6-8(1947).—*C.A.* **43**, 9400*e*.

Coke had a greater chem. activity and thermal stability than wood charcoal, electrode carbon, or anthracite in reducing sulfate. Similarly, a 1:1 mixt. of coke and wood charcoal was better than the following: (1) 98% wood charcoal + 2% SiC, (2) 95% wood charcoal + 5% SiC, (3) 90% wood charcoal + 10% SiC, (4) wood charcoal and electrode carbon (2:1 or 1:1), (5) wood charcoal and anthracite (2:1 or 1:1), and wood charcoal and coke (2:1).

12151. LACOURT, A. **Absorbers for carbon and hydrogen microdetermination.** *Metallurgia* **36**, 289-90(1947).—*C.A.* **41**, 7295*d*.

The Friedrich type of absorber for absorption of CO_2 and H_2O in microanalysis was described. Methods of sealing were illustrated by diagram.

12152. MALQUORI, ALBERTO AND SERSALE, RICCARDO. **The montmorillonitic clay of Casalbore (Avelline).** *Ricerca sci.* 17, 247-9(1947).—*C.A.* 45, 7477*f*.

A soapy, yellow alk. clay used in industry showed 13.50-17.52% loss on ignition, 62.45-53.98% SiO_2, 14.91-13.77% Al_2O_3 + TiO_2, 1.87-2.64% Fe_2O_3, 2.19-8.12% CuO, 1.22-1.48% MgO, 2.55-2.09% Na_2O, 0.77-0.60% K_2O, 8.60-8.32% loss at 110°C, 0.13-5.98% CO_2, pH 8.81-9.24

12153. MARTIN, R.M. **Supplementary determinations necessary in the ultimate analyses of solid fuels.** *Chaleur et end.* **28**, 167-73(1947).—*C.A.* **41**, 7073*e*.

Detns. must be made of C as carbonate, H_2O, free and combined S and possibly also N. Carbonate was detd. by treating 0.1 to 0.2 g of the coal sample with 50% H_2SO_4; H_2S was absorbed by a mixt. made from 200 g $K_2Cr_2O_7$ with 50 ml H_2O and 100 ml concd. H_2SO_4; and H_2O by pumice soaked in concd. H_2SO_4; and the CO_2 in soda lime. Combined H_2O was detd. from the difference between total H_2O and free H_2O. Total H_2O was detd. by passing pure xylene vapor or N_2 over a sample (25 to 100 g) of the coal, heated gradually to 800°C, the water being condensed out and detd. volumetrically. Free H_2O was detd by the usual method of heating in xylene and detg. the vol. of H_2O distd. over.

12154. NESBITT, CHARLES E. AND HENDERSON, JAMES. **Determination of carbon in low-carbon steel. A low-pressure gasometric method.** *Anal. Chem.* **19**, 401-4(1947).—*C.A.* **41**, 4736*h*.

The analysis of steels contg. less than 0.1% C was detd. within an hr accurate to within 0.0003% C in a 2-g sample. The sample was burned at 1140-1450°C in a stream of purified O_2. S was removed with activated MnO_2 and the CO_2 absorbed in 4 ml of 20% NaOH. The absorbent contg. Na_2CO_3 was treated with a little H_2SO_4 and the resulting CO_2 measured under reduced pressure.

12155. RAY, F.E. AND POTAS, A.E. **Simplified method for determination of carbonaceous deposits on cracking catalysts.** *Oil Gas J.* 46, No. 28, 255-8(1947).—*C.A.* 42, 1726*d*.

The app. consisted of an electrically heated furnace, combustion tubes, and a gas-collecting system. A sample of approx. 20 g was used. The C- content of the sample being analyzed was calcd. from vol. of gas collected (CO_2 content), and the wt of sample charged to the combustion tube. A deviation of ± 3% of the total C present was reported with up to 7% by wt on the catalyst.

12156. TITOVA, A.N. **The nature of synthetic aluminosilicate catalysts and the mechanism of contact catalytic reactions in the presence of such catalysts.** *J. Gen. Chem.* (U.S.S.R.) 17, 673-80 (1947).—*C.A.* 42, 729*d*.

Catalysts were made by mixing hydrosols of H_2SiO_3 and of $Al(OH)_3$, coagulation in an alk. medium and drying at different velocities. With a "standard" aluminosilicate catalyst, chem. analysis showed almost identical contents of SiO_2 80-85, and Al_2O_3 11-12 in all 4 catalysts; SiO_2/Al_2O_3 ≈7:1; metals (Na, Fe, Ca, and Mg) were present only in insignificant amts. Spectrographic analysis showed absence of As, Be, Pt, Au, Th, Sc, Ag, Zn, Cd, Co, Mo, Ta, Cb, Bi, Te, P, Sb, In, Ga, K, Li, Ba, W, Ge, V, and Sr; presence of Ti up to 0.05% in three catalysts; and Zr 0.05 in the "standard" catalyst.

12157. CHERNIKHOV, YU. A AND MAKAROVA, R.F. **Rapid determination of sulfide sulfur.** *Zdvodskaya Lab.* 14, 649-53(1948).—*C.A.* 43, 969*f*.

The sample was heated in a combustion tube in a current of air, keeping the temp. at 800°-820°C to avoid decompn. of carbonates. The SO_2 was absorbed in 25 ml of 1% H_2O_2 which had been neutralized to methyl red with 0.1 *N* NaOH. The H_2SO_4 formed was titrated.

12158. COLSON, A.F. **Rapid microanalytical determination of carbon and hydrogen in organic compounds.** *Analyst* 73, 541-7(1948).—*C.A.* 43, 969*a*.

Excellent results were reported on 5-mg samples burned in an "unpacked", helical combustion tube of silica or glass (heated to 800° or 750°C, resp.) through which a stream of O_2 passed at the rate of 40 ml per min. Halogen and S were retained, if present, on granular Ag heated to 600°C and oxides of N were removed by passage of the products of combustion through PbO_2 at 180°C. The detn. of C and H required only 30-40 min.

12159. Deitz, Victor R.; Higginson, Helen R., and Parker, Cola. **Determination of sulfur in bone char.** *J. Research Natl. Bur. Std.* 40, 263-74 (1948).—*C.A.* 42, 5698*b*.

Soln. of the total S in bone char was obtained by 3 methods: (1) after oxidation with HNO_3 and $HClO_4$, (2) after air oxidation in an intimate mixt. with Na_2CO_3 and MgO, (3) after oxidation with HNO_3 in a modified Carius tube. The ppt. of $BaSO_4$ was found to be contaminated with Ca and phosphate from the bone char. $BaSO_4$ was completely sol. in hot 70% $HClO_4$; this makes possible a purification by repptn. The distribution of the total S between the carboneous residue and the filtrate was detd after digestion in 3 mixts.: HNO_3 and HCl, $KClO_3$ and HCl, and HCl, alone. The S contained in the gases evolved with HCl was greater in most samples than that detd. as sulfide S.

12160. Furter, M.F. and Steyermark, Al. **Pressure regulator for use in microdetermination of carbon and hydrogen.** *Anal. Chem.* 20, 257-8 (1948).—*C.A.* 42, 4001*h*.

A glass pressure regulator to contain 5% NaOH soln. for the C and H microdetn. was described.

12161. Goulden, Frank. **Semimicrodetermination of carbon and hydrogen by the Sucharda and Bobranski method using a macrobalance.** *Analyst* 73, 320-1(1948).—*C.A.* 42, 6702*b*.

The time required was shortened by increasing the CuO content of the combustion tube and increasing the flow rate of O_2.

12162. Irimescu, Ion and Popescu, Barbu. **Simplified micro-method for determining carbon and hydrogen in organic compounds.** *Z. anal. Chem.* 128, 185-93(1948).—*C.A.* 42, 5801*h*.

For retention of N compds., highly active silica gel powder impregnated with a soln. of diphenylamine in H_2SO_4 was used. The combustion tube contd. a 120 mm layer of CuO, PbO, and kieselguhr. The results of 14 tests with various compds. showed sataisfactory agreement with the theory.

12163. Korshun, M.O. and Sheveleva, N.S. **Rapid simultaneous micro-determination of carbon, hydrogen, halogens, or sulfur in organic compounds.** *Doklady Akad. Nauk S.S.S.R.* 60, 63-5 (1948).—*C.A.* 42, 6270*d*.

The sample was burned in an empty tube with O_2 flowing at 35-50 ml/min. The exit gas was passed through a tube which contained a roll of thin Ag ribbon which retains halogens and S. The usual H_2O-CO_2 absorption train followed this tube. When the Ag-filled tube was at 450°C, complete retention of Cl, Br, and I occurred, while S was retained at 750°C. C. detns. were usually within 0.3%; H detns. within 0.1-0.2%.

12164. Lányi, B. and Kafka, L. **Determination of silver in active carbon.** *Müegyetemi Közlemények* 1948, 173-6 (in English).—*C.A.* 43, 6539*c*.

Moisten the sample (100g) with 100 ml of 5% $KMnO_4$ soln. and heat on a sand bath for at least 6 hrs. Repeat this treatment 3 times or until the $KMnO_4$ shows no sign of being reduced. Dry at 200°C and heat in an elec. furnace for at least 4 hrs. Cool, spray with 100 ml of water, and add 150 ml of 12 *N* H_2SO_4. Heat till dense fumes are evolved. Cool, add water and SO_2 soln. until all MnO_4- or MnO_2 is reduced; use a little H_2O_2 if necessary. After evapg., dil. to about 250 ml, filter if necessary, and titrate the Ag^+ by the Volhard method.

12165. Lindenbaum, Arthur; Schubert, Jack, and Armstrong, W.D. **Rapid wet-combustion method for carbon-determination with particular reference to isotopic carbon.** *Anal. Chem.* 20, 1120-1 (1948).—*C.A.* 43, 1285*f*.

Heat the sample together with about 0.3 g of KIO_3 at 160°C with a mixt. of Cr_2O_3, H_3PO_4, and fuming H_2SO_4 in an evacuated app. arranged so that the resulting CO_2 can be absorbed in a freshly filtered, satd. $Ba(OH)_2$ soln. After removing the $BaC^{14}O_3$ ppt. with the aid of the centrifuge and drying with acetone and Et_2O, the ppt. can be weighed and its radioactivity detd.

12166. Marling, John B. **Spectrographic determination of sodium in a silica-alumina catalyst.** *Anal. Chem.* 20, 299-300(1948).—*C.A.* 42, 4867*g*.

A rapid method for the spectrographic detn. of Na involved the use of Cu counterelectrodes as a standard to furnish reference lines. The material to be analyzed was placed in the crater of a graphite electrode and volatilized in an a.-c arc. This procedure was repeated 3 or 4 times, and the results averaged.

12167. Pieters, H.A.J. **Notes on analytical procedures I. Determination of carbon dioxide.** *Anal. Chim. Acta* 2, 263-9(1948).—*C.A.* 42, 8710*f*.

The CO_2 liberated by H_2SO_4 was absorbed in $Ba(OH)_2$, the excess of which was titrated with 0.1 *N* HCl, with cresolphthalein as indicator. The absorption and titration were performed in a special vessel in which the liquid was agitated by CO_2-free air.

12168. Rickson, J.B. **Semimicro combustion method for the determination or organic carbon.** *Analyst* 73, 268-74(1948).—*C.A.* 42, 6481*g*.

In detg. org. carbon in soils, a modification of the Ter Meulen combustion procedure was described in which a new type of vessel was used for adsorbing the CO_2 in a measured vol. of $Ba(OH)_2$, with subsequent titration of the excess of absorbent.

12169. Willey, R.A. and Caine, J.B. **Develop chemical methods for faster sand analysis.** *Am. Foundryman* 14, No.1 50-6(1948).—*C.A.* 42, 8694*i*.

Short, accurate procedures were given for the detn. of loss on ignition, carbon, Fe_2O_3, CaO, Na_2O, K_2O, SiO_2, Al_2O_3, and MgO in foundry sand. Proper care in sampling was stressed.

12170. Aranda, Vicente Gomez and Miranda, Maria Luisa Gonzalez. **Analytical methods in the chemistry of coal. Determination of moisture.** *Combustibles* (Zaragoza) 9, 99-114 (1949).—*C.A.* 44, 6099*d*.

The various methods of moisture detn. in coal were reviewed, including drying at 105°C, drying in vacuum over a desiccant, drying in a current of inert gas followed by recovery of H_2O by $CaCl_2$

and weighing, gasometric methods using MeMgI, CaC_2, etc., cryohydric method of Dolch, dielec. methods, and distn. with an immiscible solvent.

12171. BAUMINGER, B.B. AND POULTON, F.C.J. **Combustion method for the estimation of carbon black in compounded rubber.** *Analyst* 74, 351-60 (1949).—*C.A.* 43, 9515*h*.

Ext. the weighed sample with Me_2CO and, should hard asphalt be present, also with $CHCl_3$. Then weigh a sample of about 0.1 g into a SiO_2 combustion boat, introduce N_2 at the rate of 500 ml per min. and slowly raise the temp. to 600°C, with preheating of the gas to 500°C. Finally cool in N_2. The residue consists of carbon black + mineral matter. Transfer the boat and its contents to another tube for combustion in O_2 and absorption of the CO_2 formed in a weighed ascarite tube. Data were obtained with tests on 11 samples of rubber and rubber substitutes and on 16 different kinds of carbon black.

12172. BURR, ALEX C.; OPPELT, WALTER H., AND KAMPS, TED W. JR. **The rate of drying of lignite in hot oil at 315°F.** *Proc. N. Dakota Acad. Sci.* 2, 32-6(1949).—*C.A.* 43, 4831*b*.

Lignite (1, 2 and 4 in. in diam.) was dried by immersion in motor oil, SAE 20, at 310-20°F. The final moisture content of the dried lignite depended upon time and was a function of the diam. of the sphere.

12173. EDGCOMBE, L.J.; CROSSLEY, H.E.; MACDOUGALL, D., AND PARKER, A. **Improved methods for the quantitative analysis of coal ash and coke ash.** *Dept. Sci. Ind. Research* (Brit.) *Fuel Research Survey Paper* No. 50, 40 pp. (1949).—*C.A.* 44, 4226*i*.

The prepn. of the ash avoided thin layers of coal or coke. The procedure for dissolving the ash allowed soln. of all constituents. A simplified and shorter method for sepg. silica and detn. of Ba were given. Fe and Ti were detd. without previous sepn. by titrating first with $HgNO_3$ to obtain Fe, then reducing with Zn amalgram to obtain Ti. Pt from contamination by lab. app. was removed, then Mg, Mn, P, S, and alkalies were analyzed.

12174. GEORGIADIS, CONSTANTIN. **Determination of the mineral content of coals.** *Compt. rend. congr. ind. gaz, Lyon* (Assoc. tech. ind. gaz France) 66, 272-7(1949).—*C.A.* 46, 6807*c*.

For the calorimetric process of mineral detn. a new formula, $Q' = (Q \times 100)/(100 - ac)$ was suggested where Q' = heat content as measured in the bomb, Q = true heat content, and c = ash content. The coefficient a, detd. by given exptl methods, ranged between 1.070 and 1.086. The factor ac represented the mineral content of the examd coal.

12175. GUNN, E.L. **Metallic contaminants in fluid cracking catalyst.** *Anal. Chem.* 21, 599-602 (1949).—*C.A.* 43, 8655*i*.

The emmission spectrograph was routinely applied to the analysis of alumina-silica catalysts for traces of Fe, Na, Ca, Ni, Cr, and W. Co, W, and Sr salts were used as internal standards: selected lines of Co for Fe, Ni, V, and Na; W for Cr; and Sr for Ca.

12176. HESSE, GERHARD AND SANTER, O. **pH measurements on adsorbents.** *Angew. Chem.* 61, 24-8 (1949).—*C.A.* 43, 4076*d*.

Exptl. results were presented for the Pt-H_2, glass, quinhydrone, and alloxanthine electrodes as well as indicator dyes. Suspensions of the adsorbent contg. sufficiently high concn. of solids permitted the reproducible detn. of the pH. The Pt-H_2 and glass electrodes gave values in good agreement, but the quinhydrone values showed variations from +0.8 to -0.5 pH units. Indicator dyes gave even larger deviations.

12177. HILL, W.L.; HARDESTY, J.O., AND WHITTAKER, C.W. **The determination of moisture in fertilizers.** *J. Assoc. Offic. Agr. Chemists* 32, 228-41(1949).—*C.A.* 43, 9325*g*.

The methods were: (1) oven drying at 100°C (official); (2) vacuum desiccation at room temp.; and (3) air flow at 60°C. It was recommended that (2) and (3) by made official methods for free water. Several changes in the present A.O.A.C. text on moisture detn. were also recommended.

12178. HIMUS, G.W. AND BASAK, G.C. **Analysis of coals and carbonaceous materials containing high percentages of inherent mineral matter.** *Fuel* 28, No. 3, 57-65 (1949).—*C.A.* 43, 3168*d*.

Coal or oil shale, divided into fractions yielding percentage of ash higher and lower than that of the original material, showed a linear relationship between the percentages of ash and of C, H, N, and S. The compn. of the mineral-free org. matter was detd. by extropolating to zero ash. The ratio of original mineral matter to ash was also calcd. While the agreement with direct analysis was generally good, the generalization failed in some cases (carbonaceous rocks).

12179. IKENBERRY, L.C. AND CANFIELD, J.J. **Rapid method for determining nickel on the surface of enameling iron.** *J. Am. Ceram. Soc.* 32, 308-12(1949).—*C.A.* 43, 9406*i*.

The sample was obtained by dissolving the Ni coating on a small area with dil. HNO_3. The HNO_3 was confined by using a weighted rubber ring and the soln. was withdrawn by suction into a 200 ml Erlenmeyer flask, 30 ml concd. NH_4OH, 10 ml 20% $(NH_4)_2S_2O_8$, and 5 ml of 1% alc. soln. of dimethylglyoxime were added with mixing. The soln. was then dild. with H_2O to 200 ml and after filtn. of the $Fe(OH)_3$, the intensity of the red color was measured photometrically.

12180. KOIDE, TAKEKI; KUBOTA, TAKEO; KOMURO, NOBUYUKI, AND KUROI, TETSUI. **Determination of free carbon in vulcanized rubber by nitric acid methods.** *J. Soc. Rubber Ind. Japan* 22, 272-5 (1949).—*C.A.* 46, 1792*f*.

The analytical value of the HNO_3 method, which used 1.05 as correction factor was affected by the kind of carbon used. The Louth method, in which heat-treatment of carbon was applied before ignition, gave fairly accurate results without using a correction factor, but some variation occurred, according to the kind of carbon used. When vulcanized rubber contg. carbon was decompd. by HNO_3, carbon was oxidized and its wt increase varied with the kind of carbon, which was also true for the blank test of carbon blacks alone.

12181. LaForce, J.R.; Ketchum, D.F., and Ballard, A.E. **Microdetermination of total carbon in carbonates, cyanides, and alkali, or alkaline earth organic salts and mixtures.** *Anal. Chem.* 21, 879(1949).—*C.A.* 43, 8306*h*.

Weigh 5 to 20 mg sample into a Pt microcombustion boat and cover with about 60 mg of powd. $NaHSO_4$. The combustion was carried out in a Hallett app. with a pyrolysis furnace at 725-75°C; water was absorbed in a Drierite tube and the liberated CO_2 in Ascarite.

12182. Lescher, Vera L. **Determination of carbon and hydrogen by combustion.** *Anal. Chem.* 21, 1246-9(1949).—*C.A.* 44, 3403*i*.

Solids were burned in a compartmented boat of special design. The combustion tube filling (in the direction of gas flow) was Cu gauze, quartz chips, platinized asbestos, CuO wire, $PbCrO_4$ on CuO, glass wool; the absorption train was essentially conventional. Six to 8 detns. were made per day.

12183. Majumdar, K.K. **A new method for the analysis of adulterated graphite.** *J. Sci. & Ind. Research* (India) 8B,168-9(1949).—*C.A.* 44, 5266*e*.

Carbonaceous adulterants of natural graphite, such as charcoal, coke, and coal, were detd. by burning off the adulterants. The dried sample (1g) was weighted into a porcelain crucible and heated over an open flame at about 700°C. The temp. of the contents was slowly raised until the adulterant particles glowed. The temp. was maintained as low as possible and the contents stirred constantly. Complete combustion of the adulterants took 5-20 min. When glowing ceased, the temp. was slowly raised to ensure complete combustion and the end-point judged by the difference in color of the red-hot graphite. Loss in wt represented volatile matter and adulterants.

12184. Poncins, Pierre de. **The chemistry of macromolecules. Its application to the study of the chemical composition of coals, cokes, and rosins.** *Compt. rend. congr. ind. gaz. Lyon* (Assoc. tech. ind. gaz France) 66, 590-6 (1949).—*C.A.* 46, 6806*i*.

During coking of coal, 3 stages were observed: (1) The degradation of the macromols. into viscous liquid and into gaseous mols., which reached a max. between 400° and 600°C and gave coke its characteristic cavernous structure. (2) The thermal hardening of the coke to semicoke at 700°-750°C brought about by the addn. of linear macromols. to the planes of C atoms in polymerization reactions, particularly the combination of H and OH end groups to eliminate H_2O. (3) The production of metallic coke by heating to 900°-1000°C which transformed the amorphous carbon into graphite.

12185. Sanchez, Felipe González. **Sampling of solid fuels and preparation for analysis. I.** *Combustibles* (Zaragoza) 9, 16-3, 64-76 (1949). —*C.A.* 44, 6099*c*.

The standard methods of various countries were reviewed, with a view toward developing one for Spain.

12186. Schmitkons, George E. **Determination of carbon on cracking catalyst by the Leco method.** *Proc. Am. Petroleum Inst. III.* 29M, 25-38(1949). —*C.A.* 44, 4662*f*.

Carbon on the catalyst was burned with O_2 in a combustion furnace. Ceramic chips impregnated with CuO, prepd. by decompn. of $Cu(NO_3)_2$, used to convert CO to CO_2 in the combustion tube. The combustion gases were collected alternately in 2-water-jacketed burets, one with 1000-ml capacity and a 5% stem and the other with 500-ml capacity and a 1% stem, while the CO_2 was being absorbed from the previous sample in a pipet packed with steel wool and filled with caustic soln. A rapidly burning sample may be run in about 10 min.

12187. Shell, Haskiel R. **Chemical analysis of clay.** *U.S. Bur. Mines, Rept. Invest. No.*4420, 36 pp. (1949).—*C.A.* 43, 8628*e*.

Methods were given for moisture, ignition-loss, SiO_2, Al_2O_3, Fe_2O_3, TiO_2, P_2O_5, CaO, MgO, Na_2O, K_2O, total C, carbonate C, total S, sol. salts, and sol. sulfate. Tests showed that 1100°C was the min. temp. for const. ignition loss results within 1 hr. In detg. SiO_2, 2 dehydrations were necessary, the 1st with HCl and the 2nd with $HClO_4$ were chosen.

12188. Snyder, Robert E. and Clark, Ralph O. **Determination of free and combined iron in cracking catalysts.** *Proc. Am. Petroleum Inst. III.* 29M, 104-8(1949).—*C.A.* 44, 4662*i*.

The sensitive colorimetric reaction between o-phenanthroline and Fe^{++} was used. For total Fe, the catalyst was digested with hot HCl or fused with $KHSO_4$; for free Fe, it was treated with neutral $CuSO_4$ soln. and the excess Cu removed by displacement with pure Al. $NH_2OH.HCl$ was added, the pH of the soln. adjusted with an acetate buffer, and the colored complex developed.

12189. Tanner, Louis and Deming, W. Edwards. **The sampling of bulk materials.** *Proc. Am. Soc. Testing Materials* 49, 1181-6, discussion 1187-8 (1949).—*C.A.* 44, 9194*d*.

12190. Vesserberg, V.E. and Zhabrova, G.M. **Catalytic combustion column for gas analysis.** *Zavodskaya Lab.* 15, 1256 (1949).—*C.A.* 44, 1287*f*.

An app. suitable for gas analysis in the field utilized a combustion tube, filled with suitable catalyst, wrapped with Pt or Pd asbestos, heated preliminarily by ignition of some alc. poured on it, then inserted into a can contg. some MeOH. The continued combustion of MeOH vapor on the catalyst maintained 280-300°C within the combustion tube, which could be raised to 400°C by forcing air from bellows into the combustion chamber.

12191. Willits, C.O. and Ogg, C.L. **Report on standardization of microchemical methods. Carbon, hydrogen, and nitrogen.** *J. Assoc. Offic. Agr. Chemists* 32, 561-86 (1949).—*C.A.* 43, 8962*f*.

A comprehensive collaborative study of the methods was made. The semimicro procedure for C gave significantly better results than the micro procedure, provided variables other than sample size were disregarded. The data indicated that the A.O.A.C. micro-Kjeldahl method was unsatisfactory for many compds. with ring N.

12192. Allen, H.R. **Report on sampling fertilizers.** *J. Assoc. Offic. Agr. Chemists* 33, 229-34(1950).—*C.A.* 44, 8580*i*.

Results of a preliminary study were presented on reducing the inspection sample to the desired size and of prepn. of sample for analysis.

12193. Barber, E. Gordon. **The determination of moisture in coal.** *J. Inst. Fuel* 23, 296-6 (1950).—*C.A.* 45, 329*g*.

Accurate sampling of wet products was made more difficult by the uneven distribution of moisture in the batch or consignment. Duplicate sampling was desirable and the use of sub-samples and control charts was a necessary adjunct to a proper appraisal of the moisture content.

12194. Bogdanchenko, A.G. **Determination of elementary and carbonate carbon in blast-furnace dust.** *Zavodskaya Lab.* 16, 97-8(1950).—*C.A.* 44, 6764*i*.

The total C was detd. by combustion and the carbonate C by CO_2 evolution in the app. previously used for carbide detns.

12195. Burr, Alex. C. and Magnusson, Adelynn. **Sulfur in North Dakota lignite.** *Proc. North Dakota Acad. Sci.* 4, 49-51(1950).—*C.A.* 45, 3144*d*.

The data were based upon the analyses of 1017 samples. Org. S, sulfate, S, and pyritic S were found to be the principal forms in which S occurred.

12196. Coulson, J.M. and Maitra, N.K. **The mixing of solid particles.** *Ind. Chemist* 26, 55-60 (1950).—*C.A.* 44, 6202*i*.

The equation $ln\ (100/X) = kt$, where X = percentage unmixed, t = time and k a const. of proportionality, represented the mixing process for a binary solid-solid system in a simple drum mixer.

12197. Deinum, H.W. and Schouten, A. **The direct semimicro determination of oxygen in organic substances.** *Anal. Chim. Acta* 4, 286-99(1950). —*C.A.* 44, 10591*b*.

The procedure involved pyrolysis at 1050°-1100°C in a stream of O_2-free N_2, and conversion of all the O into CO by passing over carbon at the same temp.; the CO was oxidized to CO_2 by HgO, then absorbed in $Ba(OH)_2$ soln. and detd. titrimetrically. About 4 mg of oxygen was detd. with a max. error of 0.1 mg, and a mean error of 0.05 mg.

12198. Fedoseev, P.N. and Pavlenko, M.M. **Determination of carbon and hydrogen in the presence of catalysts. I.** *Zhur. Anal. Khim.* 5 296-9(1950).—*C.A.* 44, 10590*a*.

The substance to be analyzed was flamelessly surface-burned in a stream of air or O_2 passed at a rate of 100-300 ml/min. Cr_2O_3, tabletted and broken into pieces 1.5-2 mm, was used as surface combustion catalyst. The combustion carried out in high-melting glass, quartz, or porcelain tubes of 10-20 mm diam. and 350-760 mm long. Samples of 0.1-0.06 g were analyzed with sufficient accuracy.

12199. Harris, Charles C.; Smith, Donald M., and Mitchell, John Jr. **Direct determination of oxygen in compounds containing carbon, hydrogen, and oxygen. A physical-chemical technique.** *Anal. Chem.* 22, 1297-1304(1950).—*C.A.* 45, 979*c*.

The sample was decompd. in a stream of He and the pyrolysis products circulated in a closed system over carbon at 1100-50°C until all the O was converted to CO. During the circulation, practically all the H_2 was removed selectively by diffusion through a heated Pd tube. The compn. of the resulting He-CO mixt. was detd. with a thermal cond. bridge with a sensitivity of 0.20% CO per mv.

12200. Hüttig, G.F. **Catalytic activity and composition of oxide systems.** *Discussions Faraday Soc.* **1950, No. 8,** 215-22.—*C.A.* 45, 9988*e*.

Intermediate states in the transformation from an oxide mixt. to a chem. compound were important in the theory of catalysts. The transformation did not proceed discontinuously but went through individual characteristic states by the diffusion of the mobile component, i.e. the oxide of lower m.p. over the surface of the less mobile component. Later the mobile component became strongly bound and localized.

12201. Ipatieff, Vladimir N. and Pines, Herman. **Composition of W-6 Raney nickel catalyst.** *J. Am. Chem. Soc.* 72, 5320-1(1950).—*C.A.* 45, 2298*a*.

Raney nickel contained about 77% Ni, 21% Al_2O_3, 1.4% Al, and $NaAlO_2$ rather than Al and Ni. Treatment with HNO_3 proved Al_2O_3 was present. The high activity of the catalyst may be, in part, caused by the presence of Al_2O_3.

12202. Kipling, J.J. **Retention of sulfur by cokes and activated charcoals.** *Fuel* **29,** No. 3, 62-3(1950).—*C.A.* 44, 3699*a*.

The S content of a coal, of the coke made from it by carbonization to 700°C, and of a series of charcoals prepd. by steam-activation of the coke at 890°C, were detd. About 1/3 of the total S originally present in the coal escaped with the volatile matter on carbonization; all of the remainder was removed progressively by steam-activation of the coke. The coke and charcoals contg. Cu(2.5%) retained more of the original S as CuS.

12203. Kirsten, W. **Micro- and semimicrodetermination of carbon and hydrogen.** *Mikrochemie ver. Mikrochim. Acta* 35, 217-35(1950).—*C.A.* 44, 7712*i*.

Experiences in detg. C and H by different methods and an improved procedure and app. were described. Samples of 2-5 mg gave results within 0.1% of the truth for H and within 0.3% for C.

12204. Lowry, H.H. **Carbonaceous products from coal.** *Chemistry & Industry* **1950,** 619-25.—*C.A.* 45, 7335*e*.

Data obtained in the survey of coals carbonized by the U.S. Bur. of Mines were used to show quant. relationships between chem. and phys. properties of the cokes produced and the max. temp. to which the samples were heated. The properties of the cokes thus evaluated were the contents of volatile matter, O, N, and S, resp.; the C/H, and C/H, N, O + S ratios; the "true" and apparent sp. grs.; the 1.5-in. shatter index; and the size distribution.

12205. Lucas, Jacques and Millot, Georges. **The quartz content and behavior when heated of**

some refractory clays. *Géol. appliquée et prospection minière* 3, 63-88(1950).—*C.A.* 46, 6801*g*.
Chem. analyses, detns. of free SiO_2, expansion, loss of wt on heating, and x-ray detns. were made on kaolinitic clays.

12206. Miles, S.R. and Quackenbush, F.W. **Precision of samples and analyses of fertilizers and feeds.** *J. Assoc. Offic. Agr. Chemists* 33, 424-48 (1950).—*C.A.* 44, 8581*a*.
An investigation was conducted to det. how many bags of feed or fertilizer should be sampled to obtain a reliable sample. It was found that a sufficiently precise sample of a lot was usually obtained by taking full-length diagonal cores from a max. of 20 bags, regardless of the number of bags in the lot.

12207. Mott, R.A. **The rapid determination of the forms of sulfur in coal.** *Fuel* 29, No. 3, 53-61(1950).—*C.A.* 44, 3696*f*.
Org. S was obtained by the difference between the total S and the sum of sulfate and pyritic S. The present standard methods for detg. sulfate and pyritic S in coal required digestion for 40 and 24 hrs, resp., in dil. HCl and dil. HNO_3 at 60°C and at air temp. The proposed methods reduced the time of digestion to 30 min. for each acid, which was boiled.

12208. Mott, R.A. **Sulfur in coking coal.** *Coke and Gas* 12, 369-70(1950).—*C.A.* 45, 2179*f*.
Coal was ground to 72 mesh and extd. by boiling with 16% HCl 30 min., thus removing nonpyritic and sulfate S; another sample was extd. by boiling 30 min. with 2*N* HNO_3, removing pyritic S. Fe was detd. on the HNO_3 ext., then the non-pyritic Fe in the HCl ext. was deducted to calc. pyritic S as FeS_2.

12209. Pichler, Helmut and Merkel, Heinrich. **Chemical and magnetochemical investigations of iron catalysts used in Fischer-Tropsch syntheses. I.** *Brennstoff-Chem.* 31, 1-9 (1950); *U.S. Bur. Mines, Tech. Paper* **718**, 16-45 (1949).—*C.A.* 44, 3696*g*.
The compn. of Fe catalysts used in medium-pressure syntheses was studied by means of acid decompn. The activity of the catalysts increased with increasing formation of carbide during carburization. In synthesis the large amt. of carbide present after pretreatment decreased during the first days of operation to 0.2-0.4 g of carbidic C/10 g of Fe in an active catalyst; there was a corresponding increase in the O-content to 0.1-0.2 g/10 g of Fe.

12210. Pichler, Helmut and Merkel, Heinrich. **Chemical and magnetochemical investigations of iron catalysts used in Fischer-Tropsch syntheses. II. Magnetochemical investigations.** *Brennstoff-Chem.* 31, 33-42 (1950); *U.S. Bur. Mines, Tech. Paper* **718**, 47-100 (1949).—*C.A.* 44, 4223*h*.
Two Fe carbides, both having the formula Fe_2C, appeared in various stages in the prepn. and use of Fe catalysts for hydrocarbon synthesis. The more stable form had a Curie point of 265°C; the less stable a Curie point of 380°C.

12211. Pozzetto, L. **Rapid determination of the ash content of solid fuels by regulated combustion in oxygen.** *Rev. ind. minérale* 31, 156-61(1950).—*C.A.* 45, 4021*e*.
A sample of 1 g coal was dried in an air current at 100-10°C and burned in O_2 in a muffle at about 825°C. The whole procedure including crushing, drying, incineration, and weighing took only 13 min.

12212. Rodden, C.J. **Carbon, hydrogen, and oxygen.** *Natl. Nuclear Energy Ser.*, Div. VIII, 1, *Anal. Chem. Manhattan Project*, 271-86(1950).—*C.A.* 45, 1911*f*.
H was detd. in graphite and in powd. U by combustion in O_2 and absorption of the water in Anhydrone. To distinguish between H and H_2O, the latter was detd. first by heating in dry N_2. CO_2 was detd. by standard methods. Water in U_3O_8 was obtained by mixing with Na_2CO_3 and heating to 900°C. In UF_4, water was detd. by heating in N_2 and passing the liberated gases over Cu and then CuO; it was also detd. by mixing with Na_2CO_3 and heating to 1000°C in a stream of O_2. Water in UO_2SO_4 was detd. by thermal decompn. and allowing the gases to react with Na which formed H_2 from the H_2SO_4. The Karl Fischer method was successful for detg. H_2O in $UO_2(NO_3)_2$ and in its ethereal soln.

12213. Šimek, Břetislav G.; Helm, Jiří, and Koštál, Jaroslav. **Determination of free sulfur in coke and semicoke.** *Paliva* 30, 23-6(1950).—*C.A.* 44, 5566*i*.
A 10-g sample was extd. with benzene at 78°C or with CCl_4 at 60°C for 24 hrs. H_2S was removed by shaking with $CdCl_2$ or Cd acetate, and free S was pptd. by shaking with Hg. Hg sulfide was dissolved in aqua regia and the resulting H_2SO_4 detd. as the Ba salt. Added S (from 0.1 to 4.8% of the extd. semicoke) could be recovered quantitatively within 0.02%.

12214. Sutcliffe, G.R. **Determination of organic matter by acid ashing.** *J. Textile Inst.* 41, T196-7(1950).—*C.A.* 44, 8824*h*.
When $HClO_4$ oxidations were applied to material incapable of easy oxidation by HNO_3, explosions may occur. There was no danger with materials that were easily oxidized by hot HNO_3.

12215. Thomas, W.C. and Wilkinson, H.C. **Determination of carbon dioxide in coal.** *J. Soc, Chem. Ind.* (London) 69, 306-9 (1950).—*C.A.* 45, 2649*d*.
CO_2 was detd. by adding 10 ml of 5 *N* HCl and measuring the pressure increase in an app. of const. vol. Grinding the coal to 72 Brit. Standard mesh was satisfactory. The short period of heating and strength of acid used did not produce H_2S or release occluded CH_4.

12216. Unterzaucher, Josef. **A new automatic micromethod for the determination of carbon and hydrogen based on the micromethod for determining oxygen.** *Chemie Ing. Tech.* 22, 39-40 (1950).—*C.A.* 44, 3840*e*.
The unknown was oxidized in a stream of air over CuO, the excess O_2 removed from the combustion gas by Cu heated to about 500°C and the H_2O absorbed on anhyd. $BaCl_2$. The CO_2 was converted

to CO over a carbon catalyst heated to 1120°C and the CO made to react with I_2O_5 to form CO_2 and I_2. The I_2 was absorbed in dil. alkali hydroxide and titrated; the absorbed H_2O was then evapd. from the $BaCl_2$ and passed over the carbon catalyst where it was converted to CO, which was detd. as before.

12217. Yebra Montagut, Joaquín de and Rich, José Ma Mensa. **Analysis of mixtures of graphitic and amorphous carbon.** *Afinidad* 27, 488-93 (1950).—*C.A.* 45, 5568*b*.

A finely powd. sample (1.0 g) free from combined water and carbonates, was boiled for 2.5 hrs in a Kjeldahl flask with 30 g concd. H_2SO_4 and 2-3 g of K_2SO_4. The cooled liquid was dild. with water; the solid residue filtered off, washed, dried 2 hrs at 105°C, weighed, and calcined in O_2 until no dark or brilliant particles were seen. The residue was weighed as ash and the graphite calcd. by difference. The method was tested on Ceylon graphite, various coals, and carbon black.

12218. Aleixandre Ferrandis, Vicente and Garcia Verduch, Antonio. **Relations between certain physical, chemical, and technical properties of clays. II. III.** *Anales edafol. y fisiol. vegetal* (Madrid) **10**, 207-46; 327-400 (1951).—*C.A.* 46, 4187*f*.

Chem., mech., and thermal analyses of a no. of Spanish clays were made and the presence of org. and inorg. gels and the surface activity were detd. The base-exchange capacity was affected by fineness, but this was evident only in samples of the same compn. The montmorillonite samples had a capacity to absorb methylene blue of 159.9 mg/g, the illites less than 76, the halloysites less than 68, and the kaolins less than 12. The study of the clays was extended to include plasticity, viscosity, thixotropy, vol. of sedimentation, rate of loss of water through the mass, shrinkage on drying, porosity during drying, shrinkage during firing, and porosity, sintering, and mech. resistance in dried and fired samples.

12219. Ballow, F.H. Jr. **Limestone in the California beet-sugar industry.** *Calif. J. Mines Geol.* 47,9-16(1951).—*C.A.* 45, 4951*h*.

The prepn. and use of limestone in beet-sugar making was described. Desirable phys. and chem. qualities in the stone were: fine-grain size, 95% or more $CaCO_3$, 4% or less $MgCO_3$, and 1% or less SiO_2.

12220. Baron, J. **Determination of water of constitution and of carbon dioxide in ferrous minerals.** *Chim. anal.* 33, 92-4(1951).—*C.A.* 45, 4174*d*.

To det. H_2O by itself, heat the sample to 300°-350°C in a stream of dry air and pass the escaping gases through a mixt. of PbO and PbO_2 before absorbing the H_2O in weighed tubes contg. P_2O_5. The method for detg. CO_2 was similar to that commonly used.

12221. Belcher, R. and Goulden, R. **Microdetermination of carbon and hydrogen in organic compounds containing fluorine.** *Mikrochemie ver. Mikrochim. Acta* 36/37, 679-89(1951).—*C.A.* 45, 5067*f*.

Burn the substance in a silica combustion tube in O_2 at 4 ml/min. Complete the oxidation by passing the product over a Pt contact at 750°C. Ag wool at this temp. removed S and halogens, including the F from any HF formed. Use granular NaF to absorb SiF_4. Det. H_2O and CO_2 as usual by absorption in $Mg(ClO_4)_2$ and Ascarite, resp. Preliminary work with fluorocarbons indicated that these compds. could be analyzed in the same way, if water vapor was introduced.

12222. Bertholf, W.M. **The design of coal-sampling procedures.** *Am. Soc. Testing Materials, Symposium on Bulk Sampling, Spec. Tech. Pub.* No. **114**, 46-57, discussion, 58-65(1951).—*C.A.* 46, 10579*i*.

A min. no. of increments must be taken to obtain a sample of pre-assigned accuracy, regardless of the increment wt. The principal variances included the true variability of the coal from time to time, the random variation in increments, (such as no. of particles, particle wt, and ash content), and variations of reduction and analysis.

12223. Burr, Alex C. and Jaffer, M.M. **Sulfur in North Dakota lignite. III. Humic and resinic sulfur.** *Proc. N. Dakota Acad. Sci.* 5, 11-18 (1951).—*C.A.* 46, 7738*e*.

Total S was detd. by both the Eschka and turbidimeter methods; total inorg. S and sulfate S were detd. directly. Resinic S was detd. indirectly by subtracting from the total S the phenol-insol. fraction. Humic S, pyritic S, and total org. S were detd. by difference.

12224. Bush, Joseph L. **Determination of moisture in pigments with the Karl Fischer reagent.** *Natl. Paint, Varnish and Lacquer Assoc., Sci. Sect. Circ.* No. **748**, 15-22(1951).—*C.A.* 46, 2961*h*.

A sample of pigment suspended in MeOH was titrated with the Karl Fischer reagent. Results on various pigments agreed with oven-drying and toluene-distn. methods. This method could not be used for pigments such as Cu_2O, Cd red, and certain pigments contg. Pb and Zn.

12225. Chamberlain, E.A.C.; Caldwell, J.B., and Waters, P.L. **A variable-ratio sample-divider for granular materials and powders.** *Nature* **167**, 980-1(1951).—*C.A.* 46, 2345*i*.

Granular or powd. material (coal) fell by gravity through a duct and was deflected to alternate outlets by an oscillating chute. The rates of feed and of movement of the chute detd. the size of sample.

12226. Cuneo, R. **Devices and methods for water determination in different substances.** *Bull. école meunerie belge* **13**, 134-43(1951).—*C.A.* 46, 1389*e*.

The recent methods used in different countries were reviewed.

12227. Dalen, E. van. **Rapid determination of dissolved nitrate by catalytic reduction with hydrogen.** *Anal. Chim. Acta* 5, 463-71(1951)(in German).—*C.A.* 46, 7473*d*.

N as nitrate was estd. by reduction to NH_3 in alk. soln. by means of H_2 in the presence of a Ni catalyst. The NH_3 was transported by the H_2 to a receiver in which it was absorbed and titrated simultaneously. PO_4^{3-}, Ca^{2+}, K^+, Cu^{2+}, and Fe^{2+} did not interfere seriously but Cd^{2+} and Pb^{2+} caused low results.

12228. DUNDY, MORRIS AND STEHR, ERVIN. **Determination of oxygen in organic materials by a modified Schütze-Unterzaucher method.** *Anal. Chem.* 23, 1408-13(1951).—*C. A.* 46, 855*e*.

Analyses of hydrocarbon samples indicated O-content as high as 2.5%. This anomaly was caused by liberation of extraneous I_2O_5 through the partial reaction of the oxidant and the H_2 formed by the pyrolysis of the sample. A gravimetric procedure precluded interference due to extraneous I_2. The I_2 was retained in an absorption tube contg. crystals of $Na_2S_2O_3$ and suitable drying agents.

12229. EMERY, E.T.G. **Sampling of small coal.** *Engineering* 172, 452-4(1951).—*C. A.* 46, 2264*c*.

If the sampling was designed to limit the variability of the ash detn. to some predetd. value, other properties of coal, such as volatile-matter content and calorific value, would be obtained with sufficient precision. Since the general level of ash content may vary from place to place in the coal consignment, a sampling procedure for com. application should take this factor into consideration.

12230. GAMBLE, LEON W. **Spectrographic analyses of cracking catalysts. Determination of magnesium and zirconium.** *Anal. Chem.* 23, 1817-20 (1951).—*C. A.* 46, 5826*i*.

Spectrographic methods were applicable to either natural clay, synthetic silica-alumina, or silica-magnesia catalysts, or their mixts. For Mg the catalyst was mixed with CuO and graphite and arced at various intensity levels by means of a step sector; the ratio Mg 2779.8/Cu 2768.9 was used. Standards were prepd. by working pure catalyst into a slurry with known amts. of pure $Mg(NO_3)_2$ soln. and calcining. Cu was a better internal standard than Mo. The analytical range for Mg was 0.2-12% MgO. For Zr a similar technique with Co internal standard, was used.

12231. GANGULY, A.K. **Hydration of exchangeable cations in silicate minerals.** *Soil Sci.* 71, 239-44(1951).—*C. A.* 46, 318*g*.

The moisture content of silicate minerals was affected markedly by the exchangeable cations. The following nos. of mols. were found assocd. with various cations on bentonite: H 1, Na 2.86, K 0.96, Ca 6.6, Ba 2.84; on kaolinite, H 1, Na 2.93, K 1.29, Ca 8.5, Ba 3.54. These values were detd. from losses of wt on ignition.

12232. GLOGOCZOWSKI, JAN JACEK. **Simplified thermal analysis of clays.** *Nafta* (Poland) 7, 262-4(1951).—*C. A.* 46, 4424*d*.

The method was based on heating gradually a steel block having twin cavities filled with clay and with calcined Al_2O_3, resp., and recording at intervals of 2 min. the temps. read on two Hg thermometers inserted with their bulb ends into the samples. The differences in temp. were plotted against the temp. of the Al_2O_3. Irregularities in the resultant curve were indicative of exothermic or endothermic effects (e.g. removal of adsorbed H_2O, crystn. H_2O, changes in structure, etc.).

12233. GOUVERNEUR, P.; SCHREUDERS, M.A., AND DEGENS, P.N. JR. **Direct determination of oxygen in organic compounds. Some sources of error in the Schütze-Unterzaucher carbon reduction method.** *Anal. Chim. Acta* 5, 293-312 (1951)(in English).—*C. A.* 46, 855*d*.

The high blanks and extra corrections normally required were eliminated by changing the volumetric I_2 end point to a volumetric CO_2 one, and by improving the purification of the transport gas.

12234. GUNN, E.L. **Spectrographic determination of metal contaminants in cracking catalyst—characteristics of arc excitation.** *Anal. Chem.* 23, 1354-8(1951).—*C. A.* 46, 1237*i*.

Results indicated that arcing the catalyst sample to depletion did not provide as good precision as that obtained by a somewhat shorter arcing period in analysis. Basic compn. of the catalyst was a factor which significantly influenced the excitation characteristics exhibited by spectra of the contaminant elements.

12235. HALE, CECIL H. AND HALE, MARGIE N. **Carbon on cracking catalyst. Determination by combustion and conductivity.** *Anal. Chem.* 23, 724-6 (1951).—*C. A.* 45, 8750*g*.

An analytical method, based on the decrease in elec. cond. when CO_3^{--} replaced OH^-, was devised. For best detn., the NaOH soln. should have a concn. of 0.04 *M* with a sample size of 0.2-0.3 g of catalyst, so that the depletion of NaOH did not exceed 50%. The burning was followed closely because the measurements could be made in a few sec. The change in cond. was linear with the CO_2 absorbed.

12236. HAMMER, A.S. **Sulfide content of clays and its bearing on calculations for barium treatment.** *Ceram. Age* 57, No. 4, 17-18, 60 (1951).—*C. A.* 45, 7759*i*.

Many clays and shales contained S in the form of insol. sulfides, which exceeded the amt. of sol. sulfates. Sulfide S was usually ignored in the calcns. for the Ba requirement.

12237. HARMON, DUANE D. AND RUSSELL, RAYMOND G. **Impurities in catalyst materials—quantitative spectroscopic analysis with an alternating-current spark.** *Anal. Chem.* 23, 125-8(1951).—*C. A.* 45, 3751*a*.

A spectrographic method for the analysis of an Al silicate matrix catalyst for Fe, Ni, V, and Na with Si as an internal standard was described. Samples of catalyst were ground to 100 mesh before ignition at 500°C for 2 hrs.

12238. HENTOLA, YRJÖ. **The activation of native (Finnish) clays.** *Suomen Kemistilehti* 24A, 18-22 (1951).—*C. A.* 46, 662*d*.

Two deposits of clays suitable after activation as a catalyst for the polymerization of sulfate (kraft) turpentine to lubricating oil were found in Finland. Analysis of the former sample showed SiO_2 48.42-49.82, Al_2O_3 17.44-17.68, Fe_2O_3 13.12-14.24%. The clays were activated with H_2SO_4.

12239. HOLOWCHAK, JOSEPH AND WEAR, G.E.C. **Direct determination of oxygen in organic compounds.** *Anal. Chem.* 23, 1404-7(1951).—*C.A.* 46, 855*b*.

The modified procedure involved oxidation of the CO to CO_2 by means of CuO, collection of the CO_2 in a liquid-N_2 trap, and, after the residual gases were pumped out, detn. of the CO_2 manometrically in a standard vol. H_2 was removed as H_2O and frozen out in a Dry Ice trap.

12240. LIDDELL, F.D.K. **Coal sampling.** *Fuel* 30, 275-83(1951).—*C.A.* 46, 705*g*.

Sampling procedures should give an accurate sample and some measure of the variation in the lot of coal sampled. Duplicate samples should be taken so that the differences between the duplicates can be used to indicate accuracy. Further, the use of sub-samples will give an idea of the variation within a large quantity of coal. The sampling accuracy required will depend on the purpose of the sampling. For much routine work the accuracy of each sample could be much reduced from the present accepted standards; the total wt of coal to be examd. may not be substantially altered and the over-all gain would be considerable.

12241. MARTIN, F. **Rapid microanalysis of sulfuric ashes in organic materials (determination of alkalies).** *Mikrochemie ver. Mikrochim. Acta* 36/37, 660-4(1951).—*C.A.* 45, 5071*c*.

A combustion was conducted in a Pt boat with O_2 contg. a little SO_2. With the aid of the Pt as catalyzer, the S was all converted to SO_3. The alkalies remaining in the boat retained only sufficient SO_3 to form the anhyd. sulfates which were weighed.

12242. MERKEL, H. **Thermomagnetic analysis.** *Chem.-Ing.-Tech.* 23, 570-5(1951).—*C.A.* 46, 3897*c*.

Fundamental principles, construction of magnetic balances, and procedures were discussed. Mixts. of Fe, Fe_2O_3, and Fe_3C, of Cr and Ni in alloys, and examns. of metal-contg. catalysts were analysed.

12243. ORNING, A.A. **Coal-sampling problems.** *Am. Soc. Testing Materials, Symposium on Bulk Sampling, Spec. Tech. Pub.* No. 114, 29-35(1951). —*C.A.* 46, 10579*h*.

The economic sampling of coal required attention to max. piece to sample wt, and applicability to estimates of ash content, methods of mining as related to impurities, methods of handling affecting mixing of varying components. The compositing of alternate increments into 2 gross samples to be reduced and analyzed separately provided one method of routine control of sampling.

12244. OTTING, W. **Experiments for the explanation of the blank values in the microdetermination oxygen.** *Mikrochemie ver. Mikrochim. Acta* 38, 551-3(1951).—*C.A.* 46, 2446*a*.

Traces of Fe in the contact carbon acted as catalyst for the reduction of the quartz tube and thus gave rise to high blank values.

12245. RADMACHER, WALTER AND LANGE, WILFRIED. **The determination of the nitrogen content of solid fuels.** *Glückauf* 87, 739-46(1951).—*C.A.* 46, 2777*g*.

When the N-content of coals was detd. under the same conditions as for cokes, the results were too high, because pyrolytically formed CH_4 contaminated the N_2 and entered the azotometer. This CH_4 could be oxidized completely by a layer of Pt wool 40-50 mm long, heated to about 1000°C and placed directly behind the combustion tube with the sample. Procedures and results of the N detns. in coals, cokes, and org. N compds. (test substances) obtained with this modified Unterzaucher method were given in detailed tabular form.

12246. RODRIGUEZ PIRE, LUCAS. **Proximate analysis, swelling, and agglutination of coals.** *Combustibles* (Zaragoza) 11, 71-82(1951).—*C.A.* 45, 9831*g*.

Methods of sample prepn. and analysis were described. The sample prepn. method and methods for detn. of moisture, ash, volatile matter (British standard), and fixed carbon were taken from the ASTM and its British, German, and French counterparts. An increment in ash content of coal represented a loss in value substantially greater than the carbon it replaced, e.g. in blast furnace operation the ash in the coke was a large contributor to the S and other impurities to be dealt with.

12247. SCHUSTER, FRITZ. **Estimation of mineral constituents in bituminous coal.** *Brennstoff-Chem.* 32, 366-8(1951).—*C.A.* 46, 2264*h*.

12248. STALZER, ROBERT F. AND VOSBURGH, W.C. **Determination of available oxygen and total manganese in manganese oxides.** *Anal. Chem.* 23, 1880(1951).—*C.A.* 46, 2446*b*.

The error was greater with OsO_4 as catalyst than with iodate and was probably caused by atm. oxidation or Mn^{2+} in the presence of pyrophosphate. Good results were obtained by titrating under N_2.

12249. THORN, J.A. AND SHU, PING. **A new apparatus for the rapid determination of carbon by wet combustion.** *Can. J. Chem.* 29, 558-62(1951).—*C.A.* 45, 8938*i*.

A sample contg. 0.3-15 mg of C was analyzed. The sample was mixed with KIO_3 and Van Slyke-Folch combustion reagent (contg. CrO_3, sirupy H_3PO_4 and fuming H_2SO_4) and heated to 210°C in 7 9 min. at a pressure of 20-30 mm Hg. The CO_2 produced was allowed to diffuse through a tube contg. KI and Zn turnings into standard NaOH for another 10 min. after the cessation of heating. The NaOH was stirred magnetically during the absorption. The excess NaOH was titrated with HCl.

12250. UNTERZAUCHER, J. **Elementary determination of oxygen, a method of determining carbon and hydrogen developed from it, and a new procedure for carrying out the Dumas nitrogen determination for compounds difficult to burn.** *Mikrochemie ver. Mikrochim. Acta* 36/37, 706-26(1951). —*C.A.* 45, 5066*i*.

The method consisted in changing the O to CO at 1120°C, and causing the CO to react with I_2O_5 at 118°C, absorbing the liberated I_2 in NaOH soln., oxidizing it to IO_3^-, and titrating iodometrically with $Na_2S_2O_3$ soln. A new procedure for the microdetn. of C and H was given. The sample was burned in air over CuO, the excess O_2 removed by Cu heated to 500 °C, water removed by $BaCl_2$, and the CO_2 reduced to CO which was analyzed as in the detn. of O_2. The Dumas detn. of N in compds. hard to burn completely was discussed.

12251. WAGNER, HERBERT. **Notes on the determination of carbon and hydrogen.** *Mikrochemie ver. Mikrochim. Acta* 36/37, 634-40(1951).—*C.A.* 45, 5067*d*.

A somewhat modified combustion tube was recommended for detg. C and H by combustion and 2 readily exchangeable extension tubes were provided. To obtain good H values, it was recommended to burn samples free from N without any PbO_2 in the combustion tube and to use aged PbO_2 in the extension tube when N was present.

12252. WILLITS, C.O. AND OGG, C.L. **Report on standardization of microchemical methods (carbon, hydrogen, and nitrogen).** *J. Assoc. Offic. Agr. Chemists* 34, 607-20(1951).—*C.A.* 45, 10118*c*.

A statistical analysis of the results obtained showed that they were superior to or as good as those obtained in the previous study in which each analyst used his own method. Another collaborative study indicated that a microkjeldahl method for N employing 1.30 g of K_2SO_4 per 2 ml of H_2SO_4 was superior to one employing 0.85 g.

12253. WNEKOWSKA, LIDIA AND CZUBEK, STANISLAW. **Determination of phosphorus in bituminous coal.** *Prace Glównego Inst. Górnictwa, Komun.* No. 83, 14 pp. (1951)(English summary).—*C.A.* 46, 11628*d*.

Kjeldahl decompn. resulted in detn. of inorganically and organically combined P. Pyro- and meta P compds. were converted into the ortho form. After H_2SO_4 was sepd. by pptn., orthophosphates were detd. as ammonium molybdenum phosphate. This method was found to be up to 98.48% accurate (based on P content), and good reproducibility was obtained.

12254. WURZSCHMITT, BERNHARD. **Simultaneous determination of nitrogen and hydrogen in organic substances.** *Mikrochemie ver. Mikrochim. Acta* 36/37, 614-27(1951).—*C.A.* 45, 5066*g*.

Instead of using PbO_2 in the combustion tube, a small, weighed, drying tube was introduced between the combustion tube and the microazotometer. The N and H were detd. in the same app. and with the same filling of the combustion tube; in the first case CO_2 was used to drive out the combustion products from the tube and in the C detn., moist N_2 was used.

12255. BARTLET, J.C.; COUTU, CLEO; LIST, ETHEL, AND WOOD, MARGARET. **The composition of edible bone meal.** *Can. J. Technol.* 30, 137-42(1952).—*C.A.* 46, 8288*e*.

The compn. of 16 samples of edible bone meal from 3 processors was detd. The av. values obtained were Ca 33.0, P 15.4, total ash 87.9, and moisture 1.46% with only a slight variation between samples. The fluoride content varied between 350 and 770 p.p.m. with an av. of 572 p.p.m. The av. Zn was 129 p.p.m. and with one exception less than 10 p.p.m. Pb was present. Less than 10 p.p.m. of Cu and 1 p.p.m. As was found.

12256. BHATTACHARYA, A.T. AND GUPTA, M.P. **Nitrogen and sulfur of cokes and the possibility of their recovery.** *J. Proc. Inst. Chemists* (India) 24, 105-19(1952).—*C.A.* 47, 4063*g*.

Ordinary and synthetic cokes, prepd. by heating charcoal with different org. substances at 400°-800°C, were investigated with respect to N and S elimination. The synthetic product was invariably the more active of the two, with respect to both adsorption and elimination of N and S.

12257. BRYSON, ALEXANDER AND PICKERING, W.F. **The determination of moisture in coal with the Karl Fischer reagent.** *J. Inst. Fuel* 25, 28-30(1952).—*C.A.* 46, 2265*a*.

Prior to titration, the coal was suspended in MeOH for short periods, and to improve the clarity of the end point, it was found desirable, although not always essential, to extend this period to at least 15 min. The results combined the accuracy of a distn. procedure with the speed, simplicity, and convenience of the oven-drying method.

12258. DUKE, FREDERICK R. **The disproportionation of manganate ion. Manganese dioxide as a heterogeneous catalyst.** *J. Phys. Chem.* 56, 882-4(1952).—*C.A.* 47, 958*d*.

The disproportionation was followed by measuring the absorption of the manganate ion at 600 mμ. The reaction was forced to go to completion by adding tetraphenylarsonium chloride, which removed the $KMnO_4$ as it was formed. The MnO_2 formed acted as a catalyst.

12259. ELPHICK, J.O. AND GERSON, T. **Conductometric determination of sulfur in coal.** *Fuel* 31, 438-44(1952).—*C.A.* 46, 11628*f*.

The calorimeter bomb washings were boiled, neutralized with excess (approx. 0.0025 *N*) NaOH, brought to a boil, filtered while hot, and then after cooling titrated conductometrically against $Ba(OH)_2$ soln. Significant results were obtained when the wt of S detd. was not less than 0.0016 g, with 0.8 g of coal. The results were in good agreement with those obtained by the Eschka method for all coals tested.

12260. EVANS, U.R. AND TOMLINSON, R. **A new method for the transfer of oxide films from heat-tinted iron to glass or plastic.** *J Applied Chem.* (London) 2, 105-9(1952).—*C.A.* 46, 6515*h*.

A heat-tinted Fe or stainless steel specimen was attached to glass by means of petroleum jelly or sealing resin, and the Fe then removed anodically, leaving the film clinging to the transparent support.

12261. GRASSNER, FRIEDRICH. **Determination of traces of sulfur in organic materials.** *Z. anal. Chem.* 135, 186-91(1952).—*C.A.* 46, 6036*e*.

The new procedure consisted in vaporizing the material in a suitable app. through which H_2 slowly flowed, burning the resulting mixt. of gases in O_2 against Pt, absorbing the resulting SO_3, and measuring the turbidity produced with $BaCl_2$.

12262. Guérin, Henri; Bastick, Marthe, and Marcel, Paul. **The direct determination of oxygen in combustible solids.** *Chaleur & ind.* 33, 177-80(1952).—*C.A.* 46, 10580*d*.

Two methods of O analysis in coal were compared with 11 different coals, some high in S. The preferred method involved pyrolysis in N_2 at 1200°C, passage of the gases through wood charcoal at 1200°C to give CO, subsequent oxidation to CO_2 with a Pt catalyst, and finally, gravimetric detn. of CO_2.

12263. Guérin, Henri and Marcel, Paul. **The direct determination of oxygen in coals. II. Method of hydrogenation.** *Bull. soc. chim. France* 1952, 310-11.—*C.A.* 46, 10580*b*.

The method based on the pyrolysis of the sample and the transformation of the oxygenated compds. of H_2O by catalytic hydrogenation was investigated. At 325°C and with a delivery of 2 liter H_2/hr, the conversion of CO and CO_2 to H_2O was quant. A catalyst of reduced Ni with 2% Th proved to be satisfactory for coals poor in S. Oxides of Fe, carbonates, and sulfates interfered in the detn.; silica did not.

12264. Howard, H.C. **Evidence for the cyclic structure of bituminous coals.** *Ind. Eng. Chem.* 44, 1083-8(1952).—*C.A.* 46, 6362*i*.

Consideration of the at. C:H ratios in the coal series, as well as the nature of the products obtained in degradations by mol. distn. up to 525°C, solvent action at 250° to 400°C, hydrogenation at 300° to 400°C, and oxidation at 100° to 270°C led to the conclusion that coal was predominantly cyclic in character.

12265. Jahns, Hans. **Accuracy of sampling coal and ores.** *Glückauf* 88, 289-303(1952).—*C.A.* 46, 6561*d*.

The sample wt should be proportional to the wt of the shipment. In sampling a conveyor belt the timing of the sample must be such that the quality was not influenced by the end of a shift or other extraneous conditions. The wt of the largest particles in the sample should be as small as practical in relation to the wt of the sample, a ratio of 1:3000 being desirable.

12266. Jahns, Hans. **The influence of the largest particles on sample quartering and the residue left in the apparatus on the accuracy of sampling.** *Glückauf* 88, 684-8(1952).—*C.A.* 46, 9461*h*.

A statistical survey was given of the effect of factors such as the ratio of the wt of large particles to the wt of the sample and of the effect of sample prepn. on the accuracy of sampling.

12267. Key, C.W. and Hoggan, G.D. **Spectrographic method for analysis of cracking catalysts.** *Anal. Chem.* 24, 1921-5(1952).—*C.A.* 47, 2638*i*.

Cr, Fe, Ni, Na, and V in silica-alumina cracking catalysts were detd. spectrographically. A high-voltage spark and a rotating-disk electrode contg. Li_2CO_3 as flux and buffer and Co as internal standard were used.

12268. King, J.G. **Standard methods of coal analysis.** *Coke and Gas* 14, 363-7(1952).—*C.A.* 47, 3541*i*.

The standards covered sample analysis, detn. of total moisture, ash and mineral matter, volatile matter and calorific value, C and H, total S, N, O, calcn. of the "ultimate" analysis, P, Cl, and As, forms of S, caking properties of coal, crucible swelling test, Gray-King assay coke type and Arnu test, agglutinating value, reporting of results, and sampling of coal.

12269. McCarthy, Robert and Moore, Carl E. **Determination of free carbon in atmospheric dust.** *Anal. Chem.* 24, 411-12(1952).—*C.A.* 46, 4709*d*.

Treat 0.2-0.8 g of sample with 25 ml of concd. HNO_3 and boil 20 min. Dil. with 125 ml of 6 *N* HNO_3 and let stand over night. Filter through a tared, filtering crucible, dry 2 hrs at 140°C, cool, and weigh. Ignite for 2 hrs at 700°C, cool, and weigh. The loss in wt was due to oxidation to gaseous CO_2. In large cities the carbon content of the dust may reach nearly 50%

12270. Otsubo, Yoshio and Kato, Chuzo. **Hydrothermal synthesis of Japanese acid clay. I. II.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 73, 146-8; 148-50(1952).—*C.A* 46, 10057*f*.

The clay was synthesized from Al_2O_3 gel, silica gel, $Mg(OH)_2$, and water in the steel autoclave at 300°C and under 85 atm. The product was studied by thermal, chem., and x-ray methods and found to consist of montmorillonite 35, beidellite 58, and silica gel 7%. The acidity, color reactions, swelling, and decolorizing abilities of synthesized products were studied.

12271. Pagliassotti, J.P. and Porsche, F.W. **Spectroscopic determination of metals in silica-alumina cracking catalysts.** *Anal. Chem.* 24, 1403-5(1952).—*C.A.* 47, 69*g*.

Ignite the sample to 815°C for 1 hr and then dissolve in acid. Analyze the soln. spectrographically for Fe, V, Ni, Cu, Pb, Ca, and Mg with a pos. rotating electrode by interrupted-arc or spark discharge. Na was detd. by the flame photometer with precision and accuracy both within ±1% of the amt. present.

12272. Schöberl, Heimo. **Determination of the oxygen content of coals.** *Brennstoff-Chem.* 33, 241-4(1952).—*C.A.* 46, 10580*a*.

Best results were obtained by the use of a modified differential method in which the true content of mineral matter was used instead of the ash content, and in which consideration was given to the carbonate C content.

12273. Shugar, D. **Semiquantitative spectrographic analysis of the boron content of graphite and carbon.** *Bull. centre phys. nucleaire, Univ. libre Bruxelles* No. 34, 5 pp. (1952).—*C.A.* 46, 6029*c*.

A powd. sample of graphite or carbon was mixed well with a $Ca(OH)_2$ suspension and evapd. to dryness. It was then fired at 850-900°C for 1.5 hrs. The resulting mixt. was divided into 3 portions, each being packed into a 5-mm deep hole in

Acheson graphite electrodes. Arcing was carried out at 10 amps. for 60 sec. Intensity of the 2497.8 A. line of B was estd. with a 7-step sector. Standards were made up with known quantities of B in the $Ca(OH)_2$ suspension.

12274. Shultz, J.F.; Seligman, B.; Lecky, J., and Anderson, R.B. **Studies of the Fischer-Tropsch synthesis. XII. Composition changes of nitrided iron catalysts during the synthesis.** *J. Am. Chem. Soc.* 74, 637-40(1952).—*C.A.* 46, 5290*h*.

Chem. and x-ray analyses were used to det. changes in the compn. of nitrided Fe catalysts during use in the Fischer-Tropsch synthesis at 7.8 and 21.4 atm. The ϵ-nitrides were converted slowly to ϵ-carbonitrides; the rate of replacement of N by C was somewhat more rapid at 21.4 than at 7.8 atm. At 7.8 atm. pressure, oxidation and deposition of carbon proceeded at a very slow rate, whereas at 21.4 atm. these reactions were considerably more rapid in some catalysts. When used nitrided catalysts were treated with H_2, the N was removed almost completely, but the C content was not changed greatly.

12275. Tendolkar, G.S. and Thakoor, N.R. **Ash from coconut shell.** *J. Sci. Ind. Research* (India) **11B**, 501(1952).—*C.A.* 47, 6122*a*.

The ash content of coconut shell at 550° and 750°C was 0.67 and 0.46% ash, resp., based on the wt of the oven-dried material.

12276. Tendolkar, G.S. and Thakoor, N.R. **Ultimate analyses of coconut shell and shell charcoal.** *J. Sci. Ind. Research* (India) **11B**, 501-2 (1952).—*C.A.* 47, 5664*h*.

Ultimate analyses of the shell and the shell charcoal were carried out and the variation of C, H, and calorific value of charcoal with temp. of carbonization was studied. The coconut shell contained: C 51.58; H 5.83; N 0.145; S 0.055; Cl 0.324; ash 0.49; and O (by difference) 41.576%.

12277. Wildenstein, Raoul. **Alteration of Ascarite.** *Mikrochemie ver. Mikrochim. Acta* 39, 194-5(1952).—*C.A.* 46, 6776*c*.

Examn. showed that considerable free NaOH was present, but the absorption of CO_2 was very slow although regeneration occurred after rapid trituration. Apparently, the sample of Ascarite was covered with a thin film of Na_2CO_3.

12278. Wurzschmidt, B. **Microdetermination of carbon and hydrogen without lead dioxide.** *Mitt. Lebensm. Hyg.* 43, 126-8(1952).—*C.A.* 46, 7937*b*.

The combustion tube was packed with CuO/Ag pumice-Cu-CuO/Ag pumice.

12279. Banerjee, N.G. **Determination of carbon and hydrogen in coal.** *J. Sci. Ind. Research* (India) **12B**, 24-8(1953).—*C.A.* 47, 6633*d*.

The method was used for coal, coke, coal tar, pitch, coal ext., and montan wax, with results that compared favorably with standard methods. The precision for C was 0.10% and for H was 0.03%. Fourteen detns. could be made in 7 hrs.

12280. Belcher, R. **A wet-combustion method for the determination of chlorine in coals.** *Anal. Chim. Acta* 8, 16-21(1953)(in English).—*C.A.* 47, 4579*e*.

Cl was detd. in coals by wet-combustion with H_2SO_4 in the presence of $K_2Cr_2O_7$ and Ag_2SO_4. The liberated Cl was absorbed in H_2O_2 and detd. acidimetrically after treatment with $Hg(OH)CN$.

12281. Fereday, F. and Flint, D. **Use of mineral matter formulas in the classification of coal.** *Fuel* 32, 115-16(1953).—*C.A.* 47, 2956*f*.

For evaluating elementary analyses of coal for the purpose of classification, two formulas for mineral matter were suggested, both derived by statistical methods from a large no. of coal analyses.

12282. Foster, Margaret D. **Geochemical studies of clay minerals. III. The determination of free silica and free alumina in montmorillonites.** *Geochim. et Cosmochim. Acta* 3, 143-54 (1953)(in English).—*C.A.* 47, 6831*b*.

The uncombined SiO_2 or Al_2O_3 was found by the following method: Digest 1 g of sample with 75 ml of 0.5*N* NaOH in a covered Pt crucible for 4 hrs, stirring at intervals of 30 min. After filtration, wash the undissolved material several times with 1% NaOH. Neutralize the filtrate with HCl and add 5 ml in excess. Det. SiO_2 and Al_2O_3 in the usual way. The free SiO_2 or Al_2O_3 was found by detg. the excess of either oxide over that found in the clay.

12283. Frei, Erwin. **Sampling and sample preparation of solid fuels.** *Z. Erzbergbau u. Metallhüttenw.* 6, 56-62(1953).—*C.A.* 47, 5091*i*.

12284. Goodman, John B.; Gomez, Manuel, and Parry, V.F. **Determination of moisture in low-rank coals.** *U.S. Bur. Mines, Rept. Invest. No.* 4969, 20 pp. (1953).—*C.A.* 47, 6632*c*.

Volumetric methods, which gave the most if not all the recoverable H_2O short of that derived from coal decompn., were the most accurate. The problem of air oxidation in the low-rank, high-moisture coals was eliminated by distn. methods. The coal particle was protected at all times by the liquid or vapor phases of the oil or xylene.

12285. Headlee, A.J.W. and Hunter, Richard G. **Elements in coal ash and their industrial significance.** *Ind. Eng. Chem.* 45, 548-51(1953). —*C.A.* 47, 5094*i*.

Analyses of 596 spot samples of coal ash were made for 38 elements. Na, K, Ru, Ca, Mg, Si, Cr, and Mn were present in the coal ash to a lesser extent than their av. presence in the earth's crust. Li, Sr, Ag, As, Bi, B, Ga, Ge, La, Hg, Pb, Sb, Sn, Zn, and Zr had enrichment values (coal ash to earth's crust) between 10 and 185.

12286. Mitsui, Tetsuo. **Organic elementary analysis. V. Removal of nitrogen oxide in the microdetermination of carbon and hydrogen.** *Japan Analyst* 2, 3-5(1953).—*C.A.* 47, 5844*d*.

Instead of using Pregl's PbO_2 for removing NO in detg. C and H in org. compds. contg. N, the use of a satd. soln. of $K_2Cr_2O_7$ in concd. H_2SO_4 was tried. Samples contg. NH_2 groups gave good results, but NO_2 groups gave high H values. A device to prevent the condensation of H_2O on the end of the combustion tube or on the joints of train was described.

12287. TOMLINSON, R.C. AND HALL, DAVID A. **Analytical tolerances and the detection of mistaken results with particular reference to coal analysis.** *Fuel* 32, 77-81(1953).—*C.A.* 47, 2956*g*.

It was usual to fix tolerances to the difference between duplicates, so that if the tolerance was exceeded, further detns. were carried out to detect whether an error had been made. Care must be taken in fixing the tolerances; if they are too close unnecessary extra work will be called for. A method for fixing the tolerances was outlined.

VI-3. Density and Other Physical Properties (Hardness)

12288. KING, A.T. **Specific gravity of wool and its relation to swelling and sorption in water and other liquids.** *J. Textile Inst.* 17, 53-67T (1926).—*C.A.* 20, 1326.

The effect of sorption on the actual detn. of sp. gr., penetration by solvents and oils, influence of salts on swelling and sorption, and density methods of detg. regain and of estg. wool-cotton mixts. were discussed.

12289. MURPHY, E.J. AND WALKER, A.C. **Electrical conduction in textiles.** *J. Phys. Chem.* 32, 1761-86 (1928).—*C.A.* 23, 1273.

The rate of change of resistivity with moisture content was much greater for silk and wool than for cotton, and for a given moisture content the resistivity of silk or wool was greater than that of cotton.

12290. STAMM, ALFRED J. **Electrical conductivity method for determining the moisture content of wood.** *Ind. Eng. Chem., Anal. Ed.* 2, 240-4 (1930).—*C.A.* 24, 4240.

The elec. resistance of wood increased over a millionfold from a 20-35% moisture content (satn. of the fibers) to the oven-dried condition. A linear relationship existed between the logarithm of the sp. elec. resistance and the moisture content.

12291. HEERTJES, P.M. **Density determinations as an aid in examination of fibers.** *Chem. Weekblad* 36, 610-11 (1939).—*C.A.* 34, 4565^{5}.

An examn. of the d. of cotton in He-H_2O mixts. showed that part of the adsorbed H_2O (6.25%) was actually fixed in the cellulose lattice and the remainder (about 20%) was adsorbed on the surface in the usual manner.

12292. BOUTARIC, A. **Investigations of the viscosity of colloidal solutions.** *Rév. gén. sci.* 51, 231-4 (1940-41).—*C.A.* 37, 2978^{7}.

Measurements on hydrous sols of clay, bentonite, humin, gum arabic, As_2S_3, $Fe(OH)_3$ and serum albumin were reported. The effect of electrolytes and acetone were investigated. The viscosity-concn. relation for the disperse phase was interpreted on the basis of Arrhenius' equation: $\ln \eta/\eta_0 = Ac + Bc^2$. ($\eta_0$ was the visocity of the pure solvent; A and B were consts.)

12293. HALLER, K. **Microscopic test of hardness.** *Werkzeugmaschine* 44, 465-70 (1940).—*C.A.* 37, 3640^{8}.

A micro hardness-testing app. was described and its possible uses reported for testing the variation in hardness in an Eloxal coating on Hydronalium as well as for measurements of hardness on a Cr-matrix steel and a high-speed steel.

12294. SCOGNAMIGLIO, CIRO. **Activated carbon.** *Riv. fis. mat. sci. nat.* 14, 385-94(1940).—*C.A.* 37, 515^{3}.

The true d. of a series of commercial activated carbons dried in vacuum at 300°C was detd. by the pycnometric method. Water could not be used for this purpose. The values obtained with toluene were always higher than those obtained with benzene. With benzene, the density was detd. in the same manner for specimens of carbon of the same origin (almond shells but of varying degrees of activation). An increase from 1.08 to 1.92 was found for an increase in the period of activation (with water vapor) from 0 to 45 minutes.

12295. SHAROV, V.S. AND BUTOVSKAYA, V.A. **The production and the properties of calcium clay in the state of primary dispersity.** *Colloid J.* (U.S.S.R.) 6, 587-96 (1940).—*C.A.* 37, 6519^{5}.

The percentage of particles under 0.001 mm of Na clay was the same whether the suspension was prepd. from powd. clay or from a thick dough; that of Ca clay was less if made from powd. clay. Expts. with the Kudin clay indicated that by grinding thick clay dough it was possible to obtain from a soil satd. with bivalent cations a suspension of the same degree of dispersion as from Na soil.

12296. DÉRIBÉRÉ, M. **Effect on reflecting power in the near infrared of liquids absorbed by solids.** *Compt. rend.* 213, 379-80 (1941).—*C.A.* 36, 6857^{3}.

Measurements of percentage of reflection of finely powd. ZnO, kaolin, pptd. silica, sand, Prussian blue, and graphite contg. 0-9% H_2O showed a rapid initial decrease followed by a slow decrease tending to an asymptotic value corresponding with the value for a liquid paste. The influence of the liquid was shown by data for pptd. Al_2O_3 contg. 0-5% of various liquids.

12297. HEERTJES, P.M. **The density and sorptive capacity of some samples of cotton, silk and wool. II. Determinations on silk.** *Rec. trav. chim.* 60, 329-41(1941).—*C.A.* 35, 8303^{2}.

The densities of raw silk, of fibroin obtained by degumming raw silk, and of dyed fibroin were detd. in H_2, He, benzene and air. The amts. of H_2 and of air adsorbed were also measured at various temps. The d. in He was independent of temp. and was the true d. Reproducible detns. of the adsorption of air could not be obtained.

12298. HEERTJES, P.M. **The density and sorptive capacity of some samples of cotton, silk, and wool. III. Determinations on Egyptian cotton.** *Rec. trav. chim.* 60, 689-99(1941).—*C.A.* 37, 1275^{2}.

The density of mercerized cotton, dyed and undyed, in H_2, He, and air as well as the apparent density in air, H_2, water, and benzene were detd. Cotton dyed with substantive dyes was unchanged and the dye was between the micelles. Air and H_2 were adsorbed by cotton. The amount of adsorbed gas was not affected by the dyeing operation.

12299. Higuti, Izuni. **Dielectric properties of a substance in the sorbed state.** *Bull. Inst. Phys. Chem. Research* (Tokyo) (Abstracts (in English) 33-4 (in *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 38, Nos. 1036-8)) 20, 489-513 (1941).—*C.A.* 37, 3985^1.

The dielec. const. of PrOH sorbed by TiO_2 gel was measured between 70° and -70°C. Values in the adsorbed state and in the state of capillary condensation from -60° to 40°C were calcd. Both were less than those for the bulk liquid, the differences increasing with fall of temp.

12300. Courty, Clément. **Magnetic properties of porous bodies.** *Compt. rend.* 215, 18-20(1942).—*C.A.* 38, 6144^7.

The additivity law applied to "clean" porcelain (i.e. washed in water) and H_2O and to pulverized activated coconut charcoal and H_2O. It did not apply, however, to "dirty" porcelain and H_2O nor to granular charcoal (whether activated or not) and H_2O. The failure of the additivity law in these cases was ascribed to the difficulty with which the H_2O penetrated the pores.

12301. Courty, Clément. **The magnetic properties of the iron included in activated charcoals.** *Compt. rend.* 215, 461-3(1942).—*C.A.* 38, 6144^2.

The coeff. of magnetism of Fe_2O_3 existing in activated charcoal was large, but less than that of the pure compd. It was a function of the particle size, becoming larger as the surface increased due to the larger quantity of air retained on the surface.

12302. Dériberé, M. **Role of pH in the preparation and use of silicic acid sols.** *Chimie & industrie* 47, 538-40(1942).—*C.A.* 37, 4288^6.

Silica gel was transformed into a sol by replacing the water with NH_3 soln., either by purifying the gel and soaking it in 0.5-1% NH_3, or by treating it with NH_3 gas, or by washing the unpurified gel with ammoniacal H_2O. Such a peptized gel heated 24 to 48 hrs was liquified to a sol. The pH of such sols was 8 to 10. However, if the sols were prepd. by pptn. from a soln. of silicate by HCl, followed by dialysis, they were capable of cataphoresis and had neg. charges. Hence, colloidal silica was amphoteric, the isolec. point being at pH = 2.5.

12303. Heertjes, P.M. **The density and sorptive capacity of several samples of cotton, silk and wool. IV. Remarks on the sorption of water by cotton, silk and wool.** *Rec. trav. chim.* 61, 751-62(1942).—*C.A.* 38, 3137^8.

The true vol. of water held by 1 ml of dry fiber was $1 + (q'/100) = d_h\,[(p/s) + (1/d_w) + (1/d_h) - (1/d_b)]$, where q' = vol. increase by water taken up minus the vol. of the non-accessible pores of the fiber as detd. by sorption with benzene, d_h, d_w, d_b = the densities of the fiber in He, water and benzene, s = d. of water and p = g of water adsorbed per g of fiber substance. At first the water mols. entered the outer layers of the fiber. Then the water-intake continued by adsorption on the inner and outer fiber substance without any noticeable change in vol. Finally, the water was taken up by capillary condensation in the pores of the fiber, still without any noticeable change in vol.

12304. Hendricks, Sterling B. **Lattice structure of clay minerals and some properties of clays.** *J. Geol.* 50, 276-90 (1942).—*C.A.* 37, 585^2.

Minerals appearing in clays generally had layer lattice structures formed from (1) uncharged layers with OH ions on both surfaces, (2) OH ions on one surface and O ions on the other, (3) O ions on both surfaces, (4) charged layers with O ions on both surfaces or (5) two types of layers, one with OH ions on both surfaces and the other with O ions on both surfaces. The discussion was limited to class (2) kaolin minerals, serpentines, and cronstedtite; class (3) pyrophyllite and talc; class (4) hydrous micas (illite, bravaisite, pholidolite), glauconite, celadonite, and the montmorillonite-nontronite group of minerals.

12305. Heyes, J. and Lueg, W. **A new method for the characterization of the surface quality of materials.** *Mitt. Kaiser-Wilhelm Inst. Eisenforsch. Dusseldorf* 24, No. 3, 31-9; *Werkstattstech u. Werksleiter* 36, 98-104 (1942).—*C.A.* 37, 4946^7.

Highly polished and very rough surfaces, plane or curved, were tested by detg. the ratio between the light brown thrown into the microscope objective by the surface under bright-field illumination and the same under dark-field illumination. The reciprocal value of this ratio was a measure for the roughness.

12306. Meincke, Hermann. **The determination of maximum hardness with the ball method.** *Z. Metallkunde* 34, 289-91 (1942).—*C.A.* 38, 2298^1.

The use of max. hardness instead of Brinell hardness led to a better evaluation of the metal with respect to compression and tensile-strength data. A modified equation was obtained: $H = P\,[(1.28/d^2) - (0.4/D^2)]$ where H = hardness, P = the load, d the diam. of impression, and D for the diam. of the steel ball.

12307. Hüttig, G.F. and Hennig, W. **Reactions in the solid state. CXXXII. Dilatometric study of fritting in lead powders.** *Z. anorg. allgem. Chem.* 251, 260-9 (1943).—*C.A.* 37, 5633^5.

Finely powdered Pb (99.92%) was compressed in rectangular rods and the linear expansion observed in H_2, A, N_2 and air. The results were compared with those obtained with compact Pb. Up to 100°C reversible expansion occurred; at higher temps. fritting set in, retarded by the absorbed gases which were partly expelled at 225°C. This was noticed in the dilatometric curve by the concealed max.

12308. Milner, G.; Spivey, E., and Cobb, John W. **The solid product of carbonization.** *Proc. Chem. Soc. London* 1943, Part II, 578-89.

True specific gravity of cokes reached approximately 1.4 at 500°C and 1.8 at 800°C, with very slight further change to 1200°C. The absence of progress to 2.25, the specific gravity of graphite, was attributed to gas (which escaped very slowly) between the layers of graphitic crystallites. Oxygen remaining in the substance carbonized was held responsible for the subsequent gasification from 500°C upwards. Increasing the surface of a coke by carbonizing it with admixed inert material increased reactivity but not adsorption.

12309. Moll, W. **The density of cellulose.** *Beih. Z. Ver. deut. Chem. A: Chemie, B: Chem. Tech.* **1943**, No. 47, 105-11—*C.A.* **38**, 6091^6.
Pycnometer and gasometric d. measurements for regenerated cellulose gave a value of 1.52 (earlier values were 1.4-1.6). The use of the suspension method (especially in CCl_4) led to much greater accuracy. The av. value of the usual com. fibers was about 1.520 ("mantle fibers" 1.507, native fibers (cotton) and pulp 1.54). The d. of regenerated cellulose was independent of its degree of polymerization, its concn. in the viscose and its stretching during the spinning.

12310. Morris, Humbert and Selwood, P.W. **Magnetic moments on some catalytically active substances.** *J. Am. Chem. Soc.* 65, 2245-52 (1943).—*C.A.* 38, 294^4.
Magnetic-susceptibility measurements, over a range of temp. and field strength, were made on a series of Ni-activated Cu hydrogenation catalysts, on Ni supported on magnesia, and on a catalyst derived from NH_4 Ni molybdate. Active Cu-Ni catalysts were a continuous series of solid solns. ranging in compn. from about 66 to 92.5% Ni. Pure metallic Ni was not present. Thermal deactivation was accompanied by diffusion of Cu into the Ni-rich alloys. Poisons affected a small but measurable fraction of the Ni atoms.

12311. Rossman, R.P. and Smith, W.R. **Density of carbon black by He displacement.** *Ind. Eng. Chem.* 35, 972-6(1943).—*C.A.* 37, 5896^8.
Liquid pycnometer ds. of com. carbon blacks were found considerably lower than the resp. ds. computed from x-ray diffraction. Ceylon graphite was used to interrelate d. data, structure of the working particle, and reinforcing value as rubber pigment. He ds., were preferable for surface-area detns., and H_2O values were adequate for ink and rubber compounding. For graphite, Carbolac 1, grade 6 rubber black, and Shawinigan acetylene black, resp., the "immediate He d." was found to be 2.26 ± 0.1, 2.10, 1.88 and 1.84: the "final He d." (after pentration of He into the free space within the working particle) 2.26, 2.13, 1.90 and 1.95: and the "H_2O d." 2.26, 1.99, 1.82 and 1.79.

12312. Schumb, Walter C. and Rittner, Edmund S. **A helium densitometer for use with powdered materials.** *J. Am. Chem. Soc.* 65, 1692-5 (1943). —*C.A.* 37, 6497^9.
The densitometer was applicable to fine powders that did not appreciably adsorb He and did not possess appreciable vapor pressures at room temp. The method was accurate to ± 0.1% with samples of about 0.5-ml vol. and a ratio of bulk to true d. of about 0.5.

12313. Hermans, P.H.; Hermans, J.J.; Vermass, D., and Weidinger, A. **Volume relations in the system cellulose-water. (Preliminary communication).** *Rec. trav. chim.* **63**, 44-5(1944)(in English).—*C.A.* **39**, 1584^9.
The d. of cellulose in water, rather than that in other media, must be regarded as the true d. D. was a typically macroscopic concept which must be replaced by considerations involving the packing of spheres when systems of mol. dispersion were discussed.

12314. Illingworth, J.W. **The density of textile fibers. I.** *Textile Recorder* **61**, No. 737, 60-2, 64-5(1944).—*C.A.* **38**, 6102^1.
The d. of a fiber in an inert medium such as benzene was usually very close to the value obtained for the over-all d. Porosity of these fibers was apparently very small and swelling must take place before there was appreciable penetration of the fiber. An anamolous d. figure indicated penetration. The apparent d. at any regain = 100 + $R/[(100/Da)\ (R/Ds)]$, where R = percentage regain, Da = apparent d. of the dry fiber and Ds the d. of the swelling medium. This permitted calcn. of the apparent d. at any regain, knowing the apparent d. of the dry fiber.

12315. Lauer, K. and Westermann, U. **Cellulose fibers. VI. Density determinations of cellulose in different media.** *Kolloid-Z.* **107**, 89-93(1944).—*C.A.* **39**, 183^6.
The d. of cellulose was influenced by the mol. forces between the OH groups and certain groups of the displacement media in which the measurements were made. The influence was small when H_2O was used. The influence was appreciable if the medium was an org. liquid (e.g., higher alcs., $CHCl_3$, acetone, benzene or toluene). The d. values in the org. liquids were all lower than those for H_2O.

12316. Lauer, K. **Cellulose fibers. VII. The physical structure of fibers.** *Kolloid-Z.* **107**, 93-103(1944).—*C.A.* **39**, 183^9.
The dry and wet strength of native cellulose and cellulose hydrate fibers as measured in H_2O and org. liquids were discussed.

12317. Mason, B. **The determination of the density of solids.** *Geol. Fören. Förh.* **66**, No. 1, 27-51 (1944) (in English).—*C.A.* **40**, 6903^3.
The concept of d. and 6 different methods used for its detn. in mineralogical work (volumetric, gas volumenometer, La Chatelier and Bogitch, pycnometric, Archimedes, direct comparison with heavy liquid) were discussed. The possible sources of error in the detn. were considered.

12318. Serrallach Juliá, José and Rotllant de Franch, Mario. **A technical method for the analysis of active carbon.** *Ion* 4, 840-6 (1944). —*C.A.* 39, 2467^5.
Methods for detg. apparent d., heat of wetting, adsorptive capacity and concn. of impurities for active carbon were described.

12319. Smith, W.R and Wilkes, G.B. **Thermal conductivity of carbon blacks.** *Ind. Eng. Chem.* 36, 1111-12(1944).—*C.A.* 39, 602^8.
The thermal cond. of 2 samples of com. carbon black was found to be lower than that of still air, viz. 0.141 and 0.148, resp., apparently independent of apparent d. and ultimate particle size.

12320. WADDAMS, A. LAWRENCE. **Flow of heat through granular materials.** *Chemistry & Industry* 1944, 306-10.—*C.A.* 38, 5438^9.
Theoretical methods were reviewed and considered not yet satisfactory.

12321. WADDAMS, A. LAWRENCE. **The flow of heat through granular material.** *J. Soc. Chem. Ind.* 63, 337-40(1944).—*C.A.* 39, 1091^4.
A simple and reliable method of measurement of the apparent thermal cond. of granular materials was described which involved unsteady heat flow from the surface to the axis of a cylinder of material.

12322. BERKELHAMER, LOUIS H. AND SPEIL, SIDNEY. **Differential thermal analysis. II.** *Mine & Quarry Eng.* 10, 273-9 (1945).—*C.A.* 40, 2378^4.
The hydrothermal and thermal analysis curves of kaolin were given and the effect of rate of temp. rise on the form and position of the peak in the thermal-analysis curve shown. Differential curves of kaolin and quartz mixts., kaolin and bentonite mixts., bauxite flotation products, and distinctive characteristics of montmorillonite, beidellite, allophane, Fuller's earth, and bleaching clay were given.

12323. HEERTJES, P.M. **Volume relations in the system cellulose-water.** *Rec. trav. chim.* 64, 52-3; 53-4(1945)(in English).—*C.A.* 40, 786^1.
The true d. of cellulose was discussed. The closest approximation to the true d. of a porous material was found with He.

12324. KRIEGER, K.A. **Apparatus for measurement of the density of porous solids.** *Ind. Eng. Chem., Anal. Ed.* 17, 532 (1945).—*C.A.* 39, 4271^1.
A method was described for detn. of the d. of a porous solid using He as the displaced fluid.

12325. LECLERC, YVES. **Testing methods for carbon black and lamp black.** *Rev. gén. caoutchouc* 22, 18-19 (1945).—*C.A.* 40, 6788^8.
Procedures were outlined for detg. the true d., apparent d., moisture, volatile matter, ash, acetone ext., fixed carbon, particle size, grit, absorptive capacity, coloring power, covering power, color, pH value, and reenforcing power in rubber.

12326. RIBAUD, GUSTAVE AND BÉGUÉ, JULIETTE. **Temperatures of sublimation of carbon under reduced pressure.** *Compt. rend.* 221, 73-5 (1945).—*C.A.* 40, 1713^5.
A graphite cylinder (20 mm diam. and 50 mm high) was heated in a high-frequency furnace in A at pressures from 3 to 76 cm. The cylinder was heated gradually to about 2000°C. The power was then increased considerably above that necessary for sublimation and the time-temp. curve was plotted. The temp. at which this flattened out was taken as the temp. of sublimation. Also, the temps. of operation for different power inputs were detd. The flattening of the input-temp. curve gave the temp. of sublimation. Between 3 and 76 cm, the temp. (T°K) of vaporization was represented by the equation $T = 3424 + 5.37\ p - 0.0118\ p^2$, where p = pressure.

12327. URAZOVSKIĬ, S.S. **Variation of the specific gravity of precipitates and a new method for its determination.** *Trudy Khar'kov. Khim.-Tekhnol. Inst. im. S. M. Korova* No. 5, 40-3 (1945)(in Russian).—*C.A.* 42, 808*c*.
A known amt. of substance was pptd. with a known amt. of precipitant in a pycnometer which was then filled up to the mark and weighed; the wt G of the ppt., being known from the amts. of the reactants, gave the wt g of the supernatant liquid. Since the vol. V of the pycnometer and the sp. gr. d of the liquid phase were known, the sp. gr. D of the ppt. was found: $D = G/[V - (g/d)]$. Detns. on $BaSO_4$ pptd. from $BaCl_2$ with H_2SO_4 1/2 N, 1/4 N, and 1/8 N, at 19.3°C, gave D = 3.08, 3.37, and 3.97, resp.

12328. WILSON, D.M. **Sieving and bulk-density tests.** *J. Oil Colour Chem. Assoc.* 28, 104-7 (1945).—*C.A.* 39, 4497^9.
Coarse pigment particles retained by a 300-mesh sieve were examd. microscopically to detect possible adulteration. Percentages of coarse residue in typical pigments were given. Bulk densities were easily detd. by settling the pigment in C_6H_6 by a standardized procedure and observing the settled vol. The result was computed by $D = M/V$, where D = bulk d., M g of pigment, and V the vol. of settled bulk in ml.

12329. BANGHAM, D.H., AND FRANKLIN, ROSALIND E. **Thermal expansion of coals and carbonized coals.** *Trans. Faraday Soc.* 42B, 289-94 (1946).—*C.A.* 42, 6512*h*.
The thermal expansion coeff., α, up to 400°C was detd. on 3 coals: (1) a bituminous coal of high O-content; (2) a bituminous coal of high C-content, and (3) anthracite coal. The α for each temp. range was practically independent of the preheat temp. below 300°C. Within each temp. range (about 50°) α, for coals (1) and (2) was independent of: (a) "rank"; (b) whether artifact or monolith; (c) pressure applied during fabrication (of artifacts); and (b) orientation with respect to the bedding plane (of monoliths).

12330. GUEST, R.M.; MCINTOSH, R., AND STUART, A.P. **The pore structure and adsorptive properties of some activated charcoals. II. The apparent density of charcoal in liquid media.** *Can. J. Research* 24B, 124-36 (1946).—*C.A.* 40, 7573^5.
The apparent d. of 8 charcoal samples was detd. in a series of liquids at 25° and 55°C. A correlation between apparent d. of the charcoal and surface tension of the measuring fluid was suggested. An attempt was made to explain this approx. regularity in terms of the surface free-energy change on immersion.

12331. HERMANS, P.H. AND VERMAAS, D. **Density of cellulose fibers. I. Introduction and experiments on the penetration of liquids into dry cellulose.** *J. Polymer Sci.* 1, 149-55(1946).—*C.A.* 40, 5255^2.
Substances like H_2O and glycerol penetrated very slowly into dry cellulose; indifferent org. liquids did not penetrate into dry fibers, even after being heated for 24 hrs at 100°C. On penetration by water vapor, sharp, microscopically visible boundary lines appeared between the wet and the dry portions of the fiber.

12332. HERMANS, P.H.; HERMANS, J.J., AND VERMAAS, D. **Density of cellulose fibers. II. Density and refractivity of model filaments.** *J. Polymer Sci.* 1, 156-61(1946).—*C.A.* 40, 5255⁵.

Densities were detd. (by the flotation method), and *n* (by immersion methods) of the following types of dry model filaments from viscose: (1) common isotropic fibers, (2) similar fibers which had first been subjected to a steam treatment, and (3) highly oriented filaments. Densities were detd. by means of mixts. of CCl_4 and $PhNO_2$. The immersion liquids used in the optical measurements were standardized mixts. of Bu stearate and tritolyl phosphate; contamination with moisture during the measurements was carefully avoided.

12333. HERMANS, P.H.; HERMANS, J.J., AND VERMAAS, D. **Density of cellulose fibers. III. Density and refractivity of natural fibers and rayon.** *J. Polymer Sci.* 1, 162-71(1946).—*C.A.* 40, 5255⁸.

A micromethod was described for d. detns. of artificial cellulose fibers by the floating method in CCl_4 under dry CCl_4 vapor; the method was accurate to within 1 part per thousand. The d. was derived from the temp. at which the samples neither sunk nor floated. The temp. varied, with the kind of fiber, between 45° and 65°C. Refractive power was measured simultaneously. The ds. were given for native ramie, of contracted and reoriented ramie, and of several series of rayon fibers spun with increasing stretch.

12334. LYSAGHT, VINCENT E. **The Knoop indenter as applied to testing nonmetallic materials ranging from plastics to diamonds.** *ASTM Bull.* No. 138, 39-44(1946).—*C.A.* 40, 2699⁶.

Hardness data were reported on diamond (Knoop no. 5500-6950), other stones, such as sapphire (Knoop no. 1837), on dentine and enamel, on plastics, such as cellulose acetate (Knoop no. 18.1), cellulose acetobutyrate, and polystyrene (Knoop no. 16.7), and on various glasses (Knoop nos. 373 to 546).

12335. MAGGS, F.A.P. **Adsorption-swelling of several carbonaceous solids.** *Trans. Faraday Soc.* 42B, 284-8(1946).—*C.A.* 42, 6200*a*.

Adsorption-swelling relations in MeOH were detd. on charcoal blocks, monoliths of coal, and compressed coal powder artifacts after heating. The swelling-adsorption relations with charcoal were detd. by its obedience to Hooke's law, the dimensional change being proportional to the pressure of the films formed at its inner surfaces. The stress-strain relation for charcoal resulted in a straight-line curve, but that for coal was complex.

12336. MEADE, GEORGE P. **Apparent specific gravity of refined sugar.** *Ind. Eng. Chem.* 38, 904-5 (1946).—*C.A.* 40, 6856⁷.

A simple method was described for wt/ft³ of refined sugars. The app. consisted of a metal funnel 7 in. in diam. and 7 in. on the vertical axis with a slope of 67.5°. A 5/8 in. brass nozzle with a shear gate was attached at the bottom. Sugar was run from the funnel into a 1000-ml tared and calibrated Erlenmeyer flask with a 1-1/4 in. mouth. After the flask was filled, the sugar was poured back into the funnel and the flask refilled and weighed. This gave a reproducible wt. The av. wt of refined sugars by this method was 50 lb/ft³. Large-grain sugars were lighter than small grain, but mixts. of large and small grain gave wts higher than any of the components.

12337. SCHWAB, G.M. **Mechanical strength as electron effect.** *Experientia* 2, 103-4(1946) (in German).—*C.A.* 40, 4010².

The Brinell hardness of Hume-Rothery alloys depended on their electron concn. in the same way as did catalytic activation energy and elec. resistance. A wave-mechanical theory of hardness based on the more or less total completion of the Brillouin zones was proposed.

12338. THIELE, E.W. **Material or heat transfer between a granular solid and flowing fluid. Present status of the theory.** *Ind. Eng. Chem.* 38, 646-50 (1946).—*C.A.* 40, 4284⁷.

The work so far reported on the computation of the transfer of material (or heat) was reviewed when a fluid (liquid or gas) was passed through a bed of granular solid. There was need for better and more exptl. information.

12339. DOBRY, JAROSLAV. **A new apparatus of Czechoslovak construction for measuring hardness.** *Hutnicke Listy* 1, 177-80(1947).—*C.A.* 41, 5075*d*.

A force of up to 30 kg/mm² was applied by means of a spring, and the depth of the impression left in the material by a diamond pyramid was detd. with the attached microscope. The hardness corresponding to each reading was given.

12340. JAGER, F. **The grinding of powders.** *Tech. moderne* 39, 357-9 (1947).—*C.A.* 42, 1767*i*.

The slow application of high pressures to sand or cement in a cylinder further decreased the particle size, and more efficiently than by normal milling methods. Pressing to 9000 kg/cm² produced the max. compressive strength in cement, although higher pressures were necessary for particle-size analysis to show an increase in fineness. Tests with 2.6 kg steel balls falling 1 to 2 m indicated that max. instantaneous av. pressures of 28,000 to 23,000 kg/cm², resp., were reached at the contact against a flat steel plate.

12341. MARIANI, EUGENIO. **The actual density of coke.** *Ann. chim. applicata* 37, 47-50(1947). —*C.A.* 41, 5704*i*.

Coke ground to 60 mesh was not fine enough to give a true d.; it was necessary to grind to 200 mesh.

12342. PENTICE, T.K. AND CLEMES, A. **Crushing and grinding efficiencies. Discussion.** *J. Chem. Met. Mining Soc. S. Africa* 47, 283-5 (1947).—*C.A.* 41, 4971*a*.

Tests were carried out on a milling unit consisting of a 9-ft × 10-ft primary ball mill in closed circuit with a 10-ft × 25-ft rake classifier, followed by two 8-ft × 16-ft secondary pebble mills, each in closed circuit with sep. 16-ft bowl classifiers at the mines of the Venterspost Gold Mining Co., Ltd. The surface areas of the various screen fractions of the samples were calcd. down to -28 mesh by means of the Prentice H_2O and paraffin method. The specific surface of smaller sizes was detd. by the air-permeability method.

12343. Rossi, Corrado. **Granulometric measurements on powders.** *Proc. Intern. Congr. Pure and Applied Chem.* 11, 609-20(1947).—*C.A.* 44, 5183*f*.

The d. of a suspension was detd. with a Westphal balance and plotted vs. time; the av. diam. of the particles could then be calcd. from the initial slope. Values so obtained agreed well with microscope values both for direct products of chem. reaction and for pulverized materials.

12344. Ault, W.B. **A method for the determination of the apparent density of dry powders.** *J. Soc. Chem. Ind.* 67, 313-15(1948).—*C.A.* 43, 3265*a*.

Work was done mainly on pptd. $CaCO_3$ with an apparent d. ranging from 0.100 to 1.310. The app. was: (1) a dropping box built to confine (2) 250-ml graduated cork-stoppered cylinder weighing 240 g, allowing only a vertical movement, (3) a timing device, and (4) a standard 30-mesh sieve. Prep. 40-g sample (w) by rubbing through the 30-mesh sieve and transfer to the cylinder carefully. Place in the dropping box. Record vol. before (V_o) and after (V_d) dropping 50 times at a rate of 1 drop/2 sec. The apparent d., (AD) $= w/V_d$ and V_o indicated the lightness or bulk. The test was accurate to 1 ml on a V_o of 250 ml or to an AD of 0.002.

12345. Franklin, Rosalind E. **A note on the true density, chemical composition, and structure of coals and carbonized coals.** *Fuel* 27, No. 2, 46-9(1948).—*C.A.* 42, 7003*i*.

The true sp. vol. of coals was a linear function of the H-content, and the d. of a hypothetical coal of zero H-content would be considerably lower than that of graphite. This indicated that there was a fundamentally similar structure in a wide range of different coals, and that this was markedly different from that of graphite. The true d. of various carbonized coals was primarily dependent on the max. carbonization temp.

12346. Haayman, P.W. **Use of inorganic, nonmetallic materials in the electrical industry.** *Chem. Weekblad*, 44, 603-8 (1948).—*C.A.* 45, 4151*g*.

Resistors unaffected by temp. were prepd. by heating ceramic tubes, roughened by treating with HF, to 800-900°C in the vapor of a hydrocarbon. A smooth, graphitic layer was gradually built up. Resistors with a very high temp. coeff. were produced by mixing Fe_2O_3, MgO, and Cr_2O_3, and heating the mixt. in N_2 to approx. 1300°C. For resistors in which the resistance value depended on the direction of the current, very pure Si, prepd. by decompg. $SiCl_4$, was mixed with 0.1-0.01% of Al and B.

12347. Hatta, Shiroji and Maeda, Shiro. **Heat transfer in granular beds. I-II.** *Chem. Eng.* (Japan) 12, 56-64(1948).—*C.A.* 45, 5465*e*.

Theoretical equations were derived for axial temp. distribution caused by the heat transfer between the fluid passing through the granular beds and the wall of const. temp., with the assumption that chem. reaction was absent and the only resistances to heat transfer were that in turbulent core and that in the fluid film near the wall.

12348. Reif, Arnold E. **The lump density of coke.** *J. Inst. Fuel* 22, 24-31, 52(1948).—*C.A.* 43, 378*i*.

The experimentally detd. lump density of a porous body varied with the state of the body and with the inherent nature of the method used for its detn. The lump density of a porous body, which had a definite limit of max. pore size, may lie in the range between the density of individual mol. units and the true lump density; with no max. limit of pore size it may lie in the range between the density of individual mol. units and zero density. Coke was best evaluated from a consideration of the shatter test, bulk density, and lump density.

12349. Utescher, K. **Chemistry of Fuller's earth clays.** *Z. Pflanzenernähr. Düngung u. Bodenk.* 42, 228-41 (1948).—*C.A.* 43, 7651*d*.

A clay suitable for the prepn. of Fuller's earth was fine and sandy; 85-92% of the particles were less than 0.01 mm in diam. It was extensively disintegrated but the disintegrated products were still present. In spite of effluorescence it was very rich in exchangeable bases, especially Na. Bentonite-like compds. were responsible for the fine distribution of the clay particles and consequently the great effective adsorptive surface.

12350. Adams, J.T. Jr.; Johnson, J.F., and Piret, Edgar L. **Energy - new surface relationship in the crushing of solids. II. Application of permeability measurements to an investigation of the crushing of halite.** *Chem. Eng. Progress* 45, 655-60 (1949).—*C.A.* 44, 380*f*.

In contrast to the straight line reported previously for brittle materials such as quartz, fluorite, glass, and labradorite, the energy input-new surface relationship for cryst. NaCl had a pronounced curvature over the same range of energy input. X-ray diffraction photographs indicated that plastic deformation occurred under the conditions of crushing used. The efficiency of crushing was confirmed as being extremely low.

12351. Agroskin, A.A.; Mikhaĭlik, A.D.; Pitin, R.N., and Sapronov, V.S. **Bulk weight of some coals of the Donets basin.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* 1949, 532-7.—*C.A.* 45, 6365*f*.

The bulk wt of samples up to 6-mm particle size reached a min. at 7-8% H_2O content. An addn. of 0.05-0.8% of kerosine caused a progressive increase in bulk wt to a max. which in some cases was in excess of 20%. The optimal amt. of kerosine varied with the coal used and with its H_2O content, being about 0.1-0.4%.

12352. Akamatsu, Hideo and Inokuchi, Hiroo. **The electric resistance of various kinds of carbon.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 70, 185-9 (1949).—*C.A.* 45, 4110*b*.

Measurements by the potential-drop method were made on the compressed powd. samples. The relation between resistivity p and pressure p was expressed by $p = (a/p) + b$, for p greater than 30 kg/cm², where a and b were consts. Thus, carbons were classified according to the values of b:

graphite (b = 0.02-0.03 ohm-cm), C_2H_2 black (b = 0.07-0.09), carbon black (b = 0.2-0/8), and charcoal ($b \approx 10^3$).

12353. BEARER, LOUIS C.; FINDLAY, R.A., AND GOINS, R.R. **Development of test methods for heat-exchange pebbles.** *Petroleum Refiner* 28, No.12, 104-8 (1949).—*C.A.* 44, 3729*f*.

Resistance to mech. shock included resistance to abrasion and crushing strength. A choice of suitable pebbles for use as heat carriers could be made based on these data. The particular process in which the pebble was to be used governed the actual selection. Several of the pebbles studied possessed the desired properties to a high degree. The method of making the pebbles was found to be of great importance.

12354. BOEHLER, ROBERT E. AND ASON, THOMAS. **Determining densities and adsorption of gases by solids.** *Anal. Chem.* 21, 1568-70(1949).—*C.A.* 44, 4818*f*.

The vol. of the material was detd. by gas displacement and was based on the equation correlating the amt. of a gas to the time needed to escape through an orifice until a certain pressure-drop was obtained at a const. temp. By comparison of a dense and porous material the addnl. vol. was found. The timing was done automatically by elec. contacts in the Hg manometer. The values obtained were in agreement with liquid displacement detns.

12355. DELASSUS, MARCEL; GEORGIADIS, CONSTANTIN, AND MONTIGNY, P. **The state of carbon in metallurgical coke.** *Compt. rend. congr. ind. gaz, Lyon* (Assoc. tech. ind. gaz France) 66, 597-611 (1949).—*C.A.* 46, 6809*i*.

Dilatometric tests of coal mixts. were not infallible and must often be substantiated by costly and inconvenient large-scale tests in cokeries. The cohesion of a coke could not be related with graphite content. Resistivity and cohesion measurements of coal mixts. pyrogenated in the lab. showed no direct relation between these 2 properties.

12356. DÉRIBÉRÉ, M. **Testing of surface conditions by fluorescence.** *Rév. gén. mécan.* 33, 251-6 (1949).—*C.A.* 43, 7368*a*.

Defects on the surface of materials were made more clearly visible than by other known methods by applying a very thin fluorescent film which fills all cracks, fissures, and irregularities. The material was also applied as a powder on the surface where the condition of the test piece did not permit the other method, as in testing antiques, paintings, etc. The piece is then examd. in filtered ultraviolet light. Fluorescent substances, suitable liquids, and photographic plates were discussed; a yellow fluorescence was best for visual examn.

12357. DOBROCVETOV, E.N. **The specific gravity of solids as a function of some physical constants.** *Bull. soc. chim. Belgrade* 14, 1-11 (1949)(English summary).—*C.A.* 46, 4288*d*.

The sp. gr. of solids depended not only on the mass per unit vol. but also on the vol. occupied by the particles ("own mass vol.," v_k). For elements with coordination nos. 12, 8, 6, and 4, v_k = 0.7405, 0.6802, 0.5236, and 0.34 ml, resp. The sp. gr. of elements and binary compds. was given as a function of the coordination no.: $d = v_k \{(1 \times 10^{24})/(4/3)\pi R^3\}\{[(A + B)/2]/(6.061 \times 10^{23})\}$ (R = interionic or interat. half-distance, A and B = at. wt of 2 adjacent particles: for elements $(A + B)/2$ = at. wt; for binary compds. $(A + B)/2$ = mol. wt).

12358. FRANKLIN, ROSALIND E. **Fine structure of carbonaceous solids by measurements of true and apparent densities. I. Coals.** *Trans. Faraday Soc.* 45, 274-86(1949).—*C.A.* 43, 5653*f*.

True d. was detd. with He and the apparent d. with MeOH, water, *n*-hexane, and benzene liquids. He rapidly and completely filled the pore space of coals ground to pass a 72 B.S. sieve. The pore space was filled by MeOH almost completely in a few hrs. There was a contraction of 2.6×10^{-8} ml for each cm^2 of surface covered by MeOH. Water, *n*-hexane, and benzene filled the pore space of some low-rank coals practically completely; *n*-hexane and benzene penetrated only very slowly into the pore space of some coals.

12359. FRANKLIN, ROSALIND E. **Fine structure of carbonaceous solids by measurements of true and apparent densities. II.** *Trans. Faraday Soc.* 45, 668-82(1949).—*C.A.* 43, 9412*d*.

The d. of 4 coals carbonized from 300° to 1650°C were detd. with He, MeOH, water, and *n*-hexane. CS_2 was also used with one coal and C_6H_6 with another. After heating to 600°C there was a large pore vol. which was accessible to He, but inaccessible to *n*-hexane. As the carbonization temp. was increased above 600°C, this pore vol. increased however, it became less accessible to fluids. MeOH, CS_2, and water were successively excluded; and, after carbonization at 1,000°C, He was excluded from the pores of one coal and penetrated only slowly into the others. The adsorption of He, H_2, CH_4, and O_2 decreased with increasing carbonization temp.

12360. HATTA, SHIROJI AND MAEDA, SHIRO. **Heat transfer in granular beds. III. Factors affecting the turbulent conductivity and the film coefficient.** *Chem. Eng.* 13, 79-84(1949). —*C.A.* 45, 5465*f*.

12361. HUDSON, DOUGLAS R. **Density and packing in an aggregate of mixed spheres.** *J. Applied Phys.* 20, 154-62(1949).—*C.A.* 43, 2842*i*.

In close-packing of spheres, 2 types of interstice were noted, bounded by 6 and by 4 convex spherical surfaces. These were termed "square" and "triangular." They were connected by a continuous labyrinth through which a ball not exceeding a specified radius could be threaded. In both cubic and hexagonal arrangements, their shape and size were identical, but their distribution differed. Radii R for n smaller balls, which could take up patterns with cubic symmetry within each square interstice, were calc. for values of n up to 27 and plotted. When R/r was plotted against the d. increment attributable to this interstitial packing, a set of spires was obtained.

12362. JOHNSON, J.F.; AXELSON, J., AND PIRET, EDGAR L. **Energy-new surface relationship in the crushing of solids. III. Application of gas adsorption measurements to an investigation**

of crushing of quartz. *Chem. Eng. Progress* 45, 708-15(1949).—*C.A.* 44, 879*c*.

The crushing of quartz was studied covering a much wider range of energy input to the material than that previously reported. Screened particles retained in a steel mortar were crushed by impact and also by slow compression. Surface areas of the samples were measured by the gas adsorption and also by the permeability method. Use of the drop-wt method resulted in a definitely curved relation of energy input to new surface, while a practically straight line was obtained by slow compression. Adsorption areas of the crushed samples were shown to bear a const. ratio of about 2.0 to the permeability areas.

12363. KWONG, J.N.S.; ADAMS, J.T. JR.; JOHNSON, J.F., AND PIRET, EDGAR L. **Energy-new surface relationship in crushing. I. Application of permeability methods to an investigation of the crushing of some brittle solids.** *Chem. Eng. Progress* 45, 508-16 (1949).—*C.A.* 43, 8751*f*.

The crushing of quartz, fluorite, glass, labradorite, and a few other solids was studied. Crushing was accomplished by dropping a steel ball on a piston resting on the material in a steel mortar. Surface areas of the samples were measured by the permeability method. The relation of energy to new surface for these materials was shown to be a straight line through the origin over the range studied.

12364. MACKENZIE, J.K. AND SHUTTLEWORTH, R. **A phenomenological theory of sintering.** *Proc. Phys. Soc.* (London) 62B, 833-52 (1949).— *C.A.* 44, 1771*i*.

The rapid increase of d. during the sintering of single substances was studied. The d. of a compact was calcd. as a function of the time for 2 different laws of deformation. The effect of gas in the pores was calcd. in the case of the viscous law. The theory suggested that gas pressures of a few atms. applied to the outside of a compact could appreciably increase the rate of sintering.

12365. SMEKAL, A. **The initiation of reactions between solid phases.** *Powder Met. Bull.* 4, 120-6(1949).—*C.A.* 44, 14*g*.

For contact areas of 10^{-7} cm diam., forces of a few γ produced stresses sufficient for the splitting of chem. valence bonds. Up to diam. of 1 micron, the full strength of the chem. bonding forces may be utilized. Beyond this, the notch effect had to be taken into account. Local reactions were stimulated which were accompanied by the liberation of heat in the order of magnitude of heats of fusion. This could no longer be considered a process involving only solid phases. Such small loads as created by packing may initiate chem. reactions between solids as well as sintering of metals.

12366. ZHAVORONKOV, N.M.; AEROV, M.E., AND UMNIK, N.N. **Hydraulic resistance and packing density of a layer of grains.** *Zhur. Fiz. Khim.* 23, 342-60(1949).—*C.A.* 43, 5645*h*.

Glass tubes (diam. $D = 0.8$-10 cm) were filled with Pb shot (diam. $D' = 0.25$ cm) or steel balls ($D' = 0.32$ or 0.71 cm), and ϕ = (vol. of solid): (vol. of system) was detd. as function of $n = D/D'$. Air was forced upward through these tubes and the pressure gradient Δp detd. If f was the coeff. of friction of an equiv. tube and *Re* its Reynolds no. (between 2 and 800), $f = (36.3/Re) + 0.4$ as long as $n > 3$. Also catalyst tablets gave a similar result.

12367. AUVIL, H. STUART AND GAYLE, JOHN B. **Physical properties of coke: size and its measurement.** *U.S. Bur. Mines, Rept. Invest.* No. 4735, 27 pp.(1950).—*C.A.* 45, 846*i*.

Twelve samples of run-of-oven coke were taken at coke plants in the United States and Canada. Sampling procedure was directed toward obtaining the highest possible degree of uniformity in the gross samples. Under these conditions the standard deviation of the screen analysis test on 500-lb samples was found to range from 1.2% for the 1-in. screen to 4.5% for the 5-in. screen. Statistical procedures were given to check on the adequacy of a testing procedure.

12368. BEVAN, D.J.M. AND ANDERSON, J.S. **Electronic conductivity and surface equilibria of zinc oxide.** *Discussions Faraday Soc.* 1950, No. 8, 238-41, discussion 241-6.—*C.A.* 45, 9989*b*.

The electronic cond. of ZnO at 500°-1000°C, in air, varied widely according to prepn. of the oxide. At low O_2 pressures the cond. was quasi-metallic, and fairly reproducible for samples irrespective of their origin. At pressures greater than 0.01-0.1 mm for any one sample, the cond. varied with O_2 pressure in readily reversible fashion. The bulk-phase cond. of zinc oxide was probably high, but electrons were trapped by chemisorption of O_2 on the surface. The cond. of ferric oxide at 500°-600°C displayed similar features, a pressure-independent conducting state preceding the dissocn. to Fe_3O_4.

12369. BUSLIK, DAVID. **Mixing and sampling with special reference to multi-sized granular material.** *ASTM Bull.* No. 165, 66-73(1950).—*C.A.* 44, 5652*g*.

Equations were developed for the detn. of the min. size of sample that should be taken to obtain results within prescribed sampling error. Derivation was from probability theory in the classical mathematical statistics manner. Results were applicable only to sieve analysis in certain specialized cases. No generally applicable results were obtained. The validity of the results was tested by use of table of random nos.

12370. DE WIT, C.T. AND ARENS, P.L. **Moisture content and density of some clay minerals and some remarks on the hydration pattern of clay.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 59-62; 4, 59(1950).—*C.A.* 46, 4714*b*.

The d. of some clays with varying moisture contents was detd. Relationships between d. and moisture content of montmorillonite and illite samples and the sp. vol. of bound H_2O were calcd. At concns. below 1% the calcd. hydration of the mineral was independent of the concn. The d. of fully hydrated montmorillonite practically did not exceed that of H_2O.

12371. GREEN, I.E. **Measurement of surface roughness. I. II.** *Finish* 7, No. 6, 27-30; No. 7, 22-4(1950).—*C.A.* 44, 7595*a*.

Instruments developed for comparing, measuring, and delineating the surface profiles of metallic materials were described. The stylus type of surface analyzer was adapted for the analysis of surface roughness of painted surfaces and the required modifications were discussed.

12372. GRIFFITH, R.H.; CHAPMAN, P.R., AND LINDARS, P.R. **The physical properties of promoted molybdenum dioxide catalysts.** *Discussions Faraday Soc.* 1950, No. 8, 258-64.—*C.A.* 45, 9989*g*.

In catalysts promoted by the addn. of small amts. of silica, changes in surface area occurred as the silica content increased, but these changes did not alone account for the differences in the activity for hydrocarbon decompn. Measurements of the compn., crystal structure, elec. cond. and thermoelec. potential suggested that MoO_2, rather than the metal, was the catalyst. The function of the promoter was to increase the surface of the dioxide. This took place to the greatest degree when the max. amt. of silica was incorporated into the MoO_2 lattice.

12373. KAZINTSEV, A.I. **Apparatus for determination of density of solids.** *Zavodskaya Lab.* 16, 369-71(1950).—*C.A.* 44, 6685*c*.

A double glass-bulb device was used with a graduated leveling flask attached to the lower bulk with flexible tube. The upper bulb was charged with the sample and xylene, the lower with xylene and water. The vol. of liquid displaced by the solid was read on the calibration scale of the leveling flask. The value of d. obtained was within 0.2% using grain, beads, etc., for test samples.

12374. KRUSHCHOV, M.M. **Microhardness, Mohs hardness, and a hardness scale.** *Doklady Akad. Nauk S.S.S.R.* 72, 779-80 (1950).—*C.A.* 44, 10424*f*.

The microhardness was defined for diamond pointers shaped as four- or three-sided pyramids, the first type with an angle of 136° of the facets. A linear function was valid between the log of the "hardness class" H_o, and the Mohs hardness no. H_o was defined as a function of the load, *H*, in kg/mm^2 required for a const. impression the microhardness test: $H_o=0.7\ X(H)^{1/3}$. The difference between corundum and diamond, only one class in Mohs scales, was in the microhardness scale not less than 6 classes.

12375. MAEDA, SHIRO. **Heat transfer in granular beds. IV. Data for small Reynolds number.** *Chem. Eng.* 14, 110-12(1950).—*C.A.* 45, 5465*g*.

In specially designed app. data were obtained for $d_k u_p/\mu<30$; λ/k can be expressed as a linear function of the Reynolds no.

12376. MOTT, R.A. **Superfine grinding of coke and other materials.** *J. Soc. Chem. Ind.* 69, 346-9 (1950).—*C.A.* 45, 4428*i*.

Cokes and coals were ground wet or dry in a porcelain ball mill by using 3/16-in. steel balls. Results were plotted on a log scale as surface area *vs.* time of grinding with mean particle size indicated. In wet grinding, freshly distd. H_2O contg. 0.6-2.0% NH_4OH was used in the amt. of 10 times the coke. Dry grinding of Parkgate clarain and durain showed a linear increase in surface area with time up to 8 hrs with no change thereafter. Dry grinding of electrode coke (low ash) gave a faster size reduction, with a particle size of 0.3 μ after 8 hrs. Grinding electrode coke with double the former charge and double the amt. of balls gave the same rate of reduction (slope of plot) up to 4 hrs when the rate decreased somewhat, but reduction continued up to 40 hrs at the lower rate, giving a particle size of 0.13 μ.

12377. NAKAI, TATSUNDO. **Contact resistance between metals and a graphite film. II.** *Repts. Sci. Research Inst.* (Japan) 26, 240-6(1950).—*C.A.* 46, 1321*e*.

The contact resistance between Cu and a graphite film increased or decreased at times with temp. and was affected by the oxidation of the Cu surface and the lowering of the film resistance. With Pt, the resistance decreased uniformly with temp., but to a higher degree than that of the lowering of film resistance, owing to a decrease of both centralized and boundary resistance of Pt. With brass the resistance decreased in proportion to the -0.068 power of pressure applied and recovered gradually with the release of the pressure.

12378. ORLOV, D.P. AND LOGGINOV, G.I. **The endurance of crystals of gypsum and of mica in periodic torsion.** *Doklady Akad. Nauk. S.S.S.R.* 70, 249-51 (1950).—*C.A.* 44, 4303*a*.

The endurance, measured in the no., *N*, of cycles of plates subjected to alternating torsion around an axis lying in the plane of greatest cohesion, and always in the same crystallographic direction, changed with increasing thickness of the plate. At equal thickness, *N* was considerably lowered when the specimen was immersed in a surface-active medium. For gypsum, with the thickness increasing from 0.8 to 2 mm and a frequency of 250/min., *N* in H_2O fell from 5300 to 1000, and in a 6% aq. soln. of $CaCl_2$ from 3000 to 600. In contrast, *N* increased for mica with the thickness; between 0.05 and 0.4 mm and at the same frequency *N* increased from 900 to 3000 in H_2O and from 350 to 1650 in a satd. (2.7%) aq. soln. of iso-AmOH. Presence of adsorbable matter always lowered *N* very distinctly.

12379. SHERLOCK, E. **Studies on some properties of Alberta coals. I. Density.** *Fuel* 29, No. 11, 245-52(1950).—*C.A.* 45, 328*d*.

The true and apparent d. of a no. of Alberta coals were measured. A relation between true sp. vol., H-content, and O-content was shown. Measurements in xylene, together with data on the penetration of a coal by xylene and tetrahydronaphthalene led to a partial evaluation of the distribution of pore size in these coals. The hydrophilic properties of coal were presumably a function of their O-content and the drop in d. proportional to the O-content. Beyond the point when water no longer penetrated into the layer planes, the d. in org. solvents equaled or exceeded that in water.

12380. SRIVASTAVA, ARVIND M. **Ultrasonic investigation of the elastic constants of iron silicate gels.** *Kolloid-Z.* 119, 146-51(1950).—*C.A.* 45, 6458*h*.

The elastic consts. of iron silicate gels were studied by an ultrasonic method over the frequency range 0.5-2.5 Mc./sec. A decrease with decreasing frequency and increasing temp. over the range 20° to 70°C was observed in Young's moduli and an increase with time of standing up to 24 hrs. The velocity of the waves in the gel increased as the frequency increased. The d. of the gel varied from 1.18 at 20° to 1.16 at 90°C.

12381. TAKAHASHI, HARUO. **Electrical resistance of carbon powders. I. The relation between the volatile-matter contents and the electrical resistance of carbon powders.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 71, 29-32(1950).—*C.A.* 45, 4988*h*.

With phenol-formaldehyde resin, coal, coal-tar pitch, some kinds of wood, filter paper, and starch powder as raw materials, carbon powders were prepd. in the range 600°-1000°C. The elec. resistances R of the carbon powders were measured, all under 28 kg/cm² pressure. The volatile-matter contents V % (wt decrease by heating *in vacus* at 1000°C) were also measured. In all cases, the relation $R = AB^v$ held where A and B were consts.

12382. TAKAHASHI, HARUO. **Electrical resistance of carbon powders. II. Electrical resistance of freely heaped carbon powders.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 105-8(1950).—*C.A.* 45, 4988*i*.

Carbon blacks in their freely heaped states showed a linear relation between the logs of elec. resistance R and their bulk d. d. The straight lines in the log R *vs.* d graph differed so much among the carbon blacks that the graph could be used for a test.

12383. TAKAHASHI, HARUO. **Electrical resistance of carbon powders. III. Considerations by models on the electrical resistances of freely heaped carbon powders and a report on some related experiments.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 108-11(1950).—*C.A.* 45, 4989*a*.

The carbon black particles treated in various ways had varying bulk ds., but their resistances did not change appreciably. This was because the treated particles or agglomerates had many projections or were covered with tiny particles.

12384. TAKAHASHI, HARUO. **Electrical resistance of carbon powders. IV. Sedimentation volume of carbon black powders.** *J. Chem. Soc. Japan.* Pure Chem. Sect. 71, 181-3(1950).—*C.A.* 45, 4989*c*.

The sedimentation vol. of acetylene black powder did not depend on whether the powders had previously been dried or not, nor whether the powders had adsorbed moisture or not. The vol. was smaller, the higher the temp. of measurement. The sedimentation vol. in various liquids decreased with decreasing dielec. const. of the liquids. The sedimentation vol. of various sorts of carbon blacks in benzene was 5-34 ml/g.

12385. TAKAHASHI, HARUO. **Electrical resistance of carbon powders. V. Electrical resistance of carbon powders sedimented in liquid.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 71, 240-3 (1950).—*C.A.* 45, 4989*d*.

The relation between the bulk d. and elec. resistance of various kinds of carbon blacks in benzene was measured and compared with the analogous relation of carbon blacks heaped freely in air. The powders, which seemed to be solvated considerably, had very high resistance and showed small sedimentation vols.

12386. TAKAHASHI, HARUO. **Electrical resistances of carbon powders. VII. Electrical resistance versus pressure relations of compressed fine carbon powders.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 71, 361-4(1950).—*C.A.* 45, 6367*g*.

For 2 types of carbon the resistivity (r) in ohm cm in the range of pressure (p) of 15-100 kg/cm² followed the equation: $r = a/p + b$ (1); for 2 others it was: $r = \alpha/p^{1/2} + \beta$ (2), where a, b, α, and β were consts. For the pressure range of 100-200 kg/cm², no definite conclusion could be drawn.

12387. TAKEUCHI, SAKAE AND IGAKI, KENZO. **Effects of the oxygen pressure on the electrical conductivity of a semiconductor, NiO.** *Nippon Kinzoku Gakkaishi* (J. Japan Inst. Metals) 14B, No. 2, 16-21(1950).—*C.A.* 46, 800*c*.

The relation of elec. cond. and temp. of a single NiO specimen was measured under different partial pressures, P, of O_2. It changes from the form $A \exp(-E/kT)$ to $A' \exp(-E/2kT)$ with increase of pressure of O_2 ($P = 10^{-3}$ —760 mm Hg). From this change the unique value of the activation energy E could be detd. ($\Delta E = 1.25$ e.v.). The dependence on the O_2 pressure at a definite temp. could be expressed generally by the formula $\sigma \infty P^{1}/x$. Exptl. value of x was 3.7 at 1000°C.

12388. AMIEL, JEAN AND RODIER, GEORGES. **The thermal analysis of activated manganese dioxides.** *Compt. rend.* 232, 1209-10(1951).—*C.A.* 45, 6472*g*.

Changes in wt of samples of MnO_2 were plotted as a function of temp. Breaks at about 230°C and 320°C were attributed to a rearrangement of the atoms of Mn and O, with loss of catalytic properties.

12389. DAHME, ADOLF AND MACKOWSKY, MARIE THERESA. **Chemical-physical and petrographic investigations of coals, cokes, and graphites. V. Microscopic, chemical, and x-ray investigations of anthracite.** *Brennstoff-Chem.* 32, 175-86(1951). —*C.A.* 45, 7772*g*.

It was not possible to establish differences in the coal formation by reflection measurements of the different vitrains of a coal vein. Reflection measurements were of more value in establishing coal rank in the high-rank region, than with low-rank coals, since the reflection-% volatile matter curve for the latter was rather flat. The regularity in crystallite arrangement, was detd. although the size of the single crystallite was far under the resolving power of the microscope, as detd. by x-ray measurements. A model representation of the position of the crystallites in bright and dull coals and the changes in coalification was developed.

12390. DRYDEN, I.G.C. **The apparent solubility of colloidal materials comprising a continuous distribution of micellar size, with special reference to coals.** *Discussions Faraday Soc.* No. 11, 28-42, discussion 89-91(1951).—*C.A.* 46, 7844*d*.

Unusual results obtained in the fractionation of coals in amine solvents necessitated a reexamn. of the factors controlling the soly. behavior of colloids. The preferred fractionation method for coals involved extn. of dried ground coal with ethylenediamine, diethylenetriamine, and ethanolamine at a series of temps. The yield was considered proportional to the fraction of coal below a crit. mol. or micellar size.

12391. Duffy, George J. **A study in black.** *Official Digest Federation Paint & Varnish Production Clubs* No. 312, 28-32(1951).— *C.A.* 46, 8385*i*.

The manufg. process and properties of channel and furnace carbon blacks were described. Optimum dispersion in a ball mill was obtained with a paste contg. as much carbon black as possible and with only enough paste to fill the voids between the balls. In alkyd enamels as much as 10% moisture on the black aided in stabilizing consistency.

12392. Dulhunty, J.A. and Penrose, Ruth E. **Some relations between density and rank of coal.** *Fuel* 30, 109-13(1951).—*C.A.* 45, 5388*h*.

A method was described for measuring in water the ds. of low rank coals which could not be dried without undergoing permanent phys. changes. Results of an investigation of ds. of coals varying from peat to anthracite provided evidence of a well defined relation between d. and rank.

12393. Egun, Sabri. **Determination of particle density of crushed porous solids; gas-flow method.** *Anal. Chem.* 23, 151-6(1951).— *C.A.* 45, 3684*f*.

Pressure drop and gas flow rates were correlated as follows: $\Delta P/LU_m = a + bG$, where ΔP = the pressure drop, L = the bed height, U_m= the av. linear gas velocity, and G = the mass flow rate of the gas; a and b were consts. involving viscosity of the particular gas, the specific surface of the enveloped particles and the fractional void vol., plus certain statistical consts. a and b were detd. from a plot of $\Delta P/LU_m$ against G. Graphical solution for a and b was possible, but a least-squares resolution was preferred. Once derived, the values of a and b were used to give independent values of particle d. A known wt of porous material was introduced into a large tube between two pressure taps, packed to different bulk ds. and pressure drop was correlated with flow rate of N_2.

12394. Forster, Michael J. and Mead, Darwin J. **Electrical properties of some carbon black-oil suspensions.** *J. Applied Phys.* 22, 705-10(1951). — *C.A.* 46, 1322*a*.

The d.c. cond. and a.c (1000 per sec.) properties of suspensions of R-40 carbon black in transformer, silicone, and linseed oils, and suspensions of Shawinigan black in linseed oil, were studied as functions of time, carbon black concns., and rotational speed of test cell. Immediately after agitation of the suspension, both a.c. and d.c. conds. increased rapidly with time and then approached a satn. value. For the d.c. cond., this value increased with increasing voltage in all suspensions studied except the highest concns. (10% by wt), which obeyed Ohm's law.

12395. Gregg, S.J. and Behrens, A. **The bulk density of kaolin.** *J. Applied Chem.* (London) 1, Suppl. Issue No. 2, S139-41(1951).— *C.A.* 46, 5285*f*.

The bulk vol. of a monodisperse sample of kaolin was detd. *in vacuo* and in the presence of varying amts. of adsorbed water vapor. The bulk vol. was detd. by measuring the vol. of a weighed sample in a 10-ml cylinder after standard tapping (tapping rate, 120 per min.; tapping time, 60 min.; distance of fall of cylinder, 1.54 cm). From an *in vacuo* value of 1.17 ml per g, the bulk vol. decreased 15% from 0 up to 0.15% adsorbed water and then varied only slightly as the water content increased up to 1.3%.

12396. Gregor, Harry P.; Gutoff, Fradelle, and Bregman, J.I. **Ion-exchange resins. II. Volumes of various cation-exchange resin particles.** *J. Colloid Sci.* 6, 245-70(1951).— *C.A.* 45, 9994*e*.

The sp. vol. of polystyrene, phenolic, and permutite resins increased with the hydrated ionic vol. of the exchange cation, except where ion-pair formation occurred. The vol. of swollen resins decreased with increasing cross-linking.

12397. Gregor, Harry P.; Held, K.M., and Bellin, Judith. **Determination of the external volume of ion-exchange resin particles.** *Anal. Chem.* 23,620-2(1951).— *C.A.* 45, 6968*h*.

Several techniques were described for the precise detn. of the external vols. of ion-exchange resin particles.

12398. Grisdale, R.O.; Pfister, A.C., and Van Roosbroeck, W. **Pyrolytic film resistors: carbon and borocarbon.** *Bell System Tech. J* 30, 271-314(1951).— *C.A.* 45, 10102*g*.

Carbon or borocarbon films were deposited on suitable ceramic supports by tumbling together with clean sand in a furnace at temps from 975° to 1300°C, in which a suitable atm. was maintained. Suitable atm. for carbon deposition contained an inert carrier such as O_2-free N_2, contg. some hydrocarbon. For deposition of borocarbon films, the film-former gas subject to pyrolysis was tripropylborane, a mixt. of a boron hydride plus a hydrocarbon, or a hydrocarbon plus a boron halide. The introduction of B (3-4%) into the carbon films lowered the temp. coeff. of resistance to values as low as, or often lower than, wire-wound resistors.

12399. Lehovec, K. and Imalis, O. **Gradual capacity changes of selenium rectifiers and ionization equilibrium of adsorption points.** *Z. physik. Chem* 198, 127-46(1951).— *C.A.* 46, 5462*e*.

If a potential was applied to a Se cell in the nonconducting direction, its capacity decreased greatly. Upon removal of the potential, the capacity increased instantaneously almost to the original value, then continued to recover slowly. Illumination greatly increased the speed of recovery, and increased capacity beyond the original value (photocapacitative effect). The amt. of increase was at first proportional to the light intensity, but at higher intensities reached a satn. value. These results were explained by the slow establishment of an equil. between adsorption points and electrons, depending on external potential. The initial rapid increase in capacity on removal of the external potential was due to an instantaneous shift in pos. "holes."

12400. LIDMAN, W.G. AND HAMJIAN, H.J. **Kinetics of sintering chromium carbide.** *Natl. Advisory Comm. Aeronaut., Tech. Note* No. 2491, 16 pp. (1951).— *C.A.* 46, 3835*h*.

The kinetics of grain growth and densification during sintering of Cr_3C_2 under pressure was investigated. The grain diam., D, and sintering time, t, was related by the equation $D^n = Kt$, where K was a rate const. The value of n was assocd. with the location, size, and shape of the pores in this compact. Densification of the sintered compact was accompanied by grain growth; d. and grain size seemed independent during this stage.

12401. LOVELL, G.H.B. **The rapid determination of powder density.** *Trans. Brit. Ceram. Soc.* 50, 1-9(1951).— *C.A.* 45, 6815*c*.

Powder d. was detd. by running a specified vol. of a liquid into an evacuated flask of known vol. and contg. a specified wt of the sample. By measuring the total vol. of liquid and solid the vol. of the sample was obtained, and its powder d. could then be calcd., or the instrument could be calibrated to read directly in powder d.

12402. MAEDA, SHIRO. **Heat transfer in granular beds. V. Theoretical equations of heat transfer accompanied by chemical reaction.** *Chem. Eng.* 15, 5-8(1951).— *C.A.* 45, 5465*g*.

A math. treatment was applied to granular beds in which there was evolution or dissipation of heat, provided the heat of reaction depended only upon the gas concn. The results were presented graphically in dimensionless groups.

12403. MAEDA, S. AND KAWAZOE, KENJIRO. **Heat transfer in granular beds. VI. Temperature distribution in completed oxidation of ammonia.** *Chem. Eng.* 15, 9-14(1951).— *C.A.* 45, 5465*h*.

Axial temp. distribution was measured in 0.5-in., and 2-in. columns packed with Co catalysts, in which NH_3 was nearly completely oxidized to N_2 by an excess of air. The exptl. results agreed fairly well with the calcd. temp. distribution.

12404. MAXWELL, LOUIS R.; SMART, J. SAMUEL, AND BRUNAUER, STEPHEN. **Thermomagnetic investigations of promoted and unpromoted iron oxide and iron catalysts.** *J. Chem. Phys.* 19, 303-9 (1951).— *C.A.* 45, 8829*h*.

The Curie temp. (θ) and intensity of magnetization of certain unreduced and reduced iron oxide catalysts were detd. For the singly promoted unreduced systems of Fe_3O_4 contg. small amts. of Na_2O, K_2O, Cs_2O, BaO, B_2O_3, Al_2O_3, or SiO_2, θ was practically the same as for Fe_3O_4, but large reductions in the satn. intensity of magnetization were observed. The doubly promoted unreduced systems studied contained addns. to Fe_3O_4 of Al_2O_3 and small amts. of Na_2O, K_2O, BaO, or SiO_2. θ for these materials varied only slightly and was equal to or less than that for Fe_3O_4.

12405. MERKEL, HEINRICH AND WEINROTTER, FERDINAND. **Thermomagnetic studies of iron catalysts for hydrocarbon synthesis.** *Brennstoff-Chem.* 32, 289-97(1951).— *C.A.* 46, 662*a*.

When pptd. Fe catalysts were reduced with tech. H_2, the low partial pressure of CO, CO_2, and CH_4 was sufficient to cause appreciable carbide formation. Catalysts treated in this way were fully active for synthesis in a few minutes, in contrast with those reduced with electrolytic H_2. In addn. to Fe_2C with a Curie point of 265°C, Fe_3O_4 and Fe were also found. The Fe content may be the cause of the CH_4 peak noted early in the synthesis.

12406. MIKLASHEVSKIĬ, A.I. AND USPENSKAYA, P.I. **Porcelain resistors with a carbon layer (not wire wound).** *Zhur. Priklad. Khim.* 24, 242-51; *J. Applied Chem. U.S.S.R.* 24, 267-77(1951) (Engl. translation).— *C.A.* 46, 3881*f*.

A paste contg. 35.0% Karelian feldspar, 26% Prosyanovsk kaolin, 20% Chasovyar clay, and 19% quartz sand produced a porcelain superior to the standard porcelain studied. The conducting layer was graphitic, contg. 95-96% C and with a sp. gr. of 2.26. Its thickness varied from 0.03 to 0.1 μ for resistors of the order of 6000-3000 ohms. The closer the coeff. of linear expansion of the porcelain was to that of the conducting layer, the better was the bond between the two. The optimum temp. for producing a coating on the porcelain by hydrocarbon cracking was found to be 900°-1000°C.

12407. MILLS, G.A. AND SHABAKER, H.A. **Factors controlling aging of cracking catalysts.** *Petroleum Refiner* 30, No. 9, 97-102(1951).— *C.A.* 46, 243*h*.

Catalysts used were Hondry synthetic silica-alumina catalyst and Filtrol TCC clay catalyst. The harmful effects of Fe, Cu, and V were given in a graphical form. The activity and selectivity depended critically on the nature of gases coming in contact with them and the temp. to which they were subjected. The factors controlling aging of cracking catalysts summarized.

12408. MOORE, A.J.W. AND TEGART, W.J. McG. **Rupture of oxide films during repeated sliding.** *Australian J. Sci. Research* 4A, 181-4(1951).— *C.A.* 45, 7493*c*.

Microscopic examn. of Cu strips subjected to repeated friction by a hard steel or diamond hemispherical slider under a 4000-g load, moving at 0.01 cm/sec, showed nonmetallic particles to be included below the surface. Subsequent annealing caused these particles to coalesce, but even on prolonged annealing no grain growth occurred in their immediate vicinity. Evidence suggested that the particles consisted of Cu_2O, formed by rupture of the oxide film at pts. of crit. plastic flow, subsequent adhesion, and surface deformation sufficient for successive oxide layers to be entrapped.

12409. NAKATOGAWA, TAKESHI. **Silicon carbide. I. Surface structure of single crystals.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 441-3(1951).— *C.A.* 47, 5208*d*.

The surface structure of single crystals of SiC was studied with respect to the mechanism of rectification. Two layers were found on the surface (0001). The upper layer was of SiO_2 with the thickness less than 10^{-5} cm, not contributing to rectification.

12410. SCOTT, J.R. **Improvements in accuracy of hardness testing.** *Trans. Inst. Rubber Ind.* 27, 249-63(1951).— *C.A.* 46, 2329*g*.

To avoid errors arising from both instruments and test-specimens, the best procedure was to use both a zero load and a presser foot. Most hardness tests made no provision for avoiding errors from friction in the measuring device, and tests showed that, by gentle vibration during the test, much more consistent readings and better agreement between different labs. and instruments were obtained.

12411. SPOONER, C.E. **Swelling power of coal.** *Fuel* 30,193-202(1951).— *C.A.* 45, 9831*e*.

The swelling power of coal was directly proportional to the tar produced on thermal decompn. and inversely proportional to the amt. of porous structure of the coal. In general, swelling was proportional to (% hydrogen — 4.2)/(% oxygen)^2.

12412. STOKES, C.A. AND VIVIAN, J.E. **Application of sonic energy in the process industries. I. Fundamentals.** *Chem. Eng. Progress Symposium Ser., Ultrasonics* 47, No. 1, 11(1951).—*C.A.* 46, 294*c*.

Detailed data were given on agglomeration of carbon black smoke, specifically, lab. and pilot-plant data, to show comparison of sonic with static agglomeration technique, other uses in the gas phase, and liquid-phase application.

12413. TAKAGI, SHUNSUKE AND ABOSHI, HISAO. **Accurate determination of true specific gravity of granular or pulverulent materials.** *Rept. Inst. Sci. Technol., Univ. Tokyo* 5, 253-7(1951). — *C.A.* 46, 5931*i*.

The true sp. grs. of sand and clay were measured by carefully evacuating the pycnometer which contained the sample to a pressure of about 10^{-3} mm Hg and then filling the pycnometer with water that had been boiled to remove dissolved air. The results revealed that the air that could not be removed by the usual method occupied a vol. that amounted to 12% of the true vol. of the sample.

12414. TORKAR, K. **The effect of the pore volume of sintered materials on the magnetic characteristics.** *Powder Met. Bull.* 6, 13-17(1951).— *C.A.* 46, 5498*g*.

The satn. varied proportionately with the d. Deviations from this relation were attributed to nonmagnetic inclusions, such as oxides. The internal demagnetization factor was controlled by pore distribution.

12415. UZUMASA, YASUMITSU AND HIKIME, SEICHIRŌ. **Freezing of gelatinous precipitates. I. Freezing of aluminum hydroxide.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 54, 317-19(1951).— *C.A.* 47, 3085*a*.

$Al(OH)_3$ was subjected to freezing-thawing treatments under various conditions. The sedimentation vol. of the resulting ppt. decreased with increase in freezing time and lowering of freezing temp.

12416. WALZ, ALVIN E. AND GLOCKLER, GEORGE. **Electron emission from a carbon surface.** *Proc. Iowa Acad. Sci.* 58, 261-4(1951).— *C.A.* 46, 5426*d*.

It was possible to obtain the required temp. with a voltage drop less than the ionization potential of carbon.

12417. WEININGER, JOSEPH L. AND SCHNEIDER, WILLIAM G. **Thermal conductivity of granular beds filled with compressed gases.** *Ind. Eng. Chem.* 43, 1229-33(1951).— *C.A.* 45, 5464*a*.

Measurements of thermal cond. of granular beds of Al_2O_3 and powd. borosilicate glass when filled with He, H_2, or N_2 at varying pressures yielded linear relations between thermal cond. and pressure; CO_2 in the same beds gave rise to a parabolic relation. Except for the measurements with He and H_2, the measured values of the thermal cond. were much greater than would be predicted from calcd. values of the pressure coeff. of thermal cond. of the gas in question. This behavior was attributed to increasing gas adsorption on the solid granules with increasing pressure.

12418. YANCEY, H.F.; GEER, M.R., AND PRICE, J.D. **An investigation of the abrasiveness of coal and its associated impurities.** *Trans. Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 3027-F (in *Mining Eng.* 3, 262-8)(1951).— *C.A.* 45, 4021*a*.

The test consisted of rotating four 16-gage Armco iron blades, 2 in. long × 1 in. wide, in a charge of coal for a fixed no. of revolutions and then detg. the loss in wt of the blades. A shaft-and-arm assembly rotated the blades in a mortar (pipe) 8 in. inside diam. × 9 in. deep. The edge of the blade next to the wall of the mortar was curved backward with respect to the direction of rotation on a 5/8-in. radius, to crowd or nip the coal particles between the blades and the wall of the mortar. The clearance was 0.20 in. both between the blades and the bottom of the mortar and between the blades and wall of the mortar. Tests at 6000 and 12,000 revolutions showed that doubling the length of the test did not double the abrasion loss. On 5 samples, doubling the duration increased the abrasion loss by an av. of 63%.

12419. ASHLEY, K.D. AND INNES, W.B. **Control of physical structure of silica-aluminum catalyst.** *Ind. Eng. Chem.* 44, 2857-63(1952).— *C.A.* 47, 2909*h*.

The porosity of an alumina-silica catalyst, prepd. by adding alum to the silica sol, increased with an increase in time, temp., and pH of aging, and with higher silica content during gel formation. Very rapid spray-drying gave 25% greater porosity than kiln drying. Thermal stability increased markedly with increased porosity up to a pore vol. of 0.7 ml/g. Increased porosity resulted in decreased attrition resistance. Optimum porosity for an alumina-silica catalyst was in the range of 0.6 to 0.9 ml/g.

12420. BEISCHER, D.E. **Melting phenomena of a surface of unimolecular thickness.** *Science* 115, 682-4(1952).— *C.A.* 46, 8921*g*.

A monolayer of C^{14}-labeled stearic acid was supported on mica plates. The melting process was indicated by surface diffusion of the radioactive mols. to scratches marked in the mica; the optical d. of the radioautograph showed inhomogeneities at locations corresponding to the scratches where the acid mols. were immobilized as Al stearate. The monolayers did not show phase transitions at the m.p. of the bulk acid as indicated by the lack of change of direction of the log D *vs.* 1/T relation, nor was any sharp m.p. found during the expts.

12421. BREITMAYER, THEODORE AND WEST, FRANK B. **Improving the density and strength of charcoal briquets.** *Ind. Eng. Chem.* 44, 2234-7(1952).— *C.A.* 46, 11641*c*.

At a crit. size range for charcoal particles of the order of 25-40 μ, approximating the diam. of the major cells of the original wood, "loose-packed" d. increased to 3-fold that of the coarser fraction and twice that of solid charcoal. The blending of 25-50% of moderately fine charcoal with the coarse raised briquet ds. and strengths far above those obtained from either starting material used alone.

12422. D'ORSI, GIULIO. **Determination of the density of leather.** *Cuoio, pelli, mat. concianti* 28, 35-44,93-103,156-60(1952).— *C.A.* 46, 8403*c*.

A new method and app. was suggested which permitted the detn. of d. with gas displacement on either leather or hide powder. The av. values obtained were: vegetable-tanned leather 1.535, hide powder 1.602, raw dry hide 1.715-1.735.

12423. DOWNING, V.F. AND PARKER, F.R. **Improved pycnometer for powders, precipitates, and synthetic resins.** *Anal. Chem.* 24, 229-30(1952).— *C.A.* 46, 3806*h*.

A wide-mouth glass jar similar to a weighing bottle was used fitted with special interchangeable glass caps. These were provided with ground-in thermometers and capillary vent plugs.

12424. EDGCOMBE, L.J. AND MANNING, A.B. **A special study of ash and clinker in industry. Origin and nature of ash; sampling and analysis.** *J. Inst. Fuel* 25, 166-70(1952).— *C.A.* 46, 8346*f*.

The origin of the inherent and of the extraneous mineral matter in coal was outlined. The sampling of coal for the detn. of ash was reviewed with reference to the Brit. Standard Specifications, and methods of ash analysis and of ash-fusion-temp. detn. were described. Some correlation between ash compn. and fusion temp. was observed.

12425. FRÖHLICH, H.G. **Density determination of cellulose fibers by the suspension method.** *Z. ges. Textil-Ind.* 54, 337-9(1952).— *C.A.* 46, 8365*a*.

About 30 g of cellulose fiber was dried 2 hrs at 120°C, then boiled in a 500-ml round-bottom flask with a ground-in stopper which was filled 2/3 with CCl_4. The fibers dropped to the bottom on cooling; on heating to 60°C they floated and finally came to the surface. An accuracy of ±0.002 d. units was obtainable. Mixts. of CCl_4 and C_6H_6 made measurements at lower temp. possible. The d. of the fiber (D_f) was calcd. from $D_f = D_{SM} - a(x-20°)$, where D_{SM} = d. of the solvent mixt. at 20°, x = temp. of floating, and a = change of d. per degree.

12426. GYANI, B.P. **Factors governing hardness and transparency of alumina gels.** *J. Phys. Chem.* 56, 762-3(1952).— *C.A.* 46, 8463*g*.

Gels prepd. from $Al_2(SO_4)_3$ and NH_4OH were soft and chalky when aged at room temp. in the presence of the by-product salts. When the pptn. was performed at boiling temp. and the salts were removed immediately, hard, transparent gels were obtained. A small quantity of AcOH prevented deterioration.

12427. HEWITT, F.J.; RILEY, H.L., AND SAVAGE, P. **The quality of blast-furnace coke.** *Gas World* 135, No. 3524, Coking Sect., 21-32(1952).— *C.A.* 46, 4199*i*.

The phys. and chem. properties of cokes were characterized more exactly in order to correlate them with furnace performance. The micro-strength test and the wet-oxidation test were selected as measures of the strengths and reactivities of the cokes. Sections were cut from single half-oven pieces, and the tests were applied at various points along each section between the wall end and the center of the oven. Curves obtained in tests on 24 coke samples were used.

12428. HORTON, L. **Separation of coals into fractions of different densities.** *Fuel* 31, 341-54 (1952).— *C.A.* 46, 7731*c*.

Finely divided, clean bright coals, or, where possible vitrains, were fractionated (hand selection, followed by exhaustive float and sink sepns. with C_6H_6-CCl_4 mixts. of different ds.). At a point in the scale of rank between 84.6 and 88.6% C content, coals possessed a min. d. At lower ranks, the fractions of any one vitrain had substantially const.N-contents, but this was not the case, in general, with coals of higher rank.

12429. JURA, GEORGE AND PITZER, KENNETH S. **The specific heat of small particles at low temperatures.** *J. Am Chem. Soc.* 74, 6030-2(1952).— *C.A.* 47, 3678*e*.

Each particle was treated as if it were a sep. mol., but the Debye equations were retained for the calcn. of the frequencies of given modes of oscillation in terms of macroscopic elastic consts. The calcd. sp. heats of Al from 0 to 6°K were compared for (1) the infinite crystal, (2) cubes of vol. 10^{-18} ml, and (3) rectangular parallelopipeds of 10^{-18} ml vol. with dimensions of 79.37, 79.37, and 158.74 A. At 1°K the gross translation and rotation of the whole particles made the principal contributions.

12430. KREVELEN, D.W. VAN. **Some newer views as to the chemical structure of bituminous coal.** *Brennstoff-Chem.* 33, 260-8(1952).— *C.A.* 46, 11628*b*.

A graphical-statistical method was developed in which the at. H/C and O/C relations of the bituminous coal were used. The coalification ranges of the various petrographic constituents were shown as well as the changes during the most important reaction processes of bituminous coal. By introducing the d. (or the sp. vol.) as an addnl. quantity, it became possible to calc. the percentage of C present in aromatic and nonaromatic form, as well as the magnitude of the ring condensation of the bituminous coal mols.

12431. MANNING, A.B. **Size distribution in a randomly fractured solid, and its application to coal.** *J. Inst. Fuel* 25, 31-2(1952).—*C.A.* 46, 2264*i*.

The theory of random subdivision of a magnitude was used to derive an expression for the size distribution of a randomly fractured solid.

12432. MICHEL, A. **Application of thermomagnetic analyses to the study of catalyst.** *Ind. chim. belge* 17, 643-51(1952).—*C.A.* 47, 31*e*.

The relation between the thermomagnetic and catalytic properties of Fe, Ni, and Co catalysts for Fischer hydrocarbon synthesis ($CO + 2H_2$) was studied (*a*) for a variety of conditions of catalyst prepns. and (*b*) with several catalyst promoters. Good catalysts exhibited a distinct type of thermomagnetic curve.

12433. MIZUSHIMA, SANCHI. **Thermal and electrical conductivities of carbon materials.** *Phys.Rev.*86, 1040(1952).—*C.A.* 46, 8445*g*.

Coke, prepd. from pitch coke, was prebaked at 1300°C, and then heated 20 min. at 1500°-2700°C. Curves for thermal cond. and for crystallite size in the *hk*0 direction were nearly parallel: both rose rapidly with temp. even where elec. cond. was nearly const. Curves for the elec. cond. and for crystallite size in the *hkl* direction were nearly parallel.

12434. MROZOWSKI, S. **Thermal conductivity of carbons and graphite.** *Phys. Rev.* 86, 251-2 (1952).—*C.A.* 46, 5950*b*.

The effect of heat-treatment and of microcryst. dimensions on the thermal cond. of polycryst. graphite and baked carbons was examined. For com. carbons heat-treated at 1800-2200°C, the max. thermal cond. occurred at 0-500°C.

12435. PEPPARD, D.M. **Machine for determining packed density.** *Anal. Chem.* 24, 1869-70(1952). —*C.A.* 47, 2549*b*.

A machine to perform the tapping operation mechanically was described for use with standard proportion graduates, the smallest used being 100 ml. The basic rate of drop was 30/min., but on some materials the rate may be increased to 60/min. with a time saving. Experience with $CaCO_3$ pigments showed that results obtained with coarser pigments were more reproducible than those obtained with finer pigments.

12436. QUARLES, GILFORD C. **Effects of sonic vibrations on packed granular materials.** *Ind. Eng. Chem.* 44, 213-17(1952).—*C.A.* 46, 5388*g*.

Packed wet-sand particles between 0.062 to 0.71 mm were studied in molded form and in hoppers to det. the effects of grain size, moisture content, and vibration frequency. A definite threshold amplitude existed, above which molded briquets crumbled. In the case of discharge from a hopper, sand flowed more readily with horizontal vibration.

12437. SELWOOD, PIERCE W. AND LYON, LORRAINE. **Supported oxides of manganese: influence of support modification.** *J. Am. Chem. Soc.* 74, 1051-3(1952).—*C.A.* 46, 5944*d*.

The susceptibility-isotherm method was extended to a series of modified alumina supports; the supported oxides were those of Mn. The support-phase modification had a negligible effect on the oxidation state or dispersion of the supported Mn when the specific surface area was maintained large and no appreciable amts. of alkali were present. The presence of alkali in the support caused a large change in the susceptibility isotherm.

12438. SHISHCHENKO, R.I. AND AVANESOVA, A.M. **Effect of pressure on the limiting shearing stress of clay suspensions.** *Doklady Akad. Nauk S.S.S.R.* 83, 721-3(1952).—*C.A.* 46, 6900*c*.

An increase of the pressure (1-400 atm.) increased the limiting shearing stress of suspensions of 2 kinds of local clays. The effect was more marked with the less colloidal sort. Chem. purification of the clay, e.g. with sulfite-alc., suppressed the effect of the pressure.

12439. VENSTREM, E.K. **Action of hardness-lowering adsorbed substances in the mechanical rupture of solid bodies.** *Doklady Akad. Nauk S.S.S.R.* 86, 99-102(1952).—*C.A.* 47, 2011*i*.

The effect of electrolytes ($ThCl_4$, $AlCl_3$, $FeCl_3$, $FeCl_2$, NaCl, LiCl, Na_2CO_3) in aq. soln. and of surface-active nonelectrolytes in nonpolar hydrocarbon soln. on the hardness of different minerals and rocks was investigated by the pendulum and by the grinding methods. The expts. were done with quartzite, limestone, pyrite, and orthoclase. In contrast to electrolytes, surface-active nonelectrolytes gave curves without a max., only tending to satn. H_2O lowered the hardness of quartzite and limestone by about 20-30%; this effect was enhanced by adsorption of ions, which increased the thickness of hydrate envelopes.

12440. VENSTREM, E.K. **Adsorbed substances as depressors of hardness of brittle bodies.** *Kolloid. Zhur.* 14, 297-306 (1952).—*C.A.* 47, 2012*d*.

As inverse measure of hardness, the decrement V of the amplitude of a pendulum swinging on the solid surface, of v/F, was used; v = vol. of solid ground off by a tool along 1 cm of its path and F = tangential force applied to the tool. When the solid was moistened with a soln., V and v/F increased. This increase was max. at a medium load on the pendulum or tool. This load was greater, the softer was the pendulum and the harder the solid; it was, e.g., 0.8 kg for diamond on limestone and 4.5 kg for a steel alloy on quartzite. When the concn. of the electrolyte soln. increased, V and v/F either increased to a max. and then decreased, or increased first rapidly and then gradually.

12441. WYLLIE, M.R. AND SPANGLER, M.B. **Application of electrical resistivity measurements to problem of fluid flow in porous media.** *Bull. Am. Assoc. Petroleum Geol.* 36, 359-403(1952).—*C.A.* 46, 7376*b*.

The Kozeny equation for fluid flow through isotropic unconsolidated porous medium was expanded to apply to consolidated and nonisotropic porous media. The Kozeny const. for a system having a random distribution of pores could be obtained if the tortuosity of the porous system was known.

New equations for permeability and wetting phase relative permeability were given.

12442. Anon. **Properties of electrodeposited nickel.** *Can. Metals* 16, No. 5, 38, 40, 42 (1953).—*C.A.* 47, 6276*g*.

A comprehensive study of conditions during the electrodeposition of Ni showed that hardness, tensile strength, and other properties could be varied over a wide range by the proper choice of plating bath.

12443. Bradley, R.S. **A silica microbalance; its construction and manipulation, and the theory of its action.** *J. Sci. Instr.* 30, 84-9 (1953). —*C.A.* 47, 6705*f*.

These balances could be used in studies on adsorption, solid reactions and evapn. kinetics, analysis, mass d. detns., and magnetic studies. A detailed account of its construction and method of using was given.

12444. Dryden, I.G.C. **Chemical significance of the true density of coals.** *Fuel* 32, 82-8(1953). —*C.A.* 47, 2956*i*.

Values of a "ring condensation index" in the coal series were examd. The index varied linearly with the H-C ratio. Simplification of van Krevelen's original equation led to an expression for specific vol. in terms of H-content plus either (1) C-content, (2) O-content, or (3) a log term in H-content.

12445. Piret, Edgar L. **Fundamental aspects of grinding.** *Chem. Eng. Progress* 49, 56-63(1953). —*C.A.* 47, 3626*a*.

Some of the newer area-measuring techniques, some advantageous methods of plotting, some industrial mill correlations, and indicated directions for future research were outlined. Important progress in the fields of crushing and fracture will have to be based on other concepts than those prevailing at the time.

12446. Shepherd, A.A. **The effects of oxygen on the electrical properties of oxide cathodes.** *Brit. J. Appl. Phys.* 4, 70-5 (1953).—*C.A.* 47, 6244*g*.

The mechanism of reduction of electron emission from oxide-coated cathodes by O_2, and of the recovery process after O_2 poisoning, by mass spectrometer techniques, showed that the formation of singly charged O^- in the cathode coating played a major part in the recovery process. The results showed that at temps. above 700°K the cond. of the coating and the electron emission were poisoned by O_2 in the same way; but at temps. below 700°K the cond. was scarcely affected by the introduction of O_2 into the cathode coating, even though the electron emission was reduced to 0.1 of its original value.

VI-4. Particle Size Determinations (Sieving) (Aerosols)

12447. Martin, Geoffrey; Blyth, C.E., and Tongue, Harold. **Researches on the theory of fine grinding. I.** *Trans. Ceram. Soc.* 23, 61-118 (1924).—*C.A.* 18, 3659.

The law governing the connection between the number of particles and their diams. was discussed in grinding crushed sand. Definitions were given for statistical diam. and the mean diam. of a particle, as used in connection with the frequency curve. The app. was described and the data secured in the exptl. runs shown.

12448. Martin, Goeffrey and Watson, Walter. **Researches on the theory of fine grinding. IV. The air analysis of large quantities of crushed sand.** *Trans. Ceram. Soc.* 25, 226-39 (1926).—*C.A.* 21, 1857.

The app. for elutriating large quantities of sand was described for air speeds ranging from 2 in. to 20 ft per sec. The compd.-interest law connecting particle size and number was confirmed by the fact that log (W/X^3) plotted against X formed a straight line, where W = wt of a grade and X = av. arithmetical diam. of the particles forming a grade.

12449. Martin, Goeffrey; Bowes, E.A.; Coleman, E.H., and Littlewood, T.H. **Researches on the theory of fine grinding. V. The existence and preparation of statistically homogeneous grades of crushed sand.** *Trans. Ceram. Soc.* 25, 240-52(1926).—*C.A.* 21, 1857.

Crushed sand, when subjected to careful air elutriation, can be separated into homogeneous grades. These were characterized by the fact that repeated fractional elutriation did not alter the av. arithmetical diam. of the particles composing the grade. The frequency curve (no. plotted against diam.) of such a homogeneous grade followed the probability law, $N = a\exp(-bx^3)$, where N = no. of particles in a grade, x = diam. of particles and a and b were consts.

12450. Martin, Geoffrey. **Researches on the theory of fine grindings. VI. The diameters of irregularly shaped crushed sand particles lifted by air currents of different speeds and different temperatures.** *Trans. Ceram. Soc.* 26, 21-33 (1927).—*C.A.* 21, 3692.

When regularly shaped particles were very small, Stokes' law was obeyed, the const. k depending on whether the fluid flow was in stream line or turbulent flow, and also on the shape and nature of the supported particles. As the particles became larger, at some critical diam. Stokes' law gave way to the linear law: $V + V_0$ (const. velocity) = k (diam.). At still higher fluid velocities the linear law was replaced by the parabolic law, velocity = k (diam.)$^{1/2}$. The diam. and wt of quartz particles lifted by air speeds from 0 to 328 ft/sec., together with mesh apertures of the chief industrial sieves, were tabulated.

12451. Andreasen, A.H.M. **The grinding of materials. Theoretical and experimental researches on particle-size distribution incident to the disintegration process.** *Kolloidchem. Beihefte* 27, 349-458 (1928).—*C.A.* 23, 653.

For disintegrated products no general law held for the particle-size distribution, method and material. The particle shape was not dependent upon its size if the same method of disintegration was used. The compd.-interest law did not hold for ball-mill disintegration. Nothing was found that showed the particle shape varied with particle size.

12452. Rosin, P. and Remmler, E. **The laws governing the fineness of powdered coal.** *J. Inst. Fuel* 7, 29-36(1933).—*C.A.* 28, 3870^8.
Definite laws, expressed by the exponential law of fine grinding, governed the process of coal pulverization. Fineness-characteristic curves may be extrapolated into the range of the finest particles where measurements were difficult and lengthy. Considerable reduction in the lab. work of fineness analyses was thereby effected.

12453. Pirozhkov, N.A. **Methods for evaluating "nondusting" carbon black.** *Caoutchouc & Rubber* (U.S.S.R.) 1939, No. 10, 45-9; *Khim. Referat. Zhur.* 1940 No. 3, 101.—*C.A.* 36, 2392^3.
The degree of compression of "nondusting" carbon black from the wt and vol. no. was detd. The average resistance of the aggregates to abrasion and the individual carbon-black balls to crushing was discussed.

12454. Halberstadt, H. **Determination of the size of invisible particles.** *Staub* 1940, 151-80.—*C.A.* 37, 3317^1.
The determination of particle size with the help of x-rays was reviewed, with several examples of such determinations. The determination of particle size from photographs of electron deflections and the use of the ultramicroscope for this purpose were briefly discussed.

12455. Travis, Pierce M. **Measurement of average particle size by sedimentation and other physical means.** *ASTM Bull. No.* 102, 29-32 (1940).—*C.A.* 34, 3152^4.
The rate of sedimentation in a liquid was detd. for particles from 44 to 4 μ in diam. The settling times were based on Stokes' law of sedimentation. Calibration curves were drawn so that particle size could be detd. directly from time.

12456. Bietlot, Albert. **Methods of particle-size analysis and their application to some Eocene Belgian sands.** *Ann. soc. géol. Belg., Mem.* 64, 81-169(1941).—*C.A.* 38, 3181^6.
Sieve analysis, grain counts, approved methods, possible simplifications and sources of error were discussed in some detail.

12457. Butt, Yu. M. and Plotnikov, L.A. **Separation of fine powders by air.** *Zavodskaya Lab.* 10, 650-1 (1941).—*C.A.* 40, 6894^4.
An app. for the sepn. of fine powders into uniform fractions was described. A known quantity of the powdered substance passed through a sieve (4900 openings/cm^2) was placed in a V-shaped tube in the app., and air was forced through the system at various velocities. The granulometric compn. of the fractions thus obtained was very uniform.

12458. Kammermeyer, Karl and Binder, J.L. **Particle-size determination by sedimentation.** *Ind. Eng. Chem., Anal. Ed.* 13, 335-7 (1941).—*C.A.* 35, 4654^9.
The method consisted in measuring the change in pressure exerted by the suspension as the suspended material sepd. The pressures were indicated by the deflections of a spoon gage and mirror attached to the side arm of the settling chamber. The deflections of the spoon gage were amplified by an optical arrangement.

12459. Brieghel-Müller, A. **Filtration. III. Indirect methods for the investigation of filtration with filter aids.** *Kolloid-Z.* 99, 293-301(1942).—*C.A.* 38, 1917^5.
The effectiveness of kieselguhr prepns., $CaCO_3$, kaolin and activated carbon were studied. No unequivocal relation between particle size and vol. of the sediment was found, and it was concluded that no adsorption effect could be expected when kieselguhr was used as filter aid. Adhesion should be considered in the evaluation of the efficiency of kieselguhr, but no suitable test for measuring this property was available.

12460. Humbert, R.P.; Shaw, B.T., and Caldwell, O.G. **Studies of clay particles with the electron microscope. II. The fractionation of beidellite, nantronite, magnesium bentonite and attapulgite.** *Soil Sci.* 54, 149-58 (1942).—*C.A.* 36, 6951^2.
The 2-layer method, as applied to the Sharples supercentrifuge, was used. Photographs by means of an electron microscope showed that fractionation down to very small sizes had a real meaning. The larger particles did not appear to be oriented aggregates of small particles and their compact character suggested that considerable shearing force would have to be used within the suspension to break them down.

12461. Laguarta, Eduard, M. Galvez. **A streaming method for the determination of number of particles.** *Kolloid-Z.* 101, 165-7(1942).—*C.A.* 38, 5127^5.
The no. of particles was counted which passed through a cross section normally to the direction of flow in a given time at a given flow rate, produced by hydrostatic pressure or a known elec. field.

12462. Romanovsky, Vsevolod. **Effect of ions on the settling of a suspension of quartz powder.** *Compt. rend.* 215, 531-3 (1942).—*C.A.* 38, 3532^4.
Quartz powders of 7 to 20 μ were dispersed in aq. solns. of salts, stirred for 15 min., and allowed to settle. A table was given of the vol. of the ppt., and conclusions were drawn concerning the effect of various ions on the vol.

12463. Schiel, F. **Determining the particle shape of aggregate by the "falling-particle method."** *Asphalt u. Teer* 42, 863-5(1942).—*C.A.* 40, 5221^2.
Aggregates of the same particle size were allowed to settle in a tank (1 m diam. × 1.3 m deep) in the bottom of which was a rotating shutter (0.3-3 sec. per box width). This allowed particles having increasing time of fall (in the order cubical, lamellar, acicular) to be collected in a series of radially disposed boxes in the bottom of the tank. The results were compared with those of a standard sample.

12464. TIKHOMIROV, M.V.; TUNITSKIĬ, N.N., AND PETRYANOV, I.V. **The influence of van der Waals forces on coagulation of aerosols.** *Acta physicochim. U.R.S.S.* 17, 185-96 (1942) (in English).—*C.A.* 37, 4609⁴.

The rate of coagulation of an aerosol was detd. uniquely by the 3 mean values R, T/R, and T/R^2, where R = radius of the particles. The inclusion of interaction forces increased the coagulation const. by a factor, which did not depend on the av. size of the particles. The rate of coagulation, with interaction forces taken into account, was calcd., and the graph of the dependence of the rate of coagulation on the const. of van der Waals forces was given.

12465. FAIRS, G. LOWRIE. **The use of the microscope in particle-size analysis.** *Chemistry & Industry* 1943, 374-8.—*C.A.* 38, 10⁵.

12466. KOCHENDÖRFER, A. **Determination of particle size and lattice distortion of crystalline materials by the width of the x-ray lines.** *Naturwissenschaften* 31, 506-7(1943).—*C.A.* 38, 3546³.

The corrections to be applied in detg. particle size by x-ray line width were checked carefully by variation of slit width from 0.01 to 0.7 mm. The finally corrected figures were of the order of accuracy of 30% both for particle size and for lattice distortion. The upper limit for particle size was 10^{-4} cm.

12467. MANEGOLD, ERICH AND BÖHME, CHARLOTTE. **Capillaries, capillary systems and capillary phenomena. XXIV. The Berndel filters.** *Kolloid-Z.* 103, 96-104 (1943).—*C.A.* 37, 6498⁸.

Attemps to use a Berndel filter with an av. pore size of 5.5 μ for the filtration of an aq. suspension of red blood corpuscles were unsuccessful. Some of the pore sizes of this filter were considerably larger than 5.5 μ and the suspension went through these pores. More work was required to make these filters practical.

12468. PARTRIDGE, M.W. **Particle-size distribution of kaolin for internal administration.** *Quart. J. Pharm. Pharmacol.* 16, 1-6 (1943).—*C.A.* 37, 5194⁹.

The particle-size distribution of kaolin for internal administration was investigated. A method for the detn. of particle-size distribution in terms of the d. of a suspension after sedimentation was given, including the detn. of coarse particles in kaolin for internal administration.

12469. POCOCK, BRYANT W. **Particle size.** *Products Finishing* 7, No. 6, 38, 40, 42 (1943).—*C.A.* 37, 2244⁹.

The particles responsible for chemical reactions involved in electroplating, physico-chemical processes concerned in the manufacture and application of paints, enamels, lacquers, cleaners, and rust-preventives, and the combined activities of the various agents of corrosion and rust formation were for the most part between 1 and 40,000 A. in diameter.

12470. RIGDEN, P.J. **The measurement of the fineness of powdered materials.** *Chemistry & Industry* 1943, 393-6.—*C.A.* 38, 672³.

The sieve size of fine particles gave little information on the nature and behavior of the particles. Recourse was necessary to size analysis by elutriation, sedimentation, microscopic study, detn. of total surface area, or permeability of a bed of known dimensions by a gas or liquid.

12471. SCOTT, G.S. **Application of the Rosin-Rammler law to the "missing sizes" in screened coal.** *U.S. Bur. Mines, Rept. Investigations* 3732, 9 pp. (1943).—*C.A.* 38, 1092⁴.

The Rosin-Rammler law was illustrated in studying changes in sizing characteristics which would appear in screened coals if screens of different-size openings than those employed had been used.

12472. GAUDIN, A.M. AND HUKKI, R.T. **Principles of comminution-size and surface distribution.** *Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 1779, 17 pp. (1944).—*C.A.* 39, 1090⁷.

Logarithmically plotted size-distribution graphs were straight lines only in exceptional cases. At the fine end, each curve approached asymptotically a straight line of slope 1.0. In the medium fine range, the size-distribution curves had slopes less than 1.0. Repeated crushings and increased energy inputs gave flatter size-distribution lines and increased curvature. Under certain exptl. conditions, size-distribution graphs exhibited pronounced humps at the coarse end. The surface produced was studied by a gas-adsorption method.

12473. HARVEY, EDMUND N., JR. **Particle-size analysis.** *Interchem. Rev.* 3, 59-70(1944).—*C.A.* 39, 11⁶.

The subject was reviewed.

12474. LADD, W.A. **Electron microscope studies of colloidal carbon in vulcanized rubber.** *Ind. Eng. Chem., Anal. Ed.* 16, 642-4 (1944).—*C.A.* 39, 216¹.

Three new exptl. techniques for studying colloidal C in vulcanized natural and synthetic rubbers were discussed. A vulcanizing method was preferred, whereby the unvulcanized sample was pressed to a thin film between 2 disks(a crowned steel plate and a flat Al plate, both coated with collodion), vulcanized in a press, the plates soaked in AmOAc to remove the collodion, and the films digested in AmOAc and photographed. Despite some distortion, it was the most promising of the 3 methods.

12475. SMALLWOOD, HUGH M. **Limiting law of the reinforcement of rubber.** *J. Applied Phys.* 15, 758-66(1944).—*C.A.* 39, 437⁴.

Expts. were performed to check calcns. on the stress system near a spherical filler particle. Carbon black was flocculated in rubber, and P-33, Thermax and gilders' whiting were completely dispersed. Kadox and XX grades of ZnO caused abnormally large increase in modulus, presumably because of alterations in type of cure and modulus of the rubber matrix.

12476. ERNSBERGER, FRED M. AND FRANCE, WESLEY G. **Portland cement dispersion by adsorption of calcium ligno-sulfonate.** *Ind. Eng. Chem.* 37, 598-600(1945).—*C.A.* 39, 3137³.

The mechanism of dispersion of cement particles in aq. suspensions due to Ca lignosulfonate was investigated by means of the Wagner turbidimeter and spectrophotometric analysis.

12477. McCartney, J.T. **Determination of the size distribution of fine coal particles by the electron microscope.** *U.S. Bur. Mines, Rept. Investigations* 3827, 11 pp. (1945).—*C.A.* 40, 4864^7.

Uniformity of distribution or closeness of sizing was greater for fine particles, and a regular increase in uniformity was traced from run-of-mine coal to colloidal sizes. An equation for calcg. surface areas of fine coal samples from their Rosin-Rammler parameters was derived, and good agreement was shown between areas so calcd. and those obtained from the av. diams. of the particles. Distribution of sizes in samples of several petrographical constituents was similar. Subdivision of the coal particles was followed down to the practical limit of resolution of the electron microscope.

12478. Nayer, M.G. and Doss, K.S. Gururaja. **Computation of screen analysis of the product of crystallization from the screen analysis of the seeds.** *J. Univ. Bombay* 13, Pt. 5, 11-2 (1945).—*C.A.* 39, 3991^9.

The formula $W_p = [1 + (\Delta D/D)]^3 W_s$ was used in industrial crystn. studies, where W_s and W_p = the wts of crystals before and after the expt., and D = the weighted mean of D_s, the size of the sieve opening. If W_s and W_p of the samples were known, the latter equation gave the value of D directly. An error less than 1.5% was usually obtained.

12479. Artemov, I.S. **Effect of foreign vapors on the coagulation of aerosols.** *J. Phys. Chem.* (U.S.S.R.) 20, 553-60(1946).—*C.A.* 41, 20*f*.

Mists of a mineral oil, stearic acid, and purified paraffin were produced by cooling the corresponding vapors. Their av. particle radius was 10^{-5} cm, and the concn. was 25 mg/m^3. The progress of coagulation was followed by counting the particles in darkfield illumination. No measurable sedimentation took place during the expts., (3 hrs); the change in the particle no., n, was produced solely by formation of larger particles from several small ones. The rate of increase was not affected by vapors of phenol, oleic acid, glycerol, and water. The concn. of the vapor in the mist was varied from 0.5 mg/m^3 almost to satn.

12480. Bailey, Emerson D. **Particle-size distribution by spectral transmission.** *Ind. Eng. Chem., Anal. Ed.* 18, 365-70 (1946).—*C.A.* 40, 5978^1.

The method was applicable to particles in the range of 0.4-2.0 μ with approx. spherical or cubic shapes. For 4 different minerals of varying particle-size distributions, the specific extinction-projected area vs. radius (r) curves were made to coincide by multiplying r by a factor M. M was a function of the relative refractive index (n_D of particles divided by n_D of dispersing medium) and the wave length. The method was calibrated by fractionating each of 4 minerals into 6-9 homogeneous fractions. The distributions were detd. in a Svedberg low-speed ultracentrifuge, and the av. specific extinctions were detd. The radius value corresponding to the max. sp extinction could be varied by changing the wave length of the radiation.

12481. Barnes, Marion D. and LaMer, Victor K. **II. Total scattering from transmittance as a basis for the calculation of particle size and concentration.** *J. Colloid Sci.* 1, 79-91 (1946).—*C.A.* 40, 3038^3.

The form of the transmittance curve observed for light passing through mono-dispersed S sols agreed with the predictions of the Mie theory. The diam. and no. of particles per unit vol. could be calcd. from the transmittance as a function of wave length. The form of the total scattering curve was exptly. detd. for a range of (particle circumference):(wave length) ratios wherein it has been too difficult to calc. it.

12482. Böttcher, C.J.F. **A differential method for the calculation of the mean radius of particles.** *Rec. trav. chim.* 65, 14-18(1946) (in English).—*C.A.* 40, 4586^4.

The radius (r) can be calcd. from measurements of the d. (p), n, dp/dn, the mol. wt (M), and Avagadro's no. N. A formula was derived the validity of which depended on assumed constancy of the polarization (α). The truth of this assumption was demonstrated by preliminary calcns. Between 30° and 70°C dp/dn was almost const. with a value of 2.62 ± 0.01 for water; this gave r = 1.36 A for the water mol.

12483. Dotts, Walter M. **Measuring the distribution of particle size in dispersed systems.** *Ind. Eng. Chem., Anal. Ed.* 19, 326-8 (1946).—*C.A.* 40, 3654^3.

Improvement of an existing micromanometric method by the introduction of a more consistent technique, simplified calcns. The use of app. made it possible to measure with an accuracy of 1% or better the distribution of particle size in any system varying from concd. emulsions to dil. suspensions.

12484. Druett, H.A. **Determination of the variation of composition of airborne crystalline materials with particle size.** *Nature* 158, 946 (1946).—*C.A.* 41, 1524*i*.

A 4-plate sampling instrument, the "cascade impactor," was designed so that particles in successive size ranges were deposited in turn on the corresponding plate. This instrument was suitable for the study of aerosols consisting of mixed silicates and silica. The sample underwent no treatment before the x-ray diffraction pattern was obtained, coagula were deposited appropriate to their Stokes-law size, and the sample was representative of the dust in a considerable vol. of air (5 ft^3).

12485. Dunkin, H.H. **Meaning of particle size, I. II.** *Chem. Eng. Mining Rev.* 38, 129-31, 169-72 (1946).—*C.A.* 40, 3207^3.

The problem of arriving at an "average" particle diam. for masses of particulate material was discussed.

12486. Engelhardt, W. v. **Grindability and surface energy of solids.** *Naturwissenschaften* 33, 195-203 (1946).—*C.A.* 41, 7181*i*.

Work relating power required for grinding various materials, salts, glasses, cement, metals, etc., to different phys. properties were reviewed.

12487. GOODEN, ERNEST L. AND UPDIKE, ROBERT L., JR. **Preparation of standard powders for reference in particle-size measurement.** *Ind. Eng. Chem., Anal. Ed.* **18**, 802 (1946).—*C.A.* 41, 898*h*.

Glass beads used for coating moving picture screens were sepd. by sieves into closely graded portions suitable for checking app. used in particle-size measurements. A rod-shaped powder made by pulverizing glass wool in a hammer mill was also used.

12488. HELLER, W.; KLEVENS, H.B., AND OPPENHEIMER, HANS. **The determination of particle sizes from Tyndall spectra.** *J. Chem. Phys* **14**, 566-7 (1946).—*C.A.* 40, 6933^9.

The wave-length exponent n, obtained from the Tyndall spectrum, was calibrated against the particle size of aq. emulsions of polystyrene, polyisoprene, and styrene-isoprene copolymer, in the range of particle diams. from 500 to 3000A. The calibration curve changed as the ratio m of the refractive index of particle and medium changed. A curve was given for $m = 1.24 \pm 0.01$. The method was valid for any type of dispersed system with spherical particles.

12489. HEYWOOD, HAROLD. **A comparison of methods of measuring microscopical particles.** *Bull. Inst. Mining Met. No.* 477, 14 pp. (1946).—*C.A.* **40**, 2698^6.

Measurements were made by 10 experienced observers on the profile outlines of pieces of crushed sandstone graded to pass a 1-1/8 in. sq aperture and be retained on a 1 in. sq aperture. Profile comparisons were made with opaque and with transparent circles. From a statistical analysis of the measurements it was suggested that the comparison graticule was more suitable for visual work and the Martin statistical diam. method was best for profiles projected on a screen.

12490. HEYWOOD, HAROLD. **A study of sizing analysis by sieving.** *Bull. Inst. Mining Met. No.* 477, 18 pp. (1946).—*C.A.* **40**, 2699^4.

The variation in length, breadth, thickness, and vol. occurring in practice was detd. by measurements on 142 crushed sandstone particles, hand-graded to be retained on a 1 in. sq aperture and to pass through a 1-1/8 in. sq aperture. The least variation was in particle breadth. The sieving process occurred in 2 stages, the fine dust being eliminated fairly rapidly, followed by the near mesh particles at a gradually diminishing rate. The proportion of material passing the sieve was increased in all cases by wet sieving.

12491. JACOBSEN, A.E. AND SULLIVAN, W.F. **Centrifugal-sedimentation method for particle-size distribution.** *Ind. Eng. Chem., Anal. Ed.* **18**, 360-4 (1946).—*C.A.* **40**, 5977^4.

The particle-size distribution of com. TiO_2 pigment was detd. by two centrifugal sedimentation methods and by electron-microscope counts. An ordinary beaker-type centrifuge was used to sediment the pigment fractions. The particle diams. were calcd. from the modified Stoke's law equation.

12492. LAMER, VICTOR K. AND BARNES, MARION D. **Monodispersed hydrophobic colloidal dispersions and light-scattering properties. I. Preparation and light-scattering properties of monodispersed colloidal sulfur.** *J. Colloid Sci.* 1, 71-7 (1946).—*C.A.* 40, 3038^1.

Colloidal dispersions of very uniform particle size were prepd. by adding 1 ml of 1.5 N $Na_2S_2O_3$ to 1 liter of 0.0015 N H_2SO_4 at 25°C. The particles of S in the sol were at first very small but continued to grow. The sols were stabilized at any time so as to stop further change in particle size by titrating the unchanged $Na_2S_2O_3$ with I_2, leaving a slight excess of $Na_2S_2O_3$ to stabilize the dispersion. Sols with larger particles dispersed scattered light to form bands of different colors whose intensity, polarization, and angular distribution depended on the particle size.

12493. ROSE, H.E. AND LLOYD, H.B. **Measurement of the size characteristics of powders by photo-extinction methods. II. Experimental investigation of the photoextinction laws.** *J. Soc. Chem. Ind.* 65, 65-74(1946).—*C.A.* 40, 4582^4.

The linear relation between opacity and powder concn. was obtained if the solid angle subtended by the photocell at the center of the suspension was small. In these cases the linear relation held up to concns. in which 99.5% of the light was extinguished. The linear relation between opacity and the product of the concn. and the length of the path was again obtained if the solid angle subtended by the photocell was small.

12494. STEINHERZ, A.R. **Shape of particles in finely ground powders.** *J. Soc. Chem. Ind.* 65, 314-20 (1946).—*C.A.* 41, 2626*i*.

A method for measuring the mean particle shape was as follows: a fraction of nearly equal-sized particles was isolated, their mean vol. detd. by counting the particles of the same wt, and the mean of their greatest cross sections (i.e., of the images of the particles in their most stable positions) was measured. The mean thickness was then calcd. as a quotient of the mean vol. and the mean cross section, a prismoidal form of the particles being assumed. Portland cement, ground quartz sand, and ground glass were used.

12495. TÖTTERMAN, H. **Casagrande hydrometer method for determining particle size in finely dividing material.** *Finska Kemistsamfundets Medd.* 55, 34-35(1946).—*C.A.* 43, 4923*i*.

A sedimentation size analysis was made in which the variation of solids content with time was obtained by measurement of d. of the suspension with a hydrometer. The method was readily applicable to chalks, clays, etc., of particle size 1-100 μ.

12496. AMOR, ISIDORO ASENSIO. **A comparison of methods for the determination of particle size in soils.** *Anales inst. espan. edafol., ecol. y fisiol. vegetal* (Madrid) 6, 117-28(1947).—*C.A.* 43, 6346*h*.

If the soil contains an excess of org. matter, macerate with oxygenated water for 24 hrs before dispersion. Disperse 50 g soil with 2 g Na_2CO_3 and 5 ml of a soln. of Na_2SiO_3 (sp. gr. 1.36). Transfer to a 100-ml cylinder, invert several times, and sample with the pipet after 4 min. 48 sec. and after 8 hrs. Test with the densimeter at 0.5, 1.0, 2, 4, 10, 15, and 45 min., 2,4,6, and 24 hrs.

12497. ARTEMOV, I.S. **Effect of the particle shape on the rate constant of the coagulation of aerosols.** *Kolloid. Zhur.* 9, 225-30(1947).—*C.A.* 47, 941*i*.

The aerosols were produced in an elec. field and the concn. was 25 mg/m^3 and particle radius approx. 3×10^{-5} cm. Aerosols of anthraquinone and nitrosodimethylaniline coagulated at about 10°C with the rate consts. $K = 30 \times 10^{-9}$ and 27×10^{-9}, resp. In the presence of $CHCl_3$, Et_2O, PhOH, H_2SO_4, or oleic acid vapor, nitrosodimethylaniline gave nearly isometric particles, and K was 20×10^{-9}, i.e. agreed with the theoretical value. The same K was found for anthraquinone in the presence of H_2SO_4 and toluene vapors which caused these particles to be almost isometric.

12498. BARDWELL, J. AND SIVERTZ, C. **Determination of particle size by light scattering.** *Can. J. Research* 25B, No. 3, 255-65 (1947).—*C.A.* 41, 7202*a*.

An analysis of the exptl. measurements necessary for the detn. of the size of small dielec. particles from the Debye-Einstein equation was presented. Exptl. results obtained in detn. of latex particle size were, in general, in agreement with those obtained with the electron microscope.

12499. CROSS, A.H.B. **The variation of specific gravity of crushed silica brick with particle size.** *Trans. Brit. Ceram. Soc.* 46, 105-8(1947).—*C.A.* 41, 6683*h*.

The sp. gr. of crushed samples from a hard-fired silica brick, a soft-fired silica brick and glass increased slightly with fineness. This indicated that selective crushing of allotropes in silica bricks might occur.

12500. DAVIES, C.N. **The sedimentation of small suspended particles.** *Trans. Inst. Chem. Engrs.* (London) and *Soc. Chem. Ind.* (London), *Road and Bldg. Materials Group, Advance copy,* Feb. 4, 1947, 12-26.—*C.A.* 41, 2822*h*.

The types of particles considered were isolated solid spheres, liquid drops, air bubbles, ellipsoids, and particles of irregular shape. Sufficiently small liquid drops and air bubbles behaved as solid spheres but, for larger drops or bubbles, fluid viscosities and interfacial tension affected the sedimentation rate. The orientation of irregular-shaped particles changed in going from viscous flow through the transition range to turbulent flow. The effect of diffusion and also the Brownian motion on the orientation of the particle was considered. Turbulence, or random air movement, resulted in an exponential decay of the no. of suspended particles.

12501. DUBUISSON, ADRIEN. **Determination of the degree of fineness of powdered materials.** *Rév. matériaux construction trav. publ. C, No.* 383/384, 306-10 (1947).—*C.A.* 42, 799*d*.

Air was passed through a tube contg. the powd. material. The size of the particles was detd. from the air velocity required to suspend the particles, by using Stokes' law.

12502. GINELL, ROBERT; GINELL, A. MARGOT, AND SPOERRI, PAUL E. **Association phenomena. I. The growth of particles of silver chloride and the higher-order Tyndall effect.** *J. Colloid Sci.* 2, 521-5(1947).—*C.A.* 42, 1478*f*.

The formation of AgCl on mixing NH_4Cl and $AgNO_3$ in 95% EtOH was followed by measuring turbidity as a function of time. The results were correlated with the appearance of Tyndall light of different colors. Monodispersed AgCl sols formed by this method were stable for as long as 4 months. The stability was more pronounced with excess Cl^- and with more dil. solns.

12503. HANSON, E.E. AND DANIEL, J.H. **Instrument for measuring particle diameters and constructing histograms from electron micrographs.** *J. Applied Phys.* 18, 439-43(1947).—*C.A.* 41, 4972*f*.

The scanning mechanism measured the arithmetic mean of the major and minor diams.; a recording unit constructed the histogram by dropping steel balls in appropriate slots. At least 200 individual particles should be measured to get a representative figure, and they should have a major/minor axis ratio of less than 2. This method was more accurate and twice as fast as manual methods.

12504. HEYWOOD, HAROLD. **The scope of particle-size analysis and standardization.** *Trans. Inst. Chem. Engrs.* (London) and *Soc. Chem. Ind.* (London), *Roads and Bldg. Materials Group, Advance copy,* Feb. 4, 1947, 1-11.—*C.A.* 41, 2822*g*.

The basic principles in sizing analysis and the methods used, such as sieving, sedimentation, elutriation, and microscopic measurements, were reviewed. The use of the relation between particle shape and equiv. diams. was stressed.

12505. JACOBSEN, A.E. AND SULLIVAN, W.F. **Particle-size distribution for the entire subsieve range.** *Anal. Chem.* 19, 855-60(1947).—*C.A.* 42, 423*a*.

The balance pan in Odén's method was replaced by a tall cylindrical cup (polished stainless steel of inside diam. 4.5 cm, height 11.90 cm) and the weighings were made with a chainomatic balance. The amts. sedimented at various times were detd; these can be converted by a graphic method to a cumulative distribution curve. On a quartz suspension, this curve agreed reasonably well with that detd. by direct microscopic counting. By using a buoyancy factor, waiting for complete sedimentation could be avoided. The method gave the subsieve particle-size distribution down to a particle diam. of about 1μ.

12506. JOHNSON, IRVING AND LAMER, VICTOR K. **The determination of the particle size of monodispersed systems by the scattering of light.** *J. Am. Chem. Soc.* 69, 1184-92(1947).—*C.A.* 41, 5767*b*.

The particle size of monodispersed sulful sols was detd. by light scattering detg. the number and position of bands of different colors. Use was made of the red bands, called orders, which increased from 0 to 9 as the particle size increased. Measurements were made with a visual photometer of the intensities of the light scattered at different angles using two narrow-wave-length bands centered in the red (6290 A) and green (5240 A) resp. The ratios of the red and green intensities when plotted against the angle of observation had max. at the same angles. Calibration of particle-size measurements was made by detn. of the rate of deposition of the sulfur particles.

12507. Kegeles, Gerson. **A new optical method for observing sedimentation equilibrium.** *J. Am. Chem. Soc.* 69, 1302-5(1947).—*C.A.* 41, 7201*h*.

The theory and exptl. method used to observe in a single photograph both the concn. distribution and the concn.-gradient distribution required the "wt-av." mol. wt in the study of sedimentation equilibrium of polydisperse systems. The construction of the double prismatic cell and the exptl. technique connected with its use were described in detail.

12508. Klevens, H.B. **Latex particle size as determined by soap titration and light scattering.** *Colloid Sci.* 2, 365-74(1947).—*C.A.* 41, 6454*f*.

The particle size as a function of polymerization yield was detd. for synthetic latexes prepd. at 50°C by polymerizing an emulsion contg. 180 parts of a 2.5% aq. soln. of K myristate, 75 parts isoprene, 25 parts styrene, and small amts. of mercaptan and persulfate. Particle sizes were detd. by a spectrophotometric-interferometric technique and by titration of latex contg. a known excess of soap with a dye capable of undergoing a color change when the soap concn. corresponded to the crit. value for micelle formation. By the titration method the adsorptive capacity of the polymer particles for soap was detd. and from this the surface area of the particles calcd.

12509. Matheson, George L. **Modification in Roller analysis for the determination of particle-size distribution.** *Oil Gas J.* 46, No. 28, 307-10 (1947).—*C.A.* 42, 1727*e*.

For application to fluid cracking catalyst, the Roller app. was provided with a porous-plate air distributor to insure that fragmentation of the catalyst did not occur during the analysis. An investigation of the effect of moisture indicated that relative humidity of the air delivered to the catalyst during the test should be 50-70%.

12510. Rossi, Corrado. **Particle size of powders. I. Calculation of the sedimentation curve.** *Ann. chim. applicata* 37, 216-29(1947).—*C.A.* 41, 7201*h*.

The Boltzmann law was applied to the detn. of particle size as a function of the density.

12511. Smith, Mervyn L. **Particle-size measurement in the radio industry.** *Trans. Inst. Chem. Engrs.* (London) and *Soc. Chem. Ind.* (London) *Roads and bldg. Materials Group, Advance copy,* Feb. 4, 1947, 77-84.—*C.A.* 41, 2823*b*.

Particle-size analysis was extremely important for obtaining uniform products in the manuf. of radio tube parts. Methods were discussed for particle-size analysis for refractory metals in powder form, powd. metals such as Fe, Ni, Al, and Co, gas-absorbing powders, insulating materials, ceramic materials, emissive materials, black coating powders, conducting powders, and fluorescent powders.

12512. Stairmand, C.J. **Some practical aspects of particle-size analysis in industry.** *Trans. Inst. Chem. Engrs.* (London) and *Soc. Chem. Ind.* (London), *Roads and Bldg. Materials Group, Advance copy,* Feb. 4, 1947, 58-68.—*C.A.* 41, 2822*f*.

The various methods of detg. particle size for industrial applications were reviewed and comparison of the results by different methods given. A study of the cleaning of blast-furnace gas was presented.

12513. Stairmand, C.J. **Sedimentation apparatus for particle-size analysis in the subsieve range.** *Inst. Chem. Engrs. and Soc. Chem. Ind. Road and Bldg. Materials Group, Symposium on Particle Size Analysis* Feb. 4, 1947, 128-45*(Suppl. to Trans. Inst. Chem. Engrs,* 25, (1947).—*C.A.* 44, 5158*d*.

The app. was based on the Andreasen sedimentation tube and a special technique was used which allowed the use of much lower concns. than possible with the original Andreasen app. App. dimensions (sketch) and the method of operation were given. Little particle interference occurred during sedimentation at concns. up to 0.5% by vol. Quantities weighed were such that 0.05% could be used without loss of accuracy which were sufficient for plant control or general research work.

12514. Vendramini, Renzo. **Measurement of aerosol particles.** *Boll. Soc. med. chir. Modena* 47, 276-82 (1947).—*C.A.* 43, 6883*e*.

Various methods were critically discussed.

12515. Druse, J. **Measurement of carbon black in rubber by the microscope.** *Kolloid-Z* 110, 125-32(1948).—*C.A.* 43, 4887*e*.

The technique of prepg. samples and of detg. particle size were described. Dark-field photographs were shown and discussed. A table of results for 5 types of carbon black gave information of active and inactive portions of the material.

12516. Frenkel, Ya. I. **Mechanism of the electrification of solids and liquids in dusts and mists.** *Zhur. Eksptl. Teoret. Fiz.* 18, 799-806 (1948).—*C.A.* 45, 9402*e*.

Ionic holes with the sign corresponding to the smaller energy of formation were accumulated at the surface, while holes of the opposite sign formed the diffuse elec. layer. Smallest grains of the material carried a charge of the same sign as the surface; that charge decreased with increasing size. In an ascending air current, the lighter particles were sepd. from the heavier grains which carried the opposite charge. The fields arising in this process could be of the order of 1000 v./cm.

12517. Mills, Gervase L. **Particle-size measurement.** *Nature* 161, 313-14(1948).—*C.A.* 42, 3624*f*.

A simple app. was described and an equation given for measuring the mean radius of particles of a powder. The mean error of an observation by the method was 0.0008mm.

12518. Olevskii, V.A. **Preferred size of balls for ballmills.** *Gornyi Zhur.* 122, No. 1, 30-3(1948). —*C.A.* 43, 3247*g*.

In calcg. the size of balls, the particle size of the product should be taken into account. Where the balls were of one size, the following formula was derived for the preferred size balls: $D < 6(\log d_k)\ (d^{1/2})$, where D_m = diam. of the balls in mm, d = upper diam. of feed particles in mm, and d_k = diam. of product in μ. The finished product was considered as having a residue of 10% on a screen with d_k meshes.

12519. Powers, H.E.C. **Determination of the grist of sugars using the mean aperture and coefficient of variation numbers.** *Intern. Sugar J.* 50, 149-50(1948); *Sugar J.* 12, 9-11 (June, 1949).—*C.A.* 42, 6560*a*.

Hundreds of different sugars were sieved and cumulative percentage of each was plotted against aperture size on arithmetic probability paper. In all cases a straight line was obtained between 10 and 90%. It was possible to construct the curve for any sugar from the results obtained by using only two sieves, providing the points fell between the extremes of 10 and 90%. The results were reported as "Mean Aperture" (M.A.) and "Coefficient of Variation (C.V.). M.A. was the aperture corresponding to 50% on the graph; C.V. was given by [(aperture corresponding to 16%) − (aperture corresponding to 84%) divided by (M.A. × 2)] × 100.

12520. Rose, H.E. and French, C.C.J. **The extinction coefficient: particle-size relationship for fine mineral powders.** *J. Soc. Chem. Ind.* 67, 283-9(1948).—*C.A.* 43, 2843*c*.

A curve relating the extinction coeff., K, to the particle size of material in suspension in the range 0-50μ was derived exptly. The assumption that K was independent of particle size led to errors of about 100% in the estn. of specific surface and this observation reduced the probability of developing accurate, single-measurement methods. In view of the rapid variations in the value of K with particle size, observations of light intensity must be taken at small intervals of particle size.

12521. Sharratt, E. **The industrial control of size grading.** *Trans. Brit. Ceram. Soc.* 47, 22-37(1948).—*C.A.* 43, 2388*h*.

A sieve test to control the coarse material and a surface-area test to control the fine material were used. Intermediate size grading will then be automatically decided provided the grinding is normal. Data showed that the Murex "Spekker" surface-area method gave results in good agreement with those found by air permeability. Comparison was also made between the results obtained for full-size analyses by means of the pipet, turbidimetric, or microscopic methods, where again good agreement was shown.

12522. Simon, Leslie E. **Variation in materials, testing, and sample sizes.** *Proc. Am. Soc. Testing Materials* 48, 21-5, discussion, 26-9 (1948).—*C.A.* 43, 5515*f*.

The design of expt. involved identification of the test phenomena, evidence of state of predictability in material sampled, and a tech. procedure designed to yield a max. of information with a min. of cost and effort. The execution phase must contemplate the variability in the material and precision and accuracy of measuring processes.

12523. White, Locke Jr. **The determination of the particle size of aerosols by scattered light.** *J. Colloid Sci.* 3, 251-3(1948).—*C.A.* 42, 6201*d*.

A method, which depended on the measurement of the amplitude of vibration of a charged particle in an alternating elec. field, was used to det. the particle size of aerosols with radii in the range 0.15-0.59μ. The results agreed well with those obtained by the optical method of LaMer.

12524. Wilks, S.S. **Sampling and its uncertainties.** *Proc. Am. Soc. Testing Materials* 48, 3-19 discussion, 20(1948).—*C.A.* 43, 5515*h*.

Math. and statistical methods were discussed for analyzing sampling results and describing sampling laws at each stage of sampling. In sampling from lots of bulk material the sampling laws for the least and greatest measurements in a sample and their application in making inferences about the lot were described. Representative sampling as a method of overcoming nonuniformity in lots and the conservative nature of inferences from representative samples were considered.

12525. Ackerman, L. **Errors in routine screening tests.** *Chem. Eng. Mining Rev.* 41, 211-14(1949). —*C.A.* 43, 5885*h*.

Variations were noted in screening methods, in screening machines, and errors due to carelessness and other factors. A no. of recommendations were given.

12526. Blake, P.D. **Comparison of methods for determining surface area and other particle-size data of fine powders, especially welding electrode powders.** *J. Soc. Chem. Ind.* (London) 68, 138-48(1949).—*C.A.* 43, 6883*i*.

Use was made of Stokes' equiv. statistical diam. with the modified Roller method which gave the closest approximations to the abs. hydrometric values. Other advantages were that it used only points on the wt-distribution curve measurabl accurately, required only 4 points on the curve, and provided data on max. wt and no. frequency and the no. of particles/g.

12527. Coughanour, L.W. and Norton, F.H. **Fundamental study of clay IX. Influence of particle shape on properties of suspensions.** *J. Am. Ceram. Soc.* 32, 129-32(1949).—*C.A.* 43, 4436*h*.

Suspensions contg. mono-disperse particles of muscovite, kaolinite, halloysite, and orthoclase were studied at various concns. to det. the influence of particle shape on flow properties. The shapes had a considerable effect on dispersed suspensions, the more isometric particles yielding the lower viscosity. Particle shape made no difference in flocculated suspensions. There was some evidence that isometric particles in any suspension were nonthixotropic.

12528. Davies, C.N. **The sedimentation and diffusion of small particles.** *Proc. Roy. Soc.* (London) A200, 100-13(1949).—*C.A.* 44, 3768*d*.

The concn. of particles that settled and diffused while in suspension in a fluid was given as a function of time and position for a dil. suspension that was initially uniformly dispersed in a wide vessel. All particles that struck the surfaces of the container were assumed to be adsorbed. Solns. were obtained for a liquid with a free surface and also for a gas or liquid that entirely filled the space between 2 horizontal planes.

12529. Forsythe, W.L. Jr. and Hertwig, W.R. **Attrition characteristics of fluid cracking**

catalysts. *Ind. Eng. Chem.* 41, 1200-6(1949).— *C.A.* 43, 7217*f*.

A simple lab. accelerated attrition test was developed to evaluate particle breakdown of catalysts for fluid cracking units. The catalyst was subjected to the action of a high-velocity air jet and the extent of breakdown measured by screen and Roller analyses. Com. grades of fresh natural, SiO_2-Al_2O_3, and SiO_2-MgO ground catalysts had the same range of attrition resistance. Fresh microspheroidal catalysts had better breakdown resistance than ground catalysts except where there were excessive proportions of agglomerates.

12530. Fréchette, V.D. and Sephton, H.I. **A method of particle-size determination by means of the microscope.** *Am. Ceram. Soc. Bull.* 28, 496-7(1949).— *C.A.* 44, 1779*d*.

The sample was dispersed in warm raw Canada balsam, and the particles classified with respect to Martin's diam. by means of an external scale that was visible through the camera lucida. This was done at 3 successive magnifications. Either a micrometer-driven stage or an internal standard was used to reduce the counts to the same basis, as percentage of the total sample.

12531. Hartley, A.W. **Measurement of particle size.** *Mfg. Chemist* 20, 108-12(1949).— *C.A.* 43, 3687*h*.

12532. Johnstone, H.F. and Roberts, M.H. **Deposition of aerosol particles from moving gas streams.** *Ind. Eng. Chem.* 41, 2417-23(1949).— *C.A.* 44, 2674*e*.

For dusts contg. particles larger that 2 μ in diam., the cyclone spray scrubber had a max. efficiency at accelerations of 100 X gravity with droplets approx. 100 μ in diam. The removal of fine dusts and fumes by the atomization of a liquid injected into a high velocity gas stream, and accelerated by a Venturi tube, was 92-99% efficient. The efficiency varied as the specific drop surface developed per unit vol. of gas, and depended on the nature of the fume.

12533. Kidvidze, R.E. **Effect of the size of the original particles of lead on the distribution function in alcohol suspensions.** *Soobshcheniya Akad. Nauk Gruzin. S.S.R.* 10, No. 3, 133-8 (1949).— *C.A.* 46, 8932*i*.

Pb particles (filings) of known granulometric compn. were shaken with EtOH under identical conditions, for the same length of time (60 min.), and the surface area *S* of the resulting suspension was detd. by ultracentrifugal analysis. Detns. of *S* were made with size fractions (in 10^{-2} mm): 110.0-64.2, 64.2-32.4, 32.4-20.0, 20.0-13.5, 13.5-7.0. After 60 min. dispersion, the corresponding *S* values were 55.65, 71.59, 73.54, 71.11, and a very coarse suspension. On still more prolonged dispersion, *S* decreased again.

12534. Klovers, E.J. **How you can predict product screen analyses.** *Eng. Mining J.* 150, No. 6, 80-1(1949).— *C.A.* 43, 5885*i*.

12535. Kuczyński, G.C. **Self-diffusion in sintering of metallic particles.** *J. Metals* 1, No. 2, Trans. 169-78(1949).— *C.A.* 43, 2557*e*.

The mechanism of sintering of 2 metallic particles or of a metallic particle and a flat metallic block at atm. pressure was predominantly that of vol. diffusion for large particles and higher temps.

12536. Manning, A.B. **A theory of coal sampling.** *Fuel* 28, No. 3, 49-56(1949).— *C.A.* 43, 3168*f*.

The accuracy with which a sample of coal represented the bulk was calcd. from the wt of the sample taken, the particle-size distribution, and the results of a float and sink test. Conversely, the min. wt of sample required for a given accuracy was calcd. The theory was developed from the calcd. distribution of samples drawn at random from a mixt. of two different kinds of particles, e.g. particles of coal and particles of dirt, and extended to ternary mixts.

12537. Marshak, F.M. **Fractionation of fine polydisperse powders by an air current.** *Kolloid. Zhur.* 11, 30-3(1949).— *C.A.* 43, 7290*c*.

Fractions below 0.9 μ and 0.7 μ, resp., were obtained from quartz and goethite.

12538. Mörtsell, Sture. **Accuracy of sieve analyses made by means of sieving machines.** *Acta Polytech. No.* 30, *(Mech. Eng. Ser. 1). No.* 6, 44 pp. (1949); *Kgl. Tek. Hogskol. Handl. No.* 17 (1948).— *C.A.* 43, 6007*b*.

12539. Sinclair, David and LaMer, Victor K. **Light scattering as a measure of particle size in aerosols. The production of monodisperse aerosols.** *Chem. Revs.* 44, 245-67(1949).— *C.A.* 43, 6039*d*.

12540. Spektor, A.G. **Rapid calculation of size distribution of spherical particles in nontransparent solid.** *Zavodskaya Lab.* 15, 1134-5 (1949).— *C.A.* 44, 10458*i*.

The vol. V, surface S, no. of particles per unit area of field n, and max. diam. of particle $D_{max.}$ of the dispersed phase was detd. by microscopic observation of several fields. If $a = D_{max.}/6$, $A = n/a$, $B = S/\pi a^2$, and $C = 6V/\pi a^3$, it was shown that the total no. of particles present per unit vol., $N = (23A - 9B + C)/15$.

12541. Spektor, A.G. **Relation between the characteristics of the dispersity of heterogeneous structures.** *Zavodskaya Lab.* 15, 1314-16(1949).— *C.A.* 46, 2375*g*.

In the case of a 2-phase system, it was shown that $\bar{a} = 4(1 - V_B)/S$, where $\bar{a}$ was the av. distance between dispersed particles, V_B the vol., and S the surface of the dispersed phase per unit vol. of the system. When V_B was small, $\bar{a}$ approached $4/S$.

12542. Srikantan, B.S. **Limits of supersaturation and the particle size of the solute.** *J. Indian Chem. Soc.* 26, 60-2(1949).— *C.A.* 43, 8241*f*.

Supersoly. could exist only for particles whose radii were between 5 μ and 50 mμ. A much higher supersoly. could be maintained on cooling for substances with high soly. and temp. coeff. of soly. than for others.

12543. Tourky, A.R. and El Wakkad, S.E.S. **Solubility and particle size from a study on**

silver oxide. *J. Phys. & Colloid Chem.* 53, 1126-34(1949).—*C.A.* 44, 904*f*.

Ag_2O was prepd. from dil. solns. of $AgNO_3$ and $Ba(OH)_2$, and the particle size detd. by a petrographic microscope or by sedimentation. By the disintegration of pure Ag_2O in H_2O, it was found that the particles could not be broken down below a certain limiting value, 26.8 mμ, irrespective of their initial size. The concn. of the OH^- on the surface of the particles showed an unequal distribution of both Ag^+ and OH^- from the solid wall of the particles into the bulk soln. The soly. of a slightly sol. electrolyte such as Ag_2O ceased to depend on the particle size whenever the condition of equal distribution of ions in the bulk soln. was not fulfilled.

12544. VÉLON, PIERRE. **Particle size of raw materials for face powders.** *Ind. parfum.* 4, 394-9(1949).—*C.A.* 44, 7023*d*.

A brief discussion was given of the screening, microscopic examn., turbidity, elutriation, and sedimentation methods for detg. particle size. The Andreasen sedimentation technique was applied to talc, kaolin, TiO_2, Zn stearate, and Zn oxide.

12545. VOLKOVA, Z.V. **The probability characteristics of separation of solids.** *Zhur. Priklad. Khim.* 22, 1231-6(1949).—*C.A.* 46, 5371*f*.

A more detailed evaluation was given of separability based on calcn. of probability characteristics of sepns., degree of recovery of separable components in the concentrate, and content of sepd. component in the concentrate. Particles of heterogeneous compn. were formed at the phase boundaries in the solid body. Math. formulas were given for calcn. of area of a particle at the phase boundary and for calcn. of probability of sepn. of a particle from the phase boundary. Calcns. were carried out for 3 powder fractions having av. particle sizes 0.380 mm, 0.200 mm, and 0.050 mm.

12546. WALL, CLARENCE J. AND ASH, WILLIAM J. **Fluid-solid air sizer and drier.** *Ind. Eng. Chem.* 41, 1247-9(1949).—*C.A.* 43, 6471*g*.

A unit was developed for the continuous drying and sizing of dolomite, the fluid-solid technique was used. The unit now operated on a com. scale in the prepn. of dry, sized feed for a rotary lime kiln. Hot air was used to evap. the moisture and the feed was sized by differential entrainment from a fluidized bed. Removal and recovery of marketable fines from the feed gave an improved product and effected a fuel saving in the kiln operations.

12547. YEOMANS, A.H. **Directions for determining particle size of aerosols and fine sprays.** *U.S. Bur. Entomol. and Plant Quarantine* **ET-267**, 7 pp. (1949).—*C.A.* 43, 6883*f*.

Microscopic measurements were made of the particles of nonvolatile materials collected on slides coated with a 1% alc. soln. of mannitan monolaurate or a Si product called Dri-film 9987. Volatile materials were collected on slides coated with MgO or carbon soot, and size estns. were made by measuring the craters left at the point of contact.

12548. YEOMANS, ALFRED H.; ROGERS, E.E., AND BALL, W.H. **Deposition of aerosol particles.** *J. Econ. Entomol.* 42, 591-6(1949).—*C.A.* 44, 262*e*.

Aerosol particles in still air tend to settle directly downward unless deviated by a force greater than gravity. Usually air currents prevented downward settling, but nearly all deposition occurred on horizontal surfaces or on horizontal protrusions from vertical surfaces. The optimum particle size for insecticidal aerosols increased with the size of the insect (for mosquitoes 15.81 μ in diam., for house flies 22.4 μ).

12549. BOYE, ERICH. **For the laboratory: a colloid mill in laboratory glassware.** *Chem.-Ztg.* 74, 721(1950).—*C.A.* 45, 4493*b*.

Two oppositely rotating disks on a concentric axis had several slotted rings attached to one face, each ring having the same axis as the disks, and moving in the annular space between a pair of similar rings attached to the facing side of the opposing disk. The mixt. to be emulsified entered through slots near the center of each disk and was forced by centrifugal action through a series of changes of direction and pressure in its passage through the narrow spaces between the intermeshing, oppositely moving rings. Stable emulsions of water and light mineral oil were thus prepd. without using emulsifying agents.

12550. CARPENTER, FRANK G. AND DEITZ, VICTOR R. **Methods of sieve analysis with particular reference to bone char.** *J. Research Natl. Bur. Standards* 45, 328-46(1950)(Research Paper 2143)

Sieve openings in the range between U.S. Standard Sieves No. 8 and No. 80 were studied. The largest source of error was in the testing sieves due to the tolerences permitted by the present specifications. It was feasible to calibrate testing sieves by the use of a calibrated sample of glass spheres. An analysis with seven Ro-Tap machines indicated that, in general, best results were obtained when the Ro-Tap was operated at 115 taps/min. of the knocker mechanism. The other variables concerned with shaking need not be rigidly controlled. The shaking time should be adjusted to the weight and the particle size distribution of the sample according to relationships developed.

12551. COLLINS, FRANK C. **Diffusion in chemical reaction processes and in the growth of colloid particles.** *J. Colloid Sci.* 5, 499-505 (1950).—*C.A.* 45, 3684*d*.

The Smoluchowski theory was applied to generalized processes involving diffusion. The probability a of a mol. diffusing up to the sink being absorbed was investigated. For planar sinks, the effective flux became independent of a at sufficiently long times. For spherical sinks, the effective flux became independent of a at sufficiently large radius.

12552. COSBY, W.T. **The formation and stability of aerial disperse systems.** *Bull. Brit. Coal Utilisation Research Assoc.* 14, 201-11(1950).—*C.A.* 45, 3219*i*.

The formation and behavior of systems of particulate solid and liquid materials dispersed in a gaseous medium were reviewed.

12553. Deshpande, V.V. and Telang, M.S. **Pipet method of sedimentation analysis rapid determination of distribution of particle size.** *Anal. Chem.* 22, 840-1(1950).— *C.A.* 44, 7592*i*.
Simultaneous suspension samples were drawn from a 1000-ml cylinder through tubes of different lengths into two 10-ml pipets. The time required for a detn. was lowered from 1130 min. for a single pipet of the Andraesen type to 480 min. for this double pipet method.

12554. Evva, Ferenc. **Sedimentation analysis of alumina hydrate suspensions.** *Aluminium* 2, 148-53(1950).— *C.A.* 45, 5486*g*.
On the basis of the expts. the following method was proposed for practical sedimentation tests: Pour the hydrate suspension into a 500-ml cylinder to the 100 or 200-ml mark, let stand until the hydrate is settled, add sufficient aluminate soln. so that the height of the settled hydrate layer is 5-6% of the total column height of the settled hydrate each 5-10 mins. When the liquid becomes quite clear, decant, and measure the d. with a hydrometer and the viscosity with an Ostwald viscometer.

12555. Hayakawa, Sohachiro. **A theoretical attempt on the packing of powder.** *Rept. Inst. Sci Technol.* 4, 87-92(1950).— *C.A.* 45, 7846*c*.
A quantity corresponding to the free energy of a unit cell was introduced for the assembly of powder particles in analogy to the mol. theory of the crystal lattice. A potential energy between particles was assumed to be inversely proportional to the degree of irregularity of shape, resulting in an exponential function of the distance between the particles. The relation between the void and particle size was obtained by calcg. the condition of the most stable packing.

12556. Jullander, Ingvar and Olsson, Bertil. **Physical-chemical investigation of fly ash from pulverized coal.** *Svensk Papperstidn*, 53, 199-204(1950)(in English).— *C.A.* 45, 844*d*.
Screen analyses of the pulverized coal and fly ash were given. Special app. for fractionating 18 fractions by sp. gr. was based on floating fractions on various mixts. of butanol (sp. gr. 0.807) and acetylene tetrabromide (sp. gr. 2.942). Size distribution of the fly ash particles was detd. microscopically after placing sample in glycerol on a blood-counting chamber.

12557. Kramer, Harris P. and Rigby, Malcolm. **Selective annotated bibliography on cloud physics and "rain making."** *Meteorol. Abstr.* 1, 174-205(1950).— *C.A.* 46, 9352*c*.
Many of the references (1895-1950) were to recent works on cloud seeding by means of solid CO_2 or AgI; to papers on aerosols or the atmosphere as a colloid; on chem. and phys. properties of, measurement and frequency of condensation, sublimation, and freezing nuclei, etc.

12558. Kunkel, W.B. **Charge distribution in coarse aerosols as a function of time.** *J. Applied Phys.* 21, 833-7(1950).— *C.A.* 44, 10447*h*.
The neutralization of highly charged dust particles, if suspended in air, was treated in detail. The result was in qual. agreement with expt. Multiply charged particles should be present in appreciable no. in coarse aerosols at times. This was confirmed by expts. both for initially charged quartz dust and for initially neutral NH_4Cl smoke.

12559. LaMer, Victor K. and Dinegar, Robert H. **Theory, production, and mechanism of formation of monodispersed hydrosols.** *J. Am. Chem. Soc.* 72, 4847-54(1950).— *C.A.* 45, 2745*g*.
Monodispersed colloids exhibiting higher-order Tyndall spectra were prepd. by pptn. of S_8 from EtOH and Me_2CO solns. by the careful addn. of H_2O. The relation between the concn. of S and the vol. fraction of H_2O at the crit. point of S-EtOH-H_2O solns. was investigated. Sols prepd. by this diln. method were investigated as to dispersion of wave length in their angular scattering of visible light and their transmission as a function of wave length. The size, no., and charge of the particles of such sols were in the same range as those prepd. by the acid decompn. of $Na_2S_2O_3$.

12560. LaMer, Victor K.; Inn, Edward C.Y., and Wilson, Irwin B. **The methods of forming, detecting, and measuring the size and concentration of liquid aerosols in the size range of 0.01 to 0.25 microns diameter.** *J. Colloid Sci.* 5, 471-96(1950).— *C.A.* 45, 926*c*.
The homogeneous-aerosol generator was used to form aerosol droplets of 0.01-0.08 μ radius from a variety of liquids, such as H_2SO_4 or dibutyl phthalate. H_2SO_4 formed a homogeneous aerosol by self-nucleation. Droplets of this size were too small to measure by established optical methods. Their size was estd. by growing the droplets by exposure to an appropriate vapor (e.g., H_2O for H_2SO_4 or toluene for dibutyl phthalate) to form radii above 0.08 μ, in which size-range optical methods could be used.

12561. Langstroth, G.O.; Diehl, C.H.H., and Winhold, E.J. **The evaporation of droplets in still air.** *Can. J. Research* 28A, 580-95(1950).— *C.A.* 45, 1831*h*.
The evapn. of droplets of 1 to 2 mm in diam. into still air was studied with the following 9 liquids forming a series of graded volatility: toluene, PrOH, glacial AcOH, ethylbenzene, o-chlorotoluene, AmOH, aniline, water, and BuOH. The exptl. results agreed with calcns. based on diffusion and heat-transfer theory.

12562. Ljunggren, Gustaf and Wilner, Torsten. **Aerosol indicator for rapid test of the dust content of air.** *Tek. Tid.* 80, 551-2(1950).— *C.A.* 44, 8704*i*.
The aerosol indicator functioned as a small ultramicroscope, through which the air was driven by an elec. blower. The suspended particles were illuminated from the side by a very strong light and appeared luminous against a dark background. The particles, which were too small to appear under an ordinary microscope, became noticeable.

12563. Mazurak, Andrew P. **Aggregation of clay separates from bentonite, kaolin, and a hydrous-**

mica soil. *Soil Sci. Soc. Am., Proc.* **15**, 18-24 (1950)(Pub. 1951).— *C. A.* 46, 206*h*.

Particles $> 1.15\ \mu$, 1.15-$0.58\ \mu$, 0.58-$0.29\ \mu$, 0.29-$0.15\ \mu$, and $< 0.15\ \mu$ were obtained from bentonite, kaolin, and Hesperia sandy loam and suspensions of these separates were electrodialyzed and air dried. The stability of the dry aggregates formed was detd. The ratio of ultimate particles $> 1.15\ \mu$ for kaolin was larger than for the other 2. The kaolin aggregates after 2-min. shaking in water showed the largest ratio (geometric mean of the aggregates/geometric mean of the ultimate particles) while those after 2000-min. shaking showed the smallest.

12564. Reiss, Howard and LaMer, Victor K. **Diffusional boundary value problems involving moving boundaries, connected with the growth of colloidal particles.** *J. Chem. Phys.* **18**, 1-12 (1950).— *C. A.* 44, 5680*d*.

In a naphthalene-like aerosol system, growing by means of the diffusion of vapor toward sinks (nuclei) that could not support supersatn., spontaneous nucleation did not occur if the no. d. of nuclei exceeded 100/ml. Several curves that depicted the rate of growth of S hydrosols were calcd. This supported the idea that the particles grew by means of a simple diffusion mechanism rather than by a surface-catalyzed deposition. The crit. supersatn. concn. for S in aq. soln. was 4.7×10^{-6} g/atom/liter, and the diffusion coeff. of S_8 was 2×10^{-6} cm^2/sec. A unit larger than S_8 may be diffusing, e.g., a polythionate.

12565. Rose, H.E. **Powder-size measurement by a combination of the methods of nephelometry and photo-extinction.** *J. Soc. Chem. Ind.* (London) **69**, 266-72(1950).— *C. A.* 45, 2744*f*.

An app. for the simultaneous measurement of the light transmitted and the light scattered by a powder was investigated. In the photo-extinction method of powder-size analysis, the single equation connecting the light transmitted by a suspension with the phys. characteristics of the suspension contained 2 unknown variables – the extinction coeff. K for all particle sizes, and the frequency of occurrence of the particles of every size.

12566. Stokes, C.A. **Sonic agglomeration of carbon black aerosols.** *Chem Eng. Progress* **46**, 423-32(1950); *Colloid Chem.* **7**, 403-29(1950).— *C. A.* 44, 9138*e*; 10301*d*.

Sonic-collection efficiencies as good as with electrostatic agglomeration systems were obtained. The sonic app. was simple and dependable. Further exptl. data and correlations were required to put sonic collection on a firm design basis.

12567. Viland, C.K. **Gravity separation of inactive catalyst.** *Oil Gas J.* **49**, No. 30, 74-5, 78, 80(1950).— *C. A.* 45, 2656*g*.

Cracking catalyst d. increased with catalyst age. A fraction of the circulating stream was centrifuged and the fines returned to the system; the coarse material (greater than 200 mesh) was conducted to a Sutton, Steele, and Steele gravity sepn. air table. Here, the heavy material was rejected and the light returned to the system. Mixts. of natural and synthetic catalyst and straight natural were successfully processed.

12568. Wolf, Karl. **Particle classification in uniform spiral-forming air-streams.** *Zement-Kalk-Gips* **3**, 141-7(1950).— *C. A.* 44, 9653*e*.

The operation of the Wolf and Rumpf equipment and factors affecting the sepn. of fine dusts into closely-sized fractions were discussed. Photographs were given of the fractions produced with various materials. The method was applied successfully in the manuf. of special cements.

12569. Amstein, E.H. and Scott, B.A. **Measurement of particle-size distribution by sedimentation methods.** *J. Applied Chem.* (London) **1**, Suppl. No. 1, S10-20(1951).— *C. A.* 46, 4321*b*.

The amt. of suspended material was detd. at a predetd. depth after certain intervals under conditions of free fall (up to 3% concn.). Samples were withdrawn from a Dewar flask by means of a pipet at the predetd. depth. The liquid was evapd. and the concn. of solids detd. by weighing. The exptl. details and results were given for calcined Al_2O_3, hydrated Al_2O_3, Al powder, and various cokes and anthracites.

12570. Andreev, S.E. **Average-diameter formulas.** *Gornyĭ Zhur.* **125**, No. 11, 32-6(1951).— *C. A.* 46, 2856*i*.

Thirteen formulas for calcg. the av. diam. of loose material were quoted and analyzed mathematically. For a mixt. of sizes with relatively narrow limits and a modulus not exceeding $2^{1/2}$ the formula $D = (d_1 + d_2)/2$ could be used. However, where the limits were wide, use of an arbitrary formula resulted in considerable error.

12571. Bredl, J. and Grieve, T.W. **A thermal precipitator for the gravimetric estimation of solid particles in flue gases.** *J. Sci. Instruments* **28**, 21-3(1951).— *C. A.* 45, 5979*a*.

An instrument was designed to collect all the solid matter from a flue-gas sample, which was large enough for the deposit to be easily weighed. The use of Al foil collecting surfaces facilitated accurate weighing. The advantages of the instrument over the usual filtering methods were mentioned.

12572. Cadle, R.D. and Magill, P.L. **Preparation of solid- and liquid-in-air suspensions for use in air-pollution studies.** *Ind. Eng. Chem.* **43**, 1331-5(1951).— *C. A.* 45, 7830*g*.

Aerosol generators were developed which dispersed liquids by an aspirating action. They could also be used for dispersing certain solids. In a device for dispersing powders at a uniform and easily controllable rate, the material was spread on a long brass trough which was drawn beneath an air-operated glass aspirator. The methods and equipment are well-suited for air-pollution studies.

12573. Carpenter, Frank G. and Deitz, Victor R. **Glass spheres for the measurement of the effective opening of testing sieves.** *J. Research Natl. Bur. Standards* **47**, 139-47(1951)(Research Paper No. 2238).— *C. A.* 46, 2857*e*.

The "effective" opening of testing sieves was generally somewhat larger than the av. opening or the nominal opening. A method of measuring the effective opening with a calibrated mixt. of glass spheres was described. Glass beads of the type used for highway markings were a suitable source of glass spheres for sizes from 80 to 1,000 μ (U.S. Sieves No. 170 through 18). Details were given for the selection of the spheres, the prepn. of the desired mixt. of spheres, subdivision of the samples, the measurement of the diams., and the calcn. of the wt-size distribution. From a statistical analysis of the calibration data, both the reproducibility and accuracy of the method were about 1%.

12574. Chomse, Heinz. **Sedimentometric analysis: model experiments on space factors.** *Mikrochemie ver Mikrochim. Acta* 36/37, 1026-41(1951). —*C.A.* 45, 5486*i*.

The quant. relations between the wt of a material deposited from a soln. as a component of a ppt. and the vol. of the sediment depended not only on chem. and other phys. factors, but particularly on spatial factor. The "sp. suitability" for the attainment of reproducible forms was fundamentally conditioned by the particle form; possible variations in the arrangement of the particles produced the variability of the interstitial vol.

12575. Corner, J. and Pendlebury, E.D. **The coagulation and deposition of a stirred aerosol.** *Proc. Phys. Soc.* (London) 64B, 645-54(1951).—*C.A.* 46, 9932*e*.

The variation of the deposition rate of NH_4Cl smoke with size was due to the effect of diffusion and ordinary sedimentation. The min. of the deposition, near 1/2 micron radius for a velocity of air motion of 50 m/min., explained why the stirred aerosols took up a size distribution with a peak in this neighborhood, whereas in a still aerosol the most common radius soon became much larger, roughly 1 μ.

12576. Dalla Valle, J.M.; Orr, C. Jr., and Blocker, H.G. **Fitting bimodal particle-size distribution curves; comparison of methods.** *Ind. Eng. Chem.* 43, 1377-80(1951).—*C.A.* 45, 8323*a*.

Methods of describing two bimodal distribution curves that occurred in studies of aerosol aggregation were presented. A selected-ordinate method was developed and described these bimodal distributions better than did the more complicated methods of moments and least squares.

12577. Goeb, August. **Particle size and particle shape of pigments, and their significance.** *Farbe u. Lack* 57, 14-18(1951).—*C.A.* 45, 3165*h*.

Pigments suitable for paints have av. particle sizes of 0.5-5 μ. The max. of hiding power and tinting strength was found in pigments of 0.2 to 0.3 μ; below this size, undesirable effects (poor hiding power, colloidal soly., tendency to agglomerate, high reactivity, poor flow, poor gloss) may result. Colors also varied with the particle size of a given pigment (e.g. Siegle red 1 and BB).

12578. Gregg, C.C. and Kopelman, Bernard. **Particle-size analysis of metal powders.** *Trans. Am. Soc. Metals* Preprint No. 32, 12 pp. (1951). —*C.A.* 45, 9336*e*.

A rapid, routine method was described for com. control of particle size and size distribution of 6 metal and 7 inorg. powders.

12579. Ivey, F. Emerson, Jr. **The particle-size analysis of fluid cracking catalyst.** *Petroleum Refiner* 30, No. 6, 99-103(1951).—*C.A.* 45, 8238*c*.

The 4 variables of significance in screening were size of sample, time of shaking, moisture preconditioning of the sample, and physical variation in and between the screens. A test procedure was developed which involved a 2-hr sample humidification with air of 60% relative humidity to eliminate static electricity, followed by 30-min. shaking of a 25-g sample on a Ro-Tap machine. Analysis of a microspherical catalyst indicated that a substantial variability in screen-analysis data for screens finer than 80 mesh was due to periodic changes in the screens used, all of which met the manufacturers specifications.

12580. Ivey, F. Emerson Jr. **The particle-size analysis of fluid cracking catalysts. II.** *Petroleum Refiner* 30, No. 7, 141-5(1951).—*C.A.* 45, 9251*g*.

The Roller test as applied to fluid catalytic cracking catalysts had the following disadvantages: poor precision (± 2.1% at 0-20 μ size to ± 7.6% at 80+ μ size), poor accuracy based on a microscope standard, presence of attrition, and sensitivity to electro-static charge.

12581. Ivey, F. Emerson, Jr. **The particle-size analysis of fluid cracking catalysts. III.** *Petroleum Refiner* 30, No. 9, 127-32(1951).—*C.A.* 46, 717*c*.

The elutriation d. vs. change in measured diam. was a straight line: $R = 1.854-0.982\ \rho_E$, where R = d. ratio and ρ_E = elutriation d. The theoretical effect of air rate in the Roller app. for various particle diams., Roller cylinder diams. and pore diams. was discussed. Statistical analyses showed that the precision of the screen analysis was ± 0.79% with the 100-mesh sieve and ± 3.34% with the 200-mesh. Precision was independent of the particle-size distribution; 31.6% of the variability of the 100-mesh analysis and 68.6% of the variability of the 200-mesh analysis were caused by the variance between the supposedly matched screens.

12582. Jottrand, René. **Application of dielectric-constant measurement to determination of the concentration of solids in a suspension.** *Chem. Eng. Sci.* 1, 81-5(1951).—*C.A.* 46, 3830*h*.

The concn. of a suspension at any point was rapidly and precisely detd. by measuring the capacity of a condenser suspended at the point to be measured. Expts. with silica powder of 56 μ diam. in a mixt. of benzene and nitrobenzene indicated that the degree of packing of the sediment was a function of its height and not of the time left in the settling tank.

12583. Kandilarov, G.G. **Sedimentation volumes of polydisperse kaolin suspensions in electrolyte solutions.** *Kolloid. Zhur.* 13, 357-65(1951).—*C.A.* 46, 2375*c*.

The sedimentation vol. (V) of 2.5 g kaolin (dried at 250°-300°C) in 10 ml liquid was 5.5 ml in 10^{-3} M, 7.8 ml in 10^{-2} M, 5.2 ml in 0.5 M, and 8 ml in 10 M H_3PO_4 after 24 hrs' standing. Similar sequence of max., min., and final rise was observed also in AcOH. In $Ca(OH)_2$ solns., *V* was 5.5 in $10^{-5}-10^{-3}$ *M* and 7.0 in 10^{-2} *M*. *V* decreased when sedimentation lasted longer, e.g. in *M* AcOH *V* was 6.08 after 24 hrs and 5.75 after 24 days. Pretreatment of kaolin with H_3PO_4 or AcOH raised its *V* in $Ca(OH)_2$ solns. and also affected *V* in Na_2CO_3 solns.

12584. LEITH, CARLTON J. **Sedimentation cylinder for particle-size analysis.** *Science* 113, 412-13(1951).—*C.A.* 45, 5459*h*.

Particles of 1/16-1/32 mm diam. were isolated. A liter ungraduated cylinder was furnished with a side tube with stopcock control. The tube was far enough above the base that flow through it did not affect the sediment on the bottom. Graduations were etched into the cylinder 5, 10, and 20 cm above the outlet tube.

12585. NAUMANN, ERICH. **Construction and operation of rapid filters; new goals and points of view.** *Gas-u. Wasserfach* 92, No. 20 (Water), 250-6(1951).—*C.A.* 46, 294*g*.

Interfacial forces of an elec. nature played an important role in catalytic-adsorptive processes. The relation between internal surface and water content of the filter had important implications for the structure of the filter bed, the filter velocity and the form of the filter base and the supporting layers. Filters were generally washed with air and water in Germany because of the necessity for removing Fe and Mn; in the U.S. water washing was generally used alone. The water- and air-washing process must be carried out with consideration of the individual installation.

12586. NISSAN, ALFRED H. **Particle-size analysis from sedimentation curves.** *Discussions Faraday Soc.* No. 11, 15-27, discussion 86-9(1951).—*C.A.* 46, 7843*h*.

Best results in particle-size analysis required direct visual observation of particle dimensions and shape as well as accurate detn. of sedimentation curves. The frequency distribution was best calcd. by an algebraic method based on the *T* tables of Fisher and Yates.

12587. OYAMA, TADASHI AND YASHIMA, SABURO. **The sizing analysis of fine particles by the phototube method.** *Technol. Repts. Tohoku Univ.* 16, 66-85(1951).—*C.A.* 46, 7843*e*.

Analyses of particle-size distribution in the range 66-1 μ were obtained by measuring the light transmission *vs.* time for a sedimenting system and applying Stokes' law. The effect of dispersion medium on the particle-size distribution of magnetite powder was given for nitrobenzene, H_2O, MeOH, EtOH, and mixed benzene-liquid paraffin.

12588. RAMMLER, E. **Particle-size distribution curves of powdered coal and other ground materials.** *Braunkohlenarch.* 1951, No. 58, 52-7.—*C.A.* 45, 10544*a*.

The rapid solution of Bennett's equation for particle-size distribution in pulverized materials was presented in tables and graphs.

12589. ROBINSON, JAMES V. **The viscosity of suspensions of spheres. II. The effect of sphere diameter.** *J. Phys. & Colloid Chem.* 55, 455-64 (1951).—*C.A.* 45, 5487*f*.

The viscosities of suspensions in sugar solns. of 3 sizes of glass spheres were measured, the sphere diams. being 3-4, 4-10, and 10-30 microns, resp. The viscosities showed some decrease as the rate of shear varied from 101 to 639 sec^{-1}, but were assumed to be Newtonian for this treatment. The sedimentation vols. of the largest spheres were nearly the same in glucose solns. and in water, whereas the sedimentation vols. of the smaller spheres were substantially greater in glucose soln. than in water.

12590. ROSSI, CORRADO. **Particle size of sulfurs and anticryptogamic activity.** *Chimica e industria* (Milan) 33, 794-8(1951).—*C.A.* 46, 5771*i*.

The anticryptogamic activity of S was mainly detd. by the size of the particles. The method of sedimentation gave reproducible values which were in good agreement with direct size measurements. The sedimentation method was used to show that in a well-ground S powder the statistical distribution of particle size corresponded to a Boltzmann distribution.

12591. ROSSI, CORRADO AND BALDACCI, RUFFO. **Determination of the particle size of fine powders—kaolins.** *J. Applied Chem.* (London) 1, 446-52(1951).—*C.A.* 46, 6900*b*.

The sedimentation curves for several kaolin suspensions were simply obtained by using a hydrostatic balance provided with a normal plunger. Sp. gr. of the suspension was plotted *vs.* time, and the tangent to the curve at zero time was related to the av. diam. of the particles.

12592. SCHROEPFER, GEORGE J. **Effect of particle shape on porosity and surface area of trickling filter media.** *Sewage and Ind. Wastes* 23, 1356-66(1951).—*C.A.* 46, 3687*h*.

If the surface areas were corrected to the average median size of plant-run material, they did not vary appreciably with shape ratio. The shape factor had very little effect on filter efficiency. Increasing the shape ratio resulted in increasing the percentage of voids which was desirable in filter design and operation. Material of high shape ratio did not tend to pile to such an extent that filter operation was affected.

12593. SEYER, PIERRE. **Errors in particle-size analyses.** *Ann. mines* 140, No. 4, 3-6(1951).—*C.A.* 46, 3387*b*.

Sieve analyses were discussed in general.

12594. SMIRNOV, N.I. AND LI, DE EP. **A suspended layer of spherical particles.** *Zhur. Priklad. Khim.* 24, 383-91; *J. Applied Chem. U.S.S.R.* 24, 419-26(1951)(Engl. translation).—*C.A.* 47, 380*b*.

Exptl. studies were made on suspensions of glass and Pb balls in H_2O, kerosine, air, and CO_2. The balls used varied from 0.805 to 1.972 mm in diam. The Reynolds no. varied from 4.3 to 630.

12595. SMIRNOV, N.I. AND LI, DE EP. **A suspended layer of particles of different shapes.** *Zhur. Priklad Khim.* 24, 439-38; *J. Applied Chem. U.S.S.R.* 24, 479-87(1951)(Engl. translation).—*C.A.* 47, 380*c*.

The equation developed was tested on irregular particles of Al, NaCl, and sand in kerosine, water, air, and CO_2. The value of the shape simplex may be computed from the simple ratio of the surface of a sphere whose vol. was the same as that of the suspended particle to the surface of that particle.

12596. Sproull, Wayne T. and Nakada, Yoshinao. **Operation of Cottrell precipitators—effects of moisture and temperature.** *Ind. Eng. Chem.* 43, 1350-8(1951).—*C.A.* 45, 7829*b*.

The temp. and moisture content of the gases being treated had a great effect on the performance of Cottrell precipitators. Most dusts reached their max. resistivity around 95° to 120°C. Moisture reduced the resistivity, especially at temps. below this peak value. This behavior was treated mathematically. Expts. revealed that the elec. characteristics of the precipitator were sensitive to moisture and temp., even though there was no dust.

12597. Stoyanovskiĭ, A.F. **Apparatus for counting the number of dust particles in the air.** *Gigiena i Sanit.* **1951**, No. 1, 16-20.—*C.A.* 45, 5459*i*.

A metallic cylinder was made in 2 halves which could be opened by means of a hinge. The cylinder was mounted on a shaft of a small elec. motor. In use, the cylinder was opened to the test atm., until dust equil. was established, then it was clamped shut. The cylinder was spun by means of the motor for settling the dust on the interior walls, along two of which were clamped glass slides coated with sticky material, such as castor oil. The dust particles settled per unit area of the glass slides gave the dust population per given vol. of air.

12598. Suito, Eiji and Taki, Koiji. **Measurement of the particle-size distribution of powder by the thermal analysis of reaction velocity. II. Particle-size distribution of calcium carbonate powders.** *J. Chem. Soc. Japan, Pure Chem. Sect.*, 72, 715-17(1951).—*C.A.* 46, 1330*i*.

The velocities of soln. of 6 kinds of $CaCO_3$ powders in acetic acid were measured by the method of thermal analysis. The particle-size distribution was calcd., and was compared with those obtained by other methods. The agreement was fairly good. From the expts. on the mixt. of $CaCO_3$ and TiO_2 powders, only the distribution curve of the former could be obtained.

12599. Volkova, Z.V. **Distribution of inclusions of an inhomogeneous solid in the disperse systems obtained from it.** *Kolloid Zhur.* 13, 416-21(1951).—*C.A.* 46, 2375*h*, 8463*b*.

If a solid consisted of a matrix and inclusions, and if these behaved equally when comminuted, then comminution of the solid gave largest no. N of sep. particles when inclusions were present as flat plates, a smaller N when inclusions were cylinders, and a smaller still when inclusions were spheres. If a solid contg. many inclusions was comminuted, the probability that a particle of the diam. b contain fraction c of inclusions depended on the initial vol. ratio of the inclusions, their particle size, and their shape. The shape factor was calcd. for spheres, circular cylinders, plates, cubes, and prisms.

12600. Volkova, Z.V. and Smirnova, I.V. **The separability of solid bodies.** *Zhur. Priklad. Khim.* 22, 965-9(1951).—*C.A.* 46, 5371*d*.

The efficiency of sepn. by grinding of the components of a heterogeneous solid was dependent on the degree of exposure of the components. A math. derivation of the formulas was given for calcg. degrees of exposure. The degree of exposure of included phase did not depend on its content in the heterogeneous solid, but the degree of exposure of including phase increased sharply with decreasing content of included phase. The degree of exposure of both the phases depended on the form of the distribution function of the including grains.

12601. Voyutskiĭ, S.S.; Zaionchkovskiĭ, A.D., and Rubina, S.I. **Causes of the granulation of powders.** *Doklady Akad. Nauk. S.S.S.R.* 78, 307-10(1951).—*C.A.* 45, 7846*e*.

Fine lampblack powder was granulated by tumbling in the presence of compact flakes obtained by rolling lampblack between cylinders; however, any large-size body, such as plant seed, sugar crystals, etc., acted similarly. Adsorbed gases definitely counteracted granulation; *in vacuo*, granulation was approx. 3-4 times as fast as in air, and the granules were more compact and stronger. Chalk and kaolin could be granulated in the same way as lampblack, but not sulfur, activated carbon, or graphite.

12602. Wilson, B.W. **Principles of filtration.** *Plating* 38, 831-5(1951).—*C.A.* 46, 1305*f*.

Variables affecting power consumption sepn. mechanisms, and effects of particle size and concn. were discussed.

12603. Alércio, John S. and Harley, John H. **Evaluation of α-particle absorption by filter paper.** *Nucleonics* 10, No. 11, 87(1952).—*C.A.* 47, 4212*i*.

Air in the A.E.C. plants was routinely sampled for U contamination by collection of dusts and mists on No. 41 Whatman paper and counted in an α-counter where the max. U level (50 γ/m^3 of air) should give 30 counts per min. equiv. to 70 disintegrations per min. Only 70% of this count could be realized because the dust and mist penetrated into the paper to such a depth that 30% of the α-particles were absorbed by the paper.

12604. Atherton, E. **Photoelectric turbidimeter for particle-size determination.** *J. Textile Inst.* 43, T173-8(1952).—*C.A.* 46, 6438*b*.

The instrument measured, photoelectrically, the intensity of light scattered from a suspension or soln. over a range of angles from 40 to 150°. It was particularly adapted to measurements on solns. of polymers.

12605. Atherton, E. and Peters, R.H. **Determination of the particle size of dispersed resins by two optical methods.** *J. Textile Inst.* 43, T179-87(1952).—*C.A.* 46, 6904*h*.

The dissymmetry and turbidity methods of light scattering were investigated as means of particle-size measurement. The results of the 2 methods agreed with each other, but were generally lower than those provided by electron micrographic study. Reasons were found why the micrographs might provide misleading evidence.

12606. BOSTOCK, W. **A sedimentation balance for particle-size analysis in the subsieve range.** *J. Sci. Instr.* 29, 209-14(1952).—*C.A.* 47, 1986*h*.
A torsion balance was used to measure the cumulative weight of material setting from a suspension as a function of time.

12607. BRITISH STANDARDS INST. **Methods for the use of British Standard fine-mesh test sieves.** *Brit. Standards* 1796:1952, 27 pp.—*C.A.* 46, 5481*h*.
Details were given of methods for both wet and dry sieving. Methods of subdividing bulk samples, details of sample dividers, notes on procedure, and details of an auxiliary vibrator were included.

12608. BUECHE, F. **Size distribution of spheres by light scattering.** *J. Am. Chem. Soc.* 74, 2373(1952).—*C.A.* 47, 6769*d*.
The method made use of the fact that for a soln. of spheres of unequal size the position of the 1st angular intensity min. did not yield the same sphere size for 2 different wave lengths.

12609. CREMER, E.; CONRAD, F., AND KRAUS, TH. **The adhesion of powders and its application in determination of particle size.** *Angew. Chem.* 64, 10-1 (1952).—*C.A.* 46, 2877*h*.
The adhesion of powders on an inclined support (plate) was a function of the friction factor and an adhesive force. The latter depended on the particle size of a single powder or resp. particle sizes of mixed powders. Exptl. values were given for burned and unburned magnesite, as well as Fe and Mo powders on different supports.

12610. DELFOSSE, P. **The particle-size distribution of a mineral pigment.** *Peintures, pigments, vernis* 28, 774-82(1952).—*C.A.* 47, 5696*f*.
The method of graphically representing particle-size distribution data was reviewed. A distribution curve was given for a naturally occurring $CaCO_3$ mineral.

12611. DINEGAR, ROBERT H. AND SMELLIE, ROBERT H. **Stability of monodispersed sulfur hydrosols.** *J. Colloid Sci.* 7, 370-81(1952).—*C.A.* 46, 10785*g*.
S hydrosols made by the chem. reaction method of LaMer and Barnes were unstable with respect to a change in ionic environment. The instability resulted from a reversal of the decompn. reaction $S_2O_3^{2-} \rightleftarrows SO_3^{2-} + S$. The rate of consumption of S by the reverse reaction was strongly favored by high pH. Beer's law was obeyed with respect to the scattering and scattering plus absorption of light.

12612. FUJITANI, YOSHIYASU. **Aerosols. I. Coagulation process of ammonium chloride smoke resulting from aging. II. Size of the particles forming the sedimentation boundary.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 418-23; 423-6(1952).—*C.A.* 47, 4168*c*.
The sedimentation velocity of the particles of NH_4Cl smoke in a polydisperse aerosol was detd. at 20 ± 2°C by means of a microscope. The change of the particle distribution with time was discussed in relation to Smoluchowski's theory of coagulation. The av. size of the particles obtained by the detn. of the sedimentation velocity of macroscopic boundary surface was compared with the particle-size distribution curve obtained by the detn. of the sedimentation velocity of individual particles.

12613. FUJITANI, YOSHIYASU. **Aerosols. III. Adhesion of microscopic particles on the inclined glass surface.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 578-80(1952).—*C.A.* 47, 4689*h*.
The smokes of starch, $CaCO_3$, Al_2O_3, ZnO, NH_4Cl, glass, and clay were made to settle, and the numbers of the particles settled on a microscope slide tilted at various inclinations were detd. The mode of adhesion of the particles was discussed in the light of surface phenomena.

12614. GAYLE, JOHN B. **Theoretical precision of screen-analysis results.** *U.S. Bur. Mines, Rept. Invest.* No. 4933, 9 pp.(1952).—*C.A.* 47, 1442*f*.
The exptl. detn. of the standard deviation for a particular set of conditions required tests on a large no. of duplicate samples, which was laborious. An equation was, therefore, developed for predicting standard deviations from theoretical considerations. The equation: $\sigma^2 = G(100 - G)W_1/W$, where σ = standard deviation of plus-K result, K being any given screen. G was the detd. % of plus-K material in the samples, W the sample wt, and W_i the wt of a particle just fitting the given screen.

12615. GILESPIE, T. AND LANGSTROTH, G.O. **Coagulation and deposition in still aerosols of various solids.** *Can. J. Chem.* 30, 1003-11 (1952).—*C.A.* 47, 4689*i*.
Aerosols of MgO, ZnO, C, copal resin, and SiO_2 powder were studied as regards changes with time in the no. of particles in suspension and in the no. of particles lost from the system by deposition on container surfaces. A 60-cm-cube chamber was used with still air at 20°C and 15-40% relative humidity. Humidity had little or no effect. Particle shape and structure were not predominantly responsible for difference in k, the coagulation const.; k did not increase in the order of bulk d. of the aerosol.

12616. HARKORT, H. **The determination of particle grain sizes by elutriation analysis.** *Glas-Email-Keramo-Tech.* 3, 165-8(1952).—*C.A.* 46, 8905*f*.
The app. was constructed with 2 elutriation cones with stainless steel nozzles with 1-6-mm openings. They could be accurately adjusted in the vertical axis of the feeding tube. The depth of the elutriation level was 250 mm for a const. pressure of the liquid column. The rate of elutriation was tabulated for H_2O, and the equiv. grain diams. of the particles defined by Stokes' formula. Slight defects in the nozzles, or obstructions, were easily detected.

12617. HOUNAM, R.F. **Some colloidal properties of inert dusts.** *Arch. Ind. Hyg. Occupational Med.* 5, 375-86(1952).—*C.A.* 46, 10489*b*.
In a series of dye-absorption (methylene blue) and sedimentation studies, dusts that produced

silicosis and pneumocosis formed negatively charged hydrophobic sols when suspended in H_2O or 50% EtOH soln. The neg. charge varied directly with toxicity, and non-toxic dusts generally formed positively charged sols, although some may carry a very small neg. charge.

12618. KIRCHBERG, HELMUT. **Definition and formularization of screening processes.** *Bergakademie Frieberg. Forsch. A, Bergbau* 4, 3-11 (1952).—*C.A.* 46, 10702*b*.
Ambiguities existed in the definition of particle size, av. diam., specific screening efficiency, and, in general, of terms used in screening analysis. The terminology used in related fields such as in grinding, in the construction industry, etc., should be considered.

12619. KYNCH, G.J. **A theory of sedimentation.** *Trans. Faraday Soc.* 48, 166-76(1952).—*C.A.* 46, 7843*f*.
It was assumed that at any point in a dispersion the velocity of fall of a particle depended only on the local concn. of particles. The settling process was then detd. entirely from a continuity equation, without knowing the details of the forces on the particles. Starting with uniform initial dispersions the formation and existence of layers could be treated where the d. suddenly changes its value. These occurred in dil. solns.

12620. LEHMANN, KURT. **Sugar sieves and sifting machines and their use.** *Zucker* 5, 180-2, 202-6 (1952).—*C.A.* 47, 3015*g*.

12621. MANLEY, R. ST. J. AND MASON, S.G. **Particle motions in sheared suspensions. II. Collisions of uniform spheres.** *J. Colloid Sci.* 7, 354-69(1952).—*C.A.* 47, 1461*b*.
The interaction of model glass spheres in suspensions subjected to velocity gradients was studied in detail. Abs. inelastic collision frequencies were measured and found to be in excellent accord with a theory based upon simple geometric considerations. A doublet rotated as a rigid dumbbell at a known const. angular velocity, and sepd. at a point that was a mirror image of the point of contact. This memory effect persisted through interruptions of motion of the suspension, which cast some doubt on the otherwise definite evidence of true contact of the spheres.

12622. MASTERMAN, F.E. **Particle size of clay, its determination and effects.** *Tappi* 35, 420-5 (1952).—*C.A.* 47, 313*b*.
By centrifuging for a certain time, and recentrifuging the decanted liquid, several clays were fractionated into groups having diams. of over 10, 2-10, 0.6-2, 0.2-0.6 and under 0.2 μ. These fractions were made into coating slips and coated on paper. The properties of the coatings were measured and found to vary widely with the particle size. For an American clay, some of the properties were (in the same order as the fractions listed above): G. E. brightness, 80, 79.5, 81.5, 81.5, 81.0; B. and L. gloss, calendered, 29, 27, 41, 52, 56; wet rub rating (low = good), 5, 6, 4, 2, 1; adhesive demand, 10,5, 11, 12.5, 14.7, 16.5. This centrifuge technique was used for control work on incoming clays.

12623. MELDAU, ROBERT AND ROBERTSON, ROBERT H.S. **The fracture surfaces of finely ground mineral powders.** *Tonind.-Ztg.* 76, 365-8(1952).—*C.A.* 47, 2571*c*.
Recrystn. in wet grinding, grid slippage, shapeless fracture, size range, adhesion of finest particles to larger ones, and other properties were discussed.

12624. NAESER, G. AND PEPPERHOFF, W. **Optical determination of the size of soot particles.** *Kolloid-Z.* 125, 33-4(1952).—*C.A.* 47, 2587*e*.
From the relation $k \sim \lambda^{-n}$, where n, a const. for the visible spectrum, depended on the size of soot particles, estn. of particle size were made. Changes in temp. as observed with the "Bioptex" pyrometer for a beam of light passing through a layer of soot on a glass slide, also led to a particle size estimate.

12625. RAMMLER, ERICH. **Evaluation of particle-size analysis in sieves.** *Bergakademie Freiberg. Forsch.* A, *Bergbau* 4, 12-22(1952).—*C.A.* 46, 10702*a*.
A common language should be adopted for the study of particle- size analysis. Test standards should be based on a logical sequence and not on some arbitrary no. system. Work on the standardization of sheet-metal screens with sq. holes should be continued.

12626. RANZ, W.E. AND JOHNSTONE, H.F. **The physical behavior of atmospheric aerosols.** *Proc. Natl. Air Pollution Symposium* 2, 35-41(1952).—*C.A.* 47, 5590*i*.
The forces acting on the individual particles of highly dispersed atm. aerosols (0.05-10 μ diam.) were discussed. The effect of atm. elec. field on deposition of dust particles, the washout of dust by raindrops, the coagulation by thermal and turbulent motion, and the decay and growth of aerosol particles were reviewed.

12627. RANZ, W.E. AND WONG, J.B. **Jet impactors for determining the particle-size distributions of aerosols.** *Arch. Ind. Hyg. Occupational Med.* 5, 464-77(1952).—*C.A.* 46, 10488*d*.
Particle-size distribution data were collected for NH_4Cl and H_2SO_4 aerosols by passage through jet impactors with open space of 1 to 3 jet diams. onto microscope slides and microscopic examn. Classification occurred approx. for the product of the square root of particle d. and the effective particle diam.

12628. RANZ, W.E. AND WONG, J.B. **Impaction of dust and smoke particles on surface and body collectors.** *Ind. Eng. Chem.* 44, 1371-81(1952). —*C.A.* 46, 7829*d*.
The systems analyzed were rectangular and round aerosol jets impinging on flat plates (jet impactors and impingement separators) and cylindrical and spherical collectors placed in aerosol streams (fibrous filters and wet scrubbers). Rates of collection of glycerol and H_2SO_4 aerosol particles of nearly uniform size were measured by impaction on wires and spheres in streams moving at various velocities and by impingement on flat plates from jets of different sizes and velocities.

12629. ROSE, H.E. **Determination of the extinction coefficient-particle size relationship for**

spherical bodies. *J. Applied Chem.* (London) 2, 80-8(1952).—*C.A.* 46, 7402*i*.

By refinement of method, extinction coeff. for particles of 2 to 85μ were exptly. detd. and found to be in good agreement with calcd. values.

12630. Schweyer, Herbert E. **Sedimentation procedures for determining particle-size distribution.** *Eng. Progr. Univ. Florida* 6, No. 6, Bull. Ser. No. 54, 19 pp. (1952).—*C.A.* 46, 9461*i*.

Three standardized exptl. procedures (the pipet, the hydrometer, and the turbidimeter methods) were described in detail for use in routine particle-size analyses in the range from 44 to 0.1 μ.

12631. Seely, Ben K. **Detection of micron and submicron chloride particles.** *Anal. Chem.* 24, 576-9(1952).—*C.A.* 46, 6037*f*.

Particles were brought into contact, by impaction or otherwise, with a gelatin-glycerol film sensitized with Hg_2SiF_6 and H_2SiF_6. The reaction product formed a spot or halo which could be recognized under the microscope. This procedure was capable of detecting individual chloride particles approx. 0.2 μ in diam., representing a mass about 10^{-14} g. Carbonates, sulfates, fluorides, nitrates, borates, and phosphates did not interfere. Iodides and bromides formed halos similar to those of the chlorides.

12632. Silverman, Leslie and First, Melvin W. **Edge and variable compression filters for aerosols.** *Ind. Eng. Chem.* 44, 2777-83(1952).—*C.A.* 47, 353*g*.

The most important features of edge filters for air and gas cleaning were the high efficiencies and the ability to regulate resistance without a significant change in performance. The variable compression filter permitted operation at variable d. to give a greater range of resistance regulation with Fiberglas and plastic filters than with felted media in the same construction.

12633. Tanaka, Tatsuo. **Particle-size distribution in a concentric mill.** *J. Ceram. Assoc. Japan* 60, 99-102(1952).—*C.A.* 46, 6438*c*.

Particle-size distribution of cement clinker was studied in a concentric mill in which the fine-grinding space was divided into 5 segments by partitions parallel to the axis. The relation of the 0.088-mm oversize value *vs.* the distance from the mill entrance showed that the rate of movement of the particles through the mill was heterogeneous and that mixing by counterflow took place especially near the entrance and just behind the screens.

12634. Thomas, D.J. **Fibrous fillers for fine-particle filtration.** *J. Inst. Heating Ventilating Engrs.* (London) 20, 35-55, discussion 55-70 (1952).—*C.A.* 46, 10698*h*.

Dry fibrous filters for particles of less than 1 μ diam. were discussed theoretically.

12635. Tsuji, Mikio and Hattori, Isamu. **The size distribution of colloidal particles.** *Kagaku* (Science) 12, 476-7(1952).—*C.A.* 46, 9935*i*.

Smoluchowski's theory of time change of size distribution of colloidal particles was extended to include various initial conditions besides uniform initial distribution.

12636. Vonnegut, Bernard. **Thin films of supersaturated solutions for detecting, counting, and identifying very small crystalline particles.** *Science* 116, 300-1(1952).—*C.A.* 47, 942*f*.

Films of soln. satd. with respect to a cryst. substance were prepd. by the use of two miscible, one quite volatile and the other nonvolatile, solvents in which the substance was readily sol. Mixts. of the two liquids increasingly rich in solute were made by adding an unsatd. soln. of the substance in the volatile solvent to the nonvolatile solvent. When a drop of the mixt. was smeared on a microscope slide, the volatile solvent evaporated, leaving a thin film of the substance dissolved in the nonvolatile solvent. As the ratio of solute to nonvolatile solvent was increased, a point was reached at which the residue appeared milky because of the formation of large numbers of small crystals.

12637. Voyutskiĭ, S.S.; Zaĭonchkovskiĭ, A.D., and Rubina, S.I. **The causes of the granulation of powders.** *Kolloid. Khur.* 14, 28-36(1952).—*C.A.* 46, 4321*a*.

The rate of formation of granules of lamp black was studied. The av. diam. of granules increased with the temp. (20-95°C).

12638. Wilkening, M.H. **Natural radioactivity as a tracer in the sorting of aerosols according to mobility.** *Rev. Sci. Instruments* 23, 13-16 (1952).—*C.A.* 46, 4884*d*.

By means of an ion separator the particles of aerosols of submicroscopic range were ionized and deposited in size-distribution pattern. A proportional counter was used to detect the distribution of atm. radioactivity on these particles. Most of the radioactivity attached itself to particles of the diam. range 0.001 to 0.04 μ with predominant grouping in the vicinity of 2 particle diams.: 0.009 and 0.018 μ.

12639. Wilson, B.W. **The sedimentation of dilute suspensions of microscopic spheres in water.** *Australian J. Appl. Sci.* 3, 252-6(1952).—*C.A.* 46, 9936*a*.

A continuous photographic method showed that the settling rates of 2.5-10-μ Pyrex spheres in water were in accordance with Stokes' law. Temp. uniformity was a more crit. factor than were electroviscous effects in dil. suspensions of very fine particles.

12640. Fullman, R.L. **Measurement of particle sizes in opaque bodies.** *J. Metals* 5, *Trans.* 447-52(1953); *AIME Trans.* 197, 447-52 (1953).—*C.A.* 47, 4263*d*.

Methods were developed for the analysis of particle-size measurements by area and lineal analysis when the particles were in the form of spheres, plates, or rods. The usual types of observation did not permit measurement of the length of rod-shaped particles. For such particles there was a negligible probability that a cross-sectioning plane would cut along the rod length, so that statistical observations of the dimensions of intersections of the particles with a cross-sectioning plane would depend only on the rod's radius.

12641. GARMSEN, W. **Particle-size measurements on paints.** *Farbe u. Lack* 59, 92-7(1953).—*C.A.* 47, 6669*d*.

A new device consisted of 2 mirror glass plates, 122 × 48 mm, 12 mm thick, which had a cm scale etched into their edges, and a selection of exchangeable gages (60, 80, 100, 150, and 300 μ thick). The selected gage was placed on one of the plates at the 10-cm mark, the paint poured on, the 2nd plate placed above the 1st, and the 2 plates now joined by a strong clamp at each end; after removing the excess of paint and a short wait, the clamps were removed and the plates carefully slid apart along their contact level. In this way, each plate retained half of the paint wedge. Immediately (15 sec for nitrocellulose lacquers 1 min. for paints or enamels) after sepn., the surface was scanned for the easily countable visible particles and their no. noted along with their location on the cm scale. Each cm equaled 1/20 of the gage thickness.

12642. GOETZ, ALEXANDER. **Application of molecular filter membranes to the analysis of aerosols.** *Am. J. Pub. Health* 43, 150-9(1953). —*C.A.* 47, 3046*i*.

12643. KÄNDLER, W. AND MILLER, L. **New sedimentation apparatus.** *Kolloid-Z.* 130, 172-6(1953).—*C.A.* 47, 6710*i*.

A glass sedimentation cylinder was mounted on a plate so that the surface of the base of the cylinder contained either of 2 microscope slides. One slide could be removed and replaced by the second slide without disturbing the app. This was done by slipping the base plate from the original position centered over the first slide to an alternate position over the second slide. The size of particles sedimented from a suspension was detd. as a function of time by microscopic observation of the slide samples.

12644. KANE, EDWARD D. **Microfiltration with resin-impregnated wool filters.** *Ind. Eng. Chem.* 45, 860-4(1953).—*C.A.* 47, 6190*d*.

The woolen fiber resin-impregnated type of cartridge was classified under the oriented depth-type filter. In the manuf. of these cartridges important considerations were fiber crimp level, fiber stiffness, felting temp., wool consistency, fiber diam., and water pH. The wool-type cartridge could be used for most common org. solvents and aq. solns. of salts, up to a pH of 10. The cartridges were stable with nonoxidizing acid solns.

12645. KOHL, J. AND ZENTNER, R.D. **The preparation and utilization of metallic aerosols for filter-paper testing.** *J. Phys. Chem.* 57, 68-72(1953).—*C.A.* 47, 5044*f*.

Carbonyl iron powder, 1-20 μ av. diam., was dispersed in air to test dust-filter efficiencies at air-flow rates of 200-2000 ft/min. Fe was detd. colorimetrically with mercaptoacetate. The collection efficiencies of 5 paper filters were presented.

12646. ROSENFELD, MELVIN A.; JACOBSEN, LYNN, AND FERM, JOHN C. **A comparison of sieve and thin-section technique for size analysis.** *J. Geol.* 61, 114-31(1953).—*C.A.* 47, 5179*h*.

When grain-size analyses of 32 samples made by thin-section and sieving techniques were compared, no const. relationship between the two methods was found.

12647. SMITH, JAMES S. AND GARDENIER, RANSEN JR. **Determination of particle-size distributions by a sedimentation method.** *Anal. Chem.* 25, 577-81 (1953).—*C.A.* 47, 6710*h*.

A simple Pyrex-glass app. for the detn. of particle-size distributions as functions of the Stokes diam. in liquid media was described. The distributions were described in terms of their mean Stokes diam. and their second moments about the mean.

VI-5. Surface Area Determinations

12648. MARTIN, GEOFFREY; BOWES, E.A., AND CHRISTELOW, J.W. **The theory of fine grinding. II. A method of accurately determining experimentally the surface of crushed sand particles.** *Trans. Ceram. Soc.* 25, 51-62 (1925).—*C.A.* 20, 2034.

Weighed samples were placed in celluloid containers with definite excesses of 5 N-H_2F_2 solutions and were shaken for an hr at 25°C. The reaction was stopped by diluting the H_2F_2 solution with an equal vol. of H_2O at 0°C, followed promptly by filtration through paper pulp in Pt Gooch crucibles. The loss in wt compared with the loss by a known surface of the same material under identical conditions gave the surface of the unknown sample.

12649. MARTIN, GEOFFREY; BOWES, E.A., AND TURNER, F.B. **The theory of fine grinding. III. Connection between the surface area produced and the work done in tube-mill grinding of quartz sand.** *Trans. Ceram. Soc.* 25, 63-78 (1926).—*C.A.* 20, 2035.

The work required to grind standard sand was detd. by electrical and by the brake methods. In ordinary tube-mill grinding the surface produced was directly proportional to the work done. To increase the surface of sand by 1 ft^2 60.9 ft-lbs of work were required when 1-in. steel balls were used for grinding in the 18″ × 18″ mill. For very fine grinding the "cushioning" effect of dust was pronounced and efficiency was increased by the dust removal in the air stream.

12650. SULLIVAN, R.R. AND HERTEL, K.L. **Surface per gram of cotton fibers as a measure of fiber fineness.** *Textile Research* 11, 30-8 (1940).—*C.A.* 35, 321^4.

An air-flow method of detg. surface per g to within a standard error of 3% was described and calibration curves for high- and for low-porosity wads of fiber were given.

12651. BLAINE, R.L. **The measurement of specific surface by air permeability.** *ASTM Bull.* No. 108, 17-20 (1941).—*C.A.* 35, 2392^4.

The method of Carman for the measurement of surface areas of powders by detn. of the permeability to fluids of a bed of powder was applied to a variety of solids including cements, lime and mixts. of the two. Air was used as the fluid. The method appeared to afford a rapid and reproducible method for detg. the surface areas of finely divided powders.

12652. KURBATOV, J.D. **Evaluation of the surface area of catalysts of cubic form by the emanation method.** *J. Phys. Chem.* 45, 851-66 (1941). —*C.A.* 35, 5775^7.

A detailed analysis of the theory and practice of measuring surface area by the radio-active indicator method was presented. Correct use of the method involved the incorporation of both Ra and Th X in the catalyst.

12653. SMITH, W.R.; THORNHILL, F.S., AND BRAY, R.I. **Surface area and properties of carbon black.** *Ind. Eng. Chem.* 33, 1303-7 (1941).—*C.A.* 35, 7797^3.

Adsorption isotherms of N_2 on carbon blacks were detd. at -195.8° up to 600 mm pressure. The B.E.T. value of V_m was multiplied by 4.38 m^2/ml to give the total surface. Assuming uniformity and a density of 1.85, the calcd. diam. of a standard grade 6 rubber black from the adsorption data was 284 A., in agreement with published electron-microscope value of 280 A.; for an acetylene black, the calcd. diam was 533 A. in comparison to 510 A. by electron microscope. A linear relation was found between I_2 adsorption from 0.05 *M* soln. and surface area, indicating that 100 m^2 of surface was assocd. with 130 mg I_2. If more than 10% volatile matter was chemisorbed, I_2 adsorption was reduced. Adsorption of diphenylguanidine did not give a simple relation between adsorbed amt. and total surface.

12654. COLUMBIAN CARBON CO. RESEARCH LABORATORIES. **The surface area of colloidal carbons. I. Measurement of surface area by the electron microscope.** *Columbian Colloidal Carbons* 3, 13-52 (1942).—*C.A.* 37, 745^2.

The phenomena of particle size (microscopy, ultramicroscopy, sedimentation, adhesion tension, diffraction, and adsorption) and the electron-microscope method were reviewed.

12655. IMRE, LAJOS. **Applicability of the radioactive-indicator method for determination of the surface area of solids.** *Kolloid-Z.* 99, 147-57 (1942).—*C.A.* 37, 4286^9.

The statistical meaning of the adsorption vol., or the no. of adsorption positions, or the exchangeable positions was discussed. It was indicated that the Paneth equation for exchange adsorption had only a limited application. Results were given showing the adsorption of Th B on lead sulfate, at various low concns., with increasing time, from both aq. and alc. solns. The exptl. results could not be explained according to Paneth's equation, but were in agreement with a given extended law of distribution.

12656. JAGITSCH, R. **A note on the work of K. E. Zimens: Surface determinations and diffusion measurements by means of radioactive inert gases.** *Z. physik. Chem.* 192, 56-9(1942).—*C.A.* 38, 2564^6.

Curves of emanating power vs. temp. for solid salts gave values for the temp. increment of diffusion of the emanation that were double those for the diffusion of the lattice particles. These temp. increments were related to the heats of "loosening" of the corresponding particles. This was contrary to the observation that the activation energy for the diffusion of foreign particles was less than that for self-diffusion. Hence, there must be some unrecognized factors involved in the migration mechanism.

12657. RAMMLER, E. **The Schuhmann particle-size equation and its relation to the exponential law of particle-size distribution.** *Z. Ver. Deut. Ing., Verfahrenstech.* 1942, No. 4, 103-8. —*C.A.* 38, 4492^3.

Exptl. values were given for 12 different materials and for 9 different finenesses of a flint. Neither Schuhmann's equation nor any other general parabolic function was satisfactory because the deviation of the calcd. results from the measured results was excessive except in a relatively narrow range. Schuhmann's equation, however, gave satisfactory agreement for surface calcns.

12658. TISELIUS, ARNE. **A new method of adsorption analysis and some of its application.** *Advances in Colloid Sci.* 1, 81-98 (1942).—*C.A.* 36, 3413^8.

A detailed description was given of the application of the striation photographic technique to the Tswett chromatographic analysis of a no. of org. acids and proteins.

12659. ZEIMENS, K.E. **Surface determination and diffusion measurements by radioactive noble gases. (Practice and quantitative method.) II. The valuation of data.** *Z. physik. Chem.* A191, 95-128 (1942).—*C.A.* 37, 5648^7.

Changes in magnitude of the surface or diffusion phenomena were utilized in all cases. The dependence of these factors on time, temp. and treatment of solid substances studied was considered. The method was useful in studies of decompn., water removal, dissocn., lattice change, reactions, etc., and also in comparing the data with those obtained in other ways.

12660. AMON, F.H.; SMITH, W.R., AND THORNHILL, F.S. **Identification of carbon black by surface-area measurements.** *Ind. Eng. Chem., Anal. Ed.* 15, 256-8 (1943).—*C.A.* 37, 3631^4.

The HNO_3 method was found to be the best one for sepg. carbon black, especially in Buna-S mixts. The temp. of digestion should be 60-70°C for not over 3-4 hrs; under such conditions the correction factor was 1.08 instead of 1.05. The exptl. data indicated that carbon black underwent no appreciable change in B.E.T. surface area during incorporation in, and subsequent vulcanization of, a rubber mixt. This made it possible to identify the carbon black in an unfamiliar mixt., provided only that 1 grade of carbon black was present. The fact that carbon black could be completely recovered in unchanged form from vulcanized rubber supported the concept of phys. reenforcement of rubber.

12661. CONSTABLE, F.H. **Apparent heats of activation and surface activity in surface catalysis over wide ranges of temperature.** *Rév. faculté sci. univ. Istanbul* 8A, 112-19 (1943) (in English).—*C.A.* 38, 5133^3.

Cremer's formula, relating the no. of active centers N on a catalyst surface and the heat of activation ϵ of each active center was used: $\delta N = Ae^{\epsilon/h}\,\delta\epsilon$, where A was a const. per unit area of catalyst surface under const. conditions of prepn. and h a const. regarded as measuring the displacement from the mean conditions of the lattice. Equations were derived for the heat of activation on a surface and the fraction of the surface causing half the reaction velocity.

12662. FRICKE, R. **Properties and effects of active solids and surface chemistry.** *Naturwissenschaften* 31, 469-82(1943).—*C.A.* 38, 3529^6.

Estimates were made of the surface energy of active solids. For microcrystals of nonpolar materials the edges and corners became sharper and hence more active, for polar (ion) lattices the shape did not change with decrease in size, but the no. of active spots increased. The adsorptive and the catalytic activities increased noticeably at a crystal size around 10^{-4} cm. Heterogeneous catalysis was to a large extent 2-dimensional surface chemistry on such crystals.

12663. HARKINS, WILLIAM D. AND JURA, GEORGE. **An absolute method for the determination of the area of a fine crystalline powder.** *J. Chem. Phys.* 11, 430 (1943).—*C.A.* 37, 6518^3.

The powder was outgassed in a Pyrex tube, sepd. by a glass membrane from a tube which contained a liquid. The liquid must give a zero angle of contact with the solid. The app. was placed in a good thermostat (at 25°C), the membrane broken, and the vapor and surface of the solid allowed to come into equil. (this may require days). The powder was then immersed in a considerable vol. of the same liquid in an extremely sensitive calorimeter. The total heat in ergs/g, divided by the total surface energy of the liquid (118.5 ergs/cm^2 for water) gave the area per g of powder. The surface of such a film had the surface energy of the liquid itself. With water on anatase, the film was about 9 mol. layers thick; the effect of a solid on a water film could not be measured beyond 5 mol. layers.

12664. HARKINS, WILLIAM D. AND JURA, GEORGE. **An adsorption method for the determination of the area of a solid without the assumption of a molecular area, and the area occupied by nitrogen molecules on the surfaces of solids.** *J. Chem. Phys.* 11, 431-2 (1943).—*C.A.* 37, 6518^7.

It was shown that $S = 4.06s^{0.5}$ where S = area in m^2/g, s = slope of the isotherm. The surface areas of 58 of 60 solids investigated, detd. by this method, agreed within ± 9% with detns. made by the B.E.T. procedure. The area of the N_2 mols. on these solids was calcd. to be in the range 13.6-16.9 A^2. Langmuir's isotherm was found to apply only to unimol. adsorption.

12665. KISTLER, S.S.; FISCHER, E.A., AND FREEMAN, I.R. **Sorption and surface area in silica aerogel.** *J. Am. Chem. Soc.* 65, 1909-19 (1943).—*C.A.* 38, 10^1.

Sorption data on silica aerogel and silica xerogel were presented. The area under the sorption curve, when plotted with log p_o/p as the abscissa, was a direct measure of the total surface area of the gel. Capillary condensation greatly affected the course of all the curves studied, and with nonaq. liquids on silica gel may account for nearly all of the sorption measured. Thorough removal of residual water from the surface of silica gel did not transform the sorption curve to another type.

12666. MAGGS, F.A.P. **The relation between heat of wetting and the absolute value of the surface area of coals.** *J. Inst. Fuel* 17, 49-54 (1943).—*C.A.* 38, 1622^9.

Two modifications of the Gibbs adsorption isotherm were used to det. the internal surface area of coals. The 2 methods showed mutual agreement and gave the same correlation with heat of wetting as did the area calcd. from electron-microscope measurements of particle size of artificial graphite. The heat of wetting of coal by MeOH was detd. calorimetrically. Surface area varied from 100,000 to 1,000,000 ft^2 per lb of coal, being larger for lower-rank coals. Artificial graphite, mean particle diam. 1000 A. ± 300 A., coals and charcoal showed the same order of surface area and the same relation between heat of wetting and surface area.

12667. NELSON, R.A. AND HENDRICKS, S.B. **Specific surface of some clay minerals, soils, and soil colloids.** *Soil Sci.* 56, 285-96 (1943).—*C.A.* 39, 4420^7.

Montmorillonite in the vacuum-dry state had a relatively small B.E.T. surface (15.5 m^2/g). This was also true of its brucine salt. The submicrocryst. hydrous clay minerals tested (kaolinite, illite) did not change their sp. surface significantly upon loss by heating of essential water, although the crystallinity, as judged by the change in x-ray diffraction patterns, was greatly modified. Measurement of surface areas of soils and clays by adsorption of C_2H_6 at dry-ice temp. was found to be entirely practical.

12668. SPEEDY, ALAN. **The surface area of colloidal carbons. I. The colloidal-carbon spectrum. II. III. IV. The electron-microscope method.** *Rubber Age* (London) 24, 81-2, 114-15, 136, 138, 162 (1943).—*C.A.* 37, 6855^7; 38, 5107^5.

The published data on particle size, x-ray diffraction, and adsorption were summarized and discussed. A table giving the mean diams. and surface areas of 8 types of carbon black was discussed.

12669. TRILLAT, J.J. **States of surfaces and their measurement.** *Tech automobile* 34, 56-60(1943).—*C.A.* 38, 5709^3.

Surfaces were divided into 8 classes and the phys. and physicochem. properties discussed. Measurements of surfaces were either direct or indirect, both of which were considered.

12670. Zimens, K.E. **Surface determinations and diffusion measurements by means of radioactive inert gases. III. The process of emission of the radiation from disperse systems. Conclusions about the evaluation of emanating-power measurements and about the interpretation of the results.** *Z. physik. Chem.* **192**, 1-55 (1943).—*C.A.* **38**, 2563^9.

The emanation method of Hahn was critically investigated. By the emanating power (EP) was meant the fraction of the total emanation (produced by the admixed radioactive material) that escaped from the sample into the surrounding space. Expressions were developed for the fraction of the total EP furnished by the recoiling atoms, as a function of the range of these atoms, for emanation originating within a single granule. When the recoil EP was used for surface detn., no assumptions about the shape of the granules were necessary; also, irregularities of the surface of the order of size of the recoil range (approx. 3×10^{-6} cm) were detectable. It was shown that the emanation diffused along the intersecting pores rather than back into the surrounding material.

12671. Balma-Perrier, F. **Polarimetric measurement of the surface of silica.** *J. phys. radium* [*8*], **5**, 150-2(1944).—*C.A.* **39**, 3191^5.

In a 0.5 *M* soln. of a mixt. of tartaric acid, and SbF_3, the velocity of mutarotation at 30°C, was detd. in the presence of transparent fused SiO_2 of known dimensions (430 cm^2), for fused SiO_2 pulverized in a metallic mortar washed with HCl, chromic acid mixt., and distd. H_2O, and carefully dried, for SiO_2 pptd. by HCl from a soln. of silicate obtained by alk. fusion of pure quartz, and for SiO_2 pptd. from SiF_4 by H_2O. The velocity was proportional to the surface of the SiO_2, and unknown surfaces could be calcd. from the slopes of the straight lines obtained by plotting log $(\alpha_\infty - \alpha_t)$, where α was the rotation, against time in hrs and verified microscopically and colorimetrically. The surface of the pptd. SiO_2 was considerably greater than that of the ground SiO_2 (1000 cm^2 per g), but varied with the mode of prepn. (fused quartz, 30, 800, pptd. quartz, 346,000 and 191,000 cm^2 per g).

12672. Bell, John W. **A method for the measurement of the surface of finely divided material.** *Trans. Can. Inst. Mining Met.* **47**, 424-36 (in *Can. Mining Met. Bull. No.* **391**) (1944).—*C.A.* **39**, 1090^9.

A simple app. was described which permitted detn. of amt. of solid to bring a pulp to a standard opacity from which total surface of particles could be calcd.

12673. Emmett, P.H. **Measurement of the surface of finely divided and porous materials by low-temperature adsorption isotherms.** *Colloid Chemistry, Theory and Methods* **5**, 434-43 (1944). —*C.A.* **38**, 2862^8.

The B.E.T. method was used to measure the surface area of metallic Fe, Ni and Cu catalysts, silica gel, Cr oxide gels, soils, powd. bacteria, carbon blacks, paint pigments, etc., and homogeneously sized glass beads.

12674. Gaudin, A.M. and Bowdish, F.W. **Surface measurement by van der Waals adsorption.** *Mining Technology A.I.M.M.E.* **8**, No. 3, 1-6 No. 1666 (1944).

Apparatus was described to det. the B.E.T. surface area. The specific surface of glass spheres, 12 microns in diam., was found to be 2160 cm^2/gm. A minus 400-mesh sample of quartz was found to have a surface of 3610 cm^2/gm.

12675. Harkins, William D. and Jura, George. **Surfaces of solids. XII. An absolute method for the determination of the area of a finely divided crystalline solid.** *J. Am. Chem. Soc.* **66**, 1362-6 (1944)—*C.A.* **38**, 5125^9.

An abs. method was developed for the detn. of the area of a solid covered with a film in equil. with the satd. vapor of liquid. The area was given by a relation based on the heat of emersion of the satd. powder in cals per g and the "total energy" of the surface of the liquid. The equation was valid only if the contact angle was zero. If the solid was a finely divided crystal, the area of the clean powder could be obtained from the area of the satd. powder by the relation $\Sigma = \Sigma'/(1 + \alpha(T/d))$ where Σ (very nearly equal to Σ') was the area of the clean powder, T the thickness of the film, and d the edge of the av. cube. The areas of two different samples of TiO_2 were detd. by this method. The areas found for these samples were 13.8 and 8.9 m^2/g, whereas the B.E.T. area was 13.9 and 9.6 m^2/g, resp., with 16.2 A^2 as the area of the N_2 mol.

12676. Harkins, William D. and Jura, George. **Surfaces of solids. XIII. A vapor-adsorption method for the determination of the area of a solid without the assumption of a molecular area, and the areas occupied by nitrogen and other molecules on the surface of a solid.** *J. Am. Chem. Soc.* **66**, 1366-73 (1944).—*C.A.* **38**, 5126^4.

A plot was made of log p against the reciprocal of the square of the vol. adsorbed. In general, a straight line was obtained over a considerable range. The area (S) of the solid was given by the equation $S = ks^{1/2}$, where s was the slope of the straight line and k a const. for a given adsorbed vapor at a given temp. The value of k for N_2 at -195.8°C was 4.06; water at 25°C, 3.83; n-butane at 0°C, 13.6, and n-heptane at 25°C, 16.9. The areas of anatase, $TiO_2 + Al_2O_3$, $ZrSiO_4$, $BaSO_4$ and SiO_2 were given. The criterion for the existence of a condensed film was that the equation $\pi = b - a/\sigma$ or log $(p/p_0) = B - A/v^2$, represented the data. If a condensed film was not formed, the temp. must be lowered until this two-dimensional phase appeared.

12677. Hawksley, P.G.W. **Particle-size measurement.** *Brit. Coal Utilization Research Assoc. Bull.* **8**, 245-57(1944).—*C.A.* **39**, 236^4.

Methods of particle size detn. were reviewed with particular regard to subsieve sizes of less than 76μ. Various methods have been developed to meet particular needs for relative rather than abs. size measurement. Attempts to obtain abs. dispersion were abandoned in favor of conditions under which the material was used. Concn. and mech. conditions affect the dispersion and, therefore, the apparent particle size particularly for sedimentation tests. The choice of method must be based largely on experience. Packed powders could be examd. by liquid- or air-permeability methods.

12678. HENGLEIN, F.A. **Particle sizes and the work of subdivision of substances in the three states of aggregation.** *Chem.-Ztg.* 68, 23-5 (1944).—*C.A.* 38, 5448^7.

The relation between useful work and the work of phys. subdivision was discussed and the following general law derived: $A = (O_n - O_v/V) \times \zeta$, in which A was the work of phys. subdivision per unit vol. of a substance, V the vol. of the substance to be subdivided, O_v the surface before the subdivision, O_n the surface after the subdivision, and ζ the specific surface energy (surface tension for liquids). The application of this to particles, drops and gas bubbles was worked out mathematically.

12679. KRIEGER, K.A. **Apparatus for surface-area measurement.** *Ind. Eng. Chem., Anal. Ed.* 16, 398-9 (1944).—*C.A.* 38, 4473^9.

The app. consisted of an absorbent vessel, gas buret with 4 bulbs, a mercury leveling flask, and a manometer.

12680. LIVINGSTON, H.K. **Cross-sectional areas of molecules adsorbed on solid surfaces.** *J. Am. Chem. Soc.* 66, 569-73 (1944).—*C.A.* 38, 2541^9.

Adsorption isotherms were measured both by the low-temp. N_2-adsorption volumetric technique and by the McBain-Bakr method, with vapors from substances that boil well above room temp. By comparison of the various isotherms, the cross-sectional area values for the adsorbed mols. (A^2 per mol.) were found to be H_2O, 10.6; PrOH, 20.0; heptane, 55.0, if N_2 was taken to be 15.4. These areas were in every case in good agreement with the mol. areas of the mols. as detd. from d., x-ray, or film-balance measurements. The finely-divided solids were TiO_2, SiO_2, $BaSO_4$, and graphite.

12681. MAGGS, F.A.P. **The absolute evaluation of surface areas of solid materials.** *Proc. Conf. Ultra-fine Structure of Coals and Cokes, Brit. Coal Utilisation Research Assoc.* 1944, 95-109.—*C.A.* 39, 1266^8.

The adsorbents included 2 samples of weakly caking Northumberland coal, a sample of this coal extd. with MeOH, a long-flame, free-burning Warwickshire coal, and a finely divided, artificial graphite. Except for η-hexane on one Northumberland sample, adsorption isotherms for MeOH were detd. on all samples. All measurements were made at 25°C by a volumetric method. The graphs showed no linear portion and hence the surface area could not be evaluated with certainty. Plots of p/p_o vs. $p/s\ (p_o - p)$ showed a linear relation for MeOH adsorption on 3 coals, a slight curve for η-hexane on Northumberland coal, and an *s*-shaped curve for MeOH on graphite.

12682. SHAW, T.M. **The surface area of crystalline egg albumin.** *J. Chem. Phys.* 12, 391-2 (1944).—*C.A.* 38, 6153^4.

With N_2 at -183°C, the surface area of egg albumin was found to be 2.42 m^2/g; with H_2O vapor at 25°C, it was found to be 210-220 m^2/g the difference between the heat of adsorption in the first adsorbed layer E_1 and the heat of liquefaction E_L was 648 cal/mol. for N_2 and 1100 cal/mol. for H_2O. These areas were equiv. to particles of egg albumin contg. 10^8 mols., calcd. from N_2 adsorption, or 100 mols calcd. from H_2O adsorption. Where the area desired was that of the organized crystallite, it must first be detd. that the adsorbate could not penetrate the mol. lattice.

12683. BEEBE, RALPH A.; BECHWITH, JOHN B., AND HONIG, JURGEN M. **Determination of small surface areas by krypton adsorption at low temperatures.** *J. Am. Chem. Soc.* 67, 1554-8 (1945).—*C.A.* 39, 5149^8.

The B.E.T. method was applied with sucess to the measurement of specific surface areas in solids as low as 0.04 m^2/g with Kr vapor at liquid-N_2 temps. The use of Kr had the advantage of low satn. pressure (approx. 2 mm) at the conveniently obtainable liquid-N_2 temp. By use of an anatase (TiO_2) sample of known area, the value of the area occupied by the Kr atom in the monolayer was 19.5 ± 0.4 A^2. This was considerably higher than predicted on the assumption that the Kr atoms in the monolayer formed a close-packed liquid monolayer.

12684. CASSEL, HANS M. **The possibility of estimating the average surface area of solid particles.** *J. Chem. Phys.* 13, 249 (1945).—*C.A.* 39, 3991^9.

Difficulties in the exptl. detn. of the surface area of cryst. powders by heat of wetting techniques was discussed.

12685. DAMERELL, V.R.; GAYER, K., AND LAUDENSLAGER, H. **Effect of surface-active agents on dispersions of silica in xylene.** *J. Phys. Chem.* 49, 436-42(1945).—*C.A.* 40, 2374^5.

Silica was dispersed in xylene in the presence of 16 surface-active materials and the particle-size distribution was detd. by sedimentary analysis. The surface area detd. by the B.E.T. method was 118 m^2/g. Silica was positively charged in xylene suspension and was coagulated by the addn. of H_2O, alc., acetone, and ether. Heating also produced coagulation. Increasing the stirring time substantially increased the percentage of intermediate-size particles, but did not greatly affect the percentage of colloidal material; increasing the concn. of surface-active agent resulted in a greater degree of dispersion.

12686. DAVIES, W. AND REES, W.J. **The specific surface and grain-shape of silica sands used for glassmaking.** *J. Soc. Glass Tech.* 29, 279-88(1945).—*C.A.* 40, 2949^4.

Methods for detg. the specific surface and shape of sand grains were reviewed. The permeability of a vertical bed of sieved sizes of sand grains was detd. in a gas train equipped with manometers and a flowmeter. Grain shape varied with grain size and the variation was dependent in large measure on the mode of origin of the sand. The coeff. of angularity based on the sphere as unity ranged between 1.03 and 1.17 for some unconsolidated sands and between 1.18 and 1.29 for sands obtained by crushing sandstones.

12687. Elkin, P.B.; Shull, C.G., and Roess, L.C. **Silica-alumina gels. Specific surface and particle-size distribution.** *Ind. Eng. Chem.* 37, 327-31 (1945).—*C.A.* 39, 2241^{6}.

Silica-alumina gels of various compns. were made by 3 methods: (1) pptn. of alumina from $AlCl_3$ in the presence of a dil. slurry of silica gel; (2) mixing wet alumina gel with wet silica gel; and (3) impregnating partially dried silica gel with $Al(NO_3)_3$ and drying. The sp. surfaces of the gels were detd. by the B.E.T. method and the particle-size distributions were detd. by small-angle x-ray scattering. Sp. surfaces calcd. from particle-size data were found to change uniformly with area values from adsorption but were always higher.

12688. Emmett, Paul H. **Gas adsorption methods for measuring surface area of adsorbents.** *Ind. Eng. Chem.* 37, 639-44(1945).—*C.A.* 39, 3989^{1}.

Methods of measuring surface areas by gas adsorption could be subdivided into 2 groups. The first postulated the existence of multilayers of physically adsorbed gas and made use of adsorption isotherms of gases near their b. ps. The second assumed that the adsorption was a combination of unimol. phys. adsorption and capillary condensation. The use of low-temp. adsorption of some gas such as N_2 near the b.p. was capable of yielding reliable values for the surface areas of porous and finely divided materials or even of materials that have relatively small surface areas.

12689. Harkins, William D. and Jura, George. **An absolute method for the determination of the area of a fine crystalline powder.** *J. Chem. Phys.* 13, 449-50(1945).—*C.A.* 40, 264^{1}.

12690. Joyner, Leslie G.; Weinberger, Edward B., and Montgomery, C.W. **Surface-area measurements of activated carbon, silica gel, and other adsorbents.** *J. Am. Chem. Soc.* 67, 2182-8 (1945). —*C.A.* 40, 1376^{1}.

The adsorption and desorption isotherms for N_2 at -195°C for 2 Al silicates, six activated carbons, and a silica gel were detd. These isotherms had values of *n* (see B.E.T. theory) ranging between 1.15 and 4.2. The isotherms for *n*-butane at 0°C for one of the Al silicates and the silica gel were also detd. When the isotherm corresponded to a value of *n* greater than about 3, both the B.E.T. free surface equation and the Harkins and Jura equation were applicable. For isotherms with *n* less than 3, only the complete B.E.T. equation yielded results that agreed with the exptl. data to a reasonable extent.

12691. Kiselev, A.V. **New adsorption methods for determining the surface area of adsorbents.** *Uspekhi Khim.* 14, 367-94(1945).—*C.A.* 40, 3036^{3}.

Detailed reviews were presented of the heat-of-wetting and the gas-adsorption methods for detn. of the specific area of nonporous adsorbents. A general thermodynamic treatment of capillary condensation and formation of surface films was given. Results on the same materials usually agreed to better than 15%.

12692. Langille, R.C.; Braid, P.E., and Kenrick, F.B. **A comparison of two methods for determining the surface area of a powder.** *Can. J. Research* 23B, 31-9 (1945).

The surface area of Ba crown glass powder (between 230 and 270 mesh) was detd. by (a) comparison of adsorption of methylene blue on the powder and on large measurable broken surfaces, (b) measurement of the projection areas of randomly oriented particles. Averaged results were 682 cm^2 per g by the first method and 568 cm^2 per g by the second method. The methylene blue was found to be Zn-free and was made up in a pH 7 buffer soln. The mixt. of dye and powdered glass were sepd. in a centrifuge.

12693. Maggs, F.A.P. **Assessment of specific surface of powders and porous solids by adsorption methods.** *Brit. Coal Utilisation Research Assoc. Bull.* 9, 253-61(1945).—*C.A.* 40, 264^{2}.

12694. Ries, Herman E. Jr; Van Nordstrand, Robert A., and Teter, John W. **Surface area of catalysts. Effect of sintering on area and structure of a supported catalyst and its components.** *Ind. Eng. Chem.* 37, 310-17(1945).—*C.A.* 39, 2248^{4}.

Low-temp. N_2 adsorption isotherms were used to follow area changes of a supported pelletized catalyst after heating for various periods at 340-650°C. B.E.T. areas indicated losses in area due to sintering of as much as 75%. The area of the supported catalyst was considerably greater than that of either the unsupported material or the support. Adsorption-desorption isotherms were presented and hysteresis effects considered.

12695. Sharratt, E.; Van Someren, E.H.S., and Rollason, E.C. **A rapid optical method for estimating the specific surface of powders.** *J. Soc. Chem. Ind.* 64, 73-5(1945).—*C.A.* 39, 3476^{5}.

Surface areas of fine powders were detd. by observing the optical d. of their dil. suspensions. the method was adapted to routine testing of opaque powders between 2.5 and 150 μ. Transparent powders gave low results, but the method was suitable for comparison. No knowledge of the sp. gr. of the powder was necessary. The method was suitable for mixed powders and could also be used to test the dispersing powers of different deflocculants.

12696. Thiessen, P.A. **The absolute surface of finely divided materials.** *Naturwissenschaften* 32, 158-9(1945).—*C.A.* 40, 2055^{5}.

The surface area of a fine dispersion was detd. by adsorbing on it ultramicroscopically visible particles of a second test colloid like Au sol. The no. of test particles adsorbed was then counted microscopically.

12697. Arnell, J.C. **Permeability. I. Surface-area measurements using a modified Kozeny equation.** *Can. J. Research* 24A, 103-16 (1946). —*C.A.* 42, 807*i*.

12698. Bobrov, F.F. **Theory of specific surface in technology of paper making.** *Bumazhnaya Prom.* 21, No. 5/6, 5-9 (1946).—*C.A.* 41, 2575*c*.

The surface area of either stock or paper was the ratio of the total surface area of the fibers to their wt. If *n* was the wt of a quantity of matter, *i* the no. of particles in this wt, *m* the wt of one particle, and *f* the surface area of one particle, then $n = im$ and $F = if$, where F was the total surface area. The sp. surface area $f_o = F/n = f/m$. Dry pulp (1 g) consisting of fibers 2.55 mm long and 0.0445 mm thick had a calcd. f_o of 466 cm^2/g. Similar fibers 2.4 mm long and 0.038 mm thick had 630 cm^2/g.

12699. BOER, J.H. DE. **The determination of surface areas by adsorption methods.** *Rec. trav. chim.* 65, 576-9(1946)(in English).—*C.A.* 41, 1908*a*.

Adsorption isotherms for I_2 on $BaCl_2$ or CaF_2 layers sublimed on glass walls had the sigmoid shape assocd. with the multilayer adsorption theory of Brunauer, Emmett, and Teller. The data agreed with the theory at relative pressures from 0.05 to 0.35, but surface areas calcd. from the theory were lower than the true surface areas by a factor of 2 to 4. The true areas were detd. by the surface action of alizarin or by measuring the chemisorption of H_2O. The sigmoid form of the isotherm was not a proof of the multimol. character of the adsorption.

12700. BREGER, A. KH. AND ZHUKHOVITSKIĬ, A.A. **The superficial density of specific heat.** *J. Phys. Chem.* (U.S.S.R.) 20, 1459-70 (1946).—*C.A.* 41, 3359*e*.

By taking into account the presence of the surface area, the sp. heat of a solid at low temps. consisted of two parts, a bulk term that was proportional to the vol. and to the cube of the abs. temp., and a second term that is proportional to the surface area and to the square of the abs. temp. The energy of thermal vibration of a solid with proper boundary conditions was calcd. for both the two-dimensional and three-dimensional problems. The predicted effect of the surface area on the sp. heat should be easily capable of verification even if materials having relatively low surface areas (e.g., 12.5 m^2/g) were used.

12701. BUGGE, P.E.; KERLOGUE, R.H., AND WESTWICK, F. **Surface-area determination.** *Nature* 158, 28 (1946).—*C.A.* 40, 5616^9.

In the detn. of surface area by the B.E.T. method, it was usual to det. the dead space on each sample with He. For routine detns. on substances known to give S-shaped isotherms, the dead-space detn. was avoided by the use of a math. formula. For carbons, chalks, Paris white, clay, and asbestos, the calcd. area per g was slightly below that obtained by dead-space detn.

12702. CASSEL, HANS M. **Estimation of the surface area of solid particles.** *J. Chem. Phys.* 14, 217(1946).—*C.A.* 40, 3324^2.

Difficulties in the detn. of the surface areas of solids were discussed.

12703. DERYAGIN, B. **Measurement of the specific surface of porous and disperse bodies by their resistance to the flow of rarefied gases.** *Compt. rend. acad. Sci. U.R.S.S.* 53, 623-6(1946) (in English).—*C.A.* 41, 2626*h*.

Knudsen flow through a porous diaphragm was calcd. and from the conclusions it was possible to compute the specific surface.

12704. D'EUSTACHIO, D. **Note on thickness of quartz wafers for observed surface phenomena.** *Phys. Rev.* 70, 229 (1946).—*C.A.* 40, 6315^4.

The thickness of the wafers used was ~ 10 μ, instead of the 25-30 μ previously reported.

12705. FRITH, F. AND MOTT, R.A. **A rapid method for the determination of the specific surface and mean particle size of black powders.** *J. Soc. Chem. Ind.* 65, 81-7(1946).—*C.A.* 40, 4582^1.

The tinting-strength test was standardized so as to obtain complete dispersion of carbon blacks down to a size of 50 mu or less. Standardization of the test was possible with carbon blacks whose size (within the range of 300 to 30 mμ) was detd. by the electron microscope. The relation between surface area and mean particle size for particles (spherical, cubic, or even slightly prismatic) showed that the method could be used to assess mean specific surface or mean particle size for black powders below 50 μ (0.050 mm or 240 B.S. mesh).

12706. GAUDIN, A.M. AND PRELLER, GUSTAV S. **Surface area of flotation concentrates and the thickness of collector coatings.** *Am. Inst. Mining Met. Engr., Mining Technol.* 10, No. 3, *Tech. Pub.* No. 2002, 9 pp. (1946).—*C.A.* 40, 4007^6.

Specific surface areas of concentrates from 6 large plants were measured by the gas-adsorption method. From these data and the quantity of collector used at each mill, the concentrate surface available for each ion of collector was calcd. in order to find out what could be expected as far as the packing of these ions on the mineral surface was concerned. The results indicated that the collector coating was an incomplete monoionic layer, and the recovery was higher the denser the packing in the monolayer.

12707. HEINEMANN, HEINZ; KRIEGER, K.A., AND McCARTER, W.S.W. **Some physical properties of activated bauxite.** *Ind. Eng. Chem.* 38, 839-42 (1946).—*C.A.* 40, 5316^6.

Data were presented on bulk, apparent, and true ds., void and pore vols., percentage voids and pores, surface areas, and equiv. pore diams. for Arkansas and South American bauxites, a synthetic alumina, and silica gel. The changes of these phys. properties with increasing activation temp. investigated were interpreted. The apparent d. was detd. by Hg displacement, the true d. by He displacement, and the surface area by the B.E.T. method. Bulk d., void vol., and percentage voids depended on granule size distribution. The other properties were independent of granule size, but were altered by changes in structure of the adsorbents produced by increasing activation temps.

12708. HOLMES, W.R. **Flow of gases through fine powders and the measurement of specific surface.** *Nature* 157, 694 (1946).—*C.A.* 40, 5317^5.

If the voids were much narrower than the mean free path, the flow ceased to be governed by the viscosity of the gas and became a process of diffusion. The mass flow per unit area per unit time was given by $Q = -(8/3)(2M/\pi RT)^{0.5}[\epsilon^2/S(1-\epsilon)\rho](dp/dx)$, where the mean free path, $\lambda = 4\epsilon/[S(1-\epsilon)\rho]$, was detd. by the dimensions of the voids. The sp. surface of a powder could be calcd. from permeability measurements made at a suitable gas pressure.

12709. Keyes, William F. **Determination of specific surfaces by permeability measurements.** *Ind. Eng. Chem., Anal. Ed.* 18, 33-4 (1946).—*C.A.* 40, 1377^2.

The effect of varying porosity on air permeability of powder was investigated. The relation between permeability K, specific surface S_o, and porosity ϵ, could be expressed by the following modification of Kozeny's equation: $K = \{g(1 + a)/5\eta S_o^2\}\{(\epsilon - [a/(1 + a)])^3/(1 - \epsilon)^2\}$. For ground limestone, quartz and portland cement $a/(1 + a)$ was found to be about 0.11.

12710. Kiselev, A.V. and Krasil'nikov, K.G. **Specific area and heat of wetting of asbestos fiber.** *J. Applied Chem.* (U.S.S.R.) 19, 316-21 (1946).—*C.A.* 40, 6966^3.

The specific area of dry asbestos fiber, measured by adsorption of butyl alc. or butyric acid from CCl_4 soln., was 2.10×10^5 cm²/g, as compared with an external fiber surface area of 460 cm²/g measured by the microscope. The integral molar heat of wetting of dry, out-gassed (by evacuation) material was 10.3 ± 0.1 kcal/mol.

12711. Pechukas, Alphonse and Gage, F.W. **Rapid method for determining specific surface of fine particles.** *Ind. Eng. Chem., Anal. Ed.* 18, 370-3 (1946).—*C.A.* 40, 6268^9.

The surface areas of pigments (0.1-1.0 μ diam.) were detd. by a modified air-permeability method. The effect of variable porosities on the detn. were minimized by the use of a simplified equation: $K_3^2/d_m^2 = t/Q_2$, where K was a const. that was a function of the gas used (air), the pressure drop across the pigment plug, the thickness and cross-sectional area of the plug, and the d. of the pigment. The mean diam. of the pigment particles was d_m; Q_2 was the vol. of air flowing through the plug in time t. Curves of t/Q_2 vs K_3^2 for various values of d_m made rapid detns. of d_m possible.

12712. Ries, Herman E. Jr; Johnson, Marvin F.L., and Melik, John S. **Nitrogen and stearic acid adsorption by supported and unsupported catalysts.** *J. Chem. Phys.* 14, 465-6(1946).—*C.A.* 40, 5317^1.

Unsupported catalysts and catalysts supported on diatomaceous earth and on TiO_2 were studied. The catalyst pptd. in the absence of diatomaceous earth formed finely divided essentially nonporous particles, whereas the catalyst pptd. in the presence of low-area diatomaceous support developed a small pore structure of much greater area.

12713. Rigden, P.J. **Flow of gases through fine powders and the measurement of specific surface.** *Nature* 157, 694(1946).—*C.A.* 40, 5317^6.

A formula similar to that of Holmes was derived. Such a formula was valid only if the diam. of all the pores in the bed of powder was considerably less than the mean free path. At atm. pressure, only powders as fine as carbon black of 50 m²/g would meet this requirement.

12714. Russell, Allen S. and Stokes, John J. Jr. **Surface area in dehydrocyclization catalysis.** *Ind. Eng. Chem.* 38, 1071-4 (1946).—*C.A.* 40, 6945^9.

Activated aluminas were impregnated with varying quantities of MoO_3, and their catalytic activities were detd. for dehydrocyclization of heptane to toluene at atm. pressure. Surface areas were detd. by the sorption of C_4H_{10} at 0°C and results expressed as millimol. C_4H_{10}/g activated alumina. The standard catalyst was activated alumina of area 0.38 impregnated to an at. ratio of 0.05 Mo:1 Al. Comparison of the calcd. molybdena area with the exptl. value for max. catalytic activities showed that the alumina surface was covered with a monolayer of molybdena at max. catalytic activities.

12715. Skolnik, Sol; Tarbutton, Grady, and Bergman, W.E. **Particle size and surface area of red phosphorus as functions of the percentage conversion.** *J. Am. Chem. Soc.* 68, 2310-14 (1946).—*C.A.* 41, 639*i*.

In connection with the prepn. of red P by the partial conversion of liquid white P at its b.p., the particle-size distribution and specific surface of the red P were studied as functions of the degree of conversion in the range 6 to 60%. The sp. surface, as measured by the gas-adsorption method with propane at -78.6°C as the adsorbate, was a linear function of the reciprocal of the percentage compn. Application of the adsorption data to calcn. of particle sizes yielded values significantly smaller than those measured by sedimentation. Also, the existence of well-defined hysteresis loops in the adsorption data at high relative pressures were consistent with the hypothesis that the particles of red P were porous.

12716. Smith, Hilton A. and Fuzek, John F. **Adsorption of fatty acids on nickel and platinum catalysts.** *J. Am. Chem. Soc.* 68, 229-31 (1946).—*C.A.* 40, 2724^1.

The surface area of Raney Ni was detd. by adsorption of capric, lauric, palmitic, nonadecylic, and behenic acids; of palmitic acid from solns. of methanol, acetone, heptane, benzene, cyclohexane, and cyclohexene; and for the adsorption of these fatty acids as compared with other methods of detg. surface areas. The results with Pt indicated that the adsorption method could be used to calc. the specific surface of this catalyst. Values ranged from 50 to 75 m² per g depending on the individual prepn., as well as on the conditions of reduction of the oxide. The adsorption of fatty acids gave the same results for Raney Ni, using acids varying from 10 to 22 C atoms. These results also agreed with those found by the N_2-adsorption method. The assumption of the cross-sectional area occupied by a fatty acid chain was probably better than the assumptions made concerning the cross-sectional area of the N_2.

12717. Sutherland, K.L. **The surface area of fine powders.** *Australian J. Sci.* 8, 155-9 (1946).—*C.A.* 41, 20*h*.

12718. Zimens, Karl E. **Surface exchange of solids and the determination of surface area.** *Arkiv Kemi, Mineral. Geol.* A21, No. 17, 26 pp. (1946) (in German).—*C.A.* 41, 895*h*.

The limitations of Paneth's method were discussed. The results of previous workers with Pb and Ag salts were tabulated and the conditions were given for which Paneth's equation could be operative. There must be no marked exchange with the inner crystal, and all the atoms lying in the phase boundary must undergo exchange.

12719. ANDERSON, ROBERT B.; HALL, W. KEITH; HEWLETT, HARLAN, AND SELIGMAN, BERNARD. **The Fischer-Tropsch synthesis. II. Properties of unreduced cobalt catalysts.** *J. Am. Chem. Soc.* 69, 3114-19(1947).—*C.A.* 42, 2739*g*.

Surface area and pore vol. were studied on two types of unreduced Co Fischer-Tropsch catalysts, prepd. with and without promoters and kieselguhr. The pptd. catalysts were of the type Co: thoria: kieselguhr (100:18:100) and Co: thoria:magnesia: kieselguhr (100:6:12:200). The surface areas of the unreduced catalysts of the latter type contg. kieselguhr ranged from 58.6 to 149.6 m^2/g whereas that of the kieselguhr ranged from 1.9 to 37.3 m^2/g. Pelleting decreased the surface area 10 to 20%. Av. pore diams. varied from 500 to 770 A. (granular) and 165 to 310 A. (pelleted). Catalysts prepd. in small batches had fairly reproducible surface areas.

12720. ARNELL, J.C. **Permeability. II. Surface-area measurements of inorganic pigment powders.** *Can. J. Research* 25A, 191-209(1947).—*C.A.* 42, 808*a*.

Permeability data for carefully packed beds of powd. SiO_2, Fe_2O_3, and Cr_2O_3, and of 2 com. pigments were used to calc. the surface areas, shape factors, and pore radii, by use of the modified Kozeny equation. The results obtained with different beds of the same powder were found to be consistent within ± 10%. The greatest error in the method appeared to lie in the difficulty of packing the bed in exactly the same way in repeat runs. The one powder with which no consistent results could be obtained was hydrated Cr_2O_3.

12721. BALMA-PERRIOR, FRANCOISE AND DARMOIS, EUGÈNE. **The measurement of the specific surface of silica powders.** *Compt. rend.* 224, 1562-4(1947).—*C.A.* 41, 6107*e*.

The detn. of the sp. surface of powd. silica was based on the speed of mutarotation of a contacted aq. soln. of tartaric acid and SbF_3. It was applied to fused SiO_2 rods, powd. SiO_2 prepd. from SiO_2 rods, and pptd. SiO_2 prepd. either from SiF_2 and H_2O, or from Na_2SiO_3 and HCl. The powd. SiO_2 gave a value of 1000 cm^2/g, compared with 1300 by microscopic examn., and 800 by adsorption of Diamond Magenta dye. The surface area of pptd. silica fell from 6.1 to 0.3×10^5 cm^2/g for one prepn. as the temp. increased from 280° to 1270°C.

12722. BERING, B.P. AND SERPINSKIĬ, V.V. **Method of measuring adsorption of gases and vapors by solids.** *Compt. rend. acad. sci. U.R.S.S.* 55, 731-4(1947)(in English).—*C.A.* 41, 6791*b*.

By use of a McBain-type balance with a sensitivity of the order of 10^{-5} g, with an adsorbent wt of about 50 g and a mol. wt of the adsorbate of 30 to 100, the sensitivity of the method was 10^{-6} millimoles/g. The method was suitable for studying the low-pressure region of the adsorption isotherm, in the investigation of adsorption of gaseous mixts. and adsorbents of small sp. surface, and in measuring differential heats of adsorption.

12723. BROWN, CALLAWAY AND UHLIG, HERBERT H. **Surface area of chrome-plated nickel.** *J. Am. Chem. Soc.* 69, 462-4(1947).—*C.A.* 41, 3380*g*.

A large ratio of accessible to apparent area existed for electrodeposited Cr and the magnitude of the accessible area was sensitive to the previous history of the surface. Results were given for samples etched with warm 1.5 *N* HCl until H_2 was evolved over all the surface. Typical data for the ratio of plated and plated-etched samples were: 15, 27; 12, 9.4; 53.

12724. BUGGE, P.E. AND KERLOGUE, R.H. **The determination of the surface area of powders by means of low-termperature adsorption iostherms.** *J. Soc. Chem. Ind.* (London) 66, 377-81(1947).—*C.A.* 42, 2836*d*.

The "deadspace" detn. was eliminated for routine procedure where the substance was known to give an S-shaped isotherm. The degree of vacuum obtained by a rotary oil pump (10^{-2} to 10^{-3} mm) was sufficient. The following areas m^2/g were given: Carbon A, 790; Carbon B, 847; Carbon C, 814; Carbon D, 460; Carbon E, 280; Chalk A, 30; Chalk B, 19; Paris white, 2; Clay, 10; Asbestos, 18.

12725. GAPON, E.N. **Electrochemical method for determining the surface of adsorbents and colloids.** *Kolloid. Zhur.* 9, No. 1, 29-36(1947).—*C.A.* 41, 4350*h*.

The cation adsorption by soils was given by: $S = \alpha + \beta$ pH $- \gamma$ pM, where α, β and γ were const. and pM was the neg. log of cation concn. in the soln. From thermodynamic considerations the following relations was derived $\gamma = 1/n\ \beta$, where n was the valency of the cation. The equation thus became $S = \alpha + \beta\ [\text{pH} - (1/n).\text{pM}]$. $\beta = 2.303.$ $pCRT/F^2$, where p was the area of adsorbent, C was the capacity of the elec. double layer, F was the Faraday const., and R was the gas const. The equation was used to det. the surface area of adsorbents.

12726. GAPON, E.N. **Specific surface area of soil humus.** *Kolloid. Zhur.* 9, 329-34(1947).—*C.A.* 43, 7617*g*.

If S = the amt. of cation adsorbed and x = pH, the const. β in the equation $S = \alpha + \beta x$ was proportional to the surface area of the adsorbent. If the adsorbent was a mixt. of several substances, this term was the sum of the β values of the components. Humus in soil had a smaller (3-30 times) adsorbing surface than humic acid. Usual soil humus had a surface of 1900 m^2/g.

12727. GREGG, S.J. **Adsorption and heat-of-wetting methods of measuring surface area.** *Soc. Chem. Ind.* (London), *Roads and Bldg. Materials Group*, Advance copy, Feb. 4, 1947, 27-33.—*C.A.* 41, 5374*d*.

The exptl. methods and the comparative advantages of detg. a surface area by the adsorption of gases, adsorption of solutes from soln., and heat of wetting were discussed.

12728. OWEN, J.R. **Correlation of surface area and dehydrogenation activity for a chromia-**

alumina catalyst. *J. Am. Chem. Soc.* 69, 2559-60(1947).—*C.A.* 42, 442*b*.

In the dehydrogenation of butane, the data showed a definite correlation between surface area and dehydrogenation activity for the CrO_3-Al_2O_3 catalyst.

12729. RIGDEN, P.J. **The specific surface of powders. A modification of the theory of the air-permeability method.** *J. Soc. Chem. Ind.* 66, 130-6(1947).—*C.A.* 41, 6107*g*.

By correcting the equation for slip of air at the walls good agreements were obtained between air and water, acetone and *n*-hexane on surfaces between 0.4 and 5 m^2/g. The av. of 5 sp.-surface detns. on a portland cement gave a value of 0.395 with air compared with 0.390 using acetone and 0.399 using *n*-hexane.

12730. SCHOFIELD, R. KENWORTHY. **Calculation of surface areas from measurements of negative adsorption.** *Nature* 160, 408-10(1947).—*C.A.* 42, 17*i*.

An equation for the calcn. of neg. adsorption was derived. When applied to anions of Na salts in aq. Na bentonite, the surface area per 100 g of bentonite was 4.7×10^8 cm^2, whereas a "complete dispersion" of 100 g of pure montmorillonite should have a surface area of 8×10^8 cm^2. Jute fiber was found to have a surface area of 8×10^8 cm^2 per 100 g of dry fiber.

12731. TOVAREV, V.V. **Apparatus for determination of the surface area of cement by air permeability.** *Tsement* 13, No. 3, 15-19(1947).

12732. TOVAREV, V.V.; GINSBURG, YU. N., AND MASSIL'ON, T.K. **Determination of the specific surface area of cements by means of a pneumatic surface-meter.** *Tsement* 13, No. 7, 12-17 (1947).—*C.A.* 43, 1937*f*.

The instrument proved suitable for plant lab. use. The specific surface of samples from various cement mills was 2100-3900 cm^2 per g. The residue on the screen having 4900 mesh per cm was 2-18%. There was a definite relation between the residue on the screen and the specific surface area for the same clinker ground to various degrees of fineness; where cements from different clinkers were tested, this relation was no longer const.

12733. ZETTLEMOYER, A.C. AND WALKER, W.C. **Active magnesia. Surface areas and pore structures from nitrogen adsorption.** *Ind. Eng. Chem.* 39, 69-74(1947).—*C.A.* 41, 1140*a*.

The B. E. T. surface areas of 7 samples of com. MgO were detd. ranging from 0.8 to 200 m^2 per g; areas detd. by iodine adsorption from CCl_4 soln. were about 35% lower. In the relative-pres. range 0.3 to 0.5, the N_2 adsorption exceeded by a few percent that predicted by the B. E. T. theory. From the Kelvin equation and the N_2 adsorption isotherms, the approx. diam. of the holes was estd. to be about 50 A. Two electron photomicrographs were interpreted as confirming the plate structure.

12734. ZETTLEMOYER, A.C. AND WALKER, W.C. **Active magnesia. III.** *J. Phys. & Colloid Chem.* 31, 763-7(1947).—*C.A.* 41, 4992*a*.

The particle sizes of a no. of activated magnesias were measured by x-ray line broadening and found to vary from 53.4 to 120 A.; one inactive grade gave a particle size of 374 A. The cell const. increased with a decrease in particle size from 4.201 A. for the inactive grade to 4.211 for the sample with a particle size of 53.4 A. The surface areas calcd. from the x-ray results agreed with those measured by N_2 adsorption for samples having areas of about 300 m^2/g.

12735. ZHURAVLEV, V.F. AND SYCHEV, M.M. **Determination of the specific surface area of cement by the method of P. C. Carman.** *J. Applied Chem.* (U.S.S.R.) 20, 171-8(1947)(in Russian).—*C.A.* 42, 1717*b*.

The method of Carman was somewhat modified by using air over pressure instead of rarefaction. True sp. areas were obtained by calibration with cement powder of known granulometric compn., previously detd. by the sedimentation method.

12736. ANDERSON, R.B. AND EMMETT, P.H. **Measurement of carbon black particles by the electron microscope and low-temperature nitrogen adsorption isotherms.** *J. Applied Phys.* 19, 367-73(1948).—*C.A.* 42, 6602*g*.

Electron micrographs and N_2 adsorption isotherms were compared on 6 com. carbon blacks as methods for detg. particle size and surface areas of finely divided materials. Good agreement (within 4%) was obtained between the 2 procedures for 4 of the 6 blacks: Grade 6, P 33, acetylene black, and lampblack.

12737. ARNELL, J.C. AND HENNEBERRY, G.O. **Permeability studies. III. Surface-area measurements of carbon blacks.** *Can. J. Research* 26A, 29-38 (1948).—*C.A.* 42, 5743*a*.

Surface areas of 12 com. carbon blacks were detd. by application of a modified Kozeny equation, and were found to range from 42 to 428 m^2/ml. In each case the results were compared with those obtained by electron microscopy or from N_2 adsorption as calcd. by the B.E.T. or Harkins-Jura methods. Surface areas obtained by any of the methods were probably subject to an error of about 10% when applied to carbon blacks.

12738. CARMAN, P.C. AND ARNELL, J.C. **Surface-area measurements of fine powders using modified permeability equations.** *Can. J. Research* 26A, 128-36(1948).—*C.A.* 42, 8573*b*.

Several modified Kozeny equations for measuring the specific surface of fine powders by gas-permeability methods were compared. Permeability data for powd. quartz, inorg. pigments, cements, carbon black, and other materials were used in the calcns. The equations gave very similar surface-area values for a set of data.

12739. DERYAGIN, B.; DRIDLYAND, R., AND KRYLOVA, V. **New method of measurement of the specific surface area of porous bodies and of powders.** *Doklady Akad. Nauk S.S.S.R.* 61, 653-6(1948).—*C.A.* 43, 18*f*.

The surface area S (cm^2/ml) was detd. from the rate of flow Q (ml/sec) of a gas of mol. wt M across unit cross-section of the body of porosity δ, under a pressure gradient dp/dx, in the low-pressure range of Knudsen flow. *Q* was actually proportional to Δp for ZnO powder up to about 120 ml/sec for exit pressure below 0.3 cm. Measurements on adsorbents gave the values (m^2/g): corundum powder 1.20, ZnO 2.6, $BaSO_4$ 9.5, heavy soil 0.94, silica gel 14.2, cement 0.64. The B.E.T. method gave fair agreement with the Knudsen-flow method for the nonporous corundum (1.17) and ZnO (2.7), but much too high values for porous substances (soil 3.9, silica gel 56.0, cement 1.9).

12740. Granquist, W.T. and Amero, R.C. **Low-temperature nitrogen-adsorption studies on attapulgite (floridin).** *J. Am. Chem. Soc.* 70, 3265-70(1948).— *C.A.* 43, 2840*b*.

A gradual decrease in surface area and increase in pore vol. with activation temp. from 400° to 700°C were followed by abrupt decrease of both properties at higher temps. Structure calcns., based on the Kelvin equation, resulted in curves showing the distribution of pore vol. over a large range of pore radii. Radius values taken from the max. of these curves showed increase with activation temp., and were of the same magnitude and varied in the same order as the "geometrical" av. pore radius based on twice the pore vol. surface area.

12741. Hahn, Otto. **The use of radioactive methods for the determination of surface areas and changes in surfaces.** *Festskr, J. Arvid Hedvall's* 1948, 227-30 (in German).— *C.A.* 42, 5761*a*.

The importance of Hedvall's early work for later radioactive research was emphasized.

12742. Kiselev. A.V. and Mikos, N.N. **Determination of the surface area of adsorbed films on porous adsorbents.** *Zhur. Fiz. Khim.* 22, 1043-57(1948).— *C.A.* 43, 460*h*.

The equation was based on the assumption that the adsorption in the hysteresis region was capillary condensation. For coarse pores, the area of the adsorbed film was nearly equal to the area of the adsorbent calcd. by the B.E.T. method. Adsorbents with fine pores gave values smaller than the areas of the adsorbent.

12743. Lafitte, M. and Reis, T. **Gas adsorption apparatus.** *Rev. inst. franc. petrole et Ann. combustibles liquides* 3, 285-92(1948).— *C.A.* 43, 2474*f*.

A precise, yet rugged and flexible adsorption unit was described for the detn. of surfaces and related parameters of porous solids. The theoretical principles and method of operation of the instrument were discussed.

12744. May, D.R. and Kolthoff, I.M. **The aging of precipitates and coprecipitation. XL. The solubility of lead chromate as a function of the particle size.** *J. Phys. & Colloid Chem.* 52, 836-54(1948).— *C.A.* 42, 6607*f*.

A true detn. of the increase of soly. was obtained by measuring ion concns., chromate by amperometric titration and Pb and chromate also polarographically. 0.1 *M* $HClO_4$ was used as solvent in the expts. and specific-surface measurements were made by the wool violet adsorption method. Fresh (very small particle) and aged chromate of Pb were studied. The former had about a 70% greater soly. than the latter. At 25°C aging of the fresh product (prepd. from K chromate and Pb nitrate) occurred rapidly, normal soly. being found after 20 min. The fresh Pb chromate had a specific surface of 5.6 m^2 per g (particle radius 0.086μ). After aging 20 min. at 25°C in the acid the surface decreased to 1.7 m^2 per g (radius 0.28μ).

12745. Mennessier, André and Boucher, Raymond. **Measurement of the specific surface of an adsorbent or of a catalyst accessible to gaseous molecules.** *Compt. rend.* 226, 1448-9(1948).— *C.A.* 42, 5319*c*.

Measurements of the B.E.T. surface area of adsorbents using mols of different shapes and sizes presented a method for estg. the area of small fissures in a catalyst. The surface area of a specimen of active carbon was detd. at 20°C by use of methylisobutyrate, 1, 2, dichloroethane, acetone, and methanol. The calcd. surface area increased from 712 to 1095 m^2/g as the cross-sectional area of the adsorbed mol. decreased from 37.7 to 18.5 A^2.

12746. Ross, Sydney. **Physical adsorption. II. A comparison of methods of estimating surface areas of crystalline solids by gas adsorption.** *J. Am. Chem. Soc.* 70, 3830-7(1948).— *C.A.* 43, 2066*b*.

Adsorption isotherms were detd. for ethane at -183°C on carefully prepd. cubic crystals of NaCl and KCl. Probable mol. areas were estd. for the mols. of ethane in the "gassy" and the condensed phases, and the total area of the samples calcd. from these estd. mol. cross-sections. For NaCl, the areas (2250 and 2433 m^2 per g) compared favorably with those deduced from the B.E.T. plots (2260 m^2 per g) and from the plots of Harkins and Jura (2350 m^2 per g). Similarly for KCl, the two Gregg values for the areas were 3190 and 3416 m^2 per g compared to a value of 3430 for the B.E.T. method.

12747. Saunders, L. **Measurement of specific surfaces of calcined and hydrated alumina powders by adsorption of heptoic acid from aqueous solutions.** *J. Chem. Soc.* 1948, 969-73.— *C.A.* 42, 8575*d*.

The adsorption of heptoic acid from dil. aq. soln. yielded surface-area values for a series of calcined alkali-free alumina hydrate powders that were in good agreement with areas detd. by an air-permeability method, provided the areas were less than 1 m^2/g. For more finely divided samples, the adsorption method gave area values much larger than those obtained by permeability measurements.

12748. Scott, B.A. **Photometric measurement of specific surface.** *Nature* 161, 358-9(1948).— *C.A.* 42, 4020*f*.

Expts. to measure the light transmission of dispersions of fine alumina powder in aq. media showed that the effective projected area per unit wt of powder gave a straight line of neg. slope when plotted against the 4th power of the wave length of the incident light.

12749. TOVAROV, V.V. **Measurement of the specific surface area of powdery materials.** *Zavodskaya Lab.* 14, 68-76(1948).—*C.A.* 44, 403*i*.

The powder was placed in a steel tube on a perforated disk and compressed with a plunger. Air was sucked through the compressed mass by means of a hydraulic aspirator at a const. rate, and the amt. of the air passed was measured by the vol. of H_2O flowing out of the aspirator per sec. The pressure on both sides of the layer was measured with manometers. The surface area, S, in cm^2/g, was calcd. Detns. on powd. quartz samples of av. particle sizes ranging from 724 to 69.9μ showed good agreement with detns. by the gas-adsorption method.

12750. ZETTLEMOYER, ALBERT C. **Gas adsorption-a new printing-ink research tool.** *Am. Ink Maker* 26, No. 1, 25-7, 59(1948).—*C.A.* 42, 2835*h*.

Methods for surface-area measurement and pore-size detn. by gas adsorption were described. Phys. adsorption of gases on solids was considered to take place with a close-packed first layer. The area occupied per mol. could be calcd. from the d. of the normal condensed phase. Total surface areas calcd. from the adsorption of various substances on active magnesias by using these values were nonconcordant.

12751. ARNELL, J.C. **Permeability studies. IV. Surface-area measurements of zinc oxide and potassium chloride powders.** *Can. J. Research* 27A, 207-12(1949).—*C.A.* 44, 3333*c*.

From gas-permeability measurements, the modified Kozeny equation, contg. a term correcting for slip, gave values for specific surfaces that were in good agreement with those obtained from gas adsorption or from liquid-permeability detns.

12752. BLAINE, RAYMOND J. AND VALIS, HAROLD J. **Surface available to nitrogen in hydrated portland cements.** *J. Research Natl. Bur. Standards* 42, 257-67(1949)(Research Paper 1967). —*C.A.* 43, 4826*e*.

The adsorption of N_2, O_2 and A (at or near the b.p. of the adsorbate) was detd. on samples of hydrated portland cement. The influence of storage, age, and water-cement ratio on the surface areas available to N_2 was also studied. Pastes using water-cement ratios of 0.25, 0.40, and 0.55 by wt were tested. The surface area as measured by adsorption of N_2, O_2, or A was much lower than that reported by others using water vapor. Cement ground to pass a No. 10 sieve and retained on a No. 20 had higher surface values than did the whole specimens. Surface values of granulated specimens were lower for the smaller granules.

12753. DUNCAN, JAMES F. **Determination of the surface area of a solid from an adsorption isotherm.** *Trans. Faraday Soc.* 45, 879-91(1949). —*C.A.* 44, 402*h*.

Two methods of estg. surface area were applied to adsorption isotherms of ethylene at liquid-air temp. and led to the same results for a given isotherm. A quick method of detg. the surface areas of a large no. of solids to about 20% accuracy was based on the assumption of a value for the Anderson const., K, and the linearity of the p/p_o vs. $1/V$ plot over the range of p/p_o from 0.25 to 0.75.

12754. HOUGHTON, G. AND WINTER, E.R.S. **Exchange of oxygen^{18} between oxides and gaseous oxygen.** *Nature* 164, 1130-1(1949).—*C.A.* 44, 3340*a*.

The data for MgO indicated a first-order reaction. Provided a similar heat-treatment was used, the calcd. reactive surface areas of the oxide were of the same order as those calcd. from low-temp. N_2 isotherms by the B.E.T. method.

12755. JOHNSTON, A.L. **Surface area and its effect on exchange capacity of montmorillonite.** *J. Am. Ceram. Soc.* 32, 210-14(1949).—*C.A.* 43, 6036*b*.

The bonds on the faces normal to the *a* and *b* crystallographic axes were more than enough to account for the entire exchange capacity of the samples studied. The thickness of particles of montmorillonite below 0.1μ was in the order of 40 A.; kaolinite particles had a thickness of about 600 A.

12756. KOMAROV, V.A.; DROZDOVA, V.M., AND CHERNIKOVA, E.A. **Surface determination by the method of adsorption of vapors.** *Zhur. Fiz. Khim*, 23, 1141-51(1949).—*C.A.* 44, 1302*g*.

Adsorption of N_2 by MgO, ZnO, CdO, and Cr_2O_3 (all pptd. from nitrate solns., with NH_3 and heated to 500°C), by Cr_2O_3 from $(NH_4)_2Cr_2O_7$, by a natural and 3 artificial samples of SiO_2, and by metallic Mg and Zn was detd. at -185°C. Adsorption of butane at 0°C was detd. for ZnO, MgO, the 4 silica samples, and one of the Cr_2O_3 samples. If the areas occupied by N_2 and butane were 16.2 and 38 A^2, resp., the surface accessible to butane after long adsorption was in all instances smaller than that accessible to N_2.

12757. KREIMER, G.S.; VAKHOVSKAYA, M.R.; SAFONOVA, O.S., AND BOGINO, E.E. **Methods of determination of the dispersity and specific surface area of powders of tungsten and tungsten carbide.** *Zavodskaya Lab.* 15, 159-67(1949). —*C.A.* 44, 1304*b*.

Detns. of the rate of adsorption of methylene blue (from 100 ml of a 0.2 g/liter per 5 g powder), the equil. adsorption (from the same soln. per 2 g), the limiting max. equil. adsorption (5 g in soln. of increasing concn.), the oxidizability in concd. HNO_3, the rate of catalytic decompn. of H_2O_2, and the vol. contraction on sintering were made on samples of W powders. The av. amts. of O_2 evolved at 25°C, per min., during the 1st 25 min., per g of powder were detd. For W, the order of the catalytic activities paralleled that of the oxidizabilities, but not for the WC samples. The vol. contraction on compression under 500 kg/cm^2, followed by sintering under H_2 at 1550°C, was detd.

12758. LIVINGSTON, H.K. **The cross-sectional areas of molecules adsorbed on solid surfaces.** *J. Colloid Sci*, 4, 447-58(1949).—*C.A.* 44, 19*c*.

The ratio between the cross-sectional area of adsorbed N_2 and of other adsorbed mols. was detd. from published data. The abs. area of the adsorbed area was calcd. from these ratios, by taking a value of 15.4 A^2/mol. for the N_2 mol. adsorbed at -196°C. The values obtained for 22 mols. (giving mol., cross-sectional area in A^2, and adsorption temp. °C) were: H_2, 8.3, -253°; D_2, 7.2, -253°; CH_4, 16.0, -183°; C_2H_2, 21.1, -78°; C_2H_6, 22.5, -183°; 1-butene, 40.6, 0°; C_4H_{10}, 44.6, 0°, C_6H_6, 32.3, 25°; C_7H_{16}, 59.4, 24°; NH_3, 14.6, -32°; O_2, 14.6, -183°; H_2O, 10.8, 25°; PrOH, 19.8, 25°; CO, 16.3, -183°; CO_2, 19.5, -78°; N_2O, 20.4, -78°; Ne, 10.0, -253°; CS_2, 37.9, 0°; $CHFCl_2$, 38.2, 0°; EtCl, 24.8, 0°; A, 14.6, -195°; Kr, 18.5, -195°.

12759. LOEBENSTEIN, W.V. AND DEITZ, V.R. **Simplified technique for surface-area determination by adsorption of nitrogen.** *J. Chem. Phys.* 17, 1004-5(1949).— *C.A.* 44, 2323*f*.

A new simplified procedure for detg. B.E.T. surface areas was described. It was based on the preferential adsorption of N_2 from N_2-He mixts. The method had the advantage that no vacuum pumping system was required.

12760. LONG, EARL A. AND MEYER, LOTHAR. **Anomalous adsorption of helium at liquid-helium temperatures.** *Phys. Rev.* 76, 440-1(1949).—*C.A.* 43, 8777*i*.

The adsorption of He^4 on jeweler's rouge (Fe_2O_3) was investigated at 2.45, 2.11, 1.78, and 1.53°K. The He II isotherms were identical (± 2% at 1.53-2.11°K) with 25-80% satn. The entropy of adsorbed layers was higher than that of liquid He. The He II isotherms showed anomalously high adsorption, starting at $P/P_o \sim 0.7$ (P = measured equil. pressure, P_o = satn. pressure of the bulk liquid He) and increasing enormously at high satns. The isotherm at 2.45°K gave v_m = 0.9 ml/cm^2.

12761. ROBERTSON, A.A. AND MASON, S.G. **Specific surface of cellulose fibers by the liquid permeability method.** *Pulp Paper Mag. Can.* 50, No. 13, 103-10(1949).— *C.A.* 44, 4250*a*.

The theoretical basis of the Kozeny-Carman equation was discussed. A relatively simple exptl. app. was constructed to permit the evaluation of the effective vol. and the sp surface. The pulp was confined between 100-mesh screens in a glass tube. Const.-level feed and permanent removal devices provided const. head, pressure head, and pad thickness were measured with a cathetometer. The upper of the 2 restraining screens was attached to a rod protruding from the liquid surface.

12762. SVENSSON, JONAS. **Determination of the specific surface of finely divided materials according to the gas-permeability method.** *Jernkontorets Ann.* 133, 33-86(1949).— *C.A.* 43, 4076*h*.

Two different exptl. arrangements were used: (1) air at atm. pressure, (2) a closed app. in which the permeability was detd. at pressures between 1 and 76 cm Hg, with both air and N_2. The permeability of the bed was compared with that of a bed of glass beads of known permeability. Nineteen expts. were made with pulverized quartz. The permeability was always found to be a linear function of the mean pressure in the bed; the sp surface was independent of the gas used. The increase in surface generally decreased with the grinding time, although in some cases with quartz the sp surface increased approx. linearly during the first 7.5 hrs of grinding.

12763. SWINTOSKY, JOSEPH V.; RIEGELMAN, S.; HIGUCHI, T., AND BUSSE, L.W. **Pharmaceutical powders and the state of subdividion. I. The application of low-temperature nitrogen-adsorption isotherms to the determination.** *J. Am. Pharm. Assoc.* 38, 210-15(1949).— *C.A.* 43, 8610*b*.

Low-temp. N_2-adsorption isotherms were used in the detn. of specific surface areas and surface diams. of pharmaceutical powders. Data were given for TiO_2, ZnO, and $BaSO_4$. The correlation of specific surface areas of slightly sol. medicinal powders with soln. rates, adsorption rates, and therapeutic response was discussed.

12764. SWINTOSKY, JOSEPH V.; RIEGELMAN, S.; HIGUCHI, T., AND BUSSE, L.W. **Pharmaceutical powders and the state of subdivision. II. Surface-area measurments of some pharmaceutical powders by the low-temperature nitrogen-adsorption isotherm technique.** *J. Am. Pharm. Assoc.* 38, 308-13(1949).— *C.A.* 43, 8610*d*.

Measurements made by the N_2-adsorption method on $Bi_2O_3CO_3$, $BiONO_3$, HgS, and sulfanilamide indicated that the particle sizes and specific surface areas of different pharmaceutical powders varied over wide ranges. The results depended on the compn. of the material and the method of manuf. The efficacy of sparingly sol. drugs may vary directly with the surface areas.

12765. ANDREEV, S.E. **Calculation of the mean diameter.** *Gornyi Zhur.* 124, No. 4, 28-31(1950). — *C.A.* 44, 8706*i*.

A formula was derived from the mean diam. of particles of a granular mixt. This formula was used to calculate total surface area, sp surface area, total vol. sedimentation, and power required to grind a certain particle size to a smaller one.

12766. BESSON, P. AND SANLAVILLE, J. **The possibility of using adsorption from solution in measuring the specific surfaces of solids.** *J. chim. phys.* 47, 108-12(1950).—*C.A.* 44, 7619*a*.

The adsorption of I_2 was detd. after one-hr exposure of a sample of acetylene black to a soln. The surface-area values were in good agreement with those obtained by using the low-temp. adsorption of N_2 and agreed with those from electron micrographs of the carbon black.

12767. CARMAN, P.C. AND MALHERBE, P. LE R. **Routine measurement of surface of paint pigments and other fine powders.** *J. Soc. Chem. Ind.* 69, 134-43(1950).— *C.A.* 44, 8736*b*.

An air-permeability method for the detn. of the surface area of powders was modified to include mol. and slip flow. There was no significant change in the sp surface when different gases were used. The surface area increased exponentially as the porosity decreased. The surfaces obtained by air-permeability were compared with N_2-adsorption measurements and if the normal porosity was chosen, the two methods agreed within 32%.

12768. CARMAN, P.C. AND MALHERBE, P. LE R. **Diffusion and flow of gases and vapors through micropores. II. Surface flow.** *Proc. Roy. Soc.* A203, 165-78(1950).— *C.A.* 45, 4605*d*.

Flow through porous plugs was measured under conditions where surface flow of adsorbed gases made an important contribution. Surface diffusion coeffs. were calcd. and indicated conditions likely to reduce the correction for flow in the gaseous phase to small proportions. This was confirmed by studying the effect of variations of porosity. Surface diffusion coeffs. increased with "coverage" of the adsorbent surface. Data were given for flow of SO_2 through Linde silica, of CF_2Cl_2 in silica and Carbolac, of He, H_2, N_2, CO_2, also in Carbolac.

12769. Catalano, Elsiades. **Determination of the specific area of portland cement by permeability measurements. II. Experimental arrangements.** *Rev. obras sanit. nacion.* (Buenos Aires) 14, 45-59(1950).—*C.A.* 45, 5386*e*.

Various methods were discussed based on the use of gases with different const. pressures and of those with variable pressures.

12770. Davis, Raymond T. Jr.; Shuler, Luke, and Weaver, Virginia. **The adsorption of gases by solids.** *Proc. Penna. Acad. Sci.* 24, 133-9 (1950).—*C.A.* 45, 7406*d*.

The surface areas of 4 activated carbons and MgO were detd. by use of N_2, C_4H_{10}, and Kr. The results obtained by various methods of calcn. were compared.

12771. Deryagin, B.V.; Krylova, V.I., and Fridlyand, P.M. **New methods of measurement of specific surface (cm^2/g) and specific adsorption (g/cm^2). I.** *Zhur. Fiz. Khim.* 24, 1371-82 (1950).—*C.A.* 45, 9992*c*.

The method utilized the Knudsen flow of a rarefied gas through a plug of porous or nonporous disperse material the sp surface of which had to be detd. Gas-kinetic theory led to the formula $Q = k\Delta p/\Delta x$, where Q was the flow rate per unit surface of a gas experiencing a pressure drop Δp over a length Δx of material; k was given by $k = A(2/\pi)^{1/2}(\delta^2/S_o)(MRT)^{-1/2}$; S_o, the sp surface; δ, the ratio of pore vol. to total vol. of material; M, the mol. wt of the flowing gas, $A = 8/3$ or 24/13 according to the elasticity or nonelasticity of the gas mol. collisions with the pore walls. With porous adsorbents, the method which did not measure the surface of dead-end pores gave low values, e.g. silica gel: Deryagin 14.2, B.E.T. 56 cm^2/g.

12772. Ewing, Warren W. and Rhoda, Richard N. **Determination of relative specific surface of zinc oxide pigments.** *Anal. Chem.* 22, 1453-5 (1950).—*C.A.* 45, 1783*c*.

Samples of the pigments were weighed into centrifuge tubes, aq. solns. of various concns. of a surface-active agent, Daxad No. 11, added, and the tubes stoppered and manually shaken and rotated end over end for at least 8 hrs. The samples were centrifuged until clear, and clear portions withdrawn for analysis. The adsorption isotherms for each pigment were extrapolated to zero concn. and these intercepts, in the units of Daxad adsorbed in mg per g of pigment, were plotted against the specific surface values of the pigments as detd. from electron micrographs; 1 mg of adsorbed Daxad covered 0.864 m^2 of ZnO surface.

12773. Fu, Ying. **Remarks on Mizushima's method for the determination of surface areas of powders.** *J. Chem. Phys.* 18, 899-900(1950).—*C.A.* 45, 4516*i*.

12774. Gray, Vincent R. **Surface films and particle-size determination of powders.** *Can. J. Research* 28B, 277-91(1950).—*C.A.* 45, 1406*b*.

By compression of the monoparticulate surface layer of a powder on water and from the surface pressure-area relation by film-balance techniques, its mean particle dimensions could be detd. A sprinkler consisting of a fine Cu gauze set by means of paraffin wax in a wide glass tube closed by a rubber stopper and joined at right angles to a narrower tube was used with compressed air to spread the powder. Flotation agents such as castor oil and fatty acids caused the powders to float on the surface. A point on the compression curve representing a rigid film and suitable for detg. a reproducible mean film thickness was selected as the first position of max. curvature near the region where the film appeared compact visually.

12775. Griffith, R.H. and Lindars, P.R. **Physical properties of promoted molybdenum catalysts.** *Nature* 165, 486-7(1950).—*C.A.* 44, 7638*e*.

A pronounced max. in the surface area was found at a ratio of 5 atoms of Si to 100 of Mo. This max. was superimposed on a curve that gradually rose with increasing amts. of Si.

12776. Hall, W. Keith; Tarn, William H., and Anderson, Robert B. **The Fischer-Tropsch synthesis. VIII. Surface area and pore volume studies of iron catalysts.** *J. Am. Chem. Soc.* 72, 5436-43(1950).—*C.A.* 45, 5907*h*.

Two fused Fe_2O_3-MgO-K_2O catalysts were compared to two Fe_2O_3-CuO-K_2CO_3 pptd. catalysts. The surface areas of unreduced fused catalysts were negligible, but the raw pptd. catalysts had large surface areas and small-pore diams. The surface area and pore vol. of the fused catalysts increased linearly with reduction but the pore diams. remained const. The pore structure was a function of the extent of reduction and could be established by surface-area measurement and a complete chem. analysis.

12777. Harris, B.L. and Wolock, I. **Surface area-permeability studies of pigmented films.** *Paint Ind. Mag.* 65, 192-3, 194(1950).—*C.A.* 45, 1356*f*.

The porosity of a pigmented oil film was studied to see if there was a variation of porosity with pigment vol. concn. The method of detg. the porosity, the vehicles used, etc., were outlined.

12778. Hirst, W. and Lancaster, J.K. **Estimation of the surface areas of powders from the temperature dependence of adsorption from solution.** *Research* 3, 336-7(1950).—*C.A.* 44, 8736*a*.

The surface areas of powders was detd. by variation of concn. with temp. and hence satn. kept const., and by variation of temp. and, hence, satn. concn. while relative concn. was kept const. Both methods used solns. of $C_{17}H_{35}CO_2H$ in C_6H_6. Measurements of powd. TiO_2, SiO_2, TiC, and SiC by both methods gave good agreement.

12779. Kraus, Gerard and Thiem, John R. **Simplified air-flow method for the determination of the surface area of powders.** *J. Applied Phys.* 21, 1065(1950).— *C.A.* 45, 21*d*.

12780. Matouschek, F. **Determination of particle size of cements.** *Rev. materiaux construction trav. publ., Ed. C, No.* 417, 197-201(1950).— *C.A.* 44, 7507*b*.

Approx. methods for calcg. the specific surface of ground materials were reviewed, and the effects of different methods of grinding on specific surface discussed.

12781. Maxted, E.B.; Moon, K.L., and Overgage, E. **Relation between sensitivity to poisoning and catalytic surface.** *Discussions Faraday Soc.* 1950, No. 8, 135-40.— *C.A.* 45, 9987*b*.

The inverse variation of sensitivity to catalyst poisoning with the surface area was confirmed by expt. for Pt hydrogenation catalysts poisoned with Me_2S. The relation obtained was of the type $\alpha_1 s_1 = \alpha_2 s_2$, where α and s were measures of sensitivity and surface area, resp. A characteristic value for the product αs made possible the calcn. of the surface area of Pt catalysts by sensitivity tests performed on small quantities.

12782. Moore, Alice E. **Specific-surface measurement-light-absorption methods.** *J. Soc. Chem. Ind.* 69, Suppl. No. 1, 533-6(1950).— *C.A.* 45, 5486*d*.

A method of detg. the surface area of fine powders was based on the light absorption of the powder when in a suspension. The powder suspension was placed in a wedge-shaped cell through which the light passed to a photo-cell connected to a galvanometer. From the known wt of the powder and the detd. absorption, the surface area could be calcd. Despite the error caused by the opacity of the powder, this method was rapid and had greater accuracy than the hydrometer method.

12783. Prettre, Marcel. **The conditions for utilizing surface-area measurements by adsorption in the study of adsorbents, catalysts, and their constituents.** *J. chim. phys.* 47, 99-103(1950).— *C.A.* 44, 7615*f*.

Surface-area measurements by low-temp. gas adsorption were useful in studying adsorbents and catalysts. However, in comparing surface area and catalytic activity, cognizance must be taken of the many variables such as catalyst compn., temp., time of evacuation, and nature of prior chem. treatment that might cause marked variation in the activity per unit surface area.

12784. Roxburgh, J.M. and Winkler, C.A. **The surface area of cadmium and copper, and the mechanism of cadmium polarization.** *Can. J. Research* 28B, 383-90(1950).— *C.A.* 45, 25*f*.

The areas of mechanically cleaned Cd electrodes were found (by measurement of the rate of build-up of H_2 overvoltage) to be up to 1500 times the apparent area and decreased with time of immersion in air-free dil. H_2SO_4. The decrease in area was independent of acid concn. and was accelerated by exposure to air. The area increased with decrease in current. Cu electrodes did not show these effects. Cd polarization was linearly dependent on current and independent of the measured electrode area.

12785. Russell, Allen S. and Cochran, C. Norman. **Surface areas of heated alumina hydrates.** *Ind. Eng. Chem.* 42, 1336-40(1950).— *C.A.* 44, 8735*d*.

The adsorption of n-butane at 0°C was detd. on Al_2O_3 hydrates: α-trihydrate, β-trihydrate, α-monohydrate, β-monohydrate, and amorphous Al_2O_3. The greatest B.E.T. areas were obtained by heating trihydrates; area began to develop in α-trihydrate at 220°C, went through a max. of 1.4 millimols. of butane adsorbed per g at 400°C, diminished at 550°C to 0.9, and declined slowly to 0.1 at 1200°C (millimols. of butane multiplied by 235 equals area in m^2/g). Dry inert gas flowing over the surface during heating produced greatest areas, whereas gases that might react or that contained water produced smaller area.

12786. Teichner, Stanislas. **Measurement of the specific surfaces of certain clays.** *Compt. rend.* 231, 1063-4(1950).— *C.A.* 45, 4013*c*.

The specific surface of a solid was measured from the adsorption isotherm of N_2 at its b.p. The method of prepg. the clay must be standardized. Small amts. of water must be excluded and the clay should not be neutralized by base. Optimum conditions were obtained by heating the acid montmorillonite clay in vacuum for 1.5 hrs at 150°C giving a surface of about 310 m^2/g.

12787. Teichner, Stanislas and Pernoux, Émile. **Ultrasonic fractionation of kieselguhr used to support Fischer catalyst.** *Compt. rend.* 230, 1063-4(1950).— *C.A.* 44, 5679*e*.

Silica gel, resulting from the acid treatment of kieselguhr, was subjected to ultrasonic treatment. Two fractions formed; 12% constituted a stable dispersion; the rest pptd. B.E.T. measurements of the evapd. dispersion yielded a surface of 40 m^2/g, contrasting with 27 m^2/g in the original unsepd. material. Electron-microscope examns. were made of fractions.

12788. Arnell, J.C. **Measurement of surface areas of powders by permeability methods.** *Chemistry in Can.* 3, 21-4(1951).— *C.A.* 45, 3684*e*.

The development of various permeability equations was reviewed.

12789. Avgustinik, A.I. and Dzhansis, V.D. **Measuring the changes in the specific surface of highly dispersed materials by the torsion-balance method.** *J. Applied Chem. U.S.S.R.* 24, 471-7(1951)(Engl. translation).— *C.A.* 46, 4188*d*.

Air-penetrability methods were not satisfactory to det. the surface of flaky heterogeneous particles. A method was devised for use with a torsion balance to weigh the samples collected by sedimentation in aq. suspension. Specific surfaces were: Glukhovetsk kaolin 10.8; Prosyanovsk kaolin 11.5; Borovichi clay 12.5; Chasovyari clay 15.0; Oglanlino bentonite 28.6 m^2/g.

12790. Bloecher, F.W. Jr. **A new surface-measurement tool for mineral engineers.** *Trans. Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 3013-B (in *Mining Eng.* 3, 255-8)(1951).— *C.A.* 45, 3661*d*.

The method involved low-temp. Kr adsorption measurements in a Pyrex glass app. consisting of

He and Kr storage flasks, a McLeod gage, a manifold, Hg valves, a thermocouple gage, and vacuum pumps. Coarse materials (35 to 48-mesh) as well as clays or colloidal slimes were measured. Kr offered the advantage of low satn. pressures (2 to 3 mm) at the conveniently obtained liquid-N_2 temp.; hence, the vacuum system need not be designed to measure or withstand internal gas pressure above 1 atm. as in the N_2 gas method.

12791. BUPP, LAMAR P. AND SCOTT, ALLEN B. **A technique for the study of solid-gas surface reactions; the decomposition of nitrous oxide on iron oxide-zinc oxide catalysts.** *J. Am. Chem. Soc.* 73, 4422-6(1951).—*C.A.* 45, 9346*e*.

A method for the measurement of surface area, magnetic susceptibility, and catalytic efficiency for solid catalysts was described. The decompn. of N_2O at 500°C and 1 atm. pressure over α-Fe_2O_3 catalysts was studied by this method. Pure α-Fe_2O_3 was the most efficient of the catalysts studied. The efficiency for equal molar mixts. of ZnO and Fe_2O_3 pretreated at a series of temps. showed a regular decrease in activity with pretreatment temp. The surface area decreased regularly with pretreatment temp. and the loss of catalytic activity may be due to this effect, though other possibilities were discussed. No correlation was observed between magnetic susceptibility and catalytic activity.

12792. CALVET, ÉDOUARD. **Thermal effects associated with adsorption. I. Application to the measurement of the surface area of powders.** *Compt. rend.* 232, 964-6(1951).—*C.A.* 45, 5506*b*.

The solid sample under study was placed in a recording microcalorimeter, sepd. from a liquid by a small valve that could be controlled from the outside. A discontinuity in the plot of the heat transfer rate vs. time indicated the point at which the unimol. surface film was completed. The surface area was then calcd. from the known area covered per mol. of liquid.

12793. CARMAN, P.C. AND MALHERBE, P. LE R. **Routine measurement of surface of paint pigments and other fine powders. II.** *J. Applied Chem.* (London) 1, 105-8(1951).—*C.A.* 45, 6009*a*.

The gas permeability method for surface area and particle-size measurement was applied to solids such as Pyrex glass spheres, powd. W, $CaCO_3$ ZnO, carbon black, silica, and γ-Al_2O_3. The results obtained were compared with those obtained by one or several of the following methods: N_2 adsorption, liquid permeability, Me stearate adsorption, light microscope, electron microscope, and sedimentation. For the finest particles (Carbolac I, carbon black), 30 A. diam., surface flow of adsorbed mols. may interfere.

12794. CHARLES, R.J.T. **Photometric measurement of particle size and relative surface area.** *Trans. Can. Inst. Mining Met.* 54. (in *Can. Mining Met. Bull.* No. 475, 722-9)(1951).—*C.A.* 46, 1307*e*.

The light source was mounted in a tee-shaped tube and a condenser lens was mounted in each arm of the tee. The focal lengths of the lenses were such that the rays of light after passing through them were parallel. A plastic block in which glass windows had been set was fixed to the end of one arm of the tee. On the other side of the plastic block one of the phototubes was mounted. The circulating tubes passed vertically through the plastic block. Another plastic block was attached on the opposite arm of the tee. A slot was cut in this block so that a piece of ground-glass screen could be inserted, cutting off a portion of the light reaching a phototube mounted on the other side of the block. An elec.-eye vacuum tube (6E5) arranged in a bridge circuit served to balance the outputs of the phototubes. The circulating chamber was built of clear plastic, and had built-in baffles. An impeller was installed which had enough power to prevent even the heaviest of minerals from settling out.

12795. DODD, CHARLES G.; DAVIS, JAMES W., AND PIDGEON, FRANCES D. **Measurement of specific surface areas of nonporous powders by a pressure-decline liquid-permeability method.** *J. Phys. & Colloid Chem.* 55, 684-98(1951).—*C.A.* 45, 6895*b*.

A pressure-decline liquid-permeability app. for the measurement of surface area of a packed powder was presented. A sample of 70-100-mesh glass spheres yielded a surface area in good agreement with one obtained independently by electron microscopic examn. of the samples. Measurements of quartz powder consisting of particles ranging from less than a μ to 7 μ in diam. confirmed the applicability of the method to the measurement of permeability. The surface area for the fine quartz powder measured by using isoöctane as a fluid was smaller by about 40% than the surface area obtained with water as a fluid.

12796. EMSCHERMANN, H.H. AND KRUSE, J. **Measurement of changes in paper surface area by means of a surface extensometer.** *Das Papier* 5, 299-302(1951).—*C.A.* 45, 9267*c*.

By use of the Pfender extensometer, the surface-area changes of board and paper samples were detd. at 20°C with changes in relative humidities (65 → 30%, and 30 → 90%). The method was rapid and highly reproducible.

12797. FEDORCHENKO, I.M. **Specific surface area of metal powders.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* 1951, 411-18.—*C.A.* 45, 6453*a*.

Sp surface areas S were detd., on Fe, Cu, and Ni powders of different prepns., by measurements of the rate of flow Q, in moles of gas of mol. wt M flowing per sec through 1 cm^2 of a layer of powder of thickness dx under a pressure gradient dp/dx, with the use of Deryagin's formula $S = (24/13)(2/\pi)^{1/2}(\delta^2/Q)(1/MRT)^{1/2}(dp/dx)$, where δ = vol. of pores per unit vol. This equation was applicable to the range of Knudsen flow, which was practically reached at pressures below 0.3 mm Hg. For powders of corundum and ZnO, the method gave values of S practically identical with those obtained by adsorption of N_2. The method permitted detn. of the surface area of through pores, and that in dead-end pores remained unnoticed.

12798. FU, YING AND BARTELL, F.E. **Surface area of porous adsorbents.** *J. Phys. & Colloid Chem.* 55, 662-75(1951).—*C.A.* 45, 6894*i*.

The surface area of porous solids was detd. using only low-temp. gas adsorption data. Values for $a\phi$ were derived as a function of relative pressure by applying the Gibbs equation directly to the adsorption data. The difference between the limiting value of $a\phi$ at a relative pressure of 1 and the value of $a\phi$ at the point corresponding to the meeting of the two straight portions of the plot gave a reasonable value for the surface area of the catalyst when divided by the surface tension of the particular adsorbate being used in the measurements. The method gave values for surface area of porous glass that were in excellent agreement with those obtained by the usual B.E.T. plots of the same adsorption data.

12799. Gamboa, J.M. and Maddock, A.G. **Exchange reactions with radioactive tracers and the determination of specific surface. I. Laboratory technique. II. Experiments with Pb_3O_4. III. Experiments with Fe_2O_3.** *Anales real soc. espan. fís. y quím.* 47B, 401-12, 471-88, 489-94 (1951).—*C.A.* 46, 7854*c*.

The kinetics of exchange between Pb^{++} ions in aq. soln. and powd. cryst. Pb_3O_4 was detd. with ThB as a tracer. ThB was prepd. by electrolysis of solns. of $Th(NO_3)_4$ or of mesothorium. There was a fast initial exchange due to surface reaction followed by a much slower process due to reaction with ions in the body of the crystal. The kinetics of exchange of Fe^{+++} in aq. soln. and powd. cryst. Fe_2O_3 were detd. with Fe^{59} as a tracer. As in the case of Pb, the reaction was initially rapid but had a slower secondary phase. Calcn. of sp surface was based on the 1st phase.

12800. Innes, W.B. **Apparatus and procedure for rapid automatic adsorption, surface area, and pore volume measurement.** *Anal. Chem.* 23, 759-63 (1951).—*C.A.* 45, 8320*g*.

Surface area was measured in less than 15 min. The method was based on the const. slow flow of gas into an adsorbent chamber at approx. equil. pressure and the amt. adsorbed was proportional to time. The surface area was calcd. from the time for the pressure to reach a relative pressure of 0.2, by using N_2 at liquid-N_2 temp. Surface-area measurements were within 5% of those by the B.E.T. method and were reproducible within 3%.

12801. Jockers, K. **The emanating power and surface area of various aluminum hydroxides and oxides.** *Z. anorg. u. allgem. Chem.* 265, 49-55 (1951).—*C.A.* 46, 7840*c*.

The emanating power (*EP*) of the bayerite and boehmite series of Al oxides was measured. The *EP* of the series had a very simple relation to the surface area calcd. from a unimol. layer: surface area = $k.EP$. For γ-Al_2O_3: k_{20}°C = 440, k_{175}°C = 400.

12802. Kiesskalt, S. and Matz, G. **Determination of specific surfaces of granules.** *Z. Ver. deut. Ing.* 93, 58-60(1951).—*C.A.* 45, 5486*f*.

Available sp-surface tabulations were revised and a simple relation found to express the theoretical surface area. The actual sp surface could be computed from the theoretical one, taking into account the sp. gr. of the material and the Heywood shape factor of the granule, which was detd. under the microscope.

12803. Kimura, Ichiji. **Thickness measurement of thin films by polonium α-rays.** *Ôyô Butsuri* (J. Applied Phys.) 20, 223(1951).—*C.A.* 46, 5922*g*.

The thickness (a few μ) and its inhomogeneity was measured. Examples were reported on the measurement with Al film used for electrolytic capacitor and with insulating paper.

12804. Liang, S. Chu. **Some measurements of thermal transpiration.** *J. Applied Phys.* 22, 148-53 (1951).—*C.A.* 45, 3672*h*.

Measurements were made of the pressure ratio, R, due to thermal transpiration in H_2, He, A, and N_2 between a warm temp of 297°K and cold temps. of 77.3 or 195°K. R depended on X, the product of the pressure and tube diam. according to the empirical relation, $R = P_1/P_2 = (AX^2 + BX + R_m)/(AX^2 + BX + 1)$, where A and B were consts. that depended on the gas and on the warm and cold temps., and $R_m = (T_1/T_2)^{1/2}$. The use of these results to correct measurements of adsorption equil. and vapor pressures at low pressures and low temps was discussed.

12805. Loebenstein, W.V. and Deitz, Victor R. **Surface-area determination by adsorption of nitrogen from nitrogen-helium mixtures.** *J. Research Natl. Bur. Standards* 46, 51-5 (1951) (Research Paper No. 2174).

The sample was heated initially in a stream of He. The adsorption of He in mixts. with N_2 was negligible at the temp. concerned and temp. equilibration was rapidly attained. Thermomol. pressure differences were negligible under the conditions of the expt. The surface-area detn. for 8 materials were in good agreement with results obtained by the conventional B.E.T. method.

12806. Rubinshtein, A.M. and Vasserberg, V.E. **Causes of the optimum of the catalytic activity as a function of the dispersity and effective specific surface area of a catalyst.** *Doklady Akad. Nauk S.S.S.R.* 79, 263-6 (1951).—*C.A.* 45, 10020*i*.

A ppt. of $Al(OH)_3$ obtained from a boiling Al $(NO_3)_3$ soln. with 5% NH_4OH was sepd. into 3 portions of increasing particle size. The 3 portions were converted into γ-Al_2O_3 by heating, and their sp surface areas S and crystal sizes d detd. The data (S, m^2/g by adsorption of MeOH and C_5H_{12}, d in A.) were: (1) 286 and 182, $\leqslant$ 35; (2), 286 and 179, 35; (3), 286 and 264, 51.4. The striking feature was the strong discrepancy of S values detd. by adsorption of MeOH and C_5H_{12} in the 1st two cases. Detn. of the sp surface area only by low-temp. adsorption of N_2 was insufficient for the characterization of the catalytic activity. With BuOH, the ratio of the activities of the 1st and 3rd was about the same as with EtOH, although the abs. activities were about 10% higher.

12807. Schwarz, W. **Local cell action and oxide coating on passive iron.** *Z. Elektrochem.* 55, 170-2(1951).—*C.A.* 45, 7447*f*.

By measuring the excess quantity of Fe dissolved during the initial period, the quantity of oxide could be calcd. from the equiv. amt. of local current developed by the dissolving Fe, which cathodically reduced the oxide coating. Then, by assuming the oxide layer to be Fe_2O_3 and if the geometrical surface area was known, the av. thickness of the oxide was calcd. For Fe passivated in HNO_3 (d. = 1.4) and satd. with urea, the av. oxide coating thickness was calcd. to be 80 A.

12808. Tesner, P.A. and Rafal'kes, I.S. **New method of measurement of the specific surface area of carbon black.** *Doklady Akad. Nauk S.S.S.R.* 80, 401-3 (1951).—*C.A.* 46, 239*b*.

The amt. of carbon deposited under const. conditions was proportional to the carbon surface area on which the decompn. took place. The decompn. was carried out on known amts. of 2 samples of carbon black, one of known, the other of unknown sp surface area. Detns. with mixts. of 15% C_6H_6 with N_2, 30 min. at 800°C, samples of 100 mg, were reproducible within 7-10%, and the sp areas detd. checked satisfactorily with values detd. by electron microscopy. The method was not suitable for porous carbon black.

12809. Weidenhammer, Fritz. **Calculation of the surface of granular material according to Rosin-Rammler.** *Tonind.-Ztg.* 75, 133-5 (1951). —*C.A.* 45, 6898*h*.

An empirical formula was derived and auxiliary graphs presented for its solution based on coeff. of uniformity and lower grain-size limit.

12810. Zwietering, P.; Oele, A.P., and Krevelen, D.W. van. **Pore structure and internal surface of coal.** *Fuel* 30, 203-4 (1951).—*C.A.* 45, 9243*g*.

The values for the internal surface of coal, detd. from the adsorption of N_2 at -196°C showed that the "heat-of-wetting method" gave results many times too high. The provisional results of an investigation of the change of internal surface during carbonization were given.

12811. Arakawa, Masafumi; Arakawa, Teru, and Suito, Eiji. **Measurement of the specific surface area of powders by permeability method.** *Bull. Inst. Chem. Research, Kyoto Univ.* 29, 78(1952)(in English).—*C.A.* 46, 10782*h*.

$CaCO_3$, ZnO, cement, and polyvinyl chloride were measured. With regard to the packing of the sample bed, it was confirmed that the sp surface area decreased linearly with increase in the porosity function of the same sample. The sp area measured satisfactorily agreed with the values by other methods at the min. porosity function.

12812. Barrer, R.M.; Mackenzie, N., and Macleod, D. **The adsorption method of measuring surface areas.** *J. Chem. Soc.* 1952, 1736-44.-*C.A.* 46, 8459*e*.

New multilayer equations similar to that of B.E.T. were derived. These equations were examd. with the exptl. isotherms of N_2 on montmorillonite and of N_2 and NH_3 on attapulgite. The characteristic plots of a no. of the new isotherm equations were linear to large relative pressures. The ratio of the extreme values of v_m, the vol. of gas adsorbed when the entire adsorbent surface was covered with a complete unimol. layer, on montmorillonite for 12 equations was 1.57:1 and that on attapulgite for 11 equations was 1.39:1. The corresponding ratios for the 3 or 4 best-fitting equations were 1.15:1 and 1.12:1, resp.

12813. Bower, C.A. and Gschwend, F.B. **Ethylene glycol retention by soils as a measure of surface area and interlayer swelling.** *Soil Sci. Soc. Am., Proc.* 16, 342-5(1952).—*C.A.* 47, 5596*f*.

The ethylene glycol-retention method for detg. interlayer swelling and the surface areas of clays was modified for use on soils. Values for external surface areas of soils obtained by this method agreed satisfactorily with those obtained by the B.E.T. method. The nature of the exchangeable cation had no significant influence upon values obtained for external retention by soils. Total retention by Ca- and H-satd. samples tended to be higher than that by Na- and Mg-satd. samples. The lowest values for total retention were obtained on K- and NH_4- satd. samples.

12814. Courtney-Pratt, J.S. **An optical method of measuring the thickness of adsorbed monolayers.** *Proc. Roy. Soc.* (London) A212, 505-8(1952). —*C.A.* 46, 8461*f*.

A unimol. layer of fatty acid was spread over mica. A highly reflecting layer of Ag was then deposited on both sides of the mica specimen, and the thickness of the acid layer detd. by multiple-reflection interferometry. The values so obtained were in agreement with x-ray data on the length of the fatty-acid mol. The layers were uniform in thickness; multimol. layers were absent. The method provided direct and independent evidence that mols. of a fatty acid, spread by the retraction technique, were adsorbed on a solid surface as a uniform unimol. layer.

12815. Deryagin, B.V.; Mel'nikova, M.K., and Krylova, V.I. **The effective magnitude of the spreading angle during imbibition of porous bodies and a method for its evaluation.** *Kolloid. Zhur.* 14, 423-7 (1952).—*C.A.* 47, 3082*c*.

The sp surface S was calcd. from the rate of imbibition; $l^2/t = 2KS\sigma \cos\theta/\delta^2$, where l was the depth of imbibition during time t, K ratio of the vol. rate of filtration to pressure gradient, σ surface tension, θ contact angle, and δ the relative pore vol. This equation was tested for quartz sand in H_2O and compared with the Kozeny-Carman equation; to achieve agreement, θ must be 60-70°.

12816. Ergun, Sabri. **Determination of geometric surface area of crushed porous solids (gas-flow method).** *Anal. Chem.* 24, 388-93 (1952).—*C.A.* 46, 7398*a*.

The flow equation developed was for beds having sp surfaces less than 2000 cm^2 per ml and limited to particles larger than 0.1 mm. The following linear expression was developed for pressure drop through granular beds: $\Delta P/LU_m = a + bG$, where ΔP = pressure drop, L = height of bed, U_m = av. gas velocity, G = mass flow rate and a and b were straight-line coeff. intercept and slope, resp., and were represented by $a = k_1 \mu S_V^2[(1 - \epsilon)^2/\epsilon^3]$ and $b = k_2 S_V[(1 - \epsilon)/\epsilon^3]$, where μ was abs. viscosity of gas, S_V the sp surface area of particles, ϵ the fractional void vol. of bed, and k_1 and k_2 were consts. $\epsilon = 1 - (p_B/p)$, where p_B was the bulk d. and p was particle d.

12817. Franck, E.U. and Biedermann, H. **Surface development of platinized platinum.** *Kolloid-Z.* 129, 137-40(1952).—*C.A.* 47, 4686*c*.

Measurements of the surface of electrolytically and chemically pptd. Pt black were made. The surface obtained by the polarization-capacity method was too high, because of the soly. of H_2 in Pt. The methylene blue value was too low because of the large size of the dye mol. The most probable value of the surface area of Pt black made by the electrolytic method was that obtained by the A-adsorption method, which was of the order of 200 m^2/g.

12818. Jopling, D.W. **The determination of the specific surface of barium sulfate.** *J. Appl. Chem.* (London) 2, 642-51(1952).—*C.A.* 47, 3082*a*.

Surface detns. obtained by air permeability, dye adsorption, and light extinction methods, and by calcn. from grain-size distributions obtained from pipet and centrifuge sedimentation methods were compared. The comparison was for $BaSO_4$ particles in the size range of 0.1 μ to 5 μ. The results for the dye adsorption and air permeability methods agreed well with each other, but did not always agree with the values calcd. from grain-size distribution. Electron micrographs showed that the deviation was due to aggregates settling in the sedimentation analysis.

12819. Kulp, J. Laurence and Carr, Donald R. **Surface area of deep-sea sediments.** *J. Geol.* 60, 148-59(1952).—*C.A.* 46, 3919*h*.

The theory and measurement of surface areas by the gas-adsorption method were discussed. Data obtained from the measurement of a representative suite of specimens from deep-sea cores were presented. The values ranged from 2.5 m^2/g. (fine red silt) to 48.0 m^2/g. (continental clay).

12820. Niwa, Makoto and Yamaguchi, Mitsuo. **Sintering of catalysts. I. Sintering of copper catalysts and the effects of traces of promoters.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 159-62(1952).—*C.A.* 46, 10488*a*.

The surface area of the reduced catalyst was detd. by the adsorption of methylene blue. The surface area decreased as the sintering time at 190°-250°C increased. The data were expressed by $A = a\exp(-bt)$ where A = adsorbed methylene blue in mg/g Cu, t = sintering time and a and b = consts. The activation energies of sintering were 16 and 37 kcal for CuO pptd. by $(NH_4)_2CO_3$ and NaOH, resp. When promoters such as Ni. ThO_2, PbO, and $NaNO_3$ were added in 0.1-0.5%, they prevented the sintering. $NaNO_3$ was most effective and PbO had no effect.

12821. Orr, Clyde Jr. and Bankston, P.T. **A rapid liquid-phase adsorption method for the determination of the surface area of clays.** *J. Am. Ceram. Soc.* 35, 58-60 (1952).—*C.A.* 46, 3365*c*.

A dry sample of clay was exposed to a soln. of fatty acid of known concn., and the fatty acid remaining after a period of agitation detd. The amt. of fatty acid adsorbed by the clay provided a basis for calcg. the total surface area.

12822. Orr, Clyde Jr.; Blocker, H.G., and Craig, Susan L. **Surface areas of metals and metal compounds. A rapid method determination.** *J. Metals* 4, *Trans.* 657-60(1952).—*C.A.* 46, 6059*i*.

The validity of the gas adsorption method as a means of measuring surface areas was confirmed; fatty acid adsorption was a valuable companion technique. Liquid-phase adsorption, because extensive sample evacuation or heating was unnecessary, and because the method was rapid, should be usable with heat-sensitive and high-vapor pressure materials.

12823. Rose, H.E. **The assessment of specific surface by single-observation photoextinction methods.** *J. Applied Chem.* (London) 2, 217-20 (1952).—*C.A.* 46, 7843*i*.

By combination of equations $\log_e(I_o/I_2) = ClK_mS_t/4$, $S_m = K_m6/pd_m$, and $S_m = K_mS_t$, the sp surface of a suspension was obtained by making one optical transmission measurement; C = concn. of suspension in g/ml, l = cell length, K_m = mean extinction coeff. for the powder, S_t = true sp surface, cm^2/g, p = d. of powder, g/ml, d_m = mean particle diam., S_m = measured sp surface, cm^2/g, I_2 = intensity of emergent beam for particle diam., d_2. Flint, cement, and iron oxide had surfaces 1730, 1980, and 13,900 cm^2/g, resp.

12824. Rose, H.E. **Permeability method of specific-surface determination: a correction factor.** *J. Appl. Chem.* (London) 2, 511-20 (1952).—*C.A.* 47, 2571*f*.

A semiempirical correction factor was developed upon the thesis that the mol. flow term required correction by a factor that depended on the true sp surface, S_t, of the powder and the percent voids. The S_t was obtained by plotting S_c vs. the corresponding value of voidage and extrapolating until the curve became horizontal. Further calcns. were made to obtain a corrected S_t which was then plotted versus S_c to give a set of iso-voidage lines. The correction factor was then obtained from a plot of S_t vs. percent voidage giving a series of iso-S_c lines. This family of curves was used by detg. S_c according to Carman's equation.

12825. Schellinger, A. Kenneth. **Solid surface energy and calorimetric determinations of surface-energy relationships for some common minerals.** *Trans. Am. Inst. Mining Met. Engrs.*, *Tech. Pub.* No. 3223-B(in *Mining Eng.* 4, 369-74) (1952).—*C.A.* 46, 4901*c*.

Quartz, pyrite, calcite, and halite were tested separately in a grinding calorimeter designed to give an accurate measure of all of the heat energy output from a small tumbling mill using cast-Fe shot as the grinding medium. The surface-energy values obtained were quartz 107,000, pyrite 60,000, calcite 32,400, and halite 26,100 ergs per cm^2. Surface-area detns. were made by the B.E.T. method on CO_2 adsorption measurements.

12826. Schubert, Y. and Kopelman, B. **Determination of particle size in the submicron range.** *Powder Met. Bull.* 6, 105-9 (1952).—*C.A.* 46, 10782*g*.

Particle sizes below 1000 A. were detd: (1) the gas-adsorption technique based on the exptl. detn. of an adsorption isotherm of an inert gas near its b.p., and (2) the x-ray line broadening technique which utilized the relationship between line broadening of the diffracted beam and crystal size. Good agreement between the results of both methods was found. Particles of superfine Fe down to 242 A. were measured.

12827. Smith, Dan E. **A simplified surface-area apparatus and catalyst tester.** *Petroleum Engr.* 24, No. 12, C-52-6(1952).—*C.A.* 47, 4658*h*.

A simplified app. and procedure were described for detg. surface area by adsorption of N_2.

12828. WARNER, B.R. **Surface areas of tobaccos by low-temperature nitrogen absorption.** *Arch. Biochem. Biophys.* 40, 143-52(1952).—*C.A.* 47, 1900^e.

Tobacco-leaf tissue was porous with a surface area of 1-10 m^2/g. Force aging greatly increased the area. The heats of low-temp. adsorption of N_2 on tobacco surfaces indicated changes in the chem. compn. of the leaf surfaces, which were caused by the specific treatment of the tobacco.

12829. ZAVARITSKAYA, T.A. AND GRIGOROV, O.N. **Determination of the true surface area of solid dispersoids by the air permeability.** *Doklady Akad. Nauk S.S.S.R.* 86, 757-8 (1952).—*C.A.* 47, 944^g.

Measurements of the surface area of samples of Al and of polystyrene powders by filtration of air gave divergent results depending on whether the filtration expts. were done under atm. or under reduced pressure. Homogeneous dispersions, obtained by emulsion polymerization of styrene, and composed of regularly spherical particles within the size limits of 10-15, 15-20, and 40-60 μ, were studied. Only air permeability measurements under reduced, not under atm. pressure, gave the correct sp surface area.

12830. KARAGOUNIS, GEORG. **A simple method for determining the internal surface of finely divided solids.** *Helv. Chim. Acta* 36, 282-90 (1953) (in German).—*C.A.* 47, 4691^g.

Org. substances spreading on finely divided solids reached a crit. surface concn. (X) expressed in g of spread substance per g of solid. The specific surface of a solid in cm^2/g of solid was calcd. from X/dD, where d = d. of the spreading substance, and D = the min. thickness (in cm) of a surface film that will cause crystn. The method was applied to Fe, Cu, CuO, Al_2O_3, talcum, and graphite powders. Close agreement on any powder sample was usually obtained with at least 2 of the spreading liquids.

12831. KRAUS, G.; ROSS, JOHN W., AND GIRIFALCO, L.A. **Surface-area analysis by means of gas-flow methods. I. Steady-state flow in porous media.** *J. Phys. Chem.* 57, 330-3 (1953).—*C.A.* 47, 5733^c.

Steady-rate flow rates were measured for 7 fractions of glass microspheres, $BaSO_4$, $PbCrO_4$, TiO_2, and CuO in packed columns ranging in B.E.T. surface area from 0.30 to 8.0 m^2/g. The exptl. data suggested that the surface area deduced from the Poiseiulle flow contribution represented the geometric area of particles, while the Knudsen flow area was identified with the total surface of the continuous pore space. In no case did steady state flow areas include the surface of blind pores.

12832. KRAUS, G., AND ROSS, JOHN W. **Surface-area analysis by means of gas-flow methods. II. Transient state flow in porous media.** *J. Phys. Chem.* 57, 334-6 (1953).—*C.A.* 47, 5733^d.

Transient-state flow rates in the Knudsen flow region were measured. Surface areas calcd. from the transient flow data with N_2 were found to agree well with adsorption areas, even in cases where steady-state measurements yielded too small a surface area. The flow measurements resulted in somewhat larger areas, suggesting that more surface was accessible to He than to N_2.

VI-6. Porosity Determinations, Flow Through Beds, Pressure Drop

12833. FOWLER, J.L. AND HERTEL, K.L. **Flow of a gas through porous media.** *J. Applied Phys.* 11, 496-502 (1940).—*C.A.* 35, 677^6.

Exptl. results obtained with cotton, wool, rayon and glass-wool fibers were given, and were in good agreement with those obtained from independent detns. The hydrodynamic method using air seemed to be well adapted to the detn. of the sp surface of fibrous materials.

12834. HATCH, L.P. **Flow through granular media.** *J. Applied Mechanics* 7, 109-12 (1940).—*C.A.* 35, 4998^7.

Formulas for detg. the resistance of flow through granular media were evolved. Exptl. results showed close agreement between calcd. and observed values.

12835. SULLIVAN, R.R. AND HERTEL, K.L. **Flow of air through porous media.** *J. Applied Phys.* 11, 761-5 (1940).—*C.A.* 35, 677^7.

The values of the const. in the equation for permeability in terms of porosity and sp surface were found to be approx. 4.5 for small glass beads (random orientation), 3 for glass fibers (cylinders) parallel to the flow, and 6 for glass fibers perpendicular to the flow.

12836. SULLIVAN, R.R. **Further study of the flow of air through porous media.** *J. Applied Phys.* 12, 503-8(1941).—*C.A.* 35, 5016^7.

For high porosities, where the shape factors were different for wads of different fiber, the flow at a given porosity may not be considered proportional to the inverse square of the specific surface, but to a lower inverse power.

12837. HANCOCK, R.T. **Interstitial flow.** *Mining Mag.* 67, 179-86 (1942).—*C.A.* 37, 554^7.

The resistance experienced by a fluid as a function of its velocity was studied. The "voidage" was the ratio of the space unoccupied by the solid to the total vol. occupied by both solid and fluid. Equations relating to the former could be made applicable to suspensions and immobilized beds by embodying in them a factor which employed the sixth power and the fourth power, resp., of the voidage. The derivation and application of various empirical formulas were discussed.

12838. DROTSCHMANN, C. **Porosity measurements.** *Batterien* 11, 207-9(1943); *Chem. Zentr.* 1943, I. 1391.—*C.A.* 38, 5127^8.

The following methods were considered suitable for detg. the apparent porosity: (1) the air-expansion method, with and without vapor-pressure correction, (2) the displacement method, and (3) the method for measuring the porosity of storage battery plates, in which a fluid of known viscosity was forced through the pores.

12839. KUCHARSKI, W. **Viscosity of heterogeneous liquids as a function of velocity.** *Samml. wissenschaftl. Arbeit schweiz. interniert. Pol.* **1**, 101-19 (1943).—*C.A.* 45, 4509^d.

A glycerol soln. showed signs of being heterogeneous. The coeff. calcd. by Poiseuille's formula increased with decrease in velocity. For a suspension of carbon in glycerol, a heterogeneous "liquid," Poiseuille's law could not be used. The coeffs., detd. exptly. on different days, lie on a regular hyperbolalike curve which, with increasing velocity, approached a limiting value which was reached just before the occurrence of turbulence.

12840. MÖSER, ADOLF. **Simple plant methods for the determination of porosity and water absorption of fire brick.** *Sprechsaal* 76, 147-51 (1943); *Chem. Zentr.* **1943, II**, 1304.—*C.A.* 38, 6060^7.

New methods, based on satn. and drying curves, showed structure better and allowed a differentiation of the usual porosity values. Instead of the quantity of water passing through, the quantity of test liquid absorbed was measured. Speed of absorption, penetrability, capillary porosity and progressive porosity were detd.

12841. ANDREÉ, H. **Apparatus for the measurement of very low flow rates of gases I.** Measurement of the porosity of rocks. *Oel u. Kohle* 40, 117-19(1944).—*C.A.* 38, 6136^8.

Very low flow rates of gases were measured by means of a 2-necked bottle filled with water and equipped with a precisely adjustable overflow siphon. The position of the outer arm of the siphon was set so that the system was in a labile equil. and water neither flowed out nor returned into the bottle. When gas was admitted at a very low rate of flow, the equil. was disturbed and the flow rate detd. from the time required for a definite vol. of water to flow out. The rates measurable with the app. ranged from 1 to 0.0001 ml/sec.

12842. BOGATY, HERMAN AND CARSON, FREDERICK T. **Measurement of rate of flow of water through filter paper.** *J. Research Natl. Bur. Standards* 33, 353-62 (1944).—*C.A.* 39, 1329^4.

The paper was used as a cone in the usual manner and special app. was not required. An equation was derived with which a water-filtration coeff. was detd. from the filtration data. A correlation was shown between the air permeability of filter paper and the rate of filtration; this enabled one to make a good estimate of the speed of a filter paper without wetting it. A recommended procedure for detg. the rate of flow of water through filter paper was given.

12843. DERYAGIN, B.V. AND KRYLOV, N.A. **Anomalous phenomena in the flow of liquids through fine pores of rigid filters.** *Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk. Inst. Mashinovedeniya, Soveshchanie po Vyazkosti Zhidkosteĭ i Kolloid. Rastvorov (Conf. on Viscosity of Liquids and Colloidal Solns.)* 2, 52-3(1944).—*C.A.* 40, 3314^1.

The rate of flow of water through porous ceramic and carbon filters was measured as a function of the pressure P applied by means of a Hg column. No. anomalies were observed with pores of 0.3 μ diam. or more, the rate of flow being directly proportional to P. With pores of 0.1 μ diam., the flow followed Poiseuille's law only at relatively high P. At lower pressures, the flow was no longer viscous but nearly plastic in character, following approx. Bingham's law. Carbon filters showed anomalies even with pores of diam. of the order of 0.7 μ; addn. of isoamyl alc. and of isovaleric acid resulted, resp., in 4- and 5- fold increases in the rate of filtration.

12844. BABCOCK, A.B. **The porosity of bone black.** *Intern. Sugar J.* 47, 209-11 (1945).—*C.A.* 39, 4742^7.

The percentage porosity of a bone char was calcd. as 100 [1 - wt per ft^3/(% grain vol. × 182.4)]. A bone char of zero porosity would weight 93.64 lb/ft^3. The accuracy of the figure for the porosity was based upon the percentage grain vol. corresponding to the wt/ft^3 and to the value 182.4, the wt/ft^3 of the material of which bone char was composed.

12845. DRAKE, L.C. AND RITTER, H.L. **Pore-size distribution in porous materials. II.** Macropore size distributions in some typical porous substances. *Ind. Eng. Chem., Anal. Ed.* **17**, 787-91 (1945).—*C.A.* 40, 786^9.

The macropore size distributions of samples of activated clay, Fuller's earth, diatomaceous earth, bauxite, activated Al_2O_3, silica gel, activated carbons, silica-Al_2O_3 gels, flint quartz, Coors porous plate, porous iron, and fritted glass were detd. by means of the pressure porosimeter.

12846. GRIMLEY, S.S. **Liquid-flow conditions in pack towers.** *Soc. Chem. Ind.*(London) *Chem. Eng. Group Proc.* 27, 228-35; *Trans. Inst. Chem. Engrs.* (London) 23, 228-35 (1945).—*C.A.* 43, 1614^d.

The flow of liquids on vertical surfaces was investigated. Significant departures from theoretical values in the streamline flow range were related to channeling and wetting phenomena in a lab. column packed with 3/8-in. rings. Departures from theoretical in streamline flow occurred in a "ripple" region, which, for water at room temp., occurred over a range of Reynolds no. from 25 to approx. 1000.

12847. LEIBENZON, L.S. **Fundamental law of gas motion through a porous medium.** *Compt. rend. acad. sci. U.R.S.S.* 47, 16-18 (1945); *Doklady Akad. Nauk S.S.S.R.* 47, 15-17(1945).—*C.A.* 40, 3961^2.

A differential equation was developed which, when integrated, described the movement of a gas or an incompressible fluid through a porous medium. The movement may be laminar or turbulent.

12848. LEPINGLE, MARCEL. **Determination of the porosity of refractory products.** *Chaleur et ind.* 26, 101-6(1945).—*C.A.* 40, 3244^3.

Comparative porosity tests showed that values obtained by immersion in H_2O at room temp. were only 60-70% of the values given by immersion in cold H_2O, boiling, and recooling under H_2O and immersion in H_2O and then evacuating by a H_2O pump. Immersion in cold H_2O, boiling, and recooling under H_2O gave max. values most rapidly. Cut test cubes gave generally higher values than were given by whole pieces. Immersion in H_2O and then evacuating by a H_2O pump was modified by immersion of the test piece in H_2O after the piece was under vacuum which modification gave max. values more rapidly with no loss of precision. Test pieces were dried to const. wt in an oven at 110°C before test to eliminate humidity effects.

12849. Ries, Herman E. Jr.; Van Nordstrand, Robert A.; Johnson, Marvin F.L., and Bauermeister, Herman O. **Adsorption-desorption isotherm studies of catalysts. I. Supported catalysts in the powder and pellet forms.** *J. Am. Chem. Soc.* 67, 1242-5(1945).—*C.A.* 39, 4786^4.

N_2 adsorption-desorption isotherms were studied at low temps. with supported catalysts in the powder and pellet forms. Hysteresis effects were very similar for both forms of two catalysts widely different in area. The pore structure responsible for the hysteresis effect was not produced by pelleting nor was it affected by subsequent grinding to 100-mesh powder. Hysteresis extended from 0.4 relative pressure to p_o. The vol. of the adsorbate, V_s, may be detd. more precisely on desorption than on adsorption. Pore vols. were in agreement with those obtained in He-Hg displacement measurements.

12850. Ritter, H.L. and Drake, L.C. **Pore-size distribution in porous materials. Pressure porosimeter and determination of complete macropore size distributions.** *Ind. Eng. Chem., Anal. Ed.* 17, 782-6 (1945).—*C.A.* 40, 786^9.

The macropore size distribution in porous materials was detd. by measuring the vol. of Hg that entered the pores when a mass of Hg surrounding the sample was subjected to varying external pressure. A description of the porosimeter was given. The complete distribution curves of a diatomaceous earth, a Coors porous plate, an ultrafine fritted glass, an activated clay, and a pelleted silica-Al_2O_3 gel were detd.

12851. Rose, H.E. **An investigation into the laws of flow of fluids through beds of granular materials.** *Inst. Mech. Engrs., Applied Mechanics, Proc.* 153, *War Emergency Issue* No. 5, 141-8 (1945).—*C.A.* 40, 3306^9.

An equation governing liquid flow through a bed of granular materials was derived by dimensional analysis and verified by expt. for liquids having abs. viscosities ranging from 16.0 to 0.01 poise. The bed material was spherical shot graded to a mean size. The curve relating fluid resistance to Reynolds no. was similar in form to that for a single sphere moving in an infinite fluid and wall effect was negligible. Resistance to flow was proportional to depth of bed and varied inversely as the fourth power of the voidage approx. for beds of normal density of packing.

12852. Rose, H.E. **The isothermal flow of gases through beds of granular materials.** *Inst. Mech. Engrs., Applied Mechanics, Proc.* 153, *War Emergency Issue* No. 5, 148-53(1945).—*C.A.* 40, 3307^1.

Pressure-drop data for sand (0.042 cm diam.) packed to various heights in a brass tube 1.5 in. inside diam. by 4 ft long using air, H_2, O_2, and C_2H_2 was compared with calcd. values. Discrepancies were attributed to the uncertainty in the relation between resistance coeff. and Reynolds no.

12853. Rose, H.E. **The resistance coefficient--Reynolds number relationship for fluid flow through a bed of granular material.** *Inst. Mech. Engrs., Applied Mechanics, Proc.* 153, *War Emergency Issue* No. 5, 154-61(1945).—*C.A.* 40, 3307^2.

Literature data for nonspherical particles was correlated with those for spherical particles by use of appropriate shape-factors. Values of the resistance coeff. correlated well in the viscous and turbulent flow ranges but scattered widely in the transition region. Curves for beds of particles of various degrees of angularity were presented.

12854. Sackmann, L.A. and Hughes, L. **The permeability of filter beds. Precision measurements.** *J. phys. radium* 6, 134-44 (1945).—*C.A.* 40, 1065^4.

Terminology, history, and laws were reviewed for the detn. of permeability of various beds.

12855. Kocatopcu, Sahap S. **Fundamental study of clay. VII. Effect of particle size on properties of casting slips.** *J. Am. Ceram. Soc.* 29, 99-107(1946).—*C.A.* 40, 3578^9.

Binary and ternary mixts. were made of 0.2-0.4 μ and 0.8-1.6 μ purified fractions of clay and of 16-44 μ purified flint. Sp. gr., deflocculation point, and H-ion concn. detns. were made on each compn. to obtain the same apparent viscosity. Small cylinders were prepd. by solid casting, and the shrinkage, porosity, and modulus of rupture of the dried specimens were measured. Porosity of the dried casts was greatly affected by particle-size distribution. The min. porosity of 28.5% obtained in this work was much lower than the 35.5% of the standard sanitary body.

12856. Morcom, A.R. **Fluid flow through granular materials.** *Trans. Inst. Chem. Engrs. (London) and Soc. Chem. Ind. (London), Chem. Eng. Group*, Advance copy, Mar. 12, 1946, 8 pp.—*C.A.* 40, 3943^2.

The "normal" packing was obtained by dropping in a thin stream on the bed from a height of several ft. The containers were large in most cases compared to the particle size, ranging from 3.7 to 15.1 cm in diam. Air, CO_2, and H_2 were used. No general shape factors were predicted from the data for glass spheres, broken coke, iron oxide, spherical nodules, marble chips, irregular iron oxide nodules, iron oxide cylinders and kaolin cylinders.

12857. Pshezhetskiĭ, S.A. and Rubinshtein, R.N. **Kinetics of heterogeneous reactions on porous catalysts.** *J. Phys. Chem.* (U.S.S.R.) 20, 1127-36(1946)(in Russian); *Acta Physicochim. U.R.S.S.* 21, 1075-88(1946)(in English).—*C.A.* 41, 2972c.

The diffusion of the reactants to the surface of a porous catalyst was discussed. The conditions were defined under which (1) no hydrodynamic flow was created by the reaction, (2) the diffusion of only one reactant need by considered, and (3) the temp. gradient within the catalyst grain had a measurable effect.

12858. Zakharov, B.A. and Frost, A.V. **Pressure drop through granular materials in contact packed tubes.** *Bull. acad. sci. U.S.S.R., Classe sci. tech.* **1946**, 421-41.—*C.A.* **41**, 2300*b*.

The value of Δp (pressure drop in kg/m^2) detd. by Chilton and Colburn was too low. The following equation was established: $\Delta p = K_o NH/D_1^m D_2^n$, where H = height of packing in m, D_1 = av. diam. of packing particle in m, D_2 = diam. of tube in m, N = d. X kinematic viscosity X linear velocity of gas, and K_o, m, and n were tabulated for different values of D_1/D_2.

12859. Arthur, J.R. and Linnett, J.W. **Interchange of heat between a gas stream and solid granules.** *J. Chem. Soc.* **1947**, 416-24.—*C.A.* **41**, 5348*b*.

The app. consisted of a tube contg. a bed of graded charcoal granules. Heat was supplied to the charcoal bed at one section by an elec. heater. Small thermocouple elements were used to study the temp. distribution while air streamed through the bed. A plot of the logarithm of the temp. difference at the steady state as a function of the distance down the column gave a straight line. The slope of this line depended on the flow rate and was independent of the rate at which heat was supplied by the heater. Since the const. for heat interchange was much greater than the thermal cond., the air temp. was very close to the charcoal temp. throughout the column under steady-state conditions.

12860. Brownell, L.E. and Katz, D.L. **Flow of fluids through porous media. II. Simultaneous flow of two homogeneous phases.** *Chem. Eng. Progress* 43, No. 11, *Trans. Am. Inst. Chem. Engrs.* 601-12(1947).—*C.A.* 42, 4*d*.

In the simultaneous flow of 2 fluid phases, each was treated as a single phase with modifications for the effect of one fluid on the other. An addnl. correlation was developed to predict the quantity of fluid held in a porous bed by capillary forces. By use of the general flow equation both countercurrent and parallel flow of the 2 phases could be calcd.

12861. Brownell, L.E. and Katz, D.L. **Flow of fluids through porous media. III. Application to rotary vacuum filtration.** *Chem. Eng. Progress* 43, No. 12, *Trans. Am. Inst. Chem. Engrs.*, 703-12(1947).—*C.A.* 42, 422*g*.

"Unsteady" states resulting from changing cake thickness during deposition and from changing effective satn. during air flow necessitated integration of the "steady" state relations. Graphical integration methods could be used for either turbulent or laminar flow. Formal integration methods for predicting cake deposition were used when flow was known to be laminar. The calcn. of cake deposition, air flow, and final moisture content in the filter cycle was possible.

12862. Carman, P.C. **Slip flow in granular beds.** *Nature* 160, 301-2(1947).—*C.A.* 42, 4020*e*.

An equation was derived introducing a factor k_o/k which equals $(L_e/L)^2$ and had a value between 1.5 and 2.

12863. Heywood, Harold. **Fluid flow through stable particulate systems.** *J. Imp. Coll. Chem. Eng. Soc.* 3, 7-21 (1947).—*C.A.* 42, 5725*f*.

A stable particle packing was unmoved by the fluid because of the wt or some other constraint. Diagrams were presented to show how the cross section of the interspace element varied with three packing systems consisting of spheres. In the case of random packing, either of spheres or irregularly shaped particles, the variation of av. interspace area will not be so great as with the regular packings described. A numerical example was given of a calcn. of pressure drop for H_2O flowing through a bed of sand particles. The rate of air flow through this bed was also calcd.

12864. Hougen, O.A. and Marshall, W.R. **Adsorption from a fluid stream flowing through a stationary granular bed.** *Chem. Eng. Progress* 43, No. 4, *Trans. Am. Inst. Chem Engrs.*, 197-208, (1947).—*C.A.* 41, 3343*a*.

An analytical method was developed for isothermal conditions where a linear equil. relation existed between the adsorbate content of the gas and of the solid. Schumann-Furnas charts were modified to fit this particular case of adsorption.

12865. Leva, Max. **Heat transfer to gases through packed tubes - general correlation for smooth spherical particles.** *Ind. Eng. Chem.* 39, 857-62 (1947).—*C.A.* 41, 4972*h*.

Heat transfer to gases through tubes filled with spherical packing of low thermal cond. was investigated for ratios of D_p/D_t varying from 0.05 to 0.3. The equation developed allowed prediction of heat-transfer coeffs. if the value of the Prandtl no. was in the range of 0.74-0.80. A max. heat-transfer coeff. was found when D_p/D_t was equal to 0.15. The effect of voids in the packing was studied, but no coordinated relation with the heat-transfer coeff. was found.

12866. Leva, Max and Grummer, Milton. **Pressure drop through packed tubes. II. Effect of surface roughness.** *Chem. Eng. Progress* 43, No. 11, *Trans. Am. Inst. Chem. Engrs.* 638-8 (1947).—*C.A.* 42, 4*b*.

Exptl. data were obtained for pressure drop through particles of different degrees of surface roughness. It was found that particles as rough as clay or alundum increased the pressure drop by 50%. For particles such as irregularly shaped dense Aloxite granules, which were much rougher than clay particles, the pressure drop was more than twice as high as was observed with smooth particles.

12867. Leva, Max and Grummer, Milton. **Pressure drop through packed tubes. III. Prediction of voids in packed tubes.** *Chem. Eng. Progress* 43, No. 12, *Trans. Am. Inst. Chem. Engrs.*, 713-18(1947).—*C.A.* 42, 421*e*.

Correlations for voids in packed tubes were developed. Investigations were made with uniform and mixed size smooth spheres, with rough spheres, smooth and rough cylindrical particles, and

Raschig rings. A chart was prepd. which summarized the results observed with these materials and which could readily be used for design calcns.

12868. Metrot, Roger. **A simple apparatus for the measurement of air permeabilities.** *Rev. inst. franc. petrolé* 2, 518-20 (1947).—*C.A.* 42, 4003*i*.

A glass or metal tube was fitted with a gasket which served to hold test samples of material. The bottom of the glass or metal tube was connected to an outlet furnished with a stopcock. Another graduated tube extended through the center of the bottom of the glass or metal tube into a vessel filled with water. After insertion of the test sample in the glass or metal tube, the water in the graduated tube was made to rise to a calibrated mark by evacuation through an outlet. The stopcock in the outlet was closed, and the time was measured which elapsed before the water returned to a standard mark in the graduated tube.

12869. Rzhevkin, S.N. and Tumanskii, S.S. **The measurement of the internal friction of air in porous materials by uniform flow and by the use of sound waves.** *Zhur. Tekh. Fiz.* 17, 681-92 (1947); *Chem. Zentr.* 1948, II, 1160.—*C.A.* 44, 8736*h*.

Detns. were made of the diminished pressure of air drawn through a porous material held between perforated plates. The resistance of the porous material was calcd. Measurements were made on cotton, glass wool, spun silk, dust, and Mikal (a fine cotton fabric) for the range 0.3-300 cm/sec. The exptl. values agreed with the results of approx. calcns. in which a laminar flow was assumed.

12870. Takagi, Sadashige. **Flow of gases through porous media. I. II.** *J. Chem. Soc. Japan* 68, 5-6 (1947).—*C.A.* 43, 7288*c*.

The temp. rise of active charcoal on adsorption of various org. solvent vapors was measured. The temp. rose sharply, passed through a max. and then decreased. The dynamic pressure distribution of air flow through porous media was also measured. Some irregularities were ascribed to the inhomogenous distribution of flow velocity of vapors through a cylinder filled with charcoal grains.

12871. Zenz, Frederick A. **Mechanism of counter-current gas-liquid flow through packed towers.** *Chem. Eng. Progress* 43, No. 8, *Trans. Am. Inst. Chem. Engrs.*, 415-28 (1947).—*C.A.* 41, 5759*b*.

The characteristics of counter-current flow through packed towers was studied which permitted a definition of the "flooding point". Data were given that correlated as well or better than "visual" detns. and permitted a correlation of pressure drops at this "flooding point." An equation was derived which could be used to calc. the pressure drop at various flow rates.

12872. Zettlemoyer, A.C. and Walker, W.C. **Active magnesia. Surface areas and pore structures from nitrogen adsorption.** *Ind. Eng. Chem.* 39, 69-74 (1947).—*C.A.* 41, 1140*a*.

The B.E.T. surface area of 7 samples of com. MgO were detd. ranging from 0.8 to 200 m²/g; areas detd. by I_2 adsorption from CCl_4 soln. were about 35% lower. In the relative-pressure range 0.3 to 0.5, the N_2 adsorption exceeded by a few percent that predicted by the B.E.T. theory. A structure was assumed consisting of plates made up of a checker work of cubic crystals and holes.

12873. Allen, F.A. **Porosity. Another approach.** *Light Metals* 11, No. 121, 90-101(1948).—*C.A.* 42, 3712*d*.

The odor of C_2H_2 apparent when Al alloys were fractured, was discussed. Active solid impurities present in Al were chiefly carbides and nitrides. Nitride formation was suspected when dry N_2 was used as a flux for Al. As the combined total of carbides and nitrides in Al alloy rarely exceeded 0.5%, they were generally ignored in considering fractures in subsequent production stages. As metal contg. carbides and nitrides was poured into the mold, reactions were instantaneous and gaseous products were formed progressively as new surfaces were thrown up by turbulence during pouring. Control of carbide contamination was considered a more difficult problem to solve than the control of H_2.

12874. Barrer, R.M. **Fluid flow in porous media.** *Discussions Faraday Soc.* 1948, No. 3, 61-72.—*C.A.* 43, 2139*h*.

The displacement of one fluid by another was examd. together with the relative roles played by pressure-head and surface tension. Mol. mechanisms of gas or vapor flow in single capillaries and in porous media and transition regions from one flow mechanism to another were particularly examined. High-pressure flow in wide tubes to pore radii so small that the diffusing species move entirely within the range of surface forces were considered.

12875. Ciborowski, Janusz. **The fundamentals of the fluidization process.** *Przegląd Chem.* 6, 164-72 (1948).—*C.A.* 44, 2*e*.

A glass column (30 mm diam. and 120 cm long) was used in the study of the process. A min. gas flow was necessary for the fluidization to take place. This crit. velocity for incompressible powders was independent of their amt. The flow friction was proportional to flow velocity and the amt. of powder, also to particle diam. and d. Two phases could be distinguished in a fluidized system: a "dense" phase, whose concn. was const., and a "dilute" phase, showing a barometric effect.

12876. Cross, A.H.B. and Young, P.F. **The measurement of apparent porosity and bulk density.** *Trans. Brit. Ceram. Soc.* 47, 121-47 (1948).—*C.A.* 43, 2388*e*.

Porous materials were evacuated to pressures of 0.3 to 2 in. Hg. A few min. at atm. pressure after evacuation sufficed to fill the pores almost completely (99.7%). Test pieces weighing about 100 g were preferred. Removal of too much liquid while wiping the test piece led to greater errors than insufficient wiping. A modified method achieved almost complete soaking within a few min. by an immersion of samples at 110°C directly in boiling water at atm. pressure, followed by cooling to room temp.

12877. Ferrandon, Jean. **The laws of flow in filtration.** *Genie civil* 125, 24-8(1948).—*C.A.* 42, 8536*d*.

Physical coeffs. detg. speed and hydrodynamic action on solid particles of a filter such as clay or sand were discussed and evaluated.

12878. KOPELMAN, B. AND GREGG, C.C. **The pore size of hydrogen-reduced tungsten powder.** *Am. Inst. Mining Met. Engrs. Inst. Metals Div., Metals Technol.* 15, No. 5, Tech Pub. No. 2434, 6 pp.(1948).—*C.A.* 42, 8739*h*.

The existence of pores of mol. size in com. H_2-reduced W powder was proven. The d. of a gaseous-reduced product or sintered material in a liquid of large mol. vol. was a better criterion of the nature of the material than the d. detd. in H_2O or other conventional liquids of small mol. vol.

12879. LEDOUX, EDWARD. **Dynamic cooling of adsorbent beds.** *Ind. Eng. Chem.* 40, 1970-7(1948).—*C.A.* 43, 1253*g*.

Cooling curves for a bed of any broken solids was detd. graphically. The curves were plotted in dimensionless coordinates so that they may be used with any consistent system of units for the soln. of cooling problems. Practical application was illustrated by numerical examples which also served as a basis for the comparison between open- and closed-circuit cooling of adsorbent beds.

12880. LEVA, MAX; GRUMMER, MILTON, AND WEINTRAUB, MURRAY. **Introduction to fluidization.** *Chem. Eng. Progress* 44, No. 7, 511-20 (1948).—*C.A.* 42, 5724*c*.

Counter-gravity flow of air, CO_2 and He through beds of round and sharp sands was investigated. The point of bed expansion in connection with the onset of fluidization was correlated with the fluid rate necessary for initial bed expansion. The proposed equation applied to narrow cuts as well as mixts., provided the diam. of the particles in the mixt. was defined according to the rule proposed in the paper. Fluidization phenomena in a 2.5 and 4 in. glass tube were discussed and possible explanations for the slugging and channeling behavior of fluidized beds were proposed.

12881. LEVA, MAX; GRUMMER, MILTON; WEINTRAUB, MURRAY, AND POLLCHIK, MORRIS. **Fluidization of solid nonvesicular particles.** *Chem. Eng. Progress* 44, No. 8, 619-26(1948).—*C.A.* 42, 7583*a*.

The exptl. work was carried out with round and sharp silica sands varying in size from 0.01505 to 0.00202-in. effective diam. The flow of air, CO_2, and He through beds of these particles in 2.5-in. and 4-in. tubes was investigated. A bed of fine particles must have a certain min. voidage before fluidization could set in. This min. fluid voidage was correlated with the effective diam. of the bed particles for the various shapes considered.

12882. NORMAN, W.S. **Fluid friction, heat, and mass transfer in turbulent flow with particular reference to the performance of packed towers.** *Trans. Inst. Chem. Engrs.* 26, 81-90(1948).—*C.A.* 45, 3201*i*.

12883. OULTON, T.D. **The pore size-surface area distribution of a cracking catalyst.** *J. Phys. & Colloid Chem.* 52, 1296-1314 (1948).—*C.A.* 43, 3180*g*.

The N_2 adsorption-desorption isotherm (Type II) for an activated natural-clay cracking catalyst (Filtrol) was used. The basic assumptions were: (1) the shape of the desorption branch detd. the pore-size distribution; (2) the closing of the hysteresis loop detd. the radius of the smallest pore present; (3) at satn. the liquid condensed in the capillaries could be divided into a portion close to the solid wall and a portion of the adsorbate which possessed the properties of the bulk liquid-an "inner capillary vol.". The B.E.T. surface could be allocated to categories of pores within selected radius ranges. The surface-area distribution and the type of pore structure was interpreted in terms of an idealized structure model whereby the av. crystallite size was calcd. and the calcd. surface area of the model was in good agreement with the true surface area.

12884. RITTER, H.L. AND ERICH, L.C. **Pore-size distribution in porous materials: interpretation of small-angle x-ray scattering patterns.** *Anal. Chem.* 20, 665-70 (1948).—*C.A.* 42, 7599*e*.

The theory of small angle x-ray scattering was applied simply and approximately to porous agregates, and the results reduced to continuous distributions of pore size. Pore-size distributions were calcd. for some silica-alumina gels and for a Fuller's earth. The results were correlated with those obtained from adsorption expts. and by means of the Hg porosimeter.

12885. WEINTRAUB, MURRAY AND LEVA, MAX. **Pressure drop in packed tubes. A nomogram.** *Chem. Eng. Progress* 44, 801-2 (1948).—*C.A.* 43, 2*e*.

A nomogram was presented for aid in the rapid calcn. of pressure drop through packed tubes when the flow was turbulent and the packing smooth.

12886. WILHELM, RICHARD M. AND KWAUK, MOOSON. **Fluidization of solid particles.** *Chem. Eng. Progress* 44, No.3, *Trans. Am. Inst. Chem. Engrs.* 201-18 (1948).—*C.A.* 42, 2480*a*.

Expts. were performed in the fluidization of solid particles by means of air and H_2O in 3-in. and 6-in. diam. columns. Spherical and uniformly sized particles of sand, glass, silicate catalyst, and Pb shot ranging in size from 5 to 0.3 mm in diam., and in d. from 1.125 to 10.792 g/ml were used. Pressure drop, fraction void, and velocity were measured and correlated in generalized terms through 4 dimensionless groups.

12887. AGAFONOV, A.V. AND KALIKO, M.A. **Porous structure and catalytic activity of catalysts.** *Zhur. Obshchei Khim.* (J. Gen. Chem.) 19, 39-46 (1949); *J. Gen. Chem. U.S.S.R.* 19, 33-9 (1949). —*C.A.* 43, 6336*b*; 44, 6052*i*.

For a series of silica gel catalysts, the catalytic activity *K* was a function at const. total porosity *P* of the mean pore radius (detd. by capillary condensation of H_2O vapor at 18.7°C) with a max. at 9-10 A. For the 7 catalysts examd. *P* ranged from 24.5 to 45.8% and the total surface area from 205 to 880 m^2/ml. Catalyst activated by $Al(OAc)_3$ had a 25% higher activity than catalysts activated under the same conditions by $Al_2(SO_4)_3$ of the same concn. of Al_2O_3. Catalysts with finer porosity gave, throughout, lower yields of gasoline and greater amts. of gas than catalysts with coarse pores. For highest efficiency, aluminosilicate catalyst should be chosen with pores predominantly larger than the diam. of the reacting mols., and a low development of ultrapores.

12888. Anderson, S.L. and Warburton, F.L. **Porous plug and fiber diameter measurement. Effect of fiber orientation and use of plugs of randomized fibers.** *J. Textile Inst.* **40**, T749-58(1949).—*C.A.* 44, 1262*i*.
A method was devised for cutting short lengths of fiber, randomizing by shaking with petr. ether, and packing into a brass tube. This gave results independent of initial fiber arrangement.

12889. Badollet, M.S. **Filterability of asbestos fibers used in wet processes.** *Trans. Can. Inst. Mining Met.* **52**, 594-8 (in *Can. Mining Met. Bull. No.* 451) (1949).—*C.A.* 44, 1627*a*.
A simple lab. procedure was devised for measuring the filterability of asbestos in H_2O or of asbestos in combination with H_2O and cement. The presence of asbestic fines or shorts decreased the filterability in proportion to the quantity of fines or shorts present in the mixt. In the tests made, minus-20, plus-35-mesh material gave the max. improvement in filtration; with smaller sizes, the filtration rate began to decrease, owing to decreasing porosity of the mixt.

12890. Belden D.H. and Kassel, Louis S. **Pressure drops encountered in conveying particles of large diameter in vertical transfer lines.** *Ind. Eng. Chem.* **41**, 1174-8 (1949).—*C.A.* 43, 6476*e*.
In the vertical transport of spherical catalyst, the total pressure drop was expressed as a static term based on actual particle density in the transfer line, and a friction term which involved the particle mass velocity, but was independent of particle diam. and density.

12891. Bond, R.L. and Maggs, F.A.P. **Particle size and pore structure of finely ground coal chars.** *Fuel* 28, No. 8, 172-5(1949).—*C.A.* 43, 7208*i*.
The fine structure of the coal char behaved as a mol. sieve penetrable to small mols. but impenetrable to large ones, such as dibutyl phthalate. The immersion of the powd. char in a liquid of sufficiently large mol. vol. led to the generation of a wetting energy which was proportional to the external surface area of the particles. A powder heated to a sufficiently high temp. became impenetrable to the mols. of all of the liquids used in the expts. Heating to still higher temps. caused a smoothing of the external surface.

12892. Brinkman, H.C. **Calculations on the flow of heterogeneous mixtures through porous media.** *Applied Sci. Research* **A1**, 333-46(1949).—*C.A.* 44, 3311*c*.
Analytical soln. of Muskat's basic differential equations for the general case of flow of fluids through porous materials were obtained for two special cases: (1) flow of a liquid through a column originally satd. with a second liquid with which it was immiscible, and (2) flow from a vertical porous column filled with liquid satd. with gas when opened at its lower end. In both examples the expression for satn. through the bed had a three-valued soln.

12893. Carman, P.C. **Flow of adsorbed molecules.** *Nature* **163**, 684-5(1949).—*C.A.* 43, 6883*d*.
The transition from viscous to mol. flow (H_2, air, CO_2, Freon-12, and SO_2) through a medium (Linde silica) having pores comparible in size to the mean free path of the mols. was studied. Consistent values for the specific surface were obtained with all gases except SO_2. The flow rate of SO_2 was higher than expected.

12894. Drake, L.C. **Pore-size distribution in porous materials. Application of a high-pressure mercury porosimeter to cracking catalysts.** *Ind. Eng. Chem.* 41, 780-5(1949).—*C.A.* 43, 5575*c*.
The technique for the detn. of macropore size distribution with the high-pressure Hg porosimeter was extended to include the pore diam. range 200-35 A. Pressures from 25 to 60,000 p.s.i. were used. Representative data were presented for com. cracking catalysts with average pore diameters of 44-98 A. including activated clay, and silica-alumina gels in the form of beads and pellets.

12895. Ellis, J.N. **Some applications of fluidization bed technique. I.** *Chem. Eng. Mining Rev.* 41, 295-9(1949).—*C.A.* 43, 9414*g*.
The field of fluidization and a description of the Winkler method of brown-coal gasification and the fluid catalytic process were reviewed.

12896. Ergun, Sabri and Orning, A.A. **Fluid flow through randomly packed columns and fluidized beds.** *Ind. Eng. Chem.* 41, 1179-84(1949).—*C.A.* 43, 6475*f*.
The ratio of pressure gradient to superficial fluid velocity in packed columns was a linear function of fluid mass-flow rate. Particle specific surface, fractional void vol., and fluid velocity were consts. in this relation, and were used to predict the degree of bed expansion with increasing gas flow after the pressure gradient reached the buoyant wt of solids per unit vol. of the bed. A const. product of gas viscosity and superficial velocity may serve as a criterion of a standard state in fluidized systems used for reaction kinetic studies.

12897. Farbar, Leonard. **Flow characteristics of solids-gas mixtures in a horizontal and vertical circular conduit.** *Ind. Eng. Chem.* 41, 1184-91(1949).—*C.A.* 43, 6475*h*.
The isothermal flow characteristics of a solids-gas mixt. ($Al_2O_3—SiO_2$ catalyst and air) in a horizontal and in a vertical glass conduit were studied. Qual. observations were made on the flow in the solids feed line, mixing nozzle, horizontal and vertical sections of the conduit, and short and long radius bends. Several types of nozzles were compared to find the type yielding the most uniform mixing.

12898. Fox, J.W. **Onset of turbulent flow in certain arrays of particles.** *Proc. Phys. Soc.* (London) 62B, 829-32(1949).—*C.A.* 44, 1290*d*.
Reynold's no. were found for the onset of turbulence in H_2O flowing through a perfectly packed hexagonal array of uniform spheres. Expts. were

carried out on an imperfectly packed array of the same spheres and on an array of irregular particles (marble chips). A differential manometer, which read differences of the order of a hundredth of a mm of H_2O was described. Imperfections of packing appeared to make little difference as regards the onset of turbulence.

12899. Fuks, G.I. **The flow of structured dilute sols and suspensions.** *Doklady Akad. Nauk S.S.-S.R.* 66, 1125-8(1949).—*C.A.* 43, 7291*g*.

Radial distribution curves of the velocity of flow of colloidal systems with anomalous viscosity were obtained by observations of (0.5-mm) particles of carbon, ZnO, or Al spread on the surface of the liquid. For 0.8% $Fe(OH)_3$ + 6 mg-equiv. NaCl, a 0.15% suspension of bentonite (0.1-0.5 μ) satd. with K^+ + 0.5 mg-equiv. KCl, and a 1.2% soln. of rubber in kerosene, the curves consisted of a portion of Newtonian or near-Newtonian distribution. This confirmed the occurrence of local turbulence at Reynolds nos. well below the crit. no. and long before the appearance of general turbulence of the flow. Another type, macroscopically Newtonian, but microscopically showing local circulation layers extending not over 0.1 mm was shown by $Fe(OH)_3$ sols at low speeds; at higher speeds, these sols go over into the 1st type.

12900. Gilliland, E.R. and Mason, E.A. **Gas and solid mixing in fluidized beds.** *Ind. Eng. Chem.* 41, 1191-6(1949).—*C.A.* 43, 6475*i*.

The internal flow of gas and solid in a fluidized bed was studied by tracer gas and heat flow methods. With a high ratio of length to diam., back-mixing of the gas was found to be relatively small. The heat flow measurements indicated that solid mixing was relatively rapid, and that the sensible heat carried by the solid was sufficient to maintain essentially const. temp. throughout the reactor.

12901. Happel, John. **Pressure drop due to vapor flow through moving beds.** *Ind. Eng. Chem.* 41, 1161-74(1949).—*C.A.* 43, 6476*c*.

An investigation was made of the flow of vapors through moving beds of catalyst in which the entire bed moved with respect to the walls of the container, but the moving particles remained in a fixed position relative to each other. Air was passed in concurrent and countercurrent flow through such beds of granular, spherical, and pellet catalysts.

12902. Hariu, O.H. and Molstad, M.C. **Pressure drop in vertical tubes in transport of solids by gases.** *Ind. Eng. Chem.* 41, 1148-60(1949).—*C.A.* 43, 6476*b*.

Total-pressure and static-pressure drops were measured in the transport of solid particles through vertical glass tubes by an air stream, using sized sand and SiO_2-Al_2O_3 cracking catalyst as solids. The total-pressure drop was the sum of the drop due to the carrier gas alone plus a solids pressure drop. A residual obtained by subtracting the solids static head from the total solids pressure drop was treated as an apparent solids friction drop, but later measurements showed the major portion of the apparent friction was caused by particle acceleration in the test section.

12903. Hobson, Mer and Thodos, George. **Mass transfer in the flow of liquids through granular solids.** *Chem. Eng. Progress* 45, 517-24(1949).—*C.A.* 43, 8751*e*.

Mass-transfer coeffs. were correlated as linear functions of the modified Reynolds no. over the limited range studied. Sep. correlations were produced for each system and for each particle diam. These coeffs. varied approx. as the 0.23 power of the modified Reynolds no. Mass-transfer factors for *iso*-BuOH-water and Me, Et, ketone-water were found to produce an identical function when correlated with a modified Reynolds no. The correlation was independent of particle diam.

12904. Houpeurt, A. **Apparatus for porosity studies.** *Rev. inst. franc. petrole* 4, 95-102 (1949).—*C.A.* 43, 5234*e*.

The construction of porosimeters for the investigation of air adsorption of rock beds was described in detail.

12905. Juhola, A.J. and Wiig, Edwin, O. **Pore structure in activated charcoal. I. Determination of micro pore size distribution.** *J. Am. Chem. Soc.* 71, 2069-77(1949).—*C.A.* 44, 309*a*.

By detg. the molar vol. of adsorbed water as a function of relative pressure and the variation of the surface area as a function of the vol. of adsorbed water, it was possible to calc. the pore diam. of cylindrical pores at any relative pressure. Substitution of these values in the Kelvin equation applied to the desorption isotherm gave values of cos θ = 0.49 over practically the entire relative pressure range for two charcoals. The adsorption isotherm for one charcoal gave cos θ = 0.28.

12906. Juhola, A.J. and Wiig, Edwin O. **Pore structure in activated charcoal. II. Determination of macro pore size distribution.** *J. Am. Chem. Soc.* 71, 2078-80(1949).—*C.A.* 44, 309*c*.

The pressures at which known quantities of Hg were forced into charcoal pores were detd. Using the capillary rise equation, the pore size distribution in the pore diam. range 1200-160,000 A was obtained.

12907. Kuczynski, G.C. **Study of the sintering glass.** *J. Applied Phys.* 20, 1160-3(1949).—*C.A.* 44, 1661*h*.

The mechanism of sintering of spherical glass particles was that of viscous flow. The viscosities of the investigated glass were detd. in the range from 575° to 744°C. These viscosities were in good agreement with those obtained by other methods.

12908. Leva, Max. **Fluid flow through packed beds.** *Chem. Eng.* 56, 115-17(1949).—*C.A.* 43, 4906*d*.

The subject was reviewed.

12909. Leva, Max; Weintraub, Murray, and Grummer, Milton. **Heat transmission through fluidized beds of fine particles.** *Chem. Eng. Progress* 45, 563-72(1949).—*C.A.* 43, 8753*g*.

The study was made in tubes of 2- and 4-in. diam. with round sand, sharp sand, and an Fe Fischer-Tropsch catalyst (Fe_3O_4) in the particle size range of 400-100 mesh. The effect upon rates of heat transfer of various bed, particle, fluid, tube, and fluidization variables was investigated.

12910. LEWIS, W.K.; GILLILAND, E.R., AND BAUER, W.C. **Characteristics of fluidized particles.** *Ind. Eng. Chem.* 41, 1104-17(1949).—*C.A.* 43, 6474*h*.

The flow characteristics for both batch and continuous fluidization of fine glass spheres were investigated. The sphere diam. had a strong influence upon the flow characteristics.

12911. McCUNE, LEROY K. AND WILHELM, RICHARD H. **Mass and momentum transfer in solid-liquid system; fixed and fluidized beds.** *Ind. Eng. Chem.* 41, 1124-34(1949).—*C.A.* 43, 6475*e*.

Mass transfer between an upward stream of liquid and solid particles in fixed and in fluidized beds was studied by investigating the partial soln. of spherical and flaked particles of difficultly sol. 2-naphthol in a rising stream of H_2O. The mass transfer and friction measurements in fixed and fluidized beds were correlated and compared. Mass transfer per unit pressure drop, the importance of fraction void, and the effect of nonuniformity of flow pattern were also considered for fixed and fluidized beds.

12912. MEYER, K.S. **Practical aspects of industrial filtration.** *Ind. Chemist* 25, 5-8(1949).—*C.A.* 45, 7388*g*.

The impurities in the cake were of 3 types: (1) arranged in an orderly manner, the smallest being at the bottom, giving the best rate of filtration but not necessarily the brightest filtrate, (2) semiabsorbing cake in which an irregular distribution of some impurities tended to choke and lower the rate of filtration, and (3) double-layer cake in which completely irregular distribution of all the impurities led to rapid choking and a short filtration cycle. An initial pressure just sufficient to overcome frictional resistance gave a lower initial rate of filtration but a longer cycle and a greater total quantity, and, usually, a better quality of filtrate.

12913. MORSE, ROLLIN D. **Fluidization of granular solids-fluid mechanics and quality.** *Ind. Eng. Chem.* 41, 1117-24(1949).—*C.A.* 43, 6474*h*.

Observed differences between fluid flow in fixed and in fluidized beds were explained in terms of the flocculation of small particles, kinetic energy losses from turbulent motion of large particles, and the inherent instability of gas-fluidized systems. Fluidized-solid reactor performance was highly dependent upon quality of fluidization (defined as uniformity of the fluid and particles).

12914. ONUSAĬTIS, B.A. AND YUR'EVSKAYA, N.P. **Changes in the structure of coke at high temperatures.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk*, 1949, 519-31.—*C.A.* 45, 6367*e*.

During the roasting of samples of coke at 900-1200°C in an inert or oxidizing atm., no shrinkage occurred. Roasting in a stream of CO_2 caused an enlargement in pore vol., predominantly of the larger pores, and increased the absorptive capacity of the coke owing to its loosened structure.

12915. OVCHINNIKOV, L.N. AND MAKSENKOV, V.G. **Experimental investigation of the filtration effect in solutions.** *Izvest. Akad. Nauk S.S.S.R., Ser. Geol.* 1949, No. 3, 82-94.—*C.A.* 43, 8213*d*.

The filtration of different solns. through quartz sand was dependent on the nature of the soln. and on the magnitude of the filter pores. Dependency of the magnitude of the filtration effect on the concn. of the soln., the temp., and the height of the filtering shaft were detd.

12916. POSNER, A.M. AND ALEXANDER, A.E. **New technique for the determination of dynamic surface tensions.** *Trans. Faraday Soc.* 45, 651-61(1949).—*C.A.* 43, 8790*e*.

The method utilized the changes in contact potential to det. the dynamic surface tension and the amt. of adsorption. The solute mol. was adsorbed upon a freshly formed surface in 3 types of app.: a simple trough suitable for systems in which adsorption equil. required a time greater than a few min.; a Perspex channel suitable for times between about 0.01 and 1 sec; and a jet suitable for times between about 0.001 and 0.01 sec. Typical results were given for aq. soln. of *iso*amyl alc. and *sec*-octyl alc.

12917. BALL, CLEO GRIFFITH AND TALIAFERRO, D.B. **A Bureau of Mines method for determing porosity: A list of porosities of oil sands.** *U.S. Bur. Mines, Rept. Invest. No.* 4548 28 pp. (1949).—*C.A.* 44, 311*d*.

The data required were the vol. of the sand grains and the bulk vol. of the specimen. After removal of the contained fluids by extn., the specimen was dried, and the vol. of sand grains detd. by noting the reduction of void space in a vessel or bomb of known capacity when the specimen was placed in it. The void space in the bomb was detd. More than 2000 porosity detns. were made on cores from wells in 13 states and the results were given.

12918. SCHWERTZ, F.A. **The structure of porous materials from gas penetration rates.** *J. Applied Phys.* 20, 1070-5(1949).—*C.A.* 44, 403*h*.

Gas penetration rates were used to study the structure of 3 com. grades of sintered Pyrex glass. Specific surface areas, "av. pore diams.," pore population ds., av. particle diams., and particle population ds. were calcd. on the basis of the data obtained.

12919. SCHWERTZ, F.A. **Fluid-flow study of porous glass.** *J. Am. Ceram. Soc.* 32, 390-3(1949).—*C.A.* 44, 1661*i*.

Two methods were used to det. sp surface area, av. pore diam., and pore-population d. of Vicor glass. The first was based on Knudsen's equation for the diffusive flow of gases and the second on Poiseuille's equation for the viscous flow of liquids. The calcd. values of the two methods were approx. in agreement with each other and with results obtained by use of the B.E.T. adsorption technique.

12920. TAECKER, R.G. AND HOUGEN, O.A. **Heat, mass transfer of gas film in flow of gases through commercial tower packings.** *Chem. Eng. Progress* 45, 188-93(1949).—*C.A.* 43, 3248*d*.

Mass and heat-transfer factors were established for the gas film in air flowing through Raschig rings, partition rings, and Berl saddles. These data were obtained by measuring the rate of evapn. of H_2O into a stream of air from wetted packings during the const. drying-rate period. With the given method of correlation the same results were obtained with both random dense and staggered arrangement of the rings.

12921. Aerov, M.E. and Umnik, N.N. **Measurement of gas velocity in a real granular layer.** *Zhur. Priklad. Khim.* 23, 1009-17(1950); *J. Applied Chem. U.S.S.R.* 23, 1071-8(Engl. translation).— *C.A.* 46, 7858*d*.

Gas speed was detd. by measuring movement of front of sorption of an admixt. of H_2S from the gas stream on the surface of grains treated with sugar of lead. This method was used to det. the distribution of gas speeds along the wall of the app. and in the center of the layer of a spherical catalyst (diam. of particles 6 mm). Along the wall of the app., the speed was 30-70% higher than in the central layers.

12922. Arthur, J.R.; Linnett, J.W.; Raynor, E.J. Mrs., and Sington, E.P.C. **Flow of an air stream through a layer of granules.** *Trans. Faraday Soc.* 46, 270-89(1950).— *C.A.* 44, 8705*e*.

The distribution of air-flow through the granular bed was very sensitive to the detailed pressure conditions above and below the bed. There was always an excess flow rate down the outer regions of the charcoal bed because the smooth wall reduced the density of packing near it. Neither of these conclusions was altered when the wall of the tube was corrugated.

12923. Bernard, Robert A. and Wilhelm, Richard H. **Turbulent diffusion in fixed beds of packed solids.** *Chem. Eng. Progress* 46, 233-44(1950).— *C.A.* 44, 5652*i*.

Liquid-phase expts. were performed with a methylene blue soln. diffusing from a point source into water flowing through a bed of packed solids; gas-phase expts. used CO_2 diffusing into an air stream in a similar bed. The basic differential equation was solved for the special case when the tube wall provided a boundary condition. Aq. expts. were performed in a 2-in. tube with the following particles: 1-,3-,5-, 8-mm spheres; 3/16 × 3/16-in. and 1/4 × 1/4-in. cylinders; 1/8-in. cubes; 10-14 mesh granules; and a mixt. of 1- and 3-mm spheres. Gaseous expts. were performed in an 8-in. tube with 3/8-in. spheres. Pressure-drop data also were recorded and correlated.

12924. Breckenfield, R.R. and Wilke, C.R. **Limiting flows in packed extraction columns.** *Chem. Eng. Progress* 46, No. 4, 187-94(1950).— *C.A.* 44, 4289*d*.

An app. was described, with a discussion of packing materials, the effects of densities, interfacial tension, viscosity of the liquids, the wall effects of the columns and the correlation of data.

12925. Brownell, L.E.; Dombrowski, H.S., and Dickey, C.A. **Pressure drop through porous media. IV. New data and revised correlation.** *Chem. Eng. Progress* 46, 415-22(1950).— *C.A.* 44, 8705*c*.

New data on flow through porous media were presented for packed beds covering a range from completely laminar to highly turbulent flow, and a porosity range from 40 to 94%. Observed pressure drops were compared with those predicted by various correlations.

12926. Brownscombe, E.R.; Slobod, R.L., and Caudle, B.H. **Laboratory determination of relative permeability.** *Oil Gas J.* 48, No. 40, 68-9, 81-2, No. 41, 98, 100-2, 123(1950).— *C.A.* 44, 5082*h*.

Methods for lab. detn. of relative permeability were: (1) capillary pressure displacement, wherein satn. was controlled by pressure difference between phases maintained by the use of diaphragms permeable to only one of the phases; (2) dynamic displacement wherein satn. was controlled by the ratio of flowing phases; and (3) soln. gas displacement, where satn. was controlled by release of gas from soln. in oil by lowering the pressure. It was proposed that relative permeability be defined as the permeability to gas or oil divided by the permeability to reservoir brine.

12927. Calkins, Edward W.S. **Some comparisons of fiber "fineness" measurements.** *Textile Research J.* 20, 426-33(1950).— *C.A.* 44, 8117*a*.

Any air-permeability instrument, properly calibrated, would satisfactorily measure surface area of fibers. Fibers of the same surface area varied widely in wt per in., and no conversion from surface area to wt per in. could be accurate unless one other variable was held const., namely, wall thickness, fiber diam., or their ratio.

12928. Carman, P.C. **Diffusion and flow of gases and vapors through micropores. I. Slip flow and molecular streaming.** *Proc. Roy. Soc.* (London) A203, 55-74(1950).— *C.A.* 45, 4506*b*.

The slight min. found by Knudsen for circular capillaries was very much exaggerated for noncircular cross-sections. Expts. on flow were made with the following systems: H_2-Ag; H_2-Al; H_2-Cu; H_2-Fe; H_2-glass; C_2H_2-glass; C_3H_8-glass; air-glass; air-fresh shellac; air or CO_2-old shellac or machined brass; air-Hg; air-oil; CO_2-oil; H_2-oil; He-oil; He, H_2, air, or O_2-Ag oxide. The exptl. technique was described in detail. Flow of H_2, air, CO_2, CF_2Cl_2 through crushed chromite, fine glass spheres, α-Al_2O_3 polishing powder, $CaCO_3$, and Ag plugs were studied.

12929. Chernenko, L.E. and Rebinder, P.A. **Filtration analysis and characterization of the structure of suspensions and sediments.** *Kolloid. Zhur.* 12, 386-91(1950).— *C.A.* 45, 927*i*.

If a suspension contg. c g/ml solids was filtered, the amt. of the ppt. was cV after a vol. V passed through. If the amt. cV occupied the vol. acV and the area of the filter was S, the thickness h of the ppt. was acV/S. From Darcy's equation, $dV/dt = KS^2p/\eta acV$; t = time, p driving pressure, and η viscosity. Hence, $V^2 = 2KS^2pt/\eta ac$. The proportionality between V^2 and t was confirmed by filtering suspensions of rye flour and clay in H_2O, and of ZnO in toluene.

12930. Dorner, Hans. **Separation of solid and liquid substances by industrial filtration.** *Seifen-Öle-Fette-Wachse* 76, 296-9, 338-9, 355-7, 380-2, 400-1(1950).—*C.A.* 45, 910*e*.

Problems of industrial filtration were discussed, and filter app., media, and supports described.

12931. Elgin, Joseph C. and Foust, Harold C. **Countercurrent flow of particles through moving continuous fluid—pressure drop and flooding in spray-type liquid towers.** *Ind. Eng. Chem.* 42, 1127-41(1950).—*C.A.* 44, 6683*h*.

Data on ΔP and flooding velocity were given for solids falling through rising water (or aq. $MgSO_4$, d. 1.20 g/ml, viscosity 3.0 centipoise) at 20-24° C. The solids were bead catalysts of 3 diams. (0.127, 0.167, and 0.213 in.) having d. of 1.66 g/ml when satd. with water, 1.74 g/ml when satd. with the aq. $MgSO_4$.

12932. Fundator, V.I. **Determination of gas permeability of mold mixes on the basis of their water permeability.** *Zavodskaya Lab.* 16, 635-6 (1950).—*C.A.* 47, 3624*e*.

Water was poured into a glass tube contg. a tamped mix and resting on filter paper, and the time required for the liquid to pass through the mix was recorded. The gas permeability of the mix was detd. separately. Comparison of water- and gas-permeability curves made it possible to det. conversion factors from water to gas permeability.

12933. Ginstling, A.M. and Brounshtein, B.I. **The diffusion kinetics of reactions in spherical particles.** *J. Applied Chem.* (U.S.S.R.) 23, 1327-38(1950)(Engl. translation).—*C.A.* 46, 9959*c*.

If R = original radius of a spherical particle B reacting with a substance A according to A + B = AB to form a bed of AB of a thickness x around B, and G = degree of conversion of B (in fractions of unity), then the following equations held: $x^2[1 - (2x/3R)] = K'r$; $1 - 2/3G - (1 - G)2/3 = K'(1/R^2)r$, where r = time and K' a const. K' depended in the same manner on the phys. properties of the reactants as in the case of diffusion through a plane surface.

12934. Hambersin, J. **Determination of the permeability of beds of precipitated granules.** *Ind. chim. belge* 15, 269-83(1950).—*C.A.* 45, 4495*b*.

The permeability of $CaCO_3$ formed from gypsum by double decompn. with $(NH_4)_2CO_3$ was measured. Only a small amount of material was needed to give data which could be interpreted to predict the results of industrial filtration under a given degree of vacuum.

12935. Ishkin, I.P. and Kazaner, M.G. **The distribution of pores according to size in porous bodies.** *Zhur. Fiz. Khim.* 24, 943-52(1950).—*C.A.* 45, 1405*h*.

The system gas/liquid was studied experimentally and theoretically. The method was useful for the construction of the structural curves for cemented porous bodies with a pore radius of from 10 to several hundred microns. The distribution according to size agreed with the Maxwell distribution equation.

12936. Johnson, E. **A theory of fluidization and its application to sulfur recovery by solvent extraction.** *Inst. Gas Engrs.*, Copyright Pub. No. 378(a), 39 pp.(1950).—*C.A.* 45, 1823*f*.

A theory was developed from considerations of the free fall of a single sphere in a viscous fluid, the sedimentation of suspensions of solids in liquids, and by regarding a bed of fluidized solid merely as an expanded static bed. Exptl. data were obtained for SiC, coke, Al_2O_3, and spent oxide, fluidized by air, water, and a glycerol-water soln.; particle size, solid d., fluid d., fluid mass, and bed mass were also investigated.

12937. Kanagy, Joseph R. and Vickers, Robert A. III. **Factors affecting the water-vapor permeability of leather.** *J. Research Natl. Bur. Standards* 44, 347-62(1950)(Research Paper No. 2083); *J. Am. Leather Chemists' Assoc.* 45, 211-42(1950).—*C.A.* 44, 8145*e*.

Water-vapor permeability was measured and expressed as g H_2O per 25 cm^2 per 100 min., measured after rate of H_2O uptake became const. Most measurements were made at 100°F and 53% relative humidity in the external air. Time required was 4 to 5 hrs. The water permeability for 16 diverse leathers varied from 0.003 to 0.76. Evidence was presented to show that H_2O vapor passed through leather by conduction (activated diffusion) in addn. to gaseous diffusion through the pores.

12938. Kasten, Paul R. and Amundson, Neal R. **An elementary theory of adsorption in fluidized beds. Mathematics of adsorption in beds.** *Ind. Eng. Chem.* 42, 1341-6(1950).—*C.A.* 44, 7618*f*.

Calcns. were made for the adsorption by uniform, porous, spherical adsorbent particles that moved in a completely random manner in a fluid stream of uniform concn. The theory applied only to linear equil. isotherms and to nonequil. cases that were linear and reversible.

12939. Pennington, W.A. **The role of adsorption-type desiccants within refrigeration units.** *Modern Refrig.* (Brit.) 53, 218-20, 252-5(1950); *Refrig. Eng.* 59, 272-5, 300-1(1951).—*C.A.* 45, 6774*d*.

The adsorption capacity of the gel was found to increase with decreasing temp. in each phase of the refrigerant and to be much higher in the liquid than in the vapor at the same temp., the H_2O concn. of the refrigerant being the same for all the comparisons. The desiccant should be placed where the weighed H_2O satn. value for both phases was a min. By using equil. data for 37.8°C and 100% liquid, an equation was predicted in which the H_2O content of CCl_2F_2 was given as a parabolic function of the H_2O content of the gel for a desired set of conditions.

12940. Pillsbury, A.F. **Effects of particle size and temperature on the permeability of sand to water.** *Soil Sci.* 70, 299-300(1950).—*C.A.* 45, 4386*e*.

Under sterile conditions the variation of permeability with temp. was wholly a viscosity effect. Permeability appeared to be an exponential function of particle size when the medium was washed silica sand uniformly packed. The permeability was decreased at least tenfold when the particle diam. was reduced from 360 microns to 110 microns.

12941. UCHIDA, HIROSHI AND KURITA, MINORU. **Catalysts for synthesis of ammonia. VII. Size and distribution of micropores in the catalysts containing various promoters.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 173-87 (1950).—*C.A.* 46, 2246*f*.

The micropores of pure Fe_2O_3 and that contg. various promoters were detd. from 10 μ to 107 A. with Ritter-Drake's porosimeter.

12942. VERSCHOOR, H. **Pressure drop of fluids in single-phase flow through a layer of catalyst.** *Ingenieur* (Holland) 62, Ch. 29-32 (1950). —*C.A.* 44, 10383*b*.

The Carman correlation predicted the max. pressure drop within about 25% if the external area of the catalyst per unit vol. of packed space and the intergranular porosity of the layer *in situ* were known. These two parameters could be detd. in a lab. expt. with air as fluid at gas rates in the laminar-flow region.

12943. VERSCHOOR, H. AND SCHUIT, G.C.A. **Heat transfer to fluids flowing through a bed of granular solids.** *Applied Sci. Research* A2, 97-119 (1950).—*C.A.* 44, 5654*b*.

The effective coeff. of thermal cond. in a packed bed through which a fluid passed was calcd. Expts. were conducted in steam-jacketed tubes, 29.7, 43, or 50 mm diam. Glass beads (3-, 4-, 5-, 6-, and 8-mm) Pb balls (10-mm), steel balls (6-mm), terrana cylinders (5.2 × 5.2-mm), and pumice (6-8 mesh) were detd. with air, and with H_2 and 8-mm glass beads. Bed depths were 210-300 mm.

12944. WEINTRAUB, MURRAY AND LEVA, MAX. **Pressure drop through fixed and fluidized beds—a nomogram.** *Chem. Eng.* 57, No. 1, 110-13 (1950).—*C.A.* 44, 2804*i*.

Nomograms were presented for the calcn. of pressure drops through beds of granular material, for flow of gas or liquid in the streamline range and in the transitional range.

12945. AGARWAL, O.P. AND STORROW, J. ANDERSON. **Pressure drop in fluidization beds. I.** *Chemistry & Industry* 1951, 278-86.—*C.A.* 45, 6436*c*.

Fluidization tests were run on crushed coal, crushed hard brick, Geon, sand, flake graphite, absorption carbon, crushed soft brick, and crushed ceramic Raschig rings, in varying particle sizes, masses of material, and bed depths, with glass tubes (1.5-in.) as the retaining vessels and filter paper or sintered metal disks as the air distributors.

12946. AGARWAL, O.P. AND STORROW, J. ANDERSON. **Heat transfer in fluidization beds. II.** *Chemistry & Industry* 1951, 321-4.—*C.A.* 45, 7391*c*.

Heat transfer from a heated wall to the air flowing through fluidized and packed beds was investigated in a 1.5-in. I.D. Cu tube equipped with a steam jacket. Sand, graphite, soft brick, and crushed Raschig rings in different particle sizes were used as bed materials. The surface conductances for the packed and fluidized beds increased at approx. const. rate with increasing mass velocity, *G*.

12947. BARTH, W. **Pressure drop in packed towers with and without liquid flow.** *Chem.-Ing.-Tech.* 23, 289-93 (1951).—*C.A.* 45, 7825*f*.

The variations in packing types and systems were introduced by means of factors which in turn were obtained from tabular and graphical correlations of available exptl. data.

12948. BRÖTZ, WALTER. **Heat and mass transfer and pressure drop in fluid flow through packed beds.** *Chem.-Ing.-Tech.* 23, 408-16 (1951).—*C.A.* 46, 6*c*.

Measurements were made with N_2, H_2, and CO_2 on glass beads and catalyst particles of various sizes. A special app. was used for expts. at low gas velocities. Mass transfer expts. were carried out by observing mixing coeffs. of methylene blue in water flowing over glass beads. Pressure drop readings were made on all packings used.

12949. CAMPBELL, JOHN M. AND HUNTINGTON, R.L. **Heat transfer and pressure drop in fixed beds of spherical and cylindrical solids. I. Pressure drop and packed bed characteristics.** *Petroleum Refiner* 30, No. 12, 127-33 (1951).—*C.A.* 46, 1821*b*.

A study was made with cylindrical silica-alumina, hydrated alumina, tabular alumina and glass, and spherical Al and glass packing. The test chambers were made of 2-, 4-, and 6-in. standard pipe in sections 3, 4, and 6 ft in height, resp. Com. natural gas was used as the fluid. Particle surface area was correlated with equiv. diameter of chamber, fraction voids, and the area-vol. shape factor; a theoretical pressure-drop equation was derived.

12950. CHRISTENSEN, G.N. AND WILLIAMS, E.J. **Diffusion in wood. I. A quantitative theory of diffusion in porous media and its application to wood.** *Australian J. Applied Sci.* 2, 411-29 (1951).—*C.A.* 46, 5244*h*.

For diffusion under nonsteady-state conditions, it was not possible to characterize the diffusion system completely in terms of the single diffusion coeff. D detd. at the steady state. A second parameter k, and a diffusion coeff. D' such that $D = kD'$ was necessary; k was a function of the vol. occupied by the solute and solvent within the porous medium. For diffusion of NaCl through laminae, close agreement with Fick's law was observed, but with wood blocks changes in moisture distribution during diffusion caused complications.

12951. COBERLY, C.A. AND MARSHALL, W.R. JR. **Temperature gradients in gas streams flowing through fixed granular beds.** *Chem. Eng. Progress* 47, 141-50 (1951).—*C.A.* 45, 3662*b*.

Exptl. data showed that the resistance to heat transfer in the gas film at the inside of the tube wall was not negligible. Measurements of the velocity distribution of air flowing through packed tubes appeared to justify the assumption that rod-like gas flow occurs.

12952. DEADMORE, DANIEL L. **Sintered alumina for filter purposes.** *Ceram. Age* 56, No. 7, 15-17, 23-4 (1951).—*C.A.* 45, 3571*f*.

A com. grade of activated Al_2O_3 was used to prep. dry-pressed filter sections. Samples were sintered to 1720°C. Porosity, shrinkage, and filtering resistance were detd. and av. pore radius and specific surface area were calcd. Activated Al_2O_3 grains between 28- and 48-mesh sintered at 1720°C to a fairly rigid porous body when 10% of grains finer than 325-mesh were added. Grains between 36- and 65-mesh sintered with no addn. of fines.

12953. DOTSON, B.J.; SLOBOB, R.L.; MCCREERY, P.N., AND SPURLOCK, JAMES W. **Porosity-measurement comparisons by five laboratories.** *Trans. Am. Inst. Mining Met. Engrs.* **192**, *Tech. Pub.* No. 3231 (in *J. Petroleum Technol.* 3, 341-6) (1951).—*C.A.* 46, 4774*h*.

The porosities of 10 selected natural and synthetic core samples were measured, each lab. with its own method or methods of measurement. The av. deviation of porosity from the mean or av. values for the group of samples was ±0.5 porosity %.

12954. DOW, WILLARD M. AND JAKOB, MAX. **Heat transfer between a vertical tube and a fluidized air-solid mixture.** *Chem. Eng. Progress* 47, 637-48(1951).—*C.A.* 46, 789*f*.

The transfer of heat from a vertical-tube wall to fluidized beds of small solid particles was investigated experimentally in 2-in. and 3-in. diam. tubes. The fluidized mixt. consisted of particles of 3 different solid materials: Aerocat, pitch coke, and Fe, suspended in an upward flowing stream of air entering at av. velocities of 1/4 to 1 ft/sec.

12955. FRICKE, R. AND JOCKERS, K. **Porosity and surface of various aluminum hydroxides and oxides.** *Z. anorg. u. allgem. Chem.* **265**, 41-8 (1951).—*C.A.* 46, 7840*b*.

Bayerite consisted of compact crystals, whereas boehmite was porous without macropores. The oxides from boehmite were more accessible to impurities and also more stable than those from bayerite.

12956. FUKUDA, YOSHITAMI AND KAWASOE, KUNITARO. **Fundamental studies on adsorption in beds.** *Japan Sci. Rev.* 2, No. 1, 13-20(1951).—*C.A.* 47, 21*b*.

A derivation was given of equations for stripping adsorption in packed beds. Data were given for adsorption of methylene blue on 20-30-mesh sand and on powd. Pyrex glass.

12957. GOSTKOWSKI, KAZIMIERZ. **Determination of porosity.** *Hutnik* **18**, 484-5(1951).—*C.A.* 46, 7376*i*.

A comparatively simple app. for detn. of the porosity of porous materials based on displacement method was described. The time required for a single detn. did not exceed 30 min.

12958. GREEN, LEON, JR. AND DUWEZ, POL. **Fluid flow through porous metals.** *J. Applied Mechanics* 18, 39-45(1951).—*C.A.* 45, 3201*i*.

The pressure gradient attending the flow of a fluid through a porous medium was expressed as a function of flow rate by a simple quadratic equation. An equation of this type defined two length parameters necessary for characterization of a porous structure and permitted a general definition of the Reynolds no. for a structure of arbitrary complexity.

12959. HAWKSLEY, P.G.W. **The physics of particle-size measurement. I. Fluid dynamics and the Stokes diameter.** *Bull. Brit. Coal Utilisation Research Assoc.* **15**, 105-46(1951).—*C.A.* **46**, 1330*f*.

Size of nonspherical particles, methods of particle-size measurement, shape of particles, purpose of particle-size measurement, motion of particles at infinite diln., motion of clouds of particles, and motion of fluids through packed beds were reviewed.

12960. HOFFING, EDGAR H. AND LOCKHART, FRANK J. **Resistance to filtration.** *Chem. Eng. Progress* 47, No. 1, 3-10(1951).—*C.A.* 45, 1821*f*.

Theoretical equations for permeability should be directly applicable to filtration. Direct exptl. data were reported.

12961. HOUGEN, JOEL O. AND PIRET, EDGAR L. **Effective thermal conductivity of granular solids through which gases are flowing.** *Chem. Eng. Progress* 47, 295-303(1951).—*C.A.* 45, 6437*f*.

The solids investigated included five sizes of Celite cylinders, and two sizes of spherical Celite pellets. Flow rates ranged from 75 to 3700 $lb/(hr)(ft^2)$, and initial air temps. from 75 to 800°F. The mixed outlet air temp. was measured. The cooling water around the tube was maintained near 60°F.

12962. JONES, W. MERVYN. **Mobility in a sorbed layer. I. Flow of gases and vapors through porous media.** *Trans. Faraday Soc.* 47, 381-92 (1951).—*C.A.* 45, 8848*g*.

The sorbed vapor was treated as an ideal two-dimensional gas on the surface. Equations for flow through a hole in a plane sheet, through a fine capillary and through a porous material were derived. For a monolayer of Et_2O or EtCl on graphite the equations were used to describe the flow quantitatively. For the lower concns., and for other expts., an approx. solution was obtained when the surface field was taken into account, provided Langmuir's equation for unimol. adsorption was obeyed.

12963. KAUFMAN, DONALD J. AND THODOS, GEORGE. **Mass-transfer properties of commercial packings.** *Ind. Eng. Chem.* 43, 2582-6(1951).—*C.A.* 46, 2855*e*.

Analysis by a statistical method of existing data on transfer processes in single-phase flow through com. packings indicated that the effective area of the packing was the product of the total surface and a factor, f_A, defined as the "effective area factor." The av. critical effective area factors (based on spheres, $f_A = 1.00$) for the types of packing investigated were: Raschig rings 0.52; partition rings 0.75; regular cylinders 0.90; and Berl saddles 1.09.

12964. KRAMERS, H. **The viscosity of a bed of fluidized solids.** *Chem. Eng. Sci.* 1, 35-7 (1951).—*C.A.* 46, 3333*f*.

A dumbbell was rotated under constant torque applied to the rotating shaft while suspended in a fluidized bed. The fluidizing agent was air and the solid particles were sand, silica gel, and glass beads. No definite phys. properties could be ascribed to a bed of fluidized solids because it was essentially nonhomogeneous and nonuniform.

12965. Krevelen, D.W. van. **Mass transfer and kinetics in contact catalysis.** *Chem. Weekblad* 47, 427-35(1951).—*C.A.* 46, 1339*b*.
Transport of reactants toward, and products away from, the surface of a catalyst was largely convective, whereas transport within the pores was diffusive. Equations were derived for 3 types of diffusion: (1) normal, where the pore diam. was large with respect to the mean free path; (2) Knudsen, when the opposite was the case; and (3) surface, which was important when the adsorbed mols. were mobile and the pores were narrow.

12966. Leva, Max. **Elutriation of fines from fluidized systems.** *Chem. Eng. Progress* 47, No. 1, 39-45(1951).—*C.A.* 45, 1823*h*.
Basic observations on the elutriation of fines from fluidized beds were reported. The systems were composed of one coarse and one fines component. Rates of elutriation could be expressed by way of the law governing first-order chem. reactions, and typical rate consts. could be calcd. The rate consts. were related to such variables as linear gas velocity, size of coarse and fines constituents, material d., and bed height.

12967. Leva, Max; Weintraub, Murray; Grummer, Milton; Pollchik, M., and Storch, H.H. **Fluid flow through packed and fluidized systems.** *U.S. Bur. Mines, Bull.* No. 504, 149 pp.(1951).—*C.A.* 46, 788*d*.
The design of new equipment in which fluids were brought into contact with granular materials was studied.

12968. Martin, J.J.; McCabe, W.L., and Monrad, C.C. **Pressure drop through stacked spheres. Effect of orientation.** *Chem. Eng. Progress* 47, No. 2, 91-4(1951).—*C.A.* 45, 4972*i*.
Pressure drops for the flow of fluids through beds of spheres packed in various geometrical patterns were detd. experimentally, air and viscous oil being used. Pressure drop was markedly affected by geometric orientation as well as porosity.

12969. Miller, Clark O. and Logwinuk, A.K. **Fluidization studies of solid particles.** *Ind. Eng. Chem.* 43, 1220-6(1951).—*C.A.* 45, 5460*b*.
A "crit. mass velocity" was related to the fluid and solids properties and was found to be independent of wt or bed height for a given material. Heat-transfer studies from a hot, dense fluid bed to a vertical, cool tube were carried out; 3 gases and 2 solids were utilized. The coeffs. ranged from 40 to 200 B.t.u./hr ft^2 °F. Electrostatic effects prevalent during fluidization were discussed.

12970. Miller, Frank G. **Steady flow of two-phase single-component fluids through porous media.** *Trans. Am. Inst. Mining Met. Engrs.* 192, *Tech. Pub.* No. 3079 (in *J. Petroleum Technol.* 3, No. 7, 205-16)(1951).—*C.A.* 45, 8303*b*.
Propane entered the column entirely as a liquid, started to vaporize at a considerable distance from the inlet, and then flowed in 2 phases throughout the remainder of the column. Math. theory was developed to calc. the total rate of flow and the pressure distn. along the column of sand, for a given pressure and temp. of the all-liquid entering stream, a given pressure or temp. of the discharging gas-liquid mixt., and given sand and fluid characteristics.

12971. Morales, Maximo; Spinn, C.W., and Smith, J.M. **Velocities and effective thermal conductivities in packed beds.** *Ind. Eng. Chem.* 43, 225-32(1951).—*C.A.* 45, 3659*i*.
The variation in fluid velocity with radial position in a packed bed was detd. experimentally.

12972. Morse, R.D. and Ballou, C.O. **The uniformity of fluidization—its measurement and use.** *Chem. Eng. Progress* 47, 199-204 (1951).—*C.A.* 45, 6436*g*.
Based on the oscillograph records, a Uniformity Index was proposed which combined empirically the two factors of the extent of the deviations in the curve and the duration of the deviations. Thus, Uniformity Index = (Av. Deviation, %)/Frequency. The lower the Index, the better was the uniformity of the bed. Examples showed the effect of particle-size distribution, gas velocity, initial gas distribution, and bed height, and uniformity at various levels within the bed.

12973. Olin, H.L. and Patterson, J.S. **Fluidization.** *Petroleum Engr.* 23C, No. 6, 5-9 (1951).—*C.A.* 45, 10552*h*.
Fluidization of sands and siliceous catalysts, either clean or fouled with tar, resin, wax, or petroleum jelly, was characterized by measuring pressure drop as a function of modified Reynolds no.

12974. Osberg, G.L. and Charlesworth, D.H. **Elutriation in a fluidized bed.** *Chem. Eng. Progress* 47, 566-70(1951).—*C.A.* 46, 297*d*.
Narrow cuts of Scotchlite bead dust were elutriated from fluidized Scotchlite bead beds in a lab. unit 3-in. in diam. At low initial dust concns., the rate data could be represented by a first-order plot, the slope of which was taken as the elutriation rate const.

12975. Piret, Edgar L.; Ebel, R.A.; Kiang, C.T., and Armstrong, W.P. **Diffusion rates in extraction of porous solids. II. Two-phase extractions.** *Chem. Eng. Progress* 47, 628-36(1951).—*C.A.* 46, 789*i*.
The rates of extn. or diffusion of sol. materials from capillaries, porous slabs, and spheres in the unsteady state were studied. The use of a pore-shape factor to characterize the retarding effect of the porous structure of the inert solid which had been previously proposed for single-phase extns. was shown to be applicable also to two-phase systems.

12976. Prager, Stephen. **The calculation of diffusion coefficients from sorption data.** *J. Chem. Phys.* 19, 537-41(1951).—*C.A.* 45, 9333*d*.
The dependence of the diffusion coeff. on the concn. of diffusing material was calcd. from data obtained by studying the rates of sorption of vapors by films. The actual concn. dependence was approximated by a step function. For such a

function the differential equations involved could be solved analytically and the heights of the individual steps computed; the step function was then smoothed out by an averaging process. The method was tried out for the sorption of isobutane by polyisobutylene at 35°C and found to be satisfactory.

12977. SMIRNOV, N.I. AND LI, DE EP. **Motion of a flow across a layer of solid particles.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 24, 56-60(1951).—*C. A.* 47, 379*i*.

The phenomenon of solid particles maintained in suspension by a countercurrent of a liquid or gas was studied. It consisted of 3 processes, one being the flow of the liquid or gas through the tube filled with the solid particles, the 2nd an increase of the height of the solid layer as a result of the sepn. of the particles by the flow, and the 3rd the maintenance of the upper level of the layer at the attained height.

12978. SMITH, NORMAN L. AND AMUNDSON, NEAL R. **Intraparticle diffusion in catalytic heterogeneous systems.** *Ind. Eng. Chem.* 43, 2156-67 (1951).—*C. A.* 46, 29*e*.

A simple reversible reaction, 1st order in each direction, was assumed to take place inside the particle. The equations obtained related the phys. and chem. parameters of the system to the operating variables. In order to obtain exptl. confirmation, the hydrolysis of an ester, Et formate, was studied; Dowex 50, a cation-exchange resin, was used as catalyst.

12979. SUITO, EIJI AND HIRAI, NISHIO. **Measurement of the particle-size distribution of powder by the thermal analysis of reaction velocity. I. Theory.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 72, 713-15(1951).—*C. A.* 46, 1330*g*.

If the reaction velocity was proportional to the surface area of monodisperse powders, the relation between the time variation of reaction velocity and the time should be represented by a straight line. The theory was extended to the case of polydisperse systems, in which case the time variation of reaction velocity *vs.* time curve was no longer linear.

12980. THIRION, P.; AMERONGEN, G.J. VAN, AND CHASSET, R. **Reduction by fillers of the permeability of natural rubber to gases.** *Rev. gén. caoutchouc* 28, 684-91(1951).—*C.A.* 46, 2327*e*.

The theoretical reduction in permeability of vulcanized rubber by a spherical or lamellar filler could be calcd. if the assumption was made that it was dispersed uniformly and that the orientation remained unchanged. The validity of this theory was verified in a qual. way by lab. measurements of the permeability coeffs., of N_2, and of rubber mixts. contg. a spherical filler (whiting) and a lamellar one (mica). Quant. verification necessitated knowledge of the degree of orientation and shape factor of the particles.

12981. VLUGTER, J.C. AND VERSCHOOR, H. **Introduction to the technology of catalytic processes.** *Chem. Weekblad* 47, 465-71(1951).—*C.A.* 46, 1668*c*.

Fixed-bed, slurry, fluid, and moving-bed processes were compared in their approaches to the problems of mass and heat transfer and of catalyst regeneration.

12982. VOGT, WALTHER. **A simple apparatus for constant flow through adsorption columns.** *Chem.-Ing.-Tech.* 23, 580-1 (1951).—*C.A.* 46, 3330*g*.

A capillary tube arrangement suitable for either downward or upward flow was used.

12983. WILHELM, RICHARD H. AND VALENTINE, STEPHEN. **The fluidized bed. Transition state in the vertical pneumatic transport of particles.** *Ind. Eng. Chem.* 43, 1199-1203(1951).—*C.A.* 45, 5460*d*.

Expts. were made in a 4-in. vertical tube contg. clay spheres in 3 sizes between 0.02 and 0.03 ft in diam. Fluidized beds were formed as the direction of motion of the particles changed from cocurrent to countercurrent, relative to the rising air stream. The fluidized bed in an open, vertical tube depended upon particle properties and upon flow rates of supporting fluid and particle streams.

12984. WILLIAMS, P.S. **Some effects on the flow of concentrated suspensions of variations in particle size and shape.** *Discussions Faraday Soc.* No. 11, 47-55, discussion 86, 94-5(1951).—*C.A.* 46, 8871*f*.

Fundamental data having application in paint technology were obtained from a study of shear stress-shear rate data for concd. suspensions of glass or SiO_2 spheres. The spheres were made by melting fine glass or SiO_2 powders and fractionated by settling and continuously siphoning off the suspension contg. the finer particles. Shear measurements were made in a coaxial cylinder viscometer with fractionated spheres suspended in aq. glycerol or hydrocarbon oil.

12985. WILSON, L.H.; SIBBITT, W.L., AND JAKOB, M. **Flow of gases in porous media.** *J. Applied Phys.* 22, 1027-30(1951).—*C.A.* 46, 1330*e*.

Exptl. data indicated that viscous flow existed if the ratio of mol. mean free path to pore diam. was less than 0.025; free mol. flow if it was 1.6 or more. These ratios could be used to indicate the nature of flow in a porous medium provided the pore size was known, or they could be used to det. pore size experimentally.

12986. YAGI, SAKAE AND TAKAGI, KAZUMI. **Fluidization of powdered beds.** *Chem. Eng.* (Japan) 15, 212-17(1951).—*C.A.* 45, 8418*i*.

Expts. detd. various conditions of fluidization of pyrrhotite particles. The crit. height of the bed, where slugs were cast, was inversely proportional to the 1/2 power of the diam. of the particle.

12987. YOSHIDA, FUMITAKE AND TANAKA, TATSUO. **Air-water contact operations in a packed column.** *Ind. Eng. Chem.* 43, 1467-73(1951).—*C. A.* 45, 7391*e*.

Mass and heat-transfer coeffs. for the 3 operations, const. water-temp. humidification, water cooling, and dehumidification, were detd. in columns packed with ceramic Raschig rings. The same equations for gas and liquid-film coeffs. could be applied to all 3 operations.

12988. Balluffi, R.W. and Alexander, B.H. **Development of porosity during diffusion in substitutional solid solutions.** *J. Appl. Phys.* 23, 1237-44(1952).—*C.A.* 47, 1453*i*.

A metallographic study was made of the diffusion zones present in Cu-α-brass, Cu-Ni, and Au-Ag diffusion couples. Usual sandwich-type couples and also vapor-solid-type couples in which the higher vapor pressure component was diffused either into or out of the couple through the vapor phase were investigated. Significant porosity was always generated by diffusion in the sandwich couples and also in the vapor-solid couples when the higher-vapor-pressure component was diffused out of solid soln.

12989. Bartholomew, Richard N. and Katz, Donald L. **Heat transfer from the wall of a tube to a fluidized bed.** *Chem. Eng. Progress Symposium Ser.* 48, No. 4, *Reaction Kinetics and Transfer Processes,* 3-10(1952).—*C.A.* 47, 1437*g*.

Heat-transfer coeffs. to fixed fluidized beds were detd. in a steel reactor 4 in. in diam. and 30 in. high. Bed materials consisted of sand, Al, and Ca carbonate particles in mixts. of both wide and narrow size ranges, fluidized by air. The heat-transfer data, obtained at wall temps. of 400° and 600°F, were correlated in terms of 4 dimensionless groups.

12990. Brötz, Walter. **Principles of fluidization processes.** *Chem.-Ing.-Tech.* 24, 60-81(1952).—*C.A.* 46, 3810*d*.

A comprehensive treatise was presented covering pressure drop, min. and max. fluid velocities for stability of the fluidized bed, bed expansion, viscosity behavior, flow angle, mass and heat transfer, attrition of solids and equipment erosion, and chem. reactions in fluidized beds.

12991. Campbell, John M. and Huntington, R.L. **Heat transfer and pressure drop in fixed beds of spherical and cylindrical solids. II. Heat transfer and temperature gradients.** *Petroleum Refiner* 31, No. 2, 123-31(1952).—*C.A.* 46, 3333*c*.

Heat transfer was studied in several vertical cylinders in packed beds of packing materials previously described having widely different phys. and thermal properties. Two basic approaches were used, one based on dimensional analysis and the other based on differential heat balances.

12992. Chatenever, Alfred. **An introduction to flow of oil and water in porous media.** *Oil Gas J.* 51, No. 3, 174-5(1952).—*C.A.* 46, 7747*f*.

The behavior of fluids in porous media at a microscopic level with porous matrices of 1 or 2 layers was reviewed.

12993. Chrétien, André and Papée, Denis. **The porosity of some adsorbent products.** *Compt. rend.* 234, 214-16(1952).—*C.A.* 46, 4881*d*.

Microporosity, a property specific to a substance, was detd. from the proportion of vapors of H_2O, CCl_4, $CHCl_3$, and C_2HCl_3 at 20°C adsorbed by boehmite, bayerite, silica gel, and pptd. SiO_2, all having been heated at 400°C for 14 hrs. The total pore vol. was detd. by immersion, and macroporosity by difference. The silica gel lost microporosity when heated at 800°C, but this was partly restored by treatment with water vapor.

12994. Chu, P.C. and Storrow, J. Anderson. **Heat transfer to air flowing through packed tubes.** *Chem. Eng. Sci.* 1, 230-7(1952).—*C.A.* 47, 1438*h*.

The effect of packing diam., packing thermal cond., and ratio of packing length to tube diam. was studied in the transfer of heat from the wall of a steam-heated 1-in.-bore copper tube to air for *Re* up to 3500. The length of the packed tube was an important variable, but the packing diam. had little effect on the heat transfer.

12995. Eichhorn, Jacob and White, Robert R. **Particle-to-fluid heat transfer in fixed and fluidized beds.** *Chem. Eng. Progress Symposium Ser.* 48, No. 4, *Reaction Kinetics and Transfer Processes,* 11-18(1952).—*C.A.* 47, 1437*d*.

Steady-state heat transfer between solid and gas in fixed and fluidized beds was studied as a function of particle size, gas velocity, and gas properties. In the fixed-bed runs the particle diam. ranged from 0.0658 cm (24/28 mesh) to 0.0102 cm (150/170 mesh) and the modified Reynolds no. from 1 to 18. In the fluidization runs, particles 0.0841 cm (20/24 mesh) to 0.0140 cm (100/115 mesh) were used. The modified Reynolds no. extended from 0.7 to 28. Dielec. heating was used to generate heat continuously in a system of plastic particles, and the heat was removed by a gas stream flowing through the bed of heated particles.

12996. Engelhardt, W.v. and Schindewolf, E. **The filtration of clay suspensions.** *Kolloid-Z.* 127, 150-64(1952).—*C.A.* 47, 282*g*.

Test with suspensions of a natural clay indicated that a proposed simplified representation was not very accurate. However, it was sufficiently accurate for the 1st hr of filtration and also for certain ranges during the course of filtration.

12997. Ergun, Sabri. **Fluid flow through packed columns.** *Chem. Eng. Progress* 48, 89-94(1952). —*C.A.* 46, 2859*f*.

Pressure losses were caused by simultaneous kinetic and viscous energy losses, and a comprehensive equation applicable to all types of flow was proposed. The equation was examd. from the point of view of its dependence upon flow rate, properties of the fluids, and fractional void vol., orientation, size, shape, and surface of the granular solids. Whenever possible, conditions were chosen so that the effect of one variable at a time could be considered.

12998. Flood, E.A.; Tomlinson, R.H., and Leger, A.E. **The flow of fluids through activated carbon rods. I. II. The pore structure of activated carbon. III. The flow of adsorbed fluids.** *Can. J. Chem.* 30, 348-71, 372-85, 389-410(1952).—*C.A.* 46, 8787*g*; 47, 1461*d*.

Total flow rates consisted of the sums of comparatively independent flows through macropores and micropores. The flow rate through the macropore system was related to the relevant adsorption isotherm by an empirical equation that fitted the data within exptl. error. A simple flow equation, qualitatively in agreement with results, gave a mean micropore diam. of the order of 10^{-7} cm. Surface forces may increase flow rates of adsorbable gases by very large factors, owing mainly to the greatly increased ds. and to the increased pressure gradients resulting from action of surface forces.

12999. Gilliland, E.R. and Mason, E.A. **Gas mixing in beds of fluidized solids.** *Ind. Eng. Chem.* 44, 218-24(1952).—*C.A.* 46, 4859*e*.

Experimental work was divided into 2 phases, back-mixing and residence time studies. In back-mixing a tracer gas, He, was introduced into the fluidized bed and gas samples were taken from various positions and analyzed. In residence time studies the solid was fluidized with a He-air mixt. and the compn. of the exit gas detd. as a function of time after tracer gas addn. was discontinued. No correlation was observed between residence time curves and superficial gas velocity. Exptl. results indicated nearly complete mixing with considerable gas bypassing.

13000. Kasten, Paul R.; Lapidus, Leon, and Amundson, Neal R. **Mathematics of adsorption in beds. V. Effect of intra-particle diffusion in flow systems in fixed beds.** *J. Phys. Chem.* 56, 683-8(1952).—*C.A.* 47, 9065*b*.

Equations were derived for heat and mass-transfer operations in fixed beds of solids. Intraparticle diffusion or conduction was considered as well as transfer at the particle surface, assuming a linear adsorption isotherm and negligible longitudinal diffusion.

13001. Klute, Arnold. **A numerical method for solving the flow equation for water in unsaturated materials.** *Soil Sci.* 73, 105-16(1952).—*C.A.* 47, 3081*i*.

An equation describing the flow of water in unsatd. porous materials was derived from Darcy's law and the equation of continuity. A numerical method of solution for semi-infinite horizontal systems of flow was described and applied to 2 examples. The phenomenon of a wetting front was indicated when the variation of the diffusivity with moisture content was considered.

13002. Lewis, E.W. and Bowerman, Ernest W. **Fluidization of solid particles in liquids.** *Chem. Eng. Progress* 48, 603-10(1952).—*C.A.* 47, 924*f*.

Flow characteristics for batch fluidization of fine nonuniformly sized solids in liquids were investigated and compared with the results when glass spheres of const. diam. were used in the Stokes' law region. Data were correlated through free-motion considerations of these systems.

13003. Maeda, Shiro. **Heat transfer of granular catalysts. I. Theroretical equations and experiments for the heat transfer between the gas flowing through granular solids and the cylindrical wall.** *Technol. Repts. Tohoku Univ.* 16, No. 2, 1-17(1952).—*C.A.* 47, 3627*f*.

Hot air was passed through a small column packed with granules while the wall temp. was maintained constant. Temps. of inlet and outlet gas and distribution through the cylinder were measured by thermocouples. The differential equation for heat transfer was solved, and exptl. results checked theoretical values closely. Internal heat transfer was influenced by granules and the turbulent gas stream.

13004. Matthews, David E. **The semipermeability of silver membranes.** *Univ. Microfilms* (Ann Arbor, Mich.), *Pub.* No. 4403, 60 pp. (microfilm $1.00, paper enlargements $6.00); *Dissertation Abstracts* 12, 830-1(1952).—*C.A.* 47, 3081*g*.

13005. Molino, Donald F. and Hougen, Joel O. **Thermal conductivity of granular solids through which gases are flowing.** *Chem. Eng. Progress* 48, 147-9(1952).—*C.A.* 46, 4859*b*.

The effective thermal cond. of certain granular solids through which gases were flowing was studied. The gas (air) was heated during downward flow through the cylindrical bed of granular material. The results on Celite were given in tables and in graphs with Reynolds nos. as ordinates.

13006. Morrison, H.L. and Rogers, F.T. Jr. **Significance of flow-patterns for initial convection in porous media.** *J. Appl. Phys.* 23, 1058-9(1952).—*C.A.* 47, 357*d*.

A modification of theory, supported by new observations of flow patterns, led to more nearly valid understanding of available data on convection of a liquid in a porous medium.

13007. Nagata, S.; Matsuyama, T.; Hashimoto, N., and Hase, H. **Studies on the fluidized catalyst with mechanical agitation.** *Chem. Eng.* (Japan) 16, 301-6(1952).—*C.A.* 46, 9747*e*.

The direct synthesis of org. silicon compds. was carried out in the small-scale reactor (4 cm in diam. and 60 cm long) with mech. agitation (100 ~ 450 r.p.m.). The results obtained were superior to that obtained in the fixed beds or in the ordinary fluidized beds without agitation.

13008. Pinkus, Oscar. **Pressure drops in the pneumatic conveyance of solids.** *J. Appl. Mechanics* 19, 425-31(1952).—*C.A.* 47, 924*h*.

Expts. were performed to det. the relationship between pressure loss, solids flow rate, and air velocity, and to obtain values for the frictional consts. involved in the analysis. The presence of the solid phase caused an appreciable pressure loss which was a linear function of both solid- and gas-flow rate; this justified the theoretical equations which predicted such a relationship. Expts. with two sizes of the same sand showed a higher pressure drop for the larger particles, other conditions being equal.

13009. Ranz, W.E. **Friction and transfer coefficients for single particles and packed beds.** *Chem. Eng. Progress* 48, 247-53(1952).—*C.A.* 46, 5896*f*.

Transfer rates and friction factors for spheres were related through the application of a simple model to heat- and mass-transfer rates and pressure drops in beds packed with spherical particles. Equations for estg. effective thermal cond. and diffusivity were derived and parametric consts. relating the actual fluid velocity and the av. lateral velocity to the superficial velocity were shown to characterize the performance of a packed bed.

13010. ROSEN, J.B. **Kinetics of a fixed-bed system for solid diffusion into spherical particles.** *J. Chem. Phys.* 20, 387-94(1952).—*C.A.* 46, 7410*c*.
A solution was presented for the general problem of the transient behavior of a linear fixed-bed system where the rate of adsorption was detd. by the combined effect of a liquid film and solid diffusion into spherical particles. The result obtained was an expression for the effluent following a sudden change in the influent concn. The approx. solution and the error term were given as closed trigonometric expressions which could be easily evaluted.

13011. SCHULER, R.W.; STALLINGS, V.P., AND SMITH, J.M. **Heat and mass transfer in fixed-bed reactors.** *Chem. Eng. Progress Symposium Ser.* 48, No. 4, *Reaction Kinetics and Transfer Processes*, 19-30(1952).—*C.A.* 47, 1439*b*.
New exptl. conversion *vs.* catalyst-bed-depth data were obtained for analyzing the design procedures proposed for gas-solid catalytic reactors. Radial-heat-transfer data in terms of effective thermal conds. were presented for 1/8-, 3/16-, and 1/4-in. cylindrical pellets in a 2-in. internal diam. tube through which air flowed at mass velocities from 150 to 750 lb/hr ft^2. An approx. breakdown into sep. contributions owing to radiation, solid-solid conduction, eddy transfer, etc., was presented. Measurements indicated that the usual assumption of const. mass velocity in packed tubes was not warranted in cases where the tube diam. was relatively small.

13012. TANAKA, TATSUO AND SAITO, NOBUKI. **Ball-mill grinding of several ceramic materials. I.** *J. Ceram. Assoc. Japan* 60, 228-30(1952).—*C.A.* 46, 8340*f*.
The residue *(R)* on a 0.088-mm sieve and the specific surface area (S_a) were compared detd. by air permeability. S_a increased with time of grinding in the decreasing order: limestone, ganister, coal, cement clinker; while the decreasing order of *R* was lime, cement clinker, coal, ganister. This was due to the difference in particle distribution. Limestone formed many flakes.

13013. TOOMEY, ROBERT D. AND JOHNSTONE, H.F. **Gaseous fluidization of solid particles.** *Chem. Eng. Progress* 48, 220-6(1952).—*C.A.* 46, 5896*i*.
The system was assumed to attain the most stable configuration, and the particles were shown to be at their terminal velocities. From these considerations the av. Reynolds no. in the dense continuous phase was essentially independent of the superficial gas velocity. The gas flow through the interstices of the bed, both at incipient fluidization and at higher velocities, could be estd.

13014. TRAWINSKI, H. **Heat transfer between fluidized beds and container wall.** *Chem.-Ing.-Tech.* 24, 444-6(1952).—*C.A.* 46, 9898*c*.
An interpretation of the heat-transfer mechanism was given. The effects of gas velocity, particle size, phys. properties of particles and gas, bed d. and bed dimensions were combined into an empirical formula.

13015. VAN BAVEL, C.H.M. **Gaseous diffusion and porosity in porous media.** *Soil Sci.* 73, 91-104 (1952).—*C.A.* 47, 3081*h*.
A method was proposed for measuring the diffusivity of vapors through porous media. The exptl. results showed that the ratio between diffusivity in a porous medium and in gaseous phase was of the order of 0.6.

13016. WICKE, EWALD AND BRÖTZ, WALTER. **Proposed nomenclature for the flow of fluids through porous beds.** *Chem.-Ing.-Tech.* 24, 58-9(1952).—*C.A.* 46, 3810*h*.

13017. WICKE, E. AND HEDDEN, K. **Fluid patterns and heat transfer in fluidized beds.** *Chem.-Ing.-Tech.* 24, 82-91(1952).—*C.A.* 46, 3810*b*.
Heat transfer from a suspended heater to the air-fluidized bed was compared with the fixed bed and the empty tube. Coeffs. in the fluidized bed and the fixed bed, resp., were approx. 8 and 4 times the coeffs. obtained for the empty tube. Optimum coeffs. were obtained at a velocity which corresponded to about twice the velocity at which the bed started to expand.

13018. WICKE, EWALD AND VOLLMER, W. **Flow of gases through micropores.** *Chem. Eng. Sci.* 1, 282-91(1952).—*C.A.* 47, 4142*a*.
Experimental information on the flow of the gases CH_4, N_2, NH_3, CO_2, H_2, and CO through micropores was given. The region of special study was that in the transition zone between laminar and mol. flow. The effect of the mean gas pressure and of the temp. on the flow was examd.

13019. YAGI, SAKAE; MUCHI, IWAO, AND AOCHI, TETSUO. **Conditions of fluidization.** *Chem. Eng.* (Japan) 16, 307-12(1952).—*C.A.* 46, 9348*b*.
Expts. were made to study the effects of various factors which det. the conditions of fluidization in fluidized beds of air and particles (Fe, pyrrhotite, sand, coke, coal, etc.). A nomograph was constructed to det. easily the suitable conditions of fluidization for given particles.

13020. YAGI, SAKAE AND SHIRAI, TAKASHI. **Fluid flow through fluidized solid beds—a nomograph.** *Chem. Eng. (Japan)* 16, 2-6(1952).—*C.A.* 46, 2351*i*.
A nomograph was presented. Numerical examples of use of nomograph agreed well with data for Fischer-Tropsch Fe catalyst and with published water fluidization data of sand.

13021. CHU, JU CHIN; KALIL, JAMES, AND WETTEROTH, WM. A. **Mass transfer in a fluidized bed.** *Chem. Eng. Progr.* 49, 141-9(1953).—*C.A.* 47, 4142*b*.
Transfer was studied between regular-shaped solids and a turbulent gas stream for both fixed and fluidized granular beds. The data were found in agreement with practically all the fixed-bed data of widely varying systems, as well as with data for fluidized liquid-solid beds. The Chilton-Colburn analogy of mass transfer and pressure drop for flow in conduits was modified for flow in granular beds. The resulting relation

held remarkably well over a wide range of Reynolds and Schmidt nos., making possible the prediction of mass-transfer data in granular beds from the more easily obtained pressure-drop data.

13022. Cornell, David and Katz, Donald L. **Flow of gases through consolidated porous media.** *Ind. Eng. Chem.* 45, 2145-52(1953).—*C.A.* 48, 411*d*.

Data were obtained for 4 gases (air, N_2, He, CH_4) passing through 24 specimens of sandstones, limestones, and dolomites. These were correlated by using flow equations expressed in terms of measurable quantities, including permeability, porosity, and elec. resistivity. In the absence of complete flow data, these equations and procedures could be used to predict gaseous flow through consolidated porous media.

13023. Dryden, C.E.; Strang, D.A., and Withrow, A.E. **Mass transfer in packed beds at low Reynolds number.** *Chem. Engr. Prog.* 49, 191-6 (1953).—*C.A.* 47, 5179*i*.

Exptl. data were given for the transfer of mass from solid pellets in packed beds to water flowing at low velocities in the surrounding voids. Solids employed were 2-naphthol and benzoic acid. Other variables not prevalent in the turbulent region were discussed for the transition and laminar regions. The need for further work in all regions for both liquids and gases was pointed out with specific recommendations.

13024. Gilliland, E.R.; Mason, E.A., and Oliver, R.C. **Gas-flow patterns in beds of fluidized solids.** *Ind. Eng. Chem.* 45, 1177-85(1953).—*C.A.* 47, 8422*c*.

The gas-flow pattern in small fluidized-solid reactors had an important effect on chemical conversion. Residence-time data could be used to predict the magnitude of this effect for all orders of homogeneous reactions. He and CO_2 were used as tracers in studying residence times and gas-mixing. The oxidation of NO was studied in glass reactors by using glass beads as the fluidized solid.

13025. Grace, H.P. **Resistance and compressibility of filter cakes.** *Chem. Eng. Progr.* 49, 303-18(1953).—*C.A.* 47, 7835*g*.

Exptl. development and application of a compression-permeability technique were described for studying the properties of compressible cakes. Results were presented for cakes of 17 materials of subsieve and submicron ultimate particle size. Data on specific cake resistance, cake porosity, effective specific surface of cake solids, and phys. cake compressibility were correlated over a range of uniform compressive pressure of from 1 to 2700 p.s.i.

13026. Grace, H.P. **Resistance and compressibility of filter cakes. II. Under conditions of pressure filtration.** *Chem. Eng. Progr.* 49, 367-77(1953).—*C.A.* 47, 8420*d*.

Methods for interpreting compression-permeability data in terms of actual pressure filtration conditions were applied to prediction of av. specific cake-resistance values for 10 materials. These predicted values were found to agree within ± 10% with values detd. from actual pressure filtration over a range of filtration pressure drop from 10 to 450 p.s.i. With several materials this agreement remained valid when suspensions were used that were characterized by different degrees of particle flocculation of the same material and that yielded cakes of widely different properties.

13027. Grace, H.P. **Resistance and compressibility of filter cakes. III. Under conditions of centrifugal filtration.** *Chem. Eng. Progr.* 49, 427-36(1953).—*C.A.* 47, 9676*a*.

Interpretation of compression-permeability data in terms of conditions of centrifugal filtration was considered for general and simplified cases. Forces existing in centrifugal filtration were analyzed, and a simplified centrifugal-rate equation was developed. Results of centrifugal-drainage rate and centrifugal-filtration runs for 4 materials were correlated in terms of this simplified-rate equation.

13028. Grumer, Joseph; Schultz, Harold, and Harris, Margaret E. **Calibration of glass-wool flowmeters.** *Anal. Chem.* 25, 840(1953).—*C.A.* 47, 8418*d*.

A single gas calibration of the National Bureau of Standards glass-wool, porous-plug flowmeter was extended to gaseous mixts. by a simple calcn. based on the d. and viscosities of the gases.

13029. Martin, Jean. **Experimental study of fluidized solid-gas systems.** *Chimie & industrie* 69, 57-71(1953).—*C.A.* 47, 5180*c*.

Finely divided solid material fluidized by gas was investigated on a lab. scale. Sand and coke (70-100 mesh, 100-140 mesh, 140-200 mesh, 200-300 mesh) were used in the expts. The min. rate of fluidization for a finely divided solid could be calcd. with high accuracy by applying hydrodynamic equations.

13030. Ponomarev, V.D. and Ni, L.P. **Dependence of specific resistance in filtration on the diameter of particles and on porosity.** *Izvest. Akad. Nauk Kazakh. S.S.R. No.* **118**, *Ser. Khim. No.* 6, 3-10(1953).—*C.A.* 48, 2419*b*.

The dependence of the resistance on particle size and porosity for ppts. of quartz and galenite agreed well with the theoretical calcn. made by the equation: $r = k(1 - e)^2/d^2e^3$, where $k = 1/C$, C being the coeff. depending on the form or cross section of pores of the ppt. and on viscosity of the liquid; r was the specific resistance of ppt. layer; d was the particle diam.; e was the porosity. For Fe oxide ppts. and for alumina an empirical equation was satisfactory: $r = k(1 - e)^{4.5}/d^{1.6}e^3$.

13031. Schwartz, C.E. and Smith, J.M. **Flow distribution in packed beds.** *Ind. Eng. Chem.* 45, 1209-18(1953).—*C.A.* 47, 3425*e*.

Variations in velocity profiles may be important in catalytic reactors and packed-bed heat exchangers. For ratios of pipe-to-pellet diams. of less than 30, divergence from a flat profile increased as the ratio decreased. A correlation was given for pellets 0.125-0.5 in. in diam. in pipes 2-4 in. in diam.

13032. Sittig, Marshall. **Fluidized solids.** *Chem. Eng.* 60, No. 5, 219-31(1953).—*C.A.* 47, 6194*e*.

The design of modern fluidization equipment was discussed in detail, including methods of solids prepn., solids addn. to the system, types and arrangement of reaction vessels, methods of reactant sepn. and heat exchange, and instrumentation. Applications of fluidization were discussed for phys. processes such as heat transfer, evapn., adsorption, drying, pollution control, and size reduction, and for chem. processes such as pyrolysis, halogenation, oxidation, or reduction.

13033. Sutherland, K.L. and Winfield, M.E. **Transient rates of gas sorption. II. Rate equations for transport and adsorption in porous adsorbents.** *Australian J. Chem.* 6, 234-43(1953).—*C.A.* 48, 21*g*.

Equations were derived to describe the rate at which gas passed into a bed of adsorbent under conditions of const. vol. and diminishing pressure. Processes considered were: (1) Knudsen flow within the bed, or within granules of which the bed was composed together with simultaneous adsorption that was too fast to be a limiting factor; (2) chemisorption controlled by rate of Knudsen flow, (3) unrestricted chemisorption.

13034. Weiss, D.E. **Countercurrent adsorption separation processes. II. Shell adsorbents.** *Australian J. Appl. Sci.* 4, 510-18(1953).—*C.A.* 48, 3071*c*.

A theoretical discussion was given of the advantages of an adsorbent having a porosity limited to its outer shell. The suitability for mech. handling, rapid attainment of equil., and a consequent high rate of mass transfer made such adsorbents of particular value for use in continuous countercurrent adsorption processes.

13035. Wicke, E. and Trawinski, H. **Mixing of the fluid medium in liquid-porous media systems.** *Chem. Ing.-Tech.* 25, 114-24(1953).—*C.A.* 47, 5179*d*.

The flow of water through beds of glass beads (d. 2.84) of varying diam. (0.9-10.0 mm), pressed beads (d. 1.33, 9.8 mm diam.) and clay beads (d. 1.50, 12 mm diam.) was studied by observing the dispersion of indicator streams of HCl and hot water. The dispersion followed the diffusion laws and "mixing coeffs." could be detd. from observed distribution profiles.

13036. Wilson, B.W. **The sedimentation of dense suspensions of microscopic spheres.** *Australian J. Appl. Sci.* 4, 274-99(1953).—*C.A.* 47, 9065*d*.

Concd. suspensions of Pyrex microspheres 3.5 to 15 μ in diam. were used to interpret the roles of viscous friction and surface forces during the sedimentation of microscopic particles in liquids. Within the limits of collective sedimentation viscous forces resembled those acting on a sphere settling in a narrow cylinder and those acting in liquids flowing through beds of spheres, while surface forces were confined to kinetic friction and adhesion between the spheres.

13037. Wilson, B.W. **The permeability of beds of microscopic spheres.** *Australian J. Appl. Sci.* 4, 300-15(1953).—*C.A.* 47, 9065*e*.

Thin filter membranes formed by sintering Pyrex microspheres were used to support beds of spheres measuring between 1 and 10 μ in diam. The permeability to water of both compacted and highly porous beds were compared with that predicted by semiempirical theory based on large scale models, and a theory of agglomeration proposed to account for changes in porosity and permeability.

VI-7. X-Ray Investigations—Electron Microscope

13038. Hendricks, Sterling B. and Fry, William H. **The results of x-ray and microscopical examinations of soil colloids.** *Soil Science* 29, 457-79(1930).—*C.A.* 24, 3848.

Microscopical examn. and x-ray powder diffraction photographs of finely divided materials sepd. from soil by suspension methods showed that these fractions contained cryst. substances. The colloids showed diffraction patterns of 3 general classes: montmorillonite, halloysite and ordovician bentonite. Each of the types of x-ray pattern was found over a considerable range of values of the SiO_2-R_2O_3 ratio. Colloids from a specific type of soil obtained from widely different localities gave the same type of diffraction pattern.

13039. Kelley, W.P.; Dore, W.H., and Brown, S.M. **The nature of the base-exchange material of bentonite, soils and zeolites, as revealed by chemical investigation and x-ray analysis.** *Soil Science* 31, 25-55(1931).—*C.A.* 25, 1317.

Replaceable bases of several samples of bentonite were detd. before and after grinding in a ball mill for different lengths of time. Grinding greatly increased the exchangeable bases, particularly the Mg and K. Seventy-two hrs grinding served to render most of the bases exchangeable. X-ray studies of these various colloidal materials showed them to be cryst., and the lines in the x-ray patterns were greatly dimmed by grinding. Certain of the soil colloids were closely related to the montmorillonite-beidellite clays, others to the potash bentonites and still others to the halloysite type of clay minerals.

13040. Hofmann, Ulrich; Endell, Kurd, and Wilm, Diederich. **The crystal structure and the swelling of montmorillonite.** *Z. Krist.* 86, 340-8(1933).—*C.A.* 28, 2237^7.

Analysis of montmorillonite gave SiO_2 49.0, Al_2O_3 23.0, Fe_2O_3, CaO 1.6, MgO 2.9, H_2O 23.0. The unit cell was orthorhombic, with $a = 5.095$, $b = 8.83$ and $c = 15.2$ A. The structure consisted of layers of double SiO_4 sheets, with the free O atom of each SiO_4 tetrahedron toward the center. The Al ions and OH groups were between the SiO_4 sheets. The swelling with water was one-dimensional and reversible. The distance between layers varied from 19.6 A. with over 30% H_2O to 9.6 A. when heated to 550°C (4.6% H_2O).

13041. Hofmann, Ulrich; Endell, Kurd, and Wilm, Diederich. **X-ray and colloid-chemical investigations on clay.** *Angew. Chem.* 47, 539-47 (1934).—*C.A.* 28, 6961^3.

Exptl. data, photometer curves and x-ray photographs were presented. The SiO_2 content in some bentonites, which was in excess of the montmorillonite compn. ($Al_2O_3:SiO_2 = 1:4$), crystallized according to the geological age.

13042. ALEXANDER, L.T.; HENDRICKS, S.B., AND NELSON, R.A. **Minerals present in soil colloids. II. Estimation in some representative soils.** *Soil Sci.* 48, 273-9(1939).—*C.A.* 33, 9508[6].

Minerals present in the colloidal fraction of 15 soils from various parts of the United States were identified and their amts. estd. by the use of chem., thermal and x-ray diffraction methods. Kaolinite and free oxides and hydrous oxides of Fe were the predominant components of the red podzolic soils examd. Colloids of gray-brown podzolic soils contained these minerals assocd. with hydrous mica. A composite estn. based on analytical, x-ray and thermal data indicated the following minerallogical compn. for the colloid of a Carrington soil of the prairie group: kaolin 40, hydrous mica 40, montmorillonite 10 and Fe_2O_3 10%.

13043. FAVEJEE, J. CH. L. **Quantitative x-ray soil investigation.** *Z. Krist.* **101**, 259-70(1939). —*C.A.* 33, 8879[2].

By detg. the intensities of the powder photograph lines in synthetic mixts. of known components, it was possible to det. the compn. of the clay fraction of some soils.

13044. HENDRICKS, STERLING B. AND ALEXANDER, LYLE T. **Minerals present in soil colloids. I. Descriptions and methods for identification.** *Soil Sci.* 48, 257-71(1939).—*C.A.* 33, 9507[9].

The (001) spacing of montmorillonite varied with the water content and this variation was used as an aid in identification. Hydrous mica and kaolinite were identified with certainty by the use of oriented samples. The mixed-layer minerals, however, had a strong reflection with a spacing of about 3.0 A., and this was confused with that of montmorillonite.

13045. KELLEY, W.P.; DORE, W.H.; WOODFORD, A.O., AND BROWN, S.M. **The colloidal constituents of California soils.** *Soil Sci.* 48, 201-55(1939).—*C.A.* 33, 9507[4].

X-ray examns., dehydration curves and various chem. analyses and tests were made on a large group of California soils. Every soil colloid examd. was composed chiefly of clay minerals. More than one type of clay mineral was usually present in a particular sample. Variable amts. of quartz were probably present in the colloids which affected SiO_2-Al_2O_3 ratio. Distribution of particle sizes may differ substantially and this also might affect base-exchange capacity. There appeared to be no definite relation between content of nonreplaceable bases and base-exchange capacity or other properties of the colloids.

13046. ARDENNE, M. V.; ENDELL, K., AND HOFMANN, U. **Observations on finest fractions of bentonites and clay soils with the universal electron microscope.** *Ber. deut. keram. Ges.* 21, 209-27(1940).—*C.A.* 35, 411[6].

A Wyoming bentonite consisted of packets of montmorillonite flakes 100 to 300 mμ wide, sepd. like org. fibers, and at intervals of 15 mμ. Individual flakes were only 1 mμ thick, the thickness of an elementary layer of the lattice. A Ponza bentonite from Italy possessed a flaky appearance but contained also granular particles about 100 mμ in size which were probably opal in view of the cristobalite x-ray lines. Kaolin consisted of plates about 20 mμ thick and 100 to 500 mμ in breadth, the ratio being 5 to 25/1.

13047. EDELMAN, C.H. AND FAVEJEE, J. CH. L. **The crystal structure of montmorillonite and halloysite.** *Z. Krist.* **102**, 417-31(1940).—*C.A.* 35, 2448[8].

A structure was proposed in which (001) contained OH groups that were able to polarize water and other polar mols., i.e., $Al_2(OH)_4O_2Si_4O_6(OH)_2 \cdot nH_2O$, introducing in the place of Si_2O_5, which could be written $O_2Si_2O_3$, the layer OSi_2O_3OH. It was not possible to deduce from the available x-ray data the definite structure. The dehydration took place so easily even at a low temp. that it was impossible to make a distinction between adsorbed water and lattic water.

13048. MIDDEL, V.; REICHMANN, R., AND KAUSCHE, G.A. **Supermicroscopic investigation of the structure of bentonites.** *Wiss. Veroffentl. Siemens-Werken, Werkstoff-Sonderheft* **1940**, 334-41.—*C.A.* 35, 4167[3].

With 15,000-40,000 enlargement it was seen that only the American Na bentonites were suitable for strong films. European Ca bentonites, mostly transformed into alkali bentonites by alkali salts, were insufficient.

13049. ENDELL, JOACHIM. **The study of the fine structure of clays by means of the electron microscope.** *Keram. Rundschau* 49, 23-6(1941).—*C.A.* 35, 4559[1].

Bentonite consisting of well-developed plates was more suitable for film prepn. than that consisting of intergrown, irregular, scaly masses.

13050. HUMBERT, R.P. AND SHAW, BYRON. **Studies of clay particles with the electron microscope. I. Shapes of clay particles.** *Soil Sci.* 52, 481-7(1941).—*C.A.* 36, 2660[9].

Photographs showed the plate-shaped nature of clay particles. The crystallinity of kaolinite was many times better developed than that of montmorillonite.

13051. JACKSON, M.L. AND HELLMAN, N.N. **X-ray diffraction procedure for positive differentiation of montmorillonite from hydrous mica.** *Soil Sci. Soc. Am. Proc.* 6, 133-45(1941).—*C.A.* 37, 490[9].

A complete dispersion of the clay was based on Na saturation and digestion in dilute Na_2CO_3 solution, mechanical subdivision of the clay at 0.2 μ particle-diameter, suspension of the clay in 0.3 *N* Na acetate buffer adjusted to pH 3.5 with HCl and boiling for 5 minutes, saturation with Ca and washing free of excess salt, and dispersion in benzene followed by drying at 35°C. This preparation resulted in a 14-15 A. spacing for montmorillonite and a spacing of 12 A. for hydrous mica. Montmorillonite clays gave smaller than 15 A. (001) spacings when dried from water or benzene while saturated with H, Li, Na, Be, or K.

13052. Shaw, B.T. and Humbert, R.P. **Electron micrographs of clay minerals.** *Soil Sci. Soc. Am. Proc.* 6, 146-9(1941).—*C.A.* 37, 490[8].
Characteristic electron micrographs of several clay minerals were reproduced. The montmorillonites showed structures ranging from a fluffy amorphous-appearing material to well-defined, extremely thin plates. Nontronite had flat, frayed fibers; kaolinite and dickite both had hexagonal plate-shaped crystals and halloysite had long split rods. Dickite crystals were much thicker than most kaolinitic crystals.

13053. Biscoe, J. and Warren, B.E. **X-ray study of carbon black.** *J. Applied Phys.* 13, 364-71 (1942).—*C.A.* 36, 4746[9].
The diffraction patterns were made in evacuated cameras, and consisted of (001) and two-dimensional reflections (*hk*). The dimensions within a layer were the same as in graphite, but the layer sepn. was somewhat greater. Heat-treatment increased the size of parallel-layer groups. Small-angle scattering studies indicated the existence of clusters a few hundred A. in size.

13054. Dankov, P.D. **The structure and the mechanism of formation of oxide films on aluminum.** *J. Tech. Phys. (U.S.S.R.)* 12, 251-72(1942).—*C.A.* 37, 5296[5].
X-ray diagrams and photomicrographs were reproduced.

13055. Glocker, R. and Hendus, H. **The atomic arrangement in amorphous solids.** *Z. Electrochem.* 48, 327-31(1942).—*C.A.* 37, 5633[9].
Diffraction diagrams of explosive Sb and glassy Se were detd. with a vacuum camera with monochromatized Cu Kα radiation. Radial distribution analyses indicated neighbors as follows: for Se: 2 at 2.37 A., 8 at 3.67 A. and 8 at 4.72 A.; for Sb: 4 at 2.87 A., 2 at 3.51 A. and 12 at 4.18 A. These liquidlike states were compared and contrasted with glass, benzene and carbon black.

13056. Hellman, N.N.; Aldrich, D.G., and Jackson, M.L. **Further note on an x-ray diffraction procedure for the positive differentiation of montmorillonite from hydrous mica.** *Soil Sci. Soc. Am. Proc.* 7, 194-200(1942).—*C.A.* 37, 6075[2].
A modification of the x-ray diffraction procedure for differentiating montmorillonite from hydrous mica was proposed. The fine clay was satd. with Ca, suspended in a benzene-ethanol-water mixt., hydrated to 50% of the wt of clay by the expulsion of water from the suspension medium by addn. of benzene, freed of excess liquid, dried at 30°C and 65% relative humidity, and x-rayed while exposed to an atm. of 92% relative humidity. This procedure resulted in a 16 A. - (001) line of very high intensity for montmorillonite and a 13 A. - (001) line of moderate intensity for hydrous mica.

13057. Humbert, R.P. **Particle shape and the behavior of clay as revealed by the electron microscope.** *Bull. Am. Ceram. Soc.* 21, 260-3 (1942).—*C.A.* 37, 2149[7].
Electron photomicrographs were shown of montmorillonite, nontronite, illite, beidellite, hectorite, kaolinite, dickite, halloysite and of 3 com. clays, Sciotoville fireclay, Mayfield, Ky., ball clay and attapulgite (Attapulgus, Ga., clay). Montmorillonites showed structures ranging from fluffy, amorphous-appearing material to well-defined thin plates.

13058. Kodama, Shinjiro and Tahara, Hidekazu. **X-ray investigation of iron catalyst used in the synthesis of gasoline. I. Preliminary report.** *J. Soc. Chem. Ind. Japan* 45, 1260-2 (1942).—*C.A.* 42, 6082*e*.
A freshly prepd. catalyst for the hydrogenation of CO (Fe 100, Cu 24, Mn 2, kieselguhr 125, and K_2CO_3 2 parts) was amorphous. Heating at 700°C for 6 hrs destroyed the catalytic power and produced α-Fe_2O_3. Reduction in H_2 at 450°C also destroyed the catalytic power, and produced α-Fe. After use in the synthesis of gasoline at 255°C for 2 hours the catalyst had a spinel structure with lattice const. 8.4 A.

13059. Kratky, O.; Sekora, A., and Treer, R. **Diffuse scattering of Röntgen rays by colloidal systems at small angles.** *Z. Elektrochem.* 48, 587-601(1942).—*C.A.* 37, 6546[5].
The micelle thickness could be calcd. indirectly from the diffuse scattering. The intensity was connected with the difference between the space electron density of the colloidal particles and that of the interstitial medium. With equal electron densities, the scattering disappeared just as in optics the particle was no longer visible when immersed in a medium of the same *n*. This was applied to cellulose hydrates and to alkali celluloses.

13060. Mahl, H. **Thermally produced oxide films on aluminum.** *Kolloid-Z.* 100, 219-28(1942).—*C.A.* 37, 3648[9].
Oxide films, formed on Al foil by ignition in air at 500-600°C, were investigated by electron interference and the electron microscope. They consisted of scaly crystallites of γ-Al oxide with the plane of greatest extent of the oxide crystallites approx. parallel to the surface. Oxide films produced by sweeping Al foil over a Bunsen flame were not platelets but very fine-grained without marked fibrous structure.

13061. Schwab, Georg-Maria. **Crystal orientation in tarnish layers.** *Z. physik. Chem.* B51, 254-64(1942).—*C.A.* 36, 6859[2].
The layers arising on Ag, Cu and Pb as the result of different tarnishing reactions were investigated. In some cases regular lattice orientations with respect to crystallographic directions of the ground material were observed. The conditions for such orientations were an increase in the mol. vol. and the coincidence of certain distances of the two lattices within less than 6%.

13062. Shaw, B.T. **The nature of colloidal clay as revealed by the electron microscope.** *J. Phys. Chem.* 46, 1032-43(1942).—*C.A.* 37, 1638[4].
Montmorillonite fractions less than 50 mμ (equiv. spherical diam.) were probably composed

largely of crystals about 9 A. thick. Fractions contg. particles from 200 to 50 mμ contained aggregates of crystals as well as individual crystals. Fractions contg. particles greater than 200 mμ contained principally aggregates. By wet-grinding kaolinite for 144 hrs the exchange capacity was raised from 3.8 to 16.6 milliequiv. per liter. By dry-grinding for 144 hrs the exchange capacity of the kaolinite was increased to 49.5 milliequiv. per liter. Under some conditions the unit plates of montmorillonite may build up into packages showing orientation in the *a* and *b* directions, whereas under other conditions there was no orientation.

13063. UEDA, RYUZÔ AND TAKAGI, SACHIO. **Diffraction of cathode rays by a unimolecular layer of stearic acid.** *Science* (Japan) 12, 217(1942). —*C.A.* 45, 9984*c*.

A unimol. layer of stearic acid was prepd. on the surface of distd. H_2O, and was transferred to the cleavage surface of molybdenite by the method of Langmuir and Blodgett. A clear diffraction pattern was obtained for it by cathode rays. It was found that stearic acid belonged to the rhombic system, having $a = 7.30$ and $b = 4.98$.

13064. EITEL, W. **The electron microscope and its application to ceramic problems.** *Ber. deut. keram. Ges.* 24, 37-53(1943).—*C.A.* 38, 461^9.

Kaolin was characterized by individual crystals having hexagonal outlines. Montmorillonite had a strong tendency to form finely flaked, leafy aggregates, which appeared as a cloud in the electron microscope. The absorption of electrons was increased by exchanging the lighter cations of the montmorillonite for heavier ones. The electron-diffraction diagrams of the above clay minerals corresponded with the x-ray diagrams.

13065. ENDELL, K. AND ARDENNE, M. V. **Sintering and melting in ceramic materials, glass mixtures, slag and coal ashes heated in an electron microscope.** *Kolloid-Z.* 104, 223-31(1943). —*C.A.* 38, 1410^6.

The successive changes in powd. materials when heated to their m. p. in a suitable electron microscope were illustrated.

13066. GEILING, S. AND GLOCKER, R. **Atomic arrangement in aluminum hydroxide gel.** *Z. Elektrochem.* 49, 269-73(1943).—*C.A.* 38, 1161^2.

The α-gel was pptd. at low temp. to avoid aging effects, whereas the β-gel was prepd. by heating the former for several hrs under water at 70°C. The α-gel aged on standing with a gradual transition to β-gel, though the transformation was incomplete in 7 weeks. It was concluded that the α-gel did not have a space lattice structure. The β-gel showed some of the interferences characteristic of boehmite.

13067. HOFMANN, ULRICH. **The structure and technical properties of carbons.** *Wien. Chem.-Ztg.* 46, 97-106(1943).—*C.A.* 38, 2868^1.

Graphite, cokes (retort graphite), activated carbons and lampblacks were considered. From the broadening of Debye rings av. crystal sizes were: graphite, diam. 1000 A., height perpendicular to planes 400 A.; coke, diam. 20-60 A., height 16-45 A.; active carbon, diam. 18-20 A., height 8-10 A.; lampblack, diam. 25-200 A., height 15-60 A. The last 3 differed among themselves chiefly in secondary structure. Adsorption of methylene blue showed the active surface for cokes (1.2 to 2.5 m^2/g) to be only 1/200 to 1/1000 of the surface calcd. from crystal size. The active surface (470-550 m^2/g) of active carbon was half the calcd. surface. Lampblacks had an active surface of 7-63 m^2/g.

13068. KAMOKAWA, HIROSHI. **Study of the polished surface of glass by electron diffraction.** *J. Phys.-Math. Soc. Japan* 17, 396-415(1943).—*C.A.* 42, 14*a*.

The surface of quartz glass polished with rouge had smaller rough places than the polished surface of metals, as in the case of quartz. The particles of rouge were observed with an electron microscope, and the effect of their size and form on the polished surface was studied. The surface structure of glass undergoing chem. change was also observed.

13069. LAUBENGAYER, A.W. AND WEISZ, R.S. **A hydrothermal study of equilibria in the system alumina-water.** *J. Am. Chem. Soc.* 65, 247-50 (1943).—*C.A.* 37, 1644^1.

The data indicated that corundum was the stable phase above 450 ± 5°C; γ-alumina was metastable throughout the range investigated; diaspore was stable below 450 ± 5°C, and the lower limit for its stability seemed to be near 280°C; boehmite apparently was stable between 155 and 280°C; gibbsite was unstable above 155°C. Bayerite was unstable above 155°C, and the indications were that it was less stable than gibbsite below this temp.

13070. LINKE, F. **Condensation nuclei made visible in the electron microscope.** *Naturwissenschaften* 31, 230-1(1943).—*C.A.* 38, 9^9.

Condensation nuclei were pptd. from air on a microscope slide; electron-micrograms were given. Some of the nuclei were amorphous, some cryst., av. size 25-100 mμ.

13071. RAGOSS, A.; HOFFMANN, U., AND HOLST, R. **Graphite formation (black-leading) of Thermax carbon black.** *Kolloid-Z.* 105, 118-24(1943).—*C.A.* 38, 4849^4.

The graphite formation of Thermax C black (from natural gas) by step-wise heating from 1000° to 3000°C was followed by means of an electron microscope which showed the growth of graphite crystals. The adsorption capacity for methylene blue remained const. during graphite formation; the particles had as strong adsorptive power when they were composed of tens of thousands of small crystals with numerous edges and corners as when they were built up of the flat faces of a few larger crystals.

13072. SHIRAI, SHUNJI. **Structure of thin nickel and gold films.** *Proc. Phys. Math. Soc. Japan* 25, 169-72(1943).—*C.A.* 41, 6101*b*.

The structure of thin Ni and Au prepd. by evapn. *in vacuo* on a heat-treated rock-salt cleavage surface was investigated by cathode-ray diffraction.

13073. TAKEUCHI, TSUNEHIKO. **Mineralogical studies of bauxite. I. Properties of bauxites from various localities. II. X-ray diffraction of bauxite powder.** *Bull. Research Inst. Mineral Dressing Metall.* 2, 3-17, 18-28(1943).—*C.A.* 45, 507*b*.

Bauxite from Haiphong (French Indo-China) was mainly diaspore ($HAlO_2$); that from Montpellier (France), boehmite [AlO(OH)]; those from Bintan (Dutch East Indies), Palau (Caroline Islands), South America and Malaya, gibbsite [$Al(OH)_3$]; that from Greece, a mixt. of diaspore and gibbsite; those from Yugoslavia and India, a mixt. of gibbsite and boehmite.

13074. TANIDA, SHIGEO. **Mixed catalysts. II. Structure analysis of nickel-molybdenum and nickel-tungsten catalysts by means of x-rays.** *Bull. Chem. Soc. Japan* 18, 36-44(1943).—*C.A.* 41, 4368*ef*.

X-ray photographs of binary catalysts, Ni-Mo and Ni-W, which had various ratios of compn. were taken. In the case of Ni-Mo system, the diffraction lines shifted with increasing addn. of Mo, and the lattice const. was enlarged. The limit of soly, of the solid soln. was about 100 Ni-15 Mo, which had proved to have the highest catalytic property. In the case of Ni-W system, change of the lattice const. was not observed.

13075. TOMITA, AKIRA. **Zinc catalyst. I. The methanol-decomposing ability of the zinc catalyst prepared from zinc complex salt.** *J. Chem. Soc. Japan* 64, 423-30(1943).—*C.A.* 41, 3353*h*.

The MeOH - decompg. activity of Zn catalyst prepd. from complex compds. was great compared with that of catalyst prepd. by the usual pptn. method. From the x-ray patterns of the catalysts, it was presumed that the crystal was incomplete and that there were many atoms combined in unsatd. state.

13076. TOVBORG-JENSEN, AKSEL. **Determination of particle size by x-ray powder diffraction method.** *Kgl. Danske Videnskab. Selskab., Math.-fys. Medd.* 20, No. 8, 9 pp.(1943).—*C.A.* 38, 4172^5.

If B' was the width of an *hkl* reflection of the substance whose particle size was desired and B the width of the same line in a normal diagram, the particle thickness, t, was given by the formula $b = k\lambda/(t \cos \theta)$, where $b = (B'^2 - B^2)^{1/2}$.

13077. VENTURELLO, GIOVANNI. **Aluminum hydroxide gels.** *Atti reale accad. sci. Torino, Classe sci. fis., mat. nat.* 79, (1943-44).—*C.A.* 41, 4995*d*.

The gel of $Al(OH)_3$ obtained by pptn. (α-gel) appeared amorphous on x-ray observation; by aging or by heating at 70°C it was transformed into the β-gel, which did not show a true cryst. structure, but may be considered as a product gradually crystg., similar to boehmite.

13078. ALDRICH, D.G.; HELLMAN, N.N., AND JACKSON, M.L. **Hydration control of montmorillonite as required for its identification and estimation by x-ray diffraction methods.** *Soil Sci.* 57, 215-31(1944).—*C.A.* 38, 4535^1.

Clay particles less than 0.2 μ in diam., conditioned and satd. with Ca, were suspended in a ternary soln. of benzene, ethanol and water, the compn. of which was such as to provide true soln. but near-satn. with respect to water. Benzene was added to the suspension; this resulted in setting free a water-rich 2nd phase in finely divided form throughout the suspension so that it was sorbed uniformly by all of the clay. Most of the supernatant liquid was decanted and the clay dried under controlled conditions.

13079. BÉNARD, JACQUES. **New x-ray method of studying oxide layers.** *Bull soc. chim.* 11, 327-31(1944).—*C.A.* 40, 1715^2.

The rotating-film method, employing a diffraction standard, permitted precise measurement of the parameters in the small surface elements, using radiation that penetrated only slightly. The Kα line of Co was used, with powd. Ag as the diffraction standard, in expts. with FeO. The layer of FeO formed by heating Fe in an oxidizing atm. at 900°C showed a gradual change in the Fe content, which formed a satd. solid soln. at the underlying metal surface, and decreased toward the outer surface.

13080. BÉNARD, JACQUES; CHAUDRON, G., AND TALBOT, J. **X-ray study of splitting of a single crystal of iron by hydrogen absorption.** *Métaux, corrosion, usure* 19, No. 11-12, 106(1944).—*C.A.* 45, 3678*f*.

Single crystals of Fe were reduced to a large no. of single crystals after a long period of electrolytic charging with H_2. The effect was shown by Laue and Debye-Scherrer diagrams, the former progressively disappearing and the latter becoming more pronounced as charging proceeded.

13081. BLAYDEN, H.E.; GIBSON, J., AND RILEY, H.L. **An x-ray study of the structure of coals, cokes and chars.** *Proc. Conf. Ultra-fine Structure of Coals and Cokes, Brit. Coal Utilisation Research Assoc.* 1944, 176-231.—*C.A.* 39, 1269^6.

The crystallite dimensions in 2 planes were reported for samples including cellulose, lignin, glycine, peat, dopplerite, brown coal, lignite, poorly coking and strongly coking bituminous coal, anthracite, natural coke ("cinder coal"), fusain and vitrain from bituminous coal, and chars and cokes of these at various temps. Generally similar structure was shown by all carbonized and coalified samples, including the exts. of coal. Both carbonization and the natural process of coalification were accompanied by progressive aromatization and variation in crystallite aggregation in turbostratic arrangement. The x-ray results favored the low-temp. theory of coal origin, probably less than 200°C.

13082. ENDELL, JOACHIM. **Study of clays and diatomaceous earths by x-rays and the electron microscope.** *Ber. deut. keram. Ges.* 25, 113-26 (1944).—*C.A.* 44, 5068*e*.

13083. GIBSON, J.; RILEY, H.L., AND TAYLOR, J. **Filamentous carbon.** *Nature* 154, 544(1944).—*C.A.* 39, 852^2.

Filamentous carbon was prepd. by cracking CH_4, dild. with N_2, H_2, and CO, on an Fe surface at 1000°C. X-ray analysis showed it to be amorphous, with the *c* axis perpendicular to the fiber axis.

13084. HARIHARAN, P.S. **Intensity of x-ray reflection by diamond.** *Proc. Indian Acad. Sci.* 19A, 261-4(1944).—*C.A.* 39, 449^8.

In blue-fluorescing diamonds, the intensity of the (111) reflection increased with the intensity of the fluorescence. The intensity of the same reflection was greater in yellow-fluorescing diamonds than in blue-fluorescing ones. In yellow-fluorescing diamonds, the intensity decreased with increasing fluorescence.

13085. HEIDENREICH, R.D. AND MATHESON, L.A. **Electron-microscope determination of surface elevations and orientations.** *J. Applied Phys.* 15, 423-35(1944).—*C.A.* 38, 3543^5.

The stereoscopic method was analyzed. The parallax equation of aerial photography was employed in the form $f = (\mathrm{cosec}\ \sigma/2M) \times 10^3$ microns/mm, where σ was the stereo angle and M the total magnification. Parallax measurements were multiplied by the conversion factor f to convert them to elevations, which could be detd. to within 10% in the range from 0.1 to 2 μ, based on expts. with cubic etch figures of Al.

13086. KONIG, HANS. **Electron diffraction of copper-zinc alloys.** *Reischsber, Physik. (Beihefte Physik. Z.)* 1, 7-10(1944)(Pub. 1945). —*C.A.* 41, 6462*d*.

Cu and Zn evapd. in high vacuum onto collodion diffused at room temp. to form stable alloys. Diffraction patterns of the whole range of alloys ($\eta \rightarrow \epsilon \rightarrow \gamma \rightarrow \beta \rightarrow \alpha$ brass) were observed. Diffusion was retarded by the pressure of an oxide film on the Cu. ϵ-Brass showed a hitherto unknown lattice parameter.

13087. MRGUDICH, J.N. AND CLOCK, R.C. **X-ray and electron-microscope evaluation of carbon blacks for dry cells.** *Trans. Electrochem. Soc.* 86, 13 pp. (preprint)(1944).—*C.A.* 39, 27^9.

A black must simultaneously satisfy 3 conditions: (1) the ultimate particles of the black should be adequately conductive, (2) surface forces detg. black dispersibility should be nicely balanced between the 2 extremes of clumping and complete isolation of the particles, and (3) the particle size should not be much in excess of 38 mμ.

13088. NEUHAUS, A. AND NOLL, W. **Partial isomorphous systems. VIII. Oriented growth of organic substances on typical metals.** *Naturwissenschaften* 32, 76-7(1944).—*C.A.* 42, 4017*h*.

Bromanil, $C_6O_2Br_4$, formed deep yellow leaflets and tablets on the (100) face of Ag; a 8.62, b 6.22, c 17.94 A., β102°; $z = 4$. The (001) plane of bromanil was parallel to (100) of Ag, and the b-axis was parallel to the two (100) directions of the Ag crystal. Bromanil, like chloranil, grew very well on (100) of NaCl. Good oriented growth of $C_6Cl_5NH_2$ and C_6Br_5OH (but not of C_6Cl_5OH) took place on (100) of Ag.

13089. PETITPAS, THÉRÈSE; CHEYLAN, ÉTIENNE, AND MATHIEU, MARCEL. **Structure of catalytically active solid phase. II. Structure of hopcalite catalysts for oxidation of carbon monoxide.** *Mém. services chim. état (Paris)* 31, 323-31 (1944).—*C.A.* 40, 5986^2.

Active hopcalite preserved the structure of $MnCO_3$ (rhomobohedral rhodocrosite analogous to calcite). During thermal treatment to produce an active catalyst, the (111) line in the x-ray spectrum disappeared. On further heating, activity was destroyed and the (100) line disappeared. On still further heating the structure changed to that of Mn_2O_3. The structure of pyrolusite (MnO_2) was never observed.

13090. RILEY, D.P. **The use of x-ray methods in the study of amorphous materials.** *Brit. Coal Utilisation Research Assoc. Bull.* 8, 219-22 (1944).—*C.A.* 38, 6191^9.

13091. WINKLER, HELMUT G.F. **The crystal structure of montmorillonite.** *Z. Krist.* 105, 291-303(1944).—*C.A.* 39, 5211^9.

A new structure was proposed for montmorillonite in which all fixed lines of the powder photographs were explained as interferences from single layer packets. Such packets extended indefinitely in the a and b directions, but were limited to a single identity period in the c direction = 6.49 A. (a = 5.16, b = 8.94 A., β = 100°). The 001 and hkl interferences did not change with the swelling. The variable interference, 9.5-20 A., represented the distance between packets varying with the water content.

13092. AKAMATSU, HIDEO. **Structural model of amorphous carbon.** *J. Chem. Soc. Japan* 66, 7-8 (1945).—*C.A.* 42, 7127*e*.

The x-ray diffraction patterns of violanthrone, isoviolanthrone, pyranthrone, and indanthrene brilliant green 4G were investigated. The patterns resembled very much that of carbon black. These dyes could be considered to present a structural model of amorphous carbon.

13093. FEITKNECHT, W. **Investigation of the structure of colloidal materials by x-rays and the electron microscope.** *Vierteljahrsschr. naturforsch Ges. Zurich* 90, 161-81(1945).—*C.A.* 40, 3324^5.

The detns. of crystal structure consts. and particle sizes by conventional x-ray and electron-diffraction methods were reviewed. As_2S_3 and colloidal Au were cited as examples of spherical colloids, and V_2O_5 was cited as a linear colloid, and electron micrographs were shown for the last two.

13094. JELLINEK, M.H. AND FANKUCHEN, I. **λ-ray diffraction examination of γ-Al_2O_3.** *Ind. Eng. Chem.* 37, 158-63(1945).—*C.A.* 39, 1341^7.

The behavior of γ-Al_2O_3 when heated at various temps. for different lengths of time was studied by large-angle Bragg reflection (crystallite-size changes) and small-angle scattering (particle-size changes). The no. of Bragg reflection lines increased on heating, and the crystallite size increased too, along with the perfection of the crystal structure. Crystallite diams. were given as follows (in A.): unheated, 45; 1600°F for one hr, 55; 1472°F for 6 hrs, 59; 1472°F for 48 hrs, 67; 1600°F for 6 hrs, 62. In the last case lines of α-Al_2O_3 began to appear.

13095. KAMEYAMA, NAOTO. **Observation of cuprous oxide on the surface of a commutator by electronic diffraction.** *J. Soc. Chem. Ind. Japan* 48, 62-3(1945).—*C.A.* 42, 6199*c*.

An electron diffraction study showed that a layer of Cu$_2$O existed on the surface of the Cu.

13096. Ladd, W.A. and Wiegand, W.B. **Electron-microscope studies of colloidal carbon reticulate chain structure.** *Rubber Age* (N.Y.) 57, 299-307 (1945).—*C.A.* 39, 3686^7.

Before being subjected to shearing forces, all carbon blacks had reticulate chain structures, with lampblack and acetylene black having the most highly developed structures. Thermal carbon blacks were characterized by a distinction rod linkage structure, whereby the particles were fused tightly together. These rods were not radial, and, when broken, frequently showed skewed fractures. All other carbon blacks in their "loose" state had structures in which their ultimate spheroidal particles were closely connected. When carbon blacks were manipulated energetically, as by mulling in oil, Coblac treatment, or milling in rubber, the changes in their reticulate chain structures differed greatly, depending on the type of carbon black.

13097. Shekhter, A.; Roginskiĭ, S., and Isaev, B. **Electron-microscopical investigation of catalyst. I. Asbestos as carrier.** *Acta Physicochim. U.R.S.S.* 20, 217-26 (1945).—*C.A.* 40, 683^8.

Metallic and oxide catalysts, deposited on asbestos and used in oxidation and dehydrogenation reactions, were examd. with an R.C.A. type-B electron microscope. Heating caused a disintegration of fibers starting at 500°C and completed at 1250°C. Anthophyllite-asbestos fibers did not begin to deteriorate under 1250°C. The catalysts adhered to the fiber as isolated, nonhomogeneous crystalline grains.

13098. Turkevich, John. **Electron microscopy of catalysts.** *J. Chem. Phys.* 13, 235-9 (1945). —*C.A.* 39, 4202^3.

Electron-microscope photographs of Pt, platinized asbestos, Pt on activated charcoal, Alorco activated alumina, active silica gel, alumina silicate, zinc oxide, and nickel-thoria (supported on kieselguhr) catalysts were discussed briefly.

13099. Bénard, Jacques and Odile Coquelle. **Kinetic study of the formation of oxides on iron surfaces at high temperatures.** *Compt. rend.* 222, 884-5 (1946).—*C.A.* 40, 5985^2.

The rate of development of Fe$_2$O$_3$ layer on fresh Fe surface was linear at 900°, 950°, and 1000°C as measured micrographically by the thickness of the layer formed. The rate for Fe$_3$O$_4$ was linear at 700°, 800°, and 900°C, but diminished as time progressed at 950°C. The rate of production of FeO was parabolic at 650°, 700°, 800°, 900°, and 950°C. Two factors were involved - the diffusion of reactants across the oxide layer, and the rate of interaction of the reactants.

13100. Birks, L.S. and Friedman, H. **Particle-size determination from x-ray line broadening.** *J. Applied Phys.* 17, 687-92 (1946).—*C.A.* 40, 6934^1.

By controlled heating of MgCO$_3$ at 400° to 1000°C for 2 to 4 hrs, MgO particles ranging in size from 50 to 1000 A. were prepd. Mech. mixts. of 2 different sizes were examd. by the x-ray method, but the particle sizes could not be detd. unless the 2 max. of the distribution curve were completely resolved.

13101. Dankov, P.D. and Ignatov, D.V. **Structure of anodic films formed on alumium in oxygen gas discharge.** *Compt. rend. acad. sci. U.R.S.S.* 54, 235-8 (1946)(in English).—*C.A.* 41, 5403*g*.

The film formed on Al by anodic oxidation in an O$_2$ discharge tube had the same electron-diffraction pattern as that obtained from Al that had been exposed to the air for several months. This indicated that the same compd. (Al$_2$O$_3$) was formed in each case.

13102. Erchak, Michael, Jr.; Fankuchen, I., and Ward, Roland. **Reaction between ferric oxide and barium carbonate in the solid phase. Identification of phases by x-ray diffraction.** *J. Am. Chem. Soc.* 68, 2085-93 (1946).—*C.A.* 41, 23*f*.

The reaction of BaCO$_3$ with Fe$_2$O$_3$ in the presence of O$_2$ was studied by x-ray diffraction.

13103. Gulbransen, Earl A. **New developments in the study of surface chemistry.** *Metal Progress* 49, 553-9(1946).—*C.A.* 40, 2371^6.

Oxidation of Fe, Al, Mo, Mg, and Cu was studied by electron diffraction of thin films of the metals produced *in vacuo* after controlled oxidation in a closed container. Velocities of reaction were detd. with a vacuum microbalance.

13104. Gulbransen, Earl A. and Hickman, J.W. **An electron-diffraction study of oxide films formed on iron, cobalt, nickel, chromium, and copper at high temperatures.** *Metals Technol.* 13, No. 7; *Am. Inst. Mining Met. Engrs., Inst. metals Div., Tech. Pub.* No. 2068, 26 pp (1946).—*C.A.* 41, 358*f*.

Vacuum-formed films of Fe at elevated temps. and the effect of surface prepn. were studied. The oxidations of Co, Ni, Cr, and Cu were studied over a wide temp. range and for times up to 1 hr. The oxidation of Co indicated one lattice transformation between Co$_3$O$_4$ and CoO at 400° to 600°C. No lattice transitions occurred in the oxides formed on Ni, Cr, and Cu. Crystal growth and orientation effects were noticed, which indicated phys. changes in the surface oxides of thin metals.

13105. Hass, G. **Growth and structure of thin oxide layers on aluminum.** *Optik* 1, 134-43 (1946).—*C.A.* 41, 5770*f*.

An instantaneous film of 15-20 A. thickness was formed on exposing Al to air. Subsequent growth was slow and ceased after 1 month. The films were 45 A. thick on plane, mirrorlike surfaces and 90 A. on rough surfaces. The oxide layer had a glasslike structure. The oxidation rate of Al in contact with air was const. to 400°C, rose slowly to 500°C, and rapidly thereafter. Oxide layers that remained in contact with the Al crystallized at about 500°C, sepd. layers at 680°C, formed Al$_2$O$_3$ with a space lattice const. of a = 790 A.

13106. Hofer, L.J.E.; Peebles, W.C., and Dieter, W.E. **X-ray diffraction and magnetic studies of unreduced ferric oxide Fischer-Tropsch catalysts.** *J. Am. Chem. Soc.* 68, 1953-6 (1946).—*C.A.* 41, 644*i*.

The magnetic susceptibility of active raw Fe_2O_3 catalysts was considerably greater than that of any Fe_2O_3 or $Fe_2O_3.H_2O$ that would be identified in the diffraction pattern of the catalysts. The magnetic susceptibility of those catalysts contg. β-$Fe_2O_3.H_2O$ was very much lower than that of the active catalysts and did not greatly exceed that of β-$Fe_2O_3.H_2O$ itself. Several suggestions were proposed to account for the deactivation of the catalyst.

13107. Jellinek, M.H.; Solomon, Ernest, and Fankuchen, I. **Measurement and analysis of small-angle x-ray scattering.** *Ind. Eng. Chem. Anal. Ed.* 18, 172-5 (1946).—*C.A.* 40, 3052^1.

A simple method for the graphical analysis of data for detn. of particle-size distribution was illustrated with samples of carbon black and γ-Al_2O_3. Surface areas so calcd. compared favorably with areas evaluated from N_2 adsorption.

13108. Ruess, G.L. and Ruston, W.R. **The active surface of the carbon crystal.** *Fuel* 25, No. 6, 156-9 (1946).—*C.A.* 41, 1409*g*.

The carbon black obtained by thermal decompn. of graphite-oxide gave broadened graphite interferences, and the detn. of crystallite-size by means of x-rays and electron micrographs showed the crystallites to be of pronounced laminar shape. Difference in activity of carbons may possibly be due to slight differences between the interatomic distances within the planes.

13109. Alais, F.; Fouchécour, P. de., and Reis, T. **Preliminary note on electron microscope studies of catalysts, bleaching clays, bentonites, and schists.** *Rev. inst. Franc petrole* 2, 337-40 (1947).—*C.A.* 42, 4434*i*.

Bentonite was composed of flat particles. A montmorillonite and a German activated clay had similar cryst. structures which were confirmed by x-ray analysis. Tungstic acid was composed of long needles with extended surface. Fresh catalysts had much greater dispersion, ie., greater surface, than used ones.

13110. Aldred, F.C. and Happey, F. **Activation of copper by oxidation and reduction.** *Nature* 160, 267-8(1947).—*C.A.* 42, 4435*e*.

Preliminary x-ray data on cryst. changes produced in metallic and oxide films on Cu during activation showed that the outer surface of the Cu was oxidized to Cu_2O, which increased the vol. occupied by 4 Cu atoms. Further oxidation of CuO caused an addnl. slight increase in vol. Reduction of H_2 broke down the oxide crystals without extensive migration of metallic atoms, yielding a spongy matrix. With CO, the heat involved was not rapidly dissipated so that recrystn. occurred and the mass became less porous.

13111. Anderson, Robert B.; McCartney, James T.; Hall, W. Keith, and Hofer, L.J.E. **Kieselguhrs. Suitability as carriers in catalysts.** *Ind. Eng. Chem.* 39, 1618-28 (1947).—*C.A.* 42, 1031*e*.

Electron photomicrographs, x-ray diffraction patterns, chem. analyses, surface areas, bulk d., mercury d., and He d. were presented for natural, calcined, and fluxcalcined kieselguhrs. Diffraction patterns of natural kieselguhr indicated that it was hydrous amorphous silica. Faint lines due to quartz were found. Natural kieselguhrs showed a specific surface area in the range, 15-37 m^2/g, while calcined samples showed an area 2 to 6 m^2/g. The isotherms were type II with the natural kieselguhrs showing hysteresis at a relative pressure of 0.4; this indicated pores with a diam. of 15 to 100 A., in agreement with the photomicrographic evidence and in line with recent theory on the cause of hysteresis in adsorption curves.

13112. Brummage, K.G. **An electron-diffraction study of the structure of thin films of normal paraffins.** *Proc. Roy. Soc. (London)* A188 414-26 (1947).—*C.A.* 41, 3949*a*.

Thin films of $C_{24}H_{50}$, $C_{30}H_{62}$, and $C_{34}H_{70}$ were examd. when deposited on stainless steel, Cu, or collodion. Both the reflection and the transmission techniques were employed. A thin film of a normal paraffin upon a metal consisted of a continuous and evenly spread layer, in which the mol. axes were normal to the substrate surface. The film bridged over valleys and pits upon the surface.

13113. Brummage, K.G. **An electron-diffraction study of the heating of straight-chain organic films and its application to lubrication.** *Proc. Roy. Soc. (London)* 191A, 243-52 (1947).—*C.A.* 42, 5216*d*.

Thin films of normal paraffins, fatty acids, and esters were examd. by electron diffraction during heating upon a variety of metal surfaces. In all cases the films lost their orderly condensed structure at a comparatively low temp., leaving expanded films of individual mols. Evidence was obtained of the formation of metallic soaps when fatty acid films were deposited upon reactive surfaces such as Cu, Cd, and mild steel. Base metals used were Al, Cd, Cu, Ni, Ag, mild steel, and stainless steel.

13114. Brusset, Henry. **Carbonization of cellulose.** *Compt. rend.* 224, 1356-8 (1947).—*C.A.* 41, 6044*f*.

Powder and fiber diagrams, as well as the central diffusion method, were used to study the solid state of bleached cotton in comparison with cotton heated to 185°, 242°, 257°, 284°, 314°, 340°, 430°, 465°, and 600°C. Low-angle diffraction could not be observed for the 1st and 3rd of these samples, whereas the 5th showed slight diffraction, and the others gave an intense, sharply defined diffraction. The cellulosic structure was retained up to about 300°C in spite of an important modification of the material. An amorphous structure, appearing at about 300°C, persisted throughout heating to higher temps.

13115. Chakravarty, K.M. and Sen, Ranjit. **X-ray diffraction studies of a nickel-thoria-kieselguhr catalyst for Fischer-Tropsch synthesis.** *Nature* 160, 907-8(1947).—*C.A.* 43, 2853*d*.

Powder diffraction data were tabulated for kieselguhr and for a prepd. 100:18:100 Ni-thoria-kieselguhr catalyst. The kieselguhr was partly amorphous with cryst. accessories and the prepd. catalyst consisted of Ni and Fe_2O_3 (from the kieselguhr).

13116. Enoksson, Bertil and Wetterholm, Allan. **An examination of the sulfur-binding capacity**

of charcoal by means of x-ray and electron diffraction. *Acta. Chem. Scand.* 1, 889-92 (1947)(in English).—*C.A.* 42, 5737*i*.

X-ray and electron diffraction studies were made on pure charcoal, mixts. of charcoal and S, and on the charcoal-S "compd." obtained by extn. with either aniline or CS_2, which contained 13% S. Electron photomicrographs of Charcoal-S "compd." at magnifications of 1200 or 20,000 were no different than those of charcoal; this indicated that the particles retained their form and size after S absorption. X-ray and electron diffraction diagrams of charcoal-S "compd." were distinctly different from those of either charcoal or S.

13117. GIBSON, J. AND RIBLEY, H.L. **The x-ray scattering power of microcrystalline carbons.** *Proc. Intern. Congr. Pure and Applied Chem.* 11, 131-4(1947).—*C.A.* 44, 5176*b*.

Specimens prepd. by mixing crushed dried carbon with 0.2 its wt of finely divided Al powder were moistened with gum arabic and extruded as cylinders 0.5 mm in diam. Examn. with Co Kα radiation reflected from pentaerythritol gave pictures that could be measured with the microphotometer. After elimination of background, intensities of 002 lines from carbon and 111 lines from Al were compared. Little or no increase in scattering power occurred on heating chars from 1000° to 2350°C.

13118. GORBUNOV, N.I. AND TSYURUPA, I.G. **X-ray determination of montmorillonite, kaolinite, quartz, and gypsum with mixture of amorphous silicic acid.** *Pedology* (U.S.S.R.) 1947, 555-67.—*C.A.* 42, 3635*e*.

Quartz, gypsum, and kaolinite gave clear x-ray diffraction patterns and montmorillonite less-clear pictures. Kaolinite and montmorillonite gave interference lines when these comprised 10% of the mixt. with silicic acid. Smaller quantities could be used if the exposure time was increased.

13119. HAST, NILS. **Structure of clay.** *Nature* 159, 354-7 (1947).—*C.A.* 41, 5272*b*.

A soln. of cellulose nitrate in amyl acetate was allowed to evap. on a clay surface. The resulting film of cellulose nitrate was peeled off with an adhering layer of clay particles and introduced into a vacuum where it was coated with a layer of vaporized Be or Al 25-50 A. thick. The cellulose nitrate was then dissolved with amyl acetate. The resulting film was studied with the aid of the electron microscope. Photographs of bentonite showed that it was built up to small, plane crystals, apparently round plates about 120 A. in diam. and 10 A. thick.

13120. HOFER, L.J.E. AND PEEBLES, W.C. **Preparation and x-ray diffraction studies of a new cobalt carbide.** *J. Am. Chem. Soc.* 69, 893-9 (1947).—*C.A.* 41, 4363*g*.

The carburization of Co by CO was studied at various temps., and the reaction of H_2 with, and x-ray analyses of, the resulting products. The results indicated that the easily hydrogenated carbon produced by the action of CO on finely divided Co metal was combined with Co to form a new cryst. species, Co_2C, whose structure was distinct from either α- or β-cobalt.

13121. KAHLER, F. **Electron-microscope investigation of sintered magnesium oxide.** *Radex-Rundschau* 1947, No. 3, 50-5.—*C.A.* 43, 3986*f*.

Samples prepd. from natural $MgCO_3$ (contg. 1.54% Fe_2O_3) were examd. after firing at 400°-1000°C. CO_2 was released practically completely at 500°C. Microscopically fine MgO particles were formed, which were pseudomorphs of the $MgCO_3$ matrix. The crystals grew by recrystn. to a size of 5 μ. The secondary crystals had high porosity. The first indications of sintering with considerable reduction in porosity were observed at 900°C. Considerable sintering occurred at 1000°C.

13122. LEGRAND, CH. **Study of surface structures by means of x-rays.** *J. recherches centr. natl. recherche sci.* 1947, 147-51; *Compt. rend.* 225, 731-3 (1947).—*C.A.* 42, 5295*d*.

The thickness of cryst. material depended on the angle of incidence. From theoretical consideration the thickness was of the order of 10 μ for $\alpha = 60°$, 7μ for 30°, and 1.4 μ for 3°. At 30° incidence, no difference could be observed between samples of stainless steel that were (a) ground, (b) polished with corundum, (c) polished with chrome green. At 3° the lines were widened increasingly as the polish was made finer.

13123. OBORIN, V.I. **Elementary structure of alumina catalyst.** *Neftyanoe Khoz.* 25, No. 11, 50-4(1947).—*C.A.* 42, 5750*d*.

The catalytic action was exerted by γ-alumina presumably because two Al atoms on adjacent mols. formed a doublet wherein the distance between the centers of the atoms was 2.56 A., which was close to the distance between a C atom and every other C atom in the chain. Regular orientation of the alumina mols. in space, corresponding to the elementary cryst. lattice, provided a relatively large no. of doublets and therefore a large degree of activity. Silica as a carrier supplied a large surface for the crystn. of alumina.

13124. RAETHER, HEINZ. **The surface structure of solids.** *Naturforsch. u. Med. Deutschland 1939-1946* 8, No. 1, 109-18(1947).—*C.A.* 44, 8722*f*.

Electron-diffraction expts. and photographs made with the aid of the electron microscope indicated that cold working always reduced the grain size and that it did not produce an amorphous surface but rather a very finely cryst. surface. Results of studies of the properties of deformed surface films, especially their recrystn. and oxidation, were reported. The structures of electrolytically polished metal surfaces and tempered alkali halide surfaces were discussed.

13125. SCHWAB, GEORG-MARIA. **Crystallite orientation in coating films. IV. Oriented coating films on thallous halides.** *Trans. Faraday Soc.* 43, 724-33 (1947).—*C.A.* 42, 5294*f*.

The TlCl, monocrystals, films of TlBr grew in an isomorphously orientated arrangement, forming intermediate mixed crystals; TlI did not do so, and AgCl was orientated. On TlBr, an isomorphous orientated mixed crystal was formed; AgBr was orientated too. On (110) of TlBr, the (110) of AgBr built up, the crystallographic axes within these planes being perpendicular to each other. This orientation of a NaCl-lattice on a CsCl-lattice was energetically much more favored than the (100) on (100).

13126. SHULL, C.G. AND ROESS, L.C. **X-ray scattering at small angles by finely divided solids. I. General approximate theory and applications. II. Exact theory for random distributions of spheroidal particles.** *J. Applied Phys.* 18, 295-313 (1947).—*C.A.* 41, 2991*c*.

Scattering data, mass-distribution curves, and av. particle sizes were shown for amorphous silica gels, and cryst. Al_2O_3, NiO, Fe_2O_3, and $Al_2O_3.MoO_3$. These data correlated well with those from measurements of line broadening and specific surface. Scattering curves were presented for shapes ranging from flat disks through spheres to long thin rods having Maxwellian and rectangular distributions of particle mass. Addnl. evidence from independent investigations of such quantities as particle shape and sample specific surface was required.

13127. URAZOV, G.G.; KEFELY, L.M., AND LEL'CHUK, S.L. **Structure of skeleton catalysts and their production.** *Compt. rend. acad. sci. U.R.S.S.* 55, 509-11(1947) (in English).—*C.A.* 41, 7063*a*.

X-ray data showed that the Cu atoms not removed were regrouped into the cubic lattice; the recrystn. was incomplete and resulted in a porous structure contg. ducts of varying magnitude; the Cu was more active. The same was true for the Ni-Al alloy. The small crystals of $CuAl_2$ and Ni_2Al_3 remaining were dispersed into many very fine crystals as a result of the alkali treatment.

13128. URAZOV, G.G.; KEFELY, L.M., AND LEL'CHUK, S.L. **The structure of the nickel skeleton catalyst.** *Compt. rend. acad. sci. U.R.S.S.* 55, 735-8 (1947) (in English).—*C.A.* 41, 6800*h*.

X-ray diffraction patterns of alkali-treated Ni_2Al_3 single crystals showed that the Ni skeleton catalyst was a skeleton structure of Ni_2Al_3, left after Al was removed by alk. treatment, in which minute particles of Ni were imbedded. The size of the Ni particles, estd. from x-ray diffraction patterns obtained without rotation, were between 10^{-6} and 10^{-7} cm. During the oxidation reaction at the surface of the Ni catalyst, the latter was not oxidized; it was the adsorbed H that was removed.

13129. ALEXANIAN, C.L. **X-ray examination of decolorizing, adsorbing, and catalyzing agents.** *Rév. inst. franc. petrole* 3, 104-10 (1948).—*C.A.* 43, 840*i*.

The powder method yielded characteristic x-ray diffraction patterns for kaolinites, montmorillonites, and aluminosilicate catalysts used in the oil industry. It may, therefore, be used to control production and as a means of identification.

13130. ARNELL, J.C. AND BARSS, W.M. **A comparison of the x-ray-diffraction and nitrogen adsorption surface areas of carbon blacks and charcoals.** *Can. J. Research* 26A, 236-42(1948).—*C.A.* 42, 8576*a*.

The surface areas, as detd. from x-ray diffraction and low-temp. N_2-adsorption data, were compared for a no. of carbon blacks and charcoals. Comparative data were also obtained on samples of charcoal at various stages of activation and after calcination. From the broad x-ray diffraction bands, the crystallite dimensions of the ultimate particles could be estd. Samples examd. had specific surfaces of about 2500-3000 m^2 per ml.

13131. BERESTNEVA, Z. YA.; KORETSKAYA, T.A., AND KARGIN, V.A. **Structure of vanadium pentoxide sols.** *Doklady Akad. Nauk S.S.S.R.* 59, 1121-4 (1948).—*C.A.* 42, 7132*g*.

Electron-microscope pictures of V_2O_5 sols showed, under a magnification of 15000-18000, initial presence of sep. particles and small aggregates, growing linearly into long threads, without or with only very little branching. It contradicted any representation of a homogeneity of the surface of the particles.

13132. BHATTACHARJEE, S.B. **X-ray study of crystallization of amorphous silica.** *Science and Culture* 13, 469 (1948).—*C.A.* 42, 8570*h*.

The mean band-spacing of amorphous silica gradually increased with the period of heating of the sample at high temps., e.g. 650°C, and finally sharp rings appeared, showing complete crystn. The most intense ring corresponded approx. with the position of the amorphous band. The increase in the lattice const. after 48 hrs of heating at 550°C was found to be 7.4%.

13133. BRUSSET, HENRY. **Microporosity of carbon catalysts.** *Compt. rend.* 227, 843-5 (1948).—*C.A.* 43, 2080*c*.

Carbon blacks suitable for catalytic desulfurization of fuel gases were studied by low-angle x-ray diffraction. A plot of log I vs. θ^2 (I = intensity of the ray diffracted at the angle θ) gave a characteristic curve for the best catalysts. A good catalyst had very few pores less than 60 A. in diam.

13134. BURNHAM, JOHN AND ROBINSON, PRESTON. **Properties of insulating alumina films.** *Natl. Research Council, Div. Eng. and Ind. Research, Ann. Rept. Conf. on Elec. Insulation* 1948, 68-71 (1949).—*C.A.* 43, 5250*h*.

High-purity Al electrodes were subjected to high voltages in boric, citric, and tartaric acids to form pure Al_2O_3 films which were examd. by the electron microscope, by x-rays, and for their elec. properties. Nonporous, plate-like oxide microcrystals with hexagonal symmetry and about 100 A. wide were obtained whose boundaries coincided with that of the original Al crystal grains. Their x-ray diffraction lines agreed closely with those of γ-Al_2O_3.

13135. CHRIST, C.L.; BURTON, C.J., AND BOTTY, M.C. **Use of x-ray and electron diffraction as methods of analysis in biochemical chromatography.** *Science* 108, 91-2(1948).—*C.A.* 42, 7360*e*.

A method was described for the identification of minute amts. of amino acids in mixts. After sepn. by paper partition chromatography, the portion of the paper contg. the desired compd. was leached out. The ext., contg. approx. 200γ of the amino acid, was dropped on a glass slide, and water was removed under vacuum. Examn. of specimens by electron diffraction gave inconsistent results, but reproducible diffraction patterns were obtained from less than 50γ of a no. of amino acids by using x-ray analysis.

13136. Doxey, G.O. **Electron diffraction for film and surface studies.** *Electronics* 21, No. 6, 12-14(1948).—*C.A.* 42, 4461*b*.
Cryst. structures of thin films were detd. by diffraction patterns produced when electrons were directed through the material (catalysts, lubricants, surface deposits, pigments, dyes, and many phases of metallurgy). Surfaces of materials were studied by patterns of reflected electrons.

13137. Elleman, A.J. and Wilman, H. **The structure and growth of lead sulfide deposits on rock salt substrates.** *Proc. Phys. Soc.* 61, 164-73(1948).—*C.A.* 43, 3685*g*.
PbS deposits condensed *in vacuo* on various crystallographic rock salt faces were investigated by electron diffraction. The deposited atoms took up the position of least potential energy relative to the substrate as far as was permitted. About a third of the deposits on the (001) NaCl face showed strongly twinned structures. The deposited crystals tended to develop definite external faces.

13138. Ellis, S.G. **Electron microscopy. I. Techniques.** *Petroleum Refiner* 27, No.8, 410-15 (1948).—*C.A.* 43, 31*i*.
An outline of the techniques used in electron microscopy was accompanied by illustrative sketches. When operated properly, the electron microscope gave magnifications of 20,000 X; micrographs, which may be usefully enlarged to 200,000 X, measured particle size down to 100 A. with less than 5% error.

13139. Ellis, S.G. **Electron microscopy. II. Oil-industry uses.** *Petroleum Refiner* 27, No. 9, 487-91(1948).—*C.A.* 43, 32*d*.
The application of the electron microscope to the study of greases, asphaltic substances, and catalysts was discussed, and reproductions of electron micrographs were presented. The use of the electron microscope for electron-diffraction studies was compared with x-ray diffraction. Max. resolving power was obtained in the study of dense particles, but supplementary methods were necessary to improve contract in less-dense specimens.

13140. Georgiadis, Constantin. **Graphitization of coals.** *Compt. rend. congr. ind. gaz Paris* (Assoc. tech. ind. gaz France) 65, 389-97(1948). —*C.A.* 46, 5293*i*.
The amt. of graphite formed was detd. by x-ray analysis, following acid treatment of the coke, and by measurement of the elec. cond. Graphite formation was negligible after 6 hrs of heating at 750°C, but was appreciable at 950° and 1050°C. Graphite formation was higher for coals contg. more volatile matter and varied inversely with the swelling index.

13141. Grenall, Alexander. **Montmorillonite cracking catalyst; x-ray diffraction.** *Ind. Eng. Chem.* 40, 2148-51 (1948).—*C.A.* 43, 1554*d*.
With the thermal destruction of montmorillonite clay at about 1560°F, the cracking activity with regard to gasoline production disappeared. Catalyst activity decreased on heating the catalyst in an atm. of steam. The diffraction pattern was unchanged by this treatment at 1100°F, but at 1400°F in 100% steam atm. decrease in pattern intensity occurred.

13142. Gulbransen, E.A. **Application of electron-diffraction techniques to the study of corrosion processes.** *Corrosion* 4, 445-55 (1948).—*C.A.* 42, 7694*b*.
The electron-diffraction method was used for studying the dry oxidation films on Fe, Ni, and Cr.

13143. Harris, Louis; Jeffries, David, and Siegel, Benjamin M. **An electron-microscope study of gold smoke deposits.** *J. Applied Phys.* 19, 791-4 (1948).—*C.A.* 42, 7615*b*.
Smokes were produced by evapg. Au from a hot W filament in a partial atm. of N_2 and the samples were collected on thin collodion films. The size of the unit colloidal Au particles varied with the pressure of the atm. and the rate of evapn. The manner of aggregation of the particles was independent of the N_2 pressure and rate of evapn. over a relatively wide range. The aggregations, however, changed markedly when a small amt. of O_2 was present during the evapn.

13144. Hass, Georg. **The formation and the structure of silicon layers formed by vaporization, and their behavior at high temperatures.** *Z. anorg. Chem.* 257, 166-72 (1948).—*C.A.* 43, 6028*g*.
Electron-diffraction patterns and electron micrographs were given for Si films deposited on NaCl or Al_2O_3 supports. Diffraction patterns of films deposited under 600°C showed only 3 diffuse rings. If these were heated at about 700°C, or if the deposit was made above 600°C, the patterns showed the characteristic sharp Si ring and the undesirable 222 reflection. Oxidation of Si in air at 700°C was slight.

13145. Hoerni, J. and Weigle, J. **Diffraction of electrons by graphite.** *Helv. Phys. Acta* 21, 215-16 (1948).—*C.A.* 42, 8565*g*.
Measurements were made with single crystals of 500-1000 A. thickness and about 0.05 min. sides. The Fourier coeff. of the internal potential of the crystal for the (100) plane was 1.7 v. and was const. over the range of crystal thicknesses studied. For the (110) plane, it was 3.2 v. and did not vary between electron potentials of 20-50 kv.

13146. Jack, K.H. **Binary and ternary interstitial alloys. I. The iron-nitrogen system: the structures of Fe_4N and Fe_2N.** *Proc. Roy. Soc. (London)* 195, 34-40 (1948).
The ζ-iron nitride phase (Fe_2N) was prepd. by passing NH_3 over Fe at temp. not exceeding 450°C and under such conditions that the partial pres. of H_2 was negligible. The positions of the N atoms in γ' (Fe_4N) and in ζ were detd.

13147. Jack, K.H. **Binary and ternary interstitial alloys. II. The iron-carbon-nitrogen system.** *Proc. Roy. Soc. (London)* 195, 41-55 (1948)
Chem. and X-ray investigation of the reaction of CO with Fe nitrides and of the reaction of NH_3 with Fe carbides disclosed the existence of Fe carbonitrides—a series of new ternary interstitial alloys contg. Fe, C and N. Prolonged reaction of CO with Fe nitrides resulted in complete elimina-

tion of N. Below 500°C the product was a carbide of Fe, the narrow compn. range of which included $Fe_{20}C_9$. Above 500°C the product of the same reaction was cementite.

13148. KONIG, HANS. **The role of carbon in electron-microscope pictures.** *Naturwissenchaften* 35, 261-5(1948).—*C.A.* 44, 2843*b*.

The behavior of carbon particles (soot) was studied under the electron microscope; their tendency to increase in size owing to decompn. of hydrocarbons from the packing material and the formation of carbon envelopes around other prepns. under the influence of electron bombardent were discussed.

13149. MÜHLETHALER, K. **Electron microscope studies of the fine structure of gels.** *Makromol. Chem.* 2, 143-71(1948).—*C.A.* 45, 4528*h*.

Electron photomicrographs of V_2O_5 gels, prepd. from NH_4VO_3 and HCl, showed a random reticulation of fibrils which averaged 1-2 μ in length and 0.02 μ in diam. Electron diffraction patterns showed that these fibrils were cryst.

13150. PETRYANOV, I. AND ROZENBLYUM, N. **Contact angles of small drops.** *Doklady Akad. Nauk S.S.S.R.* 61, 661-4(1948).—*C.A.* 43, 17*f*.

Thin asbestos fibers were photographed under the electron microscope, under a magnification of 17,000 and subsequent enlargement of 1.7, and the same fibers re-photographed after wetting with a liquid until a string of droplets was formed along the fiber. At const. fiber diam. d, 0.13 and 0.05 μ, with Ti hydroxychloride as liquid. The stable liquid sheath between the drops had a thickness of the order of $0.5\text{-}1.6 \times 10^{-6}$ cm for Ti hydroxychloride and of $2.0\text{-}4.0 \times 10^{-6}$ cm for the vacuum oil. The initial liquid sheath, prior to the formation of the droplets, had a thickness of $1.0\text{-}2.0 \times 10^{-6}$ cm for Ti-hydroxychloride on asbestos fibers of 0.1μ.

13151. PINSKER, Z.G.; LAPIDUS, E.L., AND TATARINOVA, L.I. **Electronographic study of the structure of kaolinite.** *Zhur. Fiz. Khim.* 22, 1017-26 (1948).—*C.A.* 43, 481*i*.

Aq. suspensions of kaolin minerals on evapn. on a celluloid film left crystal flakes parallel to the support. With *nacrite* these flakes were oriented also in their plane, and a point pattern was obtained from which the translation group Γ_m^b and the spacings $a = 5.14$, $b = 8.90$ A. were detd.; the angle between a and b was 90 ± 0.36°. Kaolinite flakes had no preferred orientation around the normal to the support.

13152. RILEY, H.L. **Macromolecular structure of bituminous coal.** *Bull. soc. chim. belges* 57, 400-15(1948) (in English).—*C.A.* 43, 8638*i*.

Bright bituminous coals showed a max. at about 550°C in their c dimension curves, the magnitude of which appeared to be related to the coking power of the coal. The more sol. part of the coal (γ-fraction) was responsible for this max. Anthracites showed no tendency to give max. at 550°C in the c dimension. The a dimension increased slowly from 19 A. (55% C) to 22 A. (92% C), then rose rapidly to about 30 A. at 95% C.

13153. RUBINSHTEIN, A.M. **X-ray study of the effect of the lattice parameters and of the dimensions of the primary crystals on the activity and the selectivity of catalysts.** *Problemy Kinetiki i Kataliza* 5, 11-24 (1948).—*C.A.* 46, 10822*i*.

Ten MgO catalysts with primary crystallite size (detd. by x-ray diffraction) varying from 21.9 to 63.0 A., and lattice consts. varying from 4.16 to 4.24 A. (tabular value 4.20 A.) were tested in the dehydrogenation-dehydration of BuOH. Activity isotherms at 400° and at 460°C at const. lattice parameter showed a max. of activity (a) at a dispersity of the order of 25-30 A., particularly in dehydrogenation. With increasing temp. differences of a of prepns. deviating from the optimum dispersity diminished. Prepns. with a less-deformed lattice were somewhat more subject to the effect of the dispersity than are prepns. with a compressed lattice. With increasing lattice parameter, a in dehydrogenation decreased and in dehydration increased.

13154. SCHRÖDER, WILHELM. **Investigation of the thermal behavior of beryllium hydroxide by Otto Hahn's emanation method, x-rays, and the electron microscope.** *Z. Elektrochem.* 52, 140-4 (1948).—*C.A.* 43, 5300*b*.

The dehydration of metastable crystd. $Be(OH)_2$, as well as the change of the resulting BeO to increasingly inactive products, was studied directly during ignition, and also after cooling to room temp. The results were compared with x-ray detn. of the av. size of the primary particles, and with investigations by means of the electron microscope. Pseudomorphic forms like $Be(OH)_2$ remained up to about 1000°C.

13155. SHIMOMURA, YASUMITSU AND NISHIYAMA, ZENJI. **The crystal structure of nickel oxide.** *Mem. Inst. Sci. Ind. Research Osaka Univ.* 6, 30-4 (1948).—*C.A.* 45, 7404*i*.

When $Ni(NO_3)_2$ was heated in air at 1350°C for 1 hr, NiO with a rhombohedral structure was formed, as detd. by x-ray diffraction. The oxide belonged to the space group D_{3d}^1, the lattice consts. being $a = 4.16768$ and $\alpha = 90°\ 3.8'$. Oxidation of a Ni foil under conditions where the oxide remained on the surface yielded NiO with the characteristic NaCl-type structure. When the oxide film broke away from the substrate or when the foil was completely consumed by oxidation, the rhombohedral structure was observed.

13156. SODA, NORIMUNE AND MIYAGAWA, YUKIO. **The mechanical transition temperatures. (Fundamental studies of the combination of bearing metals.)** *Rept. Inst. Sci. and Technol. Univ. Tokyo* 2, 23-30(1948).—*C.A.* 45, 6373*d*.

Sliding friction was measured for the pairs of Cu-Cu, Ni-Ni, Cu-Ni, and soft iron-soft iron lubricated with normal aliphatic acids of C_4-C_{16}. The mech. transition temp. for soft iron pair were the highest and fairly coincident with the transition temps. observed by electron diffraction. Those for Cu-Cu pair were the lowest and coincident with the m.ps. of the lubricant oils in bulk.

13157. TERMINASOV, YU. S. AND BELETSKII, M.S. **X-ray investigation of the structure of the nickel-skeleton catalyst.** *Doklady Akad. Nauk S.S.S.R.* 63, 411-13(1948).—*C.A.* 44, 9784*f*.

The catalyst obtained after leaching out the Ni_2Al_3 with alkali and subsequent self-ignition of the Ni residue consisted of a mixt. of cubic Ni (lattice const. $a = 3.52$ A.) and NiO ($a = 4.15$ A.). If, after the leaching, the catalyst was stored under H_2O to prevent oxidation, x-ray patterns revealed hexagonal Ni, with $a = 2.56$, $c = 4.16$ A. The grain size of the hexagonal Ni in the skeleton catalyst was of the order of 10^{-5} - 10^{-6} cm.

13158. YAMAGUCHI, SHIGETO AND TSUTSUMI, SHIGERU. **Mechanism of the polymerization of butylene by silica-alumina catalysts.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 69, 6-7(1948).—*C.A.* 46, 8488*c*.

The catalysts of various percentages of Al_2O_3 and SiO_2, effective for the polymerization of butylene, were subjected to electron-diffraction study. The catalysts were a mixt. of Al_2O_3 of hydrargillite form and SiO_2 of β-christobalite with grain size of the order of 100 A.

13159. ZHDANOV, G.S.; KOTOV, V.P., AND LYUBARSKII, G.D. **X-ray analysis of aluminum hydroxide catalysts.** *Problemy Kinetiki i Kataliza* 5, 25-35(1948).—*C.A.* 46, 10822*f*.

The 5 samples studied, dried at 120°C proved to be either bayerite, or mixts. of bayerite with böhmite. On heating, from 210°C up, γ-Al_2O_3 was formed. This phase was present pure in samples heated to 400°-600°C; its dispersity fell with the rise of the temp. A tentative scheme of the phase compn. as a function of the anneal temp., and a diagram relating the Al_2O_3 concn. of the soln. and the pptn. temp. were given. The pptn. from more concd. solns. at higher temps. gave bayerite; the amt. of böhmite increased with decreasing concn. and decreasing temp., and at the same time the dispersity of the ppt. increased.

13160. BERESTNEVA, Z. YA.; KORETSKAYA, T.A., AND KARGIN, V.A. **Electron-microscope study of silica sols.** *Kolloid Zhur.* 11, 369-70(1949).—*C.A.* 44, 2823*i*.

Drops of silica sols evapd. on org. films and then coated with Cr showed structures of 2 types: (1) particles of 0.01-0.1 μ presumably originating from the colloidal silica, and (2) cracked structureless films presumably originating from the molecularly dissolved silica.

13161. BERRY, CHESTER R. **Structure of thin films of silver and silver iodide on silver bromide substrates.** *Acta Cryst.* 2, 393-7(1949).—*C.A.* 44, 3323*i*.

Ag films were prepd. by evapn.; AgI was formed by reaction of the AgBr with dil. soln. of KI and a cyanine-iodide sensitizing dye. The various orientations and structures of these deposits could be accounted for by assuming that the coating layers were built up by a disordered stacking of close-packed layers on minute octahedral faces of the substrate.

13162. BEYERSDORFER, K. **Electron-microscopical examination of surfaces of ruby glasses.** *Optik* 5, 557-63(1949).—*C.A.* 44, 4213*a*.

The ruby glasses contained Cu and Au as the coloring agents and fresh fracture surfaces were prepd. by knocking off splinter. The surfaces were shadowed with Au or Pt at 20°-30°C. The thickness of the metallic layer was between 10 and 50 A. The double-layer replica was lossened with 0.5% HF, washed with water, dried, and then examd. with the electron microscope. Pt showed the finer grain. Nine electron micrographs were given of replicas of unetched and etched (with 20% HF) fracture surfaces of ruby glasses showing crystallites of Au or Cu in the glass.

13163. BIBERMAN, L.M.; VTOROV, E.N.; KOVNER, I.A.; SUSHKIN, N.G., AND YAVORSKIĬ, B.M. **Scattering of electrons in thin layers.** *Doklady Akad. Nauk S.S.S.R.* 69, 519-20(1949).—*C.A.* 45, 9362*f*.

Small-angle scattering of electrons was observed in a suitably adapted electron microscope. For a Cr film of 4.9×10^{-6} g/cm² on collodion, data for the scattering as a function of angle were given by curves for 30, 60, and 80 kv., resp.

13164. BRUSSET, HENRY. **Study of the activation of carbon by low-angle x-ray scattering.** *Bull. soc. chim. France* 1949, 323-7.—*C.A.* 43, 6396*e*.

Several differently activated carbons from wood and lignite were studied, and the results compared with various measures of adsorptive capacity. The x-ray method was sensitive and complements other methods.

13165. BUĬNOV, N.N.; DEMENEV, N.V.; SHUR, A.S., AND FEDOROVA, G.G. **Electron-microscopic study of the structure of platinum films produced on the surface of aqueous solutions of salts of the metal by reduction with gases.** *Doklady Akad. Nauk S.S.S.R.* 66, 223-6 (1949).—*C.A.* 43, 6038*h*.

In the initial stages of the reduction of a K_2PtCl_6 soln. by H_2, the film consisted of single crystallites of 50 A. or more. Further prolonged reduction produced thicker films, exceedingly porous and consisting of aggregates of different sizes. These aggregates were formed by way of oriented coagulation of the original single crystallites. The metal film was formed not only at the surface, but throughout the superficial layer of the soln.

13166. COMER, JOSEPH J. AND HAMM, F.A. **Modified silica-replica technique.** *Anal. Chem.* 21, 418-19(1949).—*C.A.* 43,4557*b*.

A colloidal silica dispersion was used to prep. silica replicas for electron microscopy. Two methods were discussed: (1) silica flakes, obtained by evapn. of the dispersion, were packed in a W basket which was used as the filament in a conventional replica app., (2) the W basket was dipped 4 times in the dispersion, dried between dips, and similarly used as a filament. The method using flakes was preferred as less-frequent renewals of the filament coating were necessary.

13167. ECHEISTOVA, A.I. AND SHEKHTER, A.B. **Electron-microscopic study of structural changes of highly dispersed solids on heating.** *Izvest. Akad. Nauk. S.S.S.R.*, *Otdel Khim. Nauk.* 1949, 13-17.—*C.A.* 43, 4923*b*.

Smoke films of ZnO, MgO, Ag, and Au, showing a loose needle-network structure, stable at ordinary temp., became increasingly compact and contracted on heating. These changes were noticeable at about 0.3-0.45 of the abs. temp. of melting.

With ZnO, the change was complete in 2 min. at 900°C, but required 15 hrs at 400°C.

13168. ECHEISTOVA, A.I. AND SHEKHTER, A.B. **Changes produced in solids by the impact of electrons in the electron microscope.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1949**, 238-41.—*C.A.* 44, 9792*g*.

Smoke particles observed in the electron microscope showed a peculiar phenomenon of "thickening" as if a sheath of some foreign matter were growing around the contours of the particles. This thickening was due directly to the prolonged electron bombardment, as it did not take place on areas screened against the electrons. The sheath disappeared completely on heating in air at 600°C. Treatment of MgO smoke films with C_6H_6 at 770°C gave rise to the same thickening effect, also disappearing on oxidation at 600°C. The source of the carbonaceous sheath could be formed only by cracking of org. matter adsorbed on the surface of the particles.

13169. EISENSTEIN, A. **Some properties of the barium orthosilicate-oxide cathode interface.** *J. Applied Phys.* **20**, 776-90 (1949).—*C.A.* 43, 8856*g*.

Oxide cathodes prepd. on a Si-Ni alloy base metal had an interface of Ba_2SiO_4. The thickness of this layer was measured by means of an x-ray method and found to increase with the life of the cathode and to be of the order of 10^{-3} cm. Measurements of the effective, specific elec. cond. were made and compared with the cond. of the coating, (Ba,Sr)O. The interface layer influenced the thermionic emission characteristics of the cathode owing an interface voltage developed by the flow of emission current.

13170. FRICKE, R. **Primary, secondary, and actual structure of solid substances.** *Trans. Chalmers Univ. Technol., Gothenburg No.* **82**, 17pp. (1949).—*C.A.* 44, 3324*g*.

Thermodynamic and x-ray data were correlated for a few compds. and metals of close-packed hexagonal, body-centered cubic, and face-centered cubic lattice type to show that a new field in chemistry may exist in studying the actual structure of materials. The differences in chem. and phys. properties with the planes of the lattices might eventually be used to predict specific surface adsorption and related phenomena.

13171. FRISBY, HENRI. **Study of anodic oxidation of copper by electron diffraction.** *Compt. rend.* **228**, 1291-2 (1949).—*C.A.* 44, 53*d*.

Electrolysis of 0.1 *N* soda soln. with Cu electrodes resulted in a non-adherent CuO film, whereas heating Cu in an air stream at temp. below 175°C yielded strongly adhering Cu_2O. The latter and Cu were face-centered cubic, whereas CuO was monoclinic. In the formation of Cu_2O the orientation of the Cu surface atoms was maintained but not with CuO.

13172. FUJIKI, YOSHIBUMI. **Molecular arrangement of some organic films.** *Mem. Coll. Sci., Univ. Kyoto, Ser. A*, **25**, 119-25(1949).—*C.A.* 47, 18*f*.

Films of fine paraffin waxes(m. 44° to 74°C) were prepd. on Cu foils and plates and examd. by electron diffraction by reflection and by transmission while being heated in a small elec. furnace. The pattern obtained by transmission corresponded to a single crystal of the orthorhombic system and transformed to hexagonal as the temp. rose. This form was maintained to a certain definite temp. higher than the m.p., and there appeared a blurred ring whose Bragg spacing was 4.6 A.

13173. GONZALEZ, F. GARCIA AND VIVALDI, J.L. MARTIN. **Characterization and properties of a sample of bentonite from Almeria.** *Anales edafol. y fisiol. vegetal* **8**, 567-82 (1949).—*C.A.* 44, 5274*i*.

Bentonite from Sierra de Nijar (Almeria) was a member of the isomorphous montmorillonite-beidellite series, and it had a very fine grain and few impurities. Electron-microscopic observation disclosed the existence of fibrous particles.

13174. HANSMANN, GÜNTER AND PIETSCH, HELMUT. **Electron-microscope picture of surfaces of filter membranes.** *Naturwissenschaften* **36**, 250-1 (1949).—*C.A.* 44, 5679*h*.

Zsigmondy collodion filter membranes in the dried form showed a net structure on the surface; electron microscopy showed that the pore size inside each net cell varied from 0.15 to 1 μ and at the cell boundaries from 0.04 to 0.05 μ. The specimen was prepd. by evapg. tungsten oxide onto the surface combined with SiO_2.

13175. HOERNI, JEAN. **Diffraction of electrons in graphite.** *Nature* **164**, 1045-6(1949).—*C.A.* 44, 3326*g*.

Electron diffraction patterns of single crystals of graphite were obtained for crystals of *ababab* layers, *abababcbcbc* layers, and *abababcabcabc* layers. The structure factors for the first two crystals were the same for most spots, but crystals of the third form showed the presence of supplementary spots.

13176. HONJO, GORO. **Electron-diffraction studies on oxide films formed on metals and alloys.** *J. Phys. Soc. Japan* **4**, 330-3(1949).—*C.A.* 44, 5300*g*.

Specimens of Cu metal were polished, placed in a vacuum, and heated to the desired temp.; air at the desired pressure was admitted to the chamber. The specimen was then cooled rapidly and the oxide layer was studied by electron diffraction. CuO was formed at higher pressures (above 10 mm Hg) and intermediate temps.; Cu + Cu_2O appeared at high temps. (above 700°C) and low pressures (below 10^{-2} cm Hg); and Cu_2O was formed over the remaining regions.

13177. HUBER, K. AND ZBINDEN, H. **The aging of vanadium pentoxide sols.** *Z. anorg. Chem.* **258**, 188-97(1949).—*C.A.* 45, 22*d*.

The aging of V_2O_5 sols was observed with the aid of the electron microscope. A noticeable increase in particle size occurred at 40°C in 2-8 days, but there was little change at room temp. over 14-23 months. The aging was hastened by the presence of electrolytes, increasing in the lyotropic series Li^+, Na^+, NH_4^+, K^+. It consisted more of a coagulation than a crystn.

13178. JELLINEK, M.H. AND FANKUCHEN I. **X-ray examination of pure alumina gel.** *Ind. Eng. Chem.* **41**, 2259-65(1949).—*C.A.* 44, 1301*f*.

The tendency of low-temp. γ-Al_2O_3 to convert to stable α-Al_2O_3 with heat was measured by x-ray diffraction; the corresponding steady increase in crystallite and particle radius was measured by line width and small-angle scattering. The original Al_2O_3, contg. 30.25% volatile (mostly water), was essentially bayerite and gibbsite with traces of boehmite. This was heated several hundred hrs at 1470°, 1560° and 1650°F and a few hrs at temps. up to 1920°F. The first detectable trace of α-Al_2O_3 appeared after nearly 900 hrs at temps. up to 1650°F plus 2 hrs at 1880°F.

13179. Karšulin, M.; Tomić, A., and Lahodny, A. **Investigations on bauxite.** *Rad. Acad. Sci. Zagreb* 276, 125-38(1949).—*C.A.* 46, 9231*g*.

A method was described for the detn. of the content of boehmite ($Al_2O_3.H_2O$) and kaolinite in bauxite by means of a differential thermal analysis. The maximums shifted slightly for different samples depending on differences in crystal lattice. From the height of the max. and a chem. analysis of the sample the content in boehmite and kaolinite was calcd. The results were confirmed by Debye-Scherrer analyses.

13180. Kochanovská, A. **X-rays in investigation of bentonites.** *Instruments and Measurements Conf., Stockholm, Trans.* 1949, 71-6(Pub. 1950) (in English).—*C.A.* 45, 7760*i*.

Samples of bentonites from various localities were investigated as to the fine structure of their chief part, montmorillonite, and as to impurities. The main differences in the fine structure of montmorillonite were: in the appearance of "forbidden lines"; in differences of relative intensities of certain reflections, especially of the reflection (001), and in differences in the values of parameter *c* (measured under the same conditions of moisture).

13181. Mathieu-Sicaud, Agnes and Levavasseur, Gustave. **Ultrasonic dispersion of clay suspensions - interpretation of the results with an electron microscope.** *Compt. rend.* 228, 393-5(1949).—*C.A.* 43, 4538*b*.

The effects of the frequency of ultrasonic waves on the dispersion of kaolinite and montmorillonite suspensions in water were studied by nephelometer and electron microscope. The dispersion varied with the frequency, reaching a max. at 960 kc for kaolinite and at 320 kc for kaolinite and at 320 kc for montmorillonite. The mean particle size was 1000 A. in the former case and 1700 A. in the latter. Each frequency corresponded to a certain mean particle size.

13182. McMurdie, H.F. **Microstructure of bone char.** *Proc. Tech. Session Bone Char* 1949, 263-70.—*C.A.* 43, 8649*h*.

Marked differences in appearance were shown by low power photo-micrography for bone chars of different origins and history. Electron microscope pictures showed the change in the form of the carbonaceous residues from new and spent chars. X-ray diffraction showed the relation of the patterns to the mineral fluorapatite. The av. particle sizes of the apatite grain were obtained from a measurement of the breadth of the peaks obtained on the x-ray recording spectrometer. These were found to increase from about 200 A. for new char to 400 A. for char after service.

13183. Nakahira, Mitsuoki. **Powder röntgenograms of montmorillonite.** *Repts. Sci. Research Inst.* (Tokyo) 25, 136-9(1949).—*C.A.* 45, 2373*g*.

In the röntgenograms the intensity of the refraction lines around 12-15, 5, and 3 A. was found to be indicative of the water content, compn., and exchangeable bases. In a thoroughly dried sample the lines were strong near 12, but weak near 5.9 A. and in an air-dried sample strong near 14.8-15.8, but medium to weak near 4.9-5.2 A.

13184. Pernoux, Émile. **Electron microscope examination of kieselguhr.** *Compt. rend.* 228, 1646-7 (1949).—*C.A.* 43, 8831*a*.

Untreated kieselguhr (Filter-Cel) contained regular and well-defined pores of about 0.5 μ diam. On acid treatment, the smaller of these pores became filled with silicic acid gel and the larger ones were visibly obstructed. On treatment of the acid-treated sample with Na_2CO_3 soln., the gel was removed, and the pores were enlarged as compared with the original sample, whereas Na_2CO_3 treatment of the original sample had little effect.

13185. Pongratz, A. **Sintering phenomena on vanadium catalysts and their detection by electron-optical exposures.** *Mitt. chem. Forsch.-Inst. Ind. österr.* 3, 41-4(1949).—*C.A.* 43, 7803*a*.

If gas phase oxidations were performed at 300°-450°C, recrystns. took place that reduced the activity of vanadium catalysts considerably. Prepns. of V_2O_5 and $TiO(VO_3)_2$ were investigated by the electron microscope and the latter was found far superior because it scarcely sintered at higher temp., whereas V_2O_5 sintered to a very great extent.

13186. Raether, Heinz. **Detection of surface films by means of electron interferences.** *Z. Naturforsch.* 4a, 582-7 (1949).—*C.A.* 44, 4302*d*.

Theoretical considerations indicated that cryst. surface films of 5 to 10 A. thickness should be recognizable on smooth surfaces but not on rough ones. Applications to samples of Zn and Al were given. Electrolytically polished Al surfaces became covered with an oxide layer so thin (30-60 A.) that interferences were noticeable even after a month of exposure to the atm.

13187. Roginskiĭ, S.Z.; Shekhter, A.B.; Echeistova, A.I.; Kavtaradze, N.N., and Kushnerev, M. Ya. **Electron-microscope observation of the mechanism of dehydration of crystallohydrates.** *Doklady Akad. Nauk S.S.S.R.* 68, 879-80(1949).—*C.A.* 44, 896*c*.

Crystals of $Na_2SO_4.10H_2O$, which lost their H_2O of crystn. very rapidly on evacuation at room temp., showed no change in shape at the beginning of the examn. under an electron microscope, although dehydration was already complete. Changes, in the form of increasing cavities and hollows, did appear, however, on continued irradiation by electrons, resulting, on prolonged irradiation, in a skeleton-like structure. Similar phenomena were observed with initially hydrated $MgSO_4$, $Sr(IO_3)_2$, and $CaSO_4$ crystals.

13188. ROGINSKIĬ, S.Z.; TRET'YAKOV, I.I., AND SHEKHTER, A.B. **Electron-microscopic study of the surface of working catalysts. I. Application of the method of shadow replicas to studying variation of catalysts as result of the catalytic reaction.** *Zhur. Fiz. Khim.* 23, 50-6 (1949).—*C.A.* 43, 4087*a*.

The roughening of a Pd plate by combustion of H_2 on it for 132 hrs at 175° was shown by electron microscopy with use of collodion replicas on which a Cr wedge was later evapd. The difficulties of electron microscopy due to the smallness of the field of vision could be overcome by statistical methods.

13189. SANDERS, J.V. **Electron diffraction observations of an adsorbed ester.** *Research (London)* 2, 586-7(1949).—*C.A.* 44, 3766*f*.

The orientation of monolayers of Et stearate absorbed on metal surfaces was examd. by electron diffraction. On Pt no orientation was found above the m.p. of the ester in bulk (34°C). On reactive metals, as Cd and Zn, the diffraction pattern of the monolayer showed no change until the temp. was raised well above the m.p. of stearic acid. Me stearate behaved in similar manner. Such results supported the view that the acid was present and preferentially adsorbed on the metal surface.

13190. SPINK, J.A. **Structure of molecular films of stearic acid on copper.** *Nature* 163, 441 (1949).—*C.A.* 43, 7769*f*.

Electron-diffraction patterns of uni- and multi-mol. layers of stearic acid on Cu were obtained that showed the existence of crystallites of a metal soap on the Cu surface. The patterns indicated that the Cu stearate crystals were oriented with their (001) planes parallel to the metal surface.

13191. TRAMBOUZE, YVES. **X-ray diffraction study of Fischer catalysts.** *Compt. rend.* 228, 1432-3 (1949).—*C.A.* 43, 7313*c*.

The presence in the dried material of a Ni hydroaluminate was confirmed. When the material was heated in N_2 at 450°C for 24 hrs, lines of a Ni hydrosilicate also appeared.

13192. TURKEVICH, JOHN AND HILLIER, JAMES. **Electron microscopy of colloidal systems.** *Anal. Chem.* 21, 475-85 (1949).—*C.A.* 43, 6040*g*.

The morphology of colloidal particles as viewed by the electron microscope was presented. These included polystyrene latex, $Al(OH)_3$, Au, $Fe(OH)_3$, V_2O_5, chrysotile, calcium grease, carbon black, and WO_3 as examples.

13193. UNMACK, AUGUSTA. **X-ray investigation of commercial preparations of aluminum hydroxide and oxide.** *Kemisk* 1949, No. 1, 11 pp.—*C.A.* 44, 10271*h*.

Com. prepns. of $Al(OH)_3$ contained gibbsite, bayerite, and amorphous material, of which only the latter dissolved readily in dil. acid. Com. prepns. of Al_2O_3 contained both α- and γ-Al_2O_3, of which only the γ-modification was suitable for use in chromatography. The effect of heating to high temps. appeared to depend not on the cryst. form of the original material, but on the amt. and nature of the impurities present.

13194. YAMAGUCHI, SHIGETO AND MATSUMOTO, KO. **Electron microscopic and electron-refractive study of a corroded metallic surface (crystalline state of an iron surface corroded by hydrogen).** *Repts. Sci. Research Inst.* (Japan) 25, 60-4(1949).—*C.A.* 45, 3315*c*.

The surface of an Fe bell jar used as the cover of a H_2 generator continuously for 15 years was sepd. into a film applied to the surface of stainless steel and examd. under an electron microscope and electron beams. Around the cryst. angles were a reservoir of H_2 (Fe as a catalyst for hydrogenation seemed to be activated in this region). For the no. of bubbles counted per unit area the amt. of gas contained in the metal could be estd.

13195. YOSHIOKA, HIDE. **A study on corrosion of iron by electron diffraction.** *J. Phys. Soc. Japan* 4, 270-5(1949).—*C.A.* 44, 5300*e*.

The green rust of iron was studied and identified with a series of sharp rings in the electron-diffraction pattern. This compd. was found to be unstable in the presence of O_2, converting it to γ-$Fe_2O_3.H_2O$ in a few hrs. The oxidation of $Fe(OH)_2$, the primary corrosion product of Fe, was explained as follows: (1) under rapid oxidation conditions, $Fe(OH)_2 \rightarrow \alpha$-$Fe_2O_3.H_2O$, (2) in O_2-deficient cases, $Fe(OH)_2 \rightarrow$ green rust, (3) under slow oxidation conditions, green rust $\rightarrow \gamma$-$Fe_2O_3.H_2O$, and (4) under very slow oxidation conditions, green rust $\rightarrow Fe_3O_4$.

13196. ZVYAGIN, B.B. AND PINSKER, Z.G. **Electronographic determination of the structure of montmorillonite.** *Doklady Akad. Nauk S.S.S.R.* 68, 65-7 (1949).—*C.A.* 44, 3848*a*.

The high vacuum in which the electron diffraction was observed eliminated the excess water content of ordinary montmorillonite to such a degree that the compn. was practically $Al_2(Si_4O_{10})(OH)_2$, with characteristic replacements of Al^{3+} ions by Fe, Mg, and of Si^{4+} by Al^{3+}. The agreement of the results with the detn. of the structure by x-ray diffraction was complete.

13197. ZVYAGIN, B.B. AND PINSKER, Z.G. **Electronographic determination of the elementary cells of pyrophyllite and talc, and their structural relations to montmorillonite.** *Doklady Akad. Nauk S.S.S.R.* 68, 505-8(1949).—*C.A.* 45, 7476*h*.

From the discussions of the intensities of (*hkl*) reflexes on inclined electron-diffraction diagrams it was concluded that the facts were satisfactorily described by a monolayer structure in montmorillonite, and by a double-layer structure of two types, for pyrophyllite. The hexagonal network of pyrophyllite was accurately projected on the basis of the reciprocal lattice.

13198. AMES, J.; COTTRELL, T.L., AND SAMPSON, AVIS M.D. **An electron-microscope study of crystal surfaces.** *Trans. Faraday Soc.* 46, 938-41(1950).—*C.A.* 45, 4515*e*.

A method of prepg. inorg. crystal surface replicas was described. Step or layer-like irregularities were observed on the faces of a no. of crystals. When crystals were grown from solns. contg. habit modificants, the layers became thicker and more numerous. Secondary surface phenomena included oriented ripples and ridges. In many of the micrographs, considerable departures from the generally accepted principles of crystal symmetry could be seen.

13199. BEECK, OTTO AND RITCHIE, A.W. **The effect of crystal parameter on hydrogenation and dehydrogenation.** *Discussions Faraday Soc.* **1950**, No. 8, 159-66.—*C.A.* 45, 9987*f*.
Measurement of the surface of oriented and unoriented evapd. porous Ni films were made by the B.E.T. method using Ne, Kr, CH_4, and C_4H_{10}. The detn. of the no. of crystallographic sites through the adsorption of H_2 at liquid-N_2 temp. showed that (110)-oriented Ni films also exposed (110) planes to the gas phase. The rates of hydrogenation of benzene over oriented and unoriented Ni and Fe films were slow and about the same, and proceeded through the adsorbed state of benzene without influence by the crystal geometry of the substrate.

13200. BELETSKIĬ, M.S. **Structure of the oxide film formed on the surface of aluminum.** *Doklady Akad. Nauk S.S.S.R.* 75, 551-3(1950).—*C.A.* 45, 3275*h*.
X-ray and electron-diffraction examn. of a "medicinal alumina powder" failed to show any lines, possibly owing to the high dispersity or to an amorphous condition of the surface layer of Al_2O_3. On prolonged hydration at 10°-12°C, the powder became lighter in color, gray, and then, after 10 days, gray-yellow. By x-ray pattern, at this stage, the prepn. became boehmite, $Al_2O_3.H_2O$.

13201. BERESTNEVA, Z. YA.; KORETSKAYA, G.A., AND KARGIN, V.A. **Electron-microscope study of titania sols and the mechanism of formation of colloidal particles.** *Kolloid. Zhur.* 12, 338-41 (1950).—*C.A.* 45, 928*d*.
Sols obtained by mixing $TiCl_4$ with cold H_2O contained originally amorphous spheres (e.g. 0.2 μ) which then crystallized within some hrs. When $TiCl_4$ was mixed with hot water, cryst. particles formed at once. A new electronographic study showed that the spacings of rutile were: *a* 4.58, *c* 2.95 A.; anatase *a* 3.73, *c* 9.37; brookite *a* 9.20, *b* 5.44, *c* 5.14.

13202. BEUGOU, P. AND CONJEAUD, P. **Determination of the ash content of coals by x-rays.** *Rév. ind. minérale* 31, 164-81 (1950).—*C.A.* 45, 4021*e*.
The laws of absorption of x-rays in coal were given. App. for producing and using x-rays in irradiating specimens, and the prepn. of specimens were described. Arrangements for testing were developed. The accuracy was about 0.5%.

13203. BEYERSDORFER, K. **The structure of graphite oxide carbon black.** *Optik* 7, *Sonderheft* 2, 192-8(1950).—*C.A.* 45, 6000*c*.
In oxidation of graphite the O_2 entered between layers of C atoms, the graphite lattice being largely retained. On decompn. at 250-300°C very finely divided carbon remained. An electron diffraction diagram showed 6 intensity maxima, as expected in this structure. Size of crystallites was estd. to be 1000 to 2000 A. and thickness of foliations under 100 A.

13204. BIANCHI, GIUSEPPE. **Structure of cathodic platinum black deposits.** *Ann. chim.* (Rome) 40, 222-33 (1950).—*C.A.* 45, 7854*g*.
The appearance and structure of cathodic Pt black deposits were markedly affected by the concn. in the plating soln., of small amounts of heavy metals, particularly Pb, Hg, Cd, and Tl as well as by the c.d. and temp. X-ray studies of these deposits were made.

13205. BOETTCHER, A. **Oxidation of sputtered aluminum-magnesium and aluminum-silver alloys in a vacuum. II.** *Z. angew. Physik.* 2, 249-51 (1950).—*C.A.* 46, 9922*c*.
Al-Mg alloys, sputtered in a vacuum of 10^{-4} mm. Hg; were prepd. uniformly by subsequent heating to 265°C; this caused uniform diffusion. Electron-diffraction expts. showed that oxidation did not take place at temps. below 360°C. Al-Ag alloys could be prepd. by sputtering and subsequent tempering at 380°C.

13206. BOSWELL, F.W.C. **Standard substance for precise electron-diffraction measurements.** *Phys. Rev.* **80**, 91-2(1950).—*C.A.* 45, 436*d*.
Au and ZnO were unsatisfactory standards for precision measurements. Vacuum-evapd. TlCl, about 300 A. thick, deposited on Formvar or collodion, was satisfactory; no change was detected in a specimen left exposed to the air for weeks. MgO smoke was useful as a secondary standard.

13207. BRUSSET, HENRY. **Porosity of carbon powder.** *J. chim. phys.* 47, 583-5(1950).—*C.A.* 44, 10453*i*.
Active carbons were studied by low-angle x-ray diffraction. The activation of carbon and the catalysis of H_2S oxidation by active carbons were discussed.

13208. BRUSSET, HENRY AND KIKINDAI, TIVADAR. **Central diffusion of x-rays produced by some mineral colloids.** *Compt. rend.* 231, 858-60 (1950).—*C.A.* 45, 2744*g*.
A plot of log I vs. ϵ^2 for small angles (I = intensity, ϵ = scattering angle) was often a straight line from the slope of which an estimate of particle size could be obtained. ZnO, $Zn(OH)_2$ gel, CuS, Se, MgO, Al_2O_3, colloidal Ag, As_2S_5, and $BaSO_4$ were studied.

13209. CAMERON, H.K. **The x-ray study of carbon.** *Coke and Gas* **1950**, 21-5.—*C.A.* 44, 3239*i*.
Investigations into the graphitization of various forms of carbon at high temps. were reviewed with x-ray and electron microscope pictures.

13210. COURTEL, ROBERT. **Oxidation characteristics of metallic alloys ground at different speeds in rarified atmosphere.** *Rev. mét.* 47, 700-3 (1950).—*C.A.* 45, 519*b*.
Specimens of monocryst. Co and of C 0.06, Si 0.57, Mn 0.44, Ni 79.73, and Cr 19.44% were ground with a wheel under a vacuum or in air at 8 cm of Hg pressure while their surface was examd. by electron diffraction in the direction perpendicular to the grinding wheel. With Co ground in vacuum, the original hexagonal structure of the surface changes to cubic at 14 m/sec peripheral speed remaining hexagonal at lower velocities. The 80 Ni-20 Cr alloy ground in dry air showed the presence of velocity levels sepg. regions at which no oxides were formed from those where the examn. showed only oxide lines in the absence of any metallic rays.

13211. DEMENEV, N.V.; BUĬNOV, N.N., AND MILYUTINA, M.I. **Electron-microscopic study of the structure of palladium films produced on the surface of aqueous solutions of metal salts by the action of reducing gases.** *Doklady Akad. Nauk S.S.S.R.* 73, 751-4(1950).—*C.A.* 45, 926*i*.

Pd films produced by H_2 on the surface of solns. of $PdCl_2$ were highly porous and consist of crystallites ranging from 25 to 90 A., with a max. around 50 A. Thick films obtained by rapid reduction showed a high proportion of aggregates, evidently formed around single coarse particles acting as coagulation centers. Slow reduction produced aggregates of seemingly triangular shape which, on stereoscopic examn. were seen to be hollow cones with the generatrix lying in the plane of the film.

13212. ENDTER, FRIEDRICH. **Structure of technical lampblack.** *Z. anorg. u. allgem. Chem.* 263, 191-9(1950).—*C.A.* 46, 7392*f*.

Hexagonal lampblack particles observed with an electron microscope were not compatible with the conception that the borders of the particles should be random. The anomaly was explained by assuming the structure to consist of primary and secondary particles.

13213. EPSTEIN, H.T. **The structure of monolayers and multilayers of polar hydrocarbon molecules on solid substrates.** *J. Phys. & Coll. Chem.* 54, 1053-69 (1950).—*C.A.* 45, 419*e*.

Monolayers and multilayers of stearic acid and other fatty acids were prepd. on glass microscope slides, shadow cast, and examd. by electron microscopy. The mols. in monolayers were grouped into clusters (micelles) of characteristic diam. and tilt angle, both of which varied inversely with the length of the mol. Electron micrographs were also obtained of skeletonized films prepd. by dissolving out the stearic acid from mixed films of stearic acid and Ba stearate.

13214. FRANCOIS, JEANNINE. **Influence of temperature on the particle size of nickel oxide.** *Compt. rend.* 230, 1282-4(1950).—*C.A.* 44, 10453*h*.

Ni oxide, prepd. by heating $NiCO_3$ at various temps., was examd. by small-angle x-ray diffraction. The sample prepd. at 400 °C was homodispersed with a particle radius of 27 A. Between 400° and 425 °C, sintering occurred to give a heterodispersed system with a trend to larger particle size.

13215. FRANKLIN, ROSALIND E. **Influence of the bonding electrons in the scattering of x-rays by carbon.** *Nature* 165, 71-2(1950).—*C.A.* 44, 4776*f*.

During an investigation of the scattering of x-rays by various carbons, an anomalously high intensity of the (10) band was always observed. This was attributed to the configuration of the valency electrons in graphite or in carbons contg. incipient graphitic layers.

13216. FRANKLIN, ROSALIND E. **The interpretation of diffuse x-ray diagrams of carbon.** *Acta cryst.* 3, 107-21(1950).—*C.A.* 44, 7141*i*.

A detailed study was made of carbon obtained by pyrolysis of polyvinylidene chloride at 1000 °C. Results of the radial distribution method agreed with those from comparison of observed and calcd. intensity curves. Of the sample, 65% was in perfect graphitic layers of av. diam. 16 A. and the rest was disordered. About 55% of the layers were in parallel pairs 3.7 A. apart. The mean interparticle distance was 26 A.

13217. FRANKLIN, ROSALIND E. **The structure of carbon.** *J. chim. phys.* 47, 573-5(1950).—*C.A.* 44, 11066*d*.

Results of an x-ray study of some carbons formed by pyrolysis of various org. materials were described. From 10 to 45% of the carbon in any sample was highly disordered, the remainder being in graphite-like layers from 13 to 22 A. in diam. The interlayer spacing was 3.7 A. when a group of two layers occurred, decreasing when more layers were present in a group to a limit of 3.44 A.

13218. GARNER, F.H.; NUTT, C.W., AND MOHTADI, M.F. **Detergency of carbon black in hydrocarbon solutions. II. The effect of dispersion medium on the particle-size distribution of carbon black.** *J. Inst. Petroleum* 36, 292-4(1950).—*C.A.* 44, 7520*g*.

An electron micrograph study of the particle-size distribution of carbon black dispersed in toluene solns. of various additives showed a correlation between the particle size and the dispersive power of the medium as measured by a standard settling-rate test. The additives studied in toluene were: (a) 1.0% dibromolinoleic acid; (b) 1.0% naphtenic acid; (c) 0.47% Ca naphthenate; and (d) 1.0% com. additive, P.64.

13219. GEROULD, CHARLES H. **The use of latex spheres as size standards in electron microscopy.** *J. Applied Phys.* 21, 183-4(1950).—*C.A.* 44, 7140*d*.

Precautions were recommended in the handling of latex 580G, lot 3584. Increases in diam. of latex spheres as a result of shadowing, greater than those due to the thickness of metal film, were reported.

13220. GLEMSER, O. AND LUTZ, G. **Decomposition of molybdenum trioxide in the electron microscope and the appearance of lower oxides.** *Kolloid-Z.* 119, 99-102(1950).—*C.A.* 45, 3708*b*.

The decompn. of MoO_3 crystals into crystallites of lower oxides (Mo_4O_{11}, Mo_8O_{23}, Mo_9O_{26}, and probably MoO_2) was illustrated by 10 photographs.

13221. GUINIER, A. **Study of catalysts by scattering of x-rays at small angles.** *Discussions Faraday Soc.* 1950, No. 8, 344-7.—*C.A.* 45, 9991*e*.

Scattering measurements alone did not provide precise information about the size and shape of an irregular array of particles of a powder catalyst. However, in simple cases, or when the measurements were supplemented by information obtained by other methods, e.g. electron microscopy, the quant. use of x-ray data was possible.

13222. GULBRANSEN, EARL A. AND RUKA, ROSWELL. **Kinetics of solid-phase reactions in oxide films on iron; the reversible transformation at or near 570°C.** *J. Metals* 188, *Trans.* 1500-8(1950).—*C.A.* 45, 426*d*.

The forward and reverse reactions, $Fe_3O_4 + Fe \rightleftarrows 4FeO$, were studied by electron-diffraction methods. In thin films the forward reaction occurred at temps. 170°C below the equil. value. The mechanism of the forward reaction was governed by the diffusion of Fe. Studies on the reverse reaction indicated that a process of nucleation and growth was rate controlling.

13223. HACKERMAN, NORMAN AND ANTES, LELAND L. **Contact potentials of evaporated iron films in air and in nitrogen at low pressure.** *Science* 112, 471(1950).—*C.A.* 45, 1886*i*.

The potential of an Fe film against a Pt reference plate was independent of time and pressure in pure N_2, but increased by several tenths of a volt in the presence of 0.01 to 10μ of air. The change in potential was related to sorption of O_2 on the surface layer rather than gross penetration. Rate of O_2 adsorption was more rapid than desorption judging from the behavior of potential as a function of time and pressure. Electron diffraction studies showed that an oxide pattern was noticeable on the surface of an Fe film 1.5 min. after contact with air while on a Ni film 27 min. was required.

13224. HENSLEY, EUGENE B. AND AFFLECK, JOHN H. **The barium oxide on tungsten cathode interface.** *J. Applied Phys.* 21, 938-9(1950).—*C.A.* 44, 10485*b*.

An interface compd. formed by the reaction of an oxide coating with the metal was identified by x-ray diffraction as principally barium tungstite, $BaWO_3$, when the coating was pure BaO. The corresponding tungstites were found when SrO or the solid soln. (BaSr)O was used for coating.

13225. HERGLOTZ, H. AND LISSNER, A. **Raney metals as desulfurization catalysts. II.** *Z. anorg. Chem.* 261, 237-47(1950).—*C.A.* 44, 10474*b*.

An x-ray investigation was made of Cu and Co metal formed by the Raney process and of several Cu and Co catalysts. The grain size of Co was less than 10^{-4} cm. During desulfurization on Co catalysts, Co sulfides were formed with greater or less S than suggested by the stoichiometric formula CoS.

13226. HOFER, L.J.E.; COHN, E.M., AND PEEBLES, W.C. **Isothermal decomposition of nickel carbide.** *J. Phys. & Colloid Chem.* 54, 1161-9 (1950).—*C.A.* 45, 1850*d*.

The thermal stability of Ni_3C was studied magnetically and by x-ray diffraction between 320° and 355°C. During an induction period, which preceded the decompn., there was no detectable structural change in the carbide. Ni and free C were formed on decompn. Empirical activation energies for the induction period and the decompn. process were calcd.

13227. HOFER, L.J.E.; PEEBLES, W.C., AND BEAN, E.H. **X-ray diffraction studies of the action of carbon monoxide on cobalt-thoria-kieselguhr catalysts. II.** *J. Am. Chem. Soc.* 72, 2698-2701(1950).—*C.A.* 44, 9223*g*.

Reduced Co-thoria-kieselguhr catalysts produced increasing amts. of free carbon and decreasing amts. of Co carbide on carburization with CO at increasing temps. in the range 243° to 298°C. At the high temps., the max. amt. of carbide was formed within the first 5 hrs of carburization. Free carbon tended to make the catalyst inaccessible to further carbide formation.

13228. HOFMANN, U. AND OHLERICH, G. **The surface chemistry of carbon.** *Angew. Chem.* 62, 16-21 (1950).—*C.A.* 44, 3778*h*.

Surface compds. of carbon with O_2, S, and N_2 were prepd. and identified. Active centers, apparently, were not involved in the HBr catalysis, and it was concluded that the hexagonal network of the C atoms of the exposed base surfaces (in contrast to the prismatic surfaces) was responsible for the properties exhibited by the carbon. The catalytic production of 100 C atoms in the surface amounted to about 20 mols. of HBr per hr at 150°C.

13229. HOSEMANN, R. **X-ray diffraction in colloidal systems-relation among packing density, poly-dispersity, and pure particle scattering.** *Kolloid-Z.* 118, 116(1950).—*C.A.* 45, 21*i*.

13230. IMELIK, BORIS. **Study of the alteration of the fine structure of silica gel by the small-angle scattering of x-rays.** *Bull. soc. chim. France* 1950, 1232-4.—*C.A.* 45, 5489*a*.

Alteration of the fine structure of silica gel during adsorption and the swelling of the particles was shown to be possible by using the diffraction of x-rays at small angles. The resulting x-ray pattern had a ring whose mean radius was 29.2 A. for the gel itself. After satn. with a soln. of I_2 in CCl_4 it was 29.2 A.; after desorption of I_2 and CCl_4 it was 32.5 A.; and after prolonged desorption at 37°C it was 29.0 A. When the gel satd. with CCl_4 alone, the resulting ring gave a radius of 35.8 A.; desorbed of CCl_4 it was 34.5 A.; and after prolonged desorption at 37°C, it became 30.0 A.

13231. INOUE, KATSUYA. **Structure of humic acids. An x-ray diffraction study.** *Bull Chem. Soc. Japan* 23, 132-4(1950)(in English).—*C.A.* 45,7335*d*.

Humic acid was defined as the chocolate-colored substance which was produced by an extn. of coal with 1% NaOH up to 90°C and pptd. by the addn. of an excess of mineral acid. Fifteen samples were studied. The following data summarized the results for 14 samples: lattice parameter a = 2.11—2.40 A., c/2 = 3.44—3.85 A., crystallite dimension a = 7.0—14.3 A., c = 8.8—21.0 A. All parameters were consistent with the so-called "amorphous carbon" lattice.

13232. KANTZER, M. AND MEZARD, M. **Silica gel photographed by the electron microscope.** *Bull. soc. franc. céram.* 1950, No. 6, 37-40.—*C.A.* 46, 5402*f*.

Specimens of silica gel were prepd. by pulverizing the dry material above the screen and letting the very fine dust settle on it. The results were similar to those obtained by evapg. the suspending medium of a suspension. X-ray spectra were presented for each material photographed. After the silica gel was heated to 1280°C cristobalite was present, with no trace of quartz.

13233. KASATOCHKIN, V.I.; KUKHARENKO, T.A.; ZOLOTAREVSKAYA, E.YU., AND RAZUMOVA, L.L. **X-**

ray study of humic acids of coal. *Doklady Akad. Nauk S.S.S.R.* 74, 775-8(1950).—*C.A.* 46, 1227*h*.

Humic acids were aromatic hydroxy carboxylic acids of high mol. wt. Changes in mol. structure during the gradual coalification were studied by x-ray examn. of peats and soft coals of different localities, and artificially oxidized coal (with ratios C:H from 13.2 to 26.8). The interferences were increasingly distinct and sharper with advancing degree of coalification and mol. rearrangement. With progressive coalification, the ordered lattice of the aromatic nuclei of the humic acid increased; the disordered part appeared peripheral owing to the groups of the mols. The changes of the ratio C:H as an indicator for increasing condensation of aromatic nuclei paralleled these diffraction phenomena.

13234. Krause, A.; Kotkowski, St., and Karolewicz, St. **Influence of the structure on catalytic activity.** *Przemysl Chem.* 6(29), 25-32(1950).—*C.A.* 45, 10021*f*.

A mixt. of $Fe(OH)_3$ and $Cu(OH)_2$ was pptd. and the ratio of Fe:Cu was 1:0.5 in one case and 1:1 in another. The mixts. were heated slowly from 25° to 900°C and samples were taken at 50° intervals. The catalytic activity was measured by the peroxidative oxidation of formic acid with H_2O_2 at 37°C; it decreased with increased temp. X-ray diagrams of the samples heated above 400°C showed the formation of the spinel structure of cupric ferrite. The spinel structure was formed through different transitory phases which had a radical structure characteristic of the deformed space lattice at 400°C.

13235. Kwiecinski, Alfred. **Crystal lattices of the element carbon.** *Przeglad Górniczy* 6, No. 11, 587-95(1950).—*C.A.* 45, 4991*g*.

Atoms linked covalently were in point contact with each other on one side. When the bond energy between two atoms was less than max., they were slightly spaced from each other or tilted or rotated with respect to each other in the model. The lattices of graphite and diamond were described in detail. The latter was characterized by max. compactness, the atoms being at the corners of a pentagonal dodecahedron.

13236. Likhtman, V.I. **Sintering of metallic powders.** *Doklady Akad. Nauk S.S.S.R.* 71, 323-5 (1950).—*C.A.* 44, 5773*b*.

Micrography of a powder of oxidized electrolytic Cu, pressed at 300°C under graphite, showed tiny bridges of metal connecting grains where the metal was not brought into immediate contact by the compression. At 400°C, the bridges were broader with recrystn. beginning to appear within the grains. The highly mobile atoms migrated preferably to points where the metal grains were closest to each other. Evapn. of metal was demonstrated to take place at highly active points at as low as 300-400°C, and its condensation at less active points may also play a role in the formation of the bridges.

13237. Longuet-Escard, J. **Fixation of hydroxides on montmorillonite.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 3, 40-4; 4, 65-6(1950) (in French).—*C.A.* 46, 8791*h*.

X-ray studies were made on complexes of the chlorite type, e.g., montmorillonite $Ni(OH)_2$, montmorillonite-$Al(OH)_3$, and especially mixed montmorillonite-Ni and Al hydroxides. Compds. analogous to natural chlorite can be prepd. The tendency which anions, e.g., OH, had to penetrate even in the very dild. centers, between the layers of montmorillonite (as do cations) was shown.

13238. Lukesh, Joseph S. **The symmetry of graphite.** *Phys. Rev.* 80, 226-9(1950); *Am. Mineral.* 35, 125 (1950).—*C.A.* 45, 414*a*.

X-ray diffraction evidence indicated that the symmetry of graphite was no higher than twofold. Twin observations and the occurrence of satellite reflections was observed, both of which were incompatible with sixfold symmetry. Both phenomena strongly suggested that the classical concept of equiv. C-C bonds must be discarded in favor of one involving unequal bond lengths and bond angles.

13239. Mac Ewan, Douglas M.C. and Amoros, Jose Luis. **Röntgenographic investigation of clays.** *Anales edafol. y fisiol. vegetal* (Madrid) 9, 363-79(1950).—*C.A.* 45, 6330*h*.

The prepn. of samples by centrifugation, mounting of samples for analysis, and fundamental characteristics of the cameras used for small-angle reflections were discussed. Tables of spacings and intensities of powder diagrams were given for the minerals most frequently found in clays.

13240. Mathieu-Sicaud, Agnès. **Applications of the electron microscope to the study of dispersions. II.** *Mém. services chim. état* 35, No. 4, 33-78 (1950).—*C.A.* 46, 2878*d*.

The following ultrasonic frequencies for max. dispersion of $BaSO_4$ suspensions of varying size and inertia of particle were given: 1,320, 1,920 and 3,400 A.; 960, 720, and 576 kc, resp.; for suspensions of alumina in water: 3,800 and 11,300 A.; 240 and 960 kc, resp.

13241. McCartney, James T.; Seligman, Bernard; Hall, W. Keith, and Anderson, Robert B. **An electron-microscopic study of metal oxides and metal oxide catalysts.** *J. Phys. & Colloid Chem.* 54, 505-19(1950).—*C.A.* 44, 5691*f*.

Changes in structure were studied on reduction of Fe_2O_3 gel, hydrous NiO, CuO powder, Ag_2O powder, CoO powder, Co basic carbonate, Co-ThO_2-MgO (100:6:12) catalyst, Co-kieselguhr (100:200) catalyst, Co-ThO_2-MgO-kieselguhr (100:6:12:200) catalyst, and Fe_2O_3 catalyst (Fe:Cu:K_2CO_3, 100:10:0.5). Wt losses and comparisons of electron micrographs and B.E.T. surface areas were detd. Pptd. oxides and catalysts always showed decrease in surface area on reduction and a sizable portion of this decrease occurred in reduction rather than by sintering. Decrease in sintering on reduction of Co basic carbonate was effected by the addn. of promoters and kieselguhr, the order of increasing effectiveness being kieselguhr < ThO_2, MgO < ThO_2 plus MgO.

13242. McLauchlan, T.A.; Sennett, R.S., and Scott, G.D. **Continuous observations with the electron microscope on the formation of evaporated films of silver, gold, and tin.** *Can. J. Research* 28A, 530-4(1950).—*C.A.* 45, 2737*h*.

The growth of films of Au, Ag, and Sn was observed continuously by the use of a special specimen holder for the evapn. of metals within an RCA-EMU electron microscope. The micrographs confirmed the migration of metal atoms leading to the formation of nuclei, growth and merger of aggregates, and the effect of surface tension. The recrystn. of NaCl after exposure of an evapd. film to air was illustrated.

13243. Mering, Jacques. **The reflections of x-rays by interstratified clay minerals.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 3, 21-6(1950)(in French).—*C.A.* 46, 8792*h*.

An exact interpretation required calcg. 3 long approaches, taking into account all the parameters: thickness and structure of the layers, their relative abundance, and their degree of disorder. These calcns. could be made in advance for a sufficient no. of sequence types, permitting an interpolation.

13244. Mering, J.; Mathieu-Sicaud, A., and Perrin-Bonnet, I. **Electron-microscope study of montmorillonite saturated with different cations.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 3, 29-32, 173; 4, 60(1950)(in French).—*C.A.* 47, 805*i*.

An electron-microscope study of the evapn. of a suspension did not directly indicate the state of the suspension. Interaction of 3 types could take place: (1) between paraticles and the liquid surface, (2) between particles and the membrane support (Formvar), and (3) among the particles. In Na-montmorillonite the 3rd type predominated. In H-montmorillonite the 3rd type was weak, and the 2nd type predominated.

13245. Michel, Andre; Bernier, Roger, and LeClerc, Georges. **Thermomagnetic study of Fischer catalyst containing nickel.** *J. chim. phys.* 47, 269-73(1950).—*C.A.* 44, 7638*i*.

There existed an intimate relation between the catalytic activity of Ni and the crystal size. The most active catalysts possessed a certain type of magnetization-temp. curve that was correlated by means of x-rays with the crystal size. Under certain conditions of catalysis the Ni catalyst was transformed into a paramagnetic hexagonal carbide of Ni.

13246. Miwa, Mitsuo; Mamiya, Shoichi; Igarashi, Tatsuo, and Onai, Yoshio. **Structure of amorphous carbon.** *J. Phys. Soc. Japan* 5, 81-3 (1950).—*C.A.* 45, 4911*i*.

Graphite, CO (reduced by Fe at 500°C), CO (reduced at 350°-400°C), retort carbon, coke, C_2H_2 decompd. at 800°C, and C_6H_6 soot were examd. by means of x-ray diffraction. As the particle size of amorphous C decreased, the higher-order reflection by the (001) plane faded away rapidly.

13247. Pechkovskaya, K.; Pupko, S., and Dogadkin, B. **Structure and properties of loaded rubber mixtures. IV. An electron-microscope study of various carbon blacks and their mixtures with sodium-butadiene rubber.** *Kolloid. Zhur.* 12, 367-9(1950).—*C.A.* 45, 890*i*.

Carbon black suspensions in H_2O, EtOH, or toluene were dispersed by supersonic vibrations and observed in an electron microscope. Sections of loaded rubber were coated with collodion, which then was shaded with Cr, or with Me methacrylate, which in turn was coated with silica. Channel carbon blacks formed chains whose particles range from 260 to 400 A.; finer carbon black samples proved to be better as fillers.

13248. Picon, Marius and Flahaut, Jean. **Association of carbon and manganese sulfide.** *Compt. rend.* 230, 2192-3(1950).—*C.A.* 44, 10441*g*.

When the azeotrope of carbon and MnS obtained by vaporization in vacuum above 1400°C was condensed, the phys. and chem. properties of the product showed that it was not a simple mixt. The d. at 0°C was 3.55 compared to 3.68 for the mixt. X-ray study and soly. in fuming HNO_3 and Brodie mixt. indicated that the carbon was actually amorphous.

13249. Radushkevich, L.V. and Luk'yanovich, V.M. **The structure of sorbents determined by means of the electron microscope.** *Zhur. Fiz. Khim.* 24, 21-42(1950).—*C.A.* 44, 4747*a*.

The sorbents were deposited on films from suspensions (suitable for Al_2O_3 and SiO_2) or from dust or rubbed in a film-forming material. Over 1000 specimens of active carbon were studied. Com. specimens all gave similar pictures, but different spots of a specimen had different structures. The dimensions of the visible pores in sugar charcoal increased when the total pore vol. was increased by longer heating. SiO_2 gels (12 specimens) were studied.

13250. Rao, M.R.A. **Electron microscopic studies on aqueous sols.** *Proc. Phys. Soc.* (London) 63B, 980-1(1950).—*C.A.* 45, 4526*i*.

Electron micrographs were shown for aq. sols contg. the following colloidal suspensions: graphite, stearic acid, V_2O_5, and S. The colloidal graphite was laminated and the thickness of the lamina was a small fraction of the av. diam. The particles of stearic acid seemed to have all kinds of shapes. Large particles of the freshly prepd. V_2O_5 spontaneously disintegrated on keeping. A micrograph of colloidal S showed particles more or less spherical and very much smaller in diam. Colloidal S did not indicate any change in the degree of depolarization with orientation of the particles.

13251. Sabatier, Germain. **Crystallization, by heating, of the mixed gels of silica and magnesia.** *Compt. rend.* 230, 1962-4(1950).—*C.A.* 44, 8739*b*.

Temps. and relative heats of crystn. for mixts. of varying compns. were detd. from the positions and lengths of the horizontal stretches in time-temp. curves (cooling curves). X-ray diffraction analysis of the cryst. phases showed that only those already known, from the study of fused MgO-SiO_2 systems, occurred.

13252. Schaeffer, W.D.; Polley, M.H., and Smith, W.R. **Nature of carbon black surfaces as revealed by adsorption studies.** *J. Phys. & Colloid Chem.* 54, 227-39(1950).—*C.A.* 44, 6700*c*.

The interaction between fully reinforcing black, Spheron 6, and decane and dihydromyrcene at 100°C were given. Particle sizes were obtained by means of an RCA-EMU electron microscope and B.E.T. surface areas from low-temp. N_2 adsorption isotherms, by assuming 16.2 A.^{2} as the cross-sectional area of N_2. The initial heat of adsorption of dihydromyrcene was about 20 kcal/mole higher than that of the satd. hydrocarbons, although the heats of liquefaction were very similar. The difference in the heats disappeared when the black was devolatilized at 975°C in vacuo over a 3-5 hr period.

13253. SCHWAB, GEORG-MARIA. **Compact-dispersed silver.** *J. Phys. & Colloid Chem.* 54, 576-80 (1950).—*C.A.* 44, 5679*f*.

Pore size and particle size of compact-dispersed Ag contg. 5.4 at. % of Ag were calcd. from the velocity of decompn. of HCOOH vapor, from the sp flow penetration for H_2O, and from x-ray diffraction lines. The 3 methods agreed with values from 1 to 2×10^{-4} cm. The mechanism of reduction of Ag halide by Zn was an electrolytic one. The Zn and the Ag front formed a short-circuited element. The Ag was pseudomorphic after the AgCl. The lattice orientation of compact-dispersed Ag prepd. from single AgCl crystals showed no relation to the original crystal.

13254. SENNETT, R.S. AND SCOTT, G.D. **The structure of evaporated metal films and their optical properties.** *J. Optical Soc. Am.* 40, 203-11(1950).—*C.A.* 44, 6224*d*.

The structures of evapd. films of Ag, Au, Cu, Al, Sb, Ni, Pd, and Cr in thickness from 30 to 500 A. were observed in the electron microscope and correlated with their optical properties. The stable form of films thinner than a characteristic thickness was found to be aggregated. The rate of formation affected the structure and the optical properties; slow rates in general gave more aggregated structure and increased light absorption.

13255. SERSALE, RICCARDO. **Thermal activation of bauxite.** *Ricerca sci.* 20, 1685-98(1950).—*C.A.* 45, 5340*d*.

Two samples of bauxite $Al_2O_3.H_2O$ differing in Fe content were studied at 480° and 900°C by using x-ray analysis, thermodilatometry and thermodensitometry. At the lower temp. H_2O was lost and the higher the γ Al_2O_3 became α Al_2O_3. The dehydration was accompanied by a sudden and marked permanent expansion.

13256. SHEKHTER, A.B.; ECHEISTOVA, A.I., AND TRET'YAKOV, I.I. **Crawling of silver atoms along the surface of zinc oxide crystals.** *Zhur. Fiz. Khim.* 24, 202-6(1950).—*C.A.* 44, 6224*g*.

Ag vapor was condensed on ZnO needles. Viewed in an electron microscope, Ag formed blobs of 200-1000 A. strung along the needles. The dimensions of these blobs did not change at room temp. or 150°C, but heating to 220-300°C in air reduced the no. of the blobs and increased their diam. and mutual distance. This proved that Ag atoms could migrate along the ZnO surface.

13257. SHEKHTER, A.B.; ECHEISTOVA, A.I., AND TRET'YAKOV, I.I. **Creep of atoms of gold and of palladium on the surface of crystals of zinc oxide.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1950, 465-8.—*C.A.* 45, 3216*c*.

Electron-microscopic examn. of evapd. films of Au, of an estd. thickness of ~ 25 at. layers, on ZnO showed (X60,000 magnification) individual crystallites of Au on needles of ZnO. Prolonged heating up to 320°C produced no change, but from 320° to 340°C there was progressive coarsening of the Au crystallites, due to disappearance of the smaller ones, and a progressive increase of the distance between crystallites. Pd films on ZnO, viewed under a magnification of X40,000, showed no sep. crystallites. Electron diffraction patterns could not be obtained from films on ZnO, but on collodion evapd. films of Ag gave the characteristic lines of the Ag lattice even with amts. corresponding to about 1 at. layer.

13258. STOL'NIKOV, V.V. **Electron-microscope investigation of the hydration of cement.** *Doklady Akad. Nauk S.S.S.R.* 71, 339-41(1950).—*C.A.* 44, 6095*g*.

In the early stages of the hydration the surface of the grain was covered with bristles, probably hydration products of tricalcium silicate and tricalcium aluminate. On the presence of 0.3% of Na soap of abietic resin as surface-active addn. agent, the bristles were distinctly smaller and finer. The effect of the soap consisted in an increase of the dispersity of the new formations.

13259. TAZAKI, HIDEO AND MIYANO, KAZUYOSHI. **X-ray examination of clay minerals.** *J. Sci. Hiroshima Univ.* Ser. A, 14, 151-4(1950).—*C.A.* 46, 8512*b*.

Pure clay minerals (32 samples) were examd. by the powder method of x-rays and the lines due to kaolinite, to montmorillonite to talc, to pyrophyllite, and to muscovite were detd.

13260. TERTIAN, ROBERT. **The constitution and crystal structure of activated alumina.** *Compt. rend.* 230, 1677-9(1950).—*C.A.* 44, 10434*e*.

The structure of γ-Al_2O_3 obtained by calcining a monocrystal of the hydrate at temps up to 1100°C was found to consist of 2 forms. One form, which was most common in well-crystd. γ-Al_2O_3, had the same arrangement as corundum, but the Al atoms were inscribed in a cubic face-centered network of O. The lattice unit was hexagonal with parameters a = 8.40 A., c = 13.65 A. It contained 18 mols. Al_2O_3, and the calcd. d. was 3.66, agreeing with the measured max. 3.65.

13261. TURKEVICH, JOHN; HUBBELL, HARRY H., AND HILLIER, JAMES. **Electron microscopy and small angle x-ray scattering.** *Discussions Faraday Soc.* 1950, No. 8, 348.

Applications were cited in the use of the electron microscope for the study of catalyst preparation and sintering. Correlations were presented of particle size determinations by the electron microscope with those obtained from the low angle scattering of X-rays.

13262. ZEHENDER, E. **The electron-microscopic investigation of the structure of films of zinc and cadmium formed by condensation of vapors.** *Optik* 7, *Sonderheft* 2, 200-7(1950).—*C.A.* 45, 5995*i*.

Ag was used as the contaminant or seeding layer. With Ag in amt. corresponding to a film 10^{-2} monatomic in thickness, Zn formed a bright surface with crystals about 30 mμ in size. The film had 80% of the elec. cond. of massive Ag.

With one-tenth as much Ag, the film of Zn was bluish and was composed of crystals about 100 mμ in size. With no Ag present the film was gray and crystals were about 200 mμ in size. Results with Cd were similar to those with Zn, but the crystals of the former were larger.

13263. ABE, RYUJI. **Study on corrosion-process of iron by electron diffraction.** *J. Phys. Soc. Japan* 6, 345-50(1951)(in English).—*C.A.* 47, 952*f*.

The anodic corrosion products of Fe in 0.1% aq. NaCl soln. were studied by electron diffraction. The primary product was $Fe(OH)_2$. Under the usual conditions this was oxidized partly to γ-$Fe_2O_3.H_2O$, which combined with the remaining $Fe(OH)_2$ to form a green rust $2FeO.Fe_2O_3.H_2O$. This green rust was then oxidized to a final product of γ-$Fe_2O_3.H_2O$ if the pH of the soln. was less than 2, α-Fe_2O_3 if pH was 4 or 5, and Fe_3O_4 if pH was greater than 11.

13264. BAGNO, ODETTE; LONGUET-ESCARD, JACQUELINE, AND MATHIEU-SICAUD, AGNÉS. **Electron microscopy of nickel hydroxide sols.** *Compt. rend.* 232, 1350-2(1951).—*C.A.* 46, 2878*b*.

Electron photomicrographs showed that a flocculent ppt. of $Ni(OH)_2$ was completely peptized in 48 hrs at 20°C, to particles of diam. 50 A. After 5 days aging the diam. had increased to 150 A. A ppt. peptized at 40° to 80°C showed both large and small particles.

13265. BAGNO, ODETTE; LONGUET-ESCARD, JACQUELINE, AND MATHIEU-SICAUD, AGNÈS. **Study of nickel hydroxide sols by the electron microscope.** *Mém. services chim. état.* (Paris) 36, No. 1, 81-3(1951).—*C.A.* 47, 380*e*.

The patterns formed during the peptization and flocculation of $Ni(OH)_2$ at ordinary and elevated temp. were shown. The diam. of the monodispersed particles was about 150 A., and the aged hexagon-shaped particles (aligned on the 00*l* face) were about 1000 A. in diam.

13266. BLOIS, MARSDEN S. JR. **Approach to the microscopy of molecules.** *Science* 114, 175-7 (1951).—*C.A.* 46, 2369*b*.

Electron micrographs of very thin evapd. metallic deposits showed that under certain conditions the discontinuous distribution of particles was subject to strong orienting effects. A 10-A. deposit of Ag on collodion showed an elementary structural unit circular in form, with a tendency for the structural units to link up and form a linear beadlike pattern. Au and Ag films 10-20 A. thick were deposited by evapn. on nitrocellulose films; in all cases the lengths of the linear metallic deposits were shorter than the actual mol. lengths, but increased as the polymer length of the substrate increased.

13267. BOETTCHER, A. **Electron-microscopic studies of fillers dispersed in rubber.** *Kautschuck u. Gummi* 4, 123-8(1951).—*C.A.* 45, 5962*e*.

The dispersion of different types of carbon black, Ca silicate, and $MgCO_3$ in natural rubber vulcanizates was studied. The fillers were examd. after soln. of the rubber. Nineteen electron micrographs were shown. These techniques made it possible to identify different fillers, to det. their state of dispersion, and to follow changes in their structure as a result of processing and vulcanizing.

13268. BOUILLON, F. **Dry oxidation of copper and its alloys. I. Influence of temperature on the isochronal oxidation of pure copper.** *Bull. soc. chim. Belges* 60, 337-56(1951).—*C.A.* 46, 4452*e*.

Electropolished samples of Cu were oxidized in dry O_2 for 1 day at atm. pressure and temps. ranging from 100° to 900°C. The direct oxidation of Cu below 224°C always led to Cu_2O. At temps. above 224°C Cu_2O was in turn oxidized to CuO. Above 317°C the rate of oxidation was so great that Cu_2O could no longer be detected in the films. The first layers of Cu_2O had a strong (111) orientation which disappeared as soon as the film thickness reached about 700 A. CuO behaved in a very different manner.

13269. BRENET, JEAN AND BRIOT, ANNE MARIE. **Study of the evolution of depolarizing and catalytic activity of manganese oxides.** *Compt. rend.* 232, 2021-3(1951).—*C.A.* 45, 8335*h*.

From detns. of electrochem. potential and depolarizing activity there was a sharp discontinuity at about 150°C. After thermal activation, x-ray diagrams showed a phase other than *pyrolusite*.

13270. BRINDLEY, G.W. **The interpretation of broadened x-ray reflections with special reference to clay minerals.** *Discussions Faraday Soc.* No. 11, 75-82(1951).—*C.A.* 46, 8577*d*.

Clay minerals showed broadening of x-ray reflections as a consequence of lattice mistakes and small crystal size. The 3-dimensional character of diffraction was an added complication. The smallest crystals in the clay-mineral series were halloysite and montmorillonite, both of which were 0.01-0.2 μ in size.

13271. BROMBERG, A.V.; LUK'YANOVICH, V.M.; NEMTSOVA, V.V.; RADUSHKEVICH, L.V., AND CHMUTOV, K.V. **Electron-microscopic investigation of mutual coagulation of hydrophobic sols.** *Doklady Akad. Nauk S.S.S.R.* 79, 281-2(1951).—*C.A.* 46, 23*a*.

When neg. hydrosols of V_2O_5 were mixed with positively charged hydrosols of Au (pos. by addn. of $Th(NO_3)_4$), dialyzed $Fe(OH)_3$, or AgI (pos. by excess of $AgNO_3$), particles of the pos. sol were seen to adhere to the threads or rods of V_2O_5. Distribution of the pos. particles along the threads was uniform.

13272. BROMBERG, A.V.; LUK'YANOVICH, V.M.; NEMTSOVA, V.V.; RADUSHKEVICH, L.V., AND CHMUTOV, K.V. **Electron-microscopic study of fine structure by means of development.** *Doklady Akad. Nauk S.S.S.R.* 79, 827-30(1951).—*C.A.* 46, 1842*b*.

The surface properties were different in the middle and at the end of the rod-shaped particles of a V_2O_5 sol. With a 15-day-old dil. V_2O_5 hydrosol, one single Ag crystal formed on each rod. In the group of the shortest V_2O_5 particles, 0-0.2 μ, (which comprised 43% of all particles) the Ag crystallite was found to be located at the end of the V_2O_5 rod in more than 90% of all cases. In the groups of the longer particles, 0.2-1.6 μ, the Ag crystallite was at the end of the rod in 40-50% of all cases; in the remaining cases, it was found mostly no farther than 0.2 μ from the end.

13273. Brú, L. and Gharpurey, M.K. **Epitaxial crystal growth of silver on rock-salt (110) and (111) faces.** *Proc. Phys. Soc.* (London) 64A, 283-6(1951).—*C.A.* 45, 8315*b*.

It was found by electron diffraction that Ag grew in parallel orientation on (110) and (111) faces of rock-salt and that the Ag crystals were twinned repeatedly on their {111} faces. A new example of rotational slip was noted in which Ag crystals slipped rotationally on their {110} planes. Ag was deposited from a Ag filament on freshly etched (110) and (111) faces of rock-salt kept at 75-200°C.

13274. Cowley, J.M.; Rees, A.L.G., and Spink, J.A. **The morphology of zinc oxide smoke particles.** *Proc. Phys. Soc.* (London) 64B, 638-44(1951).—*C.A.* 46, 9932*c*.

Single-crystal electron diffraction patterns with doubled spots obtained from ZnO smoke particles originated from pairs of thin sheets joining together the members of a group of 4 spines. The plane of each sheet was parallel to a (1010)-type lattice plane. When 2 or 3 sheets were formed with a group of spines in ZnO smoke, they often grew so that the crystal lattice in all sheets was continuous with that of one of the spines.

13275. Dragsdorf, R.D.; Kissinger, H.E., and Perkins, A.T. **An x-ray study of the decomposition of kaolinite.** *Soil Sci.* 71, 439-48(1951).—*C.A.* 46, 2217*h*.

Intensive ball-milling of kaolinite resulted in the formation of a mineral, distinct from, but structurally related to the original kaolinite. The initial grinding produced disorders in the stacking of component layers. After further grinding randomness of a second type was found. The lines observed corresponded to spacing calcd. on the basis of a monoclinic cell.

13276. Fischer, Robert B. **Precipitation of barium sulfate. Investigation by electron microscopy.** *Anal. Chem.* 23, 1667-71(1951).—*C.A.* 46, 1389*c*.

During aging of $BaSO_4$ the crystals in contact with the mother liquid showed no significant change in crystal size nor in apparent degree of perfection unless the particle size at the start of the aging was well under 1 micron, in which case Ostwald ripening occurred. Sometimes slight agglomeration took place. Copptn. involved the formation of surface protuberances upon $BaSO_4$ crystals formed very slowly by a process of diffusion mixing of reagent solns.

13277. Franklin, Rosalind E. **Crystallite growth in graphitizing and nongraphitizing carbons.** *Proc. Roy. Soc.* (London) A209, 196-218(1951).—*C.A.* 46, 7391*i*.

An investigation of the structure of carbons of different origin treated at temps. between 1000° and 3000°C showed that the graphitizing and nongraphitizing carbons form 2 distinct and well-defined classes. Carbons were obtained from polyvinylidene chloride (Saran), sugar charcoal, hexachlorobenzene, coal of 82.4% C (Northumberland), coal of 83.1% carbon (Yorkshire), polyvinyl chloride, petroleum coke, pitch coke and Welsh coking coal. The nongraphitizing carbons were formed, in general, from substances contg. little H or much O. On heating such substances there developed, at low temps., a strong system of cross-linking which immobilized the structure and united the crystallites in a rigid mass. The resulting carbons were hard, and their fine-structure porosity large and preserved at high temps.

13278. Fricke, Robert and Eberspächer, Otto. **Small- and wide-angle x-ray scattering by γ-Al_2O_3.** *Z. anorg. u. allgem. Chem.* 265, 21-40 (1951).—*C.A.* 46, 7840*d*.

Boehmite, prepd. from pure activated Al, consisted of filiform structural units (av. primary particle size = approx. 90A.) which were interwoven to spongy agglomerates. The γ-Al_2O_3 formed by dehydration at 400°-1000°C had a corpuscular network. Bayerite, under the electron microscope, appeared as a cryst. powder with an av. secondary particle size of about 1000A., but the primary particle size was approx. one order of magnitude lower. The primary particle size increased with increasing dehydration temp. Bayerite prepns. produced only small-angle x-ray scattering.

13279. Gorbunov, N.I. and Tsyurupa, I.G. **Optimal conditions for x-ray studies of particle sizes separated from soils and clays.** *Doklady Akad. Nauk U.S.S.R.* 77, 717-20(1951).—*C.A.* 46, 1683*f*.

Particles <1 μ were most suited. For special purposes this fraction was divided into two: 1-0.2 μ and <0.2 μ. The finer fraction was used for x-ray and electronic methods of analyses. The thermal analysis method of this fraction was not practical since it required 2.5 g of the material. In the montmorillonitic clays (askangel, humbrin, bentonite) the quantity of the fraction <0.2 μ was not higher than 52%. In kaolinitic clays this particle-size fraction was 5.5%. The <1 μ fraction in montmorillonitic clays was 96% and in kaolinitic clays and some clay soils up to 65%. The proportion of the different particle-size fractions as deciphered by x-ray analyses was given on clays and some zonal soils.

13280. Gulbransen, Earl A. and Ruka, Roswell. **Kinetics and mechanism of solid phase reactions --in oxide films on pure iron.** *Ind. Eng. Chem.* 43, 697-703(1951).—*C.A.* 45, 4121*a*.

The formation of multiple oxides in the oxidation of pure Fe was studied using the high-temp. electron diffraction method in the temp. range of 570° to 700°C. Although α-Fe_2O_3, Fe_3O_4, and FeO (wüstite) existed in sep. layers during oxidation, the higher oxides were converted to FeO by the solid-phase reaction with Fe when O_2 was removed.

13281. Heystek, H. **Attapulgite occurrence in the northern Transvaal.** *S. African J. Sci.* 47, 287(1951).—*C.A.* 46, 5489*b*.

A clay occurring at Turfbult in the Springbok Flats (Transvaal), assocd. with a large amt. of calcite, was identified as an attapulgite by chem. analysis, x-ray diffraction, differential thermal analysis, and electron microscopy. The distinguishing features of attapulgite and its uses were enumerated.

13282. ISHIGURO, MASAKAZU. **The adsorption of diatomic molecules on surfaces of molten metals.** *Mem. Inst. Sci. and Ind. Research, Osaka Univ.* 8, 78-82(1951).—*C.A.* 46, 2372*g*.

The silhouette of a molten drop in H_2 and O_2 was detd. from x-ray shadowgraphs. The surface tension was calcd. from the shape of the drop. Surface tensions of molten Sn, Bi, and Pb were given in graphic form for 0-30 mm pressure of H_2 and 0-7 mm pressure of O_2.

13283. KADOTA, NORIAKI AND IKEDA, SADAAKI. **X-ray diffraction study on the structure of the nickel-copper coprecipitation catalysts.** *J. Am. Chem. Soc.* 73, 4475-6(1951).—*C.A.* 46, 6916*f*.

A plot of lattice distance *vs.* at. fraction in Cu and Ni gave an S-shaped curve. The rate const. from the initial structure of 3.547 A. lattice distance to the final structure of 3.577 A. lattice distance was larger than the rate from the structure of 3.580 spacing. A nonequil. state of the alloy phase was formed on the catalyst surface, which remained unstable on the surface to an extent depending on the compn. of the catalyst.

13284. KASATOCHKIN, V.I. AND LUKIN, B.V. **X-ray analysis of the molecular structure of resins. X-ray diffraction of amorphous rubber.** *Izvest. Akad. Nauk S.S.S.R., Ser. Fiz.*, 15, 209-17 (1951).—*C.A.* 45, 9907*c*.

The amt. of disordered (gaseous) chain constituents could be obtained by relative measurements of the intensities of the ring and the background in diffraction pictures taken at small angles. Fatigue of natural rubber decreased the amt. of cryst. phase; fatigue of Na-butadiene rubber increased the intensity of the ring. Addn. of a filler (gas carbon black) to the vulcanization mixt. shortened considerably the time for crystn., even at very small concns. of S.

13285. KAWAKAMI, MUTSUMI AND OGASAWARA, NAOYUKI. **Behaviors of thin barium films on molybdenum wires. Observations by the electron microscope.** *Ôyô Butsuri* (J. Applied Phys.) 20, 63-8(1951).—*C.A.* 46, 5922*f*.

Electron-microscopic observations were reported of Ba films on Mo wire in relation to the activation effect of Ba vapor from a getter on Mo filaments in vacuum tubes. There were 2 kinds of images of the activated filament.

13286. KITAZAKI, UMEKA, **Variation in coal properties. II. X-ray diffraction patterns of coking coal and the mechanism of coking.** *Misc. Repts. Research Inst. Nat. Resources* (Japan) No. 22, 42-54(1951).—*C.A.* 47, 1354*h*.

Various grades of coking coals had a plane of hexagonal C linkage well developed and piled up along the *c* axis (irregularly along the *a* and *b* axes), the development being higher with greater degrees of coking. During coking, the 2-dimensional C lattice seemed freed of loose C bonds around it, generating hydrocarbon gas to be dissipated by evapn. and subsequently transformed to the 3-dimensional graphite structure.

13287. KNAPP, D.R. AND MITRA, R.P. **Electron diffraction by clay minerals with a fibrous or rod-like habit.** *Nature* 168, 380-1(1951).—*C.A.* 46, 7871*a*.

An electron-diffraction study of kaolinite, hallosite, attapulgite and argilla esmectica verde was made.

13288. KÖNIG, H. AND HELWIG, G. **Thin layers formed from hydrocarbons by electron or ion bombardment.** *Z. Physik* 129, 491-503(1951).—*C.A.* 45, 7427*b*.

A glow discharge was passed through C_6H_6 vapor and the films collected on quartz plates. Their d. was 1.4 g/ml. and their sp elec. cond. was 10^{-9}/ohm-cm for layers 0.5 to 0.8 μ thick. When these films were heated in a vacuum they gradually turned black, their elec. cond. increased greatly, and their electron-diffraction patterns looked like those obtained with carbonized org. objects.

13289. LAIRD, A.D.K. AND PUTNAM, J.A. **Fluid saturation in porous media by x-ray technique.** *Trans. Am. Inst. Mining Met. Engrs.* 192, *Tech. Pub.* No. 3169 (in *J. Petroleum Technol.* 3, No. 10., 275-84)(1951).—*C.A.* 46, 1741*b*.

The approx. theory of x-radiation was used to predict the strength of x-ray beams emerging from cores of porous materials contg. various combinations of fluids. Making use of the fact that absorption of x-rays was independent of the order in which various materials were traversed, a method was developed for calibrating the x-ray emergent beam strengths in terms of fluid satn. of the core.

13290. LECUIR-CHAUMETON, LUCIENNE; BILDÉ, HENRY, AND DEVAUX, JEAN. **Application of electron diffraction to the study of reactions between two surfaces in contact.** *Compt. rend.* 232, 1556-8(1951).—*C.A.* 45, 8332*g*.

Electron diffraction by reflection was used to study the reaction between Al_2O_3 and NiO and between Mo metal and glass. Conglomerates of Al_2O_3 and NiO were mixed and heated at 1400°C for 2 hrs. A blue coating that formed on the Al_2O_3 pellets gave the diffraction pattern of spinel, Al_2O_4Ni.

13291. LONGUET-ESCARD, JACQUELINE AND BAGNO, ODETTE. **The formation of nickel hydroxide sols.** *Mém. services chim. état* (Paris) 36, No. 1, 77-9(1951).—*C.A.* 47, 380*d*.

The appearance of abnormal lines (along 00*l*) in the Debye-Scherrer patterns of $Ni(OH)_2$ sols was ascribed to an increase in the size of the micelles upon aging.

13292. LUCAS, L.N.D. **The structure of thin layers of zinc oxide grown on a zinc single crystal.** *Proc. Phys. Soc.* (London) 64A, 943-5(1951).—*C.A.* 46, 10761*h*.

Growth of ZnO was produced on cleavage planes of single crystals of Zn, and the result was studied by electron diffraction. The expt. showed that an extremely thin ZnO layer was grown, no more than 10 mol. layers thick.

13293. MAMIYA, SHOICHI. **Nature of metal black.** *Science of Light* (Japan) 1, No. 1, 42-5(1951).—*C.A.* 47, 4777*c*.

X-ray examn. showed that Ni, Zn, Ag, Sn, Pb, and Bi blacks evapd. in air at low pressure were aggregates of minute crystallites of the corresponding metals; the crystallites became smaller with increase of pressure. With Zn, a sooty substance was obtained even in an atm. of N_2, H_2, or NO if the pressure of the gas was properly chosen. No definite evidence of intrusion of occluded gas into the crystal lattice was found in the x-ray examn.

13294. Mathieu-Sicaud, A.; Mering, J., and Perrin-Bonnet, I. **Electron-microscope study of montmorillonite and hectorite saturated with different cations.** *Bull. soc. franç. minéral.* 74, 439-56(1951).—*C.A.* 46, 4883*a*.

Suspensions of montmorillonite and hectorite well dispersed and satd. with H_2, Na, and Ca cations were mounted on Formvar films and observed with an electron microscope. Montmorillonite satd. with Na was easily dispersed. The reversible transformation montmorillonite H-montmorillonite Na was easily obtained, whereas the transformation from hectorite Na-hectorite H was not reversible. Measurements of montmorillonite single crystals showed the hexagons to be approx. 300 A. in size, in agreement with x-ray data.

13295. McCartney, J.T. and Anderson, R.B. **Electron-microscopic replica studies of porosity in fused iron catalysts.** *J. Applied Phys.* 22, 1441-3(1951).—*C.A.* 46, 4339*e*.

The prepn. of various replicas of a fused iron catalyst was described. Micrographs of these replicas showed comparable fine structures that were attributed to the pores developed in the catalyst. on reduction.

13296. Menter, J.W. **A study of boundary lubricant films by electron diffraction.** *Phys. of Lubrication, Brit. J. Applied Phys.*, Suppl. 1, 52-4(1951).—*C.A.* 45, 4915*b*.

Exptl. work reported on the orientation and structure of thin films of long-chain hydrocarbon compds. on metal surfaces and the effect of temp. indicated that good boundary lubrication occurred only when there was a closely packed solid film of oriented mols. on the surface.

13297. Menter, J.W. and Tabor, D. **Orientation of fatty acid and soap films on metal surfaces.** *Proc. Roy. Soc.* (London) A204, 514-24(1951).—*C.A.* 46, 4875*f*.

The orientation and structure of films of lauric, myristic, palmitic, stearic, and octacosanoic acids and certain of their heavy metal soaps on surfaces of Pt, Ag, Cu, Cd, Zn, and mild steel were studied by electron diffraction. Films were applied by retraction of molten drops and by rubbing at room temp. For all films there was a characteristic temp. at which disorientation occurred. For acids on nonreactive metals the transition occurred near the m.p. On reactive metals, Zn and Cd, disorientation occurred near the softening point of the corresponding soap, suggesting soap formation.

13298. Milligan, W.O. **Recent x-ray diffraction studies on the hydrous oxides and hydroxides.** *J. Phys. & Colloid Chem.* 55, 497-507(1951).—*C.A.* 45, 6001*a*.

Work done on hydrous oxides and hydroxides since 1942 was reviewed. The discussion was limited primarily to x-ray and electron-diffraction studies on single oxides such as CuO, alumina, chromia, and the trivalent oxides of In, Sc, and the rare earths, and dual or multiple oxide systems such as $NiO\text{-}Al_2O_3$, $BeO\text{-}In_2O_3$, $Cr_2O_3\text{-}Fe_2O_3$, $Cr_2O_3\text{-}ZrO_2$, $NiO\text{-}Cr_2O_3$, and $NiO\text{-}Cr_2O_3\text{-}ZrO_2$.

13299. Mosesman, M.A. **In situ x-ray diffraction studies of heterogeneous reactions.** *J. Am. Chem. Soc.* 73, 5635-9(1951).—*C.A.* 46, 2384*a*.

The construction of the app. permitted operation at pressures up to 11 atm. and temps. up to 650°C at flow rates as low as 1.0 ml/hr. X-ray diffraction data were obtained in the application of this app. to the detn. of the stable oxidation states of Fe in an NH_3 synthesis catalyst and of MoO_3 in bulk and Al_2O_3-supported MoO_3 in reducing and oxidizing atm.

13300. Nahin, P.G.; Merrill, W.C.; Grenall, A., and Crog, R.S. **Mineralogical studies of California oil-bearing formations. I. Identification of clays.** *Trans. Am. Inst. Mining Met. Engrs.* 192, *Tech. Pub.* No. 3059 (in *J. Petroleum Technol.* 3, 151-8)(1951).—*C.A.* 45, 7924*h*.

X-ray diffraction, electron microscopy, thin-section petrography, infrared spectroscopy, and cation exchange analysis methods were described. A group of the more important clay minerals was assembled and characterized by these methods for use as standards in core analysis. Although no one method of analysis was diagnostic for all of the clay minerals, the infrared technique showed considerable promise.

13301. Newkirk, J.B.; Smoluchowski, R.; Geisler, A.H., and Martin, D.L. **Diffuse scattering by an ordering alloy.** *Acta Cryst.* 4, 507-12(1951) (in English).—*C.A.* 47, 938*d*.

Diffuse x-ray diffractions produced by a partially ordered crystal of Co-Pt alloy of about 50 at. % compn. were investigated. They were explained by assuming the presence of thin platelets of the ordered tetragonal phase on {110} planes of the disordered cubic.

13302. Nowotny, H. and Funk, R. **The system: $Al_2O_3\text{-}Fe_2O_3\text{-}SiO_2$.** *Radex Rundschau* 1951, 334-40. —*C.A.* 46, 5946*i*.

The binary systems $Al_2O_3\text{-}Fe_2O_3$ and $Fe_2O_3\text{-}SiO_2$ were investigated by means of x-rays. In the 1st case a formation of mixed crystals was observed on both ends of the system whose homogeneity limit was ascertained at 1000° or about 1700°C. In the 2nd case the 2 oxides continued to exist unchanged side by side. The ternary system of $Al_2O_3\text{-}Fe_2O_3\text{-}SiO_2$ was detd. by the phases appearing in the adjacent systems. The measured Curie points of the ferromagnetic test-pieces, whose compns. were partly within the binary systems of $Al_2O_3\text{-}Fe_2O_3$ and $Fe_2O_3\text{-}SiO_2$, and partly within the ternary system, confirmed the structure established by x-rays.

13303. Okada, Kenichi and Ishigaki, Kishiro. **Electron diffraction studies on the surface treatment of zinc.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 619-20(1951).—*C.A.* 47, 6849*b*.

After subjecting the surface of Zn to various treatments, the structure was studied by means of electron diffraction. $Zn(OH)_2$ was formed at once as soon as the Zn surface touched water. By washing with acidic Al or Cr alum solns., the corresponding $Al_2O_3.H_2O$ or $Cr_2O_3.H_2O$ was formed on the surface.

13304. PISARENKO, A.P.; SHEKHTER, A.B., AND ECHEISTOVA, A.I. **Electron-microscopic investigation of rubber structures.** *Doklady Akad. Nauk S.S.S.R.* 76, 423-5(1951).—*C.A.* 46, 1789*g*.

Films 200-800 A. thick of Na-butadiene rubber prepd. by evapn. of a toluene soln., showed characteristic ridges, oriented at different angles and occasionally forming closed cells. With a carbon black filter, and without a surface-active agent, the distribution of carbon black was highly heterogeneous; 0.1% of stearic acid, benzidine, or diphenylguanidine did not change this picture.

13305. RICHTER, H. AND FÜRST, O. **Amorphous germanium.** *Z. Naturforsch.* **6a**, 38-46(1951).—*C.A.* 46, 8925*h*.

Amorphous Ge was studied by x-ray and electron-diffraction techniques. For x-ray studies 15-20 layers, obtained by evapn. on NaCl and soln. of the NaCl, were superposed to obtain a thickness of 10^{-3} cm. Correction factors for the absorption of such layers of finite thickness were given. Results of Fourier analysis of the scattering curves indicated a noncryst. state of the Ge layers.

13306. ROBERTSON, H.S. **The microstructure of clay minerals.** *Tonind.-Ztg.* 75, 2-6(1951).—*C.A.* 45, 3768*i*.

The electron microscope structures of clay minerals and the mol. arrangement were discussed, touching on the properties caused by elec. charges. Cation exchange, adsorption, bentonite-like behavior, compressive strength, plasticity, and property of "balling" were included.

13307. RUBINSHTEIN, A.M. AND KULIKOV, S.G. **Structure and properties of titanium dioxide catalysts and their polymorphism.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1951, 133-9.—*C.A.* 45, 6031*d*.

Anatase-TiO_2 was prepd. by pptn. from $TiCl_4$ with NH_4OH, and 3 series of catalysts were prepd. by (a) 5 hrs heating at 400°, 500°, 600°, 700°, 800°C; (b) heating to 600° for 5, 10, 25, 50, 100 hrs; (c) mixing ready-made anatase and rutile in the proportions (% anatase, rutile) 100,0; 90,10; 75,25; 50,50; 25,75; 10,90; 0,100. All prepns. were examd. by x-rays.

13308. SCHOFIELD, F. **Preparing paste and powder specimens for the electron microscope.** *Brit. J. Applied Phys.* 2, 18-19(1951).—*C.A.* 45, 4097*i*.

Paste and powders were prepd. for electron-microscope examn. by a method which avoided aggregation of the solid particles by dispersing in in a liquid medium of 50% alc. and 0.02% gelatin. The sample was dild. 1000:1. As an alternative, a medium viscosity grade of ethylcellulose in isopropyl alc. could also be used.

13309. SHEKHTER, A.B.; KUSHNEREV, M. YA., AND MOSHKOVSKII, YU. SH. **Catalytic activity and structure of active zinc oxide. III. Influence of the method of preparation of zinc oxide catalysts on their x-ray structure.** *Izvest Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* **1951**, 388-94.—*C.A.* 45, 10021*h*.

A no. of samples of ZnO catalysts were prepd. by decompn. of $ZnCO_3$ at 350°C *in vacuo*, and oxidation of Zn vapor in the elec. arc, with both series subsequently heated *in vacuo* 2 hrs at a definite temp. between 500° and 1000°C. By Debye x-ray line widths, crude (i.e. not heat-treated) prepns. from $ZnCO_3$ had finer crystals (mean dimension m = 36 A.) than oxidized Zn vapor (m = 56 A.). Heating to 500°, 700°, 800°, and 1000°C produced in the first series an increase of m (47, 62, 63, and 77 A.), but practically no change in the second series.

13310. SHEKHTER, A.B. AND ZHABROVA, G.M. **Catalytic properties and structure of active zinc oxide. IV. Influence of the method of preparation on the electron-microscopic structure of zinc oxide.** *Izvest. Akad. Nauk, Otdel. Khim. Nauk* **1951**, 500-4.—*C.A.* 46, 3839*e*.

Electron microscopy revealed deep secondary-structure differences between ZnO prepns. obtained by pyrolytic decompn. of different Zn salts (nitrate, carbonate, formate, oxalate, acetate, hydroxide). ZnO from $Zn(NO_3)_2$ at 350 and 600°C was the coarsest and least porous, whereas ZnO from $ZnCO_3$ had the highest dispersity and finest porosity; the other salts occupied positions intermediate between these 2 extremes. Samples of ZnO obtained by decompn. of the salts at 200-300° and subsequently heated to 600° did not differ in structure from ZnO prepd. by decompn. at 600°. Data of surface areas (in m^2/g) of different prepns. of ZnO were given.

13311. STROHMAIER, KARL. **A simple process for the preparation of transparent films of aluminum oxide of large area and thickness between 50 and 300 mμ.** *Z. Naturforsch.* **6a**, 508-9(1951).—*C.A.* 47, 6280*g*.

A 10-15 μ thick Al foil was polished, and its edges were oxidized electrolytically at 160 v. and 0.3 amp. with Al or C cathode for 2-3 min. The flat area was then oxidized electrolytically in 3% NH_4 citrate to the desired thickness. The Al was dissolved in fuming HCl with a few crystals of $CuCl_2$. These Al_2O_3 films were more stable toward heat and chem. attack than collodion films.

13312. SUITO, EIJI AND UEDA, NATSU. **Electron microscopy and diffraction of triangular particles of gold sol.** *Science* (Japan) 21, 598-9(1951).—*C.A.* 46, 1862*a*.

The sol was prepd. by the reduction of aq. $AuCl_3$ soln. by H_2O_2 at 80°C after adding HCl to give a pH of 2.3. The electron-microscopic photograph showed the existence of particles as large as 1 to 3 μ, which were triangles, hexagons, or intermediates of these, or twins. The photographs of these thin plates showed striped patterns. All of the Au particles grew along the (111) plane.

13313. TAKAGI, RIITSU. **Electron-microscope and diffraction studies of chromic oxides.** *J. Phys. Soc. Japan* 6, 350-1(1951)(in English).—*C.A.* 47, 938*f*.

Cr_2O_3 obtained by the calcination of the following substances was studied: (1) CrO_3 at 600°

and 1300°C, (2) a mixt. of CrO_3 and C_2H_5OH at 1100°C, (3) a mixt. of $Na_2Cr_2O_7.2H_2O$ and S at 1100°C. Cr_2O_3 obtained from (1) was granular and of irregular shape, the size of the particle increasing with the temp. of calcination. Cr_2O_3 obtained from (2) and (3) was platelike, often showing hexagonal shape.

13314. Tazaki, Hideo and Kuwabara, Shigeya. **A study of oxide films formed on copper-magnesium alloys by electron diffraction.** *J. Sci. Hiroshima Univ.*, Ser. A, 15, 67-70(1951).—*C.A.* 47, 5337*h*.

Samples contg. 1, 3, 5, and 10% Mg were studied. At pressures of air from 10^{-2} mm to 100 mm, Cu_2O only was detected over a temp. range of 0° to 250°C. At the higher gas pressures and at temps. over 250°C, CuO was also detected. MgO was detected only at temps. exceeding 350°C and air pressures exceeding 0.1 mm. Abrasion of the MgO film on the surface of the specimen yielded Cu_2O diffraction rings upon subsequent examn.

13315. Trillat, Jean Jacques and Oketani, Shiguéo. **Electron-diffraction study of the cementation of iron. II. Action of a mixture of carbon monoxide and hydrogen.** *Compt. rend.* 232, 1116-18(1951).—*C.A.* 45, 5086*c*.

Cementation of thin films of Fe in the presence of pure CO produced only Fe_3C and Fe_3O_4. When a mixt. of equal vols. of CO and H_2 was used, no indications of an iron oxide were found. At 350°C, the presence of α-Fe, a little Fe_3C, and a new phase, Fe_2C, were detected. At 400°C only α-Fe and Fe_3C were observed.

13316. Turkevich, John and Hubbell, Harry H. **Low-angle x-ray diffraction of colloidal gold and carbon black.** *J. Am. Chem. Soc.* 73, 1-7(1951).—*C.A.* 45, 6045*g*.

An app. for the detn. of low-angle x-ray scattering of particles of colloid size was described and applied to the detn. of the particle size of monodisperse colloidal Au and of carbon black. The values of the particle size so obtained agreed satisfactorily with measurements using the electron microscope. The wave-length dependence of the x-ray scattering was also detd. and found to agree with theoretical predictions.

13317. Turkevich, John; Stevenson, Peter C., and Hillier, James. **The nucleation and growth processes in the synthesis of colloidal gold.** *Discussions Faraday Soc.* No. 11, 55-75(1951).—*C.A.* 46, 8932*f*.

Au sols prepd. by the following methods were examd. by electron microscopy: by the elec.-arc method, by reaction of K chloroaurate with white P, $KMnO_4$, H_2NOH, or tannin, by bubbling CO or C_2H_2 through an aq. soln. of chloroauric acid, by boiling chloroauric acid solns. with $(COOH)_2$ or citric acid, or by adding 1% aq. Na citrate soln. with good mech. stirring to a hot chloroauric acid soln. The growth of the nuclei occurred exponentially, the rate of change of diam. with time being proportional to diam. The size-distribution curves of Au sols were controlled by the amt. of Au, the nucleation process, and the exponential growth process.

13318. Voorthuijsen, J.J.B. van Eijk van and Franzen, P. **Structure and properties of compounds formed during the preparation of nickel-on-silica catalysts.** *Rec. trav. chim.* 70, 793-812(1951)(in English).—*C.A.* 46, 8490*g*.

The system $NiO-SiO_2-H_2O$ was studied. The formation of Ni hydrosilicate ions under various conditions was studied by x-ray and thermal methods. Hydrothermal treatment improved the crystallinity. The reducibility with H_2 was measured as a function of temp. It varied with SiO_2 content and with degree of perfection of the hydrosilicate structure. Usually Ni in the cubic form was obtained; however, there were indications that in the case of hydrothermally treated Ni montmorillonite and Ni antigorite gels, part of the reduced Ni atoms remained in the places they occupied as ions in the hydrosilicate structure.

13319. Wadsley, A.D. and Walkley, A. **Structure and reactivity of the oxides of manganese.** *Rev. Pure Applied Chem.* (Australia) 1, 203-13 (1951).—*C.A.* 46, 4878*d*.

The oxides and hydrous oxides of Mn showed polymorphism as well as variability of valence and compn. X-ray diffraction techniques served to distinguish between the different phases and, in some instances, to locate the positions of the ions within the unit cell. In this system x-ray and chem. methods could only rarely distinguish with certainty between different valency states. The introduction of foreign metal ions caused departures from stoichiometry, alterations in the mean metal-oxygen bond lengths, and hence alterations in thermodynamic properties. The speed of reductions and of the exchange reaction did not appear to depend on the active O-content, but more on the probable distortion caused by foreign atoms in the lattice, and on the surface area.

13320. Westrik, R. **Crystallographic and magnetochemical study of the structure of catalysts.** *Chem. Weekblad* 47, 444-52(1951).—*C.A.* 46, 2383*h*.

13321. Wilsdorf, H.G.F. **Structure of amorphous aluminum oxide films.** *Nature* 168, 600-1(1951).—*C.A.* 46, 4876*a*.

A mol. group was constructed by trial and error such that the electron diffraction pattern calcd. agreed with expt. A particle consisting of 2 Al_2O_3 mols. gave good results. This particle was an octahedron of 6 closely packed O ions with 4 Al ions in a tetrahedral arrangement.

13322. Woodward, Leroy A. and Lyons, S.C. **The mechanism of gloss development in clay-coated sheets.** *Tappi* 34, 438-42(1951).—*C.A.* 46, 4227*b*.

From electron micrographs, there was a sharp change in kaolinite particle shape with increasing diameter, as the apparent spherical diameter exceeded 2 μ. Below 2 μ, the particles were hexagonal, platelike crystals. Above 2 μ, the particles were stacked aggregates of the fine crystals.

13323. Yamaguchi, Shigeto. **Diffraction from a synthetic-ammonia catalyst of iron oxide.** *J.*

Phys. & Colloid Chem. 55, 1409-10(1951).—*C.A.* 46, 1855*c*.

Sample A showed a mixt. of powder crystals of the spinel type and single crystals giving rise to Kikuchi lines. Sample B showed large crystal grains of the spinel type. B gave better yields of NH_3 at 480°C, but had half the life of A. They were equal in activity at 610°C.

13324. Yoshioka, Shozo and Yamamoto, Hisashi. **The structure of thin films of paraffin on the surface of metals. I. II.** *Oyo Butsuri* (J. Applied Phys.) 20, 242-6, 286-9 (1951).—*C.A.* 46, 5922*e*.

An electron-diffraction study was made of the structure of thin films of $C_{25}H_{52}$ on polished Cu surface up to 500 layers. The internal elec. potential was calcd. up to the 6th layer line of the diffraction patterns and 5.04 ± 0.35 v. was obtained. The effect of roughness of the Cu surface on the orientation of paraffin mols. was studied by the electron-diffraction method.

13325. Zhdanov, G.S. and Razmanova, Z.P. **X-ray analysis of catalysts with aluminum hydroxide base.** *Izvest. Akad. Nauk S.S.S.R., Ser, Fiz.* 15, 202-8 (1951).—*C.A.* 45, 8863*i*.

The $Al(OH)_3$ was prepd. by 3 methods. The following phases were observed: boehmite (γ-$Al_2O_3.H_2O$), bayerite (metastable $Al_2O_3.3H_2O$), their mixt., and hydrargillite (stable $Al_2O_3.3H_2O$). Fast settling by the mech. Bayer method gave bayerite; slow settling, hydrargillite; annealing led to boehmite. The initial boehmite structure changed into less-dispersed bayerite. Annealing to 450°-600°C led to γ-Al_2O_3. The activity of the catalysts measured on the dehydration reaction of EtOH dropped rapidly at the transformation point to α-Al_2O_3.

13326. Allen, J.A. **Oxide films on electrolytically polished copper surfaces.** *Trans. Faraday Soc.* 48, 273-9(1952).—*C.A.* 46, 7908*b*.

Surfaces of polycryst. Cu sheet polished electrolytically in H_3PO_4 were examd. electrometrically and by electron diffraction. The surfaces were initially free from oxide films when removed from the polishing bath. The subsequent growth of oxide films in air at room temp. depended on the washing procedure adopted. Surfaces freed from phosphate contamination oxidized rapidly, giving films 15 A. thick after 0.5 hr and 20-25 A. after 17 hrs.

13327. Beckett, R.J. and Croft, R.C. **The structure of graphite oxide.** *J. Phys. Chem.* 56, 929-35 (1952).—*C.A.* 47, 2008*d*.

If in graphite oxide O was contained between graphite layers by epoxy linkages or the like, the layers should be less rigid in graphite oxide than in graphite because of the satn. of double bonds. The predicted flexibility was verified by electron-microscope observations of small ($\sim 1\mu$ across) particles. The particles were deposited from dispersions and shadow-cast with U. Micrographs of graphite oxide all showed extensive folding. The folds were predominantly along straight lines with no obvious preferred direction.

13328. Benesovsky, F. and Vidmajer, A. **Two granular forms of sublimed molybdenum trioxide.** *Österr. Chem.-Ztg.* 53, 158-60 (1952).—*C.A.* 46, 10701*g*.

The MoO_3 obtained industrially by sublimation consisted of 2 forms which were separable through d. differences. They differed mainly in phys. properties. In the electron microscope the heavy form appeared as spheres, the light as needlelike platelets.

13329. Berestneva, Z. Ya.; Koretakaya, T.A., and Kargin, V.A. **The mechanism of formation of the colloidal particles of a gold sol.** *Kolloid. Zhur.* 14, 395-8(1952).—*C.A.* 47, 3083*d*.

Electron microscope and electron diffraction showed that Au sols (prepd. by reducing $AuCl_3$ with P) originally contained relatively large amorphous particles, but these broke down to small crystals in, e.g., 5 min. In Au sols grown on nuclei both stable cryst. and unstable amorphous particles were present.

13330. Bernard, René; Pernoux, Emile, and Teichner, Stanislas. **Application of the electron microscope to the measurement of specific surfaces. Determination of the efficiency of grinding.** *J. chim. phys.* 49, 147-56 (1952).—*C.A.* 46, 7843*d*.

The nos. and sizes of particles contained in very fine powders, in suspensions, etc., were detd. with the electron microscope by making use of statistical evaluations of a large no. of measurements. From the nos. of particles per unit area and their av. diam. the sp surface was calcd. Measurements on 5 particles of wolframite gave sp surfaces in good agreement with results obtained by the N_2 adsorption method.

13331. Brady, Edward L. and Zemany, Paul D. **Effect of various gases on potassium-ion emission from hot platinum.** *J. Chem. Phys.* 20, 294-7 (1952).—*C.A.* 46, 7421*h*.

The effect of several bases on the emission of K ions from a hot Pt surface was studied. O_2, CCl_4, Br_2, and He caused a marked decrease in the K-ion emission; N_2 had a smaller effect; and H_2 caused an increase in the emission.

13332. Bramao, Luis; Cady, J.G.; Hendricks, S.B., and Swerdlow, Max. **Criteria for the characterization of kaolinite, halloysite, and a related mineral in clays and soils.** *Soil Sci.* 73, 273-87 (1952).—*C.A.* 47, 5055*a*.

Three criteria, used to sep. and identify kaolinite and halloysite, were: the shape of the main endothermic peak on the D.T.A. curve of kaolin minerals, the presence of *(hkl)* x-ray reflection with *h*, *k*, or *l* not equal to zero and of (001) reflections from interplanar spacings from 7.15 to 7.20 A.; and electron-microscopical observation of hexagonal plates of kaolinite and the cylindrical forms of halloysite. The kaolin mineral in many soils showed characteristics of of both kaolinite and halloysite.

13333. Danilov, V.I. and Serikov, A.S. **Small-angle scattering of x-rays and the porous structure of active carbons.** *Doklady Akad. Nauk S.S.S.R.* 83, 71-4 (1952).—*C.A.* 46, 8457*b*.

One single x-ray scattering intensity curve was detd. for an active carbon heated 1 hr at 1000°C, for the range of $s = \sin\theta/\gamma$ from 0.01 to

1.00, comprising small, medium, and large angles. The intensity curve was made to coincide with the curve of independent (coherent + incoherent) scattering for large s. Between $s = 0.05$ and 1.0, the intensity curve oscillated relative to scattering, as in the case of liquids and amorphous bodies. In the range of $s < 0.05$, the intensity increased rapidly with decreasing s, with the intensity lying well above scattering.

13334. DANILOV, V.I. AND ZUBKO, A.M. **Fine structure of active carbons.** *Doklady Akad. Nauk S.S.S.R.* 82, 385-8 (1952).—*C.A.* 46, 8456*i*.

The structures of a no. of carbons (activated, natural, or low-temp. cokes) were investigated by the method of integral analysis of x-ray intensity curves. Radial at. distribution functions were compared with various structure models. The results were plotted in the form of $4\pi R^2 p(R)$, where p = d. (in atoms/A.) at the distance R, as a function of R. For an active carbon heated 25 hrs *in vacuo* at 1000°C, maxima were found at R = 1.4, 2.55, 4.1, and 5 A. For different carbons, the positions of the maxima lay at the same R; these concns. coincided with the atom concn. in graphite lattices. Different carbons showed different degrees of order, always increasing with the temp. of heating.

13335. DONNET, JEAN B. AND BOSSIER, JACQUELINE. **Determination of the form and the dimensions of particles of carbon black by electron microscopy.** *Compt. rend.* 234, 195-8 (1952).—*C.A.* 46, 4878*b*.

The effect of electron bombardment on the size and shape of carbon black particles during electron microscopic examn. was checked. The contamination was apparent if the observations were made on films of Be. Carbon black particles were found to be spherical. No.-av. diam. = 301 A. Vol.-av. diam. = 372A.

13336. ELLIOTT, R.L. AND MANOGUE, B. **An electron-microscope study of the surface structure of wool.** *J. Soc. Dyers Colourists* 68, 12-14(1952). —*C.A.* 46, 3285*a*.

The mode of dye absorption and retention by wool was detd. by the properties, condition, and state of the histological phases of the fiber. A replica technique was used to investigate the effect of various nonfelting treatments as regards surface structure of the fiber. There was a definite change of the whole surface and the heterogeneous phys. (and probably chem.) structure of the cuticle of wool was confirmed. Several electron micrographs were shown and their indications pointed out.

13337. ERDMANN-JESNITZER, F. AND GUNTHER, F. **The nature of copper surfaces between 500° and 850°C.** *Z. Elektrochem.* 56, 386-90 (1952)(in German).—*C.A.* 47, 3775*e*.

Several different surface states of Cu were formed with the layer thickness of from 10^{-3} to 10^{-4} mm. Melted surface layers on solid Cu base were used at about 0.7 times the known m.p. temp. At about 760°C, Cu showed an increasing surface activity with increasing temp. Measurements were made by using both monochromatic light and x-rays reflected off the surfaces under consideration.

13338. EVANS, D.M. AND WILMAN, H. **Crystal growth and orientation in deposits condensed from the vapor.** *Acta Cryst.* 5, 731-8 (1952).—*C.A.* 47, 3073*h*.

Crystal orientation on smooth substrates initially at room temp. was investigated by electron diffraction. The effects of substrate roughness, vapor-steam obliquity, deposit thickness, crystal habit, and mobility of the deposit atoms were investigated. Materials (Zn, Cd, Sb, Bi, NaCl) having high at. mobility had initially a densely populated plane on the av. parallel to the mean substrate plane. Materials (Fe, NaF, PbS, CaF_2, Al) with low mobility had little or no orientation in thin layers.

13339. FEITKNECHT, W. **The breakdown of the oxide film on metal surfaces in acid vapors, and the mechanism of atmospheric corrosion.** *Chimia (Switz.)* 6, 3-13 (1952).—*C.A.* 46, 6069*e*.

Initial corrosion of Zn, Cd, Ni, Fe, and Cu in wet HCl was studied. Observations with electron microscope, systematic analysis of consecutively formed primary products of corrosion, and measurements of wt changes showed the existence of 3 different types of corrosion. Corrosion of Ni and Fe started in isolated points, the no. of points increasing with time. A uniform film, whose transparency decreased with time, covered Zn and Cd. A uniform film of copper oxide on Cu had a thickness which increased while a film of $CuCl_2$ was formed. Initial corrosion in wet HCl was an electrochem. process for which a crit. degree of humidity was necessary.

13340. GARROD, R.I. **The use of gold leaf as a reference material in the determination of lattice constants by electron diffraction.** *Proc. Phys. Soc.* (London) 65A, 292-3(1952).—*C.A.* 46, 10858*d*.

A series of electron-diffraction studies on NaCl with Au in the form of foil was described. For a crystal size larger than 100 A. the lattice parameter obtained for NaCl films agreed with the x-ray value. Beaten Au leaf was unreliable as a reference material for accurate work.

13341. GAY, P. AND HIRSCH, P.B. **The crystalline character of abraded surfaces.** *Symposium on Properties of Metallic Surfaces (Inst. Metals, London)* 1952, 123-32.—*C.A.* 47, 2992*d*.

The effect of various abrasive treatments on the surface structure of calcite was investigated by x-ray and electron diffraction methods. A crystal of calcite rubbed with soft wood had an electron diffraction pattern in which the Kikuchi lines disappeared and the diffraction spots elongated in a direction perpendicular to the shadow edge. X-ray diffraction examn. of a calcite crystal ground on coarse carborundum indicated that small particles were produced during abrasion and that large plastic curvatures occurred on the surface.

13342. Grasenick, F. and Haefer, R. **Electron microscope investigation of surfaces with a carbon covering.** *Monatsh.* 83, 1069-82 (1952).—*C.A.* 47, 1483*f*.
Colloidal carbon was sputtered on the surfaces of samples and the resulting replicas used for electron microscope studies. Four methods of prepn. were tried: (1) discharge in a hydrocarbon atm. and the subsequent action of an electron beam; (2) vaporization of carbon electrodes in H_2 and A; (3) action of an electron beam on the object in an atm. of gaseous hydrocarbon at pressures of 10^{-2}—10^{-4} mm; and (4) adsorption of org. substances. MgO and diatomaceous earth materials were used as the samples.

13343. Hagihara, Hitoshi. **Mono- and multilayer adsorption of aqueous xanthate on galena surfaces.** *J. Phys. Chem.* 56, 616-21(1952).—*C.A.* 46, 8458*g*.
The action of aq. xanthate on galena surfaces was studied by electron diffraction. Minute unimolecular patches adsorbed on the galena lattice were formed on both fresh and slightly oxidized galena faces. The monolayer may be composed of xanthic acid mols. adsorbed with their polar heads attached to the Pb atoms of the galena lattice.

13344. Hanson, A.W. and Lipson, H. **Optical methods in x-ray analysis. III. Fourier synthesis by optical interference.** *Acta Cryst.* 5, 362-6 (1952).—*C.A.* 46, 7422*h*.
A method of Fourier synthesis by optical interference was described, which involved the representation of a reciprocal-lattice section by an array of holes in an opaque plate. Intensities could be controlled by varying the orientation of mica plates between crossed nicols, while phase changes sufficient for the synthesis of centrosymmetrical projections were effected by interference between the fast and slow components into which the mica resolved the incident light.

13345. Hast, Nils. **Resistant surface films of crystals.** *Arkiv Fysik* 4, 535-9(1952)(in English).—*C.A.* 46, 8923*g*.
An electron-microscopic investigation indicated the presence of veil-like surface films, reproducing the shapes of crystals of NaCl, marble, and rock salt, which were left after soln. of the crystals. These films had a porous structure of threads, through which the material of the crystal must have diffused during the soln. process. The rate of growth of the crystals and the rapidity of the change from the growing process to soln. had some effect on the character of the threads. The origin of the surface films may be impurities in the soln. but not adsorbed gas mols. or dust particles.

13346. Hauser, Ernst A. and LeBeau, D.S. **The surface structure and properties of colloidal silica and alumina.** *J. Phys. Chem.* 56, 136-9 (1952).—*C.A.* 46, 10785*b*.
Thermal analysis and x-ray diffraction studies proved the amorphous structure of synthetic silica gels, silicic acid gel, alumina-silica gel, and magnesia-silica gels. The magnesia-silica gel alone showed an exothermic peak at 810°C, probably assocd. with a structural change and formation of a new compd. which was also amorphous. Ultramicroscopic studies and electron photomicrographs indicated that the particles were aggregates.

13347. Honigmann, B. and Stranski, I.N. **Habit change in hexamethylenetetramine crystals at constant temperature and under the influences of temperature fluctuations.** *Z. Electrochem.* 56, 338-42 (1952).—*C.A.* 46, 9923*f*.
A growing hexamethylenetetramine crystal was sealed in a closed tube in the presence of its own vapors. The (001) faces developed as the normal crystal habit, but at the very start of the growth both the (001) and (112) faces were present as submicroscopic faces. The growth depended on both time and temp. except that below 70°C there was no possibility for a habit change. The effect of gas mols. of N_2, O_2, CO_2, and NH_3 was tried; NH_3 was held back, whereas N_2, O_2, and CO_2 were physically adsorbed by the crystal.

13348. Kefeli, L.M. and Lel'chuk, S.L. **Structure of skeleton catalysts.** *Doklady Akad. Nauk S.S.S.R.* 84, 285-8 (1952).—*C.A.* 46, 10822*c*.
When the sol. component was leached out from a binary alloy, the remaining metal regrouped into its characteristic lattice; e.g., after the Al was leached out from the rhombohedral Ni_2Al_3, the skeleton Ni became cubic. On incomplete leaching, only the unchanged Ni_2Al_3 retained its rhombohedral lattice, but all the Ni was cubic. In the γ-phase of the Cu-Zn system, with 52-atom elementary cell of Cu_5Zn_8, the Cu remaining after dissoln. of the Zn with 3% HCl crystallized in the normal cubic lattice of Cu. The same happened upon removal of Mg and Zn from the ternary alloy Al_2CuMg.

13349. Kefeli, L.M. and Sevast'yanov, I.G. **Dispersity of the nickel-skeleton catalyst.** *Doklady Akad. Nauk S.S.S.R.* 83, 863-4(1952).—*C.A.* 46, 8489*g*.
By measurements of the width of Debye lines, the mean crystal size of a skelton Ni catalyst obtained by alk. leaching of a Ni_2Al_3 alloy was shown to decrease with decreasing temp. of the leaching and with decreasing concn. of the alkali. In leaching with 20% alkali at 103-7° 50°, 20°, 10°C, and with 10% alkali at 50° and 20°C, the mean crystal size was, resp., 176, 116, 103, 88, and 99 and 52 A.

13350. Kitazaki, Umeka; Yagishita, Hideharu, and Araki, Harumi. **Coking. II. X-ray analysis of the structural change of coal by heating.** *Misc. Repts. Research Inst. Natural Resources* No. 25, 51-60(1952).—*C.A.* 47, 847*i*.
By the x-ray diffraction patterns and thermoanalysis, the structural change of soft to hard coals during coking was traced from the loss of the primary macro-structure of C-ring nuclei with low hydrocarbon side-chain attached at 230-600°C to the graphitization (of a uniform pattern) at about 800°C. The coking property seemed to depend upon the primary structure, the coal with larger C-ring

nuclei with more numerous hydrocarbon attachments being coked at higher temp.

13351. KLIMENOK, B.V. AND SHEKHTER, A.B. **Electron-microscopic investigation of the coke formed on aluminosilicate catalysts in the cracking of hydrocarbons.** *Doklady Akad. Nauk S.S.S.R.* 83, 109-10(1952).—*C.A.* 46, 8842*d*.

Electron-microscopic pictures were taken of the same spot of the catalyst in the course of cracking of C_6H_{14} and of 2,3,4-trimethylpentane at 500°C. A change of structure was noticeable after 20 min. Porosity disappeared, with the pores becoming clogged up with a carbon deposit. The specific surface area of this catalyst was about 400 m^2/g, and the deposit was evidently multimol., hence the deposition of coke took place only on a small fraction of the catalyst surface.

13352. LAGERGREN, STIG AND MAGNELI, ARNE. **The tantalum-oxygen system.** *Acta. Chem. Scand.* 6, 444-6(1952)(in English).—*C.A.* 47, 6228*a*.

Ta powder and Ta_2O_5 were mixed and heated *in vacuo*. The product was investigated by x-ray diffraction. No reaction could be observed even when the heating, in sealed SiO_2 tubes, was prolonged (10 days at 1100° or 2 days at 1250°C). In a zirconia crucible at 1800°C, there was some reduction to Ta metal, and a new oxide phase appeared. This phase could not be prepd. by heating mixts. of Ta and Ta_2O_5, but when Ta_2O_5 was heated *in vacuo*, it was transformed into the new phase. When the transformed oxide was heated in O_2 at 1000°C, it reverted to ordinary Ta_2O_5 with no change in wt.

13353. MAIRE, J. AND MATHIEU-SICAUD, A. **Electron-microscope study of graphitic acid gels.** *Bull. soc. franç. minéral. et crist* 75, 599-604(1952). —*C.A.* 47, 5216*h*.

Graphitic acid was formed by the action of a mixt. of 20 g $KClO_3$ and 20 ml fuming HNO_3 on 1 g of either natural or artificial graphite for 2 hrs. The particles of Na graphite formed continuous membranes and at the same time formed gels, with continuous action by drying until the acid groups located at the periphery of the particles were satd. with Na.

13354. MIURA, KIN'ICHIRÔ. **A relation between the particle size and color of gold sol.** *Kagaku* (Science) 22, 545-6(1952).—*C.A.* 46, 10782*f*.

Electron microscope observations were correlated with light absorption of gold sol. prepd. by various reducing reagents. The log of the particle diam. was proportional to the frequency of the absorption max.

13355. MOONEY, R.W.; KEENAN, A.G., AND WOOD, L.A. **Adsorption of water vapor by montmorillonite II. Effect of exchangeable ions and lattice swelling as measured by x-ray diffraction.** *J. Am. Chem. Soc.* 74, 1371-4(1952).—*C.A.* 46, 6460*a*.

The univalent ions of Li, Na, K, Rb, and Cs were added to montmorillonite as solns. of the hydroxides; bivalent ions were added in the form of the solids $MgCO_3$, CaO, $Sr(OH)_2$, and $Ba(OH)_2$. Correlation between the shapes of the isotherms, heat of desorption, and x-ray diffraction data provided evidence that the adsorbed H_2O was present in discrete monolayers.

13356. NIELSEN, ANDERS AND BOHLBRO, HANS. **Investigation on surface properties of reduced iron catalysts for the synthesis of ammonia and correlation with crystal sizes and high-pressure conversion activities.** *J. Am. Chem. Soc.* 74, 963-6 (1952).—*C.A.* 46, 5414*d*.

Com. triply promoted K_2O-CaO-Al_2O_3-Fe catalysts were examd. by adsorption measurements, and the adsorption data were correlated with x-ray data and high-pressure conversion measurements. Crystal sizes detd. from line broadening in x-ray patterns and surface areas derived from low-temp. A and N_2 adsorption were in satisfactory agreement. The more active catalyst had the smaller surface area and the smaller CO chemisorption at -78°C.

13357. NODA, TOKICHI AND SATO, SHINYA. **X-ray study of carbon brushes.** *Bull. Chem. Soc. Japan* 25,195-8(1952).—*C.A.* 47, 5755*h*.

X-ray diffraction methods were used to det. unit-cell dimensions of 10 specimens of carbon brushes. D.'s were calcd. from the unit-cell data, and conclusions drawn concerning the amt. of graphitization in soot-type and pitch-coke carbon brushes.

13358. PEYTAVY, ANDRÉ ANTOINE AND LAHOUSTE, JEAN. **Technique for the use of x-rays in the study of coking.** *Compt. rend.* 234, 934-5 (1952).—*C.A.* 46, 8831*g*.

Movement of the plastic zone and the occurrence of fissuration in a cylindrical sample of coal being heated on a hot plate was followed by passing x-rays through the coal, parallel to the surface of the hot plate, with the screen placed on the opposite side of the coal.

13359. PINNICK, H.T. **X-ray diffraction of heat-treated carbon blacks.** *J. Chem. Phys.* 20, 756-7 (1952).—*C.A.* 46, 8925*g*.

Studies by x-ray diffraction were made of various carbon blacks with particle sizes ranging from 50 to 3000 A., all graphitized to 3000°C. The av. crystallite diam. was about 1/3 of the particle size. The particles retained their individuality after graphitization. For comparison, a soft coke was heat-treated to various temps. to give crystallite sizes comparable to those of the carbon blacks. The cross-lattice 101 line first appeared at a crystallite diam. of 150 A.; this line appeared at the same particle size in the carbon blacks.

13360. PORAI-KOSHITS, E.A.; KALININA, A.M., AND FILIPOVICH, V.N. **Investigation of the structure of some silica gels by the method of small-angle scattering of x-rays.** *Doklady Akad. Nauk S.S.S.R.* 86, 985-8(1952).—*C.A.* 47, 4728*h*.

The small-angle scattering method was applied to 3 samples previously studied by the vapor-adsorption method: homogeneously porous with a mean pore radius of 40 A., homogeneously course-porous with a most probable effective pore radius of 100 A., and inhomogeneously porous with the pore radius varying from about 15 to 150 A. The scattering angle α varied from 6.5′ to 2°30′. The small-angle scattering method gave the size distribution of the pores and not of the particles.

13361. RADUSHKEVICH, L.V. AND LUK'YANOVICH, V.M. **Structure of the carbon produced in the thermal**

decomposition of carbon monoxide on an iron catalyst. *Zhur. Fiz. Khim.* 26, 88-95 (1952).—*C.A.* 47, 6210*d*.

Carbon black deposits produced on Fe in a stream of CO at 600°C were examd. under the electron microscope at magnifications of 8000-15,000, with a resolution up to 50-60 A. The majority of the carbon particles were of an elongated wormlike shape. Particles grown on individual Fe grains were threadlike, and apparently consisted of Fe carbides. Some unusual formations consisting of 2 threads twisted together were observed.

13362. Richardson, H.M. and Wilde, F.G. **An x-ray study of the crystalline phases that occur in fired clays.** *Trans. Brit. Ceram. Soc.* 51, 387-400(1952); reprinted from *Brit. Ceram. Research Assoc. Research Paper* No. 41, (1949).—*C.A.* 47, 1350*f*.

The chem. analysis and the cryst. impurities of 7 clays were detd. The cryst. phases formed during firing at 800-1300°C were identified by the x-ray powder technique. The importance of the crystn. of γ-Al_2O_3 from amorphous Al_2O_3 and its combination with SiO_2 to form mullite was discussed. The value of an x-ray powder photograph in predicting the firing temp. of a firebrick was examd.

13363. Robin, Jacques and Bérnard, Jacques. **Research on the structure and stability of the phases in the system Fe_2O_3-Co_3O_4.** *Compt. rend.* 234, 734-5 (1952).—*C.A.* 46, 5415*i*.

Mixed oxides of Fe_2O_3 and Co_3O_4 produced by heating solid solns. of Fe and Co oxalates at 300°C gave a single phase of spinel structure. Samples of different compns. were heated to different temps. up to 1000°C and examd. with x-rays. A phase diagram was constructed. From 0 to 33% Co and 300 to 800°C, there was Fe_2O_3 and spinel; this 2-phase region contracted at higher temps. to 30% Co at 1000°C. At 50-91% Co and up to 860°C there were 2 spinels in equil. At more than 51% Co and above 880°C there was CoO in equil. with spinel.

13364. Roof, Raymond B. Jr. **Crystallography of nickel kieselguhr.** *J. Chem. Phys.* 20, 1181-2 (1952).—*C.A.* 46, 9922*e*.

A Ni kieselguhr hydrogenation catalyst was examd. by x-rays. Ni and NiO were present and showed their usual lattice parameters. The reported existence of hexagonal close-packed Ni may be an incorrect interpretation of the composite pattern of Ni and NiO. The linear dimensions of the Ni and NiO particles in the prepn. were approx. 330 and 160 A., resp.

13365. Sasaki, Nobuyi and Osumi, Yoshio. **Microscopic investigation of fused catalysts for ammonia synthesis. I. Optical and surface-electron microscopic observations.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 73, 808-11 (1952).—*C.A.* 47, 4560*i*.

The polished surfaces of ordinary unreduced catalyst for NH_3 synthesis and of Fe_3O_4 were investigated with a microscope. The former were crystal grains with their cleavage planes oriented regularly, while the latter lacked the appearance of definite crystal grains. Various unreduced catalysts with various promoters were subjected to electron microscope test. Those contg. K gave a pattern corresponding to dispersion at the grain boundary at about 1000°C.

13366. Sawamura, Hiromitsu. **Electron-microscopic observation of aluminum hydroxide.** *J. Sci. Research Inst.* (Japan) 46, 15-16(1952).—*C.A.* 47, 3656*b*.

The aging of freshly prepd. $Al(OH)_3$ gel was followed with the electron microscope. At 2 hrs a few fibers of 100 to 200 A. diam. were observed. At 24 hrs most of the crystals were arranged in fibers of 200 to 500 A. diam. The crystals themselves were too small (<50A.) to be observed.

13367. Sennett, R.S.; McLauchlan, T.A., and Scott, G.D. **Electron-microscope studies of evaporated cadmium and zinc.** *Can. J. Phys.* 30, 370-2(1952). —*C.A.* 47, 4159*g*.

Evapns. were effected in a microscope, and continuous observations during condensation were made. The particles first seen appeared suddenly. They had a regular cryst. shape, and were often as large as 200 A. At first they remained regular while increasing in size, but later developed irregular spurs, secondary crystallites, or became linked together with their neighbors. This behavior was very different from that of Ag and Au in which the aggregates appeared irregular in all stages.

13368. Shishakov, N.A. **Protective films of oxide and hydroxide on magnesium.** *Zhur. Fiz. Khim.* 26, 358-63 (1952).—*C.A.* 47, 6207*c*.

Electron diffraction showed that on addn. of dry air to evapd. Mg, the usual (cubic) MgO, a 4.20 A., formed. Mg treated with alk. CrO_3 solns. was coated with a hexagonal $Mg(OH)_2$, a 3.13, c/a 1.50. On Mg in boiling H_2O or hot H_2O vapor a new hydroxide formed, presumably rhombic, a 3.792, b 10.16, c 2.842. This hydroxide was a better protector against corrosion than the other oxides and hydroxides.

13369. Stech, Berthold. **Structural change produced in crystals by α-particle bombardment.** *Z. Naturforsch.* 7a, 175-85(1952).—*C.A.* 46, 7902*g*.

Fine cryst. powders of grain size smaller than the range of the α-particles were loaded into glass tubes of 3 mm diam. and exposed to emanations from 80 to 100 mc. Rn. Debye-Scherrer photographs were recorded of irradiated and unirradiated samples. Graphite, highly dispersed carbon, metallic Se, ZnS, HgS, CaF_2, NaF, KF, and Na_2CO_3 showed no noticeable changes in position, intersity, or sharpness of the rings on the x-ray patterns. $KMnO_4$, As_2O_3, Na oxalate, anthracene, hexamethylenetetramine, NH_4 tartrate, and urea showed noticeable changes.

13370. Suito, Eiji and Arakawa, Masafumi. **Observation by the electron microscope on the state of dispersion of various fillers in vulcanized rubber.** *Proc. Japan. Acad.* 28, 48-53(1952).—*C.A.* 47, 5713*c*.

Four different fillers, carbon black, basic Mg carbonate, light $CaCO_3$, and ultrafine $CaCO_3$, were dispersed in a standard rubber formulation. Pos. replicas of methyl methacryl-Al of cut sections of the vulcanized rubber were photographed with the electron microscope, and comparisons were made with similar photographs of the various fillers themselves. In rubber, the fillers were dispersed as primary particles, although when by themselves they were observed as aggregates.

13371. SULLIVAN, BARBARA M. AND MCMURDIE, HOWARD F. **Crystal forms of chromium orthophosphate.** *J. Research Natl. Bur. Standards* 48, 159-62 (1952)(Research Paper No. 2300).—*C.A.* 46, 7839*i*.

As the hexahydrate of $CrPO_4$ was heated, it began to lose water at 100°C, and at 130°C the structure broke down to an amorphous one, with a gradual transition as indicated by x-ray patterns. When powd. hexahydrate was heated, it formed stable α-$CrPO_4$ at 972°C.

13372. SUZUKI, KOICHI; KITAZAKI, U., AND YAGISHITA, H. **The elementary structure of coal with special reference to its coking property.** *Japan. J. Geol.* 22, 241-56(1952).—*C.A.* 47, 3542*h*.

X-ray analysis of coal of high rank showed a lamellar structure closely resembling that of graphite, and in coal of low rank a structure resembling that of amorphous carbon. Anthracite had a three-dimensional structure of the graphite type, though the unit cell was smaller and the atom arrangement was far more irregular than in graphite. Good coking coal had a two-dimensional lamellar structure.

13373. TALVENHEIMO, GERHARDT AND WHITE, J.L. **Analysis of clay minerals with the x-ray spectrometer.** *Anal. Chem.* 24, 1784-9(1952).—*C.A.* 47, 2638*h*.

A Norelco Geiger-counter x-ray spectrometer was used for the analysis of mixts. of bentonite, illite, and kaolinite clays. The method indicated that analysis good to 5-10% accuracy were possible under ideal conditions of analyses. The concn. of clay, the type of scattering cation, the nature and amts. of solvating compd., the relative humidity of the environment during drying, and the presence of accessory minerals all influenced the intensities of the diagnostic basal reflections for analysis.

13374. TESNER, P.A. AND ECHEISTOVA, A.I. **Electron-microscopic study of the growth of lampblack particles.** *Doklady Akad. Nauk S.S.S.R.* 87, 1029-31 (1952).—*C.A.* 47, 6210*f*.

Lampblack particles from an aerosol were examd. after different lengths of contact with streams of CH_4, C_6H_6, or cyclohexane. The growth proceeded regularly by layers, so that the outer shape of each particle remained unchanged. Therefore, measurements of the outer dimensions of the particles permitted detn. of the rates of carbon deposition at different temps. At still higher temps., threadlike formations were observed. When the threads were taken out and then put back again into the stream of hot hydrocarbon, growth in length ceased and only the thickness increased, but at a rate very much slower than the growth of thickness of regular lampblack particles.

13375. THIELE, H. AND KIENAST, G. **Effect of ions on the structure of gels.** *Kolloid-Z.* 127, 134-44(1952).—*C.A.* 47, 25*d*.

The structures of anisometric colloids, such as V_2O_5, Hg sulfosalicylic acid, and Fe_2O_3 sols, were detd. by chem. and electron-microscope methods. The effect of ions on the birefringence of these sols depended on the electrolyte concn. Multivalent ions gave trouble because of partial hydrolysis and aggregation. The formation of ionotropic gels proceeded in the sequence: diffusion, alignment, ion exchange, gel formation. The degree of order increased from sol to thixotropic gel to ionotropic gel.

13376. WATT, GEORGE W. AND PARKER, SIDNEY G. **The composition of W-6 Raney nickel.** *J. Am. Chem. Soc.* 74, 1103-4 (1952).—*C.A.* 47, 4715*e*.

Al_2O_3 was not a constituent of W-6 Raney Ni prepd. by the method of Adkins and Billica; Al_2O_3 formed during the soln. of samples taken for analysis. X-ray diffraction showed no max. attributable to any of the known forms of Al oxide or its hydrates.

13377. WEST, W.J. **Size determinations of clay particles in water suspensions by use of low-angle x-ray diffraction.** *J. Colloid Sci.* 7, 295-305(1952).—*C.A.* 46, 10783*a*.

Particle-size detn. of clay suspended in H_2O was made by low-angle x-ray diffraction without disturbance of the sample. Expts. with several clays used in com. drilling muds showed particle size to increase by swelling during formation of the suspension. The systems with the largest particles had the largest viscosity and gel strength.

13378. WILLIAMS, E.C. **Anisotropic lattice distortion in evaporated deposits of face-centered-cubic metals.** *Research* (London) 5, 392-3(1952). —*C.A.* 46, 10755*f*.

Precision measurements on electron diffraction transmission patterns of Cu, Ag, and Au deposited by evapn. *in vacuo* onto thin collodion films, indicated lattice distortion explained by dislocations. Reflecting planes should be almost parallel and close to a free surface.

13379. YAMAGUCHI, SHIGETO. **Structure of oxide replicas for electron microscopy.** *J. Applied Phys.* 23, 445-7(1952).—*C.A.* 46, 6456*a*.

The structure of oxide films, which could be used as replicas for electron microscopy, was investigated. In order to obtain a replica of the metal surface by using the oxide film formed on it and isolated from it, the oxide crystals composing the film must be oriented relative to the orientation of the substrate face. The oxide crystals formed on metal whose atom distances coincided with those of the substrate crystal could compose a replicating film of the specimen surface.

13380. YAMAGUCHI, SHIGETO. **Structure of oxide-film replica for electron microscope.** *Repts. Sci. Research Inst.* (Japan) 28, 86-8(1952).—*C.A.* 46, 10776*h*.

The oxide-film replica from the etched (with EtOH-Br) surface of an Fe monocrystal peeled smoothly and showed, by use of an electron microscope, octagonal crystals of Fe_3O_4 in relief with regular cryst. orientation (detd. by electron diffraction). That from permalloy (Ni 81.5%) peeled with curl or tear and showed flat octagonal crystals of NiO with irregular or amorphous cryst. structure.

13381. BAGNO, ODETTE. **The precipitation of nickel hydroxides by mixtures of sodium hydroxide and sodium carbonate.** *Compt. rend.* 236, 1275-8(1953).—*C.A.* 47, 6810*g*.

Titration of $NiCl_2$ solns. with $NaOH\text{-}Na_2CO_3$ mixts. gave pH curves that showed the effect of Na_2CO_3 on the formation of $Ni(OH)_2$. X-ray studies showed that the ppt. was $Ni(OH)_2$, but this product formed at pH 7.3 in 100% Na_2CO_3 compared to pH 11.2 in 100% NaOH. The basic carbonate was not formed. Studies of rate of pptn. indicated that 24 hrs was required to permit the exchange of OH^- for CO_3^{--} adsorbed on the ppt. This was supported by x-ray analysis.

13382. COWLEY, J.M. **Stacking faults in γ-alumina.** *Acta Cryst.* 6, 53-4(1953).—*C.A.* 47, 6729*e*.

Extra spot and line segments observed in single-crystal electron-diffraction patterns of γ-Al_2O_3 were interpreted in terms of faults in the cubic close-packed stacking of the O atoms. Near the fault planes some Al atom sites were "unfavorable" in that they were nearer than usual to other Al sites.

13383. HONJO, GORO. **Electron-diffraction studies on oxide films formed on metals and alloys. II. Selective oxidation of alloys.** *J. Phys. Soc. Japan* 8, 113-18(1953).—*C.A.* 47, 5334*b*.

Surface oxidation products on Cu alloys contg. 0.3% Be, 0.5% Al, 0.1% Mg, 7% Mn, and 7% Ni, and Fe with 13% Al subjected to varying oxidation conditions in the range from 300 to 900°C at 10^{-4}-760 mm. Hg pressure were studied with electron-diffraction methods. In reduced air pressures, the selective oxidation of the baser component generally took place. When the supply of the baser metallic ions toward the surface by diffusion was ample enough to consume the O atoms attacking the specimen surface, only the oxide of the baser component was formed. When the supply of O atoms to the surface overcame that of the baser metallic ions, the oxide of the nobler component also formed until at high air pressures the nobler component, having a much larger content in the alloys studied, became so abundant as to conceal the oxide of the baser component.

13384. LÜTZKENDORF, W. **The hiding power of pigments as a function of their particle size.** *Farbe u. Lack* 59, 7-16 (1953).—*C.A.* 47, 2999*b*.

Electron-microscopic measurements were used to show that the hiding power of a pigment increased with decreasing particle size, until its particle size fell below the wave length of the light which the pigment reflected or absorbed. The pigment then became colloidal or translucent, and finally became transparent when its particle size decreased below half that wave length. This was demonstrated with a large no. of pigments.

13385. RUSTON, W.R. **X-ray investigation of microcrystalline graphitic carbon. Apparent increase of the interlayer spacing with decreasing crystallite dimensions.** *Fuel* 32, 52-61(1953).—*C.A.* 47, 2591*i*.

The observed increase in the interlayer spacing of microcryst. graphitic carbons was found to be false. The higher values previously reported were due mainly to a shift of the (002) group x-ray powder reflection whose max. was considerably displaced towards smaller glancing angles as a result of the continuous intensity factors. The interlayer spacings of microcryst. graphitic carbon were the same as, or only slightly greater than, that of well-crystd. graphite.

13386. STREULI, C.A.; SCHERAGA, H.A., AND NICHOLS, M.L. **X-ray investigation of several contaminated barium sulfate precipitates.** *Anal. Chem.* 25, 306-10(1953).—*C.A.* 47, 5248*i*.

X-ray investigation of $BaSO_4$ ppts., contaminated by Fe^{3+}, Cl^-, and NO_2^-, indicated no change in diffraction pattern due to contamination. Variation in unit cell vol. was attributed to solid soln.

VI-8. Properties of Graphite and Diamond

13387. NÄSÄNEN, REINO. **Oxidation of graphite in the glow discharge.** *Ann. Acad. Sci. Fennicae* A52, No. 5, 51 pp. (1940).—*C.A.* 37, 6560⁹.

If the graphite was the anode, only CO_2 was formed in O_2; the C consumption in $O_2 + CO_2$ was much lower than if graphite was the cathode. CO formed by the combined action of the activated, slow mols., the ions and the fast mols.; the CO_2 was produced only by the ions and the fast mols. derived from these ions, as the CO yield was not decreased by the flowing stream of O_2. A moving stream of CO_2 decreased the CO yield. At a graphite cathode, CO was not oxidized appreciably in O_2 + CO mixts. The oxidation products were the results of a primary decompn.

13388. WEISS, JOSEPH. **Fluorescence and oxidation in conjugated ring systems.** *Nature* 145, 744-5 (1940).

Graphitic oxide should be considered as a salt similar to the other graphite salts where the anion HSO_4^- or ClO_4^- was replaced by O_2^- (or possibly partly by HO_2^-). This structure only referred to the "active" oxygen in graphitic oxide. The rest of the oxygen was present partly in the form of OH groups (possibly OH-ions) or as molecular water.

13389. BĂLĂNESCU, SANDA. **The graphite content of the graphitic schists from the Oltet Mountains (Gorj County).** *Inst. geol. Romaniei, Studii tech. econ. Ser. B, No.* 16, 21-32(1941). —*C.A.* 42, 8119*h*.

Graphite-bearing rocks were analyzed, by using the wt loss by calcination as an approx. indicator for the carbon and graphite contents. Elementary analysis at 700°C in O_2 was used for finding exact values. In order to distinguish between anthracite and graphite in the samples, the graphite was detd. in form of graphitic acid by oxidation with $KClO_3$ and a mixt. of H_2SO_4 and HNO_3. In addn. to the rock samples, com. graphite samples were also analyzed.

13390. BASSET, J. **Density of graphite and determination of the mean coefficient of compressibility between 1 and 20,000 kilograms per square centimeter.** *Compt. rend.* 213, 829-31(1941).—*C. A.* 37, 5296^7.

The d. of natural and artificial graphite measured after 3 compressions at 20,000 kg/cm^2 and degassing twice in vacuum at 2100°C had a max. value in a natural specimen of 2.180. The mean coeff. of compressibility of this specimen at 18°C was given.

13391. DAKE, H.C. **Fluorescence in diamonds.** *Gemmologist* 11, 55(1942); *Mineralog. Abstracts* 8, 269(1942).—*C. A.* 39, 2944^7.

In ultraviolet light, diamonds may fluoresce blue or yellow or may be nonfluorescent. Spectrochem. analysis showed traces of Al, Ca, Cr, Fe, Mg, Mn, Ni, Rh, Si, Ag, and Ti. Blue fluorescent diamonds showed an excess of Cr; yellow, of Al; nonfluorescent diamonds had no preponderance of any foreign element.

13392. GUINIER, ANDRÉ. **Abnormal diffusion of x-rays in the diamond.** *Compt. rend.* 215, 114-14(1942).—*C. A.* 38, 6152^6.

Four weak spots appeared near the original position of the Bragg spots after the crystal was turned slightly. One of these was diffuse and was produced by thermal agitation. The other 3 were sharp and their intensities were independent of temp. This phenomenon was most pronounced at the 111 position, but was also studied at the 220, 113 and 400 positions.

13393. BANNISTER, F.A. AND LONSDALE, K. **Laboratory synthesis of diamond. An x-ray study of diamonds artificially prepared by J. B. Hannay in 1880.** *Nature* 151, 334-5(1943); *Mineralog. Mag.* 26, 315-24(1943).—*C. A.* 37, 3650^2, 6175^1.

X-ray investigations showed that 11 of 12 artificial diamonds prepd. by Hannay in 1879-80 were pure or nearly pure diamond of the rare type II variety.

13394. CHUGUNOV, P. AND BRUNS, B. **Wetting and swelling of graphite.** *Acta Physicochim. U.R.-S.S.* 18, 351-7(1943)(in English).—*C. A.* 38, 5709^9.

Measurements of the contact angles of gas bubbles on the surface of graphite were made. The quantity of O_2 evolved on decompg. the graphite salts obtained, both by treatment with a mixt. of HNO_3 and H_2SO_4, and by anodic oxidation, was equiv. to the quantity of fixed H_2SO_4. The mechanism of the formation of graphitic acid salts was similar to that of the hydrolytic adsorption of strong acids by activated charcoal.

13395. COE, GLEN D. **The burning rate of natural graphite.** *U.S. Bur. Mines, Rept. Investigations* 3692, 9 pp. (1943).—*C. A.* 37, 4209^7.

A procedure for detg. burning rate of natural graphite was proposed and detns. on 6 graphite concentrates presented. Ceylon graphite had a much higher burning rate than any other tested. Gang minerals reduced the burning rate. The test was useful in evaluating graphites that were to be used at high temps.

13396. DESCH, C.H. **Artificial production of diamonds.** *Nature* 152, 148-9(1943).—*C. A.* 37, 6174^9.

13397. GÜNTHER, P.L.; GESELLE, P., AND REBENTISCH, W. **Researches on the diamond problem.** *Z. anorg. allgem. Chem.* 250, 357-72(1943).—*C. A.* 37, 5307^6.

The expts. of Moissan cannot be claimed as a successful diamond synthesis. A special app. was developed which permitted a piston-thrust pressure up to 120,000 kg/cm^2 for a short time at high temp. Highly heated graphite and charcoal were subjected to this pressure, but a direct change to diamond did not occur.

13398. RAMAN, C.V. **The structure and properties of diamond.** *Current Sci.* 12, 33-42(1943).—*C. A.* 37, 6174^9.

13399. SANDERSON, L. **Graphite.** *Can. Mining J.* 64, 283-4(1943).—*C. A.* 37, 4209^7.

The properties and uses of graphite were outlined.

13400. VERRIEN, JEAN AND DEVÈZE, HENRI. **Variation of the electric resistance of graphite granules with pressure and its anomalies.** *Cahiers phys.* 13, 61-4(1943).—*C. A.* 40, 2368^3.

The resistance of a mass of irregular graphite granules, at const. temp., to an elec. current was measured for a range of applied pressures. The curves showing the resistance-pressure variations indicated not only the presence of hysteresis, but also a lag, which caused the resistance to pass through max. and min. at the points where the pressure was reversed.

13401. WINTER, HEINRICK. **Transition of amorphous carbon into graphite.** *Glückauf* 79, No. 24/25/26, 316-20(1943).—*C. A.* 38, 3177^8.

Studies of carbon allotropes, with special attention to the elec. cond. and x-ray studies, were reviewed.

13402. BAI, K. SUNANDA. **The ultraviolet absorption spectrum of diamond.** *Proc. Indian Acad. Sci.* 19A, 253-60(1944).—*C. A.* 39, 459^9.

The relationship between the ultraviolet absorption spectra and luminescence properties of 47 diamonds were studied. In general, the ultraviolet transparency of these diamonds increased with their intensity of fluorescence. Diamonds showing yellowish green and blue fluorescence had transmissions extending to 2250 A. Absorption lines appeared at 2359.0 and 2356.5 A., with 5 bands on one side at 2405, 2399, 2396, 2395 and 2388 A., and 3 bands on the other side at 2314, 2309-2306 and 2300-2296 A. The bands sharpened and shifted toward shorter wave lengths at liquid-air temp.

13403. BAI, K. SUNANDA. **Luminescence patterns in diamonds.** *Proc. Indian Acad. Sci.* 19A, 274-9(1944).—*C. A.* 39, 460^3.

Patterns of luminescence, showing variations in intensity and color, were observed in cleavage plates of certain diamonds irradiated by long-wave ultraviolet radiation. Diamonds having both blue and yellow luminescence appeared always to exhibit such patterns although blue-luminescent diamonds usually did not.

13404. BUERSCHAPER, ROBERT A. **Thermal and electrical conductivity of graphite and carbon at low temperatures.** *J. Applied Phys.* 15, 452-4 (1944).—*C.A.* 38, 3526^1.

Specimens 32 cm long and 2.9 cm diam. were cut from Acheson graphite electrodes and from carbon electrodes. Measurements were made from -191° to 100°C. The conds. increased with rising temp. except for the thermal cond. of graphite, which decreased with rising temp. Two values were always found for graphite, depending upon whether the cond. was measured parallel to the original electrode (longitudinal) or at right angles to it (radial). The longitudinal conds. were always about twice the radial.

13405. HOFMANN, ULRICH. **The boundary between graphite and aromatic compounds.** *Naturwissenschaften* 32, 260-8(1944).—*C.A.* 40, 2956^4.

Work on similarity of graphite electron structure with that of aromatic compds. was reviewed. No sharp boundary was found; the intermediary stages of graphite nuclei in coal and in various charcoals constituted a gradual change from aromatic compd. to cryst. graphite.

13406. KRAUS, EDWARD. **"Laboratory" diamonds.** *S. African Mining and Eng. J.* 55, 595(1944).—*C.A.* 39, 851^7.

13407. KRISHNAN, R.S. **The Raman spectrum of diamond.** *Proc. Indian Acad. Sci.* 19A, 216-23 (1944).—*C.A.* 39, 459^3.

Diamonds of the ultraviolet transparent type were investigated. The 2536 resonance line of Hg was used as exciter. The following lines recorded, in addn. to the 1332 line: 1925, 2175.5, 2245, 2267, 2300.5, 2467, 2495, 2518, 2609.5 and 2664.6 (frequency shifts in cm^{-1}). These lines were octaves and allowed combinations of some of the 8 fundamental frequencies of oscillation of the diamond structure.

13408. KRISHNAN, R.S. **Experimental evidence for the existence of the four possible structures of diamond.** *Proc. Indian Acad. Sci.* 19A, 298-303(1944).—*C.A.* 39, 460^7.

The theory that the tetrahedral and octahedral forms of diamond each have 2 variants was tested by applying x-ray and Raman spectrographic techniques. The co-existence of the 2 variants of the tetrahedral structure was confirmed from the observed increased intensities of x-ray reflections in such diamonds. With the simultaneous occurrence of the variants of the octahedral structure in the same crystal, oscillation patterns showed a waviness such as would be observed if there were a difference in the crystal spacings of the alternate layers.

13409. KRISHNAN, R.S. **Thermal expansion of diamond.** *Nature* 154, 486-7(1944).—*C.A.* 39, 851^8.

By use of an x-ray method, the change in the lattice spacing of diamond was detd. The coeff. of cubic expansion was: 298-378°K, 4.50×10^{-6}; 378-478°, 6.70; 478-573°, 8.58; 573-673°, 9.81; 673-773°, 10.70; 773-873°, 11.55; and 873-923°, 12.30.

13410. MANI, ANNA. **The fluorescence and adsorption spectra of diamond in the visible region.** *Proc. Indian Acad. Sci.* 19A, 231-52(1944).—*C.A.* 39, 459^7.

Thirty-two diamonds were studied at room temp. and liquid-air temp. with a two-prism spectograph. The fluorescence and the absorption spectra in the visible region were related. In blue-fluorescing diamonds the 4152 system predominated; in yellow-fluorescing diamonds the 5032 system was the more prominent. Thirty-six electronic lines other than 4152 and 5032 were found in the visible region, some characteristic of the yellow, others of the blue, florescence.

13411. MANI, ANNA. **Polarization of Raman scattering and of fluorescence in diamond.** *Proc. Indian Acad. Sci.* 20A, 117-21(1944).—*C.A.* 39, 1104^5.

The polarization of the 1332 cm^{-1} Raman line of diamond was measured for an octahedral crystal immersed in α-bromonaphthalene with the incident light unpolarized, polarized in the plane of scattering, or perpendicular to this plane.

13412. MANI, ANNA. **Fluorescence and absorption patterns in diamond at low temperatures.** *Proc. Indian Acad. Sci.* 20A, 323-8(1944).—*C.A.* 39, 3205^5.

The luminescence and absorption patterns shown by ten cleavage plates of diamond at liquid-air temp. were studied spectroscopically. In blue luminescent diamonds a close correlation existed between the variations in intensity of the principal electronic line at 4152 A. and those of the fainter lines at 4197 and 4206 A. and the subsidiary bands at longer wave lengths. For yellow luminescent diamonds a similar correlation existed between the intensities of the 4152, 5032, and 5359 A. systems and the lines at 4123 and 4194 A.

13413. PANT, DEVI DATT. **The photoconductivity of diamond. I. Experimental results.** *Proc. Indian Acad. Sci.* 19A, 315-24(1944).—*C.A.* 39, 460^9.

The photoconductivities under ultraviolet radiation of 36 diamonds were measured. Diamonds were classified into 3 groups, depending on whether they showed high, medium or low photoconductivities. The diamonds showing the highest conductivities were transparent to ultraviolet radiation to 2250 A. and beyond, and were nonluminescent. The diamonds showing the lowest conductivities had strong absorption bands between 3000 A. and 2800 A., with practically complete extinction at shorter wave lengths.

13414. PANT, DEVI DATT. **The photoconductivity of diamond. II. Theoretical considerations.** *Proc. Indian Acad. Sci.* 19A, 325-33(1944).—*C.A.* 39, 461^3.

Exptl. evidence indicated that atoms situated at slight irregularities in the crystal formed the photoelec. active centers. This explained the high photo-cond. of the highly imperfect ultraviolet-transparent diamonds and the low photocond. of the more nearly perfect ultraviolet-opaque type. Extended surfaces of discontinuity provided channels along which trapped electrons might move; this produced the secondary currents.

13415. RAMACHANDRAN, G.N. **X-ray topographs of diamond.** *Proc. Indian Acad. Sci.* 19A, 280-92 (1944).—*C.A.* 39, 450^{2}.

The topograph was a topographic map representing the variations of the reflecting power for x-rays over the area of a crystal plate. It was obtained by using white x-radiation slightly diverging from a pinhole, and photographing the Laue reflection from a set of crystal planes. Eighteen topographs of cleavage plates of diamond showed patterns that could be correlated with other patterns obtained from other properties of diamond, luminescence, ultraviolet transparency, birefringence.

13416. RAMACHANDRAN, G.N. **X-ray reflections and the structure of diamond.** *Proc. Indian Acad. Sci.* 19A, 304-9(1944).—*C.A.* 39, 449^{6}.

Two diamonds fluorescing in blue, one weakly, the other strongly, were investigated. Laue patterns were taken, with the beam normal to (111), of cleavage planes (111). The intensity of all the spots was greater with the more fluorescent diamond. The ratio of the intensities of corresponding spots in the two crystals varied.

13417. RAMAN, C.V. **The crystal symmetry and structure of diamond.** *Proc. Indian Acad. Sci.* 19A, 189-98(1944).—*C.A.* 39, 449^{4}.

The C atoms in diamond must have tetrahedral symmetry of electron orbital movements and spins. The atoms on the 2 Bravais lattices were oriented in space and with respect to each other in 4 distinct ways; hence, there were 4 possible structures for diamond. Two of these had the symmetry T_d, the other 2 the symmetry O_h.

13418. RAMAN, C.V. **The nature and origin of the luminescence of diamond.** *Proc. Indian Acad. Sci.* 19A, 199-215(1944).—*C.A.* 39, 459^{1}.

Luminescence in diamonds was essentially phys. in origin, and not due to the presence of impurities. Many cleavage plates showed luminescence patterns with geometric characters, whose origin was found in the twinning of the different possible diamond structures.

13419. RAMAN, C.V. AND RENDALL, G.R. **Birefringence patterns in diamond.** *Proc. Indian Acad. Sci.* 19A, 265-73(1944).—*C.A.* 39, 449^{9}.

There were 2 kinds of birefringence in diamonds. One, irregular in character, was due to structural imperfections and was negligible in perfect crystals. The other, geometric or structural, produced regular patterns in perfect crystals.

13420. RENDALL, G.R. **Ultraviolet transparency patterns in diamond.** *Proc. Indian Acad. Sci.* 19A, 293-7(1944).—*C.A.* 39, 460^{5}.

Irradiation of diamonds with the 2536-A. line of Hg and photography of the screening effect of the diamonds on the fluorescence of U glass gave a simple technique of detg. the transparency of different portions of the stones to radiation of this wave length.

13421. RILEY, D.P. **Lattice constant of diamond and the carbon to carbon single bond.** *Nature* 153, 587-8(1944).—*C.A.* 38, 4849^{3}.

Diamond dust with particle sizes 0.01-0.001 cm had a lattice const. of 3.5597 ± 0.0001 kX. The C—C bond length was 1.54140 ± 0.00009 kX. or 1.54453 ± 0.00009 A.

13422. ROBERTSON, ROBERT. **Diamond.** *Chemistry & Industry* 1944, 18-24.—*C.A.* 38, 3178^{6}.

Two varieties of diamonds were based on differences in phys. properties. The occurrence of the rate Type II was 2% in 300 specimens examd. Recent x-ray studies showed that in diffraction patterns of the Type I diamonds, streamers, which in some patterns were resolved into spots, were assocd. with reflections from the 111 planes. These were absent in patterns of Type II diamonds. Type II diamonds showed a striated or mosaic structure while Type I diamonds did not.

13423. SAKSENA, BISHAMBHAR DAYAL. **Thermal expansion of diamond.** *Proc. Indian Acad. Sci.* 20A, 92-9(1944).—*C.A.* 39, 1792^{7}.

An expression for thermal expansion based on the new lattice theory of Raman was given. In applying this expression the frequencies were divided into a higher and a lower group. The vol. dependency was assumed to be different for each group but the same within the group.

13424. SIGAMONY, A. **Magnetic susceptibility of diamond.** *Proc. Indian Acad. Sci.* 19A, 310-14 (1944).—*C.A.* 39, 448^{9}.

No correlation was found between values of magnetic susceptibility and other phys. properties such as color, absorption, luminescence and photocond. in an examn. of 40 specimens of diamond.

13425. LONSDALE, KATHLEEN. **Are there four possible diamond structures?** *Nature* 155, 144(1945). —*C.A.* 39, 2018^{2}.

There was no x-ray evidence, on the basis of lattice-const. variations, for the existence of the various structures postulated by Raman.

13426. MANI, ANNA. **Excitation curves of luminescence in diamond.** *Proc. Indian Acad. Sci.* 21A, 280-7(1945).—*C.A.* 39, 5179^{8}.

The fluorescence spectra of blue and yellow luminescent diamonds were studied as a function of exciting light wave length in the range 3700-6500A.

13427. NELSON, J.B. AND RILEY, D.P. **The thermal expansion of graphite from 15° to 800°C. I. Experimental.** *Proc. Phys. Soc. (London)* 57, 477-86(1945).—*C.A.* 40, 3957^{2}.

The variation with temp. of the a and c unit cell dimensions of hexagonal Ceylon graphite was detd. in the range 15°-800°C by the x-ray powder method. At 14.6°C, $a = 2.4562 \pm 0.0001$ kX. $c = 6.6943 \pm 0.0007$ kX. The C-C bond length was 1.4210 ± 0.0001 A. The a dimension showed a slight contraction up to about 400°C, a small expansion occurred above this temp. The coeff. of thermal expansion in the c direction, was large, the av. value over the temp. range was 28.3×10^{-6}.

13428. Nelson, J.B. and Riley, D.P. **Orientation effect in powder photographs of graphite.** *Phil. Mag.* 36, 711-14(1945).—*C.A.* 40, 6929^3.
The doubling of 000*l* lines in powder photographs of graphite was due to preferred orientation of crystals in the specimen, particularly at the surface of the specimen. An extrapolation procedure to obtain accurate values of the *c* dimension was described.

13429. Ramachandran, G.N. **Crystal structure of diamond.** *Nature* 156, 83(1945).—*C.A.* 39, 4538^7.

13430. Raman, C.V. **Allotropic modifications of diamond.** *Nature* 156, 22-3(1945).—*C.A.* 39, 4538^6.
Although all diamonds scattered an intense line at 1332 cm^{-1}, the corresponding infrared absorption appeared in some diamonds (with tetrahedral structure) but not in others (cubic). This and other evidence showed that there were allotropic modifications of diamond.

13431. Riley, D.P. **The thermal expansion of graphite. II. Theoretical.** *Proc. Phys. Soc.* (London) 57, 486-95(1945).—*C.A.* 40, 3957^4.
Certain of the elastic moduli for graphite were estd. at 18°C: $S_{11} + S_{12} = 1.8 \times 10^{-13}$ cm/dyne, $S_{13} = 4.3 \times 10^{-13}$, $S_{33} = 58.5 \times 10^{-13}$. Hence, the two linear compressibilities were, at 18°C, approx. $K_1 = 2.5 \times 10^{-13}$ cm^2/dyne, $K_{11} = 50 \times 10^{-13}$ cm^2/dyne. The theory derived was not restricted to low temps.

13432. Riley, H.L. **The lamellar compounds of carbon.** *Fuel* 24, 8-16, 43-54(1945).—*C.A.* 39, 2917^8.
The compds. included the graphite salts bisulfate, nitrate, perchlorate, biselenate, phosphate, pyrophosphate and arsenate, graphite monofluoride, graphite bromide, alkali graphites, graphite-ferric chloride, graphite oxide, pyro-graphitic acid, graphite sulfide, and the graphite-hydrogen combinations. Alkali graphites, graphite salts, graphite monofluoride, and graphite oxide were definite compds. Graphite bromide appeared to be an adsorption complex; graphite-$FeCl_3$ may also be an adsorption complex, but the compd. was surprisingly stable.

13433. Sutherland, G.B.B.M. and Willis, H.A. **Some new peculiarities in the infrared spectrum of diamond.** *Trans. Faraday Soc.* 41, 289-92(1945).—*C.A.* 39, 4801^3.
The spectra of 6 diamonds were detd. between 1 and 14 μ with a rock-salt prism-spectrometer of high resolving power. Strong absorption bands at 7.78 and 8.3 μ were present in Type-I, but were absent in Type-II diamonds. With 3 Type-I diamonds examd. a new absorption band was detd. at 9.05 μ, while one diamond had a new band at 7.08 μ not hitherto reported. This same diamond lacked a band at 7.27 μ common to the other 2 diamonds.

13434. Trombe, F.; Foëx, M., and Bardet, J. **The purification of graphite.** *Ann. chim.* 20, 701-23; *Compt. rend.* 220, 691-3(1945).—*C.A.* 40, 4926^2.
Rods of graphite were purified by heating electrically, with the rod as the resistor. Fe and Mn could be eliminated completely in 5-min. heating at 1450°C. Cu, Al, Ca, V, Ti, Si, Mg, and B required higher temps. in that order, up to 3000°C for complete removal. At 2650°C only 0.001% of the impurity (B and Mg) remained.

13435. Achyuthan, K. **Local variations in the photoconductivity of diamond.** *Proc. Indian Acad. Sci.* 24A, 162-7(1946).—*C.A.* 41, 1935*f*.
Three cleavage plates of well-polished diamonds, showing variations of ultraviolet transparency over their area, were studied. An elec. field was applied across a particular area by means of 2 pointed metallic electrodes pressing on the faces of the plates. A 4th plate, completely transparent to ultraviolet above 2250 A. and to the 8-μ infrared region throughout its area, showed variations of photocond.

13436. Adie, R.J. **Mechanical method for the estimation of graphite.** *Trans. & Proc. Geol. Soc. S. Africa* 49, 209-11(1946).—*C.A.* 44, 3840*d*.
Graphite was sepd. from assocd. minerals by crushing through 60 mesh, and floating on a liquid of sp. gr. 2.40. A suitable liquid was a mixt. of 37% CCl_4 and 63% $CHBr_3$.

13437. Chandrasekharan, V. **Phosphorescence patterns in diamond.** *Proc. Indian Acad. Sci.* 24A, 182-6 (1946).—*C.A.* 41, 1936*b*.
Patterns in 12 cleavage plates revealing the variations in intensity of phosphorescence in different regions of the same diamond were recorded by contact photography.

13438. Chandrasekharan, V. **The thermoluminescence of diamond.** *Proc. Indian Acad. Sci.* 24A, 187-92 (1946).—*C.A.* 41, 1936*c*.
After exposure to ultraviolet light, blue-fluorescent diamonds showed thermoluminescence, the greenish yellow glowed at room temp. changing to blue and brightening on heating to 270°C. Green fluorescent diamonds showed greenish yellow thermoluminescence.

13439. Chandrasekharan, V. **The phosphorescence of diamond.** *Proc. Indian Acad. Sci.* 24A, 193-7 (1946).—*C.A.* 41, 1936*d*.
Fluorescent diamonds retained energy after ultraviolet irradiation, a part being released at room temp. as phosphorescence. When they were illuminated with long-wave radiations, the energy was emitted as a flash of visible light. Ultraviolet light below 3000 A. produced the greatest activation.

13440. Gibson, J. **Structure of graphite.** *Nature* 158, 752 (1946).—*C.A.* 41, 2297*b*.
X-ray diffraction photographs of natural and artificial graphites showed certain faint lines (some single and some double) that could not be explained by structures that had been proposed for graphite. The extra lines were attributed to a structure closely related to the ordinary graphite structure, and the extra double lines to 000*l* reflections.

13441. Krishnan, R.S. **The second-order Raman spectrum of diamond.** *Proc. Indian Acad. Sci.* 24A, 25-32 (1946).—*C.A.* 41, 1557*g*.
A spectrum of the second order was recorded exhibiting an intense line and no fewer than 10

Raman lines of comparatively feeble intensity. The second-order spectra became visible with an exposure of 15 min. and the anti-Stokes of the principal line 1332-cm^{-1} appeared with an exposure of 45 min. Ten distinct Raman lines with frequency shifts 2176, 2190, 2225, 2253, 2299, 2330, 2430, 2460, 2502 and 2666 cm^{-1} were reported.

13442. KRISHNAN, R.S. **Thermal expansion of diamond.** *Proc. Indian Acad. Sci.* **24A**, 33-44 (1946).—*C.A.* 41, 1904*e*.

The thermal expansion of diamond in thin plates was studied over the range 28°-605°C by the x-ray diffraction method; the variation of the lattice spacings with increase in temp. was measured, and the coeff. of expansion calcd. The coeff. of vol. expansion of diamond varied from 4.36 × 10^{-6} in the range 28°-105°C to 11.76 × 10^{-6} at 505°-605°C.

13443. KRISHNAN, R.S. **Temperature variations of the Raman frequencies in diamond.** *Proc. Indian Acad. Sci.* **24A**, 45-57(1946).—*C.A.* 41, 1934*e*.

The thermal variation of the Raman frequencies in diamond with the known thermal expansion data were recorded. Two independent sets of expts. were carried out to det. the variation of the intense principal line of the first order and the less-intense lines of the second order. The frequency of the line decreased from 1333.2 at liquid air temp. to 1316.0 cm^{-1} at 703°C. The relative change of the principal frequency with relative change of vol. decreased from a high value at liquid-air temp. to a const. small value above 127°C.

13444. LONG, L.H. AND NORRISH, R.G.W. **The two heats of atomization of carbon.** *Nature* 157, 486(1946).—*C.A.* 40, 3972^5.

The most probable value was Herzberg's figure, L_1 = 125 kcal (corresponding to D(CO) = 9.14 e.v.).

13445. LONG, L.H. AND NORRISH, R.G.W. **The thermochemistry of carbon: valence states, heats of sublimation, and energies of linkage.** *Proc. Roy. Soc.* (London) A187, 337-57(1946).—*C.A.* 41, 1542*g*.

Discrepancies in the calcd. values of the latent heat of sublimation of carbon into monatomic vapor was due to the neglect of the energy required to raise the C atoms from the ground (^3p) state to the lowest quadrivalent (^5s) electronic configuration corresponding to that in which it was normally found in chem. combination. The most probable and satisfactory value for the latent heat of sublimation was 125.0 kcal at 0°K.

13446. PIERREY, JACQUES. **Study of the thermal expansion of graphite.** *Compt. rend.* 223, 501-3 (1946).—*C.A.* 41, 1138*g*.

An optical method was used to follow the expansion of a pressed sample of parallel graphite platelets over the range 0° to 2300°C. The coeff. of thermal expansion in the range 0° to 500°C was 17.2 × 10^{-6} in the *c* direction, 1.3 × 10^{-6} in the *a* direction. In the range 1500°-2300°C, the resp. coeffs. were 27.7 × 10^{-6} and 3.2 × 10^{-6}.

13447. RAMACHANDRAN, G.N. **The crystal symmetry of diamond and its x-ray reflections.** *Proc. Indian Acad. Sci.* **24A**, 58-64 (1946).—*C.A.* 41, 1904*g*.

The symmetry of the diamond structure in relation to its x-ray reflection was considered. The presence or absence of the 200 or the 222 reflection could not uniquely decide whether the symmetry was tetrahedral or octahedral.

13448. RAMACHANDRAN, G.N. **The nature and origin of the laminations observed in diamond.** *Proc. Indian Acad. Sci.* **24A**, 65-80 (1946).—*C.A.* 41, 1904*h*.

The geometric birefringence patterns of the cleavage plates of diamond were attributed to the existence of definitely oriented laminations inside the crystal under strain.

13449. RAMACHANDRAN, G.N. **The luminescence of diamond excited by x-radiation.** *Proc. Indian Acad. Sci.* **24A**, 81-94(1946).—*C.A.* 41, 1934*h*.

The fluorescence of diamond when irradiated with x-rays was much weaker and varied over a smaller range of intensities than that excited by ultraviolet light. The color and pattern of luminescence were the same for both excitations except that the x-rays had less contrast.

13450. RAMACHANDRAN, G.N. **X-ray topographs of diamond. II.** *Proc. Indian Acad. Sci.* **24A**, 95-103, (1946).—*C.A.* 41, 1905*a*.

X-ray topographs, viz., photographic representations of the variations in the x-ray reflecting power over the area of a thin crystal plate of diamond, were photographed by using white x-rays diverging from a pinhole and obtaining Laue reflections from the full area of the cleavage plate.

13451. RAMACHANDRAN, G.N. AND CHANDRASEKHARAN, V. **Luminescence as "forbidden" electronic transitions in diamond.** *Proc. Indian Acad. Sci.* **24A**, 176-81(1946).—*C.A.* 41, 1936*a*.

The doublet centered at 4152 A. occurring in the spectrum of all fluorescing diamonds arose from "forbidden" transitions due to differences in electronic energy levels. Another fluorescent line was recorded at 7930 A.

13452. RAMAN, C.V. AND RAMASESHAN, S. **The crystal forms of diamond and their significance.** *Proc. Indian Acad. Sci.* **24A**, 1-24 (1946).—*C.A.* 41, 1521*f*.

Crit. examn. of some 72 diamonds in their natural form obtained from various sources indicated that the standard terminology of geometric crystallography could not be used to describe properly and to classify its forms. Exptl. evidence of some definite proposition concerning the proper basis of description and classification was indicated.

13453. RAMANATHAN, K.G. **Variations in the absorption of infrared radiation by diamond.** *Proc. Indian Acad. Sci.* **24A**, 130-6 (1946).—*C.A.* 41, 1935*a*.

The ultraviolet transmission limit of a diamond progressed further and further into the ultra-violet as the absorption decreased in the 8-μ region.

13454. RAMANATHAN, K.G. **The absorption of ultraviolet radiation by diamond.** *Proc. Indian Acad. Sci.* **24A**, 137-44 (1946).—*C.A.* 41, 1935*b*.

The thinnest diamonds of the ultraviolet-opaque type showed transmission to 2240 A., which was also the limit for the ultraviolet-transparent type. In blue luminescent diamond 5 new absorption bands of 2244, 2248, 2255, 2261, and 2294 A. were recorded at room temp.

13455. RAMANATHAN, K.G. **The absorption spectrum of diamond in the visible region.** *Proc. Indian Acad. Sci.* 24A, 145-9 (1946).—*C.A.* 41, 1935*c*.
The absorption spectrum of diamonds exhibiting a weak blue fluorescence was investigated in the visible region, with large absorption paths being secured by the method of multiple transmission.

13456. RAMANATHAN, K.G. **The infrared absorption spectrum of diamond.** *Proc. Indian Acad. Sci.* 24A, 150-61 (1946).—*C.A.* 41, 1935*e*.
The absorption spectra of 4 typical diamonds, 3 of them luminescent and the 4th nonluminescent, were investigated in the infrared in the wavelength range 4.5 to 13 μ with a rock-salt-prism spectrometer and radiomicrometer. Within allowance for reflection, the nonluminescent diamond was found to be completely nonabsorbing in the frequency range 770-1400 cm^{-1}.

13457. RAMASESHAN, S. **The Faraday effect in diamond.** *Proc. Indian Acad. Sci.* 24A, 104-13 (1946).—*C.A.* 41, 1905*c*.
A large Rutherford electromagnet capable of giving fields of 23,000 gausses and an image of the W bead of a powerful point-o-lite lamp focused on the slit of a const.-deviation spectrograph were used to measure the magnetic rotation of diamond over a range of 4800 to 6000 A. where background intensity was negligible.

13458. RAMASESHAN, S. **The cleavage properties of diamond.** *Proc. Indian Acad. Sci.* 24A, 114-21 (1946).—*C.A.* 41, 1905*e*.
The (111) cleavage was the most nearly perfect and most abundant, because this plane had the min. cleavage energy and on either side of it lie layers of atoms having 3 times its cleavage energy.

13459. RAMASESHAN, S. **A theory of the crystal forms of diamond.** *Proc. Indian Acad. Sci.* 24A, 122-9 (1946).—*C.A.* 41, 1905*g*.
The shape of the crystal was controlled by the varying surface tension of the molten carbon liquid in different directions due to the nonrandom orientation of the valence bonds between the atoms. A semiquant. form for the theory of crystal shapes was presented.

13460. RENDALL, G.R. **Geometric patterns of fluorescence in diamond.** *Proc. Indian Acad. Sci.* 24A, 168-75— (1946).—*C.A.* 41, 1935*h*.
The blue and yellow patterns of luminescence exhibited by 19 cleavage plates of diamond were photographed with appropriate light filters and reproduced with the patterns of transparency to the 2536-A. radiation of the Hg arc and their birefringence patterns.

13461. RIMSKI-KORSAKOV, W. AND TRAUCKI, B.I. **The industrial use of carbon.** *Industria y quím.* 8, 148-55 (1946).—*C.A.* 41, 588*b*.
Metallurgical and petroleum cokes were suitable carbon sources. A ceramic carbon was developed that would endure temps. of 1600°C and severe usage in combustion chambers. Granulated carbon resistances for elec. furnaces were also made successfully from Argentine carbons.

13462. SZYMANOWITZ, RAYMOND. **Colloidal graphite.** *Colloid Chemistry* 6, 436-58(1946).—*C.A.* 40, 2245^8.
Properties of graphite were discussed, and its use as a solid lubricant, colloidalization of graphite and lubrication with the colloid, and graphitoid surfaces and their function.

13463. TOLANSKY, S. AND WILCOCK, W.L. **Topography of the face of a diamond crystal.** *Nature* 157, 583(1946).—*C.A.* 40, 5363^4.
Triangular pits, frequently observed on natural octahedron faces of diamond crystals were hitherto ascribed to etching or soln. The depth of such pits varied between 60 and 600 A., i.e., 30-300-atom layers.

13464. BRIDGMAN, P.W. **An experimental contribution to the problem of diamond synthesis.** *J. Chem. Phys.* 15, 92-8(1947).—*C.A.* 41, 2295*b*.
Pressure up to 30,000 kg/cm^2, and in one case 45,000 kg/cm^2, was applied to graphite alone, or to graphite seeded with diamonds, at temps. above 2000°C. No detectable transformation of graphite to diamond was found in any of the expts. In the expts. with internal heating it was established that the rate of inversion of diamond into graphite at a temp. above the m.p. of Mo was a function of the pressure.

13465. CORY, M.T. AND THACHER, F.B. **Carbon- a blast-furnace refractory.** *Blast Furnace Steel Plant* 35, 1482-7(1947).—*C.A.* 42, 1400*i*.
Characteristics of carbon and graphite, which made them suitable for refractory applications, were that they did not wet either metal or slag. The thermal expansion of both carbon and graphite was well below any of the com. ceramic refractories. The compressive strength of carbon or graphite (3500-7000 p.s.i.) was comparable to fireclay brick (1000-5000 p.s.i.). However, carbon remained strong even at 3500°F, while fireclay was relatively weak at 2500°F. Carbon was also very resistant to erosion.

13466. GOUDSMIT, S. **Heat of atomization of carbon.** *Nature* 159, 742-3 (1947).—*C.A.* 41, 5350*c*.
An old calcn of the metastable ^5S state of the C atom was discussed.

13467. HAGSTRUM, HOMER D. **The dissociation energy of carbon monoxide and the heat of sublimation of carbon.** *Phys. Rev.* 72, 947-63(1947). —*C.A.* 42, 801*g*.
A new interpretation of the effects in the spectrum that brings agreement with the electron-impact value was possible. Satisfactory agreement could be attained among all data bearing on D(CO) and $L_1(C)$, the heat of sublimation of carbon.

13468. KARUNAKARAN, C. AND RAO, M. NARASINGA. **Analysis of graphite.** *Current Sci.* (India) 16, 218(1947).—*C.A.* 42, 486*f*.
For a simple and rapid detn. of C in graphite, heat the sample to const. wt at 200-10°C and oxidize in a Pt crucible in a stream of dry O_2 passed in through a perforated cover. Const. wt

was reached in 30 min. Results were 2-4% higher than by wet oxidation.

13469. Krishnan, R.S. **Raman spectrum of diamond under high resolution.** *Nature* 159, 60-1 (1947). —*C.A.* 41, 2335*c*.
The spectrum was a series of sharply defined lines. All lines were either octaves or allowed combination tones of the crystal lattice which were Raman-inactive in the first order. The vibration spectrum of the diamond lattice in the infrared was discrete.

13470. Mellor, D.P. **The possibility of a chemical synthesis of diamond.** *J. Chem. Phys.* 15, 525-6(1947).—*C.A.* 41, 6099*i*.
Hannay in 1880 heated a mixt. of light paraffin, bone oil (mainly pyridine), and Li, in a sealed Fe container; 3 of 80 cylinders withstood red heat. These conditions, inadequate to transform graphite to diamond, might have produced diamond directly by a process of polymerization.

13471. Nelson, J.B. and Riley, D.P. **Structure of graphite.** *Nature* 159, 637-8(1947).—*C.A.* 41, 6453*f*.
A no. of x-ray powder diffraction-pattern photographs of artifical and natural graphite were reexamd. Photographs were taken of purified Ceylon graphite (ash content = 0.07%), and no extra lines other than weak rhombohedral lines were noted.

13472. Ramachandran, G.N. **Thermo-optic behavior of solids.** *Proc. Indian Acad. Sci.* 25A, 266-79 (1947).—*C.A.* 41, 5767*h*.
The *n* variation was represented as the sum of 2 terms, one arising from the change in the no. of dispersion centers and the other from the variation of the frequencies. Accurate data of the thermal variation of the *n* of diamond were obtained for the first time from -180° to 450°C for three wave lengths, 4358, 5461, and 5893 A.

13473. Raman, C.V. **The vibration spectra of crystals. I. Basic theory. II. The case of diamond.** *Proc. Indian Acad. Sci.* 26A, 339-55, 356-69(1947).—*C.A.* 42, 4061*a,c*.
In diamond the C atoms were arranged in 2 similar interpenetrating Bravais lattices of the face-centered cubic type, each atom in one of the lattices being linked to 4 atoms in the other lattice by valence bonds along the four trigonal sym. axes of the crystal. The 9 observed characteristic frequencies of diamond were due to the oscillations of the lattices with respect to each other, to the normal sym. and antisym. oscillations of the cubic and octahedral planes, and to the tangential sym. and antisym. oscillations of the same planes.

13474. Ramanathan, K.G. **The infrared absorption spectrum of diamond and its variations.** *Proc. Indian Acad. Sci.* 26A, 469-78 (1947).—*C.A.* 42, 4063*b*.
The infrared absorption of 9 cleavage plates of diamond were investigated with a 10-fold increase in detector sensitivity. All the specimens irrespective of their other phys. properties showed a band extending from 1500 to 2700 cm^{-1} with two very strong max. at 2010 and 2170 cm^{-1} and a weaker one at 2470 cm^{-1}. The absorption between 750 and 1400 cm^{-1}, due to the fundamental vibration frequencies of the crystal, was of variable intensity in the different specimens.

13475. Ramanathan, K.G. **The emission and absorption spectra of luminescent diamonds.** *Proc. Indian Acad. Sci.* 26A, 479-80 (1947).—*C.A.* 42, 4064*b*.
Reproductions were presented of spectrograms and micro-photometer tracings of the emission and absorption spectra of diamonds that showed blue luminescence under irradiation.

13476. Rooksby, H.P. and Steward, E.G. **Structure of graphite.** *Nature* 159, 638-9(1947).—*C.A.* 41, 6453*h*.

13477. Rüdorff, Walter. **Saltlike compounds of graphite with hydrofluoric acid.** *Z. anorg. Chem.* 254, 319-29(1947).—*C.A.* 43, 2534*a*.
The reaction of graphite and water-free HF in an oxidizing medium, such as an elec. cell, $K_2Cr_2O_7$ soln. in HF, or F_2 bubbled through HF, produced blue compds. The degree of oxidation, as detd. by reaction with HI, indicated one anion to 24 C atoms. The F content indicated C/F ratio of 1:4.

13478. Rüdorff, Walter and Rüdorff, Gerda. **Tetracarbon monofluoride, a new graphite-fluorine compound.** *Chem. Ber.* 80, 417-23 (1947). —*C.A.* 43, 2107*f*.
Graphite reacted very readily with gaseous F_2 and HF at room temp. to form a hitherto unknown C-F compd. which was distinctly different from $(CF)_x$. Adsorbed or occluded HF was not removed completely by evacuation at room temp., as shown by an expt. with graphite and HF-laden N_2. X-ray examn. showed that the F atoms were in layers between two C planes, probably in one layer below and in a layer above each C layer at a distance of about 1.4 A.

13479. Ruess, G.L. **The structure of glance carbon.** *Monatsh.* 76, 253-62(1947).—*C.A.* 41, 6100*d*.
The cryst. dimensions of glance carbon were detd. by interference measurements. The temp. of formation was between that of soot and retort graphite. X-rays showed that the single crystal had its lower and upper surfaces parallel. The strong small-angle scattering was explained as intercryst. interference and was used for estn. of the crystal size.

13480. Tolansky, S. and Wilcock, W.L. **Interference studies of diamond faces. A crossed-fringe technique.** *Proc. Roy. Soc.* A191, 182-94 (1947).—*C.A.* 42, 4815*f*.
The curvature of diamond faces and the occurrence of triangular pits were attributed to growth and not to soln. Irregular depressions that were observed were attributed to a soln. mechanism.

13481. Achyuthan, K. **Directional variations of photoconductivity in diamond.** *Proc. Indian Acad. Sci.* 27A, 171-5 (1948).—*C.A.* 42, 6638*i*.
Five cleavage plates of diamond of varying thicknesses showed variations in photocond., being a max. in the direction of some laminae inside the diamond. Wherever birefringence was weak, the relative value of photocond. was greater than in other regions.

13482. BHAGAVANTAM, S. AND RAO, D.A.A.S. NARAYANA. **Dielectric constant of diamond.** *Nature* 161, 729(1948).—*C.A.* 42, 6186*h*.

An ultraviolet-opaque diamond about 2 cm² in area and 1.42 mm thick, and an ultraviolet-transparent diamond about 1 cm² in area and 1.27 mm thick were examd. The dielec. consts. were 5.70 and 5.65, resp., at a frequency of 1.6 mc. per sec. and 26°C.

13483. BODVAN-GRIFFITH, C.L. **Carbon and graphite for the chemical engineer.** *Ind. Chemist* 24, 666-74(1948).—*C.A.* 45, 5909*h*.

Crucible walls and Fe runners were lined with carbon which was not wetted by molten Fe, had good mech. strength at high temp., and high resistance to thermal shock or steep temp. gradients. Carbon was used for boats, etc., for sintering WC. As a lining in a chem. plant, carbon blocks were set in special cements. The degree of resistance of the blocks and cements to various concns. of acids and acid mixts. and to a no. of miscellaneous org. and inorg. chemicals were tabulated. The largest application for carbon lining was in steel works where HF was used for pickling.

13484. BREWER, LEO. **The vapor pressure and melting point of graphite.** *J. Chem. Phys.* 16, 1165-6(1948).—*C.A.* 43, 1638*e*.

A heat of sublimation of 170 kcal, an atm. sublimation point of approx. 4000°K, and a m.p. above 5000°K, were preferred.

13485. CHANDRASEKHARAN, V. **Fluoresence and phosphorescence of diamond at different temperatures.** *Proc. Indian Acad. Sci.* 27A, 316-20 (1948).—*C.A.* 42, 6669*a*.

All diamonds showed an electronic fluorescence line at 4156A. This line was quite sharp at -180°C and decreased in sharpness and peak intensity as the temp. was raised until at 350°C it was lost in the background. The integrated intensity of the line was const. within exptl. error from -180° to 150°C.

13486. GAYLORD, W.M. **Carbon and graphite.** *Chem. Eng.* 55, No. 3, 225(1948).—*C.A.* 42, 3637*f*.

13487. GILLES, PAUL W. AND JENKINS, FRANCIS A. **The vapor pressure and heat of sublimation of graphite.** *J. Chem. Phys.* 16, 797-807 (1948).—*C.A.* 42, 7153*e*.

The heat of sublimation of graphite and the heats of dissocn. of CO and C_2 were established by the direct detn. of the total vapor pressure of graphite by an equil. effusion method and by the detn. of the partial pressure of C_2(gas) in equil. with graphite. The heat of sublimation of graphite to C(*g*) was $\Delta H_o = 170.39 \pm 0.20$ kcal/mole at 0°K. The heat of sublimation of graphite to C_2(*g*) was $\Delta H_o = 233.1 \pm 7$ kcal/mole.

13488. HOUSTON, W.V. **Lattice vibrations and specific heat of diamond.** *Z. Naturforsch.* 3a, 607-11(1948).—*C.A.* 44, 6226*d*.

The at. heat of diamond from 0° to 1400°K was calcd. from the total frequency spectrum of the vibrations of the diamond lattice.

13489. KIRSCHBAUM, EMIL. **Heat transfer in evaporation with graphite and porcelain tubes.** *Angew. Chem.* B20, 235-6 (1948).—*C.A.* 43, 448*i*.

Heat-transfer coeffs. were presented for graphite tubes (28 mm inside diam., 49 mm outside diam., 1900 mm long) and for porcelain tubes (24.6 × 35.8 × 1900) as functions of water velocity in the tubes, and of total decrease in temp.

13490. LONG, L.H. **The vapor pressure and heat of sublimation of graphite.** *J. Chem. Phys.* 16, 1087(1948).—*C.A.* 43, 457*c*.

The vapor pressure of graphite as 1 atm. at 4630°K, and the heat of sublimation of 170 kcal/g-atom were shown to be inadmissable.

13491. MAJUMDAR, K.K. **Studies in colloidal graphite. I. Preparation of colloidal graphite in water from Indian raw materials.** *J. Indian Chem. Soc., Ind. & News Ed.* 11, 105-6 (1948).—*C.A.* 43, 5159*d*.

Colloidal graphite in water was prepd. by grinding purified Indian graphite with 25% Na oleate in a 3-roll mill. Coarser particles were sepd. from the colloid by diln. and sedimentation. The colloid was concd. by coagulation with mineral acid, and the coagulum was peptized by grinding additionally with 10% Na oleate and a little alkali.

13492. MAJUMDAR, K.K. **A rapid method for analysis of colloidal graphite.** *Science and Culture* 13, 510(1948).—*C.A.* 43, 5159*e*.

Colloidal graphite (1-3 g) in oil and 30 ml of a mixed solvent such as C_6H_6 and alc. plus glacial HOAc were centrifuged at 2,000-3,000 r.p.m. After decantation the content of the tube was dried at 105°C for 10-15 min. to det. wt of graphite and ash. The ash was detd. by combustion.

13493. MAJUMDAR, K.K. **Beneficiation of graphite from Mysore State.** *J. Sci. Ind. Research* (India) 7B, 167-8(1948).—*C.A.* 43, 6373*e*.

The ore required grinding to about 300 mesh to sep. the mineral from impurities. The powd. ore was then subjected to bulk flotation in a Denver Sub-A Flotation Cell of 1000-g capacity under different conditions. The concentrate from bulk flotation could be ground wet to -325 mesh and refloated a few times to improve the grade.

13494. NACHREINER. **Carbon bricks for lining containers and apparatus.** *Seifen-Öle-Fette-Wachse* 74, 139-40 (1948).—*C.A.* 42, 8445*c*.

The production of pressed tiles from coke with subsequent transformation of the carbon into graphite in an elec. oven was described.

13495. SAVAGE, ROBERT H. **Graphite lubrication.** *J. Applied Phys.* 19, 1-10 (1948).—*C.A.* 42, 2753*i*.

The slipperiness of graphite depended not only on the crystal structure, but also on adsorption films, especially water, which covered the C atoms and provided surfaces of low cohesion. In a vacuum, graphite brushes seized upon a moving base of Cu or graphite and wore away as a fine dust. This wear and accompanying high friction were instantly stopped by condensible vapors at pressures below 5 mm Hg. These substances, such as H_2O, C_6H_6, or NH_3, apparently covered the graphite with a reversibly adsorbed film, sensitive to the temp. and pressure at the surface.

13496. SPENCER, HUGH M. **Empirical heat-capacity equations of gases and graphite.** *Ind. Eng. Chem.* 40, 2152-4(1948).—*C.A.* 43, 1638*b*.

Quadratic or cubic empirical heat-capacity equations were given for solid graphite and for 117 gases in the hypothetical ideal state at 1 atm. All equations cover the range 298.16-1000° K, most equations 298.16-1500°K.

13497. VARDHAN, HARSH. **Determination of the crystallographic axes of diamond.** *J. Sci. Ind. Research* (India) 7B, 189-93 (1948).—*C.A.* 45, 2767*i*.

Many of the properties of diamond (e.g., hardness) depend on direction. Fifty-five Laue radiographs, covering all possible orientations of the diamond, were reproduced on a chart.

13498. VENCOV, S. **Purification of carbon electrodes used for spectrographic analysis.** *Bull. Inst. Natl. Cercetari Tehnol.* 3, 471-5(1948).—*C.A.* 43, 3732*b*.

The electrodes were boiled and soaked at high temp. in a mixt. of concd. HCl and HNO_3, H_2SO_4, NH_4OH, and glacial AcOH, rinsing them with distd. water before each new cleaning soln. After drying in an elec. furnace, the electrodes were subjected to thermal treatment in N_2. This eliminated most of the impurities leaving only B, Cu, Si, and Fe.

13499. BLACKWELL, D.E. AND SUTHERLAND, G.B.B.M. **Vibrational spectrum of diamond.** *J. chim. phys.* 46, 9-15(1949).—*C.A.* 44, 8771*f*.

The infrared absorption spectra of some 250 diamonds between 2 and 15 μ were detd. All the diamonds absorbed in the region of 4 to 6 μ, but the diamonds of type I had an additional absorption band in the 7 to 11 μ region. Some type II diamonds (those lacking the 7-11 μ band) had an extra band 2940 and 2780 cm^{-1}. Type I began to absorb in the ultraviolet near 3,000 A., while type II transmitted to 2,250 A.

13500. DOORSELAER, M. VAN; EECKHOUT, J., AND GILLIS, J. **Spectrochemical analysis of a solution on graphite.** *Congr. groupement avance. méthod anal. spectrograph. produits mét.* 12, 51-7(1949).—*C.A.* 45, 4168*f*.

When adsorption of the soln. on graphite took place above 100°C, the sensitivity of spectral lines was at a max. and their relative intensities were const. An increase in the concn. of the soln. gave a greater sensitivity, except in the case of some elements such as Al, but did not influence the relative intensities. The effect of the vol. of the soln. on the electrode was negligible.

13501. GOLDFINGER, PAUL AND JEUNEHOMME, WILLIAM. **The vapor pressure and heat of sublimation of carbon.** *Rév. inst. franc. pétrole* 4, 427-34 (1949).—*C.A.* 44, 6695*e*.

The vapor pressure measurement was based on the intensity of an at. beam of carbon coming from a 17.5×10^{-3} cm^2 wide opening of a graphite crucible having an inner surface of 80 cm^2. At 2100°K expts. of 30 and 80 min., resp., yielded a faint deposit on a receiver at 10.7 and 16 cm distance from the opening. This deposit disappeared on burning. It seemed to have come from the at. beam of carbon expected at this temp. if the heat of fusion had a value of 125 or 136 kcal/mole. Calcns. indicated that it consisted of 10^{17} atoms/cm^2, and that the accommodation coeff. was 10^{-5}.

13502. HOERNI, JEAN AND WEIGLE, JEAN. **Structure of graphite.** *Nature* 164, 1088(1949).—*C.A.* 44, 3326*h*.

The electron-diffraction patterns of single crystals of graphite of various origins showed the presence of new spots that would be indexed as (1/2, 0, 0) or (1/2 , 1/2, 0) in the usual unit cell. These spots were very weak and did not appear in similar structures such as molybdenite. They required the assumption of a unit cell with a basal plane twice as large as the usual one.

13503. LAIDLER, K.J. AND CASEY, E.J. **Heats of dissociation of carbon-hydrogen bonds in methane and its radicals.** *J. Chem. Phys.* 17, 1087-91(1949).—*C.A.* 44, 2362*h*.

The value of 170.6 kcal per mole for the heat of sublimation of graphite was the most probable one. This figure was consistent with a value of 393 kcal for the heat of removing the four H atoms from CH_4, the assignment of the heats of the successive dissocns. being: $CH_4 = CH_3 + H$ - 101 kcal; $CH_3 = CH_2 + H$ - < 87 kcal; $CH_2 = CH + H$ - > 125 kcal; $CH = C(^3P) + H$ - 80 kcal.

13504. LONG, L. H. AND NORRISH, R. G. W. **The latent heat of vaporization of carbon.** *Trans. Faraday Soc.* 45, 1158(1949).—*C.A.* 44, 4768*b*.

13505. NEWTON, ROBERT R. **Space-charge effects in bombardment conductivity through diamond.** *Phys. Rev.* 75, 234-46(1949).—*C.A.* 43, 3279*f*.

Electrons excited to the conduction band of an insulator under electron bombardment were, in general, not able to leave the insulator, but became trapped in imperfections in the crystal lattice. The trapped electrons gave rise to a space charge which modified the motion of electrons excited to the conduction band subsequent to the trapping.

13506. PAULING, LINUS AND SHEEHAN, WILLIAM F. JR. **Dissociation energy of carbon monoxide and the heat of sublimation of graphite.** *Proc. Natl. Acad. Sci. U. S.* 35, 359-63(1949).—*C.A.* 43, 8254*g*.

Values of 9.77 e.v. and 140 kcal/mole, resp., were reported.

13507. PERRET, A. AND RIETHMANN, J. **Reaction of carbon with calcium, barium, and magnesium nitrides and their relations with the cyanide-cyanamide equilibrium.** *Helv. Chim. Acta* 32, 1378-90(1949)(in French).—*C.A.* 43, 8930*d*.

Mixts. of Ca_3N_2 and natural graphite were heated to 850°-1180°C in a closed vessel and cooled suddenly. Relatively little $Ca(CN)_2$, but up to 70% CaNCN was formed. When Ba_3N_2 was treated in the same way, $Ba(CN)_2$ was the major product even at lower temp., but the total amt. of $Ba(CN)_2$ formed was less at low temps. and rose with temp. With Mg_3N_2 no reaction occurred up to 1200°C.

13508. Sainz, Alfredo F. **The use of graphite and additives in oils.** *Bol. inform. petrol. (Buenos Aires)* 26, 41-60(1949).—*C.A.* 43, 7675*f*.

13509. Tawde, N. R. **Dissociation energy of C_2.** *J. Univ. Bombay* 17A, Pt. 5, 9-11(1949).—*C.A.* 43, 8877*f*.

A dissocn. energy of 4.22 e.v. was estd. for C_2 from several concordant detns. of the intensity distribution in the Swan bands of C_2.

13510. Bacon, G. E. **X-ray and neutron diffraction by graphite layers.** *Nature* 166, 794(1950). —*C.A.* 45, 4130*e*.

Measurement of the x-ray diffraction pattern of carbon at 20° and 500°C verified an explanation of the anomalous two-fold increase in the x-ray diffraction intensity for the two-dimensional C band. The observed pattern indicated the anomaly to be due to an asymmetric electron distribution around the C—C bond.

13511. Bacon, G. E. **Unit-cell dimensions of graphite.** *Acta Cryst.* 3, 137-9(1950).—*C.A.* 44, 7116*d*.

The *c* axis length was measured for samples with crystallite thickness *t* from 50 to 450 A. A linear relation existed between *c* and $1/t$. The *a* axis remained const. as *t* decreased, although the *hk*·0 lines were displaced by increasing amts. of turbostratic material.

13512. Bacon, G. E. **The rhombohedral modification of graphite.** *Acta Cryst.* 3, 320(1950).—*C.A.* 45, 8233*c*.

Results of x-ray examn. supported the conclusion that the proportion of *ABC* structure in well-crystd. graphite as formed was only a few %, but that it may be considerably increased by powdering.

13513. Barriol, Jean and Metzger, Jacques. **Application of the molecular orbital method to the graphite network.** *J. chim. phys.* 47, 432-6(1950).—*C.A.* 44, 9199*g*.

The resonance energy, E_r, and the mobile order of the bonds in a hexagonal graphite network were calcd. for an indefinite mol. plane, the interaction of the adjacent planes being neglected. The cyclic conditions of Born were applied in the mol. orbital method. The limiting value calcd. for E_r was 0.383 B, where B was a resonance integral between adjacent orbitals amounting to approx. 20 kcal/mole. The calcd. bond energy in graphite was found to be 124.5 kcal/mole, compared with 127 kcal/mole obtained by Walsh.

13514. Bishui, B. M. **Origin of fluorescence in diamond.** *Indian J. Phys.* 24, 441-60(1950).—*C.A.* 45, 6931*e*.

A study of the fluorescence and absorption in the visible region of 6 diamonds showed that the fluorescence behaved similarly to an impurity fluorescence, and that the impurity was of a chem. nature. Lattice defect produced by strain was not the cause of the fluorescence.

13515. Brill, R. **The covalent bond in diamond and the x-ray scattering factor of covalent-bonded carbon.** *Acta Cryst.* 3, 333-7(1950).—*C.A.* 44, 10435*i*.

By Fourier synthesis it was found that the formation of a C covalent bond consisted in concentrating about one-half to three-quarters of one electron of the outer shell in every chemical bond. An x-ray at. scattering curve was given for the covalent-bonded C atom.

13516. Bull, C. and Garlick, G. F. J. **The luminescence of diamonds.** *Proc. Phys. Soc. (London)* 63A, 1283-91(1950).—*C.A.* 45, 4561*f*.

The luminescence of diamonds appeared to be characteristic of the matrix crystal, and a tentative model for the emission centers was given. The thermoluminescence curves of all diamonds exhibiting thermoluminescence were similar in form, indicating that luminescence in diamond was a property of the matrix and not due to impurities. This was supported by other exptl. results.

13517. Busso, R. H. **Comparison with experiment of theoretical studies on the structure and reactivity of graphite.** *J. chim. phys.* 47, 533-9(1950).—*C.A.* 45, 4120*g*.

Studies of adsorption, catalysis, and oxidation of graphite were quoted to show that the reaction occurred at active centers that were on the edges of the mol., e.g., the prismatic surfaces. Structures for various types of active centers were discussed.

13518. Busso, Raoul H.; Chalvet, O.; Daudel; Sandorfy, C., and Vroelant, C. **Application of wave mechanics to the determination of the structure and chemical properties of graphite.** *J. chim. phys.* 47, 525-32(1950).—*C.A.* 44, 10428*d*.

Methods of study of π electrons, bond index, interat. distance, bond energy, resonance, index of free valence, autopolorizability, heat of activation, and chem. reactivity in the graphite lattice were presented. Atoms along the edge of the mol. had greater reactivity.

13519. Custers, J. F. H. **The nature of the opal-like outer layer of coated diamonds.** *Am. Mineral.* 35, 51-8(1950).—*C.A.* 45, 501*c*.

Zoned diamond crystals were described consisting of a clear inner core coated by a dull gray layer averaging 0.5 mm in thickness. The outer coating was diamond (resembles opal only in its luster) contg. abundant unknown black inclusions. The contact plane between coating and inner core was (111).

13520. Ess, H. and Rossel, J. **Properties of the diamond as a crystal counter.** *Helv. Phys. Acta* 23, 484-7(1950).—*C.A.* 45, 2321*a*.

The initial charge in the diamond was produced by irradiation with α-particles from Po or γ-rays from Ra. The direction of the incident radiation was parallel to an elec. field of 8000 or 6400 v. per cm. By reversing the field, either the motion of the electrons or that of the pos. holes in the crystal could be observed. After amplification with a preamplifier and a proportional amplifier, the impulses were observed with an oscillograph.

13521. Freeman, G. P. and Velden, H. A. van der. **Photoelectric properties of diamond, measured with a crystal counter.** *Physics* 16, 486-92 (1950)(in English).—*C.A.* 45, 2305*g*.

Measurements of the function of Hecht (movement of liberated electrons in the field) were described for diamond. The results differed from earlier measurements with light or electron irradiation. The crystal counter permitted more accurate and reliable photoelec. measurements.

13522. GESSNER, H. **Sedimentation analysis of diamond powders.** *Kolloid-Z.* 118, 165-72(1950). —*C.A.* 45, 3218*g*.
The size of an individual fraction had a mean square error of 1.5% of the total sample size. The method and app. were fully described.

13523. HOERNI, JEAN. **Diffraction of electrons by graphite.** *Helv. Phys. Acta* 23, 587-622 (1950).—*C.A.* 45, 3707*i*.
A dynamic diffraction theory was developed and applied to graphite. If the diffraction pattern consisted of only 2 intense spots, the theory made it possible to calc. the thickness of the crystal and certain structure factors. When 3 or 4 intense spots occurred, an effective dispersion surface was used to account for the observed pattern. A study of different samples of graphite indicated that there were several ways of forming successive at. layers.

13524. KRYLOV, V. N.; POLUBELOVA, A. S., AND BOGDANOVA, A. G. **Effect of free carbon in the binder on the quality of electrocarbon or electrode products.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 23, 365-9(1950).—*C.A.* 47, 295*a*.
Donets anthracite was ground to a const. granulometric compn. and pressed (1 min. at 140°C under 1500 kg/cm^2) with 7 different binders with free C contents ranging from 1.87 to 30.24%, softening temp. from 59.7 to 95.6°, volatile matter from 69.14 to 54.58%, cokable C from 28.99 to 15.18%. The d. of the samples increased up to 16% C in the binder, after which the porosity increased with further increasing free C content. The optimum amt. of binder depended on its free C content; with 1.87% free C, the optimum amt. should not exceed 20%, but with 30% free C, a binder content of 24% was preferable.

13525. LEX, W. **Graphite as boiler protection.** *Die Technik* 5, No. 6, appendix, *Fertigungstech.* 3, 35-6(1950).—*C.A.* 44, 9693*f*.
In order to delay boiler incrustation and facilitate its removal, cryst. graphite should be contained in the paint used for coating the inner surfaces. The carbon content of the cryst. graphite was about 87%. As it was extremely finely ground, it could readily be added as suspension in paints which then gave a film from which the scale could easily be removed by brushing.

13526. MAJUMDAR, K. K. **Method for the analysis of natural graphite.** *J. Sci. Ind. Research (India)* 9B, 22-3(1950).—*C.A.* 44, 6343*i*.
A 1.0-g sample of graphite was heated in a covered porcelain or silica crucible for 7 min. at about 800°C for the detn. of volatile matter. The graphite was then burned off in a muffle furnace and the ash content detd. The C content was calcd. by subtracting the sum of the volatile matter plus ash from 100%. The results were in good agreement with values obtained by other methods.

13527. MAJUMDAR, K. K. **Colloidal graphite. II. Preparation of colloidal graphite in mineral oil.** *J. Indian Chem. Soc., Ind. & News Ed.* 13, 147-9(1950).—*C.A.* 45, 8214*f*.
Colloidal graphite in oil was prepd. by repeated grinding in the presence of suitable protective colloids. In one process, colloidal natural graphite was prepd. in water with Na oleate as the protective colloid. The colloid was then coagulated by the addn. of $Al_2(SO_4)_3$, then the coagulum was mixed with mineral oil and heated to remove water.

13528. MARSHALL, A. L. AND NORTON, F. J. **Carbon vapor pressure and heat of vaporization.** *J. Am. Chem. Soc.* 72, 2166-71(1950).—*C.A.* 44, 7137*a*.
Vapor pressures were computed from the measured sublimation rates by use of the Langmuir equation with the accommodation coeff. set equal to unity. From these data, the heat of evapn. of carbon was calcd. and a value of $\Delta H_0^\circ = 175.2$ kcal per mole found. This was in agreement with recent exptl. detns. and with the spectroscopic theoretical value of 170 kcal.

13529. MCKAY, KENNETH G. **Electron-bombardment conductivity in diamond. II.** *Phys. Rev.* 77, 816-25(1950).—*C.A.* 44, 6255*i*.
An earlier study of electron-bombardment conductivity in diamond was revised by the use of an improved alternating field method of internal space-charge neutralization. In addn., lower limits were set for the mobilities of electrons and pos. holes at room temp. Measurements were also made of the decay of current due to internal space-charge fields which were in reasonable agreement with theory.

13530. MIZUSHIMA, SANCHI. **Electrical resistance of graphite.** *Ôyô Butsuri* (J. Applied Phys.) 19, 138(1950).—*C.A.* 46, 3360*e*.
The difference in elec. resistance between a natural graphite single crystal and an artificial annealed sample was discussed.

13531. MROZOWSKI, S. **Electric resistivity of polycrystalline graphite and carbons.** *Phys. Rev.* 77, 838(1950).—*C.A.* 44, 6224*c*.
The effect of crystal dimensions (25-1000 A. wide) and temp. (150-770°K) on the elec. resistance of graphite and carbon was examd. The polycryst. carbons were true semiconductors with an activation energy depending on the size of the crystallites. They showed a metallic cond. for $kT \gg \Delta E$, an intrinsic semicond. for $kT \sim \Delta E$ gradually changing as the temp. decreased into a free-electron-excess semicond.

13532. PALMERI, VICTOR R. **Graphite.** *Industria Minera* (Buenos Aires) 98, No. 3, 8-9, 50-51 (1950); *Ceram. Abstr.* **1952**, 41 (in *J. Am. Ceram. Soc.* 35, No. 3).—*C.A.* 47, 6618*a*.
The phys. properties of pure graphite were summarized, and the manuf. of graphite crucibles described. A similar technique was applied in the manuf. of heating elements for a small kiln applied to the heat-treatment of minerals. The

purification by flotation of Argentine graphites was feasible but, owing to the very small size of the crystals, could not be used in the manuf. of crucibles.

13533. Parmeggiani, Luigi. **Graphite pneumoconiosis.** *Brit. J. Ind. Med.* 7, 42-5(1950).—*C.A.* 44, 10961*e*.
Twenty-four cases of pneumoconiosis found among graphite workers of the Chisone Valley, Italy, were examples of benign mixed pneumoconiosis, in which graphite tended to alleviate the scelerosing action of silica.

13534. Picon, Marius and Flahaut, Jean. **Existence of an azeotrope graphite-manganese sulfide. I. Depolarization and ionization of carbon.** *Compt. rend.* 230, 1954-6(1950).—*C.A.* 44, 8722*e*.
MnS and graphite sublimed together above 1375°C at 0.01 mm pressure. This volatilization, occurring 900°C below the sublimation temp. of carbon, constituted the first example of an azeotrope among sublimable substances.

13535. Polinard, Ed. **A tetrahedral form of diamond.** *Ann. soc. geol. Belg. Bull.* 74, B59-63(1950).—*C.A.* 45, 6893*h*.
A twinned diamond crystal found in the Belgian Congo was formed by the joining of 2 tetrahedrons along the (111) face, each crystal being sym. with respect to the twin plane.

13536. Ramachandran, G. N. **Photoelasticity of diamond.** *Proc. Indian Acad. Sci.* 32A, 171-3 (1950).—*C.A.* 45, 4513*f*.
The photoelastic consts. of diamond were redetd: $q_{11} = -5.0_5$, $q_{12} = 2.1_5$, $q_{44} = -2.8 \times 10^{-14}$ cm^2/dyne and $p_{11} = -0.31$, $p_{12} = 0.09$, $p_{44} = -0.12$.

13537. Slawson, Chester B. **Twinning in the diamond.** *Am. Mineral.* 35, 193-206(1950).—*C.A.* 45, 500*i*.
The twin plane on diamond was shown by structural considerations to be (111). The geometrical concept of twinning was inadequate because reflection across either (111) or (112) gave identical relationships. In both normal and twinned growth across (111) first and second coördinations were identical; differences appeared only in 3rd and 4th coordinations.

13538. Tabaczyński, J. **Separation of graphite by flotation.** *Przemysl Chem.* 6(29), 154-65 (1950).—*C.A.* 45, 10153*g*.
Graphite was sepd. from the end products (chiefly $CaCO_3$) produced when $CaCN_2$ was hydrolyzed with superheated steam. By use of flotation and further enrichment by chem. treatment, one metric ton of starting material gave approx. 75 kg of graphite dust, 10 kg of cryst. graphite contg. 75-90% C, and 7 kg of low-grade graphite contg. 60% C.

13539. Takahashi, Kusuhiko. **The manufacture of layer-type dry battery. I. Graphite powder for duplex electrode.** *J. Electrochem. Soc. Japan* 18, 210-13(1950).—*C.A.* 45, 7447*b*.
The change of specific resistance and apparent d. of several artificial and natural graphite powders with increasing or decreasing pressure was measured under wet and dry states.

13540. Ahearn, A. J. **Effect of inhomogeneities on the electrical properties of diamond.** *Phys. Rev.* 84, 798-802(1951).—*C.A.* 46, 2913*d*.
The well-known lattice imperfections were not distributed homogeneously in the phys. crystal, and the resulting fluctuations in the height of the energy bands relative to the Fermi level might produce interspersed "pools of mobile charge" sepd. by barriers within the diamond. These pools and barriers should lead to dielec. losses at high frequencies. Expts. supported the suggestion that inhomogeneous fields at least partially accounted for the inhomogeneities in bombardment conduction. Serious errors in the normal estimates of range and mobility of electrons or holes in insulators could be introduced by neglecting these field inhomogeneities.

13541. Bacon, G. E. **Interlayer spacing of graphite.** *Acta Cryst.* 4, 558-61(1951)(in English).—*C.A.* 47, 937*i*.
The interlayer spacing *c* of graphite was deduced from the spacings of the 0008 and the 1126 lines in the x-ray photographs of three graphite specimens: A_3 which was the most cryst. one, Ceylon graphite and A_2 which was the least cryst. one. Designating the proportion of disoriented layers in the specimen by *p*, even on the assumption of a random distribution of disoriented layers in a parallel stack of graphite layers, the relation between *p* and the mean value of *c* was linear when *p* was small.

13542. Bacon, G. E. and Franklin, R. E. **The *a* dimension of graphite.** *Acta Cryst.* 4, 561-2 (1951)(in English).—*C.A.* 47, 938*b*.
Warren's equation of the displacement of the maxima of the (*hk*) bands in random-layer structures was used to account for the difference in the values of the *a* dimension of graphite specimens of different degrees of cryst. imperfection. These were deduced from the positions of the (*hki0*) lines in x-ray photographs.

13543. Besairie, Henri; Guigues, Jean; Laplaine, Louis, and Lautel, Robert. **Graphite in Madagascar.** *Haut Comm. Madagascar et Dependances, Trav. Bur. Geol.* No. 27, 1-94(1951).—*C.A.* 45, 6546*b*.
Mining operations and flotation concn. of graphite were described.

13544. Bishui, B. M. **The fluorescence in diamond excited by x-rays.** *Indian J. Phys.* 25, 575-80(1951).—*C.A.* 46, 6939*e*.
The spectra of Type I (common) and Type II (rare) diamonds excited by x-rays were photographed and compared with those excited by ultraviolet light. The x-ray-excited spectrum of Type I showed continuous fluorescence between 3700 and 5650 A., while Type II showed no fluorescence in the visible region.

13545. Burdick, Milton D.; Zweig, Benson, and Moreland, R. Eugene. **Linear thermal expansion of artificial graphites to 1370°.** *J. Research Natl. Bur. Standards* 47, 35-40(1951)(Research Paper No. 2225).—*C.A.* 46, 1321*c*.
The linear thermal expansion in vacuum of 3 grades of artificial graphite was detd. at 20°-1370°C. Three samples were cut from each of the

3 graphite blocks, 2 perpendicular and 1 parallel to the extrusion- or molding-pressure direction. These were machined into right cylinders 3/8 in. in diam. and 2 in. in length. Expansion measurements were made with a dilatometer. The vacuum was less than 2 × 10^{-4} mm.

13546. CROFT, R. C. AND THOMAS, R. G. **Lamellar compounds of graphite with chromyl chloride and chromyl fluoride.** *Nature* **168**, 32-3(1951). —*C. A.* **45**, 9410*i*.

Graphite complexes were prepd. by treating warm CrO_2Cl_2 or CrO_2F_2 with graphite. The CrO_2Cl_2 complex contained from 43.0% to 36.3% CrO_2Cl_2, depending on the fineness of the graphite. The lamellar nature of the compd. was confirmed by x-ray diffraction data, which showed C layer plane distances of 3.45 A. for graphite and 9 A. for the new compd. Heating to 200°-300°C released the CrO_2Cl_2, exfoliated the graphite, and caused at least a hundred-fold increase in its vol.

13547. FIELD, F. H. **New calculation of the latent heat of sublimation of carbon and the first carbon-hydrogen dissociation energy in methylene from electron-impact data.** *J. Chem. Phys.* **19**, 793(1951).—*C. A.* **45**, 7396*d*.

The energy of removing a H atom from CH_2, calcd. from data in the literature was either 88 or more than 93 kcal/mole; the former was preferred. The 4 successive heats of dissocn. of CH_4 were, then, 101, 92, 88, and 80 kcal/mole. This led to 139 kcal/mole for the heat of sublimation of carbon.

13548. FRANKLIN, ROSALIND E. **Graphitizable and nongraphitizable carbons.** *Compt. rend.* **232**, 232-4(1951).—*C. A.* **45**, 6895*d*.

Carbons that did not form graphite up to 3000°C (from sugar, O-rich oils, and the pyrolysis of polyvinylidine chloride) resulted when a rigid and porous structure was formed below 500°C. These carbons when prepd. at 1000°C contained graphitic packets of 2-4.5 layers with layer diams. 12-20 A. and they showed strong scattering of x-rays at small angles. When heated between 1000° and 3000°C the packets grew to no more than 12 layers with diams. to 70 A. Graphitizable carbons (from petroleum coke, pitch coke, and the pyrolysis of polyvinyl chloride) were less porous when prepd. at low temps. and showed less x-ray scattering at small angles.

13549. FRANKLIN, ROSALIND E. **The structure of graphitic carbons.** *Acta Cryst.* **4**, 253-61 (1951).—*C. A.* **45**, 8840*e*.

In the graphitic carbons the graphite-like layers were grouped in parallel packets within which there was a random distribution of oriented and disoriented layers. The interlayer spacing in the nongraphitic carbons was const. at 3.44 A. and in graphite it was const. at 3.354 A. In the graphitic carbons the apparent interlayer spacing decreased with increasing graphitization. Whatever the degree of graphitization, the small groups of orientated and disorientated layers within the parallel-layer packet retained the spacings characteristic of graphite and the nongraphitic carbons, resp.

13550. FREEMAN, G. P. AND VELDEN, H. A. VAN DER. **Some aspects of the counting properties of diamond.** *Physica* **17**, 565-72(1951)(in English). —*C. A.* **46**, 355*i*.

Counting properties of a diamond crystal were studied with a Po-source. The product of the mobility and the mean free time was 5.3 × 10^{-5} cm^2/v. The energy required to liberate one electron in a diamond crystal ≦ 8.6 e.v. The ultraviolet-transparent parts of the crystal (diamond 11) were responsible for the counting of α-particles.

13551. GREEN, LEON, JR. **The behavior of graphite under alternating stress.** *J. Applied Mechanics* **18**, 345-8(1951).—*C.A.* **46**, 695*h*.

The fatigue properties of grade-AUF extruded polycryst. graphite were investigated at ambient and elevated temps. This graphite had a high degree of grain orientation and was graphitized at 3000°C. The endurance limit of this graphite was found to increase from 2500 p.s.i. at room temp. to about 4400 p.s.i. at 3550°C.

13552. GUPTA, N. N. **Formation of graphite at 1000°C.** *J. Sci. Ind. Research* (India) **10B**, 122(1951).—*C. A.* **45**, 8859*a*.

Several org. substances were exposed to high temps. and pressures. X-ray examn. indicated that graphite was formed. The elec. conds. of these substances were similar to those of graphite, and the sp. gr. was greater than that of water.

13553. HADERT, HANS. **Colloidal graphite.** *Seifen - Öle - Fette-Wachse* **77**, 170-1(1951).—*C. A.* **45**, 6823*e*.

The use of colloidal graphite was reviewed.

13554. HENNING, GERHART. **The properties of interstitial compounds of graphite. I. The electronic structure of graphite bisulfate.** *J. Chem. Phys* **19**, 922-9(1951).—*C. A.* **46**, 337*e*.

The elec. resistance, temp. dependence, and the Hall coeffs. of graphite bisulfate compds. were detd. at various oxidation stages. The measurements indicated that the oxidation removed electrons from a nearly full conduction band. Reduction of the lamellar bisulfate compds. produced residue compds. which retained about a third of the bisulfate ions and half the H_2SO_4 originally present in the lamellar compds.

13555. HÉROLD, ALBERT. **Action of potassium on graphite.** *Compt. rend.* **232**, 838-9(1951).—*C. A.* **45**, 6110*b*.

Curves of temp. *vs.* compn. for the system K-graphite indicated the existence of KC_8, KC_{24}, and KC_{40}. A sudden change in compn. near 107°C was manifested by a change in color from brown ocher to deep blue.

13556. ISHIKAWA, SEICHI AND HIRABAYASHI, KIHO. **Natural graphite. I. Purification.** *Repts. Sci. Research Inst.* (Japan) **27**, 482-5(1951).—*C. A.* **46**, 6340*b*.

Natural graphite after pulverizing (to 2-5 μ in diam.) was fused with NaOH at 600°-800°C for 30 min. and boiled with dil. HCl in a Ni crucible, repeating the process twice. The ash content was reduced to 0.1%.

13557. Kitano, Yoshiharu and Komatsu, Kôzô. **Electrical conductivity of graphite.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. **36**, 41-55(1951).—*C.A.* 46, 6890*g*.

Math.-theoretical calcn. was given of the elec. cond. of graphite according to the Block theory of metals. The agreement with exptl. results was poor, the cause of which may be an assumption for the transition probabilities of electronic energy levels.

13558. Kitazaki, Umeka. **Fine structure of graphite.** *Misc. Repts. Research Inst. Nat. Resources* No. **24**, 21-7(1951).—*C.A.* 47, 937*g*.

X-ray and electron-diffraction analyses of several natural and artificial graphite specimens showed that scaly graphite was most orderly oriented, earthy graphite less orderly, and Acheson's colloidal graphite the least orderly. With increasing graphitization graphite layers increased progressively in size and no. per parallel packet, and the apparent interlayer spacing decreased.

13559. Klick, Clifford C. and Maurer, Robert J. **Mobility of electrons in diamond.** *Phys. Rev.* **81**, 124-30(1951).—*C.A.* 45, 2304*i*.

The mobility of electrons in diamond was measured by means of the Hall effect. The mobility was inversely proportional to the 3/2 power of the abs. temp. The measured room-temp. value of the mobility was 900 as compared with the theoretical estimate of 156 $cm^2/v.$-sec.

13560. Komatsu, Kôzô and Nagamiya, Takeo. **Theory of the specific heat of graphite.** *J. Phys. Soc. Japan* **6**, 438-44(1951).—*C.A.* 46, 5419*h*.

The graphite crystal was considered to be a system of thin elastic plates spaced at a const. distance of 3.40 A. The vibrations of the system were separated into independent parts: the bending vibrations in which the displacements were normal to the planes of the plates, and the extensional and shearing vibrations in which the displacements were parallel to the plates. The consts. of the elastic force acting on neighboring plates were derived from the measured elastic consts. of graphite, mainly the compressibility. Observed values of the sp. heat were lower than the calcd. values up to 270°K, and the values of C_p as calcd. by the Debye formula were considerably lower than either calcd. or observed values for temps. up to approx. 700°K.

13561. Lukesh, Joseph S. **The possible identity of rhombohedral and orthorhombic graphite.** *J. Chem. Phys.* **19**, 383-4(1951).—*C.A.* 45, 6893*g*.

The possible relation was discussed between the satellite reflections observed in single-crystal photographs and the extra reflections frequently found in powder photographs of graphite. The superstructure reflections could not be due to the rhombohedral form, nor were they due to impurities. The orthorhombic character apparently was inherent in the graphite structure, possibly as a result of a localization of a bond of order 1/2.

13562. Lukesh, Joseph S. **Anomalous x-ray diffraction spectra in graphite.** *J. Chem. Phys.* **19**, 1203-4(1951).—*C.A.* 46, 3391*g*.

A sample of graphite was made the anode and electrolyzed in a KBr soln. The sample then showed x-ray peaks at the positions of 5 of the rhombohedral reflections. It was not certain whether oxidation occurred or whether Br entered the lattice. Several other anomalous spectra (nonrhombohedral) appeared after the Br treatment; notable were lines at 27°15′, 38°30′, and 63°30′.

13563. Lukesh, Joseph S. **The symmetry of graphite.** *Phys. Rev.* **84**, 1068(1951).—*C.A.* 46, 4310*a*.

With Mo $K\alpha$ radiation, the earlier results were confirmed and extended.

13564. Maire, Jacques. **The reaction of Brodie mixture with graphitizable and nongraphitizable carbons.** *Compt. rend.* **232**, 61-3(1951).—*C.A.* 45, 6110*c*.

The Brodie reaction (formation of graphitic acid by means of HNO_3 + $KClO_3$ at 60°C), with different kinds of carbons was followed by gain in wt and by x-ray diffraction. Wt of $KClO_3$ used was 10 times that of the carbon, and 30 ml of HNO_3 was used. The reaction time was 1 hr, and the carbon was 200-250 mesh. Nongraphitizable carbons did not increase in wt and their x-ray patterns did not change; graphitizable carbons increased in wt by 20-40%, and their x-ray patterns indicated almost complete change to graphitic acid. The same cross-links which, in nongraphitizable carbons, prevented the rearrangement of the graphite crystallites to form graphite, also prevented the expansion of the structure involved in forming graphitic acid.

13565. Malmstrom, C.; Keen, R., and Green, L. Jr. **Some mechanical properties of graphite at elevated temperatures.** *J. Applied Phys.* **22**, 593-600(1951).—*C.A.* 45, 6817*g*.

The short-time tensile breaking strength of various grades of graphite was measured as a function of temp. from room temp. to the sublimation point. A characteristic common to all the strength *vs.* temp. curves was that the strength approx. doubled in going from room temp. to about 2500°C and then decreased rapidly to zero near the sublimation point. Graphite could be used as a structural material at temps. much higher than those permissible with other materials.

13566. McDonald, A. D. and Benfield, D. A. **Recovery of diamond from scrap sintered tungsten carbide.** *Ind. Diamond Rev.* **11**, 155-7(1951).—*C.A.* 46, 7681*f*.

Break material contg. diamonds > 14 mesh into 12-g pieces, heat overnight at 800°C, and fuse with NaOH. Ext. first with water and then with HCl. Alternate method. Crush material contg. diamonds < 60 mesh and fuse with 10:1 $NaOH:NaNO_3$ 4-5 hrs with hourly addn. of $NaNO_3$. Ext. with HCl or 1:1 $HCl:HNO_3$.

13567. Mizushima, Sanchi and Okada, Jun. **Notes on the electrical and thermal conductivities**

of graphite and amorphous carbon. *Phys. Rev.* 82, 94-5(1951).—*C.A.* 45, 4889*h*.

Values of ρT (resistivity times, abs. temp.) were plotted at 300-1300°K for carbon filaments graphitized 0.5 hr at 2000°, 2500°, and 3000°C, and for 1 hr at 3000°C. The variation with temp. (80°-3000°K) of the thermal diffusivities of various samples of carbon and of silica were plotted.

13568. MORGENSHTERN, Z. L. **Mechanism of the luminescence of diamonds.** *Zhur. Exptl. Teoret. Fiz.* 21, 230-5(1951).—*C.A.* 45, 7876*d*.

Different samples of diamond showed the fluorescence line 415 mμ and the accompanying bands; some showed also the 503-mμ line and less-marked accompanying bands. In one sample the 415-mμ system was absent. This diamond showed an afterglow sufficiently bright and long for the detn. of the decay law which proved to be hyperbolic $I = (a + bt)^{-2}$, with a and b depending on the exciting intensity E. Diamonds with the typical fluorescence spectrum did not decay hyperbolically, but along a curve resulting from 2 exponentials.

13569. MÜLLER, H. **A method for approximate determination of the location of energy bands in crystals.** *Ann. Physik* 9, 141-50(1951).—*C.A.* 46, 802*i*.

Application of the method of Wigner and Seitz, and that of Slater with H-functions permitted estn. of the position of energy bands in crystals. The functions depended on a known empirical parameter. The effect of lattice structure could be distinguished from that of the atoms. Results were given for C (diamond), Si, and Ge.

13570. OWEN, W. S. AND STREET, B. G. **The crystal structure of graphite in cast iron.** *J. Iron Steel Inst.* (London) 167, 113-16(1951).—*C.A.* 45, 4621*a*.

Examn. by the x-ray powder method of graphite extd. from an Fe-C-Si alloy of high-purity materials and of graphites from com. cast Fe indicated no variation in the size of the unit cell from the accepted value for pure graphite. Graphite from these sources was, therefore, concluded to be appreciably pure C.

13571. RAMAN, C. V. **Luminescence of diamond. IV.** *Current Sci.* (India) 20, 55-60(1951).—*C.A.* 45, 8894*f*.

The structure and crystal symmetry of diamond, crystal form, and the origin of the blue and green luminescence was given together with photographs of diamond crystals.

13572. SEN GUPTA, PRABHAT K. **The limits of predissociation in the spectrum of carbon monoxide and the latent heat of sublimation of graphite.** *Indian J. Phys.* 25, 267-73(1951).—*C.A.* 46, 7426*h*.

From a survey of available data on predissocn. phenomena in CO, the energy of dissocn. into C (^{3}P) and O (^{3}P) was 8.87 e.v., and the latent heat of sublimation of graphite into C (^{3}P) atoms, 118.74 kcal.

13573. SEN GUPTA, PRABHAT K. **Energy of dissociation of carbon monoxide and the latent heat of dissociation of graphite.** *Science and Culture* 16, 534-5(1951).—*C.A.* 46, 8930*i*.

The value 8.87 v., taken for the dissocn. of CO into $C(^3P)$ and $O(^3P)$, explained satisfactorily the predissocn. phenomena in the spectrum of CO and led to values for the heat of sublimation of graphite of 118.74, 147.80, and 180.31 kcal. according as the products of dissocn. were $C(^3P)$, $C(^1D)$, or $C(^1S)$ atoms, resp.

13574. SÖHNGEN, R. **Graphite heat exchangers.** *Chem.-Ing.-Tech.* 23, 81-5, 165(1951).—*C.A.* 45, 5981*d*.

Phys. data and structural details were presented for exchangers of German design.

13575. STRAUMANIS, M. E. AND AKA, E. Z. **Precision determination of lattice parameter, coefficient of thermal expansion, and atomic weight of carbon in diamond.** *J. Am. Chem. Soc.* 73, 5643-6(1951).—*C.A.* 46, 2369*g*.

The lattice parameters of 4 kinds of diamond, white boart, gray boart, and two stones of gem quality, were detd. at the const. temps. 10°, 20°, 30°, 40°, and 50°C (± 0.02°) by use of the asymmetric method with a 64-mm precision x-ray camera. Spectrographic analysis revealed the presence of traces of 15 elements in the samples. The results indicated that the diamond lattice was sound; there were neither vacant sites nor interstitial atoms. The minor impurities found in diamond samples were not dissolved but mechanically included.

13576. TATEVSKIĬ, V. M.; MENDZHERITSKIĬ, E. A., AND KOROBOV, V. V. **The additive scheme of the heats of formation of hydrocarbons and the problem of the heat of sublimation of graphite.** *Vestnik Moskov. Univ.* 6, No. 5, *Ser. Fiz. Mat. i Estest. Nauk* No. 3, 83-6 (1951).—*C.A.* 46, 333*d*.

A change of datum could cause only a change of the numerical values of the heats of the different types of C—C bonds and of the C—H bond, but could not affect the validity of the scheme itself. For this statement to be valid, it was sufficient that, for each class of hydrocarbons, the no. n of C atoms be representable as a linear combination of the nos. n_1, n_2,....of C—C bonds of each type, and of m, of the form $n = \alpha n_1 + \beta n_2 + \ldots \gamma m$, where the coeffs. α, $\beta \ldots \gamma$ were consts.

13577. WEAVIND, R. G.; WOLF, I., AND YOUNG, R. S. **Flotation of diamonds.** *Trans. Am. Inst. Mining Met. Engrs.*, *Tech. Note*, No. 76B (in *Mining Eng.* 3, No. 7, 596)(1951).—*C.A.* 45, 8167*e*.

Flotation of — 16 mesh diamonds, which were naturally H_2O repellent, may be carried out using either Aerofloat 25 (0.15 lb per ton) together with cresylic acid (0.18 lb per ton), or du Pont B23 as frother with kerosine as auxiliary oily conditioner or froth stiffener. A pH between 7 and 9, and a 5- to 10-min. flotation period were necessary. Diamonds larger than 16-mesh could not be recovered satisfactorily by flotation.

13578. WEGLORZ, EMIL. **Retort graphite.** *Gaz, Woda i Tech. Sanit.* 25, 278-80(1951).—*C.A.* 46, 5896*e*.

Phys. and chem. properties, and industrial applications of retort graphites obtained from 34 gas works were given, also the chem. compns. of ashes contained in them.

13579. Young, R. S. and McDonald, A. D. **Diamonds from dust.** *Iron Age* 167, No. 26, 76-7 (1951).—*C. A.* 45, 8221*g*.

The liquid was sepd. from the nonmagnetic portion, and the powder heated in a muffle furnace to 400°C for 0.5 hr. The magnetic material also contained some diamond powder; this could be recovered by fusion with twice its wt of KOH contg. about 1% K_2CO_3 and 1% KNO_3, cooling, boiling with water, washing out the alkali, heating with 9 parts of HCl and 1 part of HNO_3, washing the residue, and heating to 400°C.

13580. Bacon, G. E. **The decrease of the crystalline perfection of graphite by grinding.** *Acta Cryst.* 5, 392(1952).—*C. A.* 46, 7392*e*.

The decrease of crystallite size and perfection on grinding of elec.-furnace graphite was investigated.

13581. Brennan, Robert O. **The interlayer binding in graphite.** *J. Chem. Phys.* 20, 40-8 (1952).—*C. A.* 46, 6481*i*.

The repulsive energy between layers of the graphite crystal was calcd. as an interaction of linear combination of at. orbitals mol. orbitals in the layers. The van der Waals attractive term was found by setting the energy min. to fall at 3.37A. When values of the effective nuclear charge and effective quantum no. were used, the interlayer binding energy was 3.99 kcal/mole. The compressibility, calcd. under plausible assumptions, was in satisfactory agreement with the exptl. value.

13582. Brewer, Leo. **Recent determinations of the vapor pressure of graphite.** *J. Chem. Phys.* 20, 758-9(1952).—*C. A.* 46, 8921*f*.

Expts. indicated that *f*, the sticking coeff., cannot be very small. Perhaps C_2 had a high and C a low *f* value. The method of presenting the vapor-pressure data was discussed.

13583. Dienes, G. J. **Mechanism for self-diffusion in graphite.** *J. Appl. Phys.* 23, 1194-1200(1952).—*C. A.* 47, 1453*a*.

Calcns. for vacancy and direct interchange mechanisms were based on at. interactions within the graphite hexagonal layers. These interactions were obtained from the known systematic change of C-C bond strength with interat. distance. For calcg. the energy of formation of an interstitial C atom, a potential function was devised to account for interaction between the planes, consisting of 2 terms, a van der Waals' attraction and an exponential-type repulsion. The adjustable consts. were evaluated from known phys. data. The interplanar cohesive energy of graphite was 4.36 kcal/mole.

13584. Doehaerd, Th.; Goldfinger, Paul, and Waelbroeck, F. **Direct determination of the sublimation energy of carbon.** *J. Chem. Phys.* **20**, 757(1952).—*C. A.* 46, 8921*d*.

Rates of evapn. from a hot carbon surface and of effusion from a graphite furnace were detd. over the range 2450° to 2840°K. The sticking coeff. *f* was much smaller than unity and the results lead to the spectroscopic value of 141.26 kcal/mole for the heat of sublimation of carbon. The rate of effusion per unit aperture area increased with decreasing ratio of aperture area to total area. The results were compatible with a value of *f* between 1/500 and 1/5000.

13585. Eyring, Henry and Cagle, F. William Jr. **An examination into the origin, possible synthesis, and physical properties of diamonds.** *Z. Elektrochem.* 56, 480-3(1952)(in English).—*C. A.* 46, 11051*g*.

A consideration of the geol. formation of diamonds indicated that they were formed at great depth and under conditions of thermodynamic stability. An explanation of some of the properties of the diamond was offered in terms of its highly localized electronic bonding.

13586. Faris, F. E.; Green, L. Jr., and Smith, C. A. **The thermal dependence of the elastic moduli of polycrystalline graphite.** *J. Appl. Phys.* 23, 89-95(1952).—*C. A.* 46, 4305*a*.

Young's modulus and the shear modulus of grade SA-25 molded graphite and grade AUF extruded graphite were measured as functions of temp. in the range from 25° to 2000°C. In the case of the extruded material, variations of the 2 moduli with position and direction relative to the axis of extrusion were also investigated. The moduli increased with temp., a behavior in contrast with that exhibited by most materials. The bulk modulus and Poisson's ratio at room temp. were calcd. from the data for the nominally isotropic SA-25 graphite to be 6×10^{10} dynes/cm^2 and 0.27, resp.

13587. Feldman, M. H.; Goeddel, W. V.; Dienes, G. J., and Gossen, W. **Studies of self-diffusion in graphite using carbon^{14} tracer.** *J. Appl. Phys.* 23, 1200-6(1952).—*C. A.* 47, 1453*f*.

Self-diffusion in graphite was measured from 1835° to 2370°C by observing the penetration of C^{14} tracer initially applied to one end of a graphite rod. The exptl. data agreed with a diffusion mechanism consisting of concurrent vol. and grain-boundary processes.

13588. Ganzhorn, K. **Homopolar and metallic bonds of diamonds.** *Naturwissenschaften* 39, 62(1952).—*C. A.* 47, 376*f*.

The diamond lattice could be calcd. on the basis of homopolar directional bonds between neighboring atoms as well as on the basis of cell structure with metallic bonds. Both calcns. led to the same system of energy bands.

13589. Grenville-Wells, H. J. **Diffraction effects observed in diamond in the vicinity of the collimated incident beam.** *Acta Cryst.* 5, 146-7(1952).—*C. A.* 46, 4309*i*.

The presence of strong absorption conics on divergent-beam photographs of diamond indicated that there should be a diminution in the intensity of the transmitted beam when the crystal was in the Bragg position. An attempt to observe this photographically with Cu *Kα* radiation, monochromatized by reflection from a calcite crystal, was made for the (111) reflection from a diamond plate.

13590. GRENVILLE-WELLS, H. J. **The graphitization of diamond and the nature of cliftonite.** *Mineralog. Mag.* **29**, 803-16(1952).—*C.A.* 46, 4429*c*.

Complete conversion of diamond to graphite was always polycryst., but the partial conversion showed a strong preferred orientation. When a diamond was graphitized either a hexagonal close-packing structure (common) or a cubic close-packing structure (rare) occurred. Upon heat-treatment, the preferred orientation of the graphite formed on a cube and on an octahedron of diamond was identical, the hexagonal axis of the graphite being parallel with the trigonal axis of the diamond and independent of the habit.

13591. GURNEY, RONALD W. **Lattice vibrations in graphite.** *Phys. Rev.* **88**, 465-6(1952).—*C.A.* 47, 2008*c*.

In both natural and artificial graphites the crystallites were reported to be agglomerates of smaller units, each contg. perhaps not more than 12 to 17 well-ordered planes. For at. displacements perpendicular to a plane the restoring forces were much weaker than for similar displacements in the plane itself. For the latter the restoring forces were so strong that these lattice vibrations were not excited at low temps. The requisite adaptation of the Debye theory of sp. heat was given; it led to a T^2 law instead of the familiar T^3 law at low temps.

13592. HALL, G. G. **The electronic structure of diamond.** *Phil. Mag.* **43**, 338-43(1952).—*C.A.* 46, 10718*h*.

The theory of equiv. orbitals was applied to the case of diamond. Each orbital was localized and corresponded to a C—C bond. The equations were equally applicable to Si.

13593. HENNIG, G. AND MEYER, L. **Search for low-temperature superconductivity in graphite compounds.** *Phys. Rev.* **87**, 439(1952).—*C.A.* 46, 9403*g*.

Graphite and graphite compds. with Br, K, Ca, B, ammonium, and bisulfate were investigated for super-cond. down to 1.25°K. None became superconducting.

13594. HERMAN, FRANK. **Electronic structure of the diamond crystal.** *Phys. Rev.* **88**, 1210-11 (1952).—*C.A.* 47, 3076*i*.

The energy-band structure of diamond was investigated by means of Herring's orthogonalized plane wave method. Some features of this solution differed significantly from previous results.

13595. HOWE, JOHN P. **Properties of graphite.** *J. Am. Ceram. Soc.* **35**, 275-83(1952).—*C.A.* 47, 373*a*.

Graphite crystals were highly anistropic. Special properties were largely due to the strong semimetallic bonds between C atoms in plane layers and to the relatively weak bonding between planes. Details of structure were partly due to the Frank dislocation mechanism for crystal growth. Graphite crystals were easily deformed in slip on the basal plane, but in polycryst. form were stong at high temps., various forms of graphite having breaking stresses of approx. 4000-7000 p.s.i. above 2400°C.

13596. ISHIKAWA, SEIICHI AND HIRABAYASHI, KIHO. **Natural graphite. II. Preparation of colloidal graphite.** *Repts. Sci. Research Inst.* (Japan) **28**, 313-15(1952).—*C.A.* 47, 6617*g*.

Natural granular graphite was most easily dispersed in $0.003N$ NaOH by Bredig's method into colloidal graphite. One sample mass-produced by passing a 200-v. 3-phase a.c. between 3 graphite electrodes in the NaOH contg. natural graphite was composed microscopically mainly (90%) of particles 0.5-2.0 μ in diam. with scattering of those 3-10 and below 0.5 μ.

13597. KEYSER, W. L. DE AND CYPRES, R. **Preparation of graphite for (use) in nuclear reactors.** *Bull. centre phys. nucleaire univ. Bruxelles* No. 35, 28 pp. (1952).—*C.A.* 47, 4063*i*.

The optimum temp. for coking gas in a graphite resistance furnace was found to be 1400°C. Higher temp. favored coke production and the higher-temp. coke gave the best graphite. Impurities especially B, were eliminated by the use of carbon of high purity as a refractory as well as for the electrode. Traces of B were evolved from the electrode but did not condense in the coke since it formed preferentially at the hottest part of the furnace. Graphitization of the coke was carried out at 2600°-2800°C. Other impurities of graphite were found to be Ca, Mg, Cu, Si, and Fe.

13598. KLEMENS, P. G. **Lattice imperfections of diamond.** *Phys. Rev.* **86**, 1055(1952).—*C.A.* 46, 8452*e*.

13599. KOBAYASHI, SHIGEHIRO. **Elastic constants of diamond.** *Busseiron Kenkyû* (Researches on Chem. Phys.) No. 49, 34-40(1952).—*C.A.* 46, 5923*g*.

A secular equation of the normal modes of vibration for the diamond lattice was set up and the acoustic part solved. The relations among elastic const. C_{11}, C_{12}, and C_{14} and force consts. K_1, K_2, and K_3 were: $C_{11} = (K_1 + 12K_2 + 12K_3)/3a$, $C_{12} = (K_1 - 6K_2 + 6K_3)/3a$, and $C_{14} = (K_1 + 2K_2 + 6K_3)/3a$, where a is the lattice const. of diamond. The more general treatment, which took account of the interaction between the optical and the acoustic parts of the normal vibration, led to a different expression for C_{14}, i.e. $C_{14} = [\{18K_1K_2/(K_1 + 8K_2)\} + 6K_3]/3a$. $K_1 = 3.11$, $K_2 = 0.200$, and $K_3 = 0.377$ (in units of 10^5 dynes/cm).

13600. KRISHNAN, K. S. AND JAIN, S. C. **Thermionic constants of graphite.** *Nature* **169**, 702-3(1952).—*C.A.* 46, 9968*f*.

The method was based on the detn. of the satn. vapor pressure of the electron gas in equil. with the substance at different temps.

13601. MEYER, LOTHAR; PICUS, G. S., AND JOHNSTON, W. G. **Electric conductivity of graphite at liquid-helium temperatures.** *Proc. NBS Semicentennial Symposium Low-Temp. Phys., Natl. Bur. Standards Circ.* **519**, 249-52(1952).—*C.A.* 47, 5201*e*.

Graphite filaments were produced by thermal decompn. of pure CH_4. The filaments showed strong orientation of the graphite planes parallel to the filament axis. From the width of the x-ray diffraction lines the grain size of the graphite was estd. to be 200-300 A. Filament resistances were measured from 1°K to room temp.

13602. MROZOWSKI, S. **Semiconductivity and diamagnetism of polycrystalline graphite and condensed ring systems.** *Phys. Rev.* 85, 609-20 (1952).—*C.A.* 46, 5383*b*.

The electronic current in substances extending from condensed-ring mol. solids to polycryst. graphite flowed preferentially along the benzene-ring planes. Scattering of electrons was due to thermal lattice vibrations and to the boundaries of mol. planes, where electrons passed through potential barriers into the neighboring crystallites. When, in the process of carbonization, foreign atoms were removed from peripheries, the C atoms left with free, unattached valencies played a role of donors and became a source of conduction (excess) electrons.

13603. OKADA, JUN AND IKEGAWA, TATSUO. **Electrical resistivity of artificial graphite.** *J. Applied Phys.* 23, 1282-3(1952).—*C.A.* 47, 3644*h*.

The effect was studied of calcining temps. of coke used to make graphite on the elec. resistivity of graphite manufd. from it.

13604. O'KEEFE, PHILIP. **Carbon and graphite materials and parts.** *Materials and Methods* 35, No. 4, 119-34(1952).—*C.A.* 46, 5896*d*.

Chem., phys., mech., and elec. properties, design and fabrication, and applications of carbon materials were given.

13605. PRINGSHEIM, PETER AND VORECK, RUTH CASLER. **Color centers in diamonds.** *Z. Physik* 133, 2-8 (1952).—*C.A.* 47, 2603*g*.

Two samples of diamond of type 1 and one of type 2 (the former having the ultraviolet absorption edge at 3200 A., the latter at 2300 A.) were exposed to irradiation by fast neutrons. A new absorption extending from the ultraviolet to the blue-green gave the crystals a bluish tinge; in addn. a flat absorption peak appeared at 6200 A. A sharp line at 5030 A. occurred in both the absorption and the fluorescence of some diamonds. Similarly, a band at 4156 appeared in blue-fluorescent diamonds of type 1.

13606. SOHNGEN, RUDOLF. **Investigation of strength properties of graphite as a basis for the design of pressure equipment.** *Chem.-Ing.-Tech.* 24, 485-92(1952).—*C.A.* 47, 4*g*.

Three types of graphite, unimpregnated (porosity 12-13%), normal and special impregnated, were tested at -50°, 20°, and 150°C for tensile, compressive, bending, and impact strengths. On the basis of the results it was recommended that a safety factor of 9 be used (as for cast iron) for impregnated materials.

13607. WAELBROECK, F. **Mechanism of evaporation of graphite.** *J. Chem. Phys.* 20, 757-8(1952).—*C.A.* 46, 8921*e*.

The sticking coeff. of carbon was complex. Discrepancies between exptl. results and theoretical calcns. largely disappeared if it was assumed that the rate of evapn. from a graphite surface was detd. mainly by the rate of evapn. of C_2 mols., whereas C mols. predominated in the equil. gas mixt.

13608. WEAVIND, R. G. **The treatment and recovery of refractory diamonds.** *J. Chem. Met. & Mining Soc. S. Africa* 52, 243-64(1952).—*C.A.* 47, 4523*c*.

Diamonds which did not adhere to grease were difficult to recover because a film of Fe, Mg, and Ca salts rendered their surfaces wettable by water. Treatment of diamondiferous gravel contg. refractory diamonds with whale acid oil dissolved in NaOH rendered the diamond surfaces hydrophobic and left the gravel surfaces hydrophyllic.

13609. WOHLFARTH, E. P. **Electrostatic contribution to the elastic constants of solids with a diamond structure.** *Phil. Mag.* 43, 474-6(1952). —*C.A.* 46, 10746*b*.

The quasigeometrical effect was studied further by assuming central forces to act between every atom in the diamond lattice. By consideration of Ge and Si, the solids were stabilized by a contribution arising from a nonuniform distribution of electronic charge such as would reside in the directed-valency-bond method.

13610. WYNNE-JONES, W. F. K.; BLAYDEN, H. E., AND ILEY, R. **Magnetic studies of carbon and of the carbonizing process.** *Brennstoff-Chem.* 33, 268-73(1952).—*C.A.* 46, 11631*h*.

Diamagnetic susceptibilities in c.g.s. units per g varied from a max. of 6.2 to 6.3 for certain natural graphites down to values below 1 for carbon blacks. Measurements were made at 4 different field strengths and extrapolated to infinite field strength, in certain cases. The variable results for the graphites were attributed to variations in particle size or slight variations in structure. The natural graphites with the highest susceptibility values gave indistinct x-ray diffraction figures, while an electrode graphite with low ash content and a natural Ceylon graphite with relatively low susceptibility gave the sharpest diffraction figures. For the carbons, the method of prepn. was important.

13611. YOUNG, R. S.; SIMPSON, H. R., AND BENFIELD, D. A. **Determination of diamond.** *Anal. Chim. Acta* 6, 510-16(1952)(in English). —*C.A.* 46, 7935*i*.

Analytical procedures were outlined for detg. the diamond content of grinding wheels, drill crowns, saws, drills, hones, polishing powders and pastes, and other tools and materials employing industrial diamonds. The isolation and detn. of diamond was often a rather complicated task.

13612. EATHERLY, W. P. AND McCLELLAND, J. D. **Anisotropic susceptibility of polycrystalline graphite.** *Phys. Rev.* 89, 661-2(1953).—*C.A.* 47, 6727*f*.

A math. analysis and exptl. work showed that manufactured graphite had the same susceptibility as natural graphite, with a minor correction for intercryst. carbon, or for crystallites too minute to develop a cryst. field.

13613. MORRISON, A. W. **Delanium carbon and graphite.** *Research* (London) 6, 29-35(1953).—*C.A.* 47, 4582*g*.

Synthesis of carbon in a stable form from a mixt. of micronized coal and graphite by pressing into blocks or extruding into tubes and heating at a rate of 5°/hr until 1000°C was reached produced a new type of carbon. From this material Delanium graphite was produced by heating electrically to 2800°C. The properties and uses of the new forms of carbon were discussed.

13614. MROZOWSKI, S. **Electric resistivity of interstitial compounds of graphite.** *J. Chem. Phys.* 21, 492-5(1953).—*C.A.* 47, 5752*g*.

The formation of interstitial compds. was assumed to be accompanied by creation of excess holes in the otherwise full band of graphite. It was shown that a linear energy-momentum relation at the Brillouin-zone corners was incapable of explaining the decrease of the elec. resistance with oxidation. For a more general model, the decrease in relative resistance should be independent of temp. for large oxidations if suitable corrections for the initial conditions were made. Data for polycryst. graphite corrected for the existence of an energy gap and of excess holes in the untreated material gave curves that converged for higher oxidation with the curve for natural graphite.

13615. TOLANSKY, S. **Microtopography of diamond surfaces.** *Research* (London) 6, 8-15(1953).—*C.A.* 47, 4680*i*.

Natural, etched, abraded, and polished diamond faces were studied by interferometry and other optical means. New growth features were revealed, including the discovery that the trigon pattern characteristic of gemstone-quality diamonds was a growth phenomenon, rather than one due to etching. Etching of 111 faces produced triangles whose orientation opposed that of the trigons, and which sometimes resulted in a spiral linking of the triangles. Polishing of diamonds was shown to be inferior to that of glass and prohibitively expensive.

13616. TSUZUKU, TAKURO. **Structure and properties of graphite crystallites.** *Kagaku* (Science) 23, 32-3(1953).—*C.A.* 47, 3648*d*.

Electron microscopy and diffraction studies were made of carbon crystallites in the process of graphitization. The sample was artificial graphite prepd. at 2500°C in which the ash content was less than 0.05%. Microscopy specimens were prepd. by the suspension method and some were shadow-cast with Cr. Straight-line edges a few μ long were observed; this indicated that the configurational ordering as a single crystal extended over much wider region than expected from the diffuse width of Debye diffraction rings. Electron diffraction gave clear Laue spots of graphite. In every photograph, bending lines like those of folded paper were found which suggest that these platelets had considerable degree of freedom along the *c*-axis, being rather flexible.

Chapter VII. PREPARATION OF ADSORBENTS

VII-1. Preparation of Carbon Adsorbents

13617. Alexandrescu, Nestor C. **The process of preparation of charcoal sticks for reduction.** *Bull. Soc. chem. Romania* 1, 11-2(1919).—*B. C. A.* **1920A**, *ii*, 47.

The following process for the prepn. of charcoal sticks for use in the reduction test in qual. analysis was given: thin wood chips, were boiled for two min. in a 2.5% soln. of ammonium phosphate, and then dried at a temp. not to exceed 60°C. When it was required to carry out the test, half the stick was burnt, and then the test carried out in the usual manner on the substance previously mixed with sodium carbonate.

13618. Podrouzek, V. **Colloidal solution of elemental carbon.** *Chimie & industrie* Special No. 291-2(Mar. 1930).—*C. A.* 24, 5571.

Anodes were prepd. by molding very pure charcoal obtained by heating carbohydrates in a current of Cl_2. They were used to electrolyze a 10% $(NH_4)_2CO_3$ soln. under a very high c.d., cooling with water to prevent excessive heating until the anode was consumed. The soln. was dialyzed with stirring 30 days in an animal-membrane dialyzer. The contents of the dialyzer were filtered on a Schott crucible, washed and dried in a vacuum, giving a fairly hard, black product, contg. about 99.2% C, insol. in H_2O and acids, but easily disintegrated without residue in fairly dil. basic solns. to a very fine colloidal soln. with particles of a diam. of about 25mμ.

13619. Blayden, H. E.; Gibson, J.; Riley, H. L., and Taylor, A. **An x-ray study of carbonization—the effect of inorganic admixtures.** *Fuel* 19, 24-7(1940).—*C. A.* 34, 3047^9.

The addn. of certain inorg. reagents to cellulose produced only small alterations in the crystallographic properties of the chars prepd. from it at 600° and 1000°C. Small changes in the *a* dimension were recorded in certain cases, but none in the *c*. The considerable increase in carbon content which occurred in every case indicated that the primary action of the admixt. was the formation of nuclei around which aromatic condensation could occur.

13620. Brown, Harry L. **Bone char—its manufacture and industrial application.** *Paint, Oil Chem. Rev.* **102**, 10-11(March) 1940.

Crushed bones were carbonized in vertical iron retorts, closely sealed to exclude air. Coal was used as fuel, in addition to the volatile combustible gases from the bones. The off-take of the retorts were connected to a hydraulic main and then to condenser and scrubbers, where ammonia (2.5%) was absorbed, tar (4%) separated and the non-condensible gas (20%) conducted to holders, to be fed back to kiln. The carbonization of bone took about 8 hrs at 1100° to 1600°F. Each retort held about 300 lbs of bone and the coke yield was approximately 65%. The red hot char was dropped into coolers, which were immediately sealed to prevent loss of carbon. It was cooled for 24 hrs, dumped on belt conveyor, passed over magnetic pulley and graded.

13621. Costa, Ignacio M. **Preparation of active carbons from cereals.** *Anales inst. invest. cient. y tecnol.* (Univ. nacl. litoral, Santa Fe, Arg.) **10/11**, 127-34(1940-41)(Pub. 1942); *Industria y quim.* 4, 3-7(1942).—*C. A.* 37, 745^1; 36, 4999^5.

Wheat, maize, barley and millet were first carbonized in an Fe pan and then activated at 900°C in an Fe retort with steam superheated to 200°C. In another series, the cereals were mixed with a 50° Bé. soln. of $ZnCl_2$, the mixt. carbonized in the Fe pan, and then activated at 550°C in an atm. of CO_2; the carbon was washed with 10% HCl; then with H_2O, and dried at 110°C. The adsorbing power was detd. with a 0.1% methylene blue soln., and the adsorption isotherms drawn according to the Freundlich formula. The gas-adsorption efficiency was detd. with a current of Cl_2 dild. with 999 parts of air, at the rate of 1570 ml per min. The carbons compared favorably with com. products as color adsorbents, but were poor gas adsorbents.

13622. Dawson, T. R. and Gallie, G. **Carbon black from peat. I.** *J. Rubber Research* 9, 2-5(1940).—*C. A.* 34, 3888^2.

A sample of carbon black made from peat contained ash 9.73%, acetone-sol. substances 2.20% and d. 1.80. The coloring power in a ZnO-glycerol paste was 0.5 that of gas black, 0.75 that of lamp black and twice that of acetylene black. On the other hand, in rubber its coloring power was less than that of acetylene black.

13623. Alekseevskiĭ, E. V. and Klemushinskaya, N. V. **Activation of charcoal by potassium thiocyanate.** *J. Applied Chem. (U.S.S.R.)* 14, 914-27(1941)(French summary).—*C. A.* 39, 4214^9.

Activated charcoal was prepd. by satn. of pine splinters and apricot kernels with KSCN solns., followed by the carbonization step. Comparison with charcoals activated by solns. of other materials failed to show any advantage for the KSCN method. The pine splinters gave satisfactory products, while apricot kernels did not yield a product of adequate potency. In the former case the activation temp. of 900°C gave the most active product, which was suitable for use in the sugar industry.

13624. Alexa, Gheorghe and Rădulescu, Fluor D. **Activation processes for some kinds of carbon. I. Preparation of an active carbon from walnut shells.** *Soc. Chim. România Sect. Soc. romane Stiinte, Bul. chim. pură apl.* [2], **3A**, 107-26(1941-1942).—*C.A.* 38, 5384^4.

The I_2 no. was used as a measure of the activity (*A*). In the absence of air, walnut shells were carbonized at 300°C for 21 to 80 hrs. The *A*-value was very low and the particle size even smaller than that of the raw material. The product of such a prepn. was treated by two methods with a soln. of $ZnCl_2$: (1) shaking with the soln., (2) evacuation of the char followed satn. with the soln. After the latter treatment the *A*-value was higher. Comparisons were made of the active carbons, Acticarbon (coconut-shell), Decolarant-Mangal (wood carbon), and Carbomet (methane soot). Subsequent activation with H_2O vapor by the vacuum method for satn. produced a better carbon.

13625. ALEXA, GHEORGHE AND RĂDULESCU, FLUOR D. **Activation processes for some kinds of carbon. II. Preparation of an active carbon from walnut shells by impregnating the uncharred raw material with $ZnCl_2$.** *Soc. Chim. România Sect. Soc. romane Stiinte, Bul. chim. pură apl.* [2], **3A**, 127-40(1941-1942).—*C. A.* **38**, 5384^7.

Small pieces of crude walnut shells were satd. with a soln. of $ZnCl_2$ after evacuation, dried at 150°C, heated at 875°C for 5 hrs in a special electric quartz-tube furnace, and finally treated with H_2O vapors at 875°C for 3 hrs. The activity was greater than for carbon first charred and then treated with $ZnCl_2$ for H_2O vapor, and also the yield was better. A considerable part of the otherwise volatile material was converted into active carbon. Decreasing the amt. of $ZnCl_2$ decreased the yield and hardness of the carbon.

13626. ALEXA, GHEORGHE AND RĂDULESCU, FLUOR D. **Activation processes for some kinds of carbon. III. Preparation of an active carbon from grape seeds.** *Soc. Chim. România Sect. Soc. romane Stiinte, Bul. chim. pură apl.* [2], **3A**, 141-50(1941-1942).—*C. A.* **38**, 5384^8.

Air-dried grape seeds were subjected to vacuum and then satd. with a soln. of $ZnCl_2$. One part was carbonized after 2 hrs, a second part after 40 hrs. Carbonization was carried out in the elec. quartz-tube furnace for 5 hrs at 875°C and was followed by a 3-hr treatment with vapors of H_2O. Satn. with $ZnCl_2$ gave no noteworthy activity. No significant increase of activity was produced by the slow heating, or by treatment with vapors of H_2O. This low quality of carbon was traced back to the considerable fat content of grape seeds; the fat produced a poor active carbon.

13627. ARNBAK, L. AND DAMGAARD, J. **Wood charcoal and peat coke. Preparation in Jutland of carbon for gas producers.** *Kem. Maanedsblad nord. Handelsbl. kem. Ind.* 22, 144-8(1941); *Chem. Zentr.* 1942, I, 1578.—*C. A.* **37**, 3248^9.

The preparation of charcoal and peat coke in Jutland was described. It was done partly in earth mounds and partly in so-called French steel mounds. For use in gas producers on motor vehicles the latter was preferred, as contamination with sand was thereby avoided.

13628. BERTHELOT, CH. **Preparation and utilization of charcoal pellets "Actigaz" for gas producers in motor vehicles.** *J. soc. ing. automobile* 14, 92-6(1941).—*C. A.* 41, 588^c.

The charcoal was mixed with small amts. of coal tar, coal, wood tar, and some water into a paste which was molded into particles and then carbonized. The carbonized pellets constituted the fuel for the gas producer.

13629. DARRAH, WILLIAM C. **Vegetable constituents of coals.** *Econ. Geol.* 36, 589-611(1941).—*C. A.* **36**, 372^7.

Coal was considered to be a mixt. composed of (1) a considerable amt. of recognizable plant fragments showing microscopic cellular construction, (2) a small amt. of mineral in the form of ash derived in part from the original plant tissues, and (3) a considerable amt. of waxy material in a colloidal mixt. rich in hydrocarbons which served as a binder (vitrain) for the coal matrix.

13630. GILLET, A. AND FASTRÉ, M. L. **Carbonization of organic natural substances.** *Bull. soc. chim. Belg.* **50**, 239-56(1941); *Chem. Zentr.* 1942, I, 2734.—*C. A.* **37**, 3249^1.

Cellulose, glucose, and wood were carbonized in a current of N_2 at 440° and 505°C. Elementary analysis of the residue for C, H, and O in residue and volatile products was established. In the course of the carbonization, there was for some minutes a spontaneous splitting off of O_2 exclusively, while the C and H balance of the residue remained unchanged. After cellulose and glucose were carbonized for 2 or more hrs, an end product formed which had the composition of a glance coal.

13631. IONESCU-MATIU, AL. AND MAIOROVICI, C. **Preparation of activated charcoal from fruit pits.** *Chimie & industrie* 45, *Suppl. to No. 3, Special No.*, 163-73(1941); *Chem. Zentr.* 1942, I, 1778.—*C. A.* 37, 3249^6.

Methods for preparing activated charcoal from peach and apricot pits were studied. The kernels were removed and the shells broken down to 2-3 mm. For activation, 6 *N* H_2SO_4 was the best impregnating medium. Carbonization should be started while the material was still moist to facilitate removal of gaseous products. Final carbonization was effected by heating for 2 hrs at 1000°C in retorts with small vent holes. If $ZnCl_2$ was used for impregnation, washing with 2% H_2SO_4, then water, was required.

13632. KURIHARA, K.; YOSHIOKA, A., AND NINOMIYA, Y. **Studies on peat. I. Thermal decomposition of peat.** *J. Soc. Chem. Ind., Japan* 44, *Suppl. binding* 226-7(1941).—*C. A.* 44, 7511*e*.

Samples (0.2 g) of 3 kinds of peat (Tanemori I and II and Tenno) were heated in a thermobalance at 5°/min. in N_2 (50 ml/min.). Each peat showed a decrease in wt up to 125°C (H_2O), rapid thermal decompn. 200°-300°C, and slow decompn. 300°-600°C. In a modified Gray-King retort, 20-g samples were carbonized between 200° and 920°C and the products detd. Vigorous decompn. occurred at 200°-400°C; water near 300°C, gas 300°-400°C, and tar 400°-500°C. The gas was chiefly CO_2 below 300°C, hydrocarbons 500°-700°C, and H_2 above 700°C.

13633. KURIHARA, K. AND YOSHIOKA, A. **Studies on peat. II. The hydrogenation of peat.** *J.*

Soc. Chem. Ind., Japan **44**, *Suppl. binding* 250 (1941).—*C.A.* **44**, 7511*f*.

Tanemori and Tenno peat was hydrogenated in tetralin soln. at an initial pressure of 100 kg/cm^2 and temps. varying from 350° to 450°C with NiO, MoO_3, SnS, $SnCl_2$, or SnI_2 as catalyst. Hydrogenation proceeded smoothly giving an oil yield of about 37% for Tanemori peat and 45% for Tenno peat.

13634. NAGARAJA, A. AND JAIN, N. S. **Utilization of [sugar-factory filter-] press mud: preparation of a dyestuff.** *Proc. Sugar Tech. Assoc. India* **10**, 265-7(1941).—*C.A.* **37**, 5883^8.

Expts. on the manuf. of an activated carbon from the mud indicated the possibility of prepg. chocolate-colored S dyes. This was done by extg. with HCl or aqua regia, filtering, adding NaOH and S, and heating until nearly dry. Such dyes might be of use in producing khaki-dyed fabrics.

13635. PIROZHKOV, N. A. **New developments in the manufacture of carbon black.** *Kauchuk i Rezina* **1941**, No. 6, 41-3; *Chem. Zentr.* **1942, II**, 2431.—*C.A.* **38**, 2809^3.

In the manuf. of carbon black from mineral oil, the yields were increased by screening the flames and, by the installation of air bolters, the quality was improved. In the manuf. of thermal black in Borislav, the reflectors on the burners were enlarged, the supply of air was more closely controlled, and other details were improved, so that the yields increased and the operations were simplified.

13636. RAZOUS, P. **Manufacture of wood charcoal in mounds and portable kilns.** *Genie civil* **117**, 105-11(1941).—*C.A.* **37**, 1848^8.

On carbonization, deciduous wood gave charcoal 25-30, gas 18-25, tar 4-6 (coniferous wood up to 12% of tar) and AcOH 5-6%. White beech gave 83 kg and debarked oak 103.5 kg of charcoal per m^3 of wood. The construction and manipulation of simple mounds and those designed for tar recovery were described.

13637. BASORE, C. A. AND MOORE, O. C. **The production of lump charcoal from pine sawdust without a binder.** *Alabama Polytech. Inst., Eng. Expt. Sta., Bull. No.* 14, 33 pp. (1942).—*C.A.* **37**, 1584^4.

Fine pine sawdust was heated to 400°C for 14 min. in a mold provided with a loosely fitting piston; a pressure of 300 p.s.i. at a rate of application of 1 min. was applied to the dried and partly carbonized material for 20 sec. The briquettes were then immediately transferred to a retort maintained at 400°C and heated in the absence of air for 25 min. for smoke removal. The following results were obtained on subjecting the finished briquettes to the Bureau of Mines drop and tumbler tests before and after weathering for 8 weeks: 90.67%, 93.46% held by one-in. screen; 87.71%, 91.6% held by one-in. screen.

13638. BROOKS, R. L. **Charcoal from coconut shells.** *Proc. Agr. Soc. Trinidad & Tobago* **42**, 150-2(1942);- *New Guinea Agricultural Gazette* **1941**, *August*.

The adaptation of a 40-gal oil drum as a kiln was described.

13639. GALLO, A. **Animal black—its manufacture, properties and uses.** *Industrie chimique* **29**, 38-41(1942); *Chem. Zentr.* **1942, II**, 1385.—*C.A.* **37**, 5573^3.

Horizontal retorts were described in detail. Bones produced 60-5 kg of animal black from 100 kg bone, in addn. to NH_3 and water (corresponding to about 10-12 kg $(NH_4)_2SO_4$), 2-5 kg of tar, and approx. 15-20 kg of permanent gases. The heat content of these gases was utilized fully in this process.

13640. IMADA, FUSAO. **Studies on amorphous carbon. I.** *J. Electrochem. Assoc. Japan* **10**, 435-41(1942).—*C.A.* **44**, 9657*h*.

In the manuf. of active charcoal various materials were treated under ordinary or reduced pressure and the carbonizing process was observed. The relative adsorptive powers of the following charcoals for Cl_2 at 18°C were: camellia > oak > hemlock-spruce > cherry. Carbonized pitch was more effective than carbonized asphalt.

13641. MARTINDALE, C. **Two wartime measures: Making animal char and revivifying Hyflo Super-Cel.** *Proc. 16th Ann. Congr. S. African Sugar Tech. Assoc.* **1942**, 48-9; *Intern. Sugar J.* **45**, 126-7(1943).—*C.A.* **37**, 279^7.

Degreased bone was passed through 4 retort pipes isolated in a standard 8-tube char kiln; 2 or 3 passages were required to obtain satisfactory charring and pH. The product was stored until a char filter had been sweetened off and placed on top of the exhausted char immediately before washing off; after washing for 8 hrs with hot water, the new char passed along with the old through the revivifying furnace. Loss in weight from bone grit to finished char was 25%. Hyflo Super-Cel filter cake from Vallez filters was washed, air dried, and fed continuously into a flat-bed furnace (described) where the organic matter was partially burned off; recovery was 60%.

13642. QUARTAROLI, A. AND FONTANELLI, G. **The chemical structure of tricalcium phosphate and of calcium carbonate in phosphorites and bones.** *Ann. facoltà agrar. univ. Pisa* [*N.S.*] **5**, 416-35(1942).—*C.A.* **41**, 2520^e.

Phosphorites, bones, and artificial $Ca_3(PO_4)_2$ contained a tri-Ca phosphate of such a structure that excess of strong acid was required to form $CaHPO_4$ directly; $CaHPO_4$ contained in the superphosphates was formed by alteration from $Ca(H_2PO_4)_2$. Phosphorites and bones contained a certain amt. of $Ca_3(PO_4)_2$ which was not transformed into the mono-Ca and di-Ca salts, but only into H_3PO_4. $CaCO_3$ could not react completely with the acid if $Ca_3(PO_4)_2$ had not already reacted.

13643. SPOON, W. **Husks of Surinam palm seeds and tree seeds for the preparation of charcoal for gas adsorption.** *Ber. Afdeel. Handlsmuseum Konink. Ver. Kolon. Inst. No.* **186**, 1-12(1942); *Chem. Zentr.* **1943, I**, 1312.—*C.A.* **38**, 3456^2.

The properties of the charcoals and their adsorptive power for aq. I_2 solns. and ether vapor were given.

13644. SPOON, W. **Charcoal from** *Acacia decurrens (var. mollis)* **of the Dutch East Indies.** *Nederland. Boschbouw-Tijdschr.* 15, No. 8, 368(1942); *Ber. Afdeel. Handelsmuseum Kolonial Inst.* No. 185, 9 pp.—*C.A.* 40, 7573^9.

The acacia tree was cultivated for the high content of tanning material of its bark. Its wood was used for paper manuf. and charcoal. The latter was superior and more uniform than other charcoals and gave an excellent AcOH yield. The air-dry wood had a d. = 0.6-0.9. One m^3 of wood furnished 200 kg of charcoal (charred in piles). Acacia charcoal (0.5 g) was shaken at 25°C with 50 ml 0.05 *N* I_2 soln. After last filtration, the filtrate was titrated back with 0.05 *N* $Na_2S_2O_3$. The mg equiv. I/g charcoal = 1.13, which in 6 comparative tests was surpassed only by medium-fine and coarse beechwood charcoal (with 1.35 and 1.29, resp.).

13645. VANZETTI, BORTOLO L. **Carbon blacks from sugars: rontgenographic investigations.** *Rend. ist. lombardo sci.* 76, No. 2, 173-6(1942-43).—*C.A.* 42, 3637*g*.

Carbon blacks obtained by slow dehydration of sugars in H_2SO_4 were dried at 120°-18°C, powd., and rontgenographically investigated. They had no cryst. structure. When heated at 300°-1300°C they gradually assumed the graphitic structure.

13646. ERDOS, JOSÉ AND VIDOR, JORGE. **Activated carbon.** *Ciencia* (Mex.) 4, 77-81(1943).—*C.A.* 38, 1094^2.

A very active carbon was obtained by adding sawdust (500 g) to a mixt. of 150 ml of concd. H_2SO_4 and 600 ml of H_3PO_4 (85%), heating to 120-150°C, mixing, driving off the H_2SO_4 at 380-400°C, heating in an insulated retort of acid-resistant steel to 950-1000°C for 2 hrs, allowing to cool, washing until free from acid, drying at 120°C, grinding and sifting to a fineness of 1000 mesh. An activation temp. above 1100°C caused a rapid decline of the activity.

13647. IMADA, FUMIO. **Studies on carbon. I. Activation of amorphous carbon and preparation of active charcoal.** *Technol. Repts. Kyushu Imp. Univ.* 18, 47-52(1943).—*C.A.* 43, 5571*h*.

With conifers and breadleaves lignin was found to be the basis for active charcoal which was best prepd. by carbonizing the trees at 400-50°C under slightly reduced pressure, removing as rapidly as possible the volatile products by passing in steam from 280°C upward.

13648. IMADA, FUMIO. **Studies on carbon. III. Activation of charcoal.** *Technol. Repts. Kyushu Imp. Univ.* 18, 58-61(1943).—*C.A.* 43, 5572b.

Activation of the refined charcoal from *Quercus acuta* at 800°-900°C for 4 hrs showed optimum adsorption (of CCl_4 0.551-0.558 g/g; of Cl_2 107.5-118.1 ml/g).

13649. IMADA, FUMIO. **Studies on carbon. IV. Preparation of active carbon.** *Technol. Repts. Kyushu Imp. Univ.* 18, 62-6(1943).—*C.A.* 43, 5572*b*.

The active carbon from plant sources, especially hard woods and ext. of lignin, showed the following adsorption of Cl_2(559 (mg/g) with *Camellia japonica*, 553 with *Quercus acuta*, 583 with alkali-extd. lignin), 376 for lamp black and wood tar mixed in 1:1, 279 for coal, 249 with silkworm pupae, 167 with asphalt, and 108 with pitch washed with H_2SO_4.

13650. KURIHARA, TOZABURO. **Dry distillation of bamboo.** *J. Pharm. Soc. Japan* 63, 330-3(1943). —*C.A.* 45, 1750*e*.

Three kinds of bamboo containing 16.6% moisture were dry-distd. at 350°-450°C, and 18.45% (wt) gas distillate, 39.4% liquid, 8% tar and 29% charcoal were obtained. Best yield was obtained when the distn. temp. was maintained at 400°C. The charcoal was a light-weight substance and a fairly powerful adsorptive charcoal could be obtained by activating with steam, $ZnCl_2$, or phosphoric acid.

13651. MIDUNO, SHIGERU AND KATO, YOGORO. **Active carbon. I. Hydrated active carbon.** *J. Soc. Chem. Ind. Japan* 46, 961-6(1943).—*C.A.* 42, 6517*b*.

Filter paper, Willstätter lignin, and sawdust were treated with 70% H_2SO_4 at 150°C and washed. The products, contg. 26% combined H_2O, showed a strong adsorptive power. That prepd. from filter paper had the strongest adsorptive power; it was comparable to ordinary $ZnCl_2$-activated carbon in the decolorization of raw sugar liquor, but its adsorptive power for KCl and $CaCl_2$ was about 5 times that of $ZnCl_2$-activated carbon. Hydrated active carbon from orange peel was about equal in adsorptive power to that from filter paper.

13652. OTHMER, DONALD F. AND FERNSTROM, GEORGE A. **Destructive distillation of bagasse.** *Ind. Eng. Chem.* 35, 312-17(1943).—*C.A.* 37, 1848^4.

Experiments were undertaken to determine the yields of several products when bagasse was carbonized in a retort under different conditions of temp. and time. Per ton of dry bagasse, approx. 1050 lb charcoal, 1.2 gal of crude MeOH and 53 lb of AcOH were obtained. The amount of charcoal was considerably greater than would be produced from an equiv. amt. of dry wood, but the volatile constituents were in each case considerably lower.

13653. RIVKINA, KH. I. **The possibility of obtaining of carbonaceous sorbents from lower strata of peat.** *Torfyanaya Prom.* 1943, No. 1, 15-18.—*C.A.* 38, 631^6.

Air-dried peat, in particles 5-7 mm long and 2-3 mm in diam., was carbonized in a porcelain tube within a vertical elec. furnace at 840-80°C, depending on the ash content. During heating to 600°C, illuminating gas was passed through the tube; this was discontinued between 600° and 840°C, and after 10 min. at 840-80°C CO_2 was passed through the tube for 15 min. The carbonized peat was cooled passed through a sieve of 600 meshes/cm^2, and its adsorptive power for phenol detd. Slightly active peat coke adsorbed less than 0.03 g of phenol per g; medium active, around 0.05; and active, 0.07 and more. The adsorptive capacity was detd. on freshly prepd. material, then after 14, 28, 42 and 90 days. Most of the aging occurred within 14 days.

13654. SHIMIDU, TOSHIHIDE. **Decolorizing carbon from bagasse. II. Ash content of primary**

carbon from bagasse. *J. Soc. Trop. Agr Taihoku Imp. Univ.* **15**, 201-5(1943).—*C.A.* 42, 3157*g*.

The pithy part of bagasse, sepd. with a 6.06-mm mesh sieve, was heated in an elec. furnace at 300°C for 6 hrs or at 900°C for 3 hrs to reduce the C-content. The yield after washing with concd. HCl was 7.25 under the 1st conditions and 13% under the 2nd. The ash (about 0.2%), boiled out with HCl, analyzed SiO_2 74.21, SO_3 3.69, Fe_2O_3 + Al_2O_3 7.9,8 CaO 1.99, P_2O_5 1.07, MgO 3.14, K_2O 3.58, and Na_2O 2.35%.

13655. SHIMIDU, TOSHIHIDE. **Decolorizing carbon from bagasse. III. Activation of bagasse and cane-sugar carbon in vacuum or by oxygen.** *J. Soc. Trop. Agr. Taihoku Imp. Univ.* **15**, 226-35 (1943).—*C.A.* 42, 3157*h*.

Bagasse carbon showed max. adsorption of acid (HCl) when activated at 600°C *in vacuo* and max. adsorption of aklali (NaOH) when activated at 300°C *in vacuo*. Activation by O_2 increased the acid adsorption, a max. appearing in O_2 when activated at 900°C and in H_2 when activated at 600°, and also the alkali adsorption, a max. appearing when activated at 300°C. Cane-sugar carbon showed max. adsorption of acid when activated at 600°C *in vacuo* or in satd. O_2, the adsorption decreasing little when activated at lower temp. Adsorption of aklali was max. when activated at 300°C *in vacuo* or by O_2, the adsorption decreasing rapidly when activated at higher temp.

13656. VANZETTI, B.L. **Colloidal carbon.** *Chimica e industria* (Italy) **25**, 137-44 (1943); *Chem. Zentr.* **1943, II**, 1945-6.—*C.A.* 39, 176^3.

Carbohydrates (sugars and cellulose) were heated gradually with concd. H_2SO_4 at room temp. Besides black colloidal suspensions of varying particle size, a black elastic gel was formed which, with respect to dehydration and rehydration curves, behaved like silica gel. If this gel was heated in a vacuum, water and CO_2 were given off, and coke-like product obtained with the compn. C=59-61(%), H=3.2-3.8, O=36. The liquid contg. the H_2SO_4 after diln. exhibited an intense-blue fluorescence, which disappeared in the basic region.

13657. WARNE, L.G.G. **English wood charcoals.** *J. Soc. Chem. Ind.* **62**, 88-90 (1943).—*C.A.* 37, 6111^5.

The anatomical features of the wood were not destroyed in the prepn. of charcoal. The identification of the botanical source of wood charcoals was possible when they were in lump form by observations of the size and arrangement of the vessels and the size and frequency of the medullary rays.

13658. WARNE, L.G.G. **The identification of powdered wood charcoals.** *J. Soc. Chem. Ind.* **62**, 141-4 (1943).—*C.A.* 38, 240^1.

A "Key" for the identification of English wood charcoal powders was given. The frequency, size and arrangement of holes in the particles of charcoal were characteristic to a limited value in detg. the source of the charcoals.

13659. BERRY, A.G.V. AND EDGEWORTH-JOHNSTONE, R. **Petroleum coke. Formation and properties.** *Ind. Eng. Chem.* **36**, 1140-4(1944).—*C.A.* 39, 802^8.

Petroleum coke was essentially a disperse system composed of graphite-like crystallites embedded in an org. matrix. Expts. on the coking of a cracked asphalt under different time-temp. conditions showed that the coking process could be conveniently regarded as taking place in 4 stages, corresponding to the production of pitch, semipitch, asphaltic coke and carboid coke. The properties of these substances were described, and their bearing on the quality and com. value of petroleum coke was indicated.

13660. BERTHELOT, CH. **Simultaneous production of gasifier wood and wood charcoal.** *Carburants nat.* **5**, 101-4(1944); *Chem. Zentr.* **1944, II**, 814.—*C.A.* 40, 7573^8.

By combination of a wood-drying process with carbonization of wood, it was possible to produce simultaneously wood charcoal and a high-quality, dry gasifier wood for use in generators producing gas for automobiles. The combustible gas produced in the carbonization of the wood was used for the production of dry gases.

13661. DAS, B.B.; NIYOGI, N.C., AND SINHA, A.K. **Studies on Indian coals. XI. Production of activated carbon from Indian coals.** *J. Indian Chem. Soc., Ind. & News Ed.* 7, 137-9(1944).—*C.A.* 40, 3247^8.

Activated carbon samples were prepd. from Indian noncaking coals. Optimum temp. of carbonization of 4 samples was found to be 480°C. For activation at 1000°C, introduction of superheated steam for periods up to 60 min. was quite effective. The resulting activity for solvent-vapor adsorption compared favorably with imported activated carbon.

13662. DEY, A.C. AND VARMA, B.S. **Quality of charcoal produced in indigeneous kilns.** *Forest Research Inst. Dehra Dun, Indian Forest Leaflet* No. 56, 1-4 (1944).—*C.A.* 42, 3158*b*.

A particular lot was crushed to a coarse powder and mixed thoroughly. A portion was further powd. to pass a 60-mesh sieve, cleaned by floating on water, and dried in an oven at 105-10°C to const. wt. A sample (5g) was ashed. One g of this powder was placed in a weighed Pt crucible (1 × 1.3 in.) and closed by pushing in another weighed crucible of the same size. Both were then heated at 950°C for 7 min. The crucibles were cooled and the amt. of charcoal remaining weighed. The difference was due to loss of volatile matter. The fixed carbon was calcd. as residue after loss due to moisture, ash, and volatiles had been deducted. Porosity was calcd. from the true and apparent d. Almost any type of kiln will produce charcoal of good quality, provided carbonization temps. are well regulated.

13663. DOSS, K.S. GURURAJA AND JAIN, N.S. **Activated carbon from wax-free press mud.** *Indian Sugar* 7, 149(1944).—*C.A.* 38, 6124^7.

A good quality of activated carbon could be obtained by carbonizing the dried press muds of sulfitation cane-sugar factories. Previous extn. of the cane wax from the mud had little influence on the quality of the carbon obtained by subsequent carbonization.

13664. Fujita, Atsushi. **Chemical studies of charred animals. I.** *J. Pharm. Soc. Japan* 64, 263-9(1944).—*C.A.* 45, 819*h*.

Charred animals were special products of the Orient. Ordinary products were prepd. by the carbonization of animals in a closed pot in the absence of air 6-8 hrs at about 300°C. Ordinary chem. analyses of these products showed only the presence of C and the usual inorg. matter, such as $CaHPO_4$, Mg, K, Na, etc., and only traces of org. components. The adsorptive affinity of the charred carbon was not very remarkable, decolorizing only about 1 ml 1:1000 methylene blue soln. per g. At the same time, the charred product also contained the so-called whited baked, i.e., completely cindered ashes.

13665. Ghatak, S.N. **Briquetting molasses with waste charcoal dust.** *Proc. Sugar Tech. Assoc. India* 13, 81-9 (1944).—*C.A.* 39, 3896^6.

Charcoal dust (60-mesh) was mixed with 40% by wt of 90° Brix molasses and 10% of water. The mixt. was molded under pressure of 1.5 tons/in^2 for 30 sec, dried at 110°C, and "smoked" at 300°C in a furnace (described) until evolution of fumes ceased. The heat value of the briquets was 11,500-12,000 B.t.u.; their advantage as a gasolene fuel was that they occupied less space and were not as friable as ordinary charcoal.

13666. Gibson, J.; Riley, H.L., and Taylor, J. **Filamentous carbon.** *Nature* 154, 544(1944).—*C.A.* 39, 852^2.

Filamentous carbon was prepd. by cracking CH_4, dild. with N_2, H_2, and CO on an Fe surface at 1000°C. X-ray analysis showed that the carbon was amorphous, with the *c* axis perpendicular to the fiber axis.

13667. Oza, T.M. **Pure charcoal from cane sugar.** *J. Indian Chem. Soc.* 21, 38(1944).—*C.A.* 39, 251^1.

Heat large crystals of sugar in an open dish until brittle, then heat at 500°C for 7 hrs *in vacuo* in a tube provided with a stopcock. Heat in a current of Cl_2 (10 liters for 25 g of charcoal) at 500°C, then exhaust for 2 hrs at 500°C. Pass H_2 through a layer of the charcoal for 1 hr at room temp. and for an addnl. hr at 500°C. Grind fine, treat in a Pt dish with HF and digest for 1/2 hr. Dil. greatly with water, filter, dry, heat strongly, throw into concd. HCl and boil for 1 hr. Dil. greatly with water, filter, wash free from Cl^-, dry and exhaust at 500°C. Repeat the treatment with HF and the remainder of the process to remove the ash completely. The purified charcoal reacted with $NaNO_2$, *in vacuo*, only above 300°C; the reaction became violent only at 355°-370°C. Charcoal that had not been treated with Cl_2 reacted violently at 265°C.

13668. Tromp, F.J. and Matthee, J.J. **Activated carbon for regenerating used lubricating oil.** *J. Chem. Met. Mining Soc. S. Africa* 45, 90-9 (1944).—*C.A.* 40, 4874^2.

The carbon was prepd. by carbonizing wattle shavings, impregnated with aq. H_3PO_4 (d. 1.6), at 350°C for 2 hrs in a pilot plant (described); 95% of the H_3PO_4 was recovered by a special H_2O-percolation process and used again. The washed, dried carbon was ground so that 90-99% passed 200-mesh; finer grades were less easily filterable from the oil.

13669. Warne, L.G.G. **Further observations on powdered wood charcoals.** *J. Soc. Chem. Ind.* 63, 124(1944).—*C.A.* 38, 5384^2.

Observations on the characters of the so-called identification particles of 7 powd. hardwood charcoals allowed the identification key to be amended and extended.

13670. Warne, L.G.G. **British softwood charcoals.** *J. Soc. Chem. Ind.* 63, 191-2(1944).—*C.A.* 38, 6077^2.

Naked-eye or hand-glass inspection usually enabled hardwood and softwood charcoals to be differentiated. Hardwood charcoal was free of small vessels, but resin canals sometimes might be mistaken for the vessels characteristic of softwood charcoals. Annual rings and their width were variable in all British woods and offered no means of distinction of charcoals.

13671. Doss, K.S.G. and Jain, N.S. **Activated carbon from bagasse.** *J. Sci. & Ind. Research (India)* 3, 393-6 (1945).—*C.A.* 40, 4543^9.

A carbon as active as Carboraffin was described.

13672. La Grange, C.C. and Petrick, A.J. **The production of zeolites from bituminous coal.** *J. Chem. Met. Mining Soc. S. Africa* 45, 235-47(1945).—*C.A.* 40, 7457^9.

Treatment of S. African coal with SO_3 at 160°C formed zeolites which compared favorably with commercially available products. Attrition tests showed that a better product was obtained if a hard coal was chosen as a raw material and if activation was not carried out to a maximum. In order to convert H-zeolites to Na-zeolites, it was found advantageous to use a NaCl soln.

13673. Mukherjee, Sudhamoy and Bhattacharya, Sukhamoy. **Preparation of activated charcoal (medicinal).** *J. Sci. & Ind. Research (India)* 4, 235-7 (1945).—*C.A.* 40, 1969^9.

Shells of groundnut and coconut were carbonized with and without acidulated $ZnCl_2$ as the activating agent. Charcoals from both sources showed good adsorptive power, and this was shown in a greater degree by the charcoals obtained by use of acidulated $ZnCl_2$. $ZnCl_2$ in HCl soln. reduced the ash content by removing the acid-sol. fraction of the minerals present. Groundnut shell $ZnCl_2$-treated charcoal satisfied the tests for medicinal charcoal.

13674. Ohara, Yasumi. **The carbonization of raw rubber.** *Bull. Rubber Research Inst. Japan. No.* 1, 19-20(1945).—*C.A.* 44, 5627*e*.

Attempts were made to obtain ashless carbon for the electrode of Al refining. The result was fairly good. Raw rubber was treated with Al_2O_3, NH_3, caustic alkali or $(NH_4)_2SO_4$ to make it fusible; the fused rubber was oxidized with concd. H_2SO_4 to a brown hard product and by carbonizing this, the desired carbon with almost no ash was obtained in 50% yield.

13675. Pallacios, J. and Vigon, M.T. **The preparation of electrolytic colloidal carbon and experiments with the same.** *Anales fís. y quím* (Madrid) 41, 934-55(1945).—*C.A.* 41, 4724*g*.

Disintegration of a carbon electrode in certain mediums increased with c.d. With high c.d. more large particles and less of colloidal size were formed. Tests were made with H_2SO_4, NaOH, Na_2SO_4, $(NH_4)_2CO_3$, NH_4OH, $(NH_4)_2SO_4$, and dist. water. For equimol. concns., the most rapid formation, with fewer large particles, was with $(NH_4)_2CO_3$ and NH_4OH; the slowest with Na_2SO_4. The action of NaOH and H_2SO_4 was about the same as regards concn. of colloid, but disintegration was much greater in the H_2SO_4 solns. With NaOH, disintegration to large particles increased as pH decreased. Colloidal carbon was obtained with anodes of arc-lamp carbon, Siemens carbon rods, and German activated carbon. Disintegration was more rapid the more porous the carbon, but was accompanied by a greater proportion of large particles.

13676. Reich, Gustave T. **Production of a carbon and potash from molasses distillers' stillage.** *Trans. Am. Inst. Chem. Engrs.* 41, 233-52 (1945). —*C.A.* 39, 2619^7.

Molasses distillers' stillage having a d. of 3° to 10° Brix contained 0.3 to 1.0% of K_2O, the remainder being org. and inorg. compds. giving it a N-content of 0.03 to 0.10%. The removal of lime before fermentation of the molasses, followed by the simultaneous distn. of the alc., concn. of the stillage and finally the high-temp. carbonization of the concd. liquor resulted in recovery of a carbon having a high decolorizing power, K_2O, and tar.

13677. Reich, Gustave T. **Molasses stillage.** *Ind. Eng. Chem.* 37, 534-8 (1945).—*C.A.* 39, 3114^3.

Concd. stillage was carbonized in a stationary retort either in acid or alk. condition. The retorts used were somewhat similar to Kopper's coke oven. Carbonization not exceeding 700°F formed a hard, brittle nonhydroscopic product. The stillage treated with alk. metal compd. at 8.5 to 9 pH formed the softest carbonized product, whereas an acid stillage of 4-4.5 pH yielded the hardest. The use of lime gave the densest product. Stillage treated with alk. metal compd. gave the most porous product. The d. of the acid char was between the lime and the alk. metal compd. char. Continuous feeding of the concd. stillage to the retorts resulted in a very dense product.

13678. Wetterholm, Allan and Davidson, Bertil. **Reaction between wood charcoal and sulfur at low temperatures as related to surface area and source of charcoal.** *Iva* 17, 80-6 (1945). —*C.A.* 41, 4909*g*.

Storage of S-charcoal mixts. at 100°C caused formation of a product which resembled charcoal, but in which part of the S was no longer extractable in CS_2 or in aniline. The amt. of nonextractable S increased with time of storage. It varied with the type of charcoal, and for a given type reached a max. at a definite degree of carbonization. Nonextractable S was presumed to form surface compds. with charcoal, analogous to the adsorption of O_2 on charcoal.

13679. Askey, P.J. **Alkali activation of coke.** *Gas World* 124, No. 3205, Coking Sect., 3-7; No. 3209, Coking Sect., 13-19 (1946).—*C.A.* 40, 1988^2.

The activation of coke by addn. of Na_2CO_3 to the coal before carbonization was studied. Coke from a small oven and that from full-scale ovens were quenched with Na_2CO_3 solns. In the latter case about 12 tons of $Na_2CO_3 \cdot 10\ H_2O$ was dissolved in about 23,000 gal of water in the quenching system. The Na_2CO_3 was distributed reasonably uniformly through the coke. There was a slight marbling effect following the lines of fissure, but no general whitening of the coke. After crushing and grading the visual effect of the alk. treatment was even less apparent. Alk. quenching did not appreciably affect the phys. properties of the coke.

13680. Bergstom, Hilding and Jansson, Harry. **Control of deliveries and methods of analysis of wood charcoal.** *Jernkotorets Ann.* 130, 89-117(1946).—*C.A.* 43, 2407*c*.

Blast-furnace charcoal should contain not more than 20%, and blast-furnace charcoal for gas producers not more than 12% of H_2O. Bulk d. (dry) should be as high as possible; it was influenced by the type of wood (beech>birch>conifers), carbonization procedure, storage, and transport (degradation and segregation). Deciduous woods gave blast-furnace charcoal of higher P content than coniferous woods, and bark>heartwood, but P was readily extd. by H_2O during log-floating. The procedure for sampling charcoal from railway cars was described.

13681. Boyk, S. and Hass, H.B. **Active carbon from chlorinated coal.** *Ind. Eng. Chem.* 38, 745-8(1946).—*C.A.* 40, 5547^8.

Coal was chlorinated in a Ni tube at various temps. yielding small amts. of volatile chlorinated products and a carbon suitable for activation. The chlorinated coal was pelleted and heated in absence of air for one hr at 500°C. The pellets were crushed, sized to 8-20 mesh, and steam-activated at 800°C. Typical results using 4-20 mesh coal showed a gain in wt of 100% on chlorination. The activated carbon contained 0.12% Cl and had an accelerated chloropicrin life of 67 min. and heat of wetting of 12 cal/ml.

13682. Hintze, Wollmar W. **Peat charcoal as gas-producer fuel.** *Jernkontorets Ann.* 130, 193-8 (1946).—*C.A.* 43, 2407*e*.

Light coke (bulk d. 290-310 kg/m^3, ash 2-4 volatiles 71-74%, both on dry basis, H_2O 10-15%) gave gas of compn.: CO_2 8.7-9.0, O 0.3-0.4, CO 24.9-26.0, H 17.8-18.3, CH_4 2.5, unsatds. 0.1-0.2, N 43.7-44.6%. Dark coke (bulk d. 310-330 kg/m^3, ash 3-4, volatiles 62-64%, both on dry basis, H_2O 5-10%) gave: $CO_2$8.2, O 0.3, CO 26.0. H 18.0, CH_4 2.5, unsatds. 0.2 N 44.2%. Raw peat (H_2O 30%) gave: CO_2 9.5, O 0.4, CO 24.1, H 14.8, CH_4 1.3, unsatds. nil, N 51.3%.

13683. Hormats, Saul. **German process for manufacturing activated charcoal.** *Chem. & Met. Eng.* 53, 112-14 (1946).—*C.A.* 40, 5547^9.

Peat (70 parts) was used for a gas mask charcoal using 30 parts dry $ZnCl_2$ (in 45% by wt soln.). A plastic mass was obtained at 50° to 60°C which was extruded in vertical hydraulic multiple-orifice presses with openings of 2.2 mm. The primary activation was in a rotary kiln for 2 hrs at 700°C. The cooled char was leached with 3% HCl and hot water, and $CuSO_4$ added to improve the adsorptive properties of the charcoal for HCN. Contents were then treated with 5-6% K_2CO_3 (KOH) and washed to a residual of 2-3% alkali. The time for leaching and impregnating 2000 kg was 24-36 hrs. The charcoal was dried in direct fired rotary kiln at 120° to 150°C and subsequently heated to 850°C with steam. The charcoal was satisfactory for use in high humidity conditions. Other adsorbents for solvent recovery and decolorization were mentioned.

13684. KORSHUNOV, V.I. **Briquetting charcoal fines.** *Za Ekonomiyu Topliva* 3, No. 8/9, 3-6 (1946).—*C.A.* 41, 2558*e*.

Briquetting of charcoal fines was discussed for use in various branches of industry, such as for production of activated charcoal, in gas generators, etc.

13685. MARVIN, GEORGE G. **Sugar charcoal.** *Inorg. Syntheses* **II**. 74-5 (1946).—*C.A.* 40, 6353^6.

Pure cane sugar was placed in a muffle furnace at 800°C. While the sugar was burning, it was removed from the furnace and stirred to minimize frothing. The product was then heated until all volatile matter evolved.

13686. MINTON, A.S. **Carbonization.** *Quart. Inst. Fire Engrs.* 6, 122-7 (1946).—*C.A.* 41, 1824*i*.

The destructive distn. of org. matter and the chem. characteristics of the carbonaceous residue, volatile matter, and condensable liquid products found thereby were discussed.

13687. MORGAN, JEROME J. AND FINK, C.E. **Binders and base materials for activated carbon.** *Ind. Eng. Chem.* 38, 219-28(1946).—*C.A.* 40, 1988^6.

Carbonaceous materials, with or without a binder, ball-milled to 95% finer than 200 mesh and pressed into briquets 1-1/8 in. diam. by 1/4 in. thick under a pressure of 5000 p.s.i. were carbonized in a rotary furnace brought up to temp. at about 3° per min. and held at temp. for exactly 2 hrs. The carbon was activated with 925°C steam. The briquets were tested for flexural strength, bulk d., and ability to adsorb I_2, toluene, and chloropicrin, and to decolorize a soln. of brown sugar. Activated carbon from cellulose with binders of 25% low-melting pitch and 25% sugar, resp., had flexural strengths of 18.8 and 5.0, I_2 removed 84.1 and 91.9, chloropicrin times 25 and 27 min. A 700°C char (unactivated) of dextrose gave an I_2 removal 14.4%, a 700°C char of sucrose 16.0%, a 500°C char of cellulose 42.0%, and a 700°C char of starch 20.1%. Activated carbon briquets from lignite, steam-treated lignite, lignocellulose, cellulose, and Southern pine were essentially of the decolorizing type. Coconut-shell briquets gave an activated carbon with a chloropicrin time of 42 min.

13688. SMIRNOV, V.A.; DOBUSH, O.A., AND MYMRIKOVA, V.N. **Preparation of the decolorizing carbon Collactivit.** *Applied Chem. (U.S.S.R.)* 19, 651-8(1946)(in Russian).—*C.A.* 41, 4290*g*.

Samples were first prepd. by treating air-dry cellolignin (2g) at 150°C, with H_2SO_4 sp. gr. 1.80 (260% of anhyd. wt) for 5 min., filtering and washing 6 times with a total of 5000% H_2O. The activity *a*, detd. colorimetrically on a 6% soln. of com. xylose, was little affected by the moisture content of the initial material up to 10%, but fell rapidly with further increasing moisture, *a* falling to 1/2 for 40% H_2O. Various inorg. addns., Hg, CuO, H_3PO_4, $CuSO_4$, K_2SO_4, (5%), increased *a* by 23-36%; 0.5% $ZnCl_2$ increased *a* by 30%. On drying (at 120°C) *a* fell (approx. hyperbolically) with increasing length of drying. In storage in closed vessels at room temp. water-washed Collactivit lost *a* fastest, dried more slowly, acid-wets very slowly. Collactivit made from sawdust (pine, birch) was more active than that made from cellolignin, but yields were lower.

13689. WILLIAMS, A.E. **Activated carbon from coal.** *Mining J. (London)* 227, 1026-30 (1946).—*C.A.* 41, 2558*e*.

The type of coal used, briquetting of the powder, carbonization, activation, evaluation of activated carbon, detn. of moisture, water-sol. matter, particle size, oil-retention value, solvent recovery, and a large-scale activated-carbon plant were described.

13690. BODNÁR, LÁSZLÓ. **Distillation of sawdust and briquetting of charcoal powder.** *Magyar Kém. Lapja* 2, 245-51(1947).—*C.A.* 41, 7708*h*.

In the Holiday system 500 kg of sawdust yielded 13.5-14.0 kg of methanol. In briquetting charcoal powder the min. pressure required was 50 kg/cm². Good results were obtained with beet-sugar molasses as binding material in briquetting charcoal powder in the air-dry state (10-12% moisture content) with about 13-15% molasses. Acid wood tar caused severe corroding on machines; therefore, tars were previously neutralized by lime milk. The waste lyes of sulfite cellulose plants could be used in emergency cases as binding material.

13691. CHOWDHURY, J.K.; CHAKRABORTY, K.M., AND GHOSH, J.K. **Preparation of activated carbon from rice-husk. I. Activation by impregnation with boric acid, ammonium borate, and ammonium phosphate.** *J. Indian Chem. Soc. Ind. & News Ed.* 10, 40-6(1947).—*C.A.* 42, 6473*g*.

Rice husk was studied as a suitable raw material for the manuf. of activated carbon. After washing and sun-drying to 12.8% H_2O, analysis gave 13.6% ash, 43.7% cellulose, and 39.2% lignin (H_2SO_4). The husk was treated with varying amts. of reagent, dried, carbonized at 350°-450°C, extd. with HCl, washed and dried. Adsorption tests with I_2, 0.5 *N* AcOH, and 0.15% methylene blue soln. gave activities which were not in agreement.

13692. DANNER, CHARLES E. AND GOLDENSON, JEROME. **Determination of halogenated organic vapors in air by adsorption on specially prepared activated charcoal.** *J. Ind. Hyg. Toxicol.* 29, 218-24 (1947).—*C.A.* 41, 6494*i*.

Activated charcoal was prepd. from a puttylike mixt. of 120 g Cl-free light cylinder oil, 485 g Cl-free lampblack, and 260 g sucrose by heating in a vented Nichrome tube in 4 hrs to 800°C and holding at this temp. for 20 hrs. The tube was cooled and the fines passing a 16-mesh sieve rejected. It was then heated in a 3/4-inch silica tube in a vertical furnace to 875°C, steam passed through for 35 min. The Cl content of the product was about 0.008%. The unknown sample was passed through a column of this charcoal, 3/4 × 5 inches and Cl detd. in the ash of the charcoal. A S-free charcoal, which could probably be prepd. from sucrose alone, should be useful for detg. compds. contg. S, P, Se, or As.

13693. Krenkel, Theodore G. **The effect of temperature on the destructive distillation of wood from the white** *quebracho, Aspidosperma. Rev. facultad cienc. quim (Univ. nacl. La Plata)* 20, 19-24 (1947).—*C.A.* 42, 2418*g*.

Wood from *Aspidosperma quebracho* was placed in a retort and subjected to destructive distn. at 205°-400°C. The yields of AcOH, MeOH, Me_2CO, CO, CO_2, and charcoal were detd. The optimum temp. was found to be 300°C. Charcoal of superior quality resulted when the temp. was raised rapidly to 400°C and held there. Analyses were given for the wood used as a starting material and for the 10 different charcoals produced.

13694. Mukherjee, Sudhamoy and Bhattacharya, Sukhamoy. **Preparation of activated charcoal from bamboo.** *J. Sci. Ind. Research* 6, No. 1, B., 8-9 (1947).—*C.A.* 41, 4909*e*.

A thin bamboo (*Melocanna bambusoides*) and a thick variety (*Dendrocalamu strictus*) were used after the nodes were removed. The nodes from the thick bamboo were used separately. Solns. contg. 50-100 parts $ZnCl_2$ and 4.4-9.7 parts HCl were used for digesting 100 parts of bamboo (100 mesh) before carbonization at 600°-800°C. The charcoal was boiled with dil. HCl, washed to remove Zn, dried at 250°-300°C to remove HCl, and ground to 200 mesh. These charcoals had a much lower ash content, a higher adsorption for methylene blue, I_2, and AcOH, and a lower adsorption for caramel than a com. charcoal made in the U.S.A.

13695. Sarraillet, José M. **The preparation, activation and assay of charcoals obtained from poplar, alder, and cottonwood.** *Rev. facultad. cienc. quim.* 22, 91-109 (1947).—*C.A.* 45, 333*e*.

The yields, methods of activation, and assay of activity (adsorption of methylene blue) for the charcoals from the following woods were given: *Populus nigra* (Poplar); *Salix babylonica* (alder); *Erythrina cristagalli* (cottonwood).

13696. Simons, J.H. and McArthur, R.E. **Hydrogen fluoride as a condensing agent. XIX. Oxidation of organic compounds in liquid hydrogen fluoride.** *Ind. Eng. Chem.* 39, 364-7 (1947).—*C.A.* 41, 3439*c*.

When C_6H_6 in HF was treated with O_2 in a Cu bomb below 200°C in the presence of O-carriers, it gave PhOH and carbon with no evidence of ring rupture. The reaction took place at lower temp. when As or Se oxides were present; when Mo compds. were used, less PhOH and more carbon as well as some Ph_2 and BzOH were formed. In the absence of carriers, reaction was slower and some CO_2 was also formed. In high concns., BzOH was oxidized to carbon. At low ratios of C_6H_6 to HF, more carbon was formed, at high ratios, some CO_2 appeared. Diln. of HF with H_2O or MeOH raised the temp. required for the reaction.

13697. Žert, Karel. **Active charcoal industry in Czechoslovakia.** *Chem. Obzor* 22, 238-41 (1947). —*C.A.* 42, 2086*g*.

Present and past methods for manufg. active charcoals, their adsorbing capacity, and various applications (especially in the sugar-beet industry) were described.

13698. Alexa, Gheorghe and Rădulescu, Fluor D. **Activated carbon from nut shells and grape seeds.** *Bul. Inst. Natl. Cercetări Tehnol.* 3, 177-222 (1948) (in French).—*C.A.* 43, 9295*i*.

The prepn. of activated carbon by impregnation of nut shells and grape seeds with $ZnCl_2$, calcination at 875°C, and activation with steam was studied. The yield, homogeneity, and activity of the product depended on the uniformity of contact between the steam and the carbon, and on the temp. of the steam. The effects of superheater design, and of different methods for distributing the steam, were discussed.

13699. Araujo, Benedito de Jayme. **Beneficiation of ground charcoal and ground coke.** *Brazil, Ministerio agr., Dept.nacl. produção mineral, Lab. produção mineral, Bol.* 30, 11-28(1948).—*C.A.* 45, 7778*c*.

Mech. operations for cleaning charcoal and coke contaminated by extraneous dirt were described.

13700. Chowdhury, J.K.; Chakraborty, K.M., and Ghosh, J.K. **Preparation of activated carbon from rice husk. II. Activation by carbonizing in various gas atmospheres and secondary activation.** *J. Indian Chem. Soc. Ind. & New Ed.* 11, 83-96(1948).—*C.A.* 43, 4834*f*.

Dry rice husks were carbonized by heating at 400°C in atm. of HCl and NH_3. The primary carbon derived a basic character when carbonized in an acidic atm., and an acidic character when carbonized in a basic atm. Primary activations in N_2, steam, or CO_2 gave carbon with a poorer activity. Secondary activations with steam or CO_2 considerably increased the activity of the primary carbon. Temps. of 500-600°C were most effective, and CO_2 gave better activity than steam.

13701. Eaton, S.E.; Hyde, R.W., and Old, B.S. **Tracer study of sulfur in the coke oven.** *Am. Inst. Mining Met. Engrs., Iron and Steel Div., Metals Technol* 15, No. 7, Tech. Pub. No. *2453*, 20 pp (1948).—*C.A.* 43, 837*h*.

The results of the expt. indicated that the pyritic and org. S appeared in coke in proportion to their concn. in the coal. In view of the large initial evolution of org. S, coals contg. large amts. of org. S and small amts. of pyritic might be coked for a shorter time to produce coke contg. a given percentage of S. Coals high in pyrite S would have to be coked for a slightly longer period of time to obtain the same results.

13702. Godel, A. **Fluidization used in making activated carbon.** *Chem. Eng.* 55, No. 7, 110-11 (1948).—*C.A.* 42, 6964*a*.

A general description was given.

13703. Green, S.J. and Thakur, B. **The insoluble matter of coal tar. III. Some inorganic constituents of free carbon.** *J. Soc. Chem. Ind.* 67, 436-7 (1948).—*C.A.* 43, 3597*d*.

Zn was normally present in coals up to 0.01%, but 0.04% was found in the tar and 1-2% in the free carbon. A Zn-pyridine complex, probably $2C_5H_6N\text{-}ZnCl_2.2HCl$, was isolated from the carbon.

13704. KOROBKIN, V.A. **Optimum temperature for carbonization of wood.** *Stal* 8, 487-94(1948).—*C.A.* 44, 1246^e.

Air-dry pine wood was charred for 6 and 12 hrs at 250°-700°C. The moisture content of the sample was detd. and the yield of charcoal calcd. on a moisture-free wood basis. The yield of fixed carbon in 12-hr charring was greater (at any one temp.) than in 6-hr charring. The yield of fixed carbon increased with temp. up to 400°C and then began to decline. Charring for 12 hrs with a final temp. of 400°C yielded 28%. This charcoal contained: fixed carbon = 71.71, volatile substances = 27.43, and ash = 0.86%.

13705. OLLILA, OLLI AND HARVA, OLAVI. **The use of waste lignin from wood hydrolysis for the production of activated carbon and the characteristics of the carbon obtained. I.** *Suomen Kemistelehti* 21A, 42-53 (1948).—*C.A.* 42, 8445^e.

The activated carbon was prepd. by soaking waste lignin in the desired soln. overnight and heating the mixt. for 1 hr at 80°-90°C, after which the soln. was decanted; the waste lignin was dried for 1 day at 120°-30° and carbonized at 500°C. The product was washed with concd. HCl at 70°-80°C, washed 8-10 times with water to remove HCl, dried, and weighed. Yields of 50.8-70% of activated carbon were obtained when the impregnating soln. was $ZnCl_2$, d. 1.17-1.90, the impregnation ratios were 100-152%, and the time of heating was 1-4 hrs. The adsorption of methylene blue was 13-379 mg/g carbon. With H_3PO_4 as an impregnating agent and a temp. of 700°C, an activated carbon with an adsorption value of 695 mg/g was obtained. Best results were obtained with 1.70-1.82 d. $ZnCl_2$, an impregnating ratio of 270%, and a temp. of 500°C.

13706. RUESS, G.L. AND RUSTON, W.R. **Electron microscopic investigation of activated charcoals.** *Monatsh* 78, 193-9(1948).—*C.A.* 42, 7957^g.

The electron microscope was used to confirm the production of small pores of charcoal during activation in CO_2 at 950°C. The pore structure of an active carbon (Noritsupm) was coarser than that of a good gas-adsorbing charcoal (Degea 106) or of an activated sugar charcoal.

13707. SCHLAPFER, P. AND BROWN, R. **The structure of charcoals.** *Eidegenoss. Materialpruf. u. Versuchsanstalt Ind. Bauw. u. Gewerbe, Zurich No.* 153, 121 pp. (1948).—*C.A.* 44, 308*i*.

Twenty-one Central European woods and the resulting charcoals obtained both at 400°C and at 1000°C were described, identified, and illustrated with 69 photomicrographs.

13708. SZUBA, JERZY. **Activated carbon.** *Przemysl Chem.* 4, 307-9(1948).—*C.A.* 42, 9122*i*.

The manuf. and applications of activated carbons were reviewed.

13709. TACHIBANA, TARO AND ICHIKAWA, HIROMASA. **Hydrothermal change of sugar with inorganic salts.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 69, 81-4(1948).—*C.A.* 44, 9222*a*.

The effects of inorg. salts on the carbonization of sugar solns. were studied in the light of hydrothermal reactions. Inorg. salts effective in carbonization of sugar solns. also promoted resin formation in furfural. The action of the inorg. salts was caused by the H ions formed by hydrolysis of the salts as well as by the catalytic action of the salts themselves. The no. of colloidal particles in the sugar solns. was measured. The purity of sugar was detd. by the fluorescence in ultraviolet light.

13710. TAKAHASHI, HARUO. **Carbonization phenomena. III. Carbonization of carbohydrates.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 69, 97-100(1948).—*C.A.* 44, 9222*b*.

The relation between the residue from the carbonization of polyhydroxy compds. and their mol. structure was studied. Sugars and acids underwent carbonization, but alcs. did not. Thermal changes (dehydration and esterification) occurring in a part of the mol. made the residual OH radicals removable, and condensation resulted. Polysaccharides were believed to carbonize after being decompd. into monosaccharides.

13711. TAKAHASHI, HARUO. **Carbonization phenomena. IV. Carbonization of mixtures of polyhydroxy compounds with organic acids, proteins, and dyes.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 69, 100-2(1948).—*C.A.* 44, 9222*d*.

When acetic, oxalic, molonic, succinic, glutaric, adipic, maleic, fumaric, malic or tartaric acid was added to mannitol, glucose, or fructose with a mol. ratio of 1:1, the mixts., except with acetic, oxalic, and malonic acids, underwent carbonization.

13712. DUBININ, M.M. AND ZAVERINA, E.D. **Sorption and structure of active carbons. V. Active carbons from tar coke.** *Zhur. Fiz. Khim.* 23, 993-1004 (1949).—*C.A.* 44, 899*i*.

Charcoal prepd. by heating birch tar to 500°-550°C was heated in a current of CO_2 at 850°C; the rate of wt-loss was small (0.6%/hr) when the yield of charcoal from tar was great (46%; specimen *I*), medium (6%/hr) when the yield was 19-23% (*II* and *III*), and great (11%/hr) when tar was heated with H_3PO_4 (IV). *I* was inactive. *II* and *III* were active; when the duration of heating in CO_2 was such that wt loss from crude charcoal was small (less than 5-10%), the adsorption of AcOH was greater than that of $EtCO_2H$, valeric, and heptanoic acids. Other soln. systems were used to evaluate the products.

13713. GUPTA, N.N. **A new spacing in carbonized organic substances.** *J. Sci. Ind. Research (India)* 8B, No. 12, 237-8(1949).—*C.A.* 44, 5562*i*.

Sawdust and shellac were carbonized at 800°-1000°C under 100 atm. pressure of A. X-ray diffraction studies showed the strongest band at 6 to 4.8 A. spacing with av. at about 5 A. in agreement with similar band found in some types of coal. The shift with temp. was assumed due to change of particle size. Future work to 1000 atm. and 3000°C was indicated.

13714. KAZAKOV, E.I. **Investigation of the process of low-temperature decomposition of the constituent components of peat.** *Izvest. Akad.*

Nauk S.S.S.R. Otdel. Tekh. Nauk 1949, 1219-30.—*C.A.* 45, 6821*d*.

Waxes, resins, cellulose, water-sol. substances, lignin, and humic acids were dry distd. to det. yield and compn. of primary tars. With increasing degree of change of peat, the amt. of carbohydrates and lignin therein decreased while that of bitumens and humic acids increased relatively. Therefore the formation of primary tar from carbohydrates and lignin was directly proportional to the degree of change of peat, while for bitumens and humic acids, it was inversely proportional.

13715. MASLENIKOV, M.S. **Optimum conditions of producing carbon black.** *Legkaya Prom.* 9, No. 7, 25-8(1949).—*C.A.* 47, 1913*f*.

Results of 311 analyses of flue gases made during various conditions of operation (combustion of oil) of carbon-black furnaces were used to det. yield of carbon black as a function of excess air, O_2 concn., and temp. of combustion.

13716. MUKHERJEE, SUDHAMOY AND BHATTACHARYA, SUKHAMOY. **Effect of chemical treatments on the properties of activated charcoal.** *J. Am. Chem. Soc.* 71, 1725-9 (1949).—*C.A.* 43, 6396*c*.

The ash contents, bulk density, and adsorption of methylene blue, caramel, I_2, and HOAc were studied for charcoals prepd. from groundnut hull and coconut shell with $ZnCl_2$, $CaCl_2$, H_2SO_4, and NaOH for pre-digesting the raw material, followed by carbonization at 600-800°C. Pre-digestion with acidulated $ZnCl_2$ generally produced the most active charcoals if present in the raw material during carbonization. Pre-digestion with the other reagents gave a charcoal of low adsorptive power, although the $CaCl_2$-treated sample adsorbed caramel well.

13717. WOTSCHKE, J. AND PAASCH, K. **Acetylene black, an industrial example of a turbulent flame reaction.** *Schweiz. Arch. angew. Wiss. u. Tech.* 15, No. 6, 175-87(1949).—*C.A.* 44, 6105*c*.

The physicochem. principles of the production of C_2H_2 black were discussed in some detail. Lab., pilot-plant, and industrial methods for carrying out the reaction were described.

13718. AHMED, MOFIZUD-DIN AND KINNEY, CORLISS R. **Pyrolysis of humic acids prepared from oxidized bituminous coal.** *J. Am. Chem. Soc.* 72, 556-9 (1950).—*C.A.* 45, 1323*a*.

The pyrolysis of the humic acidlike oxidation products from a bituminous coal converted about 13% of the C to volatile substances, CO_2, CO, and CH_4. The amt. of CO_2 corresponded to an equiv. wt of 242. Neither fusion nor the evolution of volatile aromatic fragments was observed.

13719. AHMED, MOFIZUD-DIN AND KINNEY, CORLISS R. **Ozonization of humic acids prepared from oxidized bituminous coal.** *J. Am. Chem. Soc.* 72, 559-61(1950).—*C.A.* 45, 1323*b*.

Both carbonic and oxalic acids were primary products in the ozonization of the humic acids and accounted for about 65% of the carbon. Practically all of the remaining carbon was converted into almost colorless, water-sol., O_3-resistant acids. Although carbon black and graphite oxide did not react with O_3 appreciably, the brown water-sol. acids prepd. by oxidizing carbon black with HNO_3 did react like the humic acids, giving carbonic, oxalic, and O_3-resistant acids.

13720. ALBERTI, HANS JOACHIN V. **The behavior of sulfur in the low-temperature carbonization of lignite.** *Bergbau u. Energiewirt.* 3, 159-64 (1950).—*C.A.* 45, 6365*i*.

The ratio of the total S in the coke to the total S in the coal was const. The Fischer carbonization usually gave lower yields for volatile S as well as for S of the coke ashes in the retorts than the carbonization process with recycled gases. The quality of the lignite itself, the carbonization temp. and the operation of the oven had a very great influence on the behavior of the S. The combustible S content in the coke could be controlled by raising the carbonization temp. and lowering the vol. of the cooling gases.

13721. ALINARI, ERNESTO. **Carbonization and dry distillation of wood.** *Italia forest. mont.* 5, 136-41(1950).—*C.A.* 44, 11066*a*.

In the manuf. of wood charcoal the av. yield (in vol.) from coniferous plants was 60%, that from *latifoliae* 50%; the av. yield in wt was 20-25%. A rapid carbonization may lower the yield even 15% (in wt).

13722. ASAOKA, NOBUTOSHI AND ISHIBASHI, WATARU. **The preparation of active carbon from lignite.** *J. Fuel Soc. Japan* 29, 117-20(1950).—*C.A.* 44, 10301*b*.

The active carbon prepd. from the portion of lower sp. gr. by carbonizing and activating with steam was superior in adsorption power to that from the other fraction. Comparative tests were also carried out on the adsorption power of active carbons from the wood as well as coal lignites, and wood lignite was more satisfactory than the coal lignite. A satisfactory active carbon could be made by choosing a lignite rich in the so-called woody structure.

13723. BARKER, H. **Unusual phosphatic material in the Sutton Hoo ship burial.** *Nature* 166, 348(1950).—*C.A.* 45, 915*c*.

Chem. investigation of a fragment thought to be unburnt bone revealed it to be essentially a hydrated ferric phosphate. A probable mechanism for its formation was suggested by the proximity of Fe fragments of the ship, the phosphate ion being formed from soln. of bone remote from the Fe. The combined action thus formed a cast of the bone fragment.

13724. BEUSCHLEIN, WARREN L. **Production of wood coke from waste wood.** *Univ. Washington Eng. Expt. Sta. Bull.* No. 117, 9-39(1950).—*C.A.* 47, 3544*h*.

The wood dried in a rotary, direct-fired, counter-current drier, and distd. in a Stafford retort, yielded charcoal 38, condensate 42, and gases 20%. The liquid condensate products were concd. in a pot still and mixed with the pulverized charcoal. The mixts. were molded under a pressure of 5000 p.s.i. resulting in briquets of d. 0.62-0.65 and crush resistance of 330-400 p.s.i. The briquets were coked at 650°C for about 30 min.

13725. Cox, John T. Jr. **High quality-high yield carbon black.** *Chem. Eng.* 57, No. 6, 116-17 (1950).—*C.A.* 44, 8225*b*.
The manuf. of channel-type carbon black was described.

13726. Doss, K.S.G. and Singh, Ajit. **Activated carbon from molasses.** *Proc. Sugar Technol. Assoc. India* 19, 230-2(1950).—*C.A.* 46, 3781*d*.
A high-class decolorizing carbon was prepd. by mixing molasses and $CaCl_2$ in the ratio 1:1 by wt, igniting in a closed retort to expel volatile matter, and leaching with acid to remove ash constituents.

13727. Dubinin, M.M. and Zaverina, E.D. **Sorption and structure of active carbons. VIII. Structure of active carbons obtained by using inorganic activating substances.** *Zhur. Fiz. Khim.* 24, 470-8(1950).—*C.A.* 44, 8195*a*.
Carbons were prepd. by heating sucrose with various proportions of $ZnCl_2$ at 600°C for 1 hr and washing with 3 *N* HCl and then with H_2O. The yield (25-35%) of carbon activated by $ZnCl_2$ was 15 times that obtained in activation by CO_2. Activation with $ZnCl_2$ at 850°C gave almost identical results.

13728. Gernert, Georg. **Bone as raw material.** *Seifen-Ole-Fette-Wachse* 76, 509-12, 531-3(1950). —*C.A.* 45, 2688*h*.
Procedures were described to obtain fat from bones by boiling with water, treatment in an autoclave, and solvent extn., use of glue-contg. bone meal as feed, for the production of gelatin and glue, and use of glue-free bone meal as fertilizer. The prepn. of bone char, bone ash, and exts. for medicinal purposes were mentioned.

13729. Giuntini, L. **Utilization of petroleum coke in the gas industry.** *Riv. combustibili* 4, 347-55(1950).—*C.A.* 45, 847*d*.
Petroleum coke as produced in a refinery was a product which varied widely in characteristics depending on quality of treated crude, the temp. of processing, and the cycle time. The residue from distn. was useful for manuf. of electrodes in various industries when ash plus S content was less than 1%, and volatile matter under 1%. Particular attention should be paid to S content, since too high a content (2-5%) would require an addnl. purification process.

13730. Grohma, Otto. **Preparation of activated carbon from peat.** *Gas, Wasser, Wärme* 4, 1-10 (1950).—*C.A.* 44, 5567*e*.
Comparison was made of activated carbons prepd. from peat by 4 procedures: (1) heating peat without air; (2) activating with steam; (3) coking and activating with air; and (4) combining steam and air activation. The combined steam-air activation improved the quality of the coke. Washing the activated coke with HCl to remove minerals and reduce the ash content was found to have little effect on the activity.

13731. Jones, G.W.; Kennedy, R.E.; Spolan, I., and Scott, G.S. **Carbon blacks formed by decomposition of mixtures of acetylene with a hydrocarbon or other gas at elevated pressures.** *U.S. Bur. Mines, Rept. Invest.* No. 4695, 9 pp. (1950).—*C.A.* 44, 6104*i*.
Definite mixts. of the exothermic gas C_2H_2 and the endothermic gas to be tested were exploded in a high-pressure bomb. The gaseous decompn. products were analyzed, the deposit of carbon black was collected and its phys. properties detd. The test gases included CH_4, natural gas, N_2, He, CO_2, C_2H_6, C_3H_8, and C_4H_{10}. Ninety percent or more of the carbon in the test mixts. was converted to carbon black. Certain C_2H_2-CO_2-hydrocarbon mixts. were exploded at elevated pressures to give gaseous products composed esssentially of 2 parts of H_2 and 1 part of CO.

13732. Khan, H.A.; Datar, D.S., and Zahear, S. Husain. **Activated charcoal from groundnut hulls.** *J. Sci. Ind. Research* (India) 9B, 236-7 (1950).—*C.A.* 45, 5391*b*.
A process for the prepn. of activated charcoal from groundnut hulls was developed. A 44% yield of charcoal was obtained by heating the powd. hulls at 320°C for 4 hrs. The charcoal had an adsorption value of 616 mg of I_2 per g of charcoal. The yield of charcoal decreased with increasing temp. of carbonization, but the activity increased to a max. at a carbonization temp. of 500°C, and decreased at still higher temps.

13733. Kipling, J.J. **Carbonization of coal in relation to the production of active charcoals.** *Fuel* 29, No. 2, 42-7(1950).—*C.A.* 44, 3235*c*.
The properties of activated charcoals prepd. from coal depended on the carbonizing conditions. For a particular blend of 2 coals, slow carbonization gave cokes which could be activated to charcoals having higher adsorptive capacity for gases and vapors and lower mech. strength than those resulting from fast carbonization. Passage of steam through the coal during carbonization affected the coke properties, but had little effect on the charcoal properties. When these cokes were further heated to 890°C and kept at this temp. for 30 min., a considerable loss in material occurred, and the cokes increased in hardness, apparent density, moisture satn. value, and decrease in pore vol.

13734. Korver, J.A. **Production of ash-free, active charcoal.** *Chem. Weekblad* 46, 301-2 (1950).—*C.A.* 44, 7465*i*.
Large amts. of ash-free charcoal could be made by steeping in 35% HF (4 liter per kg) for several days in a paraffined vessel. After washing with strong HCl, 25% NH_3, and water until chloride free, the ash content of the charcoal was about 0.08%.

13735. Kotelkov, N.Z. **Active carbon from some industrial wastes.** *J. Applied Chem. U.S.S.R.* 23, 1387-92(1950) (Engl. translation).—*C.A.* 46, 8351*f*.
Active carbon was produced from castor-seed and sunflower-seed husks(wastes from oil-extn. plants) and from the wastes of furfural manuf. from the sunflower-seed husks. Both carbonization (dry distn.) and activation were effected in cylindrical iron retorts with a capacity of 230 ml, a diam. of 3.7 cm, and a wall thickness of 2 mm, heated in a tubular elec. furnace with temp. regulator. A distn. temp. of 700-800°C for 5-6 hrs appeared to be most suitable for all of these wastes. Copious wetting of the crude carbon with water followed by calcining for 5-6 hrs at 750-

800°C was an effective method of activation. Repeated moistening and calcining enhanced the activity of carbon prepd. by preliminary activation. Preliminary treatment with H_2SO_4 and steam was beneficial. The presence of moisture during activation eliminated local overheating and regulated the reaction rate; this gave a more uniform product.

13736. MUKHERJEE, SUDHAMOY AND BHATTACHARYA, SUKHAMOY. **Influence of oxidizing agents on the adsorptive power of charcoal. II. Potassium dichromate.** *J. Indian Chem. Soc., Ind. & News Ed.* 13, 13-17(1950).—*C.A.* 45, 332*f*.

Treatment of $ZnCl_2$-activated charcoal with approx. 0.02, 0.05, 0.1, 0.2, 1.0, and 4.0 *N* solns. of acidified $K_2Cr_2O_7$ resulted in increased adsorptive power for methylene blue, I_2, and caramel at low $K_2Cr_2O_7$ concns. The activity was max. at 0.05 *N* and decreased at higher concns. Treatment of nonactivated charcoal with 0.02, 0.1, and 1.0 *N* acidified $K_2Cr_2O_7$ showed a similar effect, with max. activity at 0.1 *N*. The adsorptive power of activated charcoal was increased by 0.05 and 1.0 *N* neutral $K_2Cr_2O_7$, the adsorption of methylene blue and I_2 being less, and of caramel greater, for 1.0 than for 0.5 *N*.

13737. MUKHERJEE, SUDHAMOY AND BHATTACHARYA, SUKHAMOY. **Influence of oxidizing agents on the adsorptive power of charcoal. III. Bromine, perchloric acid, and potassium persulfate.** *J. Indian Chem. Soc., Ind. & News Ed.* 13, 18-23 (1950).—*C.A.* 45, 332*i*.

Treatment of activated charcoal with various concns. of Br_2 water in the cold and with boiling $HClO_4$ and $K_2S_2O_8$ solns. resulted in an initial increase in adsorptive power for methylene blue, I_2, and caramel with concn. of the oxidizing agent, and then a decrease at higher concn., max. adsorption usually occurring at approx. 0.05 *N*. With $K_2S_2O_8$, however, max. adsorptivity for methylene blue and I_2 corresponded with the max. concn. of persulfate used, 0.467 *N*. No clear max. in the adsorptive power of nonactivated charcoal was indicated, although for methylene blue and I_2, it was considerably increased by treatment; caramel was not adsorbed at all by nonactivated charcoal, treated or untreated.

13738. ORESHKO, V.F. **Ignition temperature of coals.** *Doklady Akad. Nauk S.S.S.R.* 71, 331-3 (1950).—*C.A.* 44, 10295*e*.

"Ignition temp." of coal was detd. by plotting wt of coal against temp. during continuous heating. The temp. of max. wt of coal corresponded to the transition from the period of controlled oxidation, accompanied by formation of solid CO-complexes and increase in wt to the period of low-temp. burning, accompanied by smoke and ash formation and rapid loss of wt. "Ignition temp." was defined as the temp. of max. wt.

13739. RAKOVSKIĬ, V.E. AND RIVKINA, KH. I. **The nature of the mechanical strength of peat.** *Torfyanaya Prom.* 27, No. 1, 29-30(1950).—*C.A.* 45, 845*e*.

The conversion of high-mol.-wt acids in peat into bivalent (Ca) salts and trivalent (Fe and Al) salts contributed to the decreased sizing action of these materials. Lower peat had poorer mech. strength than upper peat owing to a predominance of salts in the lower layers and of free compds. in the upper layers.

13740. SAKIKAWA, NORIYUKI. **Organic geochemical reactions. I. The role of mineral waters in the formation of coal.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 71, 295-7(1950).—*C.A.* 45, 4424*e*.

The acidic mineral waters formed by the oxidation of sulfide ores reacted with peat and as a result of this reaction, humic acids contained in the peats were fixed and then changed to lignite or bituminous coal by thermal and catalytic actions.

13741. TERRES, ERNEST. **The coking process.** *Gas- u. Wasserfach* 91, No. 19 (Gas), 229-38(1950).—*C.A.* 45, 1325*c*.

Photomicrographs of coke sections at various carbonization stages showed how types of coal changed on heating. The swelling of the coal charge during carbonization was detd. by its petrographic compn.; sufficient of the dull coal was required in a predominantly bright coal blend to prevent excessive swelling and undue pressure on the walls of the carbonizing equipment. An app. was described for detg. swelling pressures during carbonization at const. vol.

13742. BAFNA, S.L.; PAI, M.U., AND SHAH, H.A. **Carbonaceous exchangers by sulfonation of Indian coal.** *Current Sci.* (India) 20, 233 (1951).—*C.A.* 46, 2717*e*.

The prepn. of a cation exchanger by sulfonation of a semi-bituminous Indian coal was described. Exchange capacities as high as 1.55 meq./g were obtained.

13743. BHATNAGAR, M.S. AND NIGAM, P.C. **Organic adsorbents from Indian tannins. I. Preparation, activation, and relative adsorptive powers.** *J. Applied Chem.* (London) 1, 517-20(1951). —*C.A.* 46, 2873*h*.

Katha and cutch (edible exts. of catecholtype tannins) were sulfonated and condensed with formalin. The products adsorbed, resp., 95% and 65% fatty acids from 0.01 *M* soln. Resins obtained by sulfonation showed little adsorption of acids. Resins obtained by direct condensation of katha and cutch with formalin showed 15% and 0% adsorption, resp., of benzoic acid. Resins were comparable with Amberlites, Zeo-carbs, and Ionac resins.

13744. BITTENCOURT, BENOUR C. AND HOEFEL, HELIO A. **Black acacia charcoal.** *Anais assoc. quím. Brasil* 10, 277-94(1951).—*C.A.* 47, 5665*b*.

The bark of black acacia (*Acacia decurrens var. molissima*), a tree originating in Australia, was a source of tanning material in Rio Grande Do Sul, leaving the wood to be used as a fuel, either as such or as charcoals. The charcoals were evaluated in accordance with applicable ASTM methods and U.S. Federal Specification L-L-L-C-251 (1933).

13745. BURGOYNE, J.H. AND RICHARDSON, J.F. **Influence of zinc chloride on the ignition of Scotch pine and its charcoal.** *Fuel* 30, No. 1, 13-16 (1951).—*C.A.* 45, 2181*d*.

The effect of impregnation with various proportions of $ZnCl_2$ upon the pyrolysis and ignition of Scotch pine sawdust was examd. The presence of the salt lowered the temp. at which carbonization began, increased the yield of charcoal at a given temp., and raised the ignition temp. of the charcoal as detd. after cooling. The impregnation of preformed charcoal with $ZnCl_2$ also raised its ignition temp.

13746. Kosaka, Yujiro. **Ion exchangers prepared from coals. III-VI.** *J. Fuel Soc. Japan* **30**, 179-89(1951).—*C.A.* 46, 1668*i*.

Ion exchangers prepd. by the H_2SO_4 treatment of coal were used as the catalyzers of esterification of higher fatty acids, and as the exchange columns in the percolating method for desalting hard water. The cation exchangers were used as the catalyzers of ethyl and butyl esterification of hardened soybean-oil fatty acids; the sulfonic acids groups of the exchangers were found to have catalytic activity. Desalting tests of the artificial hard water in the percolating method were carried out, the pH values of effluents being measured, and the variation of the pH values of supplied water as well as the variation of activity of the exchanger in the successive uses were studied.

13747. Kramers, W.J. **The preparation of highly reactive chars from coal and their interaction with sulfur.** *J. Applied Chem.* (London) 1, 189-95 (1951).—*C.A.* 45, 7774*g*.

Carbonized coal briquets were produced which were highly reactive to S and promising as a substitute for wood charcoal in the manuf. of CS_2. The influence of the process variables on the strength and reactivity of the product was discussed. These included the nature of the coal and its modification, mineral matter and moisture in coal, coal size and size distribution, prepn. of raw briquets, rates of carbonization, atm. of carbonization, and temp. of carbonization.

13748. Romwalter, A. and Fekete, A. **Removal of ash formers from mineral coal by nitric acid.** *Acta Tech. Acad. Sci. Hung.* 2, No. 1, 59-72 (1951).—*C.A.* 46, 11630*c*.

One treatment with HNO_3 reduced ash formation in coal as much as repeated treatments with HCl. However, the HNO_3 severely modified the character of the coal. It lost its ion-exchange capacity, was sol. in alkali and NH_4OH, and reduced silicate ash formers, in addn. to limonite and $CaCO_3$. The method may serve for the production of huminate and humic acid, which in turn serves as a source of PhOH and carbohydrates, a process 10 times as efficient as tar distn.

13749. Anon. **Carbon recovery from black ash.** *Chem. Eng.* 59, No. 3, 206-9(1952).—*C.A.* 46, 4200*f*.

The process used for recovering carbon for production of activated carbon from black ash (incinerated "black liquor" formed after cooking pulpwood with an alk. liquor by the soda or sulfate process) was described.

13750. Arthur, J.R.; Kapur, P.K., and Napier, D.H. **Carbonaceous deposits from hydrocarbon diffusion flames.** *Nature* 169, 372-3(1952).—*C.A.* 46, 5292*b*.

Expts. were described in which normal and reversed diffusion flames of gaseous hydrocarbons were allowed to form carbonaceous deposits. The nature of these varied with the flame arrangement and the location of the cooled target.

13751. Behrens, Hans. **Soot formation and radical equilibria in flames.** *Z. physik. Chem.* **199**, 1-14(1952).—*C.A.* 46, 11633*f*.

Radical equilibria in flames were discussed extensively on the basis of observations of luminosity owing to soot formation. The soot formed by the reaction: $CO + H = C_{(solid)} + OH$ followed by $CO + OH = CO_2 + H$ or $H_2 + OH = H_2O + H$. The fine structure of the luminosity from faintly luminous C_2H_2 flames, in which the soot formation was close to thermodynamic equil., could be analyzed in terms of variations of the (H)/(OH) ratio from the equil. value. An enhanced luminosity in a zone just after the flame front was assocd. with rapid recombination of OH radicals in two-body processes, contrasted with slower recombination of at. H in three-body processes, the result being that the (H)/(OH) ratio was increased in this region. This favored soot formation.

13752. Dubinin, M.M. and Zaverina, E.D. **Control of the structure of active carbons from sugar.** *Doklady Akad. Nauk S.S.S.R.* 84, 93-6 (1952).—*C.A.* 46, 8457*f*.

Sucrose carbons, activated with CO_2 at 850°C to wt-losses of 6, 11, 19, 41 or 62%, had micropore vols. of 0.09, 0.20, 0.28, 0.50, 0.81 ml/g, resp., and intermediate-pore vols. of 0.01, 0.01, 0.01, 0.02, 0.7 ml/g. A concd. soln. of sucrose and $ZnCl_2$ was evapd., the residue carbonized in an inert medium, and washed. The type of porosity obtained in this way was detd. by the dispersity of the salt upon evapn. of the soln. which could be controlled by the viscosity of the soln. Addn. of carbonates yielded carbons with a large vol. of intermediate pores, characterized by a steep rise of the adsorption isotherm for C_6H_6 vapor at high relative pressures; the vol. of the intermediate pores obtained 0.30-0.85 ml/g, as compared with only 0.1 ml/g for carbons of low intermediate porosity.

13753. Hassler, John W. **Active carbon.** *Northeastern Wood Utilization Council Bull.* No. 37, 93-101(1952).—*C.A.* 46, 4200*e*.

Methods for production of active carbon, and of industrial applications of active carbon were reviewed. The amt. of active carbon produced from charcoal was small.

13754. Kitagawa, Mutsuo and Narita, Isao. **Active carbon activated from zinc chloride. III. Relation of the decolorizing power to the apparent density, combustion loss (yield), and ashes.** *Sci. Ind.* 26, 334-7(1952).—*C.A.* 47, 2960*c*.

Pine sawdust was baked in aq. $ZnCl_2$ to 2 types of active carbon, namely (1) above 600°C that adsorbed methylene blue and I_2 strongly, and (2) above 730°C with 80% $ZnCl_2$ that decolorized caramel but adsorbed the above less.

13755. Kratzl, Karl. **Thermal treatment of wood with water.** *Mitt. österr. Ges. Holzforsch.* 4, 45(1952).—*C.A.* 46, 9298*f*.

Spruce was heated in H_2O at 200°C for 20 hrs. A "polymer of phenolic units" was formed which was the main carrier of the MeO groups. Isolated lignin when heated under similar conditions with or without water gave similar results. On heating wood at 200°C in the absence of H_2O, a residue was obtained having a higher potential vanillin and lower content of the above polymer. Cross sections of wood heated in H_2O showed an intense darkening in those places where lignin was concd. (middle lamella, ray cells).

13756. Othmer, Donald F. **History and present status of the industry-continuous carbonization, the Mellman retort.** *Northeastern Wood Utilization Council Bull.* No. 37, 49-65(1952).—*C.A.* 46, 4195*d*.

The chemical by-products (MeOH, HOAc, acetone) did not compete pricewise with their synthetic counterparts, but charcoal remained in command of its market because it could not be synthesized economically. Current practice was toward charcoal production without by-product recovery, whereby plant investments were reduced appreciably. The Mellman retort, for the continuous production of charcoal without recovery of chemicals, was described in detail.

13757. Puri, Balwant Rai; Lakhanpal, M.L., and Varma, Balvir. **Preparation of active carbon from a few indigenous sources and comparative efficiency of different activation treatments.** *Research Bull. East Punjab Univ.* No. 19, 1-11 (1952)(in English).—*C.A.* 47, 6636*b*.

Active carbon was prepd. from acacia and pine wood, cotton stalks, coconut shells, and sugar carbonized at 550-600°C. In each case the chars were activated by 3 methods: mixing with H_3PO_4 and heating 9 hrs at 950°C in N_2, mixing with 50% $ZnCl_2$ soln. and heating for 5 hrs at 650°C, and treating with steam for 10 hrs at 950°C. The cotton-stalk char yielded the best adsorbent and also showed the highest relative increase in true d. and the largest relative decrease in apparent d. on activation. In general, the higher the d. the better the adsorptive properties of the active carbon. On activation all of the carbon tended to become more hydrophilic and less organophilic.

13758. Shearon, Will H. Jr., Reinke, R.A., and Ruble, T.A. **Oil black.** *Ind. Eng. Chem.* 44, 685-94(1952).—*C.A.* 46, 7314*c*.

In a typical oil-black process, thermally cracked recycle oil high in aromatic content was vaporized and cracked by burning gas-air mixts. below 2600°F. The resulting mixt. was quenched by water sprays and cooled, and the carbon removed by electrostatic precipitators and cyclones. The collected black was agglomerated in mills to 0.02-in pellets of d. 24.5-25.5 lb/cu. ft.

13759. Suzuki, Zenro. **Chemical studies on active carbon. I. Mechanism of single heating activation.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 73, 478-81 (1952).—*C.A.* 47, 4582*h*.

Active carbon prepd. from various plants was calcined at 650°, 750°, 850°, and 950°C. The alky. of the soln. obtained by leaching the active carbon with water, as well as the adsorbing power of the active carbon for methylene blue, increased with the rise of the temp. of calcination.

13760. Venkatraman, R.S.; Khan, H.A.; Datar, D.S., and Zaheer, S.H. **Activated charcoal from groundnut hull.** *Chem. Age* (India) Ser. 6, 119-20(1952).—*C.A.* 47, 3544*f*.

Expts. showed that powd. hulls predigested with 40% of $ZnCl_2$ (based on the wt of the hulls) and heated at 320°C *in vacuo* gave 55.5% yield of charcoal. A yield of 36.6% charcoal was obtained with 60% $FeCl_3$ under the same conditions. The higher results over previously published data were due to carbonization at a lower temp. in complete absence of air and cooling in the absence of air. Low-temp. carbonization was found to favor color adsorption. Slight alterations in carbonization conditions varied the adsorption capacity of the final product.

13761. Comerford, F.M. **Carbon particle formation in a gaseous fuel.** *Fuel* 32, 67-76(1953).—*C.A.* 47, 2953*i*.

C_3H_8 was passed through an elec. tube furnace under controlled soot-forming conditions (temp. and aeration). The emissivity in the visible spectrum of a layer of soot-bearing gas 1 cm thick increased rapidly with temp. above 950°C, reaching 0.9 at 1100°C for a heating time of 1 sec. A higher temp. was required to produce the same emissivity in less time. Premixing air with C_3H_8 reduced the emissivity for the same time and temp., although it was still appreciable after 1 sec. at 1050°C with 1/5 of the air required for a stoichiometric mixt.

13762. Garner, F.H.; Long, R., and Throp, N. **Carbon formation in hydrocarbon diffusion flames.** *Fuel* 32, 116-17(1953).—*C.A.* 47, 2960*e*.

Aromatic, naphthenic, and paraffinic fuels were burned in diffusion flames and the soot formed was collected and extd. by solvents. The major products extd. from the soot, assumed to be intermediates in carbon formation. were sepd. into groups by steam distn. and by chromatography. Many of the fractions thus isolated from the different types of fuel were similar to one another. It seemed probable that the carbon was formed through the production and further reaction of a diene. This intermediate would have only a transient existence and would readily give rise to fulvenes and polymers of fulvenes.

13763. Hadzi, D. **Structure of possible intermediates in carbon formation during pyrolysis of organic compounds.** *Fuel* 32, 112-13(1953).—*C.A.* 47, 2960*g*.

An intermediate stage in the formation of carbon from simple compds. in the condensed state may consist in the formation of large, noncondensed polycyclic mols. which subsequently dehydrogenate to graphitic lamellas. Asphaltenes were isolated from the solid products of thermal decompn. of polyvinyl chloride and β, β-dinaphthylsulfone, from pyrolysis products of C_6H_6 and 1,2,3,4-tetrahydronaphthalene at 700-800°C and dihydroanthracene at 400°C, and finally from the products of the reaction of naphthalene and anthracene, resp., with anhyd. $AlCl_3$ at 190°C. Infrared spectra were detd. for a no. of these exts.: all of them showed the same characteristic bands, with similar intensities, indicating that the materials examd. possessed basically similar structure. These fractions may be common intermediates in the formation of graphitizing carbons.

LIST OF COMMERCIAL SOLID ADSORBENTS

In presenting a tabulation of the proprietary adsorbents that are available to industry, no claim is made for completeness. An effort has been made to contact the various manufacturers in this country, and the following table is based largely on their replies. No evaluation among the entries by the National Bureau of Standards should be implied, and the uses and applications are given as represented by the manufacturers.

Absorbo	An oil and grease granular adsorbent and floor cleaner. Offered by Fidelity Chemical Products Corp., Newark, N. J.
Acid Silicic	A 100-mesh, analytical reagent, for chromatographic analysis by the method of Ramsey and Patterson; made by Mallinckrodt Chemical Works, St. Louis, Mo.
Acid-Washed Alumina	A product produced for chromatographic analysis by Merck & Co., Inc., Rahway, N.J.
Activated Aluminas	Porous adsorptive forms of aluminum oxide produced by Aluminum Company of America, Pittsburgh, Pa. Available as crystalline and gel types in granular, ball and powder forms. Various grades cover a wide range of surface areas and adsorptive properties. All grades may be reactivated by the application of heat. Used as dehydrating agents for air, commercial gases and many organic liquids; for chromatographic separations and as catalysts or catalyst supports in organic reactions.
Activated Carbon	This term is generally considered to be synonymous with activated charcoal, active carbon, adsorbent carbons, decolorizing carbons, and vegetable carbons. Proprietary names included in this summary are: Adsorbite, Aqua Nuchar, Carbex, Carbo-Dur, Cliff-Char, Columbia Activated Carbons, Darco Activated Carbons, Dehydrite, Deodorite, Filtchar, Girdler Charcoal, H-VW-M Activated Carbon, Minchar, Norit, Nuchar, Pittsburgh Activated Carbons, and Suchar.
Activated Magnesia	Various grades (2665, XP, Sea Sorb, 2652, Elguanite, Periclase Pebbles, Remosil and Remoflur) available from Westvaco Mineral Products Division, Food Machinery & Chemical Corp., New York, N. Y.
Adsobarb	A mixture containing 1/8 grain of magnesium phenobarbital, 6 grains of magnesium trisilicate, and 1/300 grain of atropine sulfate used in medicine. Made by Carroll Dunham Smith Pharmacal Co., New Brunswick, N. J.
Adsorbite	A series of activated carbons prepared by the high temperature steam activation of nutshells by Barnebey-Cheney Co., Columbus, Ohio, since 1919. Suitable for air conditioning, gas purification, pollution elimination, gas masks, solvent recovery, liquid purification, waste disposal, water treatment, catalysis, and chemical separations.
Adsorbol Clays	An adsorption clay available in both the natural and activated states. Its chief uses are in decolorizing vegetable, marine, nut, and petroluem oils. Manufactured by the Sierre Talc & Clay Co., Los Angeles 22, Calif.
Alba-Floc	A finely divided calcium sulfate manufactured by the U. S. Gypsum Co., Chicago 6, Ill., and used as a filter and filtering medium.
Alexite	A vermiculite mica derivative used to adsorb grease and oil. Available in many particle sizes. Alexite Engineering Co., Colorado Springs, Colo.
Alon	Fine aluminum oxide about 200 A. units in particle size. Offered by Godfrey L. Cabot, Inc., Boston, Mass.
Alumina	Adsorbents which may be conveniently classified under this term are: Acid-Washed Alumina, Activated Aluminas, Alon, Alumina Gel Desiccant, Alumina-Tabular (Porous), Aluminum Oxide, Aluminum Oxide Tablets, Aluminum Oxide-Woelm, Alundum, Crystolon, Cyclocel, Driocel, Florite, Florite Desiccant, Houdry Hard Alumina, Houdry Type M and Type S, Isocel, Milwhite Bauxite, Porocel, and Puralox.
Alumina Gel Desiccant	An efficient dehydrating agent (surface area about 400 m^2/g) and available as microspheres, 3/16-in. pellets, and various mesh-size granules. Also used as catalyst base. Filtrol Corp., Los Angeles, Calif.
Alumina-Tabular (Porous)	A porous, granular form of aluminum oxide produced by Aluminum Company of America, Pittsburgh, Pa. This material is of high purity and is well suited for catalytic applications that require rugged, low surface area catalysts.

Aluminum Hydroxide	Prepared by many pharmaceutical firms such as Eli Lilley & Co., Indianapolis, Ind., John Wyeth, Philadelphia, Pa., and W. H. Rorer, Inc., Philadelphia, Pa.
Aluminum Oxide	Adsorbent suitable for chromatographic analysis, Merck & Co., Inc., Rahway, N. J.
Aluminum Oxide Tablets	Aluminum oxide in the form of cylindrical tablets of equal length and diameter used as catalysts, catalyst supports, and drying agents. Available from the Harshaw Chemical Co., Cleveland, Ohio.
Aluminum Oxides-Woelm	Adsorbents suitable for chromatographic analysis: Basic aluminum oxide (cationotropic), (2) nonalkaline (almost neutral) aluminum oxide, and (3) acid aluminum oxide (anionotropic) with highest activity (grade I according to Brockmann) and constant standardized properties. Ready for use. Offered by Alupharm Chemicals, Elmont, Long Island, N. Y.
Aluminum Silicate Pigments	Kaolin refined by a water-washing method and classified by water fractionation into various micron size, cream to white in color, inert and non-abrasive. It is available from Minerals & Chemicals Corporation of America, Metuchen, N. J.
Alundum	Catalyst supports made in sphere, ring, and pellet forms. Fused magnesia, zirconia, and mullite porous supports also available. See also Crystolon. Manufactured by Norton Co., Worcester 6, Mass.
Amberlite Ion Exchange Resins	A series of resinous Ion exchange materials manufactured by the Rohm & Haas Co., Resinous Products Division, Philadelphia, Pa.: Amberlite IR-120, strong acid resin; Amberlite IRC-50, weak acid resin; Amberlite IR-4B, weak base, phenol formaldehyde resin; Amberlite IR-45, weak base resin; Amberlite IRA-400 and IRA-410, strong base resin; Amberlite IRA-401 and IRA-411, strong base porous resin; Amberlite MB-1 and MB-3, mixtures of fully regenerated strong acid cation and strong base anion resin. With the exception of Amberlite IR-4B, IRA-410, and IRA-411, all exchangers listed are available in analytical grades. The above products vary in particle size between 16 and 50 mesh. The fine-particle-size resins, approximately 100 to 400 mesh, are XE-69, strong acid resin; XE-97, weak acid resin; XE-59, weak base resin; XE-119, strong base resin.
Anex	A series of anion exchanging resins. Offered by Infilco Inc., Tucson, Ariz.
Anhydrone	The G. Frederick Smith Chemical Co., Columbus, Ohio. A dehydrating agent consisting of anhydrous magnesium perchlorate.
Anthrafilt	A screened anthracite coal produced by The Hudson Coal Co. and sold by the Palmer Filter Equipment Co., Erie, Pa. Anthrafilt is used in rapid, gravity, pressure, and slow filters, hot and cold process softening filters, oil-removal filters, alkali and acid filters.
Aquadag	A colloidal dispersion of electric-furnace graphite in distilled water, having a solids content of 22% by weight. It has been used as a "getter" in the fabrication of vacuum tubes. Manufactured by Acheson Colloids Co., Port Huron, Mich.
Aquagel	A gel-forming, colloidal Wyoming bentonite clay used in oil-well-drilling fluids to produce high-viscosity and reduce filtrate volume when added to drilling fluids. Manufactured by Baroid Sales Division, National Lead Co., Houston, Tex.
Aqua Nuchar	A grade of powdered activated carbon prepared for removal of taste and odor from municipal and private water supplies. This grade of carbon has been used since 1931 and is supplied by the West Virginia Pulp & Paper Co., New York 17, N. Y.
Aqua Palex	A water-treating coagulant available from The Milwhite Co., Inc., Houston 20, Tex.
Asbestine	Natural, pure-white, fibrous magnesium silicate, 99% of which passes through a 325-mesh screen. Used as a pigment and as a filler in paper. Offered by International Talc Co., Inc., New York, N. Y.
Asbestos	Adsorbents which may be classified for convenience under this term are: Asbestos-Filter Aid, Asbestos-Sorb, Ascarite, and Precoat 564-Filter Aid.
Asbestos	Chrysotile, Amosite, and Crocidolite available from Johns Manville Corp., Manville, N. J. Diatomite-asbestos mixtures are also available.
Asbestos-Filter Aid	Powhatan Mining Corp., Inc., Woodlawn, Baltimore, Md.
Asbesto-Sorb	An oil and grease absorbent prepared from asbestos. Philip Carey Manufacturing Co., Lockland, Cincinnati 15, Ohio.
Ascarite	A sodium hydroxide-asbestos adsorbent supplied in three mesh grades: 8-20 mesh, 12-20 mesh, and 20-30 mesh. Used as an absorbent for carbon dioxide in laboratory work. Manufactured exclusively for Arthur H. Thomas Co., Philadelphia 5, Pa.

LIST OF COMMERCIAL SOLID ADSORBENTS

Atomite	Mechanically-ground calcium carbonate ($CaCO_3$) substantially free from particles larger than 10 microns in diameter. Thompson-Weinman & Co., Cartersville, Ga.
Attaclay	A sorptive powder derived from Attapulgite, the principal mineral of Georgia-Florida clay. It is used as a carrier and diluent for insecticides, herbicides, and fungicides. Minerals & Chemicals Corp. of America, Philadelphia 5, Pa.
Attapulgus Clay	A clay mined at or near Attapulgus, Georgia, from 1905 to 1922, by the Atlantic Refining Co., and since 1922 by the Attapulgus Division of Minerals & Chemicals Corporation of America, Philadelphia 5, Pa. There are about 60 different preparations available, including "A" nonextruded, "AA" extruded, and "AAA" extruded. All three are available in both granular and finely ground grades. Attasorb is finely divided, free-flowing powder.
Attasol	Colloidal attapulgite, the principal mineral constituent of the Georgia-Florida Fuller's earth clay. Attapulgus Division of Minerals & Chemicals Corporation of America, Philadelphia 5, Pa.
Attasorb	An extremely finely divided sorbtive powder derived from Attapulgite, the principal mineral of Georgia-Florida clay. It is used as a carrier, conditioning agent, filler and in certain types of paper and rubber. Minerals & Chemicals Corp. of America, Philadelphia 5, Pa.
Barium Perchlorate	An adsorbent of this composition is known as Dessichlora.
Basex	Glauconite mineral greensand zeolite, mined in Sewell, N. J. and used for water purification by Hungerford & Terry, Inc., Clayton, N. J. A more porous and higher capacity greensand zeolite known as Hi-Basex "A" is also available.
Basic Calcium Phosphates	Adsorbents which may be classified for convenience under this term are: Bone Char, Fluo-Karb, Fluorex, Phosphodust, and Synthad.
Bentonite	In granular and powdered forms. Tamms Industries, Inc., Chicago, Ill. See also names listed under Clay.
Bleaching Clay No. 260	A natural, acid pH, free-flowing powder produced in 200 mesh and 325 mesh fineness. Used as selective adsorbent of fruit sugars, diluent for antibiotics, and refining of vegetable oils. Industrial Minerals & Chemical Co., Berkeley 10, Calif.
Bone Char	This material is essentially a residue from the pyrolysis of animal bones. It is manufactured by the American Agricultural Chemical Co., Detroit, Mich. since 1872; by Baugh & Sons Co., Philadelphia, Pa. since 1880; by British Charcoals & Macdonalds, Ltd., Glasgow, Scotland, since 1825; by Consolidated Chemical Industries, New York, N. Y., since 1878, and by Wed. P. Smits & Zoon, Utrecht, Holland. It is principally used in sugar refining, as a pigment, and to a limited extent in petroleum refining.
Cab-O-Sil	Fine silica (99% SiO_2) produced by a high temperature flame process. Used as a white pigment easily dispersed. Godfrey L. Cabot, Inc., Boston, Mass.
Calcium Alumino-Silicate	See Linde Molecular Sieves.
Calcium Carbonate	Adsorbents which may be classified for convenience under this term are: Atomite, Snowflake, and Witcarb R.
Calcium Silicate	Adsorbents which may be classified for convenience under this term are: Micro-Cels and Silene EF.
Calcium Sulfate	Adsorbents which may be classified for convenience under this term are: Alba-Floc and Drierite.
Carbex	A series of activated carbons produced from vegetable sources by Barnebey-Cheney Co., Columbus, Ohio, especially for the decolorization and deodorization of liquids.
Carbo-Dur	A granular activated carbon of high capacity, high density and rapid wetting. The Permutit Co., New York, N. Y.
Carbon Blacks	*Binney & Smith Co.:* Furnex, Lakoblak, Micronex, Raven, Royal Spectra, Superba, Supertex, Velvetex.
	Godfrey L. Cabot, Inc.: Carbolac 1, Carbolac 2 or 46, Carbolac 2 or 48, Carbovar, Elf, Elf 4, Gastex, Kalista, Mogul, Monarch 71, Monarch 74, Monarch 76, Monarch 78, Pelletex, Spheron 4, Spheron 6, Spheron 9, Spheron C, Spheron N, SRF 3, Sterling 99, Sterling 105, Sterling I, Sterling K, Sterling L, Sterling NS, Sterling R, Sterling S, Sterling SO, Sterling V, Super Carbovar, Vulcan 3.

Carbon Blacks—Con.	*Columbian Carbon Co.; Binney and Smith Co.:* Conductex, Excelsior 6 and 12, Furnex, Lakoblac, Micronex, Micronex II, Micronex HPC-MK 11, Micronex Mark II, Micronex Standard, Micronex W-6, Mollacco, Neo-Spectra II, 999, Peerless, Raven, Raven 15, RMV, Royal, Royal Spectra, Standard Micronex, Statex 93, Statex A, Statex B, Statex K, Statex M, Statex R, Superba, Superba No. 503, Super Spectra, Velvetex.
	Continental Carbon Co.; Witco Chemical Co.: Continental A, Continental AA, Continental Channel Blacks, Continental F, Continental R-40, Continex HAF, Continex HMF, Continex SRF, Disperso, Dustless, Extra Super, Extra Witco, Hi-Tone, Kosmos-F-4, Standard, Super, Witco No. 1, Witco No. 12, Witco 50, Witco 100, Witcolac, Witco Lampblack, Witcolith, Witco Regular.
	General Atlas Carbon Co.; Herron Bros., and Myer: Gastex.
	J. M. Huber, Inc.: Wyex, Arrow, HX, a series of channel blacks of medium oil-absorption. Modulex, Essex, a series of low-oil-absorption furnace blacks. Aromex, Arovel, a series of high oil-absorption furnace blacks.
	Imperial Oil & Gas Products Co.: Eureka, Excello, Excello 2XX, Excello No. 5, Flotone, Intenso, Intenso No. 402, Kohinoor, Kohinoor No. 21, Nos. 88 and 50, No. 902, Special Flow, Supertex No. 50, Supertone or No. 302, Supreme MM, Supreme SH, Supreme VF.
	Jefferson Lake Sulfur Co.: Seminex.
	C. E. Johnson Co.: Atlantic 98, Atlantic 115, Atlantic 120, Atlantic 125, Atlantic 130, Atlantic E-42, Atlantic HPC-98, Atlantic MPC-95 (and 75-109).
	Monsanto Chemical Co.: Monsanto No. 10; also grades of Lampblack.
	Phillips Petroleum Co.: Philblack, Philblack A, Philblack O.
	Shawinigan Chemicals Ltd.: Acetylene Black, Hiflo Acetylene, Standard Acetylene.
	Shell Chemical Co.; R. W. Greef & Co., Inc.: Shell, Carbon.
	Thermatomic Carbon Co.; R. T. Vanderbilt Co.: P-33, Thermax, Thermax Stainless.
	United Carbon Co.: A, 15-A, Arrow TX, BB, Carbon 1, Carbon No. 2, Carbon Special No. 2, Carbon 5, Carbon 10, Carbon B, Carbon EP, Carbon, Ordinary, Carbon R, Carbon W, Dixicell, Dixie 5, Dixie 15-A, Dixie 20, Dixie 35, Dixie 40, Dixie 50, Dixie 60, Dixie 70, Dixie 85, Dixie 105, Dixiedensed, Dixiedensed 77, Dixiedensed HM, Dixiedensed S, Dixiedensed S-66, Dixie Perfecto, Dixie Special 102, Dixifluo A, Dixigloss, F-4, FEF Special, Kosmink, Kosmobile 66, Kosmobile 77, Kosmobile HM (and S-66), Kosmobile S, Kosmofine, Kosmolake, Kosmos 3 x B, Kosmos 15-A, Kosmos 15-D, Kosmos 20, Kosmos 35, Kosmos 40, Kosmos 50, Kosmos 60, Kosmos 70, Kosmos 85, Kosmos 97, Kosmos 102, Kosmos B, Kosmos BB, Kosmos F-4, Kosmovar, New M-1, Nuvofecto, Perfecto, Triangle, Voltex.
Carborundum	Various grades and types of porous pellets in poly-surface, cylindrical and spheroidal shape, principally ceramically bonded aluminum oxide and silicon carbide, from the Carborundum Co., Perth Amboy, N. J.
Caroxite	Absorbent for carbon dioxide, developed by Fisher Scientific Co. in cooperation with steel laboratories. It contains an indicator to show when the absorbent is exhausted and is available in two granulations: 8-20 mesh and 20-30 mesh.
Catex 12 and Catex 55	Ion-exchange materials prepared from sulfonated coal. Infilco Inc., Tucson, Ariz.
Celatom	A wide variety of natural and calcined diatomaceous earth powders and aggregates, with low density and high absorption characteristics. Celatom products are produced from a deposit at Clark, Nev. by the Eagle-Picher Co., Cincinnati 1, Ohio.
Celite	A group of filter aids prepared from the diatomaceous earth mined at Lampac, Calif. They are manufactured by the Johns Manville Corp., New York, N. Y., in nine grades intended for specific filtration conditions: Filter-Cel, Celite No. 505, Standard Super-Cel, Celite No. 512, Hyflo Super-Cel, Celite No. 501, 503, 535, and 545. Also, Celite No. 521 acid washed, and preformed catalyst carriers Celite 408 and 410.
Celite 560	Fastest flow rate diatomaceous filter aid yet developed--not yet commercially available. Johns Manville Corp., New York, N. Y.
Celite Analytical Filter Aid	A highly purified diatomaceous earth, standardized for exacting laboratory requirements. Widely used in chromatographic adsorption work, as well as a filter aid for analytical work. Johns Manville Corp., New York, N. Y.

LIST OF COMMERCIAL SOLID ADSORBENTS

Celkates	Synthetic hydrated magnesium silicates, all active adsorbents. Johns Manville Corp., New York, N. Y.
Cellulose	Adsorbents which may be classified for convenience under this term are Krafelt, Solka-Floc, and Chromatographic Cellulose Powder.
Chempro	Chempro C-20, a high capacity multi-purpose cation exchanger, sulfonated polystyrene type. Chemical Process Co., Redwood City, Calif.
Chromatographic Cellulose Powder	This is made by W. & R. Balston, Ltd. (the Whatman Filter Paper), and sold in the U. S. A. by Fisher Scientific Co., New York, N. Y.
Chromia	Principally Cr_2O_3 available from C. K. Williams & Co., Easton, Pa., East St. Louis, Ill., and Emeryville, Calif.
Clay	Adsorbents which may be classified for convenience under this term are: Adsorbol Clay, Aluminum Silicate Pigments, Aquagel, Attapulgus Clay, Attasol, Bleaching Clay No. 260, Bentonite, Desiccite, Dixie Clay, Dri-Flor, Filtrol, Florex, Floridin, Florigel, Florisil, Fuller's Earth, Hydratex Clay, Kaoklay, Kaolloid Clay, Kaolin Clays, Milwhite Bentonite, Milwhite Salt Water Gel, Palex Clay, Retrol, Silimagi, Snobrite Clay, Super Mil Sorb, Tonsil, Turcosorb, Witco Bentonite, Volclay, and Zeogel.
Cliff Char	Activated carbon produced from hardwood charcoal. Various granular sizes and powder. Used for water purification, for sterile air in fermentive processes, deodorization of gases, catalyst manufacture. Produced since 1932. Cliffs Dow Chemical Co., Marquette, Mich.
Cochroanex Ion Exchange Materials	Cation exchangers: Cochranex CCA sulfonated coal or carbonaceous exchanger; Cochranex CG low capacity greensand; Cochranex CGH high capacity greensand; Cochranex CSL synthetic gel; Cochranex CRH-L medium capacity styrene resin, and Cochranex CRZ-W high capacity styrene resin. Anion exchangers: Cochranex AF-N weakly basic phenolic type; Cochranex AH-W weakly basic styrene type; Cochranex AT-AL Type I strongly basic type, and Cochranex AP-AQ Type II strongly basic type. Available from the Cochrane Corp., Philadelphia 32, Pa.
Columbia Activated Carbons	These gas-adsorbing carbons have been used in this country since 1919 for solvent recovery, gas-mask charcoal, air purification, catalysts, and purification of gases. They are prepared by the Carbide & Carbon Chemicals Co., New York, N. Y., from coconut shells and from other materials for special grades. A variety of grades are available for special applications to various gases.
Crystalite	Sodium aluminosilicate, a water softener. Offered by Infilco Inc., Tucson, Ariz.
Crystolon	Various grades and types available in granular form from Norton Co., Worcester, Mass.
Cyclocel	A granular bauxite manufactured for use as a cracking and cyclization catalyst. It is produced by the Porocel Corp., a subsidiary of Minerals & Chemicals Corporation of America, Philadelphia 5, Pa.
Darco Activated Carbons	Manufactured at Marshall, Tex., by Atlas Powder Co., Wilmington, Del. Powdered grades include: Darco S-51 (since 1921) used in decolorizing sugar liquors, vegetable oils and organic chemicals; Red Label Darco S-51 used to remove grease, oil, soap, and colloids from electroplating solutions; Darco G-60 (since 1931) used for drug and chemical purification; Darco DC (since 1923) for removal of bleeding dyes, odors, and fatty acids from dry cleaning solvents; Darco BG for removing from beer the impurities which cause chill-haze; and Darco KB, a highly activated carbon, for treatment of certain liquid sugars, pectin, glutamic acid, and wines. Granular grades: Hydrodarco for water purification in fixed filtration units; Granular Darco in several mesh sizes for treatment of liquids by percolation.
De-Acidite	A synthetic anion exchange resin, weakly basic, manufactured by the Permutit Co., New York, N. Y. Original quality introduced in 1937 and current quality in 1941. Improved in 1949. Used in demineralizing and in industrial process work.
Decalso	A group of synthetic zeolites produced by precipitation from sodium silicate, sodium aluminate, and aluminum sulfate since 1925 by the Permutit Co., New York, N. Y. Used in water softening, particularly in household softeners.
Defluorite	See Fluorex.
Dehydrite	Anhydrous, granular magnesium perchlorate. It absorbs water to form $Mg(ClO_4)_2.6H_2O$, which, in turn, may be dehydrated to the anhydrous form by heating for 10 hours at 250°C under a vacuum. Manufactured since 1935 by The G. Frederick Smith

Dehydrite—Con.	Chemical Co., Columbus, Ohio, exclusively for the Arthus H. Thomas Co., Philadelphia 5, Pa.
	Activated nutshell carbon impregnated with an inorganic dehydrating agent. Manufactured by Barnebey-Cheney Co., Columbus, Ohio, since 1922. This product is suitable for industrial dehydration and also for simultaneous dehydration and deodorization.
Deodorite	A series of activated carbons manufactured by Barnebey-Cheney Co., Columbus, Ohio, since 1922, for deodorizing gases. It is especially suitable for air conditioning, gas purification, and atmospheric pollution control.
Desiccite	A dehydrating agent offered by the Filtrol Corp., Los Angeles, Calif. as an adsorbent for vapors and gases.
Dessichlora	A dehydrating agent consisting of barium perchlorate. Manufactured since 1935 by The G. Frederick Smith Chemical Co., Columbus, Ohio.
Dialyte	A soft, water-polished pumice (complex silicates of aluminum, potassium, and sodium of volcanic origin). James H. Rhodes & Co., Chicago, Ill.
Diatomaceous Earths	Adsorbents which may be classified for convenience under this term are: Celatom, Celite, Celite 560, Celite Analytical Filter Aid, Dicalite, Filter-Cel Standard, Fossilite, Multicel, Precoat 564-Filter Aid, and Sorbo-Cel.
Dicalite	A group of filter aids prepared from the diatomaceous earth mined near Terrebonne, Oreg., and Torrance, Calif. They are manufactured by the Dicalite Division, Great Lakes Carbon Corp., Los Angeles 17, Calif. Available in 30 or more different grades among which are: Dicalite Superaid, Dicalite UF, Dicalite Speedflow, Dicalite Special Speedflow, Dicalite 20, Dicalite Speedplus, Dicalite Speedex, Dicalite 40, Dicalite 4200, Dicalite Elx, and Dicalite M-23, the latter being a decolorizing mixture of diatomaceous earth and activated carbon introduced in 1940.
Diluex, Diluex "A"	An adsorbent-type carrier for pesticide formulations extensively used as a base for liquid toxicant formulations and as a grinding aid for organic pesticides manufactured by Floridin Co.,Tallahassee, Fla.
Dixie Clay	A hard-type, white-to-cream-colored kaolin, a mineral filler for rubber compounding, a filtering material mentioned in 1935 by the R. T. Vanderbilt Co., New York, N. Y.
Doucil	A zeolite ion exchange material composed of a double silicate of sodium and aluminum, used for water purification. Supplied in two size ranges: No. 830, through 8 mesh and retained on 30 mesh; and No. 1040, through 10 mesh and retained on 40 mesh. Offered by the Philadelphia Quartz Co., Philadelphia, Pa.
Dowex Ion Exchangers	Dowex 50 (Nalcite HCR), sulfonated hydrocarbon; Dowex 50W, a light-colored form of Dowex 50; Dowex 3 (Nalcite WBR), weakly basic; Dowex 1 (Nalcite SBR), strongly basic; Dowex 2 (Nalcite SAR), strongly basic. The Dow Chemical Co., Midland, Mich.
Drierite	A dehydrating agent consisting of anhydrous calcium sulfate for the drying of solids, liquids, and gases. Available with or without color indicator for revealing the presence of moisture. It may be regenerated by heating at 235° to 250°C. Available in various mesh sizes. Manufactured by the W. A. Hammond Drierite Co., Xenia, Ohio.
Dri-Flor	Granular, mineral-base adsorbent for use in adsorbing spillage of water and oil on floors. Offered by Turco Products, Inc., Los Angeles, Calif.
Driocel	A drying adsorbent prepared from activated bauxite and regenerated by heating at 300-500°F. It is produced by the Porocel Corp., a subsidiary of Minerals & Chemicals Corporation of America, Philadelphia 5, Pa.
Duolite	A series of ion exchange and adsorbent resins manufactured by Chemical Process Co., Redwood City, Calif. Weak base anion exchangers: Duolite A-1, A-2, A-4, A-5, A-6, A-7; intermediate base anion exchangers: Duolite A-30, A-70; strong base anion exchangers: Duolite A-40, A-41, A-42, A-43; weak acid cation exchangers: Duolite CS-100, CS-101; strong acid cation exchangers: Duolite C-10, C-3, C-25, C-26 and Chempro C-20; oxygen adsorbent: Duolite S-10; chlorine adsorbent: Duolite S-20; general resinous adsorbent: Duolite S-30
Dustex Micro-Silica	An amorphous silica containing 98.5 to 99.5% silica. It has a particle size range of 1 to 15 microns, 98% of which is less than 10 microns. Tamms Industries, Inc., Chicago 1, Ill.

Elguanite	A magnesia product used to defecate sugar solutions. Elguanite Corp., New York, N. Y.
Ferrosand	An iron and manganese zeolite for removal of iron and manganese from water. Hungerford & Terry, Inc., Clayton, N. J.
Fibrous Glass	Fibers ranging from 0.00005 in. to 0.010 in. have been produced commercially in staple, curly and continuous filament types and in a variety of fabricated forms, e.g., bulk, loose batts, bonded mats and batts, papers, woven textiles. An acid-leached form having uniform pores of the order of 20 A. adsorbs water and hydrocarbons. A partial list of suppliers include Pittsburgh Plate Glass Co., Owens-Corning Fiberglas Corp., Libbey-Owens-Ford and Gustin-Bacon Manufacturing Co. The H. I. Thompson Co. produces the acid-leached fiber.
Filtchar	The first commercial decolorizing carbon in the United States, manufactured between 1914 and 1918 by the West Virginia Pulp & Paper Co., New York 17, N. Y., from sulfite waste liquors in paper-pulp manufacture. It was applied to the oil, fat, and chemical industries, but was replaced by a product known as Superfiltchar. This was manufactured from 1918 to 1921 when it, too, was replaced by others known as the Nuchar carbons.
Filter-Cel Standard	A selected uniform laboratory standard for the diatomite industry and used extensively as the filter aid in "filtrability" testing. Johns Manville Corp., New York, N. Y.
Filtrol	A series of activated clay products of montmorillonite structure, manufactured at Jackson, Miss., Salt Lake City, Utah or Vernon, Calif., by the Filtrol Corp., Los Angeles 23, Calif. These clays are used: (1) as adsorbents in the refining of petroleum oils, fatty oils, sulfur, etc., and (2) as powdered and pelleted catalysts for the catalytic conversion of petroleum oils. Adsorbents: Super Filtrol Grade 1, Special Filtrol Grade 4, Retrol Grade 6, DC Filtrol Grade 7 and Neutrol Grade 40. Catalysts: Montmorillonite and SR type grades.
Filtros	A porous, acid-proof brick made by bonding sand (99.8% SiO_2) with a silicate and firing at 2020°F. Produced in various grades of porosity. Porous carbon, clay and mullite are also available. A porous quartz catalyst carrier is manufactured. It is crushed to irregular shapes and classified in various mesh sizes. Filtros Inc., East Rochester, N. Y.
Florex	An adsorptive clay mined near Quincy, Fla., originally known as Floridin, later improvements in efficiency noted by the trade name Florex, available in granular meshes and finely divided grades for wide applications in adsorption practices. Manufactured by Floridin Co., Tallahassee, Fla.
Floridin	A mineral product based primarily on Florida Fuller's earth commonly known as the mineral attapulgite, produced at Quincy and Jamieson, Fla., for the Floridin Co., Tallahassee, Fla.
Florigel	A hydrated form of Fuller's earth also colloidal (natural attapulgite), used for dispersions with stability in electrolytes manufactured by Floridin Co., Tallahassee, Fla.
Florisil	A synthetic gel extensively used in chromatography, highly selective adsorptive characteristics manufactured by Floridin Co., Tallahassee, Fla.
Florite	An activated bauxite specifically selected for refinery applications, service life and adsorption capacity, processed at Sweet Home, Ark., by Floridin Co., Tallahassee, Fla.
Florite Desiccant	An activated bauxite specifically selected for desiccating properties, extensively used for natural gas dehydration or pipeline transmission. Also in general use as a rugged, solid adsorbent drying agent processed at Sweet Home, Ark., by Floridin Co., Tallahassee, Fla.
Fluo-Karb	A granulated heat-treated bone. The Permutit Co., New York, N. Y.
Fluorex	A tricalcium phosphate preparation used since 1938 for water purification. Distributed by Infilco Inc., Tucson, Ariz., and manufactured by Victor Chemical Works. Also known before 1940 as Defluorite.
Fossilite	A diatomaceous earth for filtering. Offered by L. A. Salomon & Bro., New York 38, N. Y.
Fuller's Earth	A porous, adsorptive clay consisting of hydrated aluminum and magnesium silicates. See for example Floridin Co., Tallahassee, Fla.; Minerals & Chemicals Corporation

Fuller's Earth—Con.	of America, Philadelphia, Pa., and Tamms Industries, Inc., Chicago, Ill. See also names listed under Clay.
Girdler Catalysts	G-19 Steam-Hydrocarbon Reforming Catalyst, a nickel base catalyst containing approximately 20% nickel active in the reforming of hydrocarbons with steam, carbon dioxide, or with steam and air at 1300° to 1850°F. G-29 Steam-Hydrocarbon Reforming Catalyst, a nickel base catalyst containing approximately 27% nickel active in the reforming of hydrocarbons at 1100° to 1850°F. G-3 Carbon Monoxide Shift Catalyst, a chromium promoted iron oxide catalyst used in ammonia and hydrogen plants for the conversion of carbon monoxide by steam at elevated temperatures to carbon dioxide with the formation of hydrogen. G-12, a highly active nickel hydrogenation catalyst; G-15 reduced nickel hydrogenation catalyst, electrolytically precipitated nickel on kieselguhr catalyst; G-16 unreduced nickel hydrogenation catalyst, nickel hydroxide on kieselguhr; G-13 copper chromite hydrogenation catalyst containing about 50 weight percent copper oxide; G-22 barium-promoted copper chromite hydrogenation catalyst containing about 40 weight percent of copper oxide; G-23 cobalt molybdate hydrogenation catalyst, alumina supported, of about 10 weight percent of cobalt molybdate; G-21, G-24, and G-28, selective acetylene hydrogenation catalysts; G-8, a copper-chromium-promoted iron catalyst for desulfurization; G-20, a chromia-alumina desulfurization catalyst; G-11 deoxidation catalyst, copper impregnated on a natural carrier; G-5, an iron oxide base, copper promoted deoxidation catalyst. Offered by the Girdler Co., Louisville 1, Ky.
Girdler Charcoal	Manufactured by the Girdler Co., Louisville 1, Ky.
Glauconite	A natural zeolite; also known as greensand. Cochrane Corp., Philadelphia 32, Pa.
Hi-Sil 101, **Hi-Sil 233,** **Hi-Sil X303**	Synthetic hydrated amorphous particulate silica (150 m^2/g). Columbia-Southern Chemical Corp., subsidiary of Pittsburgh Plate Glass Co., Pittsburgh 22, Pa.
Houdry Hard Alumina	An hard extrudate available in various diameters and surface areas for use as catalyst supports, drying and dehydrating agents. Houdry Process Co., Marcus Hook, Pa.
Houdry Type M and Type S	Porous silica-alumina compositions for use as catalytic cracking catalysts, catalyst supports, drying agents. Houdry Process Co., Marcus Hook, Pa.
H-VW-M Activated Carbon	This activated carbon is offered to the electroplating industry by the Hanson-Van Winkle-Munning Co., Matawan, N. J., for use in purifying acid and alkaline electroplating solutions.
Hydratex Clay	A creamy-white colored, low-mica-content, hydrous aluminum silicate clay, available in lump form, and as pulverized and air-floated powders. Hydratex-R is a low-mica clay refined by water flotation. Suprex Clay, a hydrous aluminum silicate clay in the form of a creamy-white, air-floated powder. J. M. Huber, Inc., New York, N. Y.
Impermex	A water-dispersible, pulverized, organic colloid added to oil-well drilling muds to decrease the filtrate volume. Manufactured by Baroid Division, National Lead Co., Houston, Tex.
Infilco	CATEX, cation exchangers; ANEX, anion exchangers; CRYSTALITE, sodium aluminosilicate; FLUOREX, tricalcium phosphate. Infilco, Inc., Tucson, Ariz.
Inulin	Fisher Scientific Co., New York, N. Y.
Ionac Exchangers	Ionac C-200, phenol formaldehyde sulfonate; Ionac C-284, a cation-exchange resin as black particles; Ionac A-293, an acid-absorbing, anion-exchange resin; Ionac A-293 M, melamine-guanidine-formaldehyde resin; Ionac A-300, medium basic. The American Zeolite Co. and The Ionac Co., Ltd., New York 36, N. Y.
Ion Exchanger Resins	Adsorbents which may be classified for convenience under this term are: Amberlite Ion Exchange Resins, Anex, Catex 12 and Catex 55, Chempro, Cochranex Ion Exchange Materials, De-Acidite, Dowex Ion Exchangers, Duolites, Infilco, Ionac Exchangers, Ion-X Resins, Kyrite, Liquonex Ion Exchangers, Nalcite, Permutit, and Zeo-Karb.
Ion-X Resins	These are identical with Dowex 50. Distributed by Microchemical Specialties Co., Berkeley 3, Calif.
Iron Oxide	Natural pigment in red, yellow or brown. Tamms Industries, Inc., Chicago, Ill.

Iron Oxide—Con.	Contains Fe_2O_3 above 99%. C. K. Williams Co., Easton, Pa., East St. Louis, Ill., and Emeryville, Calif.
Isocel	This product is aluminum chloride impregnated on activated bauxite and used as a catalyst for isomerization reactions. Attapulgus Division of Minerals & Chemicals Corporation of America, Philadelphia 5, Pa.
Kadox-15	A finely divided zinc oxide manufactured by the New Jersey Zinc Co., New York 38, N. Y.
Kaoklay	Fine kaolinite of about 1-micron particle size. Godfrey L. Cabot, Inc., Boston, Mass.
Kaolin Clays	A full range of air-floated and water-washed kaolins of very fine to coarse particle size, from high to low adsorbencies. Available from J. M. Huber Corp., New York 17, N. Y.
Kaolloid Clay	A high absorption type of high brightness Georgia kaolin, with an average particle size of about one micron. Manufactured by Thompson-Weinman & Co., Cartersville, Ga.
Kieselguhr	See Diatomaceous Earth.
Krafelt	A bulky and highly-absorptive type of wood fiber supplied either in the form of pulp or finished paper. Manufactured by Krafelt Co., Wilmington, Del.
Kyrite	A synthetic adsorbent resin deposited upon a diatomaceous filter aid. It was proposed by the Dicalite Co., New York, N. Y. in 1941 for treatment of low-grade sugar products such as affination and granulated sirups.
Lampblack	These are carbon blacks manufactured by burning petroleum oils, tars and aromatic residues in special burning pans. Although lampblack is properly classified as a carbon black it is considered by industry in a separate category and is not covered in this tabulation.
Linde Molecular Sieves	Highly porous crystals in pellets or powder used for selective adsorption processes. They are made by removing the water of hydration from a sodium or calcium aluminosilicate. Available in two porosities: Type 4A sodium aluminosilicate (4 A.), Type 5A calcium aluminosilicate (5 A.). Manufactured and sold by Linde Air Products Co., a Division of Union Carbide and Carbon Crop., New York 17, N. Y.
Liquonex Ion Exchangers	Liquonex CG, stabilized greensand; Liquonex CGH, high capacity greensand (glauconite); Liquonex CSL, synthetic gel sodium alumino-silicate; Liquonex CRM; Liquonex CRP; Liquonex CRQ, phenol-formaldehyde resins containing sulfonic acid groups; Liquonex CRW, sulfonated polystyrene resin; Liquonex AD, strongly basic aliphatic amine resin; Liquonex AF, polyalkylene polyamine resin. Liquid Conditioning Corp., now owned by Cochrane Corp., Philadelphia, Pa.
Magnesia	A powdered adsorptive magnesia prepared by dehydration of the hydroxide by Westvaco Mineral Products Division, Food Machinery & Chemical Corp., New York, N. Y.; also Micron Brand Magnesium Oxide, Nos. 2641 and 2642 and Sea Sorb 43. Adsorbents which may be classified for convenience under this term are: Activated Magnesia, Elguanite, Periclase-S93, Remoflur, Remosil, and Sea Sorb 43.
Magnesium Perchlorate	An adsorbent of this composition is known as Anhydrone.
Magnesium Silicate No. 34	Philadelphia Quartz Co., Ltd., Berkeley, Calif.
Magnesium Silicates	Adsorbents which may be classified for convenience under this term are: Asbestine, Celkates, Magnesium Silicate No. 34, and Magnesol.
Magnesium Trisilicate	A medicinal adsorbent manufactured by the Mallinckrodt Chemical Works, St. Louis, Mo., and by the Philadelphia Quartz Co.,Berkeley, Calif.
Magnesol	An adsorptive synthetic hydrated magnesium silicate available in several modifications for specific applications. Manufactured by Westvaco Chlor-Alkali Division, Food Machinery & Chemical Corp., New York, N. Y. It is used for purifying dry cleaning and other solvents, as a filler in phenolic and other plastics, as an anti-caking agent and flow promoter for solids, as a carrier for perfumes and flavors, for purifying petroleum products, oils, fats and waxes, as a catalyst and catalyst-carrier, and as a chromatographic separation agent.

Metals, Porous	Porous metallic carrier of 18-8 stainless steel, Monel, Hastelloy and other alloys available from Micro-Metallic Corp., Glen Cove, Long Island, N. Y.
Mica	Adsorbents which may be classified for convenience under this term are: Alexite, Mica-Wet Ground, Super-Adsorbit, and Zonolite.
Mica-Wet Ground	Used in chromatographic columns and in corrosion protective systems to improve sealing against moisture penetration. Wet Ground Mica Association, Inc., New York 17, N. Y.
Micro-Cels	Synthetic hydrated calcium silicate products of different degrees of fineness, absorptive capacity, etc. Designated as No. 800, 801, 803, 900, etc. Johns Manville Corp., New York, N. Y.
Milwhite Bauxite	An activated bauxite obtained from Arkansas and used for petroleum processes related to decolorizing and catalysis. It is a granular product available in different mesh sizes from The Milwhite Co., Inc., Houston 20, Tex.
Milwhite Bentonite	Montmorillonite which may be activated to produce a high adsorbent decolorizer and also used as a drilling mud additive. A product "Mil Bond" is used for foundry bentonite and a binder for pelletized livestock feed. It is available from The Milwhite Co., Inc., Houston 20, Tex.
Milwhite Salt Water Gel	An attapulgite-type clay used for a colloid in salt water drilling mud, and also available as a decolorizing medium for contact and percolation processes and as an insecticide carrier. It is available from The Milwhite Co., Inc., Houston 20, Tex.
Minchar	A granular filter medium in which activated carbon has been deposited by the action of superheated steam at a temperature above 675°C. Produced by the Minchar Manufacturing Co., Elmira, N. Y., from a carbonaceous material of an aluminum silicate structure. Used for water purification since 1923 and for the removal of emulsified and free oils from distillates since 1916. Used as an adsorbent and catalyst.
Mineral Feed Black	A pigment that contains principally aluminum silicate 61.8%, carbon 22.1%, sulfur 1.2%, iron oxide 5.1%, silica 5.7%, lime (calcium oxide) 0.6%, and magnesia 1.0%. Tamms Industries, Inc., Chicago, Ill.
Mineral Zeolites	Adsorbents which may be classified for convenience under this term are: Basex, Crystalite, Decalso, Doucil, Ferrosand, Glauconite, Nalcolite, Refinite ZN, and Zeo-Dur.
Multicel	A diatomaceous earth offered in three grades (617, 680 and 000) by the Tamms Industries Inc., Chicago, Ill.
Nalcite	Nalcite SBR, strongly basic anion exchange resin. Nalcite HCR, styrene type cation exchange resin. Nalcite SAR, strongly basic anion exchange resin. Nalcite WBR, weakly basic anion exchange resin of polystyrene-polyamine type. National Aluminate Corp., Chicago 38, Ill.
Nalcolite	Synthetic inorganic exchanger. National Aluminate Corp., Chicago 38, Ill.
Neutrol Grade 40	An acid activated, highly processed adsorbent made from the mineral montmorillonite; used for bleaching fatty oils. Filtrol Corp., Los Angeles 23, Calif.
Norit	Activated carbons for decolorizing and many other purposes manufactured since 1934 by the American Norit Co., Inc., Jacksonville, Fla. Norit activated carbons, including granular carbons for gas adsorption and solvent recovery, are also manufactured by the General Norit Co., Amsterdam, Holland, since 1918.
Novacite	Finely divided alpha-quartz in well rounded crystalline discs containing minute cracks and fissures. In 7 grades having particle diameters ranging from 160 to 3.4 microns. Malvern Mineral Corp., Hot Springs, Ark.
Nuchar	A group of decolorizing carbons manufactured since 1922 by the West Virginia Pulp and Paper Co., New York 17, N. Y., from rotary black ash incident to paper-pulp manufacture. Aqua Nuchar is chiefly used in water purification and Suchar in sugar refining. Other grades of Nuchar are used for treatment of oils, fats, beverages, foods, and in the general chemical industries. See also Filtchar.
Nylon Fibers	Used as a filter aid and available from the E. I. du Pont de Nemours & Co., Wilmington 98, Del.
Palex Clays	Adsorbent clays of several grades used for decolorizing mineral, vegetable, and animal oils. They are available from The Milwhite Co., Inc., Houston 20, Tex.

LIST OF COMMERCIAL SOLID ADSORBENTS

Palladium and Platinum	These catalysts on various carriers are available with varying percentages of platinum metal. The American Platinum Works, Newark 5, N. J.
Periclase-S93	Catalyst support, principally of MgO, manufactured by Westvaco Mineral Products Division, Food Machinery & Chemical Corp., New York, N. Y.
Permagel	A solid thickening agent derived from refined Attapulgite, the principal mineral of Georgia-Florida clay. It is used in both aqueous and organic media to obtain stable and thixotropic gels and as a suspending agent. Minerals & Chemicals Corp. of America, Philadelphia 5. Pa.
Permutit Ion Exchangers	Manganese Permutit, Permutit A, Permutit Folin, Permutit H-70, (carboxylic), Permutit Q (sulfonated styrene cation exchanger), Permutit S—various types (quaternary amine, anion exchanger), Permutit W (weakly basic), Permutit CCG, Permutit DR (Asmit), Permutit H, Zeo-Karb, Zeo-Dur, Decalso, and De-Acidite. Made by The Permutit Co., New York, N. Y.
Phosphodust	A-325 mesh Florida land-pebble phosphate used as an insecticidal carrier dust. The American Agricultural Chemical Co., New York, N. Y.
Pittsburgh Activated Carbons	A series of granular and pulverized adsorbents manufactured from coal since 1939 by Pittsburgh Coke & Chemical Co., Pittsburgh, Pa. A number of grades are available, each having controlled pore structure, surface area, and mesh size for specific applications. Liquid-phase applications: decolorization and purification in sugar refining, water purification, beverages, organic chemicals and pharmaceuticals. Vapor phase applications: solvent recovery, gas stream purification, air conditioning, catalysis, and hydrocarbon separations.
Porocel	An activated bauxite from Arkansas produced since 1937 by the Porocel Corp., subsidiary of Minerals & Chemicals Corporation of America, Philadelphia, Pa. It is for use in petroleum refining, catalysis, and also for sugar refining.
Precoat 564 Filter Aid	An asbestos-diatomaceous filter aid used for adsorption and "polish" filtrations. Johns Manville Corp., New York, N. Y.
Protek-Sorb	A silica gel in various mesh sizes. Davison Chemical Corp., Baltimore 3, Md.
Pumice	This is used chiefly as a catalyst support. Imported by K. F. Griffith Co., Inc., Newark, N. J. from Lipari Island, Italy.
Puralox	Activated aluminum oxide (Al_2O_3) in tablet form. Harshaw Chemical Co., Philadelphia 7, Pa.
Refinite ZN	A processed zeolite clay from natural bentonites. The Refinite Corp., Omaha, Nebr.
Remoflur, Remosil	See Activated Magnesia.
Retrol	An acid-activated, highly-processed adsorbent made from the mineral montmorillonite and employed in re-refining used petroleum oils. (See Filtrol.)
Santocel	A silica aerogel produced by Monsanto Chemical Co., Inorganic Chemical Division, St. Louis, Mo. Grades: Santocel C and Santocel 54, medium oil absorbing, and Santocel A for use in thermal insulation.
Sea Sorb 43	See Activated Magnesia.
Separan 2610	Dow Chemical Co., Midland, Mich.
Silene EF	A white synthetic, hydrated amorphous calcium silicate (80 m^2/g). Columbia-Southern Chemical Corp., subsidiary Pittsburgh Plate Glass Co., Pittsburgh, Pa.
Sil-Flo Filter Aids	An alumina-silica mixture offered by the Sil-Flo Corp., Fort Worth, Tex.
Silica	Granular and powdered in the following sizes: floated, about 240 mesh; powder, about 140 mesh; granular, fine, for water analysis (80-120 mesh); granular, fine (sand); and granular, coarse, about 4 mesh. Offered by the Fisher Scientific Co., New York, N. Y.
Silica	Adsorbents which may be classified for convenience under this term are: Cab-O-Sil, Filtros, Hi-Sil 233, Hi-Sil X303, Novacite, Santocel, Silica-Amorphous, Silica-Crystalline, and Silica-Fine Sizes.
Silica Alumina Catalyst	Type MS-F-1 and others available from Davison Chemical Co., Baltimore, Md. Type MS-Al and MS-B and others available from American Cyanamid Co., New York, N. Y. Type MS-2, A, B, C, and others available from National Aluminate Corp., Chicago, Ill.

Silica-Amorphous	Velveteen "R" Silica—an amorphous silica fines 95 to 97% thru 325 mesh. OO Silica Smoke—an amorphous silica fines 99.5% thru 325 mesh. Gold Bone "R" Silica—an amorphous silica fines 98 to 99% thru 325 mesh. Tamms Industries, Inc., Chicago, Ill.
Silica-Crystalline	No. 68 Silica Flour—a crystalline silica fines 96% thru 140 mesh. No. 10 Silica Flour—a crystalline silica fines 98% thru 200 mesh. No. 400 Silver Bond "B" Silica—a crystalline silica fines 99.5% thru 325 mesh. Tamms Industries, Inc., Chicago, Ill.
Silica Gel	Known also as Protek-Sorb, produced from sodium silicate and sulfuric acid since 1919 by the Davison Chemical Co., Baltimore, Md.
Silica-Fine Sizes	Non-crystalline white powders of varying particle sizes from 6 to 20 microns (also known as Syloid 244). The Davison Chemical Co., Baltimore, Md.
Silicate Carriers	Various types available: Peerless No. 1, kaolin; Continental, kaolin; "Pyrax" B, pyrophyllite; Nytal, talc; Cherokee, kaolin; "Veegum". R. T. Vanderbilt Co., Inc., New York 17, N. Y.
Silicic Acid	The meta-precipitated form, H_2SiO_3, of a reagent grade is offered by the Fisher Scientific Co., New York, N. Y.
Silimagi	A natural clay of high pH value and showing substantial thixotropy. Produced as a free-flowing powder for use in preparation of emulsions and as a substitute for bentonite where varying pH of water disturbs thixotropic behavior of bentonite. Industrial Minerals & Chemical Co., Berkeley 10, Calif.
Snobrite Clay	A high absorption type of high brightness Georgia kaolin, with an average particle size of about one micron. Manufactured by Thompson-Weinman & Co., Cartersville, Ga.
Snowflake	Mechanically-ground calcium carbonate ($CaCO_3$) substantially free from particles larger than 25 microns in diameter. Thompson-Weinman & Co., Cartersville, Ga.
Sodium Alumino-Silicate	See Linde Molecular Sieves.
Solka-Floc	Purified wood cellulose of several grades, mesh size and density; manufactured by Brown Co., Boston 14, Mass. A non-abrasive, combustible filter aid.
Sorbo-Cel	An activated and chemically treated diatomaceous filter aid, used particularly for its adsorptive as well as filter-aid action. It is used principally for fine oil-in-water emulsions and other dispersions. Manufactured by Johns Manville Corp., Manville, N. J.
Suchar	One of the Nuchar carbon adsorbents. Suchar Engineering and Sales Co., New York, N. Y.
Super-Absorbit	See Alexite. Alexite Engineering Co., Colorado Springs, Colo.
Super Mil Sorb	A granulated attapulgite-type clay for use as a water, oil and grease absorbent, and as a carrier for insecticides. It is available from The Milwhite Co., Inc., Houston 20, Tex.
Synthad	A granular adsorbent containing principally a basic calcium phosphate, a clay binder, and a carbonaceous residue. Used as a replacement for bone char. Manufactured by Baugh & Sons Co., Philadelphia, Pa.
Talc	Purified powder U. S. P. grade. Fisher Scientific Co., New York, N. Y.
Tonsil	Manufactured in Germany and distributed in the United States by L. A. Salomon & Bro., New York 38, N. Y. These include several powdered, acid activated clays for use in decolorizing of many solutions, such as vegetable, animal, and mineral oils, etc.
Turcosorb	Granular, mineral-base adsorbents for use in adsorbing spillage of water and oil on floors. It is offered by Turco Products, Inc., Los Angeles, Calif.
Volclay	A Wyoming bentonite used as a bleaching clay in the following grades: 200 mesh, 325 mesh, KWK 33, MX 80, BC, and Minus 625. It is manufactured by the American Colloid Co., Chicago 54, Ill.
Witcarb R	Ultrafine particle size precipitated calcium carbonate. It is used chiefly in paints. Witco Chemical Co., New York 17, N. Y.

Witco Bentonite	A bentonite offered by the Witco Chemical Co., New York 17, N. Y.
Zeo-Dur	A mineral zeolite, a species of greensand, mined in New Jersey and used for water purification by the Permutit Co., New York, N. Y., since 1917. An activated variety known as Super Zeo-Dur has been available since 1935.
Zeogel	A special colloidal attapulgite clay used as a suspending agent in saline or fresh water oil-well drilling muds. Manufactured by Baroid Division, National Lead Co., Houston, Tex.
Zeo-Karb	A carbonaceous zeolite produced since 1936 from coal and sulfuric acid by the Permutit Co., New York, N. Y. It is used in water treatment, demineralizing, and in industrial processes.
Zeolex	A series of sodium and sodium calcium silico-aluminates, in 20 to 50 millimicron particle size, with high adsorbencies, used as conditioners and anti-caking agents. J. M. Huber Corp., New York 17, N. Y.
Zinc Oxide	An adsorbent of this composition is known as Kadox-15.
Zonolite	Vermiculite, sold directly as ore, and as an exfoliated product. Various classifications are given the processed material based on particle size. Zonolite Co., Chicago 3, Ill.

AUTHOR INDEX

SUBJECT INDEX

ABBREVIATIONS USED IN ABSTRACTS *

A.	Angstrom unit(s)
abs.	absolute
Ac	acetyl (AcOH, acetic acid)
a.c.	alternating current
addn.	addition
alc.	alcohol, alcoholic
alk.	alkaline
amp.	ampere(s)
amt.	amount
anhyd.	anhydrous
app.	apparatus
approx.	approximate, approximately
aq.	aqueous
assoc.	associate(s)
at.	atomic
atm.	atmosphere(s), atmospheric
at. wt.	atomic weight
av.	average
Bé.	Baumé
B.E.T.	Brunauer, Emmett & Teller
biol.	biological
B.O.D.	biochemical oxygen demand
b.p.	boiling point
B.t.u.	British thermal unit
Bu	butyl (normal)
Bz	benzoyl (BzOH, benzoic acid)
°C	degree Celsius
cal	calorie(s)
calc.	calculate
calcd.	calculated
calcn.	calculation
c.d.	current density
c.f.s.	cubic foot per second
chem.	chemical
cm	centimeter(s)
cm^2	square centimeter
cm^3	cubic centimeter
coeff.	coefficient
combn.	combination
compd.	compound
compn.	composition
conc.	concentrate
concd.	concentrated
concn.	concentration
cond.	conductivity
const.	constant
contg.	containing
co-pptd.	co-precipitated
co-pptn.	co-precipitation
crit.	critical
cryst.	crystalline
crystd.	crystallized
d.	density
d.c.	direct current
decompd.	decomposed
decompn.	decomposition
deriv.	derivative
det.	determine
detd.	determined
detn.	determination
diam.	diameter
dil.	dilute
dild.	diluted
diln.	dilution
dissoc.	dissociate(s)
distd.	distilled
distn.	distillation
dm	decimeter(s)
elec.	electric, electrical
e.m.f.	electromotive force
equil.	equilibrium
equiv.	equivalent
Et	ethyl
e.v.	electron volts
evap.	evaporate
evapd.	evaporated
evapn.	evaporation
examd.	examined
examn.	examination
expt.	experiment
exptl.	experimental
ext.	extract
°F	degree Fahrenheit
f.p.	freezing point
ft	foot
ft^2	square foot
ft^3	cubic foot
g	gram(s)
gal	gallons(s)
geol.	geological
g.p.m.	gallons per minute
g.p.s.	gallons per second
ha.	hectare
hr	hour
in.	inch(es)
$in.^2$	square inch
$in.^3$	cubic inch
inc.	increase
indep.	independent
inorg.	inorganic
insol.	insoluble
°K	degree Kelvin
kc	kilocycle
kcal	kilocalorie(s)
kg	kilogram(s)
km	kilometer(s)
kv.	kilovolt(s)
lab.	laboratory
liq	liquid
log	logarithm
lb	pound

---

*The abbreviations are mostly those used by the American Chemical Society.

m	meter(s)
m^2	square meter
m^3	cubic meter
M	molar
μ	micron
μ^3	cubic micron
ma.	milliampere(s)
manuf.	manufacture
math.	mathematical
max.	maximum
Me	methyl
measd.	measured
mech.	mechanical
meq.	milliequivalent
mg	milligram(s)
min.	minimum (also minute(s))
mixt.	mixture
ml	milliliter(s)
mm	millimeter
mm^2	square millimeter
mm^3	cubic millimeter
$m\mu$	millimicron
mol.	molecule, molecular
m. p.	melting point
mv.	millivolt(s)
n	index of refraction
N	normal

N.T.P.	normal temperature and pressure
neg.	negative
no.	number
org.	organic
oz	ounce
p.d.	potential difference
phys.	physical
physiol.	physiological
pos.	positive
powd.	powdered
p.p.m.	parts per million
ppt.	precipitate
pptd.	precipitated
pptn.	precipitation
Pr	propyl
prep.	prepare
prepd.	prepared
prepn.	preparation
pres.	pressure
p.s.i.	pounds per square inch
p.s.i.g.	pounds per square inch gage
qt	quart
qual.	qualitative
quant.	quantitative
resp.	respectively

sat.	saturate
satd.	saturated
satn.	saturation
sec	second
sep.	separate
sepn.	separation
sol.	soluble
soln.	solution
soly.	solubility
sp	specific
sp.gr.	specific gravity
sq	square
St.	Stammer
subst.	substance
sym.	symmetrical
tech.	technical
temp.	temperature
v.	volt(s)
v.p.	vapor pressure
vol.	volume
w.	watt(s)
wt	weight
yd	yard
yd^2	square yard
yd^3	cubic yard
yr	year
