Pptn. of colloids and rate of settling were governed by the nature of the juice and the degree of liming. The nonrefractory juices did not give much trouble when treated at high Brix, but refractory juices were best treated at lower Brixes. Fractional liming (cold or hot) gave good results if the optimim conditions of time of sulfitation and time of contact of the juice with lime were observed, and if the pH was kept within a fixed range. With the refractory juices the hot process was desirable, but in this process the color, pH, content of lime salts and colloid content tended to increase. To counteract the disadvantage of the higher temp., use was made of oxalic acid to reduce the pH.

6600. PARASHAR, D. R. AND SHANKAR, KRIPA. **The clarification of cane juices.** *Intern. Sugar J.* 44, 184-5 (1942).—*C.A.* 36, 6830².

Fractional liming was applied to sulfitation plants with considerable success. Method (1): The raw juice was limed to 8.0 pH in the cold, heated to 50°C and then sulfited until the pH fell to 5.1 to 5.3. It was then relimed to neutrality, heated to boiling and boiled as usual. Method (2): The juice was limed to 8.0 pH cold and heated to 71°C. The juice was sulfited to a pH of 6.2 to 6.4. Then the remainder of the SO_2 and lime were added simultaneously until at the end of the addn. the juice was neutral.

6601. RAWLINGS, F. N. AND SHAFOR, R. W. **Ion exchangers: Their application in cane- and beet- sugar juice purification.** *Sugar* 37, No. 3, 30 (1942).—*C.A.* 36, 2749².

The ion exchangers used in this work were Amberlite IR-1 and IR-4.

6602. REICH, GUSTAVE T. **Molasses elaboration.** *Trans. Am. Inst. Chem. Engrs.* 38, 1049-66 (1942); *Can. Chem Process Inds.* 27, 2-6 (1943).—*C.A.* 37, 1292⁶.

Lime up to 88% was removed by H_2SO_4, the inverting agent, and by control of the time of reaction, and concn. of the molasses. The lime removal increased production of alc. and eliminated scale formation in the beer stills and evaporators. Recovery of yeast of low ash content was realized. Pilot-plant experimentation promised the recovery of a decolorizing carbon, potash, and various chemicals from the tar obtained by the retorting of the nonsugars.

6603. SPENGLER, O. AND TÖDT, F. **The use of base-exchange substances for deliming and demineralizing sugar juices.** *Z. Wirtschaftsgruppe Zuckerind.* 92, 152-9 (1942).—*C.A.* 37, 6923⁵.

The synthetic ion-exchanger, Wofatit KS, was used in these lab. expts. The cation exchange in sugar juices at 80-90°C was accompanied by a strong lowering of the pH which inverted some of the sugar. Very encouraging results were obtained in deliming thin juices, especially from poor beets. A contact time of 30 seconds reduced the lime content of the juice to 0.01% CaO per 100 Brix, and for a contact time of 90 sec the lime content was reduced to 0.0036% CaO.

6604. SUZUKI, KAKUO. **Sugar manufacture by manganous sulfate method. IV.** *J. Soc. Chem. Ind. Japan* 45, 641-4 (1942).—*C.A.* 42, 6558*f*.

A 50% sugar soln. was evapd. in a test pan with the addn. of $MnSO_4$. The result showed that the addn. of the salt shortened the time of evapn. about 10% and saved elec. power for heating by about 9%.

6605. Vašátko, J. **The darkening of saturated sugar juice.** *Z. Zuckerind.* 66, 70-5 (1942).—*C.A.* 38, 5426^9.

The darkening of the satn. juices of Moravian sugar factories was due to the invert sugar remaining in the juices. The amt. of unaltered invert sugar left in the juices depended on the defecation time, temp. and the nature of the lime addn. and not the lime addn. only. Predefecation had no influence on the darkening of juices. The decompn. of invert sugar at the alky. of the 1st or 2nd satn. juice produced the greatest discoloration. Discoloration continued as long as the invert sugar decomposed. More color was formed when the decompn. of the invert sugar was accompanied at atm. oxidation.

6606. Werquin, V. **A liming and saturation process for juices.** *Bull. assoc. chim.* 59, 226-33 (1942).—*C.A.* 38, 3506^1.

The quantity of CaO necessary for predefecation was detd. by adding to several 2-liter portions of the cold raw juice increasing quantities (2-5 g CaO per liter) of milk of lime in steps of 0.5 g CaO per liter. The mixt. was stirred for 10 min. and then heated to 85°C. The alky., in terms of CaO, of the unfiltered and filtered samples was detd. by titration, with phenolphthalein as indicator. The optimum quantity of CaO was that where the 2 titrations showed the max. difference which max. varied from 0.8 to 1.2, av. 1.0 g, per liter of juice. Generally, 3-6 g of CaO per liter was found to be required for the predefecation.

6607. Böttger, St. **Brief consideration of the newer defecation saturation processes.** *Centr. Zuckerind.* 51, 59-60 (1943).—*C.A.* 38, 5100^2.

The following defecation processes were compared: (1) partial addn. of lime and heating, preliminary satn. addn. of residual lime as the defecation satn. with the alky. above 0.01% CaO; (2) alternating between slight super- and undersatn. until the optimum 1st satn. was reached; (3) partial addn. of lime under rigid control until the optimum 1st satn. was reached, great supersatn., before addn. of residual lime; (4) quick addn. of lime and the simultaneous introduction of CO_2 which allowed the pH to remain at 12 for a long period and slowly changed to 10.9.

6608. Eguchi, Tadashi; Morita, Shigeru, and Aoto, Eijiro. **Occlusion of impurities by growing cane-sugar crystals. I. Occlusions of dyes. II. Quantity of dyes occluded by cane-sugar crystals. III. Occlusion of coagulated particles of different dyes.** *J. Soc. Chem. Ind. Japan* 46, 689-94 (1943).—*C.A.* 43, 2003*i*, 2004*i*, 2005*a*.

Supersatd. solns. of cane sugar contg. various dyes were set to crystallize and the occlusion of dyes in the crystals was studied. Some dyes were occluded uniformly on all surfaces, but many of the direct cotton dyes and some of acid dyes were occluded only on definite crystal faces. Such a localized occlusion was likely to occur at the left pole of the crystal. The amt. of dyes occluded by cane sugar crystals was detd. by colorimetric analysis of the soln. of the colored part of the crystals. The larger the size of the colloidal particle, the greater the amt. occluded.

6609. Kröner, Waldemar and Wegner, Hans. **The purification by neutralization of sugar liquors obtained by converting starch with hydrochloric acid.** *Vorratspflege u. Lebensmittelforsch.* 6, 76-84 (1943).—*C.A.* 38, 6122^5.

Upon neutralization a ppt. began to form at pH 4, and pptn. was complete at pH 9. The ratio of bases to P_2O_5 indicated that there were no stoichiometric proportions; the filtrate from the ppt. obtained at pH 9 still contained 16% of the CaO and 75% of the P_2O_5. Fractional pptn. showed that the components were distributed irregularly among the various fractions.

6610. Löwy, Kurt. **Defecation with phosphates.** *Rev. brasil. quím.* 15, 105-6 (1943).-*C.A.* 37, 6921^7.

In the clarification of sugar solns. with $Ca(H_2PO_4)_2$ and $Ca(OH)_2$ a high concn. of phosphate (0.2%) gave a ppt. which filtered readily, but had a low decolorizing power. Low concns. of phosphate (0.05%) gave a gelatinous ppt. which was very difficult to filter off but had a superior decolorizing action.

6611. McCleery, W. L. **Juice clarification with bentonite.** *Repts. Ann. Meeting Hawaiian Sugar Planters Assoc.* 61, 114 (1943).—*C.A.* 37, 5267^3.

When bentonite in aq. suspension was added in pilot-plant test to limed juices at two different factories, both the rate of filtration and the clarity of the raw sugars were considerably improved; there was also an increase in the purity value, sufficient, it was estd., to pay for extra costs.

6612. McCleery, W. L. **Sugar technology.** *Hawaiian Sugar Planters' Assoc. Printed Repts, Ann. Meeting, Rept. Committee in Charge Expt. Sta.* 63, 60-9(1943) (Pub. 1944).—*C.A.* 38, 4465^5.

The reaction of juices and sirups at their usual operating temps., as detd. at those temps. with the glass electrode, ranged from 0.25 to 0.65 pH lower than when the reaction was detd. on a cooled portion. There was strong evidence that to avoid inversion losses the pH value of the juice entering the Dorr clarifier should be maintained at such a level (about 7.7) that the pH value of the clarified juice does not fall below 6.8. The pH value of the clarified juice entering the evaporators should preferably be held above 6.75 to prevent inversion losses at that stage of operations.

6613. Meyer, Walter. **The use of base-exchange materials to free sugar juices from salts.** *Centr. Zuckerind.* 51, 37-8 (1943).—*C.A.* 37, 6484^7.

Base-exchange materials prepd. from resins were preferable because of their higher capacity, lower sp. gr. and unlimited regeneration.

6614. SUZUKI, KAKUO. **Sugar manufacture with manganous sulfate. V. Crystalline form of sucrose.** *J. Soc. Chem. Ind. Japan* 46, 32-6 (1943).—*C.A.* 42, 6558*g*.

Sucrose crystals obtained by evapg. a 60% sucrose soln. to which 0.002-0.003% $MnSO_4$ was added were examd. and compared with crystals obtained without such addn. When the concn. of $MnSO_4$ was more than 0.0008%, the development of certain faces of the crystals was quite different from that observed in ordinary cases.

6615. SUZUKI, KAKUO. **Sugar manufacture with manganous sulfate. VI. Test-pan experiment of boiling sugar solution.** *J. Soc. Chem. Ind. Japan* 46, 32-6 (1943).—*C.A.* 42, 6558*g*.

With a test pan white-sugar boiling with and without the addn. of 0.0001% $MnSO_4$ was carried out with 3 kg of sample and 0.5 kg of seed. The results of several runs showed that by the addn. of $MnSO_4$ the time intervals required up to seeding and to completion of boiling were shortened by 12.68% and 6.10%, resp.

6616. SUZUKI, KAKUO. **Sugar manufacture with manganous sulfate. VII. Lowering the viscosity of the solns. of cane sugar, glucose, massecuite, and molasses.** *J. Soc. Chem. Ind. Japan* 46, 695-7 (1943).—*C.A.* 42, 6558*i*.

Addn. of 0.0001-0.1% $MnSO_4$ to 50-80% solns. of cane sugar, glucose, last massecuite, refinery molasses, and plantation white sugar molasses, and its effect on the viscosity of the solns. at 50-80°C were examd. A lowering in viscosity was observed in some cases.

6617. WEITZ, F. W. **Juice purification by ion exchange as applied at the Isabella Sugar Company.** *Sugar* 38, No. 1, 26-31 (1943).—*C.A.* 37, 1290[9].

The 2nd carbonation juice, cooled to 20°C, was passed through a bed of Catex, an organic cation exchanger (14-60 mesh). The cations were replaced by H, and the pH of the juice fell to 2. When it reached 3 the juice was sent through a bed of Darco, directly below the Catex tank. This decolorized the juice and removed colloids. Finally, the juice was passed through a bed of Anex, below the Darco tank. Anex (10-60 mesh) replaced the acid radicals in the juice. The effluent had at the beginning a pH of 11, which gradually dropped to 7 or below. The pH was adjusted to 8.5 by mixing the effluents in a storage tank, from which the juice goes to the evaporators. After sweetening off, the filter beds were washed in reverse direction. The Catex bed was revivified with 2.5% H_2SO_4, the Anex bed with a 1% NaOH. The runoff from the Anex bed was used for revivifying the Darco.

6618. ZIMMERMAN, B. **Attempts at improving the function of pressure filters.** *Listy Cukrovar.* 61, 83-5 (1943).—*C.A.* 42, 3601*b*.

Compressed air was used for blowing sediment out of filters. A const.-pressure pump set at some crit. value ranging from 150 to 210 atm. avoided pressures which might tear the fibers of the cloth.

6619. ALVAREZ, ALEJANDRO S. **Purification of the juice of the new cane varieties.** *Bol. estac. exptl. agr. Tucumán* 1944, No. 49, 25 pp.—*C.A.* 39, 1771[2].

The juice from 50-kg samples of the cane, extd. in a lab. mill was sulfured cold with 3 different quantities of SO_2, limed to pH 6.5-6.8, boiled for 2 min., 1 portion filtered and the other settled. Both raw and clarified juice were analyzed and the filterability, rate of settling and vol. of mud detd. The results were shown in tables and discussed in detail.

6620. ANON. **Filtration in the chemical process industries.** *Chem. Met. Eng.* 51, 117-24 (1944).

Some of the factors affecting filtration rates, product quality and related matters were evaluated. Filtration was limited to the separation of solids from a liquid by passing the liquid through a porous medium, either by vacuum, gravity or pressure.

6621. EGUCHI, TADASHI AND MORITA, SHIGERU. **Occlusion of impurities by growing cane-sugar crystals. IV. Occlusion of caramel. V. Occlusions by sugar crystals of dyes in coexistence with caramel.** *J. Soc. Chem. Ind. Japan* 47, 20-21, 289-91 (1944).—*C.A.* 43, 2005*b*, 2005*c*.

Occlusion of caramel by growing cane-sugar crystals was studied as in the previous exts. with dyes. Localized occlusion was observed. The amt. occluded varied with the conditions of crystal growth, concn. of caramel in mother liquor, etc., but the distribution of the occlusion was quite independent of the concn. of caramel, temp., pH, or concn. of inorg. salts. The occlusion of dyestuffs by growing cane-sugar crystals in the presence of caramel was detd. Localized occlusion occurred as in the case of dyes and acid dyes, but the amt. occluded was markedly higher when caramel was also present.

6622. GUTLEBEN, D. **From the log of experience.** *Chem. & Met. Eng.* 51, 152 (1944).

The activities of Henry Valley were recorded in the purification of beet sugar liquor by an ion exchange process. The acid exchanger Catex and the base exchanger Anex were used. Activated carbon was used to remove the color and colloidal matter.

6623. LIU, TOH. **The utilization of asbestos as a filter aid in sugar refining.** *J. Chinese Chem. Soc.* 11, 142-54 (1944); *Ind. Eng. Chem.* 38, 521-4 (1946); *Intern. Sugar J.* 48, 262-4 (1946).—*C.A.* 40, 483[2].

Locally produced asbestos was used as a satisfactory substitute for filter aids previously imported from abroad. The asbestos was recovered and reused.

6624. MENA VAILLANT, ARTURO DE. **A system for refining cane sugar.** *Mem. Asoc. tec. azucareros Cuba* 18, 59-67 (1944).—*C.A.* 39, 5107[7].

The melt of affined sugar was treated in a continuous operation in the cold with P_2O_5 to produce a pH of 5.4-5.6, limed, heated to 80°C, and agitated with air to a pH of 6.8-7.0; this dropped to 6.2 in the decanted liquor, which was then treated with a sufficient amt. of activated carbon, filtered, and grained in the pan. At the moment of graining a sufficient amt. of $Na_2S_2O_4$ was added to assure final decolorization.

6625. SALINAS, J. G. **Effect of clarification of molasses on filterability of raw sugars made therefrom.** *Proc. Ann. Conf., Asoc. tecnicos azucar Cuba* 15, 127-30 (1944).—*C.A.* 38, 5684^5.

If the A- and B-molasses were pre-clarified by addn. of H_3PO_4 or Na aluminate, the refining value of the raw sugar was favorably influenced. A considerable improvement was shown in the figures for color, insol. matter, ash, dye value, and filterability.

6626. SRIVASTAVA, R. S. **Utilization of carbonation press mud. I. Preparation of filter aids.** *Proc. Sugar Tech. Assoc. India* 13, 1, 69-79 (1944).—*C.A.* 39, 4248^2.

Dry carbonation press mud from a cane-sugar factory contained 41.92% of org. substance and 58.08 of ash (including 43.45% of $CaCO_3$). Samples were heated in an open iron tube at 500°-900°C until no more fumes were evolved. The best product, obtained at 800°C, was slightly inferior in rate of filtering, but better as regards clarity of filtrate than Hyflo Super-cel.

6627. STAUB, SERGE. **Chemical control notes: lead acetates.** *Rev. agr. Maurice* 23, 14-15 (1944).—*C.A.* 40, 2659^9.

The use of 1 g of Horne's dry Pb subacetate per 100 ml of juice was advocated for clarification and preservation, instead of 2 g of solid neutral $Pb(AcO)_2$, as practiced in Mauritius. The neutral salt diluted the juice through its H_2O content, and had no antiseptic properties. If the juice clarified with 1 g of Horne's dry Pb subacetate was to be used for the detn. of reducing sugar, the Pb must be removed with $(COOH)_2$.

6628. SUZUKI, KAKUO, **Sugar manufacture with manganous sulfate. VIII. IX. Manganese method of sugar manufacturing. X. Change in the amount of reducing sugar in sugar solutions.** *J. Soc. Chem. Ind. Japan* 47, 173-7, 286-8 (1944).—*C.A.* 42, 6559*a*, 6559*b*.

Various sugar solns. were prepd. from granulated sugar and molasses. Evapn. was carried out with or without the addn. of $MnSO_4$. The rate of increase in the amt. of reducing sugar in the soln. with time was smallest when 0.0001-0.001% of $MnSO_4$ was added. In some cases the content of reducing sugar was only 35-50% of that produced in the sugar soln. contg. no $MnSO_4$ after standing for 20 days.

6629. VENKATESWARHALU, D. AND VENKATARAO, C. **Clarification of cane juices. I. High-purity juices.** *Proc. Sugar Tech. Assoc. India* 13, I, 33-41 (1944).—*C.A.* 39, 4246^7.

Raw cane juice of the variety Co. 313 was subjected to the following treatments: (1) limed to pH 7.2 boiled, and cooled (simple defecation); (2) limed to pH 8.5, sulfured to pH 7.2, boiled, and cooled (preliming); (3) heated to 50°C, limed, and sulfured to pH 7.2, boiled, and cooled (Java sulfitation); (4) sulfured in the cold to pH 3.5, boiled, and cooled (cold sulfitation); (5) limed with 10% of 20°Bé. milk of lime, heated to 50°, carbonated to pH 7.2 boiled, and cooled (single carbonation); (6) limed as in (4), lime content reduced by carbonation to 400-500 mg/liter, filtered, recarbonated to pH 7.2, boiled, and cooled (double carbonation); (7), filtered juice from (6) was neutralized by SO_2, boiled, and cooled (acid thin juice process).

6630. WEBRE, ALFRED L. **Filterability of sugars.** *Mem. asoc. tec. azucareros Cuba* 18, 133-6 (1944).—*C.A.* 39, 5108^4.

The general poor filterability of Cuban raw sugars was ascribed to the presence of cane wax. Since cane wax melts at about 150°F the maceration water at the mill should be kept below this temp. so that most of the wax may pass out with the bagasse; most of the remainder may be removed by filtering the defecated juice below the crit. temp.

6631. ALVAREZ, ALEJANDRO S. **The clarification of cane juice from the varieties more difficult to clarify than P.O.J. 36.** *Bol. estac. exptl. agr. Tucumán* 51, 11 pp. (1945).—*C.A.* 39, 5108^7.

Phosphates should be added to the juice only in those cases where lab. expts. have shown it to be beneficial. The same applied to the use of filter aids, such as dried blood, fuller's earth, Super-Cel, or filter clay. If there were difficulties in settling and filtration it was advisable to sulfur and lime at 48-50°C rather than at ordinary temp., to use more SO_2, or both.

6632. BANERJEE, T. AND BHATTA, B. **Hydrolysis of cane sugar in presence of an acid sol.** *J. Indian Chem. Soc.* 22, 327-30 (1945).—*C.A.* 40, 3970^1.

The sol was prepd. by mixing x cc. of Na tungstate soln. of definite concn. with an equal vol. of HCl of definite concn. This was mixed with $2x$ cc. of sucrose soln. of known concn. The hydrolysis expts. were made at 60° and 70°C and at known pH values between 2 and 3. The presence of the sol was found to increase the velocity of hydrolysis. This increase became greater as the pH of the system increased, other factors remaining const. As the sol concn. increased, the velocity const. of hydrolysis increased.

6633. BARBER, DON J. **Removing sulfites and organic nonsugars from juices.** *Sugar* 40, No. 6, 36-8(1945).—*C.A.* 39, 3953^8.

The high SO_2-content of beet molasses prevented its economic use in the fermentation industry. In the new process the thick juice and remelt were heated together to 95°C and intimately mixed with a $CaCl_2$ soln. of 25° Be., sufficient to reduce the SO_2 to 0.04-0.06%. The SO_2 can be reduced still further, but then the Ca salts in the juice increased. The ppt. was filtered through a plate and the frame press coated with Filter-Cel; addnl. filter aid can be added to unusually bad juices.

6634. Belval, Henri. **Localization of the saccharides in the tubers of the Jerusalem artichoke, and the refractive indexes of the juices.** *Bull. assoc. chim.* 62, 282-90 (1945).—*C.A.* 40, 6855[9].

The total sugar content of the tubers varied with the variety, the size, and shape. It could not be detd. by simple polarization because the inulin present in the autumn was converted into other saccharides during the winter, the levorotation gradually decreasing and even changing to dextrorotation. The refractometer could not be used either upon samples secured with a beet borer because the sol. solids were unevenly distributed throughout the tuber and accumulate in the outer portion.

6635. Black, R. F. **Miscellaneous problems of filtration with metal filter cloth.** *Sugar Ind. Engrs.' Papers* 6, 8 pp. (1945) (Separate); *Sugar* 41, No. 5, 38-40 (1946).—*C.A.* 40, 1337[9].

Monel-covered filter leaves were subject to serious *electrolytic corrosion* if left "painted" with its own liquor during bi-weekly shutdown to prevent rusting of the cast iron filter body; remedy: wash and dry the metals.

6636. Blann, W. A. **Direct-consumption sugar from raw cane juice.** *Louisiana State Univ. Eng. Expt. Sta., News* 1, No. 2, 7-8(1945).—*C.A.* 40, 4235[7].

Pilot-plant tests were made during the 1944 season at the Audubon Sugar Factory. Raw juice of 76.75% sucrose, 14.81% non-sugar solids, and 3.14% ash was ion-exchanged to yield values of 88.4, 1.7 and 0.064, resp. The sirup was light colored, and mildly flavored, suitable for table use or for blending with strongly flavored Louisiana sirups.

6637. Buck, R. E. and Mottern, H. H. **Apple sirup by ion-exchange process.** *Ind. Eng. Chem.* 37, 635-9 (1945).—*C.A.* 39, 3599[8].

A palatable apple sirup, free from bitter aftertaste due to Ca malate formed in the usual liming process, was produced by passing the juice through a bed of anion-exchange resin. This treatment removed 80 to 90% of the malic acid and variable amts. of As derived from spray residues. Treatment with a cation- and then an anion-exchanger removed 50 to 80% As, while a 3-step (anion-cation-anion) exchanger removed 96% As. The use of a cation-exchanger removed 90% of the ash. A final liming step freed the juice of pectin and nearly all Pb.

6638. Cotter, S. E. **Vallez filter operations and recovery of kieselguhr mud.** *Sugar Ind. Engrs.' Papers* 6, 5 pp. (1945); *Intern. Sugar J.* 48, 178-9 (1946).—*C.A.* 40, 1338[1]. Manipulations were described.

6639. Deerr, Noel. **Precipitation of magnesia as an aid to settling and its possible application to the sugar industry.** *Intern. Sugar J.* 47, 269-71 (1945).—*C.A.* 40, 1337[8].

The rate of settling of a suspension of $CaCO_3$ in water could be greatly increased if a small quantity of $Mg(OH)_2$ was pptd. within the body of the suspension. The rate of settling and mud vol. in juice clarification was dependent on the natural Mg content of the juice. When a deficiency occurred, requisite quantities of Mg may be added.

6640. Gayle, F. L. **Production of sugar, sirup, molasses, and bagasse from cane in Louisiana.** *La. State Univ. Eng. Expt. Sta. News* 1, No. 3, 11-17 (1945).—*C.A.* 40, 755[5].

Material balance data were given for 1935-44. Juices treated with ion-exchange materials gave a mild-flavored, edible molasses and 10-14 lb more of sugar per ton of cane.

6641. Gutleben, Dan and Harvey, Frank. **Report on the Vallez zeolite process at Mt. Pleasant, Michigan.** *Intern. Sugar J.* 47, 11-13 (1945).—*C.A.* 39, 1771[7-9].

The juice goes to tank A contg. the cation exchanger, then to tank B contg. carbon, and finally to tank C contg. the anion exchanger. The juice comes from tank A at a pH of 2.5 and so must be kept cool (20°C) to prevent excessive inversion. The juice from tank C had a pH of 11. When the pH of the juice from tank A rose above 3 regeneration of the exchanger was necessary; when the pH of the juice from tank C fell to 7, that exchanger needed regeneration. Regeneration in tank A was accomplished with 0.5 *N* H_2SO_4 and in tank C with 1% NaOH soln. The cation exchanger could be regenerated indefinitely with little loss in capacity. The anion exchanger did not maintain its efficiency after several hundred cycles. However, its capacity was 12 kilograins per ft^3 or about twice that of the cation exchanger. The cost of equipment to remove 1000 kilograins of ash between regenerations would be $15,000.

6642. Naugle, John J. **Purifying cane juice with Elguanite.** *La. State Univ. Eng. Expt. Sta. News* 1, No. 3, 17-18 (1945).—*C.A.* 40, 7554.

Juice treated with Elguanite could be filtered rapidly without settling after the primary and secondary defecation. Sirup from this juice had better color, flavor, and odor than the sirup from the usual lime defecation, and gave sugars very light in color and superior molasses.

6643. Salinas, J. G. **Importance of the pH of crude juice and its effect of the filterability of the sugar.** *Meml. con. anual, Asoc. técnicos azucar., Cuba* 19, 206-11(1945).—*C.A.* 40, 5588[8].

The increasingly bad filterability of Cuban raw sugars was ascribed to a progressive deficiency of P_2O_5 in the cane juice, which in turn was due to progressive depletion of the reserves of P_2O_5 in the soil and failure to use sufficient phosphate fertilizer. Enlargement or change of design of the clarifying equipment would not change the situation. The ratio between percentage of P_2O_5 in the juice and percentage of nonsugars referred to 100 parts of Brix should not be less than 10; the added P_2O_5 as liquid H_3PO_4, should produce or be accompanied by a pH of 5.0-5.2.

6644. STEWART, C. W. **Sugar research.** *Louisiana State Univ. Eng. Expt. Sta. News* 1, No.1, 2 (1945).—*C.A.* 40, 4235^6.

Research at the Audubon Sugar Factory, included an investigation of ion exchange and removal to produce a high-grade sirup and direct-consumption sugar without conventional lime treatment, and a defecation process at lower temps. than usual without clarification. Effect of trash on grinding rate and on purity drop between crusher juice and mixed juice was observed.

6645. SUZUKI, KAKUO. **Crystallization of cane sugar in the presence of manganese sulfate.** *J. Soc. Chem. Ind. Japan* 48, 39-40 (1945).—*C.A.* 42, 6557*i*.

The presence of 0.002% of $MnSO_4$ promoted the crystal growth of cane sugar.

6646. WEYMOUTH, L. E. AND MILLER, M. C. **A Tyndallimetric study of refinery liquors.** *Intern. Sugar J.* 47, 325-7(1945).—*C.A.* 40, 1336^9.

Studies were made on 2.5-hr filtration cycles of washed sugar and raw sugar. The Tyndall effect decreased in intensity during the first hr but no improvement was observed from then to the end of the 2.5-hr period. In one run a 13.2-foot candle turbidity at the start decreased to a 4.0-foot candle turbidity. The latter stages of the filtration were most efficient in turbidity removal.

6647. YEARWOOD, R. D. E. **Experiments in deliming clarified juice.** *Intern. Sugar J.* 47, 102-4 (1945).—*C.A.* 39, 2895^9.

Tri-sodium phosphate was a cheap and efficient deliming agent. There was considerable variation in the efficiency of the deliming (wt of ppt. obtained expressed as percentage of theoretically precipitatable Ca) of various juices with identical conditions. Efficiencies between 28% and 120% occurred. The low results were believed to be due to overripeness of the cane at the time of processing.

6648. ALVAREZ, ALEJANDRO S. **Methods of purification of cane juice.** *Bol. estac. exptl. agr. Tucumán* No. 56, 13 pp. (1946).—*C.A.* 40, 6277^4.

With hot sulfuring (48-50°C) followed by a single liming and heating as a standard of comparison the following procedures were studied: (1) hot sulfuring (equiv. to 0.10-0.16% as CaO) followed by fractional liming and double heating, (2) cold sulfuring followed by fractional liming and double heating, (3) high sulfuring (equiv. to 0.16-0.19% as CaO) followed by a single liming and heating. Best results were obtained by high sulfuring in the cold, liming to pH 6.3-6.4, heating to 85°C, liming further to 6.8-6.9, and boiling for 1-1/2 min. High sulfuring in the cold followed by a single liming and heating was recommended.

6649. ALVAREZ, ALEJANDRO S. **Does clarification increase or decrease the purity of the cane juice?** *Bol. estac. exptl. agr. Tucumán* No. 57, 3-11 (1946).—*C.A.* 41, 609*f*.

Clarification with SO_2 and CaO raised the purity of the juice of some varieties, but lowered that of the juice of others. The most satisfactory results of clarification were obtained by high sulfitation in the cold followed by single liming and heating, the next best results by sulfitation in the cold with fractional liming and double heating.

6650. ARVIDSSON, MARTA. **Leaching of Jerusalem-artichoke slices and purification of artichoke juice.** *Socker Handl.* 2, 349-55 (1946).—*C.A.* 41, 1476*g*.

Only part of the sugar was extd. in the cold; the rest was obtained after heating to 80°C. The residue contained a small amt. of insol. inulin. The juice contained no true proteins of high mol. wt; Pb acetate, lime, alc., and activated carbon removed only about 0.1 of the N.

6651. BALEZIN, S. A. **Solubility of lime in sugar solutions in the course of the condensation of formaldehyde into sugar.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* 1946, 355-61.—*C.A.* 42, 7135*g*.

The soly. of $Ca(OH)_2$ in solns. of sugars increased with concn. of the sugar without any appreciable change of pH. Concurrent volumetric and gravimetric detns. gave for the soly. of CaO, with 0, 0.25, 0.5, 1.0, 2.0, 5.0, 15.0, and 20.0 g glucose/100 ml soln., resp., 0.112, 0.118, 0.142, 0.185, 0.264, 0.710, 2.157, and 2.400 g CaO/100 ml, corresponding to 0, 48.0, 28.0, 18.0, 15.0, 14.0, 14.0, and 12.0 g CaO/100 g glucose. In the course of condensation of HCHO to sugar in the presence of $Ca(OH)_2$, the soly. of the latter increased with the progress of the condensation reaction.

6652. BLACK, R. F. **Mechanical filtration with metal filter cloths.** *Intern. Sugar J.* 48, 207-8 (1946).—*C.A.* 40, 6856^9.

Washed raw sugar was filtd. with regenerated kieselguhr and the presses partially sweetened-off. The sluicings from the Sweetlands were recovered and further sweetened-off on an Oliver filter, and this kieselguhr again used in the affination sirup filtration. The affination sirup Sweetlands were similarly partially sweetened-off, the heavy sluicings going to a thickener Oliver and from the thickener Oliver to two other Olivers where the cake was further sweetened-off and sent to the regenerating kiln. A monel metal-cloth filter leaf for the Sweetlands and metal-cloth cover for the Oliver filters has been developed.

6653. COALSTAD, S. E. **The filtration of subsider muds and the effect of bagacillo as a filter aid.** *J. Soc. Chem. Ind.* 65, 175-80 (1946).—*C.A.* 40, 6853^9.

The most important constituents of subsider mud at Kalamia mill were CaO, 9.18%; P_2O_5, 8.62%; cane wax, 12.92%; and fiber (bagacillo), 40.15%. The filterability of filter mud with varying percentages of bagacillo as filter aid was studied. The effect of the filter aid was estd. by computing the sp resistance of the cake for different amts. of bagacillo added at 60°, 75°, and 90°C. The reciprocal of the sp resistance was employed as a measure of the permeability of the filter cake.

6654. Coppin, C. A. **Preparation of lime for juice clarification in Barbados.** *Intern. Sugar J.* **48**, 40-1(1946).—*C.A.* 40, 3011^6.
Freshly slaked lime was much more active for clarification than air-hydrated lime. Lime hydrated with a large excess of water in one dose gave by far the most reactive product. It had a very low settling rate. This colloidal lime gave a better clarification and a lower Ca content in the clarified juice.

6655. DeWhalley, H. C. S. and Gray, P. E. **Invert sugar determination in refined white sugar.** *Intern. Sugar J.* 48, 212(1946).—*C.A.* 40, 6855^4.
Difficulty in using the methylene blue method is probably accounted for by the fact that two commercial prepns. of methylene blue are available. One is Zn-free and the other contains 13 to 15% $ZnCl_2$. Only the Zn-free product will give consistent results.

6656. Doss, K. S. Gururaja and Jain, N. S. **Mechanism of demineralizing action of calcined bauxite on cane juices.** *J. Sci. Ind. Research* (India) 5B, 4-5 (1946).—*C.A.* 41, 3643*i*.
The use of calcined bauxite to produce high-purity, low-ash low-phosphate, and low-viscosity sirups was discussed. Very little Ca ion was adsorbed from pure $CaCl_2$ soln. by bauxite, but the adsorption was induced by phosphate ion. Its addn. to juices deficient in adsorable anions was recommended.

6657. Fitzwilliam, C. W. and Yearwood, R. D. E. **Suitability of ion-exchange processes for use in the manufacture of raw sugar.** *Imp. Coll. Trop. Agr., Trinidad, Sugar Technol. Circ.* No. 60, 8 pp. (1946); *Intern. Sugar J.* 49, 69-73 (1947).—*C.A.* 43, 4499*h*; 41, 4665*d*.
The cation-exchange process operating in the Na cycle was effective in removing objectional Ca ions from clarified cane juice. The process did not cause inversion. Cost of NaCl alone was greater than the av. expenditure on labor and chemicals for cleaning evaporators in Trinidad. A heavy capital outlay was involved and labor of a fair standard of intelligence would be required for its operation. The yield of sugar would be slightly less.

6658. Haagensen, E. A. **Ion exchange applied to sugar-juice purification.** *Sugar* 41, No. 4, 36-41 (1946).—*C.A.* 40, 3632^4.
A 10-day exptl. run treating 20,000 gal of 2nd carbonation beet juice per day with ion exchangers was described. The treatment removed 72.6% of the total nonsugars, 92.5% of the ash, 90.8% of the N. The invert sugar increased from 0.05% to 0.34%. From the juice analyses before and after treatment it was calcd. that the sugar recovery increased 10.5% and the molasses production decreased 20.8%, but the molasses was free from impurities that caused a bitter taste.

6659. Haagensen, E. A. **Ion exchange applied to beet-juice purification.** *Intern. Sugar J.* 48, 240-2(1946).—*C.A.* 41, 303*c*.
In a pilot-plant operation using ion exchangers, recoveries of 95-96% of the sugar were obtained without the use of Steffenizing. In order to avoid inversion at the low pH obtained in the cation exchanger, a very large bed was used and the rate of flow adjusted so that the juice never remained longer than 3-1/2 min. at the low pH. The temp. was maintained at 20°C.

6660. Halvorsen, Gordon G. and Bollaert, A. R. **Defecation of refinery sirups.** *Ind. Eng. Chem.* 38, 385-9 (1946); *Intern. Sugar J.* 48, 264-5 (1946).—*C.A.* 40, 3632^7; 41, 301*h*.
The addn. of H_3PO_4 and lime to refinery sirups between the centrifugal (line) pump and the filter minimized the mech. breakdown of the Ca phosphate flock and produced defecated sirups with excellent clarity with an adequate rate of filtration. Sirups with better clarity, less color, lower content of lime salts and longer filtration cycles were obtained by the addn. of the H_3PO_4 before the lime.

6661. Helmer, N. Arthur. **Pressure settling in clarification.** *Sugar* 40, No. 7, 37-8(1946).—*C.A.* 40, 5940^1.
Settling of limed juice was speeded up by the use of a closed vessel under pressure. The scums were reduced in bulk by the pressure, formed larger aggregates, and sank rapidly to the bottom. The app. could be operated at high temp.

6662. Manoff, Isaac. **The filter press cake produced in some sugar factories of the province.** *Rev. ind. y agr. Tucuman* 36, 105-12 (1946).—*C.A.* 41, 6425*b*.
The cane variety ground appeared to have little effect of itself, but the juice from some of the newer varieties required larger quantities of SO_2 and CaO for clarification. This increased the muds. The most important factor has been the use of juice strainers with larger perforations, 2 mm instead of the usual 1-1.2 mm, which allowed a large quantity of bagacillo to pass into the juice.

6663. Pedrosa, Puertas Rafael. **Automatic instrumentation in the sugar industry.** *Mem. asoc. técnicos azucar. Cuba* 20, 277-83 (1946). —*C.A.* 41, 7781*i*.
Discussion of appliances for controlling juice clarification, d. of juices and sirups, the multiple-effect evaporators, condensers, vacuum pans, furnaces and boilers, steam consumption, and the grinding mills.

6664. Perlman, David; Dorrell, Wm. W, and Johnson, Marvin J. **Effect of metallic ions on the production of citric acid by** ***Aspergillus niger.*** *Arch. Biochem.* 11, 131-43, (1946).—*C.A.* 40, 7508^3:
Optimim amts. of citric acid were obtained with 100-140 g sucrose and 0.1-10 mg Fe per liter, depending on the strain of *Aspergillus niger* used. Good yields were obtained with com. grades of glucose and sucrose if the cations were first removed and the soln. fortified with Fe.

6665. Salinas, J. G. **Influence of the system of cane culture on the clarification.** *Mem. asoc. técnicos azucar. Cuba* 20, 269-72 (1946).—*C.A.* 41, 7781*f*.
If the index of clarification is less than 10, the clarification of the juice will be medium or

poor; if greater than 10, the clarification will be good or excellent. In case the index is less than 10, H_3PO_4 should be added to the juice in appropriate amt., but it will be more rational and profitable to add it as fertilizer on the cane field where it becomes a constituent of the juice.

6666. SILIN, P. M. **Purification of beet juice by ion exchange.** *Sakharnaya Prom.* 19, No. 3, 19-20 (1946).—*C.A.* 41, 2919*h*.

The use of cation and anion exchangers for the purification of beet-sugar juice as practiced at the Mount Pleasant, Mich., refinery was described.

6667. SMART, S. GORDON. **Centrifugal clarification of sugar liquors.** *Intern. Sugar J.* 48, 293-6 (1946).—*C.A.* 41, 1125*b*.

Molasses dild. 50/50 with water was run to an Alpha-Laval type centrifuge rotating at 8000 r.p.m. The mud removed was 5% of the molasses. The polarization was raised from 13.0 to 13.8 and the purity from 27.7 to 29.5. Rates up to 15 gal per hr in the small centrifuge gave complete clarification.

6668. VENTRE, EMIL K.; AMBLER, J. A.; HENRY, H. C.; BYALL, S., AND PAINE, H. S. **Extraction of aconitic acid from sorgo.** *Ind. Eng. Chem.* 38, 201-4(1946).—*C.A.* 40, 2016².

The recovery of aconitic acid from sorgo juices was increased from 42.9% (by usual lime defecation) to 81.7% of the available aconitic acid by defecation with lime and $CaCl_2$. The acid was pptd. as tricalcium aconitate (contg. 13-14% of the Mg Salt) in the optimum pH range of 6.5-6.7. Juices defecated with lime and $CaCl_2$ gave sirups with slightly greater purity than the usual lime defecation.

6669. VERMA, T. N. **Clarification efficiency.** *Indian Sugar* 9, 47-8 (1946).—*C.A.* 40, 6277³.

The use of purity-rise from mixed juice to to clear juice as a measure of clarification efficiency was criticized. This rule made no distinction between removal of nonsugar and pol lost in press mud.

6670. VOLOKHVYANSKIĬ, V. M. **Exchange-sorption method of purifying sugar solutions.** *Sakharnaya Prom.* 1946, No. 10, 20-3.—*C.A.* 43, 6444*b*.

A sugar soln. (pH 6.8) was colored with the decompn. products of invert sugar. A 2nd soln. of the same concn. and pH was colored with caramel. Both were treated with Norit C. The soln. colored with caramel, in which the colored substances were present in the form of free acids, was decolorized 4.8 times more effectively than the other soln., in which the coloring matter was present as Na salts. Thus cations must first be removed by the use of a H-cation exchanger. In the tech. method developed the sugar soln. was first treated with such a sulfocarbon obtained by treating mineral coal with H_2SO_4 and then with an adsorbent (a carbon from peat or bone char). A tech. sugar soln. of 11-16° Brix was filtered first through sulfocarbon, then through carbon. The sulfocarbon was regenerated with H_2SO_4 or HCl and the carbon with NaOH or Na_2CO_3. The consumption was about 1% sulfocarbon and 1.5% carbon.

6671. YAPASKURT, V. V. **Techological processes for obtaining sugar of high purity in sugar factories.** *Sakharnaya Prom.* 19, No. 12, 9-13 (1946).—*C.A.* 44, 357*i*.

Detailed description was given of 4 processes, whereby the raw sugar was converted to one of high purity by special treatment of the different centrifugal sirups.

6672. AMBLER, J. A. AND ROBERTS, EARL J. **Determination of aconitic acid in sugarhouse products.** *Anal. Chem.* 19, 877-8(1947).—*C.A.* 42, 780*d*.

The decarboxylation method was applied to sugarhouse and refinery products. SO_2 was the only interfering compd., and it could be removed from the decarboxylation gases by washing with a satd. soln. of $K_2Cr_2O_7$ acidulated with H_2SO_4.

6673. ANGELESCU, E.; NICOLESCU, I. V., AND TIGOIU, A. **Kinetic studies on the extraction of sugar from molasses.** *Natl. Cercetari Tehnol.* 2, 64-71(1947).—*C.A.* 42, 9212*h*.

The sugar was retained on the surface of the lime by a reaction between the primary OH groups and CaO. A secondary reaction of CaO with H_2O reduced its ability to retain saccharose on the surface. Expts. were made to study the behavior of the system in the case of molasses. The general behavior of the system was identical with that of a sugar soln.-CaO system.

6674. BENIN, G. S. AND SHNAIDER, E. E. **Application of ion exchanger in beet-sugar industry.** *Sakharnaya Prom.* 20, No. 6, 9-13 (1947).—*C.A.* 42, 5696*i*.

Expts. with different brands of ion exchangers demonstrated that they could be successfully applied in the beet-sugar industry. Duolite C-3 and A-2 did not lose their efficiency on regeneration. Absorption of inorg. matter varied between 98 and 99%, organics 73-79%, N 80-88%, and coloring matter 98.3-98.6%.

6675. BINKLEY, W. W. AND WOLFROM, M. L. **Recovery of sucrose from cane blackstrap and beet molasses.** *J. Am. Chem. Soc.* 69, 664-5 (1947).—*C.A.* 41, 3645*d*.

When either cane blackstrap or beet molasses was adsorbed on a suitable clay and the chromatogram so obtained developed with 95% EtOH, a high-purity cryst. sucrose was recoverable from the effluents. The yield was 74% of the sucrose present for blackstrap molasses and 93% for beet molasses.

6676. BLOCK, EMANUEL AND RITCHIE, RICHARD J. **Ion exchange—operation of a commercial-scale plant for demineralization of cane sirups and molasses.** *Ind. Eng. Chem.* 39, 1581-4 (1947).—*C.A.* 42, 1441*a*.

The demineralizing system consisted of a cation-exchange unit, a granular carbon bed, and an anion-exchange unit. Capacity losses of the exchange materials offered a serious problem. Catex lost 11% of its capacity in 223 cycles. The Anex loss was much greater. Deacidite lost

8% of its capacity in 123 cycles. The loss was greatest with the poorly defecated molasses. A 75° Brix sirup must be dild. to 33° Brix to go to the exchanger beds. There were required per battery 13,000 gal regenerating solns., 10,000 gal rinse water, and 40,000 gal back-wash water. The battery consisted of a 610 ft^3 cation-exchange bed and a 370 ft^3 anion-exchange bed. It was doubtful that blackstrap molasses can be economically converted to an edible sirup by this method.

6677. Brueniche-Olsen, H. **The physical chemistry of the second carbonation in the beet-sugar industry.** *Sugar* 42, No. 10, 34-6 (1947).—*C.A.* 41, 7783*h*.

A new term, *"effective alky.,"* was defined as the difference between the alky. on titrating to pH 9.25 and the CaO content, both detd. on 1st carbonation juice. The effective alky., but not the natural alky., plotted against the min. CaO content or against the optimum alky., gave well-defined curves. The min. CaO content found for actual beet juices was somewhat greater than that of artificial juices of similar compn. This was due to a supersatn. phenomenon, which could be eliminated by longer contact of the carbonated juice with the filter cake.

6678. Buck, R. E. and Mottern, H. H. ***l*-Malic acid as by-product in apple sirup manufactured by ion exchange.** *Ind. Eng. Chem.* 39, 1087-90 (1947).—*C.A.* 41, 7563*i*.

l-Malic acid can be obtained as the sol. Na salt in the effluent of Na_2CO_3 soln. used as a regenerant for the anion exchanger in the manuf. of apple sirup. The effluent was acidified to pH 5.5 to remove excess carbonate, exapd. to 15-20% malate content, and adjusted to pH 6.0. The Ca salt of 97% purity was pptd. and this was converted to the free acid with H_2SO_4.

6679. Cheng, C. P. and Chang, K. T. **Middle juice carbonation.** *Taiwan Sugar J. Quart.* 1, No. 1, 137-45(1947).—*C.A.* 44, 5127*c*.

The lime consumption could be reduced by 35% without affecting the filterability of the carbonated juice if the crude juice, after the addn. of milk of lime, was concd. to 40 Bé. before the first carbonation. The procedures were illustrated by the expts. performed in the Tsung-yeh factory in 1942, which were, however, not successful. The failure was discussed.

6680. Crespin, Irene. **A study of Australian diatomites with special reference to their possible value as filter media.** *Australia, Bur. Mineral Resources, Geol. and Geophys. Bull* No. 7, 40 pp (1947).—*C.A.* 42, 3103*c*.

Most of the deposits described were small and of low grade, but could probably fill many local needs.

6681. Denisov, P. I. **Apparatus for determining the rate of filtration of clay suspensions.** *Azerbaidzhanskoe Neftyanoe Khoz* 26, No. 11, 23(1947).—*C.A.* 43, 3665*d*.

The app. comprised a manual air pump, and a metal funnel closed with a cover. The funnel cover carried a pressure gage and an inlet which was connected by a rubber tube to the pump.

6682. DeWhalley, H. C. S. and Scarr, M. P. **Microörganisms in raw and refined sugar and intermediate products.** *Chemistry & Industry* 1947, 531-6.—*C.A.* 41, 7781*b*.

Organisms capable of acid production can destroy sugar and lower the yield of white sugar. Inversion of sugar by invertase produced by bacteria can cause inversion of sugar. Frequently acetic or butyric acid is formed and causes bad odors in the finished products. Organisms found include *B. subtilis*, *B. mesentericus vulgatus*, *B. aerogenes*. Troubles have arisen from mesophiles in bag water filtration of liquors from char washing, and dust-collector water. The elimination of bacteria from these steps in the operation is described. The effect of heat and chemicals is also discussed.

6683. Dormal, E. **Treatment and reutilization of waste sugarhouse waters.** *Sucr. belge* 66, 172-82(1947); *Chimie & industrie* 59, 47 (1948).—*C.A.* 42, 7908*b*.

The waste waters at the Raffinerie Tirlemontoise were discussed. The drainage water was first sepd. from the pulp, and the latter then pressed; the drainage and press waters were subjected separately to parellel treatments, sent to holding tanks where they were sterilized with HC10, passed through "Vibro" screens to remove suspended pulp particles, and then decanted to remove org. matter.

6684. Geidelman, M. M. **The operation of lime kilns (of the sugar industry) with low-grade fuels.** *Sakharnaya Prom.* 20, No. 3, 26-9 (1947).—*C.A.* 43, 5979*g*.

The methods described produced lime of sufficient quality to meet the demands of sugar refineries even when low-grade coals were used. Low-grade fuels could be burned in ordinary shaft kilns if the fuel was coarse (65-80 mm) and the supply of air was increased. However, in this case both the flue gases and the milk of lime produced must be purified for use in sugar refineries.

6685. Inglesent, H. and Storrow, J. Anderson. **Corrosion of filters in sugar refineries. I. Investigations using plant liquors.** *Ind. Chemist* 23, 291-7 (1947); *Intern. Sugar J.* 49, 233-6 (1947).—*C.A.* 41, 7785*e*.

A Vallez filter leaf made of phosphor bronze weave on a brass wire backing gave good service with cane-sugar liquors but soon failed when changed to glucose filtration. Expts. showed that the corrosion was due to greater potential differences between the backing wire and the weave in the glucose liquors than in the cane-sugar liquors (0.10 to 0.24 in the one and 0.03 in the other). Monel was strongly cathodic to Fe and may act similarly to the Cu leaves.

6686. Inglesent, H. and Storrow, J. Anderson. **Corrosion of filters in sugar refineries. II. Investigations on prepared liquors.** *Ind. Chemist* 23, 373-9 (1947).—*C.A.* 41, 7785*i*.

Solns. of known concns. of sucrose and NaCl at pH 7 were prepd. with distd. H_2O; glucose refinery liquor (39° Bé., pH 4.6 - 4.7) was dild. to vary its chloride content. Measurements were made at 65°F of p.d. between an Fe anode and cathodes of various other metals. The order of p.d. in sucrose was monel, stainless steel, brass, Cu, phosphor bronze, Fe; in glucose the order was brass, Cu, monel, phosphor bronze, stainless steel, Fe. With increasing contents of sugar, p.d. decreased, but the relative effect varied considerably for the various metals, stainless steel showing comparatively little dependence on sugar concn.

6687. INGLESENT, H. AND STORROW, J. ANDERSON. **Corrosion of filters in sugar refineries. III. Investigation on hot liquors.** *Ind. Chemist* 23, 827-34 (1947).—*C.A.* 42, 4773*e*.

Faults in specifications for filter leaves revealed by the earlier tests at room temps. were generally confirmed for 70°C. Monel metal rapidly became more anodic to bronze as the temp. was raised. In a 30° Bé. glucose sirup stainless steel alone showed a much lower *dE* value. A Vallez filter with a stainless steel Hollander weave handling sugar liquors contg. chlorides failed completely in approx. 2 months. Phosphor bronze, which was more anodic in glucose liquors at lower temps., had a strong tendency to become cathodic at higer temps,

6688. MACADAM, W. T. **Ion-exchange process makes sugar sirup.** *Food Packer* 28, No. 10, 34, 36-7 (1947).—*C.A.* 42, 3100*e*.

The industrial use of ion-exchange systems for recovery of sugars from waste liquors was described.

6689. MAUDRY, EDWARD. **Report on ion-exchange pilot plant-Alvarado, 1946 campaign.** *Proc. Am. Soc. Sugar Beet Technol. Intermountain and Eastern Slope Div.* 1947, 161-71.—*C.A.* 42, 2792*a*.

Raw sugar beet juice was deionized in an anion-cation exchange; av. removal of nonsugars was 89.7 and of ash 98.5%; av. purity of the deionized juice was 96.8, invert sugar 2.09% per 100° Brix (invert in raw juice 0.7%). The process required about 900 gal of water per ton of beets, but a large amt. of this water was recovered as soft water.

6690. MCCLEERY, W. L. **Bentonite secondary clarification of sugar juice in Hawaii.** *Hawaiian Sugar Planters' Assoc. Repts.* 65, 62-3; *Intern. Sugar J.* 49, 49(1947).—*C.A.* 43, 2797*a*.

Used as a secondary clarifying agent, i.e., one which would follow the usual liming stage, bentonite on flocculation was particularly efficacious in removing colloidally dispersed fine material from the clarified juice.

6691. MORRISON, W. S. **Recent industrial applications of ion exchange (on sugar-beet juice)** *Proc. Am. Soc. Sugar Beet Technol. Intermountain and Eastern Slope Div.* 1947, 156-60.—*C.A.* 42, 2791*h*.

In a pilot plant 2nd carbonation juice was deionized in a double cation-anion operation; high purities were obtained but inversion was excessive in spite of low temps. In a single cation-anion exchange there was low inversion and a 9-point increase of purity with 0.001% of ash. The high green sirup, sepd. from the 1st strikes, when concd. and crystd. gave an intermediate ash-free white sugar. The calcd. gain of sugar was 29 lb per ton of beets (82.5 lb per $1.55 investment for regeneration).

6692. PEDROSA PUERTES, RAFAEL. **Error in filter-cake analysis.** *Proc. Assoc. Sugar Technol. Cuba* 21, 177-83(1947).—*C.A.* 42, 9212*d*.

The fine bagassè used as a filter aid with Oliver filters contained about 2.87% of sucrose which had already been accounted for as sucrose in bagasse per 100 cane. Since the amt. of the filter aid was about 10% of the wt of the cake, the apparent loss of sucrose in cake per 100 cane was appreciably too high.

6693. PORTER, LYLE B. **Beet-juice purification by ion exchange.** *Sugar* 42, No. 5, 22-3(1947). —*C.A.* 41, 4665*h*.

In pilot plant tests with 2nd carbonation beet juice, the treated juice had 11.0-12.2 Brix, 99.0-99.5 purity, and a pH of 7.9-6.0. At an operating temp. of 22° the invert sugar rose to 0.48-0.61%, but this could be reduced to 0.13% by working at a lower temp. A large amt. of dark colored colloidal material accumulated in the resin beds, particularly in the cation exchanger. This was removed effectively by backwashing with water of 160° F. Two strikes of white sugar with very low ash content were made Insufficient data were obtained, but the results were encouraging.

6694. RAMONDT, D. **The use of ion exchangers in the sugar industry.** *Inds. agr. et aliment.* (Paris) 64, 269-70(1947).—*C.A.* 42, 2790*i*.

Preliminary tests with the cation exchanger Dusarit and the anion exchanger Asmit upon beet diffusion juice resulted in a colorless effluent. The purity rose from 90.3 to 99.5, the ash % Brix fell from 3.06 to 0.45, but the reducing sugar % Brix rose from 10.6 to 29.3.

6695. RILEY, F. R. AND SANBORN, W. E. **The ion-exchange process has matured.** *Sugar* 42, No. 7, 24-9 (1947).—*C.A.* 41, 7783*e*.

Sugar recoveries of 95-96% were reported from beet juice, without Steffenizing. The purity of the juice was raised to 96-98, with the removal of 95-98% of the ash, and 90% of the org. nonsugars. The treated juice was light colored or water white, and free from Ca salts and colloids.

6696. SALINAS, J. G. **The pH value of mixed juice as a guide to clarification.** *Intern. Sugar J.* 49, 129-31 (1947).—*C.A.* 41, 6071*a*.

Cane juice must contain 0.03-0.035% H_3PO_4 expressed as P_2O_5 based on the weight of normal juice if it is to defecate properly. When the P_2O_5 of a juice is less then 0.03, the pH will exceed 5.4 and defecation will be very difficult. It was recommended that all juices be adjusted to a pH of 5.0 or 5.2 with H_3PO_4 before defecation to improve clarification.

6697. SAVOEI, CHARES C. **Automatic temperature regulation solves problem for Louisiana sugar mill.** *Southern Power and Ind.* 65, No. 11, 72-3(1947).—*C.A.* 42, 781*d*.

The cane juice was heated in closed clarifiers by means of low-pressure exhaust steam, so as to raise the temp. above boiling and below 219°F. This was secured by means of a special temp. control using an invar steel rod in a stainless steel case.

6698. Silin, P. M. and Silina, Z. A. **Solubility of lime sugar solutions during defecation.** *Sakharnaya Prom.* 20, No. 12, 33-4 (1947).—*C.A.* 42, 8501*b*.

A comparison of the soly. of CaO in the form of milk of lime, freshly slaked lime, or dry lime in pure and impure sugars solns. at 80°C was given. The soly. varied considerabley, being the highest when dry lime was dissolved in a juice of about 85% purity.

6699. Smit, P. **Development of the refining of sugar juice with the aid of ion exchangers and synthetic resins.** *Chem. Weekblad* 43, 42-4 (1947); *7th Congr. intern. inds. agr.:, Paris* 1948, Q4, D1-9.—*C.A.* 41, 3644*e*; 44, 9171*d*.

Reactivation of the exchangers was only effective at high temp. while agitating the mass, and adding the reactivating soln. intermittently. The use of SO_2 was the most economic process. The quality of anion exchangers was not yet satisfactory.

6700. Sudzuki, Shimichi; Su, Gon Tinn, and Lin, Suei Fa. **Accelerating effect of defecation filter muds on the alcoholic fermentation of cane molasses.** *Rept. Taiwan Sugar Expt. Sta.* (Formosa) No. 1, 92-100(1947).—*C.A.* 42, 1377*g*.

The filter cake or an aq. ext. therefrom markedly stimulated the fermentation; this effect was not produced by cake obtained in the carbonation process of juice purification, wherein the active substance was evidently pptd.

6701. Ulrich, Edward A. **New filter introduced to sugar industry.** *Sugar* 42, No. 4, 22-6 (1947).—*C.A.* 41, 3643*g*.

The "Niagara" filter consists of a vertical cylindrical vessel with removable cover. The filter frames are tubular in section and rectangular in shape, have metal filter screens, and are inserted in the tank by means of horizontal slotted spacers secured to the tank shell. The leaf outlet nozzle is at the bottom and makes connection with the manifold pipe header. The liquor enters at the bottom of the tank which is provided with a steam or hot-water jacket to maintain the temp. The filter was compared with plate and frame presses.

6702. Ventre, Emil K.; Byall, S., and Furse, R. J. **Crystallization of sorgo juices purified by ion exchange.** *Sugar J.* 10, No. 3, 9-12 (1947); *Louisiana State Univ., Eng. Expt. Sta. News* 3, No. 1, 2-6 (1947).—*C.A.* 41, 7145*f*; 42, 7072*g*.

Centrifuged sorgo juices purified by ion exchange could be concd. and crystd. without the heating, liming, and settling steps which were required in the standard method. Juices purified by ion exchange and crystd. to molasses of 30 purity can yield approx. 4 lb more sucrose per 100 lb of raw juice than the standard method. The final molasses was edible and contained fewer nonsugar solids than the original juices.

6703. Verma, T. N. **One hundred degree mark on the scale of precipitation efficiency.** *Proc. Ann. Conv. Sugar Technol. Assoc. India* 16, Pt. I, 94-99 (1947); *Sugar Ind. Abstracts* 10, No. 8, 82 (1948).—*C.A.* 43, 6847*g*.

Pptn. efficiency could be expressed as the fraction $(P_{cj} - P_{mj})$ 10,000/(100 - $P_{mj})P_{cj}$, where P_{cj} and P_{mj} were the purities of the clarified juice and mixed juice, resp. Raw juice (200cc.) of known Brix was treated with 10 cc. of basic Pb acetate soln. (or 5 cc. for last mill juice), and made up to 220 cc. with distd. water. Polarization and purity were detd. The filtrate contained Pb which made the rise in purity. The Brix of the basic Pb acetate was calcd. for various dilns. of pycnometer detns., and a graph given.

6704. Willcox, O. W. **New developments in sugar techniques.** *S. African Sugar J.* 31, 133, 135, 137, 139 (1947); *Sugar* 43, No. 6, 21-5 (1948).—*C.A.* 41, 4325*e*; 42, 5695*g*.

Progress in field and factory work during 1946 and 1947 was reviewed.

6705. Alvarez, Alejandro S. **The purity of cane juices after clarification.** *Intern. Sugar J.* 50, 16-18(1948).—*C.A.* 42, 2792*b*.

The cane varieties POJ 36, POJ 213, TUC 472, TUC 1316, and TUC 1406 showed purity increases of their juices on clarification. Other varieties, Co 270 and 290, TUC 1376, TUC 2645, TUC 2680, POJ 2725, POJ 2878, and CP 29/230, exhibited a fall. The method of clarification which gives the most satisfactory results with raw cane juices in Argentina is that based on intense cold sulfitation (0.185 CaO per 100 cc.) with liming and single heating at 6.9 to 7.1 pH.

6706. Austerweil, G. **Role of anion exchangers in the industrialization of processes of sugar-juice purification by ion exchange.** *7th Congr. intern. ind. agr., Paris* 1, Pts. 3/4, 22 (1948); *Sugar Ind. Abstracts* 10, No. 8, 87 (1948).—*C.A.* 43, 6443*b*.

To reduce the danger of inversion in the cation exchanger, it was recommended that the juice first be passed through anion exchangers. The amts. of ion-exchange material required for such a process were calcd.

6707. Badollet, M. S. **Research of asbestos fibers—results of recent investigations.** *S. African Mining & Eng. J.* 59, II, 15-17 (1948).—*C.A.* 43, 1125d.

Methods of mech. testing to obtain a more abs. rating of asbestos fiber qualities and of processing the raw material were described. Characteristics of ''soft'' and ''harsh'' fibers and filtration properties were explained.

6708. Barry, E. F. and Gaddie, Robert S. **Ion-exchange purification of low-grade beet sirup.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 674-80 (1948).—*C.A.* 43, 6442*b*.

The plant handled 1/4 of the factory's output of intermediate green sirup from the high raw centrifugals, with cation C3 and anion A2 resins of the Chem. Products Co. The green sirup was dild. to 30 Brix with factory thin juice, cooled, and pumped through the exchange battery. The general result was a reduction of the amt. of low raw massecuite in percentage of beets from the previous 5-year av. of 9.9 to 7.7%, with a net increase of 4.7% in extn. of sugar from the juice and a reduction of 1.22 in molasses percentage on beets. The av. increase of invert sugar as a result of ion-exchange was 1.12%, the molasses contained about 0.5% of invert on dry substance.

6709. Binkley, W. W. and Wolfrom, M. L. **Chromatography of Cuban blackstrap molasses on clay; some constituents of an odor and pigment fraction.** *J. Am. Chem. Soc.* 70, 290-2 (1948).—*C.A.* 42, 2793*d*.

Cuban cane blackstrap (1 kg) was dild. with 250 ml H_2O, made into a paste with 400 g clay, the paste mixed with 3.6 liters abs EtOH and 2.4 liters acetone, the ppt. washed with 3 liters acetone, the liquors were concd. to approx. 1 liter at 50°C, the concentrate dild. with 1 liter H_2O, and extd. with petr. ether (24 hrs), giving 0.41% of a viscous green liquid. On heating 4.1 g of this at 100-10°/0.03 mm, there resulted 4 g undistd. residue and a distillate which had a strong odor of molasses and gave a ppt. with $2,4\text{-}(O_2N)_2C_6H_3NHNH_2$. The residue (2 g) in 40 ml C_6H_6, passed through 150 g of a mixt. of 5 parts (by wt) of Silene-EF and 1 part Celite, and the chromatogram developed with 1250 ml 500/1 C_6H_6-EtOH gave 5 fractions.

6710. Binkley, W. W. and Wolfrom, M. L. **Chromatography of sugars and related substances.** *Sugar Research Foundation Sci. Rept. Ser.* No. 10, 29 pp (1948).—*C.A.* 43, 425*i*.

A review of the recent developments of chromatography as applied primarily to the sugars. The selection of the proper adsorbents, prepn. of the chromatogram its detection and elution of the various fractions were discussed. Partition chromatography was discussed as a method of end-group assay. Finally, the relation between the adsorption and the functional groups of sugars was presented.

6711. Biswas, H. G. **Manufacture of milk sugar from confectioners' waste.** *J. Sci. Ind. Research* 7, No. 8 B, 130(1948).—*C.A.* 43, 1119*e*.

Fresh confectioners' waste (Whey discarded after sepg. the casein from milk for the prepn. of edible products) was found to yield 2% lactose by wt. The whey (sp. gr. 1.02) was heated in an enamel pan (50 gal) until no more surface scum was formed, filtered through twill cloth, concd. to the consistency of molasses, and allowed to crystallize overnight. The brown cryst. mass was purified by dissolving in water (1:6) in a 25-gal double-jacketed steam pan after adding $MgSO_4$ (0.75%), glacial AcOH (7 cc./liter), and decolorizing charcoal (3%), boiled for a short while, and filtered through cloth bags. The clear filtrate was concd. in a vacuum pan and allowed to crystallize in shallow enamel pans.

6712. Bliss, Lesmoir R. **The routine control of phosphates in juice clarification.** *Intern. Sugar J.* 50, 205-7(1948).—*C.A.* 42, 8502*i*.

The liming process formed hydrated $Ca_3(PO_4)_2$ which adsorbed the colloids. If the phosphate was below the min. level, poor clarification resulted. The routine control involved the detn. of the phosphate requirement for a given juice and the total phosphate in the juice. H_3PO_4 was then added in sufficient amt. to fulfill the requirements.

6713. Challinor, S. W.; Kieser, Margaret E., and Pollard, A. **Effect of ion-exchange treatment on the stability of apple juice.** *Nature* 161, 1023-5 (1948).—*C.A.* 42, 6953*g*.

Depectinized and pulp-filtered apple juices were passed through columns of the Permutit ion-exchangers De-Acidite *B* and Zeo-Karb *H* 1. Ash was reduced to 1% of its original value by two passages through Zeo-Karb with intermediate passage through De-Acidite to reduce acidity. Yeasts that grew well on the original juice showed little or no growth in the treated juice adjusted to the original pH. After addn. of salts considerable growth was noted.

6714. Chamberlin, R. C. **Ion exchangers in the manufacture of sirups.** *7th Congr. intern. ind. agr., Paris* 1, Q4-G (1948); *Sugar Ind. Abstracts* 10, No. 8, 90 (1948).—*C.A.* 43, 6442*a*.

Since 1945 colorless sirups, free from ash, have been prepd. from raw cane sugar by dissoln. to 65% soln. in water, filtration through used vegetable carbon, ion-exchange purification, inversion if necessary, evapn. to 75% sugar soln., and filtration through fresh vegetable carbon. The process was described in detail.

6715. Cheng, C. P. and Loo, S. H. **Experimental results of middle juice carbonation.** *Taiwan Sugar J. Quart.* 1, No. 3/4, 1-8(1948).—*C.A.* 44, 5127*a*.

The mixt. of crude cane juice and milk of lime was concd. to 35°-38° Brix before subjecting to the first carbonation. The two isoelec. points of crude cane juice ($pH = 7$ and $pH = 11$) were thus both utilized for the pptn. of non-sugar impurities. Expts. carried out in Sing-yin Factory for 53 days indicate: (1) 19.03% more nonsugar impurities removed, (2) 2.22% more sugar and 15% less molasses produced, (3) 43.39% less limestone and coke and 71.43% less soda ash consumed, and (4) higher filterability achieved.

6716. Chugunov, I. G. **Role of cold defecation.** *Sakharnaya Prom.* 22, No. 10, 10-20 (1948); *Sugar Ind. Abstracts* 10, No. 12, 140-1 (1948).—*C.A.* 43, 6847*i*.

Cold defecation was important with unripe, defrozen, or rotted beets; with subsequent heating to 85-90°C before satn., very good results were obtained. The effect was greatest in first satn., the color being much improved. The soly. of lime during cold defecation was, owing to semisaccharate formation, 4 to 5 times that in hot defecation; on heating before satn., the saccharate hydrolyzed and the lime dissolved (1.2-1.3% CaO). With CO_2 there was then a large formation of fine $CaCO_3$. With cold defecation, the lime used was 0.5-0.8%, against 1.5-1.8% for hot defecation.

6717. Clendenning, K. A. **Copper corrosion and its control in starch-sirup manufacture.** *Can. J. Research* 26F, 277-83(1948).—*C.A.* 43, 889*b*.

Whereas water at 1.9 pH will dissolve 306 mg of Cu per cm^2 at 100°C in 16 hrs, 16° Bé. starch sirup will dissolve only 13.2 mg. The amt. of Cu in the sirup can be lessened markedly if the acid is added to the starch slurry instead of the prime water. Cu removal at the neutralization stage was promoted by protein impurities, high pH, and hot filtration. At a level of 200 p.p.m. of Cu, activated carbon will remove only about 20% of the Cu, while bone char will remove 99%.

6718. Clendenning, K. A. and Wright; D. E. **Production of sirups from wheat, potato, tapioca, and waxy cereal starches.** *Can. J. Research* 26F, 284-96 (1948).—*C.A.* 43 888*i*.

Wheat, corn, and waxy corn slurries hydrolyzed at approx. the same rate with 0.2% HCl, whereas potato starch hydrolyzed less rapidly. All sirups decolorized completely with 0.5% activated carbon at 14° or 30° Bé. Contamination with 1.6% protein did not affect the hydrolysis rate but it did promote foaming, turbidity and a bitter taste. Color and fluorescence development in stored sirups was also promoted by proteins. Acid-extd. carbon or bone char gave most efficient decolorization.

6719. Dědek, J. **Chemistry of lime salts in sugar-beet juices.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 595-610 (1948).—*C.A.* 43, 6443*i*.

Review of the most important practical experience bearing on the behavior of lime salts.

6720. Dědek, J.; Ivancenko, D., and Zerkalej, V. **Ion exchangers in sugar-beet technology.** *Listy Cukrovar.* 65, 69-72(1948).—*C.A.* 43, 4500*g*.

Satd. juices, filtered through artificial ion exchangers, lost 72% of the apparent nonsugars, 59% of the org. nonsugars, 87% of the ash, 98% of the CaO, 85% of the K_2O and Na_2O, 75% of the total N, 65% of the tannin-pptd. N, 65% of the W-pptd. N, 62% of the N detd. by the Van Slyke method, 80% of the unspecified N, 70% of the CO_2, and 84% of the coloring substances.

6721. Devillers, R. **Chromatography and the Sugars.** *J. fabr. sucr.* 1948, 177-9; *Sucr. belge* 69, 168(1949).—*C.A.* 43, 4033*h*.

Chromatoraphy and its utilization in sugar purification was discussed. A detn. of the exact compn. of the juice in different stages of refinement, even that of molasses, was possible.

6722. Dickinson, B. N. **Ion exchange in beet-sugar refining.** *Chem. Eng.* 55, No. 7, 114-17 (1948).—*C.A.* 42, 8002*i*.

A general description of the use of ion exchange was given for three plants.

6723. Dolinek, A. **Experiences with continuous Russian saturation.** *Listy Cukrovar.* 65, 99-102 (1948-9); *Sugar Ind. Abstracts* 11, 36 (1949).—*C.A.* 45, 3627*i*.

Limed juice entered in countercurrent over a distributor plate in a continuous process. Very even gas distribution is attained, and the consumption much less than that required for discontinuous satn. Difficulties were encountered in 1947/8 owing to the poor quality of beets, necessitating a higher degree of liming, and greater care to ensure complete satn. Gas must be introduced before the juice fills the vessel, to obviate excessive foaming. Satn. was controlled on a basis of the color and alky. of the juice. Temps. were 85-88°C for 1st satn., 95-100°C of 2nd satn. Alky. could be controlled to 0.056-0.102% CaO, and 0.010-0.024% CaO, resp.

6724. Doormaal, J. J. van. **Manufacture of sugar from molasses by the use of an ion exchanger.** *7th Congr. intern. ind. agr., Paris* 1, Q4-G (1948); *Sugar Ind. Abstracts* 10, No. 8, 90 (1948).—*C.A.* 43, 6442*e*.

Beet molasses, dild. to 40° Brix, was passed through a cation exchanger, neutralized with lime, concd., and crystd; 60 to 70% of the sugar was recovered. Lime salts were not melassigenic.

6725. Dubourg, J. **Ion exchangers in the sugar industry.** *J. fabr. sucre* 89, 48-50 (1948); *Sugar Ind. Abstracts* 10, No. 4, 39 (1948).—*C.A.* 43, 4034*h*.

Ion exchange was applied to beet juice after 2nd carbonation. The exchangers were exhausted in 1 hr; regeneration took 1 hr. The juice, cooled to 20-25°C to prevent subsequent inversion, was treated first with the cation exchanger, coming out with a pH about 2.5, and then with the anion exchanger, after which the pH was about 6.7. Air bubbling eliminated most of the H_2CO_3 produced by the process, and after heating the pH was nearly 7.0. The re-heating unit also acted partially as a cooling unit for incoming juice.

6726. Dubourg, J. and Lemaitre, A. **Peculiarities of the precipitation of calcium carbonate in sucrose solutions.** *Inds. agr. et aliment* 65, 273-8(1948).—*C.A.* 43, 3221*e*.

The ppt. produced by batch carbonation of a clear soln. contg. 12% of sucrose and 1.2% of lime settled most rapidly when the final alky. was 0.4, but the ultimate vol. of the ppt. was about the same at a final alky of 1.2, 0.4, or 0.0. With the final alky. at the optimum point the ppt. settled more rapidly the higher the initial alky. Batch carbonation yielded a flocculent conglomerate of $CaCO_3$ particles which occupied a much larger vol. than the well-formed crystals produced by continuous carbonation.

6727. Efron, Aaron and Blom, R. H. **Production of maltose sirup from granular wheat flour.** *Ind. Eng. Chem.* 40, 412-15(1948).—*C.A.* 42, 3903*g*.

The wheat flour must be extd. with water to remove the sol. protein. Either malt or fungal amylases can be used for the conversion, and the finished sirups were equally good with respect to protein content, color, and clarity. The process involved 4 steps: (a) cooking the grain to render the starch accessible to the enzyme; (b) enzyme conversion of the cooked mash; (c) clarification of the mash; and (d) refining and concn. of the thin liquor. Bentonite greatly reduced the sol. protein in the sirup.

6728. ELLISON, HAROLD E. AND PORTER, LYLE B. **First campaign results of de-ionization at the Layton Sugar Company.** *Sugar* 43, No. 3, 30-4 (1948).—*C.A.* 42, 3599*i*.

The de-ionizing plant (1350 tons of beets daily) consisted of 4 cation units, 10×14 feet, with an 8-foot resin bed, 4 anion units, 10×11 feet, with a 5.5 foot resin bed, and the resin-regenerating equipment, completing a service cycle in 1.75 hrs. The operations were described in detail. Second carbonation juice, cooled by means of heat exchangers, was used as raw material. The extn. was 92.03%, against 85% by straight house operation.

6729. FITCH, E. B. AND MICHENER, J. W. **Nonsugars in beet juices removable by ion exchange.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 696-704 (1948).—*C.A.* 43, 6442*f*.

Thick juice was dild. and passed through a lab. cation unit. Ionized ash constituents and simple amino acids, including betaine, were 99.9% removed until a certain percentage of the exchange capacity of the bed was used up. However, this was accomplished only when the bed had been exhaustively regenerated (9 vols. of HCl and upward flow in regeneration). An exhaustively regenerated anion bed (30 vols. of ammonia soln.) can remove from the decationized juice all anions whose acids have an ionization const. of about 10^{-7}. This includes SO_4^{--}, Cl^-, NO_2^-, and NO_3^-, and apparently all org. nonsugars passed by the cation bed, including pyrrolodone carboxylic acid, browning-reaction products, org. nitrates or nitrites, polypeptides, and perhaps some org. N compds.

6730. FORT, C. A. **Comment on the use of ion-exchange resins in demineralizing sugar-beet juices.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 704-8 (1948).—*C.A.* 43, 6442*i*.

The cost of ion-exchange operation depended on the concn. of minerals in the beets and the effect of the compn. of these minerals on the amt. of addnl. sugar recovered. The range of sulfated ash in U.S. beets was 0.4-0.8%, which meant a 100% range in required capacity and operating cost.

6731. GARINO, MARIO. **Ion exchange in the purification of sugar juices.** *Ind. saccar. ital.* 41, 103-6 (1948).—*C.A.* 42, 8003*i*.

Preliminary expts. with Amberlite cation and anion resins gave prospects of industrial success. To eleminate 1 g of nonsugar substance, it was necessary to use 15.5 g of resin.

6732. GOLOVIN, P. V. AND SUSHKOVA, A. S. **Solubility of lime in sugar solutions.** *Sakharnaya Prom.* 21, No. 5, 25-6(1948).—*C.A.* 42, 8501*c*.

Soly. of CaO in pure sugar solns. increased when lime was added to a cold soln. which was then heated. Addn. of lime to a hot sugar soln. decreased its soly. Non-sugars in diffusion juices have little if any effect on the soly. of lime.

6733. GUNDERMAN, ERICH. **The colloidal materials of technical sugar solutions.** *Kolloid-Z.* 111, 111-22 (1948).—*C.A.* 44, 6177*f*.

The colloidal properties of diffusion juice, press juice, filtered thin juice, sulfured juice, and molasses were investigated. Acids coagulated more than 92% of the colloidal material, bases only about 77%. Some of the color of impure beet juices was due to the colloid content, which was chiefly electroneg. and irreversible in character. Normal purified beet juice appeared clear, but always contained finely-dispersed colloidal material. This consisted of "organic Ca salts", N compds. which were largely albuminous in nature, silicic acid, Fe oxide, and clay. Only a small part of the coloring matter of molasses was retained on the ultrafilter. Some org. Ca salts were also found in molasses, as well as in tech. sugar solns.

6734. HAAGENSEN, E. A. **Full-scale ion-exchange operations in a beet-sugar factory.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 690-5 (1948).—*C.A.* 43, 6441*h*.

A short test run with beets of low quality gave a nonsugar removal of 82.5%, with 56% N removal. It seemed feasible to produce 60-purity molasses. Chem. consumption was 25 lbs of 93% H_2SO_4 and 6 lbs of anhyd. NH_3 per ton of beets.

6735. HANDELMAN, M. AND ROGGE, R. H. **Ion-exchange refining of dextrose solutions.** *Chem. Eng. Progress* 44, 583-90 (1948).—*C.A.* 42, 8501*e*.

The acidified raw dextrose soln. regenerated ash from the partially exhausted cation bed in the first position of the triple-pass system. This trouble was corrected by placing the anion-exchange resin ahead of the cation-exchange material. On continued service, the anion resin was modified by the process liquor to such an extent that a substantial quantity of the alkali regenerant was held by the resin despite excessive rinsing. Acidified process liquors liberated this ash and increased the ash content of the process liquor.

6736. HÄUSLEROVÁ, O. **Changes in the composition of heavy liquors during storage.** *Listy Cukrovar.* 64, 133-5(1948).—*C.A.* 42, 3601*c*.

Ten samples of heavy liquors from raw-sugar factories and 5 samples from mixed factories, analyzed before and after a 6-month storage, showed an av. decrease in the quotient of purity from 94.91 to 93.12, an av. decrease in alky. from +0.045% CaO to -0.011%, an av. rise of invert sugar from 0.067% to 0.268% per 100° Bg. and an av. rise in color from 21.66° St. per 100° Bg. to 40.08.

6737. HENRY, JOSSE. **Ion exchangers in the beet-sugar industry.** *Sucr. belge* 68, 84-95(1948).—*C.A.* 43, 1589*b*.

A resumé was given of the use of ion exchangers in U. S. sugar-beet refineries, and of the semi-industrial trials during the last 6 months at Tirlemontoise.

6738. Hruska, Josef. **The refining of raw sugar from cane.** *Listy Cukrovar.* 64, 233-7(1948).—*C.A.* 42, 8002*f*.

Raw cane sugar called gur imported from India into Iran was refined in one of the refineries for beet sugar. A better brand of gur showed an apparent dry substance 94.5, polarization 74, ash 2.33, invert sugar 1.13%; the poor brands showed an apparent dry substance 93.8, polarization 68.8, ash 2.28, and invert sugar 1.30%. Because of much caramelization of the gur the decolorization of the sugar was difficult.

6739. Kaganov, I. N. **Chemical theory of molasses formation.** *Sakharnaya Prom.* 22, No. 3, 21-3 (1948); *Sugar Ind. Abstracts* **10**, No. 8, 94 (1948).—*C.A.* 43, 6848*c*.

The theory based on the "rendement" concept, 1 part of "ash" to 5 parts of sugar, was considered faulty. In final molasses, the sugar/ash ratio (ash coeff.) = about 13; after ion exchange, the ash coeff. = nearly 50. Therefore, the ash was not melassigenic. Molasses formation was considered partly a temp. effect; extn. increased with temp., and the latter must be 90°C for fodder molasses. In an artificially prepd. concd. mixt. of sucrose, fructose, glucose, and maltose, in which the satn. coeff. for sucrose was 1.5-1.7, the sucrose should have crystd. easily; it was, however, found to be impossible. The effect could not be due to chem. compds. between the sugars, and a chem. theory cannot apply to such artificial molasses.

6740. Kats, V. M. **Decrease of lime in beet-sugar production.** *Sakharnaya Prom.* 22, No. 12, 14-16 (1948).—*C.A.* 43, 7243*e*.

Through the first of 2 parallel troughs, diffusion juice was pumped at 40°C; through the other, the unsatd. juice from the first carbonatation at 90°C with an alky. 0.4% CaO. The unsatd. juice overflowed into the diffusion juice all along the trough. Pretreated juice was defecated with 1.5% lime and pumped to two first carbonatation tanks. Since the overflow was continuous all along the troughs, the increase of alky. from 0.05 to 0.2% CaO and from 40° to 70°C was progressive. Economy of lime was 25% and filter cloth 50%.

6741. Kloppenburg, C. A. **Sugar recovery from cane molasses.** *Indian Sugar* 11, 285-7(1948).—*C.A.* 43, 4502*d*.

Molasses was dild. with 3.5 times its wt of 70% alc., filtered, treated with 15% of powd. CaO (on molasses) and stirred for several hrs at 45-70°C. Dextrose and levulose were pptd. as Ca glucosate, filtered, and decompd. with CO_2; the freed glucose was fermented to alc. The cooled filtrate was treated with 10% (on molasses) of CaO that had been slaked in 70% alc. which pptd. the sucrose as monosaccharate. The process was economic for Indian conditions.

6742. Konn, Václav. **Recent transformations in the sugar industry.** *Listy Cukrovar.* 64, 196-7 (1948).—*C.A.* 42, 6557*e*.

Ten years ago the aim of the sugar technologist was to produce more sugar and less nonsugars per unit area of soil; the aim today is more sugar per unit of man power. The mechanization of the sugar factory presents the problem of preserving the chem. constituents of stored sugar beets during a prolonged campaign.

6743. Konn, Václav. **Transformations in the sugar industry. II. The preparation of sugar.** *Listy Cukrovar.* 64, 226-7(1948).—*C.A.* 42, 7071*e*.

Recent developments were: replacement of the diffusion processes by better extn. devices, recovery of edible amino acids from slices, permutoids for removing the ions of sol. salts in sugar juices, conversion of diffusion juice into bricks which when stored can supply a refinery for an entire year, the prepn. of aromatic or fragant molasses, the purification of disposal waters so that they will not be injurious to fish.

6744. Kröner, Waldemar and Hönsch, Werner. **Decolorizing starch hydrolyzates with synthetic resins.** *Kolloid-Z.* 110, 178-83 (1948).—*C.A.* 43, 5980*d*.

A mixed resin was used to decolorize starch hydrolyzates contg. 30-85% total solids. The resin was regenerated without removing it by washing successively with 5% alkali, warm H_2O, 5% HCl soln., and water at pH 5.

6745. Lassèchère, M. **Ion exchangers in the sugar industry.** *7th Congr. intern. ind. agr., Paris* **1**, Q4-N, 2 (1948); *Sugar Ind. Abstracts* **10**, No. 8, 87 (1948).—*C.A.* 43, 6441*g*.

Tests at Dompierre sugar factory in 1947 were reported on the continuous purification of 2nd carbonation beet juice at the rate of 600 liters/hr, with 2 preliminary filters, 4 pairs of exchangers, and regenerating with H_2SO_4 or HCl, and Na_2CO_3. Full details of losses, purities, costs, etc. were recorded.

6746. Lewon, J. and Dobrowolski, J. **Calcium saccharate or "semi-saccharate."** *Gaz. Cukrownicza* 88, 117-19 (1948).—*C.A.* 43, 4035*e*.

$Ca(C_{12}H_{21}O_{11})_2$ was expected to hydrolyze back to $Ca(OH)_2$ and sucrose. For this compd., CaO soly. in 13% sugar soln. should be 1.06%. In pure water at 80°C, 0.072% CaO dissolved; then, if there was 0.24% CaO in defecated juice, 0.168% would combine CaO, and sucrose present as disaccharate would be 2.05% (or 15.8% of the total sucrose). With cold defecation at 40°C, CaO soly. was 0.99%, free CaO was 0.11%, and hence combined CaO was 0.88% and sucrose as disaccharate equaled 10.8% (83% of the total sugar).

6747. Libkind, L. I. **Application of methods for the purification of beet juices in the cold.** *Sakharnaya Prom.* 22, No. 8, 32-3 (1948).—*C.A.* 46 7800i, 43, 6444*a*.

The diffusion juice at 30-5°C was continuously subjected first to preliminary defecation in one tank and then to the regular defecation. The juice, first warmed to 40-5°C by the addn. of hot milk of lime, went to the first carbonation and then, at a temp. of 50-60°C to the filter presses and the mech. filter. The filtered juice from the first carbonation goes to the reactor of the 2nd carbonation and from there to the filter presses as degassed juice. Retarded crystn. of $CaCO_3$ prevented successful purification of beet juices at low temp. However, this could be overcome if the juices, after the second carbonation before filtration, entered a reactor tank equipped with a heater and agitator.

6748. MARBAIX, M. DE. **Improvement of the defecation of diffusion juice in the calcocarbonic processes.** 7th *Congr. intern. ind. agr., Paris,* **1**, Pt. 2, 15 (1948); *Sugar Ind. Abstracts.* **10**, No. 8, 84-5 (1948).—*C.A.* 43, 6444*f*.

The usual methods of introduction of CO_2 formed eddies and caused loss of unused gas. In a cylindrical carbonator, the gas underwent a rotary movement, giving complete homogenization. The plant handled 2000 tons of beets per day.

6749. MARIANI, EUGENIO. **Possibility of the use of ion-exchange resins in the manufacture of sugar.** *Ind. saccar. ital.* 41, 107-13, 192-213 (1948).—*C.A.* 42, 9211*f*, 8002*h*.

The expts. were made with resins of the type "Amberlite" on molasses. Treatment increased the purity of the juice from 60 to 90. The molasses ash contained, before and after the treatment, resp.: SiO_2 2.33 and 0.75, CaO 3.56 and 0.27, and $Fe_2O_3 + Al_2O_3$ 1.65 and 0.39%. Amberlite IR-100 (cation) and IR-4B (anion) raised the purity of beet molasses from 60 to 99 when the molasses was dild. 1:15; with dilns. of 1:10 and 1:5 the purity was raised to only 87 and 83, resp. The 1st fraction of liquor passing over IR-100 had pH 2.3; it increased to 5-7 at the end of the run. Passage over IR-4B left the pH of the liquid at 5.6 (16-20°C).

6750. MCGINNIS, R. A. **Studies on continuous carbonation.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 573-94 (1948).—*C.A.* 43, 6445*h*.

The optimum settings for the various variables in a Dorr system of continuous first carbonation in a Calif. beet sugar factory were reviewed.

6751. MINDLER, A. B. **Demineralization of sugar-cane juice - pilot-plant study.** *Ind. Eng. Chem.* 40, 1211-15 (1948).—*C.A.* 42, 6559*g*.

From 90 to 95% of the ash and 70 to 75% of the nonsugar solids were removed from Cuban and Louisiana cane juices. The purity rise was 4.7% for Cuban cane and 6.5% for Louisiana cane. The increased sugar yield was 3.8% for the former and 6.2% for the latter. Lime-defecated juice cooled to 30-35°C was passed through a 10 ft^3 bed of Zeo-Karb H at the rate of 6 $gal/min./ft^2$ and then through a similar bed of De-Acidite. Regeneration of the resin required 2 to 6 lb H_2SO_4/ft^3 of Zeo-Karb and 2.6 to 7.6 lb of Na_2CO_3/ft^3 of De-Acidite.

6752. MÜLLER-BRIEGHEL, A. **Problem of structural physics in sugar technology.** *7th Congr. intern. ind. agr., Paris* **I**, Pts. 3/4, 17(1948); *Sugar Ind. Abstracts* **10**, No. 8, 93 (1948).—*C.A.* 43, 6845*g*.

Morphological phenomena during defecation and carbonation were examd. The microscopic structure of limed juices were studied in varied conditions.

6753. NARULA, B. L. AND CHAWLA, B. L. **Calcium lactate from cane molasses.** *Indian Sugar* **11**, 115-18(1948).—*C.A.* 43, 2366*d*.

Molasses dild. to contain 42.7% of total sugars was mixed with 46 parts of pulverized $CaCO_3$ and fermented with stirring at 45°C with a culture of *B.delbruckii* until the lactic acid reached about 25%. The crude Ca lactate was sepd. by filtration and concd., converted with $FeSO_4$ into Fe lactate which was reconverted into Ca lactate with milk of lime. The soln. was finally decolorized with activated carbon, crystd., and the crystals washed with 95% alc. and dried in hot air.

6754. OPLATKA, GYORGY. **Purifying sugar juices by ion-exchanging synthetic resins.** *Mezögazdaság és Ipar* 2, No. 11, 1-9(1948).—*C.A.* 44, 5127*f*.

Experiences in the sugar mill at Sarkad, Hungary were described in the season 1947-48 with ion exchangers. Inorg. salts were removed up to 97%, org. substances up to only 36%. Anion removers were exhausted relatively quicker than cation exchangers.

6755. POLAK, FELIKS. **Adsorption on calcium carbonate.** *Roczniki Chem.* 22, 181-90 (1948).—*C.A.* 43, 8791*h*.

The adsorption of the color of molasses and of a dye ("Ponceau 4 R") on $CaCO_3$ was found to obey Freundlich's law. While excess Ca^{++} increased adsorption, CO_3^{--} had the opposite effect, and Ca salts were found to be greatly adsorbed. This explains why excessive carbonation of molasses during refining gives an inferior product.

6756. PONIECKI, J. **Addition of lime in defecation.** *Gaz. Cukrownicza* **88**, 66-8(1948); *Sugar Ind. Abstracts* **10**, No. 5/6, 50(1948).—*C.A.* 43, 4035*i*.

After withdrawal of the diffusion juice at 36-40°C, an addn. of 0.018% of CaO gave pH 10.8-11. After this preliming, the juice flowed by gravity, slowly enough to provide some waiting period before main liming, during which the colloids pptd. Main liming was cold with 1-1.1% CaO. The juice was then preheated to 83°C, and satd. by a continuous process. Excellent decolorization results were obtained.

6757. PORTER, L. B. **Deionization and beet-sugar production at the Layton Sugar Co.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 714-21 (1948).—*C.A.* 43, 6443*c*.

Av. pilot-plant results were: Brix of influent juice 12.95, effluent juice 11.81; sugar in influent juice 12.13%, in the effluent 11.61; influent purity 93.76, effluent 98.60; pH influent 8.14, effluent 7.13; invert influent 0.13%, effluent 0.39; overall diln. 4.28%; total sugar extn. 92.03%; ash of deionized sugar 0.006-0.008%. Chemicals for regeneration were: 20.44 lb of 66 Bé. H_2SO_4 and 11.81 lb anhyd. NH_3 per ton of beets.

6758. PORTER, L. B. **Ion exchange in the beet-sugar industry.** *7th Congr. intern. inds. agr., Paris* 1948, Q4, B1-8.—*C.A.* 44, 9171*e*.
The advantages of ion exchange purification, a description of the installation used, and the favorable effects on the bacteriol. conditions were considered.

6759. PORTER, RICHARD W. **Ion exchange finds new uses.** *Food Inds.* 20, 691-702 (1948).
Ion exchange has produced demineralized water cheaply, but has roused the greatest interest as a means of purifying sugar solns. Other applications were the recovery of sugar from waste fruit juices, reduction of the Ca content of milk for infant feeding, recovery of lactose from whey, of tartrate from winery wastes, and of pectin from grapefruit peels. The technology of ion exchange was explained, the equipment described, and the applications discussed. Ion exchange treatment is substantially the same for refining all types of sugar: beet, fruit, cane or corn.

6760. RAMÍREZ SILVA, FRANCISCO J. **Colloidal bentonite as a clarifying agent.** *Sugar J.* 11, No. 5, 3-4, 14-18 (1948); *Intern. Sugar J.* 51, 85-6 (1949).—*C.A.* 43, 1587*h*, 5613*i*.
Bentonite in sugar refining was discussed.

6761. RAWLINGS, F. N.; JACOBS, R. T., AND COLE, E. B. **Ion exchange in the beet-sugar industry.** *7th Congr. intern. ind. agr. Paris* 1, Q4-A, 1-11 (1948); *Sugar Ind. Abstracts* 10, No. 8, 89 (1948).—*C.A.* 43, 6440*i*, 9171*e*.
Ion exchange removed most ash constituents, except silica, and over 90% of the org. acids and N-compds., with some decolorization and removal of unpleasant taste. The temp. must be kept at 20-25°C. Advantages to be expected from ion-exchange purification were: increased sugar yield (92-96%), 2 or 3 high-quality white sugar strikes, elimination of evaporator scale, and the possibility of direct liquid sugar, "soft sugar" or brown sugar production, and by-product recovery. By ion-exchange treatment of thin juice without special precautions, N removal may drop to 35-50%; by flushing the cation bed every 1-3 days with *N* NH_4OH, 50% N removal may be obtained when cutting off the beds at the pH break-through point; if earlier cutting-off is applied, 65% N removal may be possible. Use of a second cation bed, as a scavenger for N, was also effective.

6762. ROBERT, M. **Ion exchangers in the sugar industry.** *7th Congr. intern. ind. agr., Paris* 1, Q4-C (1948); *Sugar Ind. Abstracts* 10, No. 8, 87 (1948).—*C.A.* 43, 6441*e*.
A semi-industrial installation for treatment of 2nd carbonation cane juice with Zeo-Carb cation exchanger and Deacidite anion exchanger was described, with graphs of the results obtained.

6763. ROSINSKI, LADISLAS. **Notes on the working of filter presses.** *Chimie & industrie* 59, 17-21, 131-43 (1948).—*C.A.* 42, 3980*g*.
Some general equations of filtration were compared with the practical results obtained in sugar-house operation. Optimum operating conditions were discussed from the standpoint of economy and improvement of the process.

6764. SEIP, JOHN J. AND KELLER, ARTHUR G. **Causes of the declining sugar recovery in Louisiana, 1943-1947.** *Louisiana State Univ. Eng. Exptl. Sta., Bull. Ser.* No. 14, 23 pp. (1948).—*C.A.* 43, 7243*b*.
A year-by-year plot showed a parallelism between the no. of mech. harvesters in operation and the decline. Mech. harvesting, by increasing the burden of trash, was the most significant factor in the reduction of sugar recovery. Attempts to correlate yield deficiency to amt. of trash gave uncertain values, depending on the basis used, the effect per 1% of trash on gross cane being equiv. to 0.26-9.33 lb of 96° sugar per ton of cane. The increased loss of sucrose in bagasse, determinable with reasonable accuracy, was calcd. as 0.46 lb of 96° sugar in bagasse per 1% of trash.

6765. SHRIKHANDE, J. G. **Recent developments in sugar chemistry and by-products research.** *Indian Sugar Suppl.* (1948), 87-93; *Sugar Ind. Abstracts* 10, No. 11, 138 (1948).—*C.A.* 43, 6439*f*.
Com. levulose production, sucrose synthesis, ion-exchange purification, fiber-board and plastics production from cane fiber, the dehydration of molasses, food-yeast production, and the extn. of sugar-cane wax from press mud were reviewed.

6766. SOLANO, JORGE A. AND VILLALOBOS, VALENTIN. **Practices for increasing efficiency in the cane sugar factory.** *Sugar* 42, No. 8, 32-5 (1948).—*C.A.* 42, 8001*d*.
The prime requisite for efficiency was clean cane, grown under the best possible conditions, and with the proper P_2O_5-gum balance. If fractional liming and double heating do not yield clarified juice of the desired quality, P_2O_5 must be added before liming, and with refractory juices, such as those from POJ 2878, sulfitation must be applied. An improved 3-boiling system was described in detail.

6767. SUSSMAN, S. **Ion exchange in the sugar industry.** *7th Congr. intern. ind. agr., Paris* 1, Q4-E, *1-7* (1948); *Sugar Ind. Abstracts* 10, No. 8, 86-7 (1948).—*C.A.* 43, 6441*f*.
A review was given of recorded results for the treatment of beet sugar, cane sugar, molasses, glucose, sorgo juice, agricultural by-products, pineapple and citrus wastes, apple juice, artichoke juice, and wood-sugar soln.

6768. SYCHEV, N. A. AND SHMATOVA, M. I. **Decoloration of solutions containing xylose with calcium oxide.** *Zhur. Priklad. Khim. (J. Applied Chem.)* 21, 655-8 (1948).—*C.A.* 43, 8714*h*.
Ca salts of the coloring lignosulfonic acids were coagulated by cold treatment of 10-20% sugar solns. with 10% lime milk, with subsequent immediate satn. with CO_2. The process used 2% CaO with respect to the amt. of the sugar.

6769. TÖDT, FRITZ. **The utilization of the sugar in molasses, with special consideration of the removal of salts by exchange materials.** *Branntweinwirtschaft* 2, 49-50(1948).—*C.A.* 45, 7809*d*.

Processes for the removal of the sugar by the use of $Ca(OH)_2$ and $Sr(OH)_2$ were discussed. The zeolite-like montmorillonite and permutit were not as satisfactory for this purpose as the exchange adsorbents having an artificial resin base.

6770. VAN HOOK, ANDREW. **Some chemical problems and prospects of the sugar industry.** *J. Chem. Education* 25, 49-51(1948).—*C.A.* 42, 2789*i*.

Agricultural and field improvements, ion-exchange agents in purification, synthesis of sucrose, by-products, and crystn. and molasses theories were outlined.

6771. VAN HOOK, ANDREW. **Kinetics of sucrose crystallization: real massecuites.** *Ind. Eng. Chem.* 40, 85-9(1948).—*C.A.* 42, 2791*c*.

Data in the literature, as well as addnl. information about crystn. rate, for both cane and beet sirups, conform to the linear semilogarithmic theoretical pattern. Sirups may be assigned a relative melassigenic value according to the slope of this rate vs. impurity plot.

6772. WERQUIN, V. **Rational use of lime and carbon dioxide.** *Inds. agr. et aliment* 65, 209-11(1948).—*C.A.* 43, 1587*g*.

The process reduced the sucrose loss in molasses from 2.51 to 2.04%, and other losses from 1.35 to 0.92%. The sugar production per day increased 20%.

6773. WILLCOX, O. W. **New developments in ion exchange.** *Sugar* 43, No. 12, 27-9(1948).—*C.A.* 43, 2475*d*.

Amberlite IRA-400 and Amberlite IRC-50 were of particular interest to the sugar industry because the pH of the solns. never fell below 7, and inversion was avoided. The possibility of operating a mixed-bed process with countercurrent flow was discussed.

6774. ZANUSO, E. AND SPETTOLI, O. **Calcium carbonate, calcium oxide, and carbon dioxide in the sugar factory.** *Ind. saccar. ital.* 41, 159-65(1948).—*C.A.* 42, 9211*e*.

A temp. of 1200-1300°C was required for complete dissocn. of limestone contg. 94% $CaCO_3$. A scheme of calcns. was presented for apportioning limestone and coke to obtain max. vol. of CO_2 and wt of lime and the appropriate dimensions of the kiln.

6775. ABRAM, I. M. AND DICKINSON, B. N. **Color removal in sugar liquors by synthetic resins.** *Ind. Eng. Chem.* 41, 2521-3 (1949).—*C.A.* 44, 2778*b*.

Decolorization and the ion-exchange treatment of industrial sugar liquors were independent of each other. Two different types of anion exchangers designated as resin A and resin B were run simultaneously. Resin A was a nonporous, translucent, gel type and resin B was highly porous and opaque. The two resins did not differ markedly in their effects on second carbonation sugar juice although A had a somewhat higher acid capacity and B a somewhat higher color capacity. The color break-through and the pH break-through occur at approx. the same time and color and the pH curves roughly paralleled each other.

6776. AFFERNI, ERNESTO. **The action of metals on the inversion of sucrose.** *Ann. chim. applicata* 39, 381-92 (1949).—*C.A.* 46, 3779*b*.

A 10% aq. soln. of sucrose was heated at a const. temp. or refluxed for various periods of time with the metal in the form of sheets of 1 mm thickness and 12 cm surface. The tests with 9 samples of steel alloys contg. various amts. of Si, Mn, S, P, and Ni, and with pure Fe showed that the inversion was inhibited by the Fe and was independent of the other elements present; the resulting solns. had a pH 3-4.2. The strongest effects were given by Fe, Pb, Sn, and Zn; the solns. obtained with these metals deposit small amts. of the metal acetates. The inversion was catalyzed and completed in 3-4 hrs at 70° in the presence of Mo.

6777. AHMAD, QAIYUM. **Purification of carbon dioxide in carbonation factories.** *Intern. Sugar J.* 51, 341(1949).—*C.A.* 44, 2778*f*.

Wood charcoal was found to be a possible substitute for coke in the production of CO_2. To avoid choking of the gas pipes and valves with the tarry smoke from the charcoal, an extra scrubber was placed in the line and the gas bubbled through kerosene and then through a layer of hard coke pieces. This extra scrubber might be used effectively even in factories using coke for CO_2 production.

6778. APEL, ALFONS. **Grape sugar from wood.** *Holz* 3, 186-8 (1949).—*C.A.* 44, 324*f*.

The hemicelluloses were dissolved and hydrolyzed with dil. HCl. The sugars thus obtained were fermented to EtOH. The wood residues were dried and hydrolyzed with cold concd. HCl. The HCl was evapd. *in vacuo*, and the residual sugar "inverted" and purified by an undescribed procedure. The crude sugar soln. when evapd. yielded cryst. D-glucose (80-85%) which, on recrystn., gave a chemically pure product. Mother liquors were also fermented.

6779. BENIN, G. S. AND SHNAIDER, E. E. **Method of estimation of ion exchangers.** *Sakharnaya Prom.* 23, No. 1, 16-23 (1949).—*C.A.* 43, 7729*i*.

A 0.1*N* soln. of CH_3COOK was advisable for detn. of adsorption by a cation exchanger. Ca adsorption was higher than K and N in sugar products. N substances in nonsugars were adsorbed in the H-cycle. A decrease of pH in the original material decreased the capacity of the cation. For complete evaluation of the quality of the cation exchanger an artificial or standard molasses soln. was recommended.

6780. BLANN, W. A. **Ion exchange and cane-sugar manufacture.** *Bol. mensual asoc. téc. Azucar. Puerto Rico*, 1949, 13 pp.; *Sugar Ind. Abstracts* 11, 56(1949).—*C.A.* 45, 3623*i*.

Ion exchange was capable of performing the main part of sugar purification, a final defecation being needed only to eliminate impurities not affected by the resins. The production of refined sugar direct from cane juice was considered to be practical.

6781. BORGHI, MARIO. **The use of ion exchangers in the sugar industry.** *Ind. saccar. ital.* 42, 78-91 (1949).—*C.A.* 43, 9503*e*.
The use of ion exchangers in the purification of raw and diffusion juices had some drawbacks; albuminoids were coagulated in acid medium and disturbed the regular behavior of the cycle. To purify highly concd. refinery sirups with ion exchangers it was necessary to treat the sirups previously by filtration with bone char.

6782. BRIEGHEL-MÜLLER, A. AND BRUENICHE-OLSEN, H. **The physical chemistry of the second carbonatation in the beet sugar industry.** *Sugar* 44, No. 4, 36-9 (1949).—*C.A.* 43, 5217*f*.
The unexpectedly high content of Ca salts in the 2nd carbonatation juice was reduced to the theoretical by digesting it with 1% of cryst. $CaCO_3$ for 15 min. at 85°C. The supersatn. of the $CaCO_3$ was caused by crystn. inhibitors, probably colloids which were adsorbed on the $CaCO_3$ crystals. Addn. of 2nd carbonatation sludge was not as effective as that of cryst. $CaCO_3$. The relation between effective alky. and Ca salts was studied.

6783. CHOW, T.-Y. **Middle-juice carbonation** *Taiwan Sugar J. Quart.* 2, No. 2, 1-19 (1949).—*C.A.* 44, 9706*c*.
The filterability of the limed juice increased with the amt. of lime used; 6-7% (based on the vol. of the middle juice) of milk of lime contg. about 15% of available CaO was optimum. Higher coloration in the purified juice was observed when the lime was less than 6 vol. %. Diln. of the juice was not affected when the amt. of lime varied between 5.5 to 8 vol. %. The water content of the filter cake decreased with the increasing amt. of lime used.

6784. CHOW, T.-Y.; CHANG, P. K., AND CHENG, C.-P. **Experiments on phosphates used for clarifying cane juice.** *Taiwan Sugar J. Quart.* 2, No. 2, 31-43(1949).—*C.A.* 44, 9703*f*.
Expts. on the clarification of the mixed juice of Da-ling factory (av. phosphate content 302 p.p.m.) by the addn. of standard KH_2PO_4 soln. indicated that in the cold liming process, the optimum phosphate content was 400 p.p.m. and the optimum pH value 7.6. In the hot liming process the optimum pH value was 7.3. Clarification of the mixed juice was studied upon the addn. of 20 Bé. H_3PO_4 and different kinds of Ehrmannite and calcium superphosphate.

6785. COOK, H. A. **Sirup clarification.** *Repts. Hawaiian Sugar Technol. 8th Ann. Meeting* 1949, 66-9.—*C.A.* 44, 3727*d*.
Improvement of sirup filtration rate can be obtained with H_3PO_4 and CaO in a frothing process with concns. between 0.03 and 0.10% P_2O_5 on sirup solids. This required approx. the same quantity of CaO. The treatment resulted in a decrease in turbidity but produced little improvement in sirup color, little change in % sirup ash, slight reduction in insol. ash, and a fair improvement in refining quality of sugar.

6786. CRUICKSHANK, G. A. AND BRAITHWAITE, D. G. **Sterilization of cation-exchange resins.** *Ind. Eng. Chem.* 41, 472-3(1949).—*C.A.* 43, 3952*i*.
The contamination of exchanger beds by bacterial growth was due to the presence of filtered suspended org. material supplying the necessary food requirements. Sterlization by 0.25% HCHO for 3 hrs was effective, inexpensive, and non-deleterious to sulfonated phenol-formaldehyde resins.

6787. DĚDEK, J. **Fundamental conditions affecting the filterability of first carbonation juices.** *Sucr. belge* 69, 73-83 (1949); *Sugar* 46, No. 5, 21-5 (1951).—*C.A.* 45, 8277*i*.
Optimum conditions were discussed for the formation of a ppt. by a reaction between added chalk and the nonsugar-contg. portion of the juice, and its sepn. by sedimentation or filtering. Large particles were obtained by maintaining a very low supersatn. of $CaCO_3$ and of substances precipitable by lime, which was secured by lowering the soly. of the CO_2 through carbonation at high temp. and keeping the pH during the whole carbonation at as low a figure as possible, compatible with good purification. An efficacious method from the standpoint of filterability was simultaneous liming and carbonation. The same result could be achieved by progressive preliming of the diffusion juice. The influence of the hydrated protein and pectin substances on the filterability was effectively reduced by slow preliming.

6788. DEWHALLEY, H. C. S. **Pure sucrose - its preparation for use in analysis.** *Intern. Sugar J.* 51, 223 (1949).—*C.A.* 43, 9502*b*.
Affined raw sugar melter liquor, after carbonatation and filtration, was treated with char in the usual way. The liquor was boiled to granulated, and spun in a Roberts machine (1250 r.p.m.) on a 5 min. cycle with a wash of 45 lb water instead of the usual 3.5 lb. A typical analysis: invert sugar 0.001%, ash 0.001%, org. non-sugar (ash × 1.5)0.0015%, sucrose (by difference) 99.996%.

6789. DICKINSON, B. N. **Commercial ion-exchange purification of sugar-containing solutions.** *Food Technol.* 3, 48-51(1949); *Sugar* 45, 28-30 (1950).—*C.A.* 44, 5127*e*.
The use of ion exchangers in the purification of cane, corn, and beet-sugar products and by-products were discussed.

6790. ELLISON, H. E. **Sugar-end operations on ion-exchange juice.** *Proc. Am. Soc. Sugar Beet Technol.* 5, 557-62 (1949).—*C.A.* 43, 6441*i*.
Discussion of some tentative procedures.

6791. FELTON, GEORGE E. **Use of ion exchangers in by-product recovery from pineapple waste.** *Food Technol.* 3, 40-2 (1949).—*C.A.* 44, 5031*c*.
When pineapple juice was passed through cation exchangers, capacity fell off rapidly because acid regeneration did not remove all adsorbed matter; alk. solns. desorbed the impurities more effectively. Some brands of anion exchangers were unsatisfactory because the exchanger was not stable toward reducing sugars.

6792. Fonseca, Manoel M. E. **Continuous refining of cane sugar by ion exchange in vacuum.** *Anais assoc. quím. Brasil* **8**, 293-302(1949).—*C.A.* 45, 885*i*.

6793. Goncalves de Lima, Oswaldo; Magelhães Neto, Bento, and Gomes de Matos, Antônio Jr. **New observations on citric fermentation of cane molasses from Pernambuco with Aspergillus niger 198.** *Anais soc. biol. Pernambuco* **9**, 19-26(1949).—*C.A.* 45, 4878*c*.

In the pH range of 6.36-4 the percentage both of oxalic acid and of citric acid from a given amt. of sugar decreased with lowering of pH. At pH lower than 4 there was no reproduction of the fungus and no production of acid. Purified molasses gave lower yields of acids than did the crude molasses. The following inorg. constituents were detd. for both crude and purified molasses and the ash from each: SiO_2, Fe_2O_3, Al_2O_3, CaO, MgO, K_2O, Na_2O, Cl, SO_3, and P_2O_5.

6794. Hamous, J. and Mudrák, O. **Sugar-manufacture experiments with activated bauxite, Porocel.** *Listy Cukrovar.* **65**, 151 (1949).—*C.A.* 43, 6848*g*.

Porocel (200 g) reduced the color in 1 liter of beet juice at 80°C from 8.25° to 6.58°St. The filtered juice was still turbid and lacked luster. Addns. of 0.01, 0.02, 0.04, and 0.08% of Porocel to beet juices digested for 15 min. at 80°C reduced the color 7.9, 12.0, 23.2, and 27.2%, resp. Equal addns. of carboraffin removed from 77 to 95.9% of the color in corresponding expts. Addns. of diatomaceous earth to the Porocel improved the quality of the filtered juice.

6795. Hinton, C. L. **The buffer power of sugars.** *Intern. Sugar J.* **51**, 222 (1949).—*C.A.* 43, 9499*g*.

The buffer power of sugars was defined as the vol. of 0.1 *N* HCl which must be added to 1000 ml of a 25% (wt/vol.) aq. soln. of the sugar to bring the pH to 4.0. The detn. can be made directly by an electrometric titration. An alternative colorimetric method was suggested.

6796. Huttl, John B. **Diatomite: Its mining and processing.** *Eng. Mining J.* **150**, No. 8, 75-7 (1949).—*C.A.* 43, 7651*c*.

The operations were outlined at the Johns Manville Products Corp.'s plant, Lompoc, Calif.

6797. Jacobs, Ray T. and Rawlings, Frank N. **Nitrogen removal in ion-exchange treatment of beet sugar juices.** *Ind. Eng. Chem.* **41**, 2769-74 (1949).—*C.A.* 44, 2777*e*.

Of the total N removable by resins from double-carbonated sugar-beet juice, 70-80% was removable by the cation bed and 20-30% by the anion bed. When an anion bed vol. equal to the cation bed was used, the anion bed gave a complete removal of anion-removable N up to the titration break-through of the cation bed. If the cation bed was operated for a sustained no. of cycles without special regeneration, it exhibited a gradual loss of 20% of its N removal capacity. A special treatment of the cation bed every three days (25 to 30 cycles) with 0.7 lb of NH_3 (as 1.0 *N* NH_4OH) per ft^3 of resin was recommended to maintain max. N removal.

6798. Jermyn, M. A. and Isherwood, F. A. **Improved separation of sugars on a paper partition chromatogram.** *Biochem. J.* **44**, 402-7 (1949).—*C.A.* 43, 8312*a*.

The detn. of sugars in mixts. of simple hexoses and pentoses on a paper chromatogram showed that a 3-component system ($EtOAc-AcOH-H_2O$, or $EtOAc-pyridine-H_2O$) was more satisfactory. Some details of the procedure were discussed critically.

6799. Khanna, K. L. and Chacravarti, A. S. **Studies in the clarification of sugar-cane juice in gur manufacture.** *Indian J. Agr. Sci.* **19**, 137-61 (1949).—*C.A.* 45, 5430*g*.

Various electrolytes were studied in relation to their efficiency in juice clarification, but none was any better than the commonly used clarifying agent, bhindi mucilage (*Hibiscus esculentus*). The superior clarifying property of castor seed and groundnut exts. might be attributed to their relatively high content of protein and phosphate.

6800. Maier, E. A. and Handcock, J. M. **Settling of cane juice by addition of calcium carbonate.** *Sugar J.* **II**, No. 8, 13 (1949).—*C.A.* 46, 9874*g*.

Ground oyster shells (2-4 lb per ton or more for exceptionally dirty cane) aided clarification of raw juice. The treatment was most effective if applied before hot-clarification followed by hot liming.

6801. Mariani, E. **Kinetics of sucrose inversion by ion-exchange resins.** *Ann. Chim. Applicata* **39**, 283-290(1949).—*C.A.* 45, 3625*f*.

Tests were carried out to det. the rate of inversion of sucrose by cation-exchange resins (Amberlite IR-100 and Montecatini GS) at 20°, 35°, 40°, 50°, and 60°C for times of contact from 30 min. to 24-30 hrs; the tests were made with 1 or 2 g of resin and 25 cc. of sucrose solns. of 10 and 20% concn. The reaction velocity const. of invert formation corresponded with a first-order reaction: $K = 2.303/t \log 10(a/a-x)$ where x = initial sucrose concn., and t = time in min.

6802. Meads, P. F. and Gillett, T. R. **Preparation of sugar liquors and sirups for color determinations.** *Anal. Chem.* **21**, 1949-7 (1949).—*C.A.* 44, 2777*i*.

The product was dild. with H_2O, rather than with heavy colorless sucrose sirup, to 30-40° Brix for washed raw sugar and 2-5° Brix for affination sirup. Filtration through uncalcined kieselguhr (1 g/250 ml) gave the lowest turbidity readings based on the Tyndall effect. The suspension was filtered through coarse filter paper and the first 50 ml of filtrate discarded. After filtration, the pH was adjusted to 7 by titration with 0.0357 *N* NaOH or H_2SO_4. The color was measured in terms of -log T.

6803. MIRČEV, ATANAS. **The course of the crystallization of sugar followed by means of electrical conductivity during the 1948-49 season.** *Listy Cukrovar.* 66, 27-8 (1949).—*C.A.* 44, 2775*i*.

A molasses-forming coeff. may be useful for predicting the yield of sugar. Studies indicated that the yield may be predicted from the mineral content of the molasses. K and Na bound large quantities of sugar but Ca salts and the injurious N did not bind any sugar.

6804. MUHAMMAD, SARDAR. **Mineral matter and its effect on the recovery of white sugar.** *Pakistan J. Sci.* 1, 108-10(1949).—*C.A.* 45, 5429*h*.

High mineral matter content in cane juice lowered the recovery of white sugar.

6805. MUKHERJI, B. K. **Modification of cane molasses.** *Intern. Sugar J.* 51, 141-2(1949).—*C.A.* 43, 5615*e*.

The modification was the removal of K and Ca ions. K was removed as the insol. K dipicrylaminate. As high as 97% removal was possible. The recovery of the dipicrylamine was difficult and the high cost and low recovery of the reagent made the process commercially unfeasible. Ca was removed as $CaSO_4$ at pH 4.1 and at a diln. of 1:1.

6806. NEISH, A. C. **Production and properties of 2,3-butanediol. XXX. Determination of the fermentation acids by partition chromatography.** *Can. J. Research* 27B, 6-20(1949).—*C.A.* 43, 4807*i*.

The acids sep. into bands in the column and were eluted with C_6H_6-BuOH mixts. contg. 5-25% BuOH. The acids were eluted in the order given above and were detd. by titration with NaOH with phenol red. The acids were identified by the amt. of solvent required to bring them through the column.

6807. NEWKIRK, T. H. AND HANDELMAN, MORTON. **Triple-pass countercurrent ion-exchange system.** *Ind. Eng. Chem.* 41, 452-7 (1949).—*C.A.* 43, 4882*b*.

Six columns of alternately placed anion and cation units (polyamine phenolic resin and sulfonated phenolic resin, resp.) operated continuously to produce 5000 lbs of dextrose per day from the hydrolysis of starch. The removal of ash, acid, color, Cu, Fe, N, turbidity, and 5-hydroxymethyl-furfural were followed. Partial recovery of lost cation exchange capacity was accomplished in lab. studies by treatment of the bed with 4% NaOH at 155°F. Color and nitrogen removal properties of the anion exchanger were improved by treatment with 10% H_2SO_4 at 140°F.

6808. OTHMER, DONALD F. AND LULEY, ARTHUR H. **Refining sugar by solvent.** *Food* 18, 81-3 (1949); *Sugar* 44, No. 7, 26-9 (1949).—*C.A.* 43, 4035*h*, 7729*f*.

Raw sugar was extd. countercurrently with hot MeOH. The resulting sugar was light yellow, practically sterile and had a max. polarization of 99.7. The MeOH passed through a settling tank and was recovered by distn. About 1 lb of MeOH was required per lb of sugar. The process could be operated alone or in conjunction with a bone char refinery.

6809. PARASHAR, D. R. **Behavior of coloring matter in refining khandsari sugar.** *Proc. Sugar Technol. Assoc. India* 18, Pt. I, 72-5 (1949).—*C.A.* 44, 5623*g*.

Reworking crude sugar obtained by boiling cane juice directly under atm. pressure offered no difficulty when it was added to the factory raw juice. In off-season operations when khandsari sugar was melted alone, limed, heated, and filtered, there was a reduction of ash content, but an increase in reducing sugar. In such case a 4-massecuite was necessary to exhaust the final molasses to 38-34 purity.

6810. PIERCE, J. **Defecation studies.** *Brit. Sugar Corp. 2nd Tech. Conf.* 1949, 28 pp.—*C.A.* 46, 4826*h*.

In lab. expts., 2 methods were compared: return of the unfiltered 1st carbonation juice to the raw juice, followed by single liming and carbonation; and simultaneous liming and carbonation, without or with return of the 1st carbonation juice to the raw juice. The latter was better than other processes tested in respect to filtration, content of Ca salts, purity, and color of the thin juice.

6811. RAMANAIAH, S. V. AND NARASINGARAO, C. **Potassium chromate as a deleading agent for the determination of Clerget's sucrose.** *J. Sci. Ind. Research* (India) 8B, 99-103 (1949).—*C.A.* 43, 8311*f*.

The removal of Pb^{++} by treatment with K_2CrO_4 did not cause error in the subsequent polarization and the results agreed well with those obtained by the use of $Al(OH)_3$. It was preferred to the use of alk. phosphate, oxalate, or carbonate and recommended in the analysis of molasses and distillery waste.

6812. REDMAN, C. C. **Observations on juices from Dorr clarifiers.** *Sugar* 44, No. 7, 37-9 (1949).—*C.A.* 43, 6846*i*.

Analyses of juices from the different compartments of Dorr clarifiers showed an increase in both Brix and purity from the top to the bottom compartment for 2 older models, but not for a modern multifeed unit. This observation, supplemented by lab. clarification expts. indicated that the increases were due to resoln. in the juice of optically active nonsugars that had been adsorbed by the ppt.

6813. RUBEŠ, E. **Physical properties of affined solutions.** *Listy Cukrovar.* 65, 145-7(1949).—*C.A.* 43, 6847*d*.

The elec. cond., polarization, and *ns* of the washings from a centrifuge were detd. in min. intervals for 7 min. The elec. cond. reached a max. at 3 min. and dropped rapidly.

6814. SCHLEICHER, JORGE AND SIMONETTI, A. LEONIDAS. **The purification of refinery molasses by demineralization.** *Bol. soc. chilena quim.* 1, 45-65 (1949).—*C.A.* 44, 9707*g*.

Refinery molasses, dild. with 2 parts of H_2O, was pretreated in lab. expts. by filtration with Filter-Cel, by liming followed by Filter-Cel filtration, by clarification with lime and acid phosphate and the reverse. The effluent after purification with acid phosphate and lime was dild. to various ds. from 1 to 25.7 Brix and treated with ion-exchange resins at 10°, 20°, 40°, and 60°C. Another sample of the same molasses of 27° Brix, without pretreatment, was passed through ion exchange resins at 14°C. Decolorization expts. were also made with bone char, a com. activated carbon, and a carbon prepd. by dry distn. of the washings from the resins. At 10°C, 0.84% invert sugar was formed by the resin treatment, 0.96% at 20°C, 5.43% at 40°C, and 24.6% at 60°C. The decolorizing efficiency of the carbon prepd. from the resin washings was 69% of that of bone char.

6815. SEN, H. D. AND SRIVASTAVA, H. C. **Edible sirup from cane molasses.** *Proc. Sugar Technol. Assoc. India* 18, Pt. I, 60-1(1949).—*C.A.* 44, 3727*e*.

Sucrose and invert sugars were pptd. from clarified molasses; the washed Ca saccharate was decompd. with CO_2. Excess CO_2 was boiled off and traces of Ca removed by Na_3PO_4. In a second method SO_2 was substituted for CO_2. The purity rise was from 31.8 to 57.9% with CO_2 and 31.8-61.2% with SO_2. Recovery of total sugars was 48.2% and 42.3%, resp.

6816. TEICHNER, STANISLAS. **Kieselguhr as support for Fischer catalysts.** *Compt. rend.* 228, 1644 (1949).—*C.A.* 43, 8830*i*.

The surface of kieselguhr (Filter-Cel) samples, measured by N_2 and CO_2 adsorption, was not affected by alkali treatment (5% Na_2CO_3) unless the sample had been given a previous treatment with $HNO_3.HCl$, in which case the surface was reduced. The efficiency of kieselguhr in a Fischer catalyst was believed proportional to the quantity of reactive silica.

6817. VAŠÁTKO, JOZEF. **Carbonation of the sugar-beet juice.** *Chem. Zvesti* 3, 137-45 (1949).—*C.A.* 44, 7575*a*.

Two principal conditions were necessary in progressive preliminary carbonation: (1) the optimum quantity of added lime and (2) the speed at which lime is added.

6818. VENTRE, EMIL K. AND BALCH, R. T. **Powdered calcium carbonate (oyster shell flour) in processing of sugar cane.** *Sugar J.* 12, No. 6, 10-11 (1949); *Sugar Ind. Abstr.* 12, 186 (1950).

The oyster shell flour should have a fineness such that 99% passes a 200-mesh screen (wet test). An amt. of 2-4 lb per ton cane was to be used. The $CaCO_3$ may be mixed with the lime before addn., or it may be added as a sep. suspension after the lime, the suspension being prepd. in lime water. Sufficient agitation to prevent settling out of the $CaCO_3$ was needed. No trouble was experienced in the usual filters, and no increase in scale formation was found.

6819. VISSER, W.; VLIES, G. S. VAN DER, AND WATERMAN, H. I. **Extraction of juice at low temperatures and use of ion exchangers in the beet-sugar industry.** *Chimie & industrie* 61, 337-44 (1949).—*C.A.* 43, 7243*g*.

Beets could be extd. at a lower temp. than ordinarily used, if an agent such as SO_2 was used to suppress the semipermeability of the cellular walls. At 35-40°C and in the presence of 0.3% SO_2 (by wt of beets), the resulting juice could be purified better with ion exchangers than could normal crude juice. Dusarit (carbon base) and Asmit (amine-formaldehyde base) were used. Regeneration of the ion exchangers was not entirely effective.

6820. WIKLUND, OLOF AND LINDBLAD, LARS. **Beet-juice purification.** *Socker Handlingar* 5, No. 9, 157-96 (1949); *Intern. Sugar J.* 52, 69-71 (1950).—*C.A.* 44, 5125*e*.

Overcarbonatation of beet-sugar juice repeptized the colloids giving a cloudy juice. By adding this overcarbonated juice to raw juice before defecation it was possible to obtain carbonatation scums that settled and filtered easily.

6821. WILLIAMS, KENNETH T.; POTTER, EARL F.; BEVENUE, ARTHUR, AND SCURZI, WARREN R. **A study of clarification methods in the determination of sugars in white potatoes, use of ion-exchange resins.** *J. Assoc. Offic. Agr. Chemists* 32, 698-706 (1949).—*C.A.* 44, 770*f*.

Agents for the clarification of exts. of raw potatoes and dehydrated potatoes to remove nonsugar reducing substances were (1) neutral lead acetate, (2) combination of (1) with decolorizing carbon, and (3) a set of ion-exchange columns, cation- and acid-binding resins. Nonsugar reducing materials in raw potatoes which interfered with the micro methods of analysis, were not completely removed by neutral lead acetate or decolorizing carbon.

6822. WISE, LOUIS E.; GREEN, JOHN W., AND RITTENHOUSE, RUTH C. **Paper partition chromatography of the simple sugars.** *Tappi* 32, 335-6 (1949).—*C.A.* 43, 9433*g*.

Paper partition chromatography was applied to the qual. sepn. of simple sugars obtained by partial hydrolysis of aspen and sprucewood, of holocellulose, spruce α-cellulose, various pulps, and such beater additives as guar and Iles mannane. Limitations of the chromatographic method are discussed.

6823. ZERO, W. **Utilization of nonsugars in diffusion juice.** *Gaz. Cukrownicza* 89, 147-156, 209-212 (1949); *Sugar Ind. Abstracts* 11, 180 (1949).—*C.A.* 45, 3623*g*.

Juice satd. in 2 stages had a better color and purity than juice satd. to final alky. in one stage. It was found that some re-peptization of the nonsugars occurred after preliminary defecation, if contact with juice was prolonged. Removal of the ppt. after preliminary defecation was advised. When the sludge was not needed for fertilizer, the nearly pure $CaCO_3$ in 1st satn. sludge could be regenerated (to lime) about 20 times. The simplest and cheapest method of sepn. of the ppt. was by decantation alone; good decantation results were dependent on accurate liming in the pre-defecation, and a slight excess was best.

6824. ALBON, N. AND GROSS, D. **Chromatographic determination of raffinose in raw sugars.** *Analyst* 75, 454-7(1950); *Intern. Sugar J.* 53, 12-13(1951).—*C.A.* 44, 11135*d*.

Make up a 40% soln. of the raw sugar and prep. standards from a sugar that is free of raffinose by adding weighed quantities of raffinose hydrate. Draw a pencil line parallel to, and 12 cm from, the top of a sheet of Whatman's No. 1 paper and mark the points of application for each sample and standard, 3 cm apart. Apply from a micropipet 0.005 ml of each soln. to the appropriate mark. Allow to dry a few min., and add another drop of the same size at the same place, making 4 mg of sugar. Dry 30 min., fold the top of the paper around a strip of glass 3 cm wide and place it in a trough contg. a solvent mixt. of 5 parts BuOH, 3 parts pyridine, 3 parts water, and 1 part benzene. After 24 hrs at 15-25°C remove the chromatogram from the tank, avoiding spillage of surplus solvent down the sheet. Hang in the drying cabinet and remove the solvent by a stream of air at 90°C. About 1 ml of reagent was required for 25 cm^2 of filter paper. Remove and compare the colors that have developed; 0.05% of raffinose can be detected.

6825. ANGELESCU, E.; NICOLESCU, I. V., AND TIGOIU, A. **Thermochemical investigation of the adsorption of sucrose on calcium oxide.** *Acad. Rep. Populare Române, Bul. Stiint., Ser.: Mat., Fiz., Chim.* 2, 189-98(1950) (French summary).—*C.A.* 45, 8279*c*.

The increase of temp. which took place when distd. H_2O and sucrose solns. were mixed adiabatically in a Dewar flask with CaO was measured. Although only qual. tests were carried out, a definite parallel between the extnd. yield and heat of reaction was observed: each factor which increased the extn. yield of sucrose on CaO resulted in a decrease of the total heat of reaction and inversely.

6826. BADOLLET, M. S. **Processing asbestos fibers: effects on physical properties.** *Trans. Can. Inst. Mining Met. Engrs.* 53, (in Can. Mining Met. Bull. No. 461, 487-91) (1950).—*C.A.* 45, 3531*i*.

Asbestos fibers usually required re-processing before they could be used to best advantage. Any fiber-reprocessing method produced a lowering of fiber strength, loss in strength, formation of fines, different degrees of buoyancy, changes in d., increase in surface area, and a tendency to become more difficult to filter.

6827. BALASUNDARAM, S.; HIRANI, R. K., AND SUBRAHMANYAN, V. **Calcium gluconate from cane sugar.** *Science and Culture* 15, 483-4(1950).—*C.A.* 45, 4951*i*.

Hydrolyzed cane sugar was electrolyzed with 1% KBr, 1% NaCl, and 5% suspended $CaCO_3$. Ca gluconate crystd. when the glucose was oxidized. Fructose could be removed by recrystn. and repeated washings.

6828. BECKER, DIETRICH. **Advantages of juice purification by Wiklund's method.** *Zucker* 3, 513-16(1950).—*C.A.* 45, 3175*h*.

6829. BENIN, G. S. AND SHNAIDER, E. E. **Selection of the place for ion-exchange installation in the technological scheme of a beet-sugar factory.** *Sakharnaya Prom.* 24, No. 10, 14-19 (1950).—*C.A.* 45, 4069*e*.

The most rational place for ion exchangers in a beet-sugar factory was after second carbonation. The present system of diffusion and other treatment of the juices must remain unchanged. However, less lime must be used. Since purities of the juices increased after ion-exchange treatment, the no. of boilings must be increased to four.

6830. BINKLEY, W. W. AND WOLFROM, M. L. **Chromatographic fractionation of cane blackstrap molasses and of its fermentation residue.** *J. Am. Chem. Soc.* 72, 4778-82 (1950).—*C.A.* 45, 2694*f*.

Fractionation of 100 g Cuban molasses on clay gave 4 fractions. A residue which was acetylated and chromatographed on Magnesol gave D-fructose, and D-mannitol as the acetates. Control expts. with pure sugars by the above procedure gave above 90% recovery of D-glucose and sucrose as acetates and 50% D-fructose as acetates in several zones.

6831. BORGHI, MARIO. **Application of ion exchangers to crude (beet) juice.** *Ind. saccar. ital.* 44, 21-8(1950).—*C.A.* 45, 5956*b*.

The raw juice was limed with enough CaO (0.2-0.3%) to flocculate the org. colloids, heated to 90-100°C, and cautiously treated with just enough gaseous SO_2 to produce a pH of 7.0. The completely neutral, turbid juice with a min. content of $CaHSO_3$ and other lime salts was cooled to 50°C, filtered, and passed through the ion-exchange process without fouling either of the 2 resin beds. Three types of resin, Wofatite, Amberlite, and Duolite, were used.

6832. BÖTTGER, ST. AND MENSCHEL, H. **Effective juice purification and continuous filtration.** *Zucker* 3, 508-13(1950).—*C.A.* 45, 3175*h*.

The optimum coagulation occurred at a pH of 10.9 and 35-45°C.

6833. BOZZA, GINO AND PEZZOTTA, ANGELO. **Carbonation velocity of magnesium oxide.** *Chimica e industria* (Milan) 32, 317-23(1950).—*C.A.* 45, 2756*c*.

CO_2 was introduced at const. rate into aq. suspensions of Mg oxides and carbonates. The amt. of Mg reacted vs. time under varying conditions of rate of CO_2 input, temp., and MgO content was detd. The mechanism of the reaction was an initial formation of $Mg(OH)_2$ at low CO_2 concns., followed by its gradual dissolving at higher CO_2 concns. Below a concn. ratio of Mg/CO_2 of 0.62-0.64, an equil. was set up with $MgCO_3.3H_2O$.

6834. BRIEGHEL-MÜLLER, A. AND BOLLERUP, J. **Some color problems relating to juice purification.** 8th *Congr. intern. inds. agr., Brussels* 1950, 219-26 (in English).—*C.A.* 45, 6406*h*.

An amethyst color was formed in beets during ripening. Beet juice was treated with lime to pH = 11, filtered, and measured by extinction coeffs. at 436 and 579 mμ. The color was isolated by removing all other colors by addn. of H_3PO_4, to pH = 2; filtration; addn. of Norit 1%; filtration; addn. of NaOH (50% soln.) to pH 11 and filtration. The colorant was probably the complex, 8 $Fe(C_6H_4O_2)_3$. It seemed to be greatly absorbed by sugar crystals.

6835. Brooks, R.; Clark, L. M., and Thurston, E. F. **Calcium carbonate and its hydrates.** *Trans. Roy. Soc. London* A243, 145-67, (1950).—*C.A.* 45, 3744*f*.

The tendency for metastable phases of $CaCO_3$ to be pptd. from aq. solns. was increased by raising the pptn. rate or by increasing the concn. of addn. agents as Calgon or Mg ion. Spherulitic crystals of $CaCO_3.H_2O$ could be prepd. by adding simultaneously and at uniform rates 60 ml of 12% $MgCl_2$ soln., 126 ml of 25% $CaCl_2.6H_2O$ soln., and 91 ml of 25% Na_2CO_3 soln. to 400 ml satd. NaCl soln. with stirring at a temp. of -3°C; the reaction product was filtered and the moist cake allowed to stand. $CaCO_3.H_2O$ was moderately stable, could be dried at 100° with very little decompn. and decompd. slowly at room temp.

6836. Carruthers, A. **Aspects of second carbonatation.** *Brit. Sugar Corp. 3rd Tech Conf.* **1950**, 13 pp.—*C.A.* 46, 7799*i*.

The contents of Ca salts in the 1st carbonatation juice, filtered, and gassed to the optimum alky., were decreased appreciably on digestion with 1% of $CaCO_3$ at 85°C for 15 min. Brieghel-Müller's results as to the effect of press cake in this respect were confirmed by analyses of juice from the lab. and factory presses, and of raw juice defecated in the lab.; the Ca salts were further reduced by digestion with $CaCO_3$ so that the cake was not fully effective.

6837. Ché León, Marcelino and Cerdan Rios, Ernesto E. **Clarification of cane juice with carbonate and oxide of calcium.** *Anales asoc. peruana technol. azucar.* 1, 153-8(1950).—*C.A.* 45, 1797*f*.

Utility of the "Louisana method" of defecating cane juice with a mixt. of 7 Bé. milk of lime and powd. $CaCO_3$ was demonstrated. Fractional liming with this mixt. with intermediate boiling was more effective than single liming.

6838. Chow, Ta-Yao and Cheng, Che-Pin. **Middle-juice carbonatation in Taiwan.** *Sugar* 45, No. 9, 34-5(1950).—*C.A.* 44, 9706*i*; 47, 6687*i*.

In factory trials, middle-juice carbonatation was satisfactory as regards saving in fuel, CaO, and other chemicals, reduction of scale formation; and improvements in clarification, filtration, over-all recovery, and rise in purity of the juice. The process was especially adaptable for juices of low purity and having high contents of sulfate.

6839. Chow, T. Y.; Chang, P. K., and Cheng, C. P. **A preliminary study of sulfate scale in evaporators and middle-juice carbonation.** *Taiwan Sugar J. Quart.* 3, No. 1, 10-15 (1950).—*C.A.* 45, 1798*c*.

The sulfate scale in the evaporators was traced to 3 major sources. (1) Water. (2) Milk of lime. (3) Cane juice. In a no. of factories in Taiwan the sulfate content of 15° Brix cane juice may vary from 295 to 1260 mg/liter. In ordinary carbonation process the sulfate removal was very little, while in the middle-juice carbonation process it was about 50% or more.

6840. Chow, J. C. and Lo, Y. F. **The efficiency of clarification by middle-juice carbonation.** *Taiwan Sugar J. Quart.* 3, No. 1, 34-42(1950).—*C.A.* 45, 1797*e*.

If the carbonation in the middle-juice process was carried out at a juice concn. of 40-45° Brix, the saving of lime was about 50% and the juice about 10% purer, contained about 25% less CaO, but three times the color value. However, if the juice concn. was 31° Brix, the saving of lime was about 40%, but the purified juice had about the same purity and CaO content, and twice the color value.

6841. Cotton, Robert H.; Rorabough, Guy, and Harris, W. A. **Recovery of waste ammonia in ion-exchange operations.** *Proc. Am. Soc. Sugar Beet Technol.* 6, 544-8(1950).—*C.A.* 45, 5956*g*.

The spent anion-exchanger regenerant contg. 0.5-1.0% of NH_3 was treated with 1.5% of CaO and distd.; recovery was 82%. Only about 15-20% of the liquid need be distd. off.

6842. Cramer, Fr. **Paper chromatography of sugars.** *Angew. Chem.* 62, 73-5(1950).—*C.A.* 44, 4699*b*.

A review with diagrams.

6843. Dědek, J. **Some aspects of ionic exchange (in sugar manufacture).** *Socker Handl.* 6, No. 2, 49-51(1950).—*C.A.* 44, 11136*g*.

The best prepn. of a beet diffusion juice for ionic exchange was by application of the Brieghel-Müller and Wiklund methods of progressive pre-liming and stablization. Proteins and pectins were combined with Ca^{2+} and removed by filtration before reaching the exchangers.

6844. Dědek, Jaroslav; Henry, Josse; Lange, Simon, and Rens, Georges. **The capacity of ion-exchange agents.** *Sucr. belge* 70, 145-68 (1950); 8th *Congr. intern. ind. agr., Brussels*, 1950, 70-96 (in French).—*C.A.* 45, 3177*c*; 47, 2909*c*.

The capacities of a resin were specific for different ions and depended drastically on the pH. The capacity decreased with repeated use. Flow methods must be used rather than static in order to evaluate exchange agents for use. The reversible exchange of glutamate ion was probably via the formation of a complex ion.

6845. Deschamps, Pierre and Charreton, Berthe. **Stability of basic lead chloride.** *Compt. rend.* 231, 1228-30(1950).—*C.A.* 45, 2806*h*.

The effect of NaOH on 0.01*M* $PbCl_2$ was studied by pH measurements. The time for equil. was reduced from several months to 30 hrs as the temp. was increased to 92°C. Et_2NH required less time than NaOH for equil. $PbO.PbCl_2$ and $3PbO.PbCl_2$ explain the pH changes found in the plot of pH *vs.* OH-added divided by OH-needed to form $Pb(OH)_2$.

6846. DeWhalley, H. C. S. **Raffinose—its estimation by a paper chromatographic method.** *Intern. Sugar J.* 52, 127-9, 267 (1950); 53, 247 (1951).—*C.A.* 44, 7575*c*, 9705*e*.

A drop of the soln. to be tested was measured from a micropipet onto a spot on the top edge of a piece of filter paper. At intervals across the same filter paper drops of solns. contg. known amts. of raffinose were also spotted. After drying the chromatogram was developed for 16 hrs at room temp. by using butanol 50, water 30, and pyridine 30 vol. The paper was then dried and sprayed with 0.25% 1-naphthol in EtOH contg. 10 ml H_3PO_4 per 100 ml. On redrying spots appeared to mark the positions of the sugars and their relative amts. Over 400 samples were analyzed. The sugars at the Plaistow refinery showed an av. of 0.25% and at the Thames refinery an av. of 0.31%.

6847. DOORMAAL, J. J. VAN. **Separation of sugar from molasses by ion exchange.** *Inds. agr. et aliment.* (Paris) 67, 143-4(1950).—*C.A.* 45, 5956*f*.

Dild. cold molasses was passed through a strongly acid cation exchanger. The percolate neutralized with lime and concd. gave better sugar yields, and the resulting feed improved because of the Ca content.

6848. DOUWES-DEKKER, K. **Some notes on the principles of our manufacturing processes.** *South African Sugar J.* 34, 297-305(1950).—*C.A.* 44, 9704*g*.

The turbid mixed juice was concd. to 40-45° Brix, carbonated, and filtered. Scaling of the evaporator tubes did not occur and filtrations were satisfactory. In a second modification (Bach process) the removal of suspended matter by centrifugal sepn. from first and second molasses resulted in smoother boiling, more regular grain, and better centrifugal efficiency. It was concluded that advantages were gained by making a thorough second clarification at higher d.

6849. DUVALL, ALLAN. **Some present-day considerations on Hawaii's sugar-mill filtration problems.** *Rept. Hawaiian Sugar Technol., 9th Ann Meeting*, 1950, 101-5.—*C.A.* 45, 7807*d*.

Filtration problems and possible remedies were discussed.

6850. ELLISON, HAROLD E. **Simplified sugar-end operations on deionized (beet) juices.** *Proc. Am. Soc. Sugar Beet Technol.* 6, 554-7(1950).—*C.A.* 45, 5956*a*.

When the temp. of the juice was not allowed to exceed 70°C after deionization and kept below 75°C during crystn., it was possible to hold good color for 2 white pans. Good elimination of invert sugar was obtained by returning the 2nd sirup to the beet end for liming and carbonation.

6851. GERSHGORN, A. D. **Progressive predefecation at Yangi-Yul'skiĭ (U.S.S.R.) sugar factory during 1949/50.** *Sakharnaya Prom.* 24, No. 9, 12-15(1950).—*C.A.* 45, 2245*h*.

Predefecation consisted in returning unfiltered carbonated juice to the diffusion preheated juice with addn. of milk of lime in a 5-section predefecator. This system permitted decreased temp. of juices at filter stations by 10-15°C with increased rate of filtration by 40-50%.

6852. GILLETT, EUGENE C. AND KENDA, W. **Development of the Gillett process of sugar crystallization.** *Intern. Sugar J.* 52, 365-8, 394-6 (1950).—*C.A.* 45, 2694*c*.

6853. GUZMAN, V. V. **Economy of reagents in manufacture of refined sugar.** *An. 1st conv. asoc. peruana tecnól. azucar* 1950, 141-3.—*C.A.* 46, 5345*i*.

By boiling 3rd raw sugars with a footing of final refinery sirup, the sugar obtained was good enough, after affination, for direct boiling in the refinery, with only a small addn. of bleaching agent ($CaOCl_2$ after an initial addn. of 0.025% (on solids) of P_2O_5).

6854. HADORN, H. AND JUNGKUNZ, R. **Basic lead acetate, an unsatisfactory clarifying agent for gravimetric sugar determinations.** *Mitt. Lebensm. Hyg.* 41, 430-5 (1950).—*C.A.* 45, 2694*i*.

Better results were obtained by using $K_4Fe(CN)_6$ + $(AcO)_2Zn$ or $CaCO_3$ + $(AcO)_4Pb$ which gave almost theoretical values.

6855. HAYDEN, J. V. **Ash removal by electrolysis.** *Proc. Intern. Soc. Sugar Cane Technol.* 7, 561-4(1950).—*C.A.* 46, 3780*d*.

In a 3-compartment vessel where the middle cell was flanked on one side by a cell contg. NaOH soln. and on the other side by a cell contg. HCl with canvas partitions between, passage of d.c. brought about reduction of molasses purity and a substantial decrease of ash content.

6856. HOFFING, E. H. AND HAAGENSEN, E. A. **Optimum conditions for sugar filtration.** *Sugar* 45, No. 11, 32-3(1950).—*C.A.* 45, 886*h*.

The max. sugar through-put at 25° to 80°C was at a concn. of 25-30° Brix. It dropped rapidly with an increase to 70° Brix, and considerably also with a decrease to 10° Brix. The length of the filter cycle changed correspondingly, in a reverse direction. The calcd. values were confirmed by expts. with raw sugars, filtered with the aid of 1.25% Dicalite Speedflow at const. pressure drop.

6857. HONIG, PIETER. **Middle juice carbonation.** *Sugar* 45, No. 2, 39(1950).—*C.A.* 44, 4272*h*.

The process required only 0.5 of the lime used in the de Haan process, and the filterability of the carbonated juice was much better. Addn. of small amts. of phosphate to the juice sent to the evaporators practically prevented scale formation.

6858. HONIG, PIETER. **Removal of nonsugars in the carbonation process.** *Sugar* 45, No. 9, 35-7(1950).—*C.A.* 44, 9707*a*.

Carbonation of washed raw sugar liquors of over 99 purity at a Brix of 60-62° resulted in the lowest concn. of the different ash constituents per 100° Brix, ranging from 0 for Al_2O_3 to less than 7 mg for CaO and SO_4. For middle-juice carbonation at 40-45° Brix the corresponding figures were from less than 1 mg for Al_2O_3 to less than 70 mg for CaO, and for carbonation of mixed mill juice according to de Haan from 2 mg of Al_2O_3 to 200-400 mg of SO_4. Middle-juice carbonation gave better results at 40° Brix than at the 28-31° Brix used in Taiwan.

6859. HONIG, PIETER. **Clay in the cane sugar industry.** *Chronica Naturae* 106, 101-4(1950).—*C.A.* 44, 11135*f*.

Filtered molasses (60° Brix, pH 7.4-7.5) were agitated with 1% Bavarian acid clay and Montana clay at 70°C for 30 min. and 2% Hyflocel added before filtration. Filtration was poor. Some Si(4.5-5%) was removed by the treatment but little else.

6860. JONES, E. LLOYD. **The correlation of laboratory filter tests and rotary vacuum filter performance.** *J. Roy. Tech. Coll.* (Glasgow) 5, 148-60(1950).—*C.A.* 45, 3201*c*.

In tests conducted on a suction leaf filter and on a rotary vacuum filter with the same filter cloth, and with a similar cake being built up in each case, it was found that the vols. of filtrate per unit area per unit filtering time for the 2 types of filters were related as follows: $V_R:V_L = \sqrt{P_R}:\sqrt{P_L}$, where V_R = vol. of filtrate of rotary filter, V_L = vol. of filtrate of leaf filter, P_R = pressure drop across rotary filter, and P_L = pressure drop across leaf filter.

6861. KLEĬMAN, B. M. **Manufacture of pressed refined sugar with greater hardness.** *Sakharnaya Prom.* 24, No. 11, 24-8(1950).—*C.A.* 45, 6405*g*.

The moisture of refined sugar before pressing must be increased to 3% or higher. Prior to drying, the pressed sugar must be heated and cooled. Also, the hardness of pressed lumps will be greater when the sugar was washed in centrifugals with sugar liquor instead of water. Intermittent vacuum drying produced a much harder-pressed lump sugar.

6862. KLEVSTRAND, ROLF AND NORDAL, ARNOLD. **A spraying reagent for paper chromatograms which is apparently specific for keto heptoses.** *Acta Chem. Scand.* 4, 1320(1950) (in English).—*C.A.* 45, 3282*h*.

The following compn. was used in filter-paper chromatography: orcinol, 0.5 g; CCl_3COOH, 15 g; butanol (water-satd.), 100 ml. Keep in a cold place and do not use more than 6-8 days after prepn. After the paper has been dried, spray it and heat at 105°C for 15-20 min. Sedoheptulose and mannoheptulose gave a bluish green color reaction, fructose and sucrose gave yellow, and no color was produced with glucose, galactose, arabinose, xylose, ribose, rhamnose, and glucuronic acid.

6863. KOOIJ, J. N. **The use of ion exchangers in the beet-sugar industry. Purification of sugar juices by means of ion exchange.** *Chem. Weekblad* 46, 795-801 (1950); *Chimie & industrie* 64, 704-7 (1950).—*C.A.* 45, 2245*e*, 4951*e*.

Several methods and the results were given of 9 lab. purification processes.

6864. MALLEA, O. S.; BLAISTEN, R. J., AND TAMARGO, H. J. **Utilization of molasses for citric acid fermentation.** *Rev. asoc. bioquím. argentina* 15, 280-7(1950).—*C.A.* 45, 8200*a*.

Filtration of cane-sugar molasses through cation and anion exchangers diminished its salt concn. by 98.6%. This purified material yielded upon fermentation with *Aspergillus niger* 42% of the theoretical amt. of citric acid while pure sucrose gave 48%.

6865. MARIANI, EUGENIO. **The possibility of recovering amino acids from molasses solutions by ion-exchange resins.** 8th *Congr. intern. inds. agr., Brussels* 1950, 275-83(in Italian).—*C.A.* 45, 4952*g*.

Molasses was filtered through a device consisting of 3 ion-exchange columns, 2 cation and 1 anion. After elution with NH_4OH and HCl, resp., total N and ammonia N were detd.

6866. MARIANI, EUGENIO. **Kinetics of sucrose inversion by ion-exchange resins. II.** *Ann. chim.* (Rome) 40, 500-11(1950).—*C.A.* 45, 9903*a*.

Expts. were made with 25 cc. of 20% aq. sucrose and 1 g ion-exchange resins (Amberlite IR-100 and Montecatini G.S.) at temps. between 20° and 50°C, and the reaction rate constants calcd. by following the inversion with time. These resins were less active catalysts than HCl but could be used repeatedly without loss in activity or in available acidity.

6867. MAUDRU, J. E. **Ion-exchange operations—Hardin, 1949 campaign.** *Proc. Am. Soc. Sugar Beet Technol.* 6, 558-60(1950).—*C.A.* 45, 5956*d*.

Flow of juice to ion exchange was restricted to 80-85% to obtain the benefit of the buffering effect of the 15-20% of untreated juice. This greatly diminished the loss of pH and the use of soda. Addn. of SO_2 to ion exchangers eliminated bacterial troubles.

6868. MICHENER, JOHN W.; FITCH, BRYANT, AND ROBERTS, ELLIOTT J. **Ion exchange in beet sugar factories.** *Ind. Eng. Chem.* 42, 643-7 (1950).—*C.A.* 44, 5125*d*.

In the sugar recovery process the earlier the ion exchange treatment was applied, the greater the apparent potential advantages. However, operation ahead of a defecation step involved problems relating to the elimination of colloidal impurities. Operation on green sirups, where only a portion of the juice was treated, minimized the amount of adaptation required in the remainder of the process.

6869. MONDRIA, H. **Continuous filtration. Influence of some variables on filtration rate and cake quality.** *Applied Sci. Research* A2, 165-83(1950).—*C.A.* 45, 2270*b*.

Rate of filtration and rate of cake washing was related to rotational speed of a rotary-drum filter. A formula was derived to calc. changes in cloth resistance with time from measurements of the filtration rate as a function of time.

6870. Mott-Smith, R. H. and Smith, W. E. Jr. **Elguanite clarification at Grove Farm Company, Ltd.** *Rept. Hawaiian Sugar Technol., 9th Ann. Meeting*, 1950, 84-9.—*C.A.* 45, 7807*g*.

Elguanite, consisting mostly of magnesium oxide with smaller amts. of other materials was proposed for clarification of cane juice.

6871. Murray, J. A.; Fischer, H. C., and Sabean, D. W. **The effect of time and temperature of burning on the properties of quicklime prepared from calcite.** *Proc. Am. Soc. Testing Materials* 50, 1263-77, discussion 1278-82 (1950).—*C.A.* 47, 4561*d*.

The porosity, surface area, and activity of quicklimes prepd. from calcite were closely related; high values of porosity were assocd. with high values of surface area and with high activity. With equal retention times in the kiln, higher temps. of burning produced limes with lower porosity and activity.

6872. Novellie, L. **Improved method of detecting sugars on paper chromatograms.** *Nature* 166, 745(1950).—*C.A.* 45, 2370*c*.

Paper chromatograms of sugars were developed by spraying with a soln. contg. 50 ml EtOH, 50 ml BuOH, 0.4 ml 3.8 *N* HCl, 0.2 ml H_2O, 0.1 g pure B-naphthylamine, and 1 drop 10% $Fe_2(SO_4)_3$ and drying at 160-170°C for approx. 10 min. A bright yellow spot changing to yellow-brown was characteristic of fructose and those oligosaccharides which yield fructose on hydrolysis.

6873. Ongaro, Dante. **The application of ion exchangers in the sugar industry.** *Ricerche sez. sper. zuccheri, Univ. studi Padova, Ist. chim. ind.* 5, 83-106(1950-1951).—*C.A.* 46, 763*i*.

Fractionated exchange by passing dil. molasses (1:10) through a battery of 3 units contg. cationic GS, Cecation, and anionic Deacidite E in a vol. ratio of 1:1.5:05 resulted in practically complete demineralization, removal of 95% of the total N, a pH of 7-8 for the anionic percolate, complete decolorization, and higher yields than by simple exchange.

6874. Powers, H. E. C. **The effect of relative humidity of the atmosphere on sugar.** 8th *Congr. intern. ind. agr., Brussels*, 1950, 128-33 (in English); *Ind. Sacc. Ital.*, 1950, 43, 335-38.—*C.A.* 47, 3589*f*.

The vapor pressure of a satd. soln. of pure sucrose at 20°C and 760 mm pressure was 15 mm Hg corresponding to a relative humidity (R.H.) of the air in equil. with the sugar soln. of 86%. As the syrup became less pure, the R.H. would be lower, dropping to 60 or much lower in some cases. The Factor of Safety as applied to raw sugar storage was closely assocd. with R.H. A study of R.H. gave a logical answer to the problems of how much moisture should be present in refined sugar.

6875. Ramírez Silva, Francisco J. **The Silva process of clarification.** *Sugar* 45, No. 2, 40-1 (1950).—*C.A.* 44, 4271*h*.

The addn. of colloidal Volclay KWK, dispersed in soft water, at the rate of 0.3-2 lb per ton of cane, to the mixed juice continuously before liming, greatly improved the clarification of refractory juices from the newer varieties. The process was recommended for juices that were not refactory.

6876. Ramos, Ramon. **Notes on the new process ''Elguanite''.** *El Crisol* 4, 70-3(1950).—*C.A.* 45, 9903*h*.

Addn. of Elguanite to the extent of 2.5-3% of the total solids to crude cane-sugar juice, followed by heating to 79-95°C for 5-15 min., gave better clarification than lime treatment.

6877. Reents, A. C. and Stromquist, D. M. **Ion-exchange purification of sugar solutions.** *Sugar J.* 13, No. 3, 18-21 (1950).—*C.A.* 45, 1363*f*.

The com. adaptation of this method of sugar purification was discussed.

6878. Rohrlich, M. and Tödt, F. **Fructose from cane sugar and molasses.** *Chem.-Ztg.* 74, 750-1, 758-62 (1950).—*C.A.* 45, 5953*i*.

Recovery in good yield of both glucose and fructose from inversion of sucrose required: (1) inversion be done with a small amt. of acid; (2) Ca fructosate must be gradually pptd.; (3) proportion of added lime to fructose could not be less than 1; (4) sepn. of Ca glucosate and Ca fructosate must be carried out within 30 min. after pptn.; (5) the Ca glucosate and Ca fructosate must both be promptly decompd. (with CO_2) after the sepn.; (6) pptn. of Ca fructosate was best carried out in the cold (near 0°C).

6879. Rounds, Hugh. **Second carbonation operations based on the effective alkalinity concept.** *Proc. Am. Soc. Sugar Beet Technol.* 6, 561-4(1950).—*C.A.* 45, 5955*i*.

A factory procedure was established to regulate the effective alky. by addn. of soda. Lime salts in filtered 2nd carbonation juice were reduced 34%, evaporator boil-outs were reduced 46%, residual lime salts in the juice were held practically const. from hr to hr, whereas formerly they varied as much as 0.100% in 1 hr.

6880. Selyatitskiĭ, V. A. **Automatic distributor of milk of lime for the primary defecation.** *Sakharnaya Prom.* 24, No. 7, 34-7(1950).—*C.A.* 45, 2245*d*.

The incoming diffusion juice raised the level of a float, which in its turn raised a sepg. knife. This admited a certain amt. of lime into the overflow box for the diffusion juice.

6881. Shu, Ping. **Estimation of reducing sugars in starch hydrolyzates by paper chromatography.** *Can. J. Research* 28B, 527-34 (1950).—*C.A.* 45, 4175*a*.

Glucose, maltose, and reducing dextrins were detd. colorimetrically with alk. Cu and arsenomolybdate reagents after sepn. by EtOAc-AcOH-H_2O on paper. An app. was described for the sepn. of many samples simultaneously. With 65-200 γ of glucose, the recovery was 95% with a probable error of 2%.

6882. Smit, P. **Ion-exchange agents in the sugar industry.** *Sucr. belge* 70, 97-107 (1950).—*C.A.* 45, 2693*e*.

The advantages and disadvantages of ion-exchange agents in cane and beet processing, and some practical results were given. Raw juice was opaque and difficult to filter after treatment with these agents. This difficulty may be obviated by coagulating at the optimum pH, addn. of a filter aid, or combination of the two treatments.

6883. Smit, P. **Cation-exchange catalysis in the sugar industry.** *Sucr. belge* 70, 108-13 (1950); **8th** *Congr. intern. inds. agr., Brussels* **1950**, 257-68 (in French).—*C.A.* 45, 2693*d*, 4951*b*.

Sugar juices may be inverted with cation-exchange agents in the H-ion cycle. This process yielded products with higher purity than those obtained by other methods, and the process was appropriate for continuous operation.

6884. Smit, P. **Cation exchangers as catalysts in sugar industry. 8th** *Congr. intern. inds. agr., Brussels* **1950**, 269-74(in French).—*C.A.* 45, 4951*a*.

Inversion of sugar solns. in contact with cation exchangers may be caused by (*a*) direct contact, (*b*) H ions produced in the soln., (*c*) both actions. Use in the glucose process was mentioned.

6885. Solano, Jorge A. and Insúa, Enrique. **Lead nitrate versus lead subacetate in clarifying sugar solutions for polarization.** *Anales asoc. peruana technol. azucar.* **1**, 159-64 (1950).—*C.A.* 45, 1798*e*.

The NO_3^- of $Pb(NO_3)_2$ in a modified Herles' reagent and the AcO^- of Horne's dry subacetate of Pb had no differential effect on the polarization of pure solns. of sucrose, glucose, and levulose or their mixts., and hence either can be used with such solns. With Horne's lead the polarization sugar was 0.3 higher than with the other reagent.

6886. Solano, Jorge A.; Mindreau, Carlos, and Insúa, Enrique. **Clarification of sugar solutions by substituting Herles' reagent for lead subacetate.** *Sugar* **45**, No. 2, 37-9 (1950); *Intern. Sugar J.* **52**, 214-15 (1950).—*C.A.* 44, 4271*i*, 9172*f*.

Herles' reagent was recommended for the clarification of juices and other products from refractory cane varieties. The dry mixt., added to the sugar soln. after making up to vol., gave the same results as Horne's dry basic lead. Darkening could be avoided by adding Herles' NaOH soln. to the sugar soln., making up to vol., and then adding dry $Pb(NO_3)_2$, at the rate of 0.5 g per ml of NaOH soln. With some molasses Horne's dry basic lead must be used in large excess to secure readable filtrates, while normal amts. of Herles' reagent gave satisfactory results.

6887. Sorgato, Ippolito and Donà, Edoardo. **Determination of glutamic acid and its anhydride in the products of the sugar industry.** *Ricerche sez. sper. zuccheri, Univ. studi Padova, Ist. chim. ind.* **5**, 73-82(1950-1951); *Ind. saccar. ital.* **44**, 288-92(1951).—*C.A.* 46, 765*h*.

The glutamine, glutamic acid and its anhydride were detd. by a combination of the methods available for the detn. of amido, amine, and imino N.

6888. Stark, J. B.; Goodban, A. E., and Owens, H. S. **Organic acids in sugar diffusion juice.** *Proc. Am. Soc. Sugar Beet Technol.* **6**, 578-83 (1950).—*C.A.* 45, 5955*h*.

By use of an ion-exchange resin and paper chromatography, glycine, alanine, leucine, isoleucine, valine, threonine, glutamic and aspartic acids, glycolic, glutaric, and pyrrolidonecarboxylic acids were identified. Chem. methods showed the presence of oxalic, citric, lactic, succinic, and malic acids.

6889. Stromquist, Donald M. **Ion-exchange behavior in a two-boiling system.** *Proc. Am. Soc. Sugar Beet Technol.* **6**, 549-53(1950).—*C.A.* **45**, 5956*e*.

In the deionization operations with 2nd carbonation juice there was excessive build-up of color in the dild. returned green sirup from the 2nd white pan, and from deionized molasses. This was overcome by use of a sep. small high-speed app. filled with a regenerable granular phenolic resin, with dild. NaOH soln. as regenerant; this increased the efficiency of the regular exchangers.

6890. Stromquist, Donald M. and Ellison, Harold E. **Ion-exchange results at Layton.** *Sugar* **45**, No. 2, 27-31(1950).—*C.A.* 44, 4271*f*.

During the first 2 campaigns the anion exchanger was damaged by oxidation and by irreversible combination of org. constituents of the juice with the reactive resin groups. These difficulties have been overcome by changes in operating practice. It was also found necessary to change from the 3-boiling to a 6-boiling system. The process increased the extn. to 92.88%, the sugar recovery by 25.15 lb per ton of beet.

6891. Tan, L. P. **Middle-juice carbonation—investigation of the pre-defeco middle-juice carbonation process.** *Taiwan Sugar J. Quart.* **3**, No. 1, 16-33 (1950)(English summary).—*C.A.* 45, 1797*h*.

The mixed juice, after being heated to 65-70°C, was adjusted to pH 7.2 with 38° Brix milk of lime. Sixty % of this predefecated juice, after passing through a sedimentation tank, was filtered and the filtrate was combined with the 40% unfiltered predefecated juice. The combined juice was concd. in the evaporator to 40-45° Brix and 5-6 vol. % of 38° Brix milk of lime was added. The carbonation was then carried out as usual. Advantages of this process over the ordinary carbonation process were given.

6892. Thielipape, Ernst. **Beet juice purification by the method of Wiklund and Lindblad.** *Zucker* **3**, 420-6 (1950).—*C.A.* 45, 885*i*.

The purification scheme of Wiklund and Lindblad was successful on a large scale during the 1948 campaign in a 2000 tons per day factory.

6893. Ventre, Emil K. **A method of juice clarification for the manufacture of sulfitation sugars, sirups, and fancy molasses.** *Sugar J.* **13**, No. 2, 20-1 (1950).—*C.A.* 45, 1363*h*.

Finely divided $CaCO_3$ (lab. scale) was added to juice up to 5% of juice solids and SO_2 added until the pH was brought back to the original value (5.0-5.2). The juice was then heated to 70-80°C to prevent supersatn. with $CaSO_3$. Lime was added to bring to desired pH (6.4), the juice heated to defecation temp. and settled. This method permitted the addn. of higher concns. of CO_2 and resulted in less haze in the final product than with conventional com. procedures.

6894. VLIES, G. S. VAN DER. **Ion exchangers for the purification of sugar-beet juice. I. II.** 8th *Congr. intern. ind. agr., Brussels*, 1950, 62-5, 65-9, (in French).—*C.A.* 47, 3591*b*.

Sugar was extd. at 35-40°C by addn. of SO_2. Ion exchange in this low-temp. juice was more efficient than in ordinary juice. Some expts. were described to remove colloids with both low-temp. and normal juice.

6895. VOGGS, L.; CUENDET, L. S.; EHRENTHAL, I.; KOCH, R., AND SMITH, F. **Separation and identification of sugars using paper chromatography.** *Nature* **166**, 520-1(1950).—*C.A.* 45, 1839*i*.

Blackening of the paper in the chromatography of sugars with a $PhOH$-H_2O mixt. and ammonical $AgNO_3$ as a developer was avoided if the paper was extd. with Et_2O before developing. Another method was to use malonic or propionic acid together with BuOH and H_2O as solvents. For highly methylated sugars the salt of an aromatic base was used as developer.

6896. BALASUNDARAM, S.; HIRANI, R. K., AND SUBRAHMANYAN, V. **Calcium gluconate. II. Preparation from cane sugar.** *J. Sci. Ind. Research* (India) **10B**, 22-4 (1951).—*C.A.* 45, 9901*i*.

Cane sugar was studied as a source for Ca gluconate. An aq. soln. contg. 1.5 lb per liter was boiled 10-15 min. with 1.5 ml concd. H_2SO_4. The electrolytic oxidation of the hydrolyzate on the exptl. scale was carried out under conditions similar to those for dextrose. The yield was about 27%. On the semi-large-scale, 30 exptl. cells were connected in series; each cell contained 20 liters of 40% invert sugar, 200 g NaCl, 200 g NaBr, and 3 lb marble powder; c.d. was 1 amp./$dm.^2$ and temp. 27°. Sucrose was a satisfactory source when glucose was not available.

6897. BENIN, G. S. AND SHNAǏDER, E. E. **Decolorization of sugar solutions with an anion-exchange resin.** *Sakharnaya Prom.* 25, No. 7, 11-15(1951).—*C.A.* 46, 3778*g*.

The removal of coloring matters from sugar solns. by a cation-exchange resin depended on pH, adsorption, and partly coagulation. Alk. treatment restored the adsorptive power. An anion-exchange resin, TM (made in USSR), was capable of decolorizing sugar solns. without previous treatment. The decolorization varied between 68 and 96%. Regeneration was effected by treating with H_2SO_4 and soda ash.

6898. BIENENSTOCK, B. AND POWERS, H. E. C. **Introducing the "Equilibrium Relative Humidity" of a sugar.** *Intern. Sugar J.* 53 254-5(1951).—*C.A.* 45, 10629*c*.

Knowledge of the percentage of H_2O in the sugar as sampled, together with the percentage of H_2O in the sugar at equil. at 75% relative humidity, will enable one to det., by reference to a chart, the relative humidity of the atm. in equil. with it, here termed "Equil. Relative Humidity".

6899. BLACK, R. F. **Major developments in mechanical filtration at the California and Hawaiian Refinery at Crockett.** *Proc. Tech. Sess. Bone Char* **1951**, 173-84; *Intern. Sugar J.* 55, 71-2 (1953).—*C.A.* 46, 6418*a*; 47, 5705*h*.

Particular emphasis was placed on the kieselguhr regenerating plant. Metal-fabric filter leaves increased the filtering capacity. The value of phosphate defecation along with mech. filtration was indicated.

6900. BLACK, W. A. P.; DEWAR, E. T., AND WOODWARD, F. N. **Manufacture of algal chemicals. II. Laboratory-scale isolation of mannitol from brown marine algae.** *J. Applied Chem.* 1, 414-424, (1951).—*C.A.* 46, 4145*c*.

D-Mannitol could be obtained from certain forms of seaweed. Mannitol was isolated by (1) the use of ion exchange resins, (2) precipitation as a water-insoluble derivative, or (3) solvent extraction. Ion exchange method was employed to demineralize the mannitol-salt mixture after solvent extraction. This was accomplished by passing the solution through columns of cation and anion exchange resins resp. The demineralized material was sufficiently pure to permit immediate crystallization from water.

6901. BODAMER, GEO. AND KUNIN, ROBERT. **Heterogeneous catalytic inversion of sucrose with cation-exchange resins.** *Ind. Eng. Chem.* 43, 1082-5(1951).—*C.A.* 45, 7421*f*.

The resins examd. were of the sulfonated styrene type similar to Amberlite IR-120 and the carboxylic type similar to Amberlite IRC-50; the resins were converted to the H-form. Measurements were made at 25°, 50°, 75°, and 100°C and the inversion was followed by optical rotation with a polarimeter. The reactions were 1st order and more effectively catalyzed by the sulfonic acid resin than by the carboxylic exchanger, although neither resin was as effective as was an equiv. amt. of strong acid.

6902. BOON, E.; BRAMMEIJER, J. J.; DOORMAN, F. A.; VERHAART, M. L. A.; VLIES, G. S. VAN DER, AND WATERMAN, H. I. **The purification of sugar-beet juice by its treatment during the diffusion process with sulfur dioxide at low temperature.** *Chimie & industrie* 65, 488-95 (1951).—*C.A.* 45, 8277*f*.

Expts. were made with a small-scale diffusion battery. Expts. were carried out by treating normal juice and low-temp. extd. juice with small quantities of CaO, the latter also with SO_2. The SO_2-treated diffusion juice was much easier to purify with small amts. of lime than normal juice. Juice having received such prepurification treatment lends itself very well to further purification by means of ion exchangers. Three tenths per cent of SO_2 is sufficient if the length of contact is 80 min.

6903. Borghi, M. and Maurandi, V. **Determination of invert sugar, based on the recent theory of sexivalency. II.** *Ind. saccar. ital.* 44, 339-45(1951).—*C.A.* 46, 11727*c*.

Dissolve 26 g molasses to 100 cc.; to 50 cc. of this soln. add exactly 50 cc. of $Pb(NO_3)_2$ soln. (53.0 g in 1000 cc.), shake, and filter; to 50 cc. of the filtrate add 25 cc. of $Al_2(SO_4)_3 \cdot 18H_2O$ (35.6 g in 1000 cc), shake, and add 25 cc. of NaOH (12.3 g in 1000 cc.). Formation of the gel takes place slowly. After 10 min. add 0.5 g of a mixt. (1:1) of anhyd. Na_2HPO_4 and $Na_2C_2O_4$. The soln., which is now 0.25 *N* in regard to the original wt of molasses, is treated with the Luff reagent, and Cu is then titrated iodometrically.

6904. Brown, Robert J. **Nitrogenous compounds in sugar-beet juices.** *Ind. Eng. Chem.* 43, 610-14 (1951).—*C.A.* 45, 5431*h*.

After passing the waste water through a cation exchange and washing out the carbohydrates and acidic compds., the amino acids were released by treatment with NH_4OH and recovered by evapn. and crystn. under suitable conditions. About 90% of the nitrogenous constituents consists of nitrates, amino acids, and betaine.

6905. Brueniche-Olsen, H. **Physical chemistry of the second carbonation in the sugar-beet industry.** *Proc. 11th Intern. Congr. Pure and Applied Chem., London 1947* 3, 37-43(1951)(in English).—*C.A.* 45, 9901*h*.

An increase in the buffer content during carbonation caused a shift toward lower pH values and produced a change in the relation between carbonate and bicarbonate; hence there was no unequivocal relation between natural alky. and the deliming of the juice. Only the alky. liberated up to pH 8 was active in converting Ca to $CaCO_3$. The "effective alky." was the difference between alky. at pH 9.25 and the lime content, both detd. in the 1st carbonation juice.

6906. Bryson, J. L. and Mitchell, T. J. **Improved spraying reagents for the detection of sugars on paper chromatograms.** *Nature* **167**, 864(1951).—*C.A.* 45, 8408*b*.

A 0.2% ethanolic soln. of naphthoresorcinol acidified with an equal vol. of 0.25 *N* HCl showed only levulose, sorbose, sucrose, and raffinose, whereas with a 0.1 vol. of H_3PO_4 (1.85 sp. gr.), rhamnose, xylose, arabinose, dextrose, galactose, mannose, maltose, and lactose could be detected in a chromatogram carrying all twelve sugars.

6907. Chang, Lie Tien. **Sugar-liquor defecation with soybean flours.** *Ind. Eng. Chem.* 43, 654-9(1951).—*C.A.* 45, 5432*g*.

Soy flour, defatted by solvent extn., was a good agent for defecating sugar juices and liquors, except affination sirup. About 0.2-0.3% of flour on total solids in the liquor was mixed with 9 parts by wt of water. The dispersion was limed to pH 10 and mixed with washed raw sugar liquor of 60-70 Brix and a pH of 7.5-8.0 at 70°C in a blow-up tank with mech. stirrer. The mixt. was heated to 90°C, and then without stirring to 100° for 30 min. The scum rose to the top and was skimmed off and washed to a mud tank for sweetening off. The clear liquor was drawn from the bottom. Still better results were obtained by treating sugar liquor with a mixt. of soy flour and vegetable carbon in the ratio of 2:5.

6908. Chow, T. Y. and Chang, P. K. **Inorganic nonsugar removal in middle juice carbonation.** *Taiwan Sugar J. Quart.* 3, 119-37 (1951)(English summary).—*C.A.* 46, 1275*h*.

The chief inorg. constituents in the mixed juice were CaO and SO_3 (300 mg/100 g Brix and 750 mg/100 g Brix, resp.). Up to second carbonation, about 40% of the SO_3 was removed, but the CaO content increased by 85%. Addn. of Ermanite (a kind of phosphate added to help the clarification of the juice) did not change the results significantly.

6909. Cunningham, W. A. **Fundamentals of lime burning.** *Ind. Eng. Chem.* 43, 635-8 (1951).—*C.A.* 45, 4906*g*.

Excessive temps. and long retention periods caused overburning, and at the same time exposure to gases contg. CO_2 at temps. below that required for calcination resulted in recarbonation of the CaO. The operating conditions to avoid both of these difficulties with rock of various sizes and of varying compn. are outlined.

6910. Dahlberg, H. W. and Bennett, A. N. **Effects of nonsugars on solubility of sucrose in sugar-beet sirups.** *Ind. Eng. Chem.* 43, 660-2(1951).—*C.A.* 45, 5432*a*.

A sirup high in N and another high in ash was prepd., and their effect on the soly. of sucrose was detd. At a ratio of 100 parts of impurities to 100 of H_2O, the second increased the soly. 5.5% at 40° and 6.6% at 50°C. At a ratio of 150:100 the increases amounted to 5.6 and 6.5%, resp. At a ratio of 100:100, high-N slightly decreased the soly. of sucrose. At the 150:100 ratio, it increased the soly., but less than did high-ash. At about equal raffinose content, the soly. of sucrose increased with the ash content of beet sirup.

6911. Daniels, R. M. and Cotton, Robert H. **Reburning of defecation lime cake.** *Ind. Eng. Chem.* 43, 624-7(1951).—*C.A.* 45, 5433*b*.

Waste lime cake was reburned in a multiple-hearth furnace (illustrated) of the Skinner type, installed in a Steffen beet factory. The furnace produced lime of excellent quality for Steffen house operation. Lime lost as dust, etc., was replaced by introducing fresh lime rock in each cycle. The Ca saccharate from the Steffen process was used for defecation of the diffusion juice.

6912. DeWhalley, H. C. S. **Carbonation in the refinery.** *Proc. Tech. Sess. Bone Char* **1951**, 185-200; *Intern. Sugar J.* 55, 39-41 (1953).—*C.A.* 46, 6419*f*; 47, 5705*f*.

A continuous carbonation process was developed which used a train of satn. tanks with separate gassing. The low gas absorption was limited to the final tank. The elimination of nonsugars and lime depended on final pH, but the optimum pH did not coincide with a practical rate of filtration. The present installation at 3 English refineries was described.

6913. DEWHALLEY, H. C. S.; ALBON, N., AND GROSS, D. **Application of paper chromatographic methods in the sugar and allied industries.** *Analyst* 76, 287-99; discussion, 299-300(1951).—*C.A.* 45, 7807*e*.

Sugars of industrial interest can be sepd. rapidly and quantitatively by paper chromatography. They were identified by comparison with controls of pure sugar, run on the same piece of paper. Sepn, of the heat-degradation products were shown to be identical with the nonfermentable products in cane molasses; some of the supposed compds. were shown to be mixts. Raffinose can be detd. in raw beet sugar with precision and certainty.

6914. DORFMÜLLER, G. **The influence of lime and carbon dioxide on the ternary system lime-sucrose-water.** *Zucker* 4, 407-9(1951).—*C.A.* 46, 1785*f*.

6915. DOUWES-DEKKER, K. AND LAUBSCHER, P. J. **The effect of removing bagacillo from mixed juice on sugar manufacture.** *Proc. Ann. Congr. S. African Sugar Technol. Assoc.* 25, 57-62 (1951).—*C.A.* 46, 5347*c*.

Fine screening of mixed juice through a Peck strainer or vibrating screen reduced the content of bagacillo in Natal mixed juice from 0.2 to 0.7% on the av. When the Peck strainer was not used at Umfolozi, the sucrose of filter cake was higher; some inconvenience was also experienced by the factory staff in running the various operating processes.

6916. DUBOURG, J. **Purification with calcium carbonate formation.** *Sucr. belge* 70, 237-40 (1951).—*C.A.* 45, 4951*i*.

Many of the peculiarities observed upon carbonating Ca saccharate were explained by the formation of a Ca sucro-carbonate in which the Ca to carbonate ratio was in the neighborhood of 2.

6917. FINKE, OTTO. **Chemical composition of suspended particles in raw sugar-beet juice.** *Zucker-Beihefte* No. 4, 45-8(1951).—*C.A.* 46, 3305*c*.

The suspended material contained 78-82% albumin, 6-8% ash, and 8-11% cellular material. Aspartic acid, glycine, glutaminic acid, valine, leucine, and isoleucine were identified in the albumoid fraction by means of paper chromotography.

6918. HOLZAPFEL, L.; ENGEL, W., AND RUDZINSKI, R. **Organic compounds of silicic acid. XIX. Adsorption experiments on asbestos.** *Gummi u. Asbest.* 4, 200-2(1951).—*C.A.* 45, 9991*f*.

Two g finely divided asbestos was shaken with 50 cc. H_2O and 1 g sugar for 24 hrs. The asbestos was then washed with distd. H_2O, and the soln. and the asbestos were tested for sugar. In serpentine asbestos about 10 times as much galactose and lactose were adsorbed as glucose.

6919. HONIG, PIETER. **The chemistry of the carbonation process applied to raw sugar liquors.** *Sugar* 46, No. 4, 37-9 (1951).—*C.A.* 45, 5431*c*.

The raw liquor was treated with 0.3-0.5% of CaO, satd., and filtered, and further treatment with bone char or decolorizing carbon was required. In another method, 1.5-2% of CaO was added, followed by 1st carbonation to about pH 9.5, filtration, 2nd carbonation to pH 8.5-9, refiltration, and sulfitation to pH 7.2-7.5. No further treatment was required if the raw sugar was of fair quality. The best criterion for the effect of a purification process was the change in the compn. of the nonsugars.

6920. HONIG, PIETER. **Fluctuations in pH readings in the liming of mill juices.** *Sugar* 46, No. 9, 30-4 (1951).—*C.A.* 45, 10627*i*.

Liming technique was best controlled by the use of pH recorders. The recorded values were classified in groups of intervals of 0.1 to 0.2 pH for equal time intervals of 3 or 4 min. each. On probability paper, the range of 6.0 to 9.5 pH was entered as abscissae, and the percentage of the total observations above and below a given pH value as ordinates. The ideal distribution curve was a straight vertical line. As variations in the pH became greater, the curve was more inclined, as shown by the 3 examples. If the curve was abnormal it could be improved by a change in operating equipment and conditions.

6921. KARTASHOV, A. K. AND GLUKHOVSKIĬ, I. E. **The control of predefecation with return of unfiltered juice from the first carbonation. The effect of main defecation.** *Sakharnaya Prom.* 25, No. 10, 10-11 (1951); 22, 11-18 (1948).—*C.A.* 46, 6417*c*; 43, 5614*g*.

To obtain reproduceable analytical results when diffusion juices were predefecated with unfiltered juices from the 1st carbonation, the alky. must be detd. on filtered juices and the alky. of the mixt. detd. after the ppt. had settled. When the lime was added as a whole before the satn., a pH of about 12 was attained for several min. before it was gradually reduced by the CO_2 to about pH 11; with continuous lime addn. and satn., a pH of about 11 could be maintained throughout. The recommended method was that of hot progressive pre-liming, with hot main liming when there were no vacuum filters, but without main liming and with continuous lime addn. to the saturators when vacuum filters were employed.

6922. KHANNA, K. L. AND CHACRAVARTI, A. S. **Nonsugars in sugar cane juice and their bearing on clarifying properties; a study in relation to the open-pan industry.** *Proc. Indian Acad. Sci.* 33B, 204-20(1951).—*C.A.* 45, 10627*e*.

Mineral matter in colloidal form was positively correlated with color, acidity, and ash, and negatively with size of grain (pore space). SiO_2, Fe_2O_3 + Al_2O_3, and CaO were positively correlated with turbidity of the sugar soln. due to greater amts. of insol. impurities. Characteristics assocd. with superior clarifying properties were: low nonprotein and high protein N, the former constituting not more than 40% of total N; a content of colloidal mineral matter (in the alc.-Et_2O ppt. from the juice) not exceeding 6% of total mineral matter; the content of sol. SiO_2, Fe_2O_3 + Al_2O_3, and CaO not more than about 6, 60, and 30 mg per 100 ml, resp.

6923. KHYM, JOSEPH X. AND ZILL, LEONARD P. **Separation of monosaccharides by ion exchange.** *J. Am. Chem. Soc.* 73, 2399-400(1951).—*C.A.* 46, 64*f*.

Fructose, glucose, mannose, and galactose, dissolved in weak Na borate solns. were quant. adsorbed on strong base anion exchangers. Elution was carried out with dil. Na borate solns. and the effluent fractions were analyzed for sugar. Identification of the sugars was made by paper chromatography.

6924. KRAUSE, A. AND WITKOWSKA, A. **Catalytic decoloration of colored natural juices.** *Bull. soc. amis sci. lettres Poznań* B11, 100-15 (1951)(in English).—*C.A.* 46, 7414*h*.

The decoloration of red beet juice at 37°C by H_2O_2 in the presence of $Fe(OH)_3$ and Cu compds. as catalysts was studied spectrophotometrically with $\lambda = 520$ mμ. The rate of the reaction with $Fe(OH)_3$ corresponded to a 1st-order reaction. Moist gel catalysts were strongly active, since they had more surface. In this case, 10^{-13}g Cu as $Cu(OH)_2$ contained in $Fe(OH)_3$ (corresponding to 8×10^{-5} g Fe) accelerated the decoloration of the juice at 37°C. The combined catalyst of a compn. corresponding to an at. ratio Fe:Cu $1:10^{-9}$ caused the decoloration in 9 hrs, whereas $Fe(OH)_3$ alone needed 9 hrs 20 min.

6925. MALLEA, OSCAR S. **Colloidal fractions of Argentine bentonite for clarification of refractory cane juices.** *Bol. estac. esptl. agr. Tucuman* No. 67, 15 pp.(1951).—*C.A.* 46, 8400*i*.

Argentine bentonites were studied and the one most similar to KWK Volclay was selected for trial in clarifying refractory sugar cane juices. Results with the Argentine product compared favorably with those with Volclay.

6926. MARIANI, EUGENIO AND TORRACA, GIORGIO. **Chromatographic analysis of amino acids of molasses and other beet-sugar industry by-products.** *Ind. saccar. ital.* 44, 234-44, 245-50 (1951); *Nature* 168, 959 (1951).—*C.A.* 45, 10628*f*; 46, 3781*b*.

In the juices, molasses, residual waters of Ba treatment, etc., the following amino acids were identified chromatographically with paper: aspartic, glutamic, and γ-aminobutyric acids, glycine, serine, alanine, valine, leucine, tyrosine, threonine, phenylalanine, proline, arginine, and asparagine.

6927. MARTIN, L. F. **Utilization of by-products of Louisiana sugar cane.** *Sugar J.* 13, No. 12, 26-7, 46, 48, 50, 52(1951).—*C.A.* 47, 3013*g*.

Processes for better recovery of aconitic acid and for the sepn. of bagasse into fractions were discussed.

6928. MAUDRU, J. E. **Ion exchange in beet-sugar manufacture.** *Ind. Eng. Chem.* 43, 615-18(1951).—*C.A.* 45, 5432*c*.

The main advantage of the ion-exchange process was increased yield of sugar, decreased yield of molasses, and less scaling in the heaters, evaporators, and pans. The economy of the process can be improved by the manuf. of fertilizer from the NH_4OH used for regeneration and the K_2O and other constituents removed by the process, by the recovery of NH_4OH as such, or by defecating with only 0.2-0.3% CaO on beets.

6929. MCFARREN, EARL F.; BRAND, KATHLEEN, AND RUTKOWSKI, HENRY R. **Determination of sugars on filter-paper chromatograms by direct photometry.** *Anal. Chem.* 23, 1146-9(1951).—*C.A.* 45, 10141*f*.

Glucose, galactose, and lactose were resolved; solvent used was the org.-rich phase of the 2 made by mixing EtOAc, pyridine, and H_2O (2.5:1:3.5 by vol.) plus $AgNO_3$. The spots were dried, exposed to NH_3, and heated in an oven. The max. d. of each spot was detd. by a photoelec. densitometer. Values for spots contg. various dilns. of standard and unknown gave linear curves of log concn. *vs.* d., from which the concn. of each sugar can be calcd. with a max. error of 5%.

6930. MEADE, G. P. **Defecation preliminary to char filtration with Williamson clarifiers.** *Proc. Tech. Sess. Bone Char* 1951, 163-72; *Intern. Sugar J.* 55, 68-70 (1953).—*C.A.* 46, 6418*b*; 47, 5705*e*.

Details of various modifications of the Williamson clarifier, the operation, advantages, and disadvantages were discussed.

6931. MEKHEDA, V. AND BALYURA, V. **Predefecation with unfiltered juice from the first carbonation.** *Sakharnaya Prom.* 25, No. 10, 11-12 (1951).—*C.A.* 46, 6417*d*.

Lime or defecated juice was added to unfiltered carbonated juice from the 1st carbonation and the alky. rose to 0.25% CaO. The alky. on predefecation was brought up to 0.10% CaO in order to coagulate all colloids in the diffusion juice.

6932. MITCHELL, E. AND SOMMERFELD, C. A. **Laboratory experiments with ion-exchange resins.** *Proc. Queensland Soc. Sugar Cane Technol.* 18, 111-20(1951).—*C.A.* 46, 3778*f*.

With Zeo-Carb 215 and De-Acidite (Permutit Co.) the elimination of ash material from sugar-cane juice was above 91%.

6933. MULVANY, P. K.; AGAR, H. D.; PENISTON, Q. P., AND MCCARTHY, JOSEPH L. **A chromatographic study of sulfite waste liquor sugars.** *J. Am. Chem. Soc.* 73, 1255-7(1951).—*C.A.* 45, 6840*e*.

Sepn. of the recovered sugars and of known sugar mixts. by partition chromatography on starch columns with a BuOH-water system was studied. The sugars in a paper pulp sulfite waste liquor derived from 85% western hemlock and 15% white fir were: mannose 48, glucose 15, xylose 15, galactose 10, arabinose 2, and fructose less than 2; unaccounted for 4%.

6934. ONGARO, DANTE. **The problem of the ion exchangers in sugar manufacture.** *Ind. saccar. ital.* 44, 293-308(1951).—*C.A.* 46, 1785*e*.

6935. Owens, H. S.; Rasmussen, C. L., and Maclay, W. D. **Production and utilization of sugar beets.** *Econ. Botany* 5, 348-66(1951).—*C.A.* 46, 1275*f*.

Diffusion, purification, crystn., Steffens process, and ion-exchange treatment were reviewed.

6936. Quentin, Gerhard. **Ion-exchange agents. Performance of cationic agents on limed thin juice.** *Zucker* 4, 342-4 (1951).—*C.A.* 46, 765*a*.

Expts. on contact time, differing ions, and varying concns. indicated that each exchange agent and each exchange reaction had their particular characteristics.

6937. Ramondt, D. **Ion exchangers for glucose (sirups).** *Stärke* 3, 194-6(1951).—*C.A.* 45, 10630*d*.

The life of an anion-exchange resin in starch sirup manuf. was estd. by treating the resin with an excess of H-exchanged strongly acid starch conversion liquor at 95°C for 100 hrs and measuring the change in dry substance and exchange capacity of the resin. Some resins disintegrated during this test.

6938. Rao, P. S. and Beri, R. M. **Analysis of sugars with paper chromatography (capillary ascent).** *Current Sci.* (India) 20, 99(1951). —*C.A.* 45, 7471*b*.

The following sugars and uronic acids were analyzed by the ascending method D-glucose, D-galactose, D-mannose, D-xylose, D-arabinose, L-rhamnose, lactose, maltose, D-galacturonic acid, D-glucuronic acid. Perpendicularly hung filter paper strips (10 × 36 cm) were used which were irrigated with solvent (water-satd. phenol or water-satd. collidine) to a height of 28 cm. The spots were developed by spraying with aniline hydrogen phthalate.

6939. Rorabaugh, Guy and Morris, V. I. **Beet-juice defecation.** *Ind. Eng. Chem.* 43, 619-24 (1951).—*C.A.* 45, 5432*e*.

The rise in purity from the diffusion juice to the evaporator thick juice was greater during cold predefecation, but the difference may be due to better quality of the beets during that period. The Teatini process gave a greater drop in purity from massecuite to green sirup, but a smaller drop from low raw massecuite to molasses. The final granulated sugar was better with cold predefecation.

6940. Rüggeberg, H. **Glucose manufacture with ion exchangers.** *Stärke* 3, 34-8(1951)(English summary).—*C.A.* 45, 7807*h*.

The starch hydrolyzate was passed over H^+, Na^+-charged Dusarite exchange resin, filtered, thence passed over an Asmite bed, and finally concd. Dusarite was regenerated with 6% NaCl in 0.74% HCl. Asmite was regenerated with 6% NaOH at 80°C followed after washing by 0.7-0.9% HCl.

6941. Rüggeberg, H. **Paper chromatography and its use in starch hydrolysis.** *Stärke* 3, 150-5(1951).—*C.A.* 45, 8280*f*.

Acid hydrolysis of wheat starch produced initially glucose, maltose, and higher oligosaccharides; at intermediate stages a second disaccharide (reversion product?) appeared and higher saccharides diminished; finally glucose and a small amt. of maltose remained.

6942. Saha, J. M. and Jain, N. S. **A new technique of clarification.** *Sugar* 46, No. 8, 32-5 (1951).—*C.A.* 45, 9285*g*.

About 1% of milk of lime (15° Bé.) was added under stirring to raise the pH to about 10.5, and the whole juice filtered through presses, giving a firm cake which washed easily. The filtrate, of very light color, was quickly neutralized with SO_2 to a pH of about 7.2, heated to near the b.p., and refiltered. The 2nd cake was wholly cryst., small in quantity, and could be returned to the alk. juice prior to the 1st filtration. If middle juice of about 45° Brix from the defecation or sulfitation process was to be used, it was withdrawn from the penultimate body of the effect. It was simultaneously limed and sulfured, with 4% by vol. of milk of lime, heated to 80-90°, and then a 2nd dose of about 4% of milk of lime was added under efficient agitation to raise the pH to 10.5. It was quickly filtered, if necessary, with a small amt. of filter aid. The filtrate was neutralized with SO_2 to pH 7, refiltered, and sent to the last body of the effect for further concn.

6943. Saha, J. M.; Jain, N. S.; Saxena, K. S., and Nigam, G. M. **New technique of clarification by sulfitation. White sugar production at high alkalinities and temperatures.** *Intern. Sugar J.* 53, 192-4, 196(1951).—*C.A.* 45, 8278*h*.

The raw juice was first heated to 70°C and then limed and sulfited simultaneously with 1% by vol. of 15° Bé. $Ca(OH)_2$. It was then heated to boiling and treated with another unit of $Ca(OH)_2$ under stirring, filtered quickly under vacuum or pressure, the filtrate neutralized with SO_2, boiled, settled, and filtered. The color of the juice was much lighter, had an extra purity rise of 2 units and a lower sol. ash. The process dispensed with settlers or clarifiers, but the filter-press capacity would have to be doubled.

6944. Saha, J. M.; Jain, N. S.; Saxena, K. S., and Nigam, G. M. **A new technique for clarification (of cane juice) by the sulfitation method.** *Sugar J.* 13, No. 10, 16-22(1951).—*C.A.* 47, 3014*g*.

The main feature was the filtration of the juice at high alky. and high temp., which gave a clarified juice with a light color, and showed a high rise in purity. The mixed juice was heated to 70°C, limed with 1-2% by vol. of 15° Bé. lime, and sulfited.

6945. Semenyuk, V. A. **Difficulties in filtration of juices from first carbonation.** *Sakharnaya Prom.* 25, No. 1, 22-3 (1951).—*C.A.* 45, 6407*b*.

Considerable decrease in filterability of juices from first carbonation was observed when a large amt. of withered sugar beets were processed.

6946. SILINA, N. P. **Control on defecation station when unsaturated juice from first carbonation is returned on pre-defecation.** *Sakharnaya Prom.* 25, No. 1, 24-5(1951).—*C.A.* 45, 6407*c*.

The detn. of the amt. of CaO in the defecated juice or unfiltered juice from the first carbonation was made by titration of 10 ml of juice plus 10 ml *N* HCl with NaOH and phenolphthalein as indicator. The amt. of returned juice could be detd. by the formula, $X = 100(a_3 - a_2)/a_2 - a_1$, where X was the amt. of returned juice per 100 liters of defecated juice; a_1 was alky. of returned defecated juice (% CaO); a_2 was alky. of mixed defecated juice, and a_3 was the amt. of lime (% CaO) used for clarification.

6947. STARK, J. B.; GOODBAN, A. E., AND OWENS, H. S. **Composition of sugar-beet liquors. Effect of processing.** *Ind. Eng. Chem.* 43, 603-5(1951).—*C.A.* 45, 5431*f*.

Diffusion juice, thick juice, and molasses from 4 factories were analyzed. Org. acids other than amino acids were fractionated by ion-exchange resins and titrated, and sepd. also by paper chromatography. The carbonation process removed most of the colloids, oxalates, citrates, and phosphates, but not the amino acids and other acid radicals which remain in the thick juice and accumulate in the molasses.

6948. STEINMANN, C. **Filtration with drum filters.** *Zucker* 4, 72-3(1951).—*C.A.* 45, 4951*f*.

Application of continuous rotary filtration in beet-sugar continuous purification process was described.

6949. TAN, L. P. **Report of the modified middle juice carbonation.** *Taiwan Sugar J. Quart.* 3, 139-43(1951)(English summary).—*C.A.* 46, 1275*g*.

The filterability of the first carbonated middle juice (40-45° Brix) was about 36% better than that of the unmodified method. The efficiency of clarification was about 10.5% better than that of the De Haan method, as compared to the 4.5% improvement obtained by the unmodified method. The total amt. of cake was about 5% of the weight of the sugar cane.

6950. TETERIN, V. A.; REVENKO, V. V., AND SHEPTUN, M. S. **Continuous predefecation with installation of "adsorbent" by a system of Yu. F. Bogatzkii.** *Sakharnaya Prom.* 25, No. 7, 7-10(1951).—*C.A.* 46, 3780*c*.

An "adsorbent" was an app. in which a preheated diffusion juice was continuously mixed with unsatd. juice from the first carbonation before this predefecated juice entered a defecation station. A considerable improvement in the quality of the juice and sugar was obtained and lesser filtering area is required.

6951. THIELEPAPE, ERNST. **Ion exchange agents in the American beet-sugar industry.** *Zucker* 4, 73-6(1951).—*C.A.* 45, 4951*e*.

6952. VAJNA, SÁNDOR AND PICHLER, EMILIA. **Behavior of nitrogen-containing components of sugar-beet juices against ionic exchangers.** *Acta Chim. Hung.* 1, 196-206(1951)(in Russian). —*C.A.* 45, 10008*d*.

Solns. of betaine and glutamic acid were examd. in closed systems to test their affinity toward synthetic-resin cation exchangers. On the basis of dynamic ionic exchange expts. the max. satn. and hydrolysis limits were calcd. for betaine and glutamic acid. The max. concn. was also detd. in the case of hydrolysis. The use of the total capacity of ion exchangers was hindered by hydrolysis.

6953. VAŠÁTKO, J.; KOHN, R., AND ZÁVODSKY, L. **Progressive liming of sugar-beet juice with return of first over-carbonated muddy juice.** *Chem. Zvesti* 5, 402-25(1951).—*C.A.* 46, 8883*f*.

By returning 1st carbonation, muddy juice, excessively carbonated, to the raw juice further subjected to a progressive liming by addn. of a reduced amt. of CaO, the negatively charged non-sugar colloidal particles (pectins) formed easily filterable aggregates with positively charged $CaCO_3$.

6954. VINOGRADOV, N. V.; ZIL'BERMAN, I. I., AND LOMOV, F. O. **Economical advantages of beet-juice clarification with ion exchangers.** *Sakharnaya Prom.* 25, No. 12, 27-9(1951).—*C.A.* 46, 9874*h*.

The economic aspect of purification of beet juices with ion exchangers was discussed.

6955. WERNER, ERICH. **Plant experiences with thin juice incrustations.** *Zucker* 4, 467-70, 484-7(1951).—*C.A.* 46, 3305*f*.

The results of preventing incrustations by means of previous ion-exchange treatment in the 1950 campaign were compared with the phosphate treatment practiced in the 1949 campaign. The former method was vastly superior in this regard.

6956. WHALLEY, T. G. **Bagacillo in rotary filtration—pneumatic separator described.** *S. African Sugar J.* 35, 575, 577, 579, 581, 583, 585 (1951).—*C.A.* 46, 3780*g*.

Bagacillo of fineness 87 to 472 was added as a filter aid at the rate of 1% to sugar-cane mud and the effect of fineness on filtration efficiency detd. Fineness = Σ (% retained on each sieve/length of opening of sieve in mm). No. 14, 20, 28, 35, 48, and 65 standard Tyler sieves were used. Increasing the fineness from 180 to 290 resulted in 100% increase in the permeability of the filter cake and only a small % decrease in retentiveness.

6957. WIGGINS, L. F. AND WILLIAMS, J. HAWORTH. **Quantitative examination of the amino acids in cane juice.** *Proc. Brit. West Indies Sugar Technol.* 1951, 40-5.—*C.A.* 46, 8400*h*.

By chromatographic techniques, the following amino acids were found in cane juice (variety B. 34104): glycine, alanine, valine, leucine, aspartic acid, glutamic acid, glutamine, lysine, asparagine.

6958. WIKLUND, OLAF; ANDERSON, GUNNAR, AND ASK, WM. **Beet-juice purification.** *Socker Handl.* 7, 7-24(1951)(in English).—*C.A.* 45, 9903*e*.

When an aliquot of 1st carbonated juice was made into overcarbonated juice (*C*) and recycled to the raw juice (*R*), the ratio *C*/*R* influenced purification. As *C*/*R* increased, the vol. of the sludge decreased and its rate of settling increased. There was an inverse relation between juice color and vol. of sludge; light colored juice and poor filtrability of the sludge go together.

6959. WILLIAMS, KENNETH T. AND BEVENUE, ARTHUR. **Use of ion-exchange resins for the removal of nonsugar reducing substances in the analysis of fresh leafy plant materials for sugars.** *J. Assoc. Offic. Agr. Chemists* 34, 817-21(1951). —*C.A.* 46, 2962*h*.

Selected ion-exchange resins were equal or superior to neutral $Pb(OAc)_2$ for removing nonsugar reducing substances and color in the analysis of the fresh leafy portion of plant materials for sugars.

6960. ZAGRODZKI, STANISLAW. **Separation of organic and inorganic nonsugars in residues of fermented (beet) molasses.** *Roczniki Chem.* 25, 242-50 (1951)(English summary).—*C.A.* 46, 5255*d*.

The dehydrated residue was sepd. into inorg. material and nonsugar org. material by acidifying with H_2SO_4 and extn. with an azeotropic aq. pyridine mixt. or by concn. to 70-80° Balling and treating with anhyd. pyridine. The cations of the residue can be sepd. by ion exchange.

6961. ALSTON, P. W. **Notes on symposium on carbonatation.** *Proc. Amer. Soc. Sugar Beet Tech.*, 7, 773-4 (1951).

(1) Split lime addition gave improvement in the carbonatation filtration. (2) While batch carbonatation gave better juice with lower lime salts and color, continuous Dorr carbonatation saved so much labor and material on the filter-press station that poorer quality juice had to be accepted in return for the reduction in costs. The standard Dorr and various European systems of carbonatation were compared.

6962. ALSTON, P. W. AND MCGINNIS, R. A. **Recent developments in beet sugar factory technology.** *Sugar* 47, No. 1, 33-7, 54(1952).—*C.A.* 46, 1785*e*.

6963. AUSTERWEIL, GÈZA V. **Reduction of the inversion of sucrose by ion-exchange agents.** *Compt. rend.* 234, 1289-91 (1952).—*C.A.* 46, 7350*c*.

Mixed ion-exchange agents (mono-bed) reduced the losses because of hydrolysis at low pH.

6964. BALYURA, V. I. **More about predefecation.** *Sakharnaya Prom.* 26, No. 9, 24-5(1952).—*C.A.* 47, 3013*f*.

An increased amt. of unfiltered first carbonation juice, prelimed and returned on predefecation decreased the amt. of Ca salts, colloids, and color in juices of the second carbonation.

6965. BECKER, DIETRICH. **Comparison of old and new methods of juice purification.** *Zucker* 5, 45-9, 68-74(1952).—*C.A.* 47, 3014*h*.

6966. BLACK, RALPH F. AND ZEMANEK, LYLE. **Continuous lime-phosphate process for defecating refinery liquors.** *Sugar Ind. Technicians* **1952**, 9 pp.(mimeograph).—*C.A.* 46, 8399*g*.

The liquor was screened through an 80-mesh vibrating screen to remove fiber and bagacillo, and then through a Sweetland filter fitted with an 80 × 80-mesh twilled Monel screen to remove dirt and silt. The usual H_3PO_4-CaO treatment then followed continuously.

6967. BROWN, ROBERT J. **Determination of raffinose in mother beets and raw-beet juices.** *Anal. Chem.* 24, 384-8(1952).—*C.A.* 46, 5347*d*.

The procedure included clarification of the beet juice, treatment by mixed-bed ion exchangers, and a modification of de Whalley's paper-chromatography method for detn. of raffinose in raw-beet sugars.

6968. CHACRAVATI, A. S.; PRASAD, KAMTA, AND KHANNA, K. L. **Role of clarifying agents in open-pan boiling of sugar-cane juice.** *J. Sci. Ind. Research* (India) 11B, 305-7(1952).—*C.A.* 47, 4637*h*.

An investigation was made with castor seed, ground-nut ext., and bhindi mucilage as clarifying agents in open-pan boiling of cane juice. Treatment with the first two removed a major part of colloidal matter and of org. and non-protein nitrogenous constituents at all stages of boiling.

6969. CHOU, J. C. **The removal of sulfur trioxide by carbonation.** *Taiwan Sugar J. Quart.* 4, No. 1/2, 67-78(1952)(English summary).—*C.A.* 47, 1414*i*.

The amt. of lime used varied from 5 to 15 vol. % of 38 Brix milk of lime or 1-3% of lime. The amt. of SO_3 removed increased with the amt. of lime used up to 10 vol. % of 38 Brix milk of lime; after that the increase became gradual. K_2O strongly hindered and Na_2O slightly hindered the removal of SO_3; while Al_2O_3 strongly promoted and P_2O_5 slightly promoted the removal of SO_3.

6970. CHOU, T. T. AND CHANG, P. K. **Comparative study in a pilot plant of various operation conditions in the middle-juice carbonation process.** *Taiwan Sugar J. Quart.* 4, No. 1/2, 1-27 (1952)(English summary).—*C.A.* 47, 1414*f*.

For middle-juice carbonation the max. saving in lime consumption was 35-40% of the lime used in ordinary carbonation process. No definite conclusion can be drawn on the optimum satn. time, satn. temp., and end point pH and no definite proof has been obtained on the benefit of mud removal prior to concn. and carbonation to filtrability and clarification efficiency. The CaO content of the juice increased after carbonation, but the SO_3 content of the juice decreased.

6971. CLAIRE, A. G. **Clarification of cane juices with Herles' reagent.** *Proc. Queensland Soc. Sugar Cane Technol.* 19, 72-3(1952).—*C.A.* 46, 8400*g*.

A normal wt of juice was placed in a 100-ml flask, 1.5 ml of Herles' reagent B (100 g NaOH in 2 liters H_2O) added, dild. to 100 ml, and shaken with 0.73 g of dry $Pb(NO_3)_2$. In all cases the filtrate was clearer and filtered more freely than in the original Herles' method; errors due to vol. of ppt. were eliminated and results agreed within the exptl. error.

6972. Crosier, H. E. and Brownell, L. E. **Washing in porous media.** *Ind. Eng. Chem.* 44, 631-5 (1952).—*C.A.* 46, 5898*e*.

The mechanism of washing of filter cakes could be divided into 3 stages: a primary displacement stage which was terminated by the break-through point, when the wash first emerged from the cake, a secondary stage during which the concn. of filtrate in the stream leaving the bed was continuously decreasing, and a final stage in which the filtrate removal by diffusion was controlling.

6973. DeWhalley, H. C. S. **Kestose and sugar losses.** *Intern. Sugar J.* 54, 127(1952).—*C.A.* 46, 7801*b*.

Kestose, a trisaccharide consisting of 1 glucose and 2 fructose units, was synthesized during invertase inversion of sucrose and was formed when microörganisms were present in cane products. Clerget molasses, however, showed a fictitious sucrose content of 0.8 for every 1% of kestose present. Refineries showing unusual sucrose losses should examine input and output items for kestose.

6974. DeWhalley, H. C. S. **Raffinose in molasses and low beet products.** *Intern. Sugar J.* 54, 158(1952).—*C.A.* 46, 7803*b*.

Kestose in beet molasses interfered with the chromatogram of raffinose and made its detn. difficult by paper chromatography.

6975. DeWhalley, H. C. S.; Gardner, S. D., and Runeckles, R. E. **Determination of sucrose in beet molasses, raw beet sirup, and other sirup containing raffinose.** *Intern. Sugar J.* 54, 244(1952).—*C.A.* 46, 11726*h*.

When raffinose was present in sirup, the sucrose content could not be obtained directly by the chem. method with invertase. Since raffinose was easily detd. by a paper chromatographic method, a correction for raffinose can now be made. Sucrose = 19/20 ((total sugars as invert) — (invert) — (0.648 raffinose hydrate)).

6976. Dimler, R. J.; Schaefer, W. C.; Wise, C. S., and Rist, C. E. **Quantitative paper chromatography of D-glucose and its oligosaccharides.** *Anal. Chem.* 24, 1411-14 (1952).—*C.A.* 46, 11730*f*.

The app. previously described was used to sep. the products of starch hydrolysis; BuOH: pyridine: H_2O, 6:4:3 by vol., or fusel oil (b. 121-9°): pyridine: H_2O, 1:1:1 are employed as solvents. Guide strips were sprayed to locate the band for each sugar, and the band was cut out and the eluted carbohydrate was detd. with anthrone.

6977. Dupont, J. and St. Antoine, R. de. **Experiences with the Oganesoff process. Production of sugar without previous chemical purification of the juice.** *Rev. agr. ile Maurice* 31, 221-5(1952).—*C.A.* 47, 4637*f*.

The process consisted of treating the raw juice at pH 6.8 in the Superstat or Cepi electronic equipment before evapn. Liming, decantation, and filtration were eliminated. Satisfactory results have been reported with beet juice, but the present single experience, with the Superstat on cane juice, was not the same on account of the higher content of impurities.

6978. Eis, F. G.; Clark, L. W.; McGinnis, R.A., and Alston, P. W. **Floc in carbonatated beverages.** *Ind. Eng. Chem.* 44, 2844-48 (1952); *Intern. Sugar J.* 55, 160 (1953).

Floc, isolated from beverages, granulated sugars, factory liquors and diffusion juice by filtering and precipitating from NaOH solution with acid, gave fractions: 26.8% pectins, etc; 9.7% oleanolic acid; 17.7% sugar beet glycoside, hydrolysing with HCl to glucuronic acid and oleanolic acid, 45.8% of a glycoside-salt complex, hydrolysing to glucuronic acid, oleanolic acid; and salt. The elimination of the floc was complete either by treatment with activated carbons, with synthetic resins ("Duolite S-30" and "Permutit DR") and with a color adsorbing resin between the cation and anion exchange resins.

6979. Gairola, B. B. **Saha-Jain process vs. carbon(ation) process.** *Sugar* 47, No. 6, 53 (1952).—*C.A.* 46, 7349*i*.

Calcns. showed that carbonation was more profitable than the Saha-Jain process.

6980. Ghosh, Dhirendra Nath. **A new sugar technology: electrical coagulation of cane-juice colloids.** *Indian Sugar* 1, 383-9(1952).—*C.A.* 46, 8399*i*.

Raw juice was filled into a rectangular cell in which were hung wrought Fe plates insulated from one another; the 2 end ones are connected with a source of d.c. at 0.9-5.0 v. and 0.04 amp. per in^2; each plate functions as a bipolar electrode. Pectins were decompd. and org. acids removed. The K contained in these acids was converted into KOH which raised the alky. of the fluid to pH 7.2. The proteins were removed partly as Fe compds. and partly by deposition on the anodes but mostly by flotation as the gas-juice interfaces. The surface of the cell became covered with froth which was skimmed off. The electrolyzed juice was drawn off from below, filtered, and treated with Ca superphosphate to remove traces of Fe.

6981. Haruni, M. M. and Storrow, J. Anderson. **Hydroextraction. IV. Radial distribution of permeability in cakes.** *Chem. Eng. Sci.* 1, 154-64(1952).—*C.A.* 46, 10701*b*.

The permeability of maize starch, pptd. chalk, and kieselguhr cakes was studied in a 9 in. diam. basket centrifuge running at 1050 and 1400 r.p.m. There was a gradual decrease in permeability with position of increasing radius in the cakes.

6982. Heinrich, Kurt. **Filtration laws.** *Zucker* 5, 465-73 (1952).—*C.A.* 47, 3014*f*.

Filtration equations were reviewed and applied to sugar liquors, with several specific examples.

6983. Hewlett, Allen M. **Continuous clarity recorder (the "clarimeter").** *Sugar J.* (La.) 15, No. 4, 23-8 (1952); *Intern. Sugar J.* 55, 164, (1953).

Continuous recording of the direct transmittancy, rather than the Tyndall beam intensity, was made. The precision was entirely adequate for station operational control.

6984. HOBBS, J. E. **The drying of granulated sugar.** *J. Inst. Fuel* 25, 65-6(1952).—*C.A.* 46, 4825*e*.

Three types of granulators were described, and data presented for the latest design in use at a British refinery.

6985. HONIG, PIETER. **The clarification of cane sugar juices.** *Sugar* 47, No. 6, 31-6(1952).—*C.A.* 46, 7349*b*.

The optimum pH varied with the compn. of the mill juice. If the juice was low in P_2O_5 and sesquioxides, it may be limed advantageously to a pH of 6.9-7.2 in the clarified juice; if the P_2O_5 and SiO_2 were high and the nitrogenous non-sugars low, a pH of 7.6-7.8 may be recommended. But the optimum pH should be detd. in each case by lab. expts. and analysis of the juice before and after treatment.

6986. KAYSER, FERNAND AND BLOCH, JEAN MICHEL. **Some catalytic properties of montmorillonite.** *Compt. rend.* 234, 1885-7 (1952); *Bull. soc. chim. France* **1951**, *M 488*.—*C.A.* 46, 7859*f*.

Montmorillonite catalyzed the inversion of sucrose. Sucrose in contact with an aq. suspension of H-montmorillonite for a few hrs was heated, after adding Fehling soln. and Cu_2O was formed immediately at the surface of the clay particles. From an aq. suspension of H-montmorillonite contg. NH_3 + C_6H_6, aniline forms, and was identified by color reactions in both the soln. and in the clay. The aniline was strongly adsorbed by the clay and could not be eluted by the usual methods.

6987. KHYM, JOSEPH X. AND ZILL, LEONARD P. **Separation of sugars by ion exchange.** *J. Am. Chem Soc.* 74, 2090-4(1952).—*C.A.* 47, 2090*b*.

Sugars were sepd. by elution of their borate complexes from Dowex-1 with boric-borate buffers. Disaccharides were easily sepd. from monosaccharides, and hexoses from pentoses. The results were consistent with current concepts of the structures of sugar-borate complexes and the reactions of free sugars in aq. solns.

6988. KORTSCHAK, HUGO P. **Filtration rates and impurities in raw sugar crystals.** *Hawaiian Planters' Record* 54, No. 2, 65-75 (1952); *Intern. Sugar J.* 55, 163 (1953).—*C.A.* 46, 10651*g*.

Insoluble material in the raw sugar retarded filtration, present not only in the film of molasses surrounding each crystal, but inside the crystal itself. Poor clarification undoubtedly caused low rates, and the use of phosphate often resulted in the production of raw sugars no longer causing difficulty in filtration in the refinery. Low rates of filtration were due mainly to inclusions of solid particles whose dimensions were of the order of 1μ.

6989. LU, P. Y.; YUAN, H., AND TSAI, H. W. **The control of first carbonatation in middle-juice carbonatation.** *Taiwan Sugar J. Quart.* 4, No. 1/2, 28-42 (1952) (English summary).—*C.A.* 47, 1413*h*.

Before first carbonatation of pH of the mud juice was 9.5-9.8 and the CaO content 410 mg/liter; after 8-11 min. the pH and the CaO content remained as above; during the last 3-4 min. the pH changed to 10.0-10.3 and the CaO content increased to 800 mg/liter; and at the final point (15 min. after the start of carbonatation) the pH was 9.9-10.1 and the CaO content 800 mg/liter. A pH of 9.5-9.8 during carbonatation gave better filtrability and a pH of 9.9-10.1 at the end point gave greater sugar yield.

6990. MAGEE, J. H. **Modernizing the Redpath Refinery.** *Sugar* 1952, 47, No. 12, 39-41; *Intern. Sugar J.* 55, 158 (1953).

An affination and carbonatation plant was designed which would take in raw sugar at the top of the 11-floor building by conveyor belt. By gravity flow, the top five floors contained the affination equipment and the floors below the carbonatation. Installation of the new building has increased the refining capacity to 2,500,000 lb per day, and effected a marked reduction in char and kieselguhr consumption.

6991. MALLEA, OSCAR S.,; VARAS, DAVID, AND BLISS, LESMOIR R. **Clarification of cane juice with colloidal sodium bentonite. I. Colloidal sodium bentonite. II. The use of colloidal bentonite in Argentina. III. Experience with "clarigel" in La Corona.** *Bol. estac. exptl. agr. Tucuman* No. 68, 7-13, 15-24, 25-36 (1952).—*C.A.* 47, 11773*a*.

Clarification was complete with colloidal sodium bentonite ("clarigel"), the juices being clear and showing a purity rise up to 3 points above that of the mixed juices. With 125 g S and 350 g bentonite per ton of cane, it was possible to obtain the same degree of clarification as with 500 g of S alone; but, in order to attain the same standard of decolorization as in the latter case, the S must be increased to about 200 g, leaving the essentially clarifying function to the bentonite.

6992. MARIANI, EUGENIO. **Chromatography of amino acids present in exhausted cossettes.** *Sucr. belge* 71, 373-6(1952).—*C.A.* 46, 6420*a*.

The following were identified: aspartic, glutamic, and α-aminobutyric acids; serine, glycine, alanine, valine, leucines, tyrosine, threonine, proline, phenylalanine, lysine, arginine, and glucosamine.

6993. MARIANI, EUGENIO. **Chromatographic investigations on the distribution of amino acids in the products of sugar manufacture.** *Ind. saccar. ital.* 45, 189-93(1952).—*C.A.* 47, 2521*g*.

In the press juice, diffusion and carbonation juice, molasses, and exhausted beets, the following amino acids were chromatographically detected: aspartic acid, glutamic acid, serine, glycine, alanine, threonine, arginine, lysine, α- and γ-aminobutyric acids, proline, oxyproline, valine, leucine, phenylalanine, tyrosine, glucosamine, asparagine, and glutamine.

6994. MÉTAYER, MAURICE. **Purification studies in a sugar refinery. II. The behavior of some amino acids in the presence of chalk, carbon dioxide, and chlorine ion.** *Inds. agr. et aliment* (Paris) 69, 307-10 (1952).—*C.A.* 47, 3591*a*.

The behavior of different amino acids under the usual conditions of the sugar refinery was studied. All the acids studied except aspartic and glutamic acid existed after the carbonation in the form of the acid amine.

6995. NAVEAU, GEORGES. **Preliming and purification of juice.** *Sucr. belge* 71, 437-51(1952).—*C.A.* 46, 8399*c*.

Improvement in filtration rate resulted from a combination of progressive preliming, liming at 80°C for 6 min. and carbonation. However, the decantation rate was definitely inferior to the Dorr and Wiklund standards. The improved filtration rate suggested the advantage of continuous filtration without previous settling.

6996. NESVADBA, L. **Progressive separation and continuous saturation in sugar manufacture.** *Mitt. chem. Forsch. Insts. Wirtsch. Österr.* 6, 5-8(1952).—*C.A.* 46, 6415*i*.

The purification processes, especially with lime and CO_2 in continuous operation were described.

6997. PAYNE, J. H.; KORTSCHAK, H. P., AND GILL, R. F. JR. **Ion-exchange resins in sugar-cane juice processing. Practical life and capacity.** *Ind. Eng. Chem.* 44, 1411-21(1952).—*C.A.* 46, 8884*a*.

The procedure for evaluating resins consisted of prepg. the resin sample for use, measuring the vol. and dry matter, detg. the capacity for inorg. ions and for clarified cane juice, and recycling the resins in a semiautomatic app. The relative performance characteristics of 17 resins were measured for the treatment of sugar-cane juice, and several performed up to 1500 cycles. The anion-exchange resins lost their capacity much more rapidly than the cation.

6998. POLLMANN, K. P. **Clarification of filtrates from rotary filters.** *Sugar* 47, No. 9, 37-8 (1952).—*C.A.* 46, 9873*e*.

The filtrate was heated to 200° F in a heater and passed through a subsider of the Deming type with a conical bottom and an inverted conical baffle attached to the cover plate. The juice traveled upward at a speed of less than 1 in/min., the clarified juice overflowed at the top, and the settlings discharged from the bottom to the filter feed tank. The pH was regulated so that the clarified filtrate was neutral.

6999. PRICE, J. F. **First carbonatation at Moorhead, Minnesota.** *Proc. Amer. Soc. Sugar Beet Tech.*, 7, 678-680 (1952); *Intern. Sugar J.* 55, 219 (1953).

Improved filtration and washing qualities of lime sludge were shown on the adoption of split liming during 1950 and 1951, a further benefit being decreased lime salts in the juice in spite of a decrease in soda ash addition. The fastest settling rate and clearest juice were obtained by liming in the primary tank to a figure of 0.005 alkalinity lower than that in the secondary tank.

7000. ROSEMAN, SAUL; ABELES, ROBERT H., AND DORFMAN, ALBERT. **Behavior of carbohydrates toward strongly basic ion-exchange resins.** *Arch. Biochem. Biophys.* 36, 232-3 (1952).—*C.A.* 46 5656*e*.

Reducing sugars were retained by a column of Amberlite IRA-400 or Dowex 1, but sorbitol, mannitol, and Me-α-D-glucopyranoside were not retained. Sucrose was partially retained. The retained carbohydrates could be eluted by solns. of AcOH, Na phosphate, and NaCl.

7001. SAHA, J. M. **Further comment on the Saha-Jain process.** *Sugar* 47, No. 2, 44 (1952).—*C.A.* 46, 9285*g*.

Certain details of the process which have been questioned were fully explained.

7002. SAHA, J. M. AND JAIN, N. S. **White sugar without sulfur.** *Sugar* 47, No. 11, 44-7(1952).—*C.A.* 47, 897*g*.

The raw juice was heated to 45-50°C and limed to pH 10.5. $CaCO_3$ was added in the form of a slurry with filter-press wash water, the mixt. stirred thoroughly for a few min., reheated to 55°C and filtered. The filtrate was neutralized with a soln. of superphosphate, the mixt. heated to boiling and refiltered. Refractory juices were first prelimed to pH 6.4-7.4, heated to 45-50°C, and treated as described above. The used $CaCO_3$ could be revivified by heating to 500°C, and the press mud reconverted to superphosphate.

7003. SALANI, RENATO; D'ORAZI, GIOVANNI, AND TEATINI, DARIO. **Purification of the raw juices by the lime-carbonatation process. I. Defecation. II. Carbonatation.** *Ind. saccar. ital.* 45, 431-7, 437-52 (1952).—*C.A.* 47,5705*f*.

A method of pre-defecation and those of gradual pre-defecation of Dedek-Vasatko, Wiklund, and Brieghel-Müller, together with the processes of carbonatation were theoretically discussed. A simple and rapid means to avoid foams, completely utilize CO_2, and to produce regular and compact crystals of $CaCO_3$ were discussed.

7004. SAMUELSON, OLOF AND SJÖSTRÖM, EERO. **Utilization of ion exchangers in analytical chemistry. XXIV. Isolation of monosaccharides.** *Svensk Kem. Tidskr.* 64, 305-14 (1952).—*C.A.* 47, 4248*e*.

A mixt. of fructose and mannose was sepd. by adsorption on Amberlite IRA-400 column, followed by elution with H_2O, frustose being eluted first. It was shown that the adsorption of sugars from H_2O-EtOH solns. increased with the EtOH concn. within the range 75-95% EtOH, and that the uptake was much greater than in case of H_2O. A mixt. of fructose, glucose, and mannose in EtOH (<95%) was adsorbed on the column in the bisulfite state (9 by 150 mm; particle size <0.12 mm) and sepd. by step-wise elution with 99.5% EtOH (fructose), 95% EtOH (glucose) and H_2O (mannose).

7005. Schneider, F.; Emmerich, A., and Schneider, H. G. **Cation-exchange action in the alkali-calcium cycle. The softening of thin juice.** *Zucker-Beihefte* No. 5, 57-70(1952).—*C.A.* 47, 3589g.

K was removed from high-K thin juices by the Na form of an exchange agent, which was displaced in turn by Ca. The working capacity depended upon the conditions of regeneration, best by high temp., with larger amts. and higher purity of the regenerating agents. The difference in capacity observed in the lab. and in the plant was probably due to lower temp., lower purity of reagents, and variable state of the resins. The residual hardness of white juice was due to the formation of a Ca complex. Nitrogenous components were only slightly removed by adsorption, but 90% of the color was removed.

7006. Schneider, F.; Reinefeld, E.; Grove, H.; Müller, H., and Zenker, B. **Nitrogenous nonsugar constituents. I. Investigation of amino acids, particularly in beet molasses.** *Zucker-Beihefte* No. 6, 79-89(1952).—*C.A.* 47, 3590*h*.

Amino acid components were isolated by combining ion-exchange treatment, electrodialysis, and extn. New equipment for continuously extg. these components with BuOH was described.

7007. Streuli, Hans. **The polarometric determination of sucrose in chocolate.** *Rev. intern. chocolaterie* 7, 14-15 (1952).—*C.A.* 46, 6283*a*.

Contrary to some earlier reports, the clarification of chocolate with lead acetate did not give a ppt. retaining sucrose.

7008. Streuli, Hans and Stesel, Marianne. **Clarification in sugar determinations in chocolate.** *Mitt. Lebensm. Hyg.* 43, 417-44 (1952).—*C.A.* 47, 3490*d*.

Somogyi's and Carrez' clarifying agents and basic and neutral Pb acetate were compared in their effectiveness, and the influence of pH and concn. of the clarifying agent examd. Somogyi's agent was effective without introducing foreign ions into the sugar soln., whereas buffering foreign ions may occur when basic Pb acetate or Carrez' agent were used.

7009. Verhaart, M.L.A. **The application of ion-exchange agents in the sugar industry.** *Chem. Weekblad* 48, 365-9 (1952).—*C.A.* 46, 8884*a*.

A general discussion of the advantages of ion-exchange treatment.

7010. Vitte, G.; Boussemart, E., and Guichard, C. **Chromatographic identification of traces of sucrose mixed with larger amounts of glucose and fructose.** *Bull. soc. pharm. Bordeaux* 90, 93-100(1952).—*C.A.* 46, 9020*c*.

Sucrose (0.1 g) was sepd. from glucose (100 g) and fructose (100 g) on a two-dimension ascending paper chromatogram developed with a mixt. of 50 parts Bu OH, 45 parts water, and 5 parts NH_3 followed by a mixt. of 50 parts PhOH, 50 of 1% NH_3 soln., and a trace of HCN. Spots of fructose and sucrose were obtained with naphthoresorcinol, and of glucose with aniline oxalate. The detd. *Rf* values with the respective solvent mixts. were: glucose 0.07, 0.39; fructose 0.1, 0.51; sucrose 0.03, 0.39.

7011. Waale, J. and Waterman, H.I. **Preparation of pure fructose sirups from cane sugar.** *Chimie & industrie* 68, 889-95(1952).—*C.A.* 47, 5706*h*.

A 40% sucrose soln. was inverted at 70-80°C by means of HCl (pH 2) or cation exchange. Calcium fructosate was then isolated at 0-5°C.

7012. Weber, J. and Becker, D. **Suitability of molasses for bakers' yeast after deliming thin juice with base-exchange agents.** *Zucker* 5, 508-12(1952).—*C.A.* 47, 3016*b*.

Two different beet molasses, from juices exchanged with sulfonated coal and phenol-aldehyde resins, were found to be suitable for yeast fabrication.

7013. Weymouth, L.E. and Montgomery, R.S. **Precoat filter filtration of phosphate-defecated affination sirup.** *Ind. Eng. Chem.* 44, 430-4 (1952).—*C.A.* 46, 4826*i*.

The advantages of color removal, filter-aid economy, and long cycles with precoat filtration appeared of real importance and warranted consideration for plant trial. A favorable operating condition to be recommended for larger-scale runs would be the use of 0.20% P_2O_5 with Hyflo taking a 0.0025-in. cut and no body feed. Filtration rate increased in proportion to drum speed from 115 to 80 sec per revolution, then somewhat more slowly to a speed of 60 sec per revolution.

7014. Wolfrom, M.L.; Binkley, W.W., and Martin, L.F. **Molasses: important but neglected product of sugar cane.** *Sugar* 47, No. 5, 33-5 (1952).—*C.A.* 46, 6856*e*.

The compn. of final cane molasses was reviewed.

7015. Yu, H.C. **Comparison of clarifying effect of dry lead with that of other clarifying agents.** *Taiwan Sugar J. Quart.* 3, 243-55(1952) (English summary).—*C.A.* 46, 9331*c*.

Effectiveness of agents for clarifying sugar solns. prior to polarization decreased in the order: Herles' liquid reagent ($Pb(NO_3)_2$ soln. and NaOH soln.), Herles' semidry reagent (NaOH soln. and solid $Pb(NO_3)_2$), basic Pb acetate soln., dry lead (basic Pb acetate), Herles dry agent (basic Pb nitrate), $Pb(OAc)_2$ soln.

7016. Yu, H.C. **Experiment on comparison of Herles' reagent with dry lead subacetate.** *Taiwan Sugar J. Quart.* 4, No. 1/2, 202-11(1952) (English summary).—*C.A.* 47, 1413*f*.

Dry lead was superior to Herles' dry reagent in the clarification of sugar soln. For sugar soln. of high purity or very dil. sugar soln. of low purity, the color and the clarity of the filtrate when treated with dry lead were comparable to that when treated with Herles' liquid reagent or semidry reagent. For more concd. sugar soln. of low purity, dry lead was slightly inferior to Herles' liquid reagent and semidry reagent but was still better than Herles' dry reagent.

7017. YUROV, A.T. **Predefecation.** *Sakharnaya Prom.* **26,** No. 3, 27-9(1952).—*C.A.* 46, 9874*c*.
Hot, progressive predefecation of diffusion juice with unsatd. juice from the first carbonation and with addn. of milk of lime to 0.15% CaO after predefecation improved operation and quality of juices.

7018. ZHUKOV, K.S. KATS, D.I. **Nomographs for control of defecation and predefecation with return of unfiltered first carbonation juices.** *Sakharnaya Prom.* 26, No. 9, 17-20(1952).—*C.A.* 47, 3014*i*.
Two nomographs were presented for detn. of the amt. of unfiltered juice returned on predefecation and for calcn. of the amt. of lime used for defecation in percentage on defecated juice and on the wt of beets.

7019. ASCHE, THEO. **Sedimentation of muddy juices.** *Zucker* 6, 100-1(1953).—*C.A.* 47, 5706*e*.
The rates of settling of first satn. juice at 46, 54, 67, and 73°C were 4.0, 5.5, 8.3, and 9.3 cm/min., resp. A temp. of about 80°C was recommended.

7020. ASCHE, THEO. **Filterability of muddy juices.** *Zucker* 6, 191(1953).—*C.A.* 47, 7243*i*.
Since rapid settling and good filterability go hand in hand, a rapid filtering test was proposed for both operations. The stirred suspension was passed, at 60°C, through a 2 cm^2 microfilter which was maintained at 400-mm Hg. The times of passing of the 2 to 4-, 6 to 8-, and 10 to 12-ml portions were noted as v_1, v_2, and v_3, resp. The av. F_k was designated as the filtration coeff., where $F_{k1} = (v_2 - v_1)/2$ and $F_{k2} = (v_3 - v_2)/2$.

7021. BLANKENBACH, W.W. **An ion adsorbing resin for the control of iron in sugar products.** *Proc. Tech. Sess. Bone Char* **1953,** 167-74.
Bone char was inefficient in the adsorption of iron compds. in the removal of the undesirable green colors in some soft sugars which were due to ferric polyphenols. An ion-exchange resin was developed at the British Columbia Sugar Refinery which had a very definite iron adsorbing capacity. Soft sugars made from syrups treated with such a resin had excellent bloom and bright colors and had a permanence not obtained by any other known means.

7022. DEVILLERS, P.L. **Analysis of sugars with ion-exchangers.** *Sucr. franc.* 94, No. 3, 58-61 (1953); *Intern. Sugar J.* **55,** 223 (1953).
The sugar solution first passed through a cation-exchange resin to absorb the cations and basic compounds and then through an anion exchanger to adsorb the anions and acidic materials, leaving an effluent which contained the neutral non-sucrose impurities. The amino acids and basic nonsugars were eluted by ammonia. The acidic components were eluted with normal HCl. The columns were well rinsed to remove sugar before elution, and a blank run simultaneously to allow for materials dissolved from the resins. In practice, 50% sugar solns. were used, with 1 kg for refined and good whites, while 500 g were used for ordinary white sugars.

7023. DÖRFELDT, W. AND STARKE, S. **Dry liming.** *Zeitsch. Zuckerind.* **78,** No. 7, 263-266 (1953).
The use of dry lime eliminated the advantages of the cold pre-defecation process and residual liming in the cold with milk-of-lime. If the residual liming was carried out partly with milk-of-lime and subsequently with lump lime, the color of the thick juice improved with the proportion of milk-of-lime. With the other methods of pre-defecation and residual liming under varying temp. conditions, there was little difference between the use of dry lime or milk-of-lime. Even with very badly deteriorated beet, cold defecation with milk-of-lime in both stages showed the best results. Calcium salts were higher where dry lime was used.

7024. FINKE, OTTO. **The fate of pectin during beet-sugar production, and its influence on filtration.** *Zucker-Beih.* No. 1, 8-14(1953).—*C.A.* 47, 7244*h*.
Three % of the original pectin came through in the diffusion juices, and 77% of this was eliminated as calcium pectate in the purification. The remaining 23% carried through to final molasses, undergoing considerable thermal degradation throughout the process. From an original number av. mol. wt of 92,000, a drop to 62,500 in the raw juice, and about 20,000 in the thin juice, thick juice, and molasses, was typical.

7025. FORT, C.A. AND SMITH, B.A. **Reverse-cycle demineralization of sugar-cane juices with ion-exchange resins.** *Sugar J.* **15,** No. 9, 16, 18, 22-5 (1953).—*C.A.* 47, 10878*h*.
Clarified sugar-cane juices and synthetic model juices were ion-exchanged by the reverse demineralization cycle. The use of a strongly basic anion exchanger followed by a weakly acidic cation exchanger caused satisfactory demineralization with 0.16% inversion of sucrose. When the cation exchanger was strongly acidic, there was a 2.8% inversion. With direct demineralization with a strongly acidic cation exchanger only, there was a 4% inversion.

7026. FORT, C.A.; SMITH, B.A., AND MARTIN, L.F. **Comparison of the effectiveness of selected ion-exchange resins for the purification of clarified sugar cane juice.** *Proc. Tech. Sess. Bone Char* **1953,** 179-98.
Several strongly-basic anion exchangers varied in their capacity for removal of N-compd. and colors, in addn. to mineral from sugar cane juices. Generally, less than 60% of the mineral satn. capacity of the basic anion exchanger could be utilized if reasonable N and color removal were to be obtained. Demineralization by the reverse cycle, utilizing the strongly basic anion exchangers, produced no inversion of sucrose and through removal of non-sugar reducing substances, resulted in an apparent decrease in reducing sugars. Temporary retention of reducing sugars by this type of anion resin made possible a fractionation of effluent juices into high and low purity products.

7027. GEE, ALLEN. **Some studies on basic calcium phosphates of interest in sugar refining.** *Proc. Tech. Sess. Bone Char* **1953,** 337-52.

Three aspects concerned with basic calcium phosphates were the nature of the solid, the apparent soly., and the behavior upon ignition. A review was supplemented by some preliminary original results. Some remarkable differences were found in the cryst. forms in which basic calcium phosphates could be pptd. from water under a variety of conditions. Some information on soly. measurements was also presented. Pyrophosphate probably formed when basic calcium phosphates were ignited to 400-800°C.

7028. HULL, WILLIAM Q.; KEEL, HARVEY; KENNEY, JOHN JR., AND GAMSON, BERNARD W. **Diatomaceous earth.** *Ind. Eng. Chem.* 45, 256-69 (1953); *Intern. Sugar J.* 55, 164 (1953).—*C.A.* 47, 7137*b*.

The production of the filter-aid "Dicalite" in Lompoc, Cal. was reported. The crude earth was fluxed in a rotary kiln with 5% of ash, the bag-house products obtained being 5-20% of pure air-floated filter-aid. The final product contained 87.9% of SiO_2, 5.9% of Al_2O_3 and 1.1% of Fe_2O_3 and has proved to be a most remarkable filter-aid in the sugar, wine and other industries.

7029. HULME, A. **An action of strongly basic anion exchanger resins and solutions containing sugars.** *Nature*, 171, 610-611 (1953).

The decomposition of sugars when treated with strongly basic exchangers in the hydroxyl form led to lactic acid formation, which may confuse an analysis for acids in fruits and other foods. It was suggested that the acids to be determined be absorbed on a weakly basic exchange resin, and then fractionated by displacement and subsequent chromatographic separation on a strongly basic exchanger.

7030. NEUBERT, A.M.; GRAHAM, D.W.; HENRY, J.L.; BREKKE, J.E., AND BEARDSLEY, C.L. **Recovery of sugars from pear-canning wastes.** *Agr. Food Chem.* 2, 30-36 (1953).

In a pilot-plant operation, sugars and other sol. solids from peelings, cores, and trimmings normally wasted in canning pears, were converted into a calcium pectate gel from which a clear, pectin-free juice was easily pressed. Excess calcium was removed by treatment with cation exchange resins; color was removed by precipitation and adsorption on activated carbon. The purified juice, when employed as a sirup base for canning pears, may replace as much as one-third of the refined sugar customarily used.

7031. OWENS, HARRY S.; GOODBAN, ALAN E., AND STARK, J. BENJAMIN. **Fractionation of organic acids in sugar beets by means of ion exchange resins.** *Proc. Tech. Sess. Bone Char* 1953, 221-32.

Most of the acids in sugar beet processing liquors were sepd. by adjusting the pH of the top portion of a column to pH 2.5 to 4.2 with HCOOH and the bottom portion to pH 2 to 2.5 with HCl or oxalic acids. The following acids have been identified in the liquors: lactic, glycolic, glyceric, succinic, pyrrolidone carboxylic, malic, citric and possibly, fumaric. Two other acids have not been identified. The exptl. details were given leading to the optimum conditions and the factors considered were: the nature of the resin, the capacity of the resin for various acids, the titration curves of the resins, and the concn. of the eluting agent.

7032. PHILLIPS, J.D. AND POLLARD, A. **Degradation of sugars on ion-exchange columns of Amberlite IRA 400 (OH^-).** *Nature* 171, 41-2 (1953).—*C.A.* 47, 4637*e*.

Upon passing neutral, av.-cider apple juices, contg. sugars in the proportions of fructose 10, sucrose 2, and glucose 1.5%, through exchange columns, it was found that (1) there was no retention of any of these 3 sugars by Amberlite IR 120; (2) all these sugars were retained by IRA 400 (OH^-); (3) there was considerable degradation of fructose and glucose with the production of org. acids; (4) sucrose was relatively little attacked by the resin; and (5) sugar which had not been degraded could be removed from the column by elution with *N* ammonium carbonate.

7033. RAO, N.S.; RAMCHANDRAN. K., AND ZAHEER, S.H. **Levulinic acid from cane molasses.** *Indian Sugar* 3, No. 2, 63-64, (1953).

Molasses from Nizam factory containing 55-56% total sugars was diluted with water and HCl to acid concentration of 6.5% and a sugars content of 27-42% for different samples. It was then heated for 1 hr in an autoclave at 100-175 p.s.i. and 167-185°C, producing a dark brown liquid and a dark bulky residue. The liquid was drained off and the solid broken up and washed free of keto-compounds, testing with 2,4-dinitrophenyl hydrazine. The liquid and washings were distilled at atmospheric pressure, interrupting to filter when fairly concentrated, and re-distilling to give a dark viscous liquid. Levulinic acid was recovered as calcium levulinate, as methyl or ethyl levulinate, by ether extraction, and by direct vacuum distillation.

7034. SMIT, P. **Use of weakly acid selective ion exchange resins for sugar juice purification.** *Zeitsch. Zuckerind.* 78, No. 4, 151-154 (1953).

A weakly acid selective cation exchanger was used to remove as much as 25 g CaO per liter of product. Besides Ca ions, other cations and organic impurities were removed by such treatment.

V-4. Purification of Water and Sewage

7035. BEHRMAN, A.S. AND GUSTAFSON, H. **Effect of low-pH waters on zeolites.** *Ind. Eng. Chem.* 28, 1279-82(1936).—*C.A.* 31, 2325^9.

Reduction in exchange capacity was not due to any disintegrating effect on the zeolite (in the absence of true mineral acidity), but simply to new equil. conditions at and with the increased pH concn. in the water. This new equil. at a lower level of base-exchange capacity was established quickly; and the active life of the zeolite at this lower level was no shorter than that of the zeolite when used for softening waters of a more favorable pH range.

7036. SIGWORTH, E.A. **Experiences with application of activated carbon in reservoirs.** *Taste and Odor Control J.* 3, No. 2, October (1936)

About 2 p.p.m. of activated carbon were required on the av. There was little likelihood of the carbon entering the supply pipes. It was claimed that 8 p.p.m. of activated carbon in water were barely perceptible in a glass of water. The carbon must be added as a thin slurry to prevent floating on the surface.

7037. COLLINS, LEO F. **A study of contemporary zeolites.** *J. Am. Water Works Assoc.* 29, 1472-1514(1937).—*C.A.* 32, 277^3.

The classification, prepn. and compn. of contemporary zeolites, the base-exchange reaction and certain characteristics limiting their industrial utility were reviewed.

7038. ABRAHAMCZIK, E. **Determination of small quantities of heavy metals in waters.** *Mikrochemie* 25, 229-41 (1938).—*C.A.* 33, 1847^3.

For detg. small quantities of heavy metals in water, the sample was filtd. at the source through a Permutit tube. The adsorbed heavy metals were washed out with NaCl soln. in the lab. Instead of Permutit, a resinous filtering material was obtainable on the market. Excellent recovery of added ion was accomplished in many cases.

7039. BIRD, P.G. **Removal of dissolved salts from water by exchange filters.** *Proc. Am. Soc. Testing Materials*, Preprint No. 101, 6 pp. (1938).—*C.A.* 32, 6370^1.

Org. exchangers should meet the requirements met by zeolites, e.g., 1/2 lb. of salt per 100 grains of hardness removed. Good anion exchangers had a capacity for HCl and H_2SO_4 of 6000 and 15,000 grains/ft^3. Operation of the cation and anion exchanger beds in series effected practically complete removal of dissolved solids, except silica. The removal of carbonate ions by aeration of effluent H_2O left it substantially neutral if effective to 15 p.p.m. Sol. org. matter and tastes and odors may be imparted to the H_2O.

7040. RILEY, RAY. **Latest development in water softening—carbonaceous zeolite.** *Paper Mill and Wood Pulp News* 61, 20-6, Sept. 24, 1938.

The carbonaceous zeolite, Zeo-Karb was used to exchange H^+ for the metal ions Ca^{++}, Mg^{++}, Na^+. The removal of Ca, Mg, and Na bicarbonates in boiler feed water treatment and methods of controlling the alkalinity of Zeo-Karb effluents were discussed.

7041. VAITSEZ, D.V. **Present method for the removal of salt from water.** *Vodosnabzhenie i Sanit, Tekh.*, XIV, No. 11, p. 12, 23-7. (1938).

Three new methods used in Russia for the removal of salt from water were described. One was a distillation method, a second was a freezing method, and a third was an ion exchange method.

7042. WELCH, W.A. **Practical considerations in the evaluation and use of activated carbon for water purification.** *Taste and Odor Control J.* 5, No. 2 October, (1938).

The phenol test and the threshold odor test were discussed as a means for evaluating the activated carbons for taste and odor removal. Individual water plants have particular problems which prevent any generalization to be made. One variable was the effect of acidity on the dispersion of the carbon.

7043. GRIESSBACH. **New ideas in the field of water treatment.** *Melliand-Textilber.* 20, 577-9(1939).—*C.A.* 33, 8417^3.

Certain resins contg. acidic groups, e.g., CO_2H, SO_3H, CH_2SO_3H, phenolic OH, can be used to replace cations, e.g., Ca ions, by Na or H ions, while resins contg. NH_2 or NH groups are capable of replacing anions, e.g., the Cl or SO_4 ions, with the OH ion. A combination treatment makes possible removal of 97% of the salt ions from water of ordinary hardness. The acidic resins are made from polyhydric phenols, natural tannins, etc., reacted with CH_2O and the basic resins from aldehydes condensed with amino bases, especially those of the aromatic series. The pH intervals, within which ion exchange occurs, are given for a no. of resins.

7044. RICHTER, A. **Treating water for use in dyeing with ion exchangers.** *Melliand-Textilber.* 20, 579-82 (1939).—*C.A.* 33, 8417^5.

Resinous ion exchangers were more economical than old-type Permutit exchangers because of greater through-put capacity and smaller pressure drop. A detailed description was given of com.-scale app. using resin ion exchangers for softening water and for removing both anions and cations for special purposes.

7045. RICHTER, A. **The application of ion exchangers having an artificial resin basis to the desalting of waters.** *Angew. Chem.* 52, 679-81 (1939).—*C.A.* 34, 1447^3.

Examples of partial and complete desalting by the use of Wofatit H and (OH) exchangers were discussed. Exptl. data showed successful operation, e.g., reduction of total solids from 1400 mg/liter to 45 and 13 mg/liter for single and double desalting, resp.

7046. BETZ, L.D.; NOLL, C.A., AND MAGUIRE, J.J. **Removal of silica from water by cold process.** *Ind. Eng. Chem.* 32, 1320-3 (1940); *Trans. A.S.M.E.* 63, 713-20 (November) (1941).—*C.A.* 34, 8122^3.

Freshly pptd. Al hydroxide was shown to remove sol. silica from water. The manner of prepg. the Al hydroxide eliminated the introduction of Na salts into the treated water. The removal of silica was most effective in the pH range 8.3 to 9.1. It was estd. that a pH range of 7.6 to 8.0 would probably provide the most effective range for practical use to avoid introduction of Al ion in soln. The efficiency of silica removal was greatest at low temps.

7047. Betz, L.D.; Noll, C.A., and Maguire, J.J. **Removal of silica from water by hot process.** *Ind. Eng. Chem.* 32, 1323-9 (1940).—*C.A.* 34, 8122[5].

Mg oxide reduced the sol. silica to practically zero when added to water. Various types of the oxide behaved differently and it was found that the most effective forms were the U.S.P. light oxide and a specially prepd. tech. grade obtained from the California Chem. Co. Greater silica removal and a lowering of hardness occurred at 95°C with a retention period of 15 min.

7048. Davis, Daniel E. **Observations on water softening.** *J. Am. Water Works Assoc.* 32[1], 85-92(1940).

The first large municipal zeolite softening plant in this country was built in 1926 in Pittsburgh. The Ca and Mg were exchanged with Na, regeneration of the glauconite being effected with NaCl. The performance of the zeolite cycle in this and other large installations was discussed.

7049. Kelley, W.P.; Brown, S.M., and Liebig, G.F., Jr. **Chemical effects of saline irrigation water on soils.** *Soil Sci.* 49, 95-107 (1940).—*C.A.* 34, 4201[8].

Irrigation waters contained varying quantities of Na which reacted with soil by base exchange. The absorption of Na by soil increased with increasing ratio of Na to Ca in the saline solns. The kind of base held by a soil in replaceable form influenced the absorption of Na. If Mg constituted a relatively high percentage of the total replaceable bases of the soil, relatively much Na would be absorbed. The ratio of Na to Ca + Mg should not exceed about 1:1 except where the sol. salts of the irrigation water were very low.

7050. Knodel, H. **Resin exchanger or carbon exchanger? Remarks on the work of E. Seyb.** *Chem. Fabrik* 13, 363-4 (1940).—*C.A.* 37, 6065[8].

The superiority of the resin to the carbon-exchange material as regards greater exchange capacity and greater resistance to hot and alk. water was disputed. Although the salt consumption was greater and not comparable to that under usual conditions, the resin-exchange material was shown to be superior under the special conditions of treating a water of high salt content and previously softened with NaOH.

7051. Mott, Kennon. **The water quality requirements of the soft drink industry.** *J. Am. Water Works Assoc.* 32, 1512-16 (1940).

Water at all times should meet the bacteriological standard established for I.C.C. It should have low turbidity and favorably compare to distd. water on visual observation. Lack of odor in a water means absence of all observable odor when submitted to both cold and hot test. Total hardness of 200 p.p.m. or less was considered unobjectionable, and over that figure objectionable. Total alkalinity of less than 50 p.p.m. was unobjectionable. Fe content of less than 0.1 p.p.m. was unobjectionable.

7052. Seyb, E. **The development of the exchange softening (of water) on the basis of ten years' operating experience in Leuna.** *Chem. Fabrik* 1940, 30-4.—*C.A.* 34, 2503[7].

Saale river H_2O, high in salts and hardness, was reduced in hardness to use in boilers at 45 atms. pressure. Experiences with silicate, carbon and synthetic resin softeners were reviewed in respect to efficiency, filter capacity, and effect of temp., pH and mech. abrasion on the material. The synthetic material gave the best results.

7053. Burtsev, D. **Operational results of chemical water purification by the base-exchange process.** *Teplosilóvoe Khoz.* 1941, No. 3, 33-45.—*C.A.* 37, 6776[9].

Because coagulation with Fe SO_4 was initially omitted and as a result of the preheating of the raw water with boiler water, the glauconite filters became strongly contaminated. At 35-40°C decompn. of the glauconite occurred. However, reducing the temp. of the raw water made preliminary purification more difficult (the reaction was slowed down, liming was incomplete and the carbonate hardness was increased). Reducing the alky. from 0.3-0.8° to 0.2° reduced the exchange capacity of the glauconite by 300-350°. Detn. of the alky. was carried out by adding to the water sample 5% of its vol. of a 10% $BaCl_2$ soln., which pptd. all the carbonate, and then titrating the hydroxide against phenolphthalein.

7054. Goodwin, R.C. and Litton, James B. **Removal of fluorides from public water supplies.** *Ind. Eng. Chem.* 33, 1046-8 (1941).—*C.A.* 35, 6031[9].

A pilot plant charged with 1.3 ft^3 of a mixt. of $Ca_3P_2O_8$ and $3Ca_3P_2O_8.Ca(OH)_2$ gave an av. of 346 grains F removed at a flow rate of 1.5 gal/min. The original H_2O contained 5.2 p.p.m. F. The av. F content of the effluent was 0.42 p.p.m. The phosphate was regenerated with 1.4 lb of NaOH when the F content reached 1 p.p.m.

7055. Guasch, J. Rovirosa. **The purification of water in industry.** *Afinidad* 18, 158-63 (1941).—*C.A.* 37, 3209[7].

The zeolite method of water softening was reviewed, including standards and analytical methods. The organic ion-exchange preparations and their use in industry for softening water was included.

7056. Hausen, J. **Treatment of water with artificial resins, increased possibilities, and improved processes with new exchange materials.** *Deut. Wasserw.* 1941, No. 2, 88; *Dept. Sci. Ind. Research (Brit.), Water Pollution Research Summary Current Lit.* 15, 108(1942).—*C.A.* 39, 2602[6].

The range of ion-exchange processes for use in treatment of water was increased by the discovery of the exchange properties of artificial resins. These could be prepd. in a variety of forms and could be used for the absorption of anions as well as cations, so that a water free from dissolved salts could be obtained.

7057. HOFER, K. **Tests of modern base-exchange materials in practice.** *Progressus* (Berlin) 6, 424 (1941); *Arch. Wärmewirt* **21**, 185 (1940); *Dept. Sci. Ind. Research (Brit.), Water Pollution Research, Summary Current Lit.* **14**, 264 (1941).—*C.A.* **38**, 5343[4].

Fused zeolites have been used, but these were attacked by waters containing aggressive CO_2. Nonsiliceous exchange materials were resistant to acids and also to waters contg. considerable alky. (up to a pH value of 9.5). They could be used to treat waters at temps. up to 95°C and could be regenerated with acids, or with an acid soln. of NaCl contg. acid and salt. Comparative tests on the use of Invertit, a mineral base-exchange material, and Wofatit, a synthetic resin, were made at a large plant. In the tests on Invertit and Wofatit filters a soln. of NaCl with a sp. gr. of 1.2 was used for regeneration. Regeneration of the Invertit filter took 40 min. and of the Wofatit 2 hrs.

7058. HULBERT, ROBERTS AND FEBEN, DOUGLAS. **Studies on the accuracy of threshold odor values.** *J. Am. Water Works Assoc.* **33**, 1945-64(1941).—*C.A.* **36**, 1123[7].

Four test carbons were sent 3 times under different codings to 4 labs. for grading. Results were uncertain - a stock odor sample was then sent to 5 labs. The results were equally uncertain. The method and the so-called "twilight zone" were discussed.

7059. LAUGHLIN, HENRY F. **Developments in taste and odor control.** *J. Am. Water Works Assoc.* **32**, 1191-4(1941).—*C.A.* **34**, 6741[3].

In two cases activated carbon was used. Prechlorination impaired the efficiency of carbon in one case. The use of any treatment should be preceded by lab. investigation.

7060. NAGAI, SHOICHIRO AND MURAKAMI, KEIICHI. **Water-softening materials of zeolite type. III.** *J. Soc. Chem. Ind. Japan* **44**, 709-12 (1941).—*C.A.* **42**, 2372*d*.

The water-softening power and the regenerative power were tested of various com. synthetic and water softeners. Gel-type water softeners prepd. from Na silicate, AcOH, and $Al_2(SO_4)_3$ solns. were good and had approx. equal water-softening and recovering powers.

7061. OLSON, H. M. **Census of U.S. Municipal water softening plants.** *J. Am. Water Works Assoc.* **33**[2], 2153-91 (1941).

The results of a questionnaire covering various aspects of water softening plants were presented in tabular form. There were 199 zeolite plants and 377 chemical pptn. plants. The questions covered included: supply, type plant, hardness of water, tap water pH, capacity, population served, etc.

7062. WEISER, HARRY B.; MILLIGAN, W.O., AND PURCELL, W.R. **Alumina floc. Composition of floc formed at pH values below 5.5.** *Ind. Eng. Chem.* **33**, 669-72 (1941).—*C.A.* **35**, 3874[7].

The alumina floc in water-purification practice was γ $Al_2O_3.H_2O$ free of basic Al sulfate. The x-ray diffraction pattern of fresh gels thrown down below pH = 5.5 consisted of broad bands that did not correspond to the lines in the γ-$Al_2O_3.H_2O$ pattern. Aging this gel in the mother liquor increased the primary crystal size until it gave a relatively sharp x-ray diffraction pattern.

7063. ADAMS, R.B. **Taste and odor control with activated carbon on waters of low odor concentrations.** *J. Penna. Water Works Operators' Assoc.* **14**, 59-64 (1942).—*C.A.* **37**, 1214[7].

Reductions of 70-75% in threshold odor were accomplished by filtration and sedimentation and by application of activated carbon on top of filters. A threshold odor of less than 2 was maintained in the tap water at Wilkinsburg, Pa.

7064. BAĬCHIKOV, A.G. AND SELIMOV, J. **Adsorption of iodine from oil-well waters by means of activated charcoal.** *J. Applied Chem.* (U.S.S.R.) **15**, 228-36 (1942).—*C.A.* **37**, 2548[9].

Extn. of I_2 from oil-well waters in southern U.S.S.R. by means of activated charcoal was found to be feasible even in waters contg. naphthenic acids. It was possible to recover up to 66% of the I_2. The charcoal used (No. 12) could be used in acid waters. Treatment of the charcoal with alkali lead to almost complete desorption of I_2; but the product was contaminated with naphthenic acids, which required an addnl. sepn. that was rather difficult.

7065. GOEHRING, E.C. **Taste and odor control for phenols with activated carbon.** *J. Penna. Water Works Operators' Assoc.* **14**, 65-73 (1942).—*C.A.* **37**, 1214[8].

Dosages as high as 948 pounds of carbon per million gallons of water were required to control phenol tastes. Other processes for the removal of tastes and odors were not as effective as activated carbon. Increase in the carbon dosage always caused an increase in the alum required for coagulation. Phenol tastes were highest when the raw water was 40°F or less.

7066. JOHNSON, B.F. **Taste and odor control with ammonia-chlorine and activated carbon.** *J. Penna. Water Works Operators' Assoc.* **14**, 74-6 (1942).—*C.A.* **37**, 1214[9].

Filtered water at New Castle, Penna., was treated with NH_3- Cl_2at all times, the raw water was treated when required. Musty, septic, sulfuretted and decomposition odors were satisfactorily removed by pretreatment with NH_3-Cl_2. The dose varied from 1/4 to 1/8 ratio of NH_3/Cl_2, with an average dose of 0.25/1.25 p.p.m. Activated carbon was applied as needed to control chem., hydrocarbon, and medicinal odors in doses ranging from 0.1 to 1.0 grains per gallon.

7067. LINDSAY, F.K. **Some applications of the organic ion exchangers.** *Proc. Ann. Water Conf., Eng. Soc. Western Penna.* **3**, 103-12(1942).—*C.A.* **38**, 6443[9].

The production of water comparable to distd. water was described for boiler make-up, for pharmaceutical manufg., and the removal of Zn ions from water soln.

7068. PARKER, A. **Potable water from sea water.** *Nature* **149**, 184-6 (1942).—*C.A.* **36**, 2653[4].

A discussion of possible methods.

7069. POLYAKOV, A.G.; ZHDANOVA, O.G., AND ASMOLOVA, M.F. **Deodorizing water in army camps at the front.** *Sovet, Zdravookhranenie Turkmenii* 1942, No. 2, 22-5.—*C.A.* 38, 1057[7].

Odors due to putrefaction of plant material in water was partially removed: (a) adding 3-5 drops of 1:1000 $KMnO_4$ soln. per 100 cc. of water, letting stand 1 hr, and treating with NaOH soln., then with $Ca(OH)_2$ soln. to alk. reaction; (b) boiling the water with permanganate for 15 min. and on cooling adding $Ca(OH)_2$ to ppt. MnO_2. Odor from putrefaction of animal waste matter was not removed by permanganate. Powd. charcoal (1 g per liter of water) completely removed odors of plant origin in 15-20 min.

7070. TIGER, H.L. **Silica removal by an improved magnesia process.** *Trans. Am. Soc. Mech Engrs.* 64, 49-63 (1942).—*C.A.* 36, 2063[3].

In the cold-process treatment, silica removal was applied first and post treatment by carbonaceous zeolites to remove any residual hardness. Carbonaceous hydrogen zeolite might also be included. These carbonaceous zeolites might be used without danger of silica pickup from them.

7071. AKEROYD, E.I. **Recent developments in water treatment.** *J. Inst. Brewing* 40, 238-44 (1943).—*C.A.* 38, 1824[8].

A general discussion of lime or lime-soda and base-exchange processes.

7072. AMERICAN WATER WORKS ASSOCN. **Tentative manual of zeolite test procedures.** *J. Am. Water Works Assoc.* 35, 721-50 (1943).

Test procedures were proposed for cation exchangers operating on the Na-cycle. Details in the construction of the testing tubes were given and the sequence of packings in the tube described. The proposed tests were: density of dry zeolite, density of saturated zeolite, sieve analysis, attrition losses, resistance to attack, exchange values, color leaching, porosity, and chemical compn.

7073. APPLEBAUM, SAMUEL B. **The demineralizing process of water softening. Latest development in the use of zeolites.** *Water and Sewage* 81, No. 10, 13-16, 42-4 (1943).—*C.A.* 38, 1825[9].

Even distd. water may contain some mineral salts owing to the mech. carry-over in evaporators and condenser leakage. It was more expensive to remove sulfates or chlorides than bicarbonates. The two-step demineralizing process involving cation- and anion-exchangers was described.

7074. BOCHER, G. **Manufacture of distilled water and the chemical purification of water.** *Ann. pharm. franc.* 1, 56-8, 126-7, 155-6(1943); 2, 33-5, 82-4(1944).—*C.A.* 40, 4825[5].

A review of methods of purifying water (by chem. treatment and by ionic exchange by means of zeolites), and of problems involved in the construction of distg. app.

7075. BUSWELL, A. M.; GORE, R. C.; HUDSON, H. E. JR.; WIESE, A. C., AND LARSON, T. E. **War problems in analysis and treatment.** *J. Am. Water Works Assoc.* 35, 1303-11 (1943).—*C.A.* 38, 439[1].

The treatment of water contaminated with war gases was considered. The studies considered were Cl_2 demand of mustard and lewisite, a titration for quant. est. of either or both. Threshold odor value of mustard and lewisite and amt. of activated charcoal required to remove mustard odors were discussed.

7076. DAVIS, D. E. **Softening and manganese removal by zeolites.** *Water Works Eng.* 96, 1012-17 (1943).—*C.A.* 38, 1826[1].

The plant described (capacity 1.5 m.g.d.) treated well water having a hardness varying between 150 and 230 p.p.m. The carbonate and noncarbonate hardness were about equal, and the Mn content varied between 1.5 and 2.9 p.p.m. Both hardness and Mn were removed by filtration through beds of greensand over gravel.

7077. DE REUTER, HERBERT. **Water softening increases consumption at Oak Lawn, Illinois.** *Public Works* 74, No. 5, 26 (1943).—*C.A.* 37, 3864[2].

A zeolite plant served 900 users.

7078. DONNELLY, R. P. **"Organolites" for water treatment. III. Some special application of the new synthetic resin products by which an extension of normal base-exchange water treatment is possible.** *Power & Works Engr.* 33, 136-7(1943).—*C.A.* 37, 5812[8].

7079. DUDOMAINE, JOHN; SWAIN, R. L., AND HOUGEN, O. A. **Cation-exchange water-softening rates.** *Ind. Eng. Chem.* 35, 546-53 (1943).—*C.A.* 37, 4837[9].

Expts. were conducted on the softening of water by a cation-exchanger ($Na_2O.Al_2O_3$-$5SiO_2$) and the regeneration of the exchanger by a salt soln. A bed (0.5 in.) was used which permitted the data to be used in detg. the differential rate equations. Equations and charts were given for the performance of com. beds of zeolite under conditions of variable thickness, rate of water flow, initial hardness of the water, and initial base-exchange capacity, particle size and activity of exchanger.

7080. FETTE, ANTHONY A. **Pure water without heat.** *Power Plant Eng.* 47, No. 5, 118, 138, 140, 144 (1943).—*C.A.* 37, 4507[3].

Distd. water from condensing steam was compared to water obtained from synthetic ion-exchange filters. The theory of the process was discussed, also operating details as applied to this particular case.

7081. GADDIS, SHIRLEY AND KUBINA, CONRAD. **Distilled water supply for small schools.** *J. Chem. Education* 20, 381, 400(1943).—*C.A.* 38, 2859[8].

Org. anion and cation exchangers were employed.

7082. HARRISSON, J. W. E.; MYERS, R. J., AND HERR, D. S. **Purified mineral-free water for pharmaceutical purposes.** *J. Am. Pharm. Assoc.* 32, 121-8(1943).—*C.A.* 37, 3564[1].

The production of resin exchange adsorbents have made possible mineral-free water equal in quality to that required for distd. water of the U.S.P. Ease of manipulation, low initial cost, and freedom from costly maintenance recommend this method of prepg. mineral-free water for many pharm. uses.

7083. HIRSCH, A. A. **Silica sol as auxiliary coagulant with copperas; graphical determination of optimum proportions of dual coagulants in water treatment.** *Ind. Eng. Chem.* 35, 811-14 (1943).—*C.A.* 37 6383^5.

A graphical method was given for the optimum coagulant adjustment of activated silica sol and copperas in treatment of the Lower Mississippi River water. Results showed advantages in the use of these dual coagulants in the treatment of the raw water and of the lime-softened water.

7084. KAHN, J. M. **Color removal with the Accelator.** *J. Am. Water Works Assoc.* 35, 597-600 (1943).—*C.A.* 37, 4168^2.

The Accelator for softening was considered a satisfactory device for clarification and color removal. Several cases were cited where, with proper selection of chemicals, very good results were obtained.

7085. KEMMER, FRANK N. AND THOMPSON, JOSEPH. **Some characteristics of acid-regenerated carbonaceous zeolite.** *Proc. Ann. Water Conf., Engrs. Soc. Western Penna.* 4, 109-19(1943).—*C.A.* 39, 1950^1.

7086. KVIRIKASHVILA, V. L. **Use of Askangel-bentonite clay as coagulant for water clarification and as antiscale.** *Bull. Acad. Sci. Georgian S.S.S.R.* 4, 977-86 (1943) (in Georgian and Russian).—*C.A.* 41, 3237*d*.

The fine-disperse, high-swelling, thixotropic clay, added in amts. of 20 mg/liter, clarified water by coagulation, particularly in mixt. with lime, as effectively as $Al_2(SO_4)_3$. Moreover, it lowered the permanent hardness. The action consisted in ion exchange against the Na and K ions of the clay. The action depended entirely on the high dispersity of the clay; coarser fractions were ineffective.

7087. LIEBIG, GEORGE F. JR.; VANSELOW, ALBERT P., AND CHAPMAN, H. D. **The suitability of water purified by synthetic ion-exchange resins for the growing of plants in controlled nutrient cultures.** *Soil Sci.* 55, 371-6(1943).—*C.A.* 37, 6711^1.

Passage of distilled water through an H- satd. cation-exchange resin removed objectionable traces of Cu and other heavy metals. Lab. distd. water contg. Cu 0.2000, Pb 0.0550 and Zn 0.02 p.p.m. contained Cu 0.0035, Pb 0.0015 and Zn 0.00 p.p.m. after one passage through the cation-exchange resin. After 5 passages, it contained Cu 0.0000, Pb 0.0010 and Zn 0.00 p.p.m. Redistd. water from an all-Pyrex-glass still contained Cu 0.0016, Pb 0.0025 and Zn 0.00 p.p.m.

7088. LINDSAY, F. K. **Removal of iron from water—use of carbonaceous ion exchangers.** *Ind. Eng. Chem.* 35, 378-80 (1943).—*C.A.* 37, 2853^6.

Tests were made confirming the removal of Fe as well as Ca and Mg by a carbonaceous exchanger. Data were given on the removal of Fe, Ca and Mg by the NaCl-regenerated carbonaceous exchanger. Also, comparative data were given with regeneration by NaCl, $MgCl_2$, or $CaCl_2$. Fe^{++} can displace the Ca and Mg ions, and Fe removal may continue after the hardness-removal capacity of the NaCl-regenerated exchanger has become exhausted.

7089. MILLER, DURANDO. **Latest developments in removal of cations and anions from water by demineralizing.** *Proc. Ann. Water Conf., Eng. Soc. Western Penna.* 4, 121-31(1943).—*C.A.* 39, 2167^8.

Large installations were made with wood to save steel and rubber previously used for acid resistance. Plants having capacities of 1000 gal per min. have been constructed. CO_2 was removed by use of a vacuum cold water deaerator to prevent satn. of the H_2O with O_2.

7090. NORDELL, ESKEL. **Demineralizing industrial water and process liquors.** *Chem. & Met. Eng.* 50, No. 10, 112-15 (1943).—*C.A.* 38, 821^4.

For the waters listed, ion-exchange operating costs ranged from $0.03 to $0.16 per 1000 gal. Comparable figures for distn. costs were $2.00 to $8.00 when single- and double-effect evaporators and $0.60 to somewhat over $1.00 for a quadruple-effect installation. Fixed charges were not included.

7091. SIGWORTH, E. A. **The extent of use of activated carbon.** *J. Am. Water Works Assoc.* 35, 1587-92(1943).—*C.A.* 38, 1308^9.

From data tabulated the av. carbon dosage was a little over 10 lb per million gal. Rivers required less than lakes, reservoirs, etc., and the av. doses decreased as the size of the plant increased.

7092. SMITH, O. K. **Water purification by the new ion-exchange method.** *Am. Gas Assoc. Proc.* 25, 308-14; *Petroleum Eng.* 14, No. 13, 57-60 (1943).—*C.A.* 38, 4355^5.

A discussion of ion-exchange water-purification materials. Complete demineralization can be accomplished without a remaining neutral salt.

7093. STICH, CONRAD. **Adsorption of microörganisms by charcoal and other adsorbents.** *Chem.-Ztg.* 67, 349(1943).—*C.A.* 39, 2833^7.

Microörganisms were almost completely removed from two potable waters by 0.2 g/100 cc., and from 0.5% yeast suspension by 1 g/100 cc. of charcoal. Talc was much less effective.

7094. TIGER, HOWARD L. AND SUSSMAN, SIDNEY. **Demineralizing solutions by a two-step ion-exchange process.** *Ind. Eng. Chem.* 35, 186-92 (1943).—*C.A.* 37, 2109^3.

A two-step ion-exchange process was outlined in which both cations and anions were removed, giving a final effluent that approached distd. water in quality. First step: acid-regenerated org. cation exchangers replaced the metallic cations in the water with H ions converting the salts present into the corresponding acids, i.e., HCl, H_2SO_4 and H_2CO_3. Second step: removal of the strong acids (HCl and H_2SO_4) formed by the anion exchangers by absorption and removal of the CO_2 in the H_2CO_3 by degasification. When necessary, silica removal must precede the demineralizing treatment.

7095. Turner, H. G. **Pennsylvania anthracite as a filter medium.** *Ind. Eng. Chem.* 35, 145-7 (1943).—*C.A.* 37, 1539^5.

Anthracite was more nearly chemically inert than other substances such as sand which, though insol. in acids, reacted readily with alkalies. Filter anthracite was prepd. from coal which would yield a particle free from fracture cracks. Its low sp. gr. and angular particle shape made possible longer filter runs and more effective filter bed washing at lower back wash rates.

7096. Akeroyd, E.I. **"Deminrolit" process of water treatment.** *Water & Water Eng.* 47, 8-12 (1944).—*C.A.* 38, 1825^6.

The Zeo-Karb H-Ion Deminrolit process was described and analyses reported on 5 waters before and after treatment. The water passed first through a base-exchange and then through an acid-exchange unit. The content of $NaHCO_3$ in the effluent was of the order of 5-10 p.p.m. as Na_2CO_3 and the content of NaCl of the order of 2 p.p.m.

7097. Bachmann, Frank. **The economics of deionized water supplies.** *J. Am. Water Works Assoc.* 36, 876-85 (1944).—*C.A.* 38, 6018^8.

Ion-exchange materials, their character and their reactions were discussed, with special reference to their interest to municipalities. Two plants were discussed, one with high $NaHCO_3$, the other with high NaCl content. In both cases part of the water was treated and later mixed with the raw water. The results were calcd. and the operating costs detd.

7098. Berry, A.E. **Activated carbon in Canadian water-treatment practice. Comparison with United States usage.** *Water and Sewage*, 82, No. 4, 24-5, 58, 60 (1944); *Water & Water Eng.* 47, 511-13 (1944).—*C.A.* 38, 6443^7; 39, 5007^5.

7099. Black, Hayse H. and Spaulding, Charles H. **Diatomite water filtration developed for field troops.** *J. Am. Water Works Assoc.* 36, 1208-21 (1944).—*C.A.* 39, 369^8.

Diatomite filtration had advantages in the quality of water produced and the capacity of the filter per unit of weight and per unit of vol. Sand filters failed to remove *Endameba histolytica* at the rates employed in the field. Diatomite or diatomaceous earth effects virtually complete removal under most severe tests. Filter elements in the form of porous cylindrical shells were given a precoat of diatomite in the form of a slurry.

7100. Breitenstein, G. von and Berger, H. **Deoiling of boiler feed water by base exchange material.** *Glückauf* 80, 261-262 (1944); *Brit. Coal Utilisation Research Assoc. Monthly Bull.* 9, 349 (1945).—*C.A.* 42, 4295*a*.

Beds of 5 tons of coarse "Invertitmasse" were used for reducing the oil content of 25 m^3 of dirty condensate per hr from 6 to 1.3 mg/liter. The filter was flushed with cold H_2O every 48 hrs and regenerated with aq. NaCl; the amt of oil removed at each flushing was 90 mg/liter. The process was officially tested for its effect in the boiler and for its cost, which compared favorably with that of alternative methods.

7101. Consolazio, W.V. and Pace, N. **Drinking water from sea water.** *U.S. Naval Inst. Proc.* 70, 971-8 (1944).—*C.A.* 38, 6441^1.

Apparatus and available methods were described. Under practical tests the most satisfactory process was a modified Permutit method.

7102. Gilwood, M.E. and Calise, V.J. **Recent experiences in demineralizing water.** *Proc. Ann. Water Conf., Eng. Soc. Western Penna.* 5, 11-26 (1944).—*C.A.* 39,5373^1.

Demineralizing units designed for flow rates of 4, 55, and 1000 gallons per min. of treated water were described. The operating cost of demineralization ranged from \$0.01 to \$0.20 per 1000 gal depending on the type of H_2O treated, compared to \$0.80 to \$8.00 per 1000 gal for com. distd. H_2O.

7103. Hassler, J.W. and Faye, Martin. **Influence of various chemicals on palatability of drinking water.** *J. Am. Water Works Assoc.* 36, 1185-91 (1944).—*C.A.* 39, 368^6.

The effect of odor from chem. elements normally employed in water purification was studied. Most chemicals used in coagulation and softening have no appreciable effect on odor intensity. Cl_2 frequently increased the odor which could be reduced by active charcoal or NH_3 in certain cases. A combination of charcoal and NH_3-Cl_2 was much more effective than charcoal alone.

7104. Hudson, F.A. **Activated charcoal in the preparation of intravenous solutions.** *Pharm.* 98, 131-2 (1944).

The successful removal of pyrogens was obtained with 0.1% of activated charcoal. Two factors of importance in considering its use in the prepn. of intravenous solns. was the surface area and diffusability of the charcoal, and the filtration of the soln. so that no particles were present in the final product.

7105. Kenworthy, Alvin L. and Howard, John Nelson. **Purification of water by use of synthetic ion-exchange resins with pH as a control.** *Soil Sci.* 57, 293-7(1944).—*C.A.* 38, 4355^6.

Water passed through "Amberlite" was comparable to distd. H_2O. The break-through or satn. point for towers filled with such a synthetic resin could be detd. by the use of an ordinary lab. model pH meter. Germination of *sporangia* of *Phytophthora infestans Thax.* (Guss.) indicated that there was a continued adsorption of Cu after the cation exchanger was satd. The Cu content of the H_2O was lower than that of distd. H_2O, but not so low as that of redistd. H_2O.

7106. Love, S.K. **Cation exchange in groundwater contaminated with sea water near Miami, Florida.** *Trans. Am. Geophys. Union* 25, Pt. 6, 951-5 (1944) (Pub. 1945).—*C.A.* 39, 4176^7.

Contaminated ground water was richer in Ca, and poorer in Mg and Na than would be expected on the basis of simple mixing. This might be due to cation exchange between clay or org. colloids and the water mixts.

7107. MANRING, W.E. **The demineralization of water by ion exchange.** *Paper Trade J.* **119**, No. 12, 33-6(1944).—*C.A.* 38, 6444[1].

Ionac C-284 and Ionac A-293, cation and anion ion-exchange resins, resp., were described. Particular attention was directed to their performance in a 4-bed system consisting of alternate beds of the cation and anion resins, as applied to (1) the treatment of brackish water, (2) a portable disposable cartridge unit, and (3) a self-contained lab. unit of 30 gal per hr capacity.

7108. PAPP, SZILÁRD. **A new filtering material for removing manganese and iron from industrial and drinking waters.** *Magyar Mérnök Építészegylet Közlönye* 78, 345-55 (1944).—*C.A.* 41, 7590*i*.

A special material called "fermago" (oxides of Fe and Mg treated by heat and mixed with disintegrated quartz), oxidized dissolved Fe or Mn, pptd. colloidal hydroxides, and removed them by filtration. This material was produced in grain sizes 0.5-1.5, 1.5-3.0, and 3.0-5.0 mm or larger. In water high in CO_2, material of smaller grain sizes (thus contg. larger surface) must be used.

7109. SOLLNER, KARL AND ANDERMAN, JOAN. **The structure of the collodion membrane and its electrical behavior. VIII. Quantitative studies concerning the acidic properties of collodion and their correlation with membrane structure and activity.** *J. Gen. Physiol.* 27, 433-49 (1944).—*C.A.* 38, 3889[9].

The activity of collodion membranes depends on dissociable acidic groups in the interstices, and can be measured by base exchange. The base-exchange capacity (after 48 hrs in 0.01 N NaOH) for the same prepns. varied within a range of 1:200. Inactive prepns. had only 1 in 770 acid groups available for exchange, whereas in the most active collodion 1 in 13 groups was available.

7110. SPEALMAN, CLAIR R. **Chemical removal of salts from sea water to produce a potable water.** *Science* 99, 184-5 (1944).—*C.A.* 38, 3061[7].

Ag_2O and uric acid were used to ppt. most of the salts. The product contained 0.58% sol. material of which 0.13% were urates.

7111. STACH, H. **Base exchange on lignite glance coals.** *Glückauf* 80, 79-80(1944).—*C.A.* 39, 4176[6].

The properties and manner of origin of this black, humified, sub-bituminous coal and its use for the removal of hardness, acids, and salts from water were discussed. The recovery of valuable metals from dil. solns. by metal ion exchange on this coal was mentioned.

7112. TURNER, H.G. **Anthrafilt and its significance.** *J. Am. Water Works Assoc.* 36, 431-8 (1944).—*C.A.* 38, 2775[2].

Because of its chem. inertness anthrafilt had many advantages as a filter material. Filter capacities were greatly increased through its use.

7113. AKEROYD, E.I.; HOLMES, E.L., AND KLEIN, A. **Drinking water from sea water by a chemical method.** *Water and Water Eng.* 48, 556-60(1945); *J. Soc. Chem. Ind.* 65, No. 1, 28-32(1946).—*C.A.* 40, 2559[9].

The ion exchanger was a Ba-Ag zeolite contg. Ag_2O. The latter compd. was used to remove the Mg ions. The mixed zeolite was compressed into briquets together with activated fuller's earth, which acted as a disruptive agent when the briquet was immersed in sea water. The sea water was treated with the briquet in a rubberized bag which was provided with a filter for the treated water.

7114. ATTEBERRY, ROBERT W. AND HERR, DONALD S. **Useful life of a molecularly dehydrated phosphate in sulfuric acid.** *Ind. Eng. Chem.* 37, 100 (1945).—*C.A.* 39, 857[9].

The use of H_2SO_4 contg. relatively small amts. of Calgon was found more beneficial for the regeneration of a cation-exchange material than H_2SO_4 alone. The effect of the metaphosphate, even in the presence of acid, was to prevent the deposition of $CaSO_4$, etc., upon the exchanger bed, improve the efficiency of regeneration, and decrease the subsequent rinse-water requirements.

7115. BAUMAN, W.C. **Synthetic ion-exchange resins.** *J. Am. Water Works Assoc.* 37, 1211-15 (1945).—*C.A.* 40, 971[9].

After brief reference to ion exchange in water treatment, the synthetic-resin exchange was described in more detail. The application of this process to silica removal was outlined.

7116. BURWELL, A.L.; CASE, L.C., AND GOODNIGHT, C.H. **Fluoride removal from drinking water. Small installations using virgin bone char.** *Okla. Geol. Survey, Circ. No.* 25, 1-41(1945).—*C.A.* 39, 3863[7].

The presence of fluoride in excess of 1.0 p.p.m. makes the water unsafe and is ground for rejection of the water supply. Waters contg. fluorides in amts. above the safe limit can be made safe by using virgin bone char, which was found to be superior to Ca phosphate in efficiency and ease of regeneration. It also removes odor and taste.

7117. CAROLLO, JOHN A. **The removal of DDT from water supplies.** *J. Am. Water Works Assoc.* 37, 1310-17 (1945).—*C.A.* 40, 969[9].

DDT in any water gradually became ineffective. Turbidity did not reduce DDT efficiency but removed some DDT by settling. Coagulation, sedimentation, filtration, and the presence of activated carbon will remove DDT from a water supply.

7118. CONSOLAZIO, W.V.; PACE, N., AND IVY, A.C. **Drinking water from sea water.** *Smithsonian Repts.*, Pub. No. **3820**, 153-63 (1945).—*C.A.* 41 2823*i*.

Silver zeolite was added to sea water and the pptd. AgCl and $Mg(OH)_2$ filtered off. Expts. were conducted to det. the optimal compn. of drinking water under field conditions, and the new method was adjusted accordingly. The zeolite was compressed to the smallest vol. possible, but because high pressure made briquets indispersible, an inert chemical which swelled to 6 to 12 times its original vol. was added to the briquets.

7119. COUVREUR, M. **Decarbonization by crystallization, base exchangers, demineralization, degassing, and the conditioning of boiler feed water.** *Soc. roy. belge ing. ind., Mém., Sér. B. No.* 2, 450-61(1945).—*C.A.* 40, 4453[9].

A procedure was described for decarbonization of H_2O in a decanter by means of milk of lime. The action took place in 2-3 hrs. Base exchangers were divided into inorg. and org. exchangers. Two methods were given for demineralization. The first consisted in electroösmosis and made use of the principle of a combination of electrodes and semipermeable membranes. In the second method the resistance employed was between 50 and 70 ohms while in the first method the resistance was generally not above 100,000 ohms. Degassing was accomplished by taking advantage of cooling the feed water and atomizing under pressure.

7120. Delaroziere, F. **Complete demineralization of water by ion removers.** *Chimie & industrie* 53, 329(1945).—*C.A.* 40, 3209[7].

Ion removers were generally humic acids obtained by oxidative treatment of certain types of lignites or coals in presence of H_2SO_4, condensation products of polyphenols (tannins) or aromatic polyamides with CH_2O.

7121. Farrow, J. Carlisle. **Your industrial water is no better than your operator.** *Southern Power and Ind.* 63, No. 10, 58-60, 67(1945). —*C.A.* 39, 5374[8].

The operation and control of a water-filtration plant for meeting textile-plant requirements was discussed. In addn. to soda ash and alum, Cl_2 and active carbon were added, the former to retard the formation of algae and scum in the settling basins and filters, and the latter whenever there was an objectionable taste or odor.

7122. Gault, Henri and Hiong, K.W. **Purification of hard waters by means of technical lignin, by-product of wood saccharification.** *Compt. rend.* **220**, 608-9(1945).—*C.A.* 40, 2248[8].

Technical lignin, retaining about 42% cellulose (100 g), was gradually triturated with 1 kg H_2SO_4 until the temp. reached 60°C. The mixt., after standing for 1 hr at room temp., was poured into 3 liters H_2O, and the residue filtered and washed with H_2O, $NaHCO_3$ (until neutral), and H_2O, and then dried at 110-20°C. The black granular mass could be used directly or after mech. disintegration for all purposes requiring cationic exchange, and was found to be especially effective in softening hard water.

7123. Gilwood, M.E. and Calise, V.J. **Mineral-free water without distillation.** *Power* 89, No. 6, 101, 144, 146, 148 (1945).—*C.A.* 39, 3099[3].

The use of sodium and carbonaceous zeolites for purifying water was described. It was possible to get almost completely mineral-free water by proper treatment. Several installations were described.

7124. Grindley, J. **Treatment and disposal of waste waters containing chromate.** *J. Soc. Chem. Ind.* 64, 339-44 (1945).—*C.A.* 40, 2563[2].

Ion-exchange with Zeo-Karb and Deminrolit B yielded demineralized H_2O, substantially nontoxic to minnows, but the activity of the exchange materials was not regenerated by simple treatment.

7125. Ingleson, H. **Preparation of drinking water from sea water.** *J. Soc. Chem. Ind.* 64, 305-9 (1945).—*C.A.* 40, 4825[7].

When sea water was passed first through a base-exchange material and then through an acid-exchange material (Zeo-Karb and Deminrolit B or Amberlite IR-1 and Amberlite IR-4), the vol. of water which could be treated was only about 1.5 times the vol. of the reagents. A Ag zeolite was prepd. by treating Doucil (an artificial Al silicate of high base-exchange capacity) with a soln. of $AgNO_3$. When sea water was passed over such a zeolite, Na was removed from the water and the Ag so displaced pptd. the Cl^- from the water. Various mixts. contg. this zeolite were compressed into briquets at a pressure of about 13.6 tons/in.[2] The most satisfactory mixt. contained: Ag zeolite 79.1, $Ba(OH)_2.8H_2O$ 9.5, Ag_2O 0.5, fuller's earth (to facilitate disintegration of the briquets in water) 9.0, and graphite 1.9%.

7126. Joos, C.E. **Removal of ammonia from boiler feedwater?** *Power Plant Eng.* 49, No. 1, 122, 124 (1945).—*C.A.* 39, 1003[2].

Troubles due to NH_3 in the steam were outlined. Three methods for its removal were given, by mech. means, ion exchange, and the use of Cl_2.

7127. Lourier, Ya. Ya. and Klyachko, V.A. **Removal of silica from boiler feed water.** *Compt. rend. acad. sci. U.R.S.S.* 49, 40-2 (1945).—*C.A.* 40, 4455[8].

Si compds. were converted into H_2SiF_6 by adding HF or a sol. fluoride and HCl, followed by air agitation, according to the following equation: $H_4SiO_4 + 6F^- + 4H^+ = SiF_6^- + 4\,H_2O$. SiF_6 ions were then removed by filtration through a special exchange resin. This was obtained by condensation of *m*-phenylenediamine with formalin in the presence of HCl followed by methylation with dimethyl sulfate for an hr on a water bath. After use, this resin was regenerated by treatment with a 5% soln. of NaOH or Na_2CO_3, with the substantially quant. removal of the SiF_6 ions.

7128. Mann, E.H. and Ruchhoft, C.C. **A study of the suitability of Chemical Warfare Service activated carbons for use in treatment of public water supplies.** *J. Am. Water Works Assoc.* 37, 238-44(1945).—*C.A.* 39, 1709[2].

Added materials for gas adsorbtion were Cu and/or Ag. Comparative tests showed that neither of these elements would be objectionable. For odor removal the carbons were not nearly so effective as activated carbons of water-purification grade and much more of the Chem. Warfare Service carbons would have to be used to produce the same results.

7129. Manring, W.E. **Demineralization of water by ion exchange.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 6, 121-6 (1945).

Four alternate beds of Ionac cation and anion exchange resins were used in the demineralization of water. Regeneration of the four beds in parallel was carried out at a flow rate of approx. 5 bed-vol./hr. The first and third beds of cation resin were regenerated with dil. H_2SO_4. Where high Ca/Na prevailed in the influent water, acid regeneration of the first bed was preceded by a NaCl regeneration in order to prevent the deposition of insol. $CaSO_4$ in the bed during the subsequent passage of H_2SO_4. The sec. bed was regenerated with caustic soda and the fourth bed with sodium bicarbonate and caustic soda or sodium carbonate, their proportions depending on the alkalinity of the raw water. The purpose of this type of fourth bed activation was to buffer it by partial exhaustion with carbonic acid.

7130. MORRISON, W.S. **De-ionized water for war plants and the ceramic finishing field.** *Paper Trade J.* **120**, No. 1, 31-2(1945); *Tech. Assoc. Papers* 27, 222-3 (1944); *Finish.* **1**, No. 2-3, 14-17, 44, 50 (1944).—*C.A.* 39, 1001^5, 2167^9.

The chem. reactions involved were discussed including the Na and H exchanges and the acid adsorption. A typical water-treating unit with plastic-lined cationic and anionic reactor tanks was shown. Several com. installations were presented to illustrate the possibilities of water-treatment systems by the pulp and paper industry.

7131. NOREUS, R.E. **Use of activated silica in the coagulation of highly colored water.** *Paper Trade J.* **120**, No. 11, 45-7 (1945).—*C.A.* 39, 2361^2.

The use of activated silica in the treatment of highly colored soft water resulted in lower settled effluent turbidities, lower filtered water colors, and increased filter runs. These improvements were attributed to the much lower effluent turbidities resulting from the heavier, faster-settling coagulation.

7132. OLIN, H.L. AND MYERS, E.M. **Water purification with bentonite.** *Paper Trade J.* **120**, No. 10, 46-9(1945).—*C.A.* 39, 2166^5.

A "split treatment", in which bentonite fortified with a small amt. of alum when needed, was utilized. It is believed that bentonite water clarification has passed the primary research stage and that it has demonstrated its applicability and value in the treatment of numerous types of water showing promise of lowering the cost of chem. dosage.

7133. STOCKWELL, H. P. JR. **Treating a colored water supply at Ottawa, Ontario.** *Water and Sewage* **83**, No. 4, 52-8, 88, 90 (1945).—*C.A.* 39, 3863^9.

Water of highest bacteriol. quality and phys. cleanliness was obtained by use of Cl_2, $Al_2(SO_4)_3$, activated carbon and lime.

7134. STRAUB, F.G. AND GRABOWSKI, H.A. **Silica deposition in steam turbines.** *Combustion* **16**, No. 7, 41-3 (1945); *Trans. Am. Soc. Mech. Engrs.* 67, 309-16 (1945).—*C.A.* 39, 1486^7.

Lab. and power-plant tests indicated that the SiO_2 left the boiler as vaporized silicic acid, which later crystallized on the blades in the lower-pressure stages of the turbine. When the SiO_2 in the steam was below 0.1 p.p.m., no appreciable deposits were found in the turbines. Deposits could be prevented by maintaining the SiO_2 in the boiler water below 5 p.p.m. or removing the SiO_2 from the steam by scrubbing with a pure water.

7135. SUSSMAN, SIDNEY AND MINDLER, ALBERT B. **Ion exchange. Old process finds new uses.** *Chem.Industries* **56**, 789-95 (1945).—*C.A.* 39, 2833^4.

7136. THOMPSON, R.B. **Some fundamental factors and the design and operation of ion exchange installations.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 6, 135-41 (1945).

The raw water analysis controlled the type and quantity of regenerants to be employed and represented the greatest single item of operating cost in water de-ionization. The cation exchangers tested all exhibited leakage of cations. Under identical regeneration conditions, the cation leakage was directly proportional to strength of exhausting soln. for the same proportion of alkalinity in the raw water. The proportion of alkalinity in the untreated water detd. the capacities and regenerant quantities. Flow rate was important in affecting cation leakage, the rate per ft^3 of exchanger being of greater significance than the rate per ft^2. Anion exchangers would accomplish essentially 100% removal of mineral acids under the concns. usually encountered in water treatment and their capacity depended on the strength of the exhausting soln. as well as on the acid being removed.

7137. WEBB, W.L. **Experience with potassium treatment at Windsor station.** *Trans. Am. Soc. Mech. Engrs.* 67, 325-8 (1945).—*C.A.* 39, 4415^1.

With hardness, Al_2O_3, and SiO_2 in quantity entering the cycle through condenser leakage, wall-tube losses in two 1350-lb/in^2 boilers were extensive under conventional Na treatment. When both boilers were operated under K treatment, with e.p.m. ratios of $K/Na = 2$ and $SiO_2/OH = 0.5$, the treatment did not prevent the failure of wall tubes on which analcite had already formed. The two boilers were then chemically cleaned and one was put on K treatment and the other on Na treatment. Both boilers received the same feedwater.

7138. APPLEBAUM, S.B. **Filtration of water through diatomaceous earth.** *Water & Sewage Works* 93, 308-10 (1946).—*C.A.* **41**, 546^i.

Pretreatment with coagulant hypochlorite was needed for all but clear surface waters. The initial precoating of diatomite on the filter membrane was patterned after industrial practice; "body-feeding" of more diatomite during progress of the filter run was required to prevent surface sealing of the media. During body-feeding the diatomite slurry was agitated by a water motor, and dild. by filtrate so as to become progressively weaker in step with decreasing rate of filtration. Backwashing required 1 min., and consumed about 2% of the output.

7139. ASTAF'EV, V.P. AND ASTAF'EVA, M.F. **Experiments on water softening with humus coals.** *Za Ekonomiyu Topliva* 3, No. 1, 32-4 (1946).—*C.A.* **40**, 4455^2.

The exchange capacity of humus coals in the Moscow region of grain size 0.3-3 mm was 400-800 and the size 0.3-1 mm was 600-1200 tons/degree/m^3. The exchange capacity of humus coals in the

Bogoslov deposit was 1200-200 tons/degree/m^3, and those found in Bashkiria were similar to those in the Moscow region. Expts. were reported on their repeated use for softening feed water.

7140. BILLINGS, L.C. **Experience with anthracite coal filter.** *Southwest Water Works J.* 28, No. 3, 18-20 (1946).—*C.A.* 40, 7456^2.

Coal permitted more desirable wash-water expansion; the bed was kept cleaner; when properly sized it was equal to sand in removing turbidity and bacteria. Filter runs were lengthened from 75 to 130%, the capacity being the same. Coal will cost 140% more than sand.

7141. BONGIOVANNI, J.P. AND NAVARRO, J.R. HURTADO **Zeolite plants for municipal water supplies.** *Rév. sanidad y asistencia social (Caracas, Venezuela)* 11, 173-8 (1946).—*C.A.* 41, 3236*i*.

7142. BRINDLE, HARRY AND RIGBY, GERALD. **Preparation of nonpyrogenic water and infusion fluids using activated charcoal.** *Pharm. J.* 157, 85 (1946); *Quart. J. Pharm. and Pharmacol.* 19, 302-9 (1946).—*C.A.* 40, 7518^2.

Dist. H_2O was rendered pyrogen-free when shaken at intervals for 15 min. with 1 g of charcoal per liter. Adsorption losses in the case of NaCl and dextrose were negligible; with procaine-HCl the loss was 27-35% on the wt of charcoal.

7143. BUNKER, GEO. C. **The control of odor and taste and the elimination of dissolved gases in water supplies.** *Rév. sanidad y asistencia social (Caracas, Venezuela)* 11, 145-72 (1946). —*C.A.* 41, 3237*i*.

7144. CHEKURDA, A.F. **Technical conditions and rate of charging filtering fields.** *Sakharnaya Prom.* 19, No. 9, 24-35 (1946).—*C.A.* 41, 4666*f*.

Sugar refineries have large quantities of waste water which require biol. purification and disposal. This was accomplished by discharging the waste water into filtering fields. The effectiveness of the disposal depended on the nature of the soil (structure, mech. analysis, etc.) and the rate of charging the filtering field. Formulas were given for calg. the filtering capacity of various types of soils.

7145. DONNELLY, R.P. **The selection and installation of a water-treatment plant.** *Power and Works Engr.* 41, 5-8, 24 (1946).—*C.A.* 40, 4453^6.

Processes in the order of their merit were: (1) full deionization to produce water free from saline constituents, (2) lime-base exchange treatment, (3) hot lime-soda process, (4) cold lime-soda process, and (5) simple base exchange.

7146. ENGLE, JAMES W. **Application of diatomaceous earth filters to swimming pool recirculation systems.** *Proc. Ann. Conf. Maryland-Delaware Water Sewerage Assoc.* 19, 36-46 (1946).—*C.A.* 45, 8173*d*.

In military use, diatomite filtration of water pretreated with a coagulant removed all amebic cysts and cercariae of schistosomes, produced water of less than 0.1 p.p.m. turbidity, and removed 90% of all bacteria. Design criteria were presented. The cost was less than sand filtration, and a smaller space required. Chlorination was still necessary.

7147. EVANS, U.R. **A simple device for preventing the formation of hard deposits in laboratory stills fed with water partially softened by base-exchange treatment.** *Chemistry & Industry* 1946, 434-5.—*C.A.* 41, 1780*f*.

A self-contained electrochem. device consisting of Zn and Cu plates supported on a glass frame was described. Use of the device in a still resulted in the formation of an easily removable sludge rather than a hard-clinging scale formed in the absence of the device.

7148. GRANATA, M. **Bacterial purification of water by means of silvered activated charcoal filters.** *Ann. igiene* 56, 284-8(1946); *Chimie & industrie* 58, 148(1947).—*C.A.* 42, 3880*b*.

Activated charcoal was silvered by the Uglow method with silvered quartz sand. Each filter element contained 85 g charcoal with 5, 10, or 20% silvered activated charcoal. Tap water or water artificially polluted with *Escherichia coli* was passed through at the rate of 1000 cc. per hr. Expts. showed the greater efficiency of the silvered charcoal.

7149. GURNEY, W.B. **Anthrafilt as a filter medium.** *Proc. 9th Ann. Short Course Water Sewerage Plant Supts. and Operators,* 1946, *Louisiana State Univ. Eng. Expt. Sta. Bull. Ser.* No. 10, 71-8 (1947).—*C.A.* 43, 2717^g.

Water for boiler feed, filtered through Anthrafilt, showed a decrease in SiO_2 owing to the removal of undissolved SiO_2 without contact action, whereas sand filter effluents showed increase in SiO_2, especially when the inital concn. was low. Vol. of water filtered during the run increased with the rate of filtration by using Anthrafilt, but decreased with sand. Cementation between the top of the gravel and sand and disturbances in the gravel were costly. With precipitators ahead of filters, no cementation occurred in Anthrafilt beds, the gravel remained level, and no topping was needed.

7150. GURVICH, S.M. **Use of anthractie as filtering material.** *Elektricheskie Stantsii* 17, No. 8, 27-30 (1946).—*C.A.* 41, 2186^d.

The use of anthracite for filtering feed water and for communal water supply was discussed. U.S.A. practices and exptl. work carried out in U.S.S.R. were compared.

7151. HARDENBERGH, W.A. **Army water supply in World War II.** *J. Am. Water Works Assoc.* 38, 952-8 (1946).—*C.A.* 40, 6718^3.

7152. HAY, HAROLD R. **Improving water-plant operation with activated silica. I. Conventional flocculation and sedimentation plants.** *Water & Sewage Works* 93, 353-8 (1946). —*C.A.* 41, 545*i*.

A summary was presented of recommended practices and advantages in the application of activated silica to aid coagulation and filtration. For waters low in turbidity, activated silica should precede alum; for other cases the silica should be added after formation of pinpoint floc with alum. Silica usually precedes lime for calcium carbonate pptn., but follows lime by several min. for Mg removal.

7153. HAY, HAROLD R. **Improving water-plant operation with activated silica. II. Upflow units. III. Low-temperature coagulation.** *Water & Sewage Works* 93, 389-92, 479-82 (1946). —*C.A.* 41, 546*e*, 5239*b*.

Activated silica improved the majority of installations by rapidly forming large, tough, heavy floc which settled well despite turbulence caused by high rates or agitation effects within the sludge zone. For color removal it was essential that silica be added with rapid mixing after alum had already formed a partial floc. In upflow softening of waters contg. org. matter and low in Mg, or in cases where only Ca was removed, the usual fine granular ppt. was transformed by activated silica to large, leathery floc. $Mg(OH)_2$ ppts. also were increased in density. Several cases were cited to show the improved flocculation and settling resulting from the use of activated silica treatment with alum. A higher ratio of silica to alum seemed advisable in cold water.

7154. HISSCHEMÖLLER, F.W. **Preparation of distilled water from tapwater containing ammonia.** *Chem. Weekblad* 42, 72-3(1946).—*C.A.* 40, 3952^4.

The tapwater at Gouda contained 2 Mg of NH_3/ liter. NH_3-free distd. water was obtained by neutralizing the feed water of the still with H_2SO_4 or H_3PO_4 or by filtering it through active carbon (Norit).

7155. HOPKINS, S.J. **Synthetic resins and water softening.** *Mfg. Chemist* 17, 285-8(1946).—*C.A.* 42, 6027*f*.

The use of these materials for producing H_2O of high purity was described.

7156. HOWARD, F. AND SPOONER, E.C.R. **Removal of taints from water.** *Chemistry & Industry* 1946, 186-8.—*C.A.* 40, 5175^5.

Sources of tastes and odors were discussed, with emphasis on American and British practice in the use of activated carbon in removing tastes and odors from potable waters. During the war activated carbon was used to remove pyrogens from distd. H_2O and medicaments.

7157. HOWARD, NORMAN J. **Progress in the treatment of water for taste and odor correction.** *Water and Sewage* 84, No. 11, 14-15, 54 (1946). —*C.A.* 41, 2512*h*.

Chlorine dioxide was used successfully in several Canadian municipalities. It was not as effective a bactericide as Cl_2 if org. matter was present. Use of activated carbon continued to grow yearly. Chloramine treatment employed where algae were present was uncertain.

7158. JOHNS, T.M. **Maintenance of base-exchange softeners.** *Southern Power and Ind.* 64, No. 2, 85, 90 (1946).—*C.A.* 40, 1956^9.

Badly-polluted zeolite was detected by washing a sample from the top of the bed in an Erlenmeyer flask; the zeolite settled out and suspended matter was visible above the zeolite. A procedure for killing and removing algae was given, which included removing and discarding the top two inches of the zeolite, washing, chlorination and rewashing, after which new material was added to restore the original depth.

7159. JONES, MYRNA F. AND BRADY, FREDERICK J. **Romoval of the cercariae of Schistosoma mansoni from water by filtration through diatomaceous silica in a small model filter.** *U.S. Pub. Health Repts.* 61, 1538-43 (1946).—*C.A.* 41, 240*b*.

Tests were made to det. the efficiency of a small model diatomaceous silica filter in the removal of the *cercariae* of *Schistosoma mansoni* from raw water. *Cercariae* added to the percolating soln. were found to be present in the water passing the filter for as long as 12 min. after the beginning of recirculation even though the filtered water appeared to be visibly free from turbidity within 1 min. after the beginning of recirculation.

7160. KIMSEY, E.G. **The softening of municipal water supplies.** *J. Junior Inst. Engrs. (London)*, 56, 270-86 (1946).—*C.A.* 41, 2825*a*.

A discussion of water hardness, old-type Clark process, development of the Clark process, excess-lime process, Accelator process, lime and lime-proportioning app., alumina-proportioning app., sludge, stabilizing treatment, base-exchange process, zeolite, and base-exchange plant.

7161. KLINGER, L.L. **Improvements in the coagulation of surface waters with activated silica.** *Paper Trade J.* 122, No. 15, 44-50(1946).—*C.A.* 40, 3843^5.

Colloidal silica was used successfully as a coagulant aid for both colored and soft lowland waters and turbid and hard lowland waters. The principle of continuous feed was applied successfully in the prepn. of the hydrosol. The resultant filtered water was less turbid, of somewhat lower color and SiO_2 content, of somewhat higher pH, sparkling and clear. The activated SiO_2 remedied many of the difficulties attendant upon the production of a suitable filtered water, such as needed in the paper industry.

7162. KOSTRIKIN, YU, M. AND YANKOVSKIĬ, K.A. **Determination of sulfates in natural, boiler, and feed waters by means of sulfocoal.** *Zavodskaya Lab.* 12, 623-4 (1946).—*C.A.* 41, 2512*i*.

Place approx. 20 g of moistened sulfonated coal in a 50-ml buret, slowly pour 50 ml of 5% HCl to replace all cations by H^+. If hydroxides, carbonates, or bicarbonates are present in the water, a part of the H^+ is used up for their neutralization. The residual acidity of natural waters is equiv. to their contents of Cl^- and SO_4^{--}, that of boiler water to contents of Cl^-, SO_4^{--}, PO_4^{---}, and very seldom NO_3^-. Det. Cl^- by the Mohr and Vollhardt method, NO_3^- and PO_4^{---} colorimetrically, and SO_4^{--} by difference.

7163. KRUSHEL, G.E. **Preventing precipitation of carbonates on glauconite grains.** *Elektricheskie Stantsii* 17, No. 9, 24-8(1946).—*C.A.* 41, 2186*f*.

Glauconite lost its effectiveness owing to pptn. of $CaCO_3$ and $Mg(OH)_2$ on it. The mech. causes could be removed by better design of filters, settling tanks, and clarifiers for the lime-treated water. The main chem. cause was supersatn. of the clarified water with $CaCO_3$ and $Mg(OH)_2$. This could be remedied in one of 4 ways: addn. of H_2SO_4 to transform the carbonates into sulfates and bicarbonates, passing in CO_2 to transform carbonates into bicarbonates, addn. of hexametaphosphate, and diln. with already softened water.

7164. Lendall, H.N. **A comprehensive survey of the taste and odor problem.** *J. Penna. Water Works Operators' Assoc.* **18**, 74-83 (1946).—*C.A.* **41**, 1780^b.
$CuSO_4$, Cl_2, and activated charcoal have been successfully used as algicides; this prevented undesirable taste and odor formation. Tastes and odors already present could be removed by: aeration, superchlorination, activated charcoal, breakpoint chlorination, and ClO_2. Other methods of limited use were ozonation, $KMnO_4$, and clays.

7165. MacGonagle, F. Robert. **Activated silica sol in water treatment.** *Paper Ind. Paper World* **28**, 533-4, 538 (1946).—*C.A.* **40**, 5917^6.
A general discussion, with special reference to its application to the pulp and paper industry.

7166. Nagai, Toyotaro; Morise, Taro; Yamamoto, Mitsugu, and Iwata, Kiyoko. **Extraction of salt from sea water.** *Research Rept. Osaka Munic. Inst. Domestic Sci.* **17**, 483-526 (1946).—*C.A.* **42**, 4695*b*.
Tests were made to find a simple method of extg. salt from sea water by using the ion substitution-water softener method. With 60 g of pos-ion substitutable resins per liter of sea water, only 6% of the salt was extd. By using Ag_2CO_3 and Ca Parmuchito the salt content was brought to 2000-3000 p.p.m. from 1 liter of sea water; 150 g of the Ag_2CO_3 and Ca Parmuchito was used over and over again.

7167. Nolte, Ernst. **Three decades of experience with waste waters from sugar refineries.** *Beitr. Wasser-, Abwasser- u. Fischereichem. Madgeburg* **1946**, 24-33.—*C.A.* **42**, 9213*d*.
Waste waters must be sufficiently dild. before discharge into streams. Disposal plants for the treatment of such wastes would have to be too large and too expensive, since they would be operated only 1/4 of the year (during the campaign.)

7168. Ôshima, Yoshio. **Filter-paper test of hot-spring water.** *Igaku to Seibutsugaku* (Med. and Biol.) **9**, 309-10(1946).—*C.A.* **47**, 1311*i*.
Capillary diffusion of a dye on filter paper was examd. as a measure of the effect of hot-spring water on the elec. charge of colloids. Congo red was used as a dye which showed a neg. charge in aq. soln. Filter paper, 1 × 9 cm, was immersed in a mixt. of 0.5 cc. of 0.5% aq. Congo red soln. and 2.0 cc. of hot-spring water for 2 min., and the distance of the diffusion of the dye was measured.

7169. Royal Naval Scientific Service. **Production of potable water from sea water.** *Chimie & industrie* **56**, 14-17(1946).—*C.A.* **40**, 7458^7.
A method suitable for emergency use at sea was outlined. The method consisted essentially in treatment with a mixt. of Ba and Ag zeolites, Ag_2O, a disintegrating agent, and activated charcoal.

7170. Simonsson, Lennart. **Investigation of stability of zeolites.** *Ing. Vetenskaps Akad., Handl. No.* **186**, 75 pp. (1946).—*C.A.* **41**, 2513*c*.
Neopermutit, SN-Permutit, greensand products, Doucil, Invertit F, Refinite, Natrolit 1933, B-Natrolit, B-Natrolit HK, and Basolit were tested for stability with distd. water at 0-60°C, with solns. contg. 0.0001-1.0 *N* NaCl and 0-60 mg/liter SiO_2, and over a range of 4-10 in pH. Sludge formation increased linearly with time and accelerated at higher temps. but did not correlate with liberation of silica or Al.

7171. Streatfield, E.L. **Recent developments in water treatment.** *Trans. Liverpool Eng. Soc.* **67**, 80 (1946); *J. Am. Water Works Assoc.* **40**, 989-90 (1948)—*C.A.* **43**, 6765*b*.
Use of silicates as aid to coagulation showed promising results. Bentonite, another aid to coagulation, was also developed in America. Coagulation by an elec. process was used for removing emulsified oil from condensate. Oil-contaminated condensate passed between electrodes, across which passed small direct current, during which time emulsified particles coagulated. Water then passed to a rapid filter contg. sand, anthracite, or activated carbon. A small quantity of water contg. sol. solids had to be added to the condensate to produce elec. cond. The conventional rectangular sedimentation tank with over- and under-baffles was unsatisfactory. An interesting development in filtration was the use of anthracite as a filter medium.

7172. Tach, M. **Chemical purification of water by mineral and organic exchange media.** *Chaleur et ind.* **27**, 169-76 (1946).—*C.A.* **41**, 545^h.
The theory and practice of the use of zeolite and org. anionic and cationic exchangers were reviewed.

7173. Teis, R.V. **Isotope composition of mineral waters.** *Compt rend. acad. sci. U.R.S.S.* **53**, 135-7(1946)(in English).—*C.A.* **41**, 4345*b*.
Previous d. detns. of 35 natural waters showed the least mineralized to have the lowest d., which resulted from soil layers adsorbing D during percolation. Isotopic exchange was also considered responsible for d. decrease, by substitution of light H for D or O exchange.

7174. Warth, A.H. **Purifying water by ion exchange.** *The Crown* **36**, No. 1, 13(1946).—*C.A.* **41**, 2512^f.
Description of the chemistry of the ion-exchange process and the use of Amberlites in water purification.

7175. Akeroyd, E. I. **Water treatment.** *Proc. Tech. Sect., Paper Makers' Assoc. Gt. Brit. & Ireland* **27**, 203-14(1947).—*C.A.* **41**, 7018*f*.
Clarification, pptn. softening, ion-exchange softening, and ion-exchange processes for removing dissolved salts were discussed. Analytical data were given to show the effect of the various treatments on a raw water.

7176. APPLEBAUM, S. B. **Iron and manganese removal.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 7, 123-30 (1947).

There was no single method that was satisfactory for the removal of Fe and Mn in all cases. Individual study was required in each case to decide the most economical design of plant to accomplish the desired result. Mn-zeolite was very valuable as a finishing or polishing process because it reduced the Fe and Mn to under 0.1 p.p.m. It was particularly efficient in Mn removal.

7177. BAILEY, HOWARD E. AND STEADLEY, JAMES. **Activated-carbon treatment of an open reservoir.** *Water & Sewage Works*, 94, 219-22 (1947). —*C.A.* 42, 8377*a*.

A pond (108 acres) used as a municipal H_2O supply was cleared of tastes and odors by application from a boat of 0.6 p.p.m. of $CuSO_4$ and 1.25 p.p.m. of activated carbon. Tastes and odors from algae could be successfully removed upon 72 hrs notice.

7178. BAUMAN, W. C.; EICHHORN, J., AND WIRTH, L. F. **Symposium on silica removal by ion exchange.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 7, 98-103 (1947).

It was of prime importance to remove the last traces of silica in the demineralized boiler feed water. A typical demineralizing unit was described, consisting of cation and anion exchangers placed in series. The exhausted anion exchanger was treated with 5% HCl before regeneration. Silica removal from the anion bed was 98% complete. Anion resin (T-A) was used in a one-inch diameter Saran tower. The cation exchanger used in all the silica tests was Dowex-30.

7179. BAUMAN, W. C.; EICHHORN, J., AND WIRTH, L. F. **Silica-free boiler feed water by ion exchange.** *Ind. Eng. Chem.* 39, 1453-7(1947).—*C.A.* 42, 701*i*.

The complete removal of silica from water was attained with ion-exchange resins. Silica was converted to fluosilicic acid and removed as such by an anion resin. Six different resins were used in this study, and the effect of various methods of adding the fluoride ion. Alkali regeneration of exhausted anion beds must be preceded by acid or salt treatment to avoid pptn. of silica in the anion exchangers.

7180. BLIGHT, F. C. **Base-exchange of lime-soda water softening?** *Mech. World*, 122, 179-82 (1947); *Dept. Sci. Ind. Research (Brit.) Fuel Abstracts* 2, No. 5, 136(1947).—*C.A.* 42, 5589*c*.

The factors influencing the choice of method of softening feed water for boilers working at less than 200 p.s.i. and 2,000 gals/hr were considered under three headings, mech., chem., and economic. The mech. aspect was shown to be wholly in favor of the base-exchange process. The chem. aspect was discussed at some length with reference to different types of boilers and of hardnesses and the results were summarized.

7181. CAMPBELL, JOHN T. **New West Penn Water Co. supply.** *J. Am. Water Works Assoc.* 39, 770-2 (1947).—*C.A.* 41, 7021*b*.

The old supply, a surface water, became contaminated with mine wastes. The new supply, also surface, was located where mine wastes were not apt to be present. Treatment includes prefiltration, settling, helped by a precipitator. The filter media of the sand filters were graded gravel and anthrafilt.

7182. CERNA, W. W. **Survey of German feed-water practice.** *Power* 91, No. 9, 72-6(1947).—*C.A.* 41, 7022*c*.

Physically hard exchange resins were used as high as 210-12°F with water deaerated and having a max. pH value of 8.5. Silica removal was based largely on the use of Mg. The use of NH_3 was successfully developed.

7183. ELLIOT, O. M. **Brackish feed water treatment.** *Proc., 8th Annual Water Conf. Engrs's Soc. of West. Penna.* 1947.

Processes in economic competition for treatment of brackish waters were: distillation, deionization, softening by ion exchange, and softening by precipitation. A discussion of the applicability of each process and a description of a precipitation plant were given.

7184. FRANCIS-BOEUF, CLAUDE. **The amount of oxygen dissolved in the interior medium of fluviomarine slimes.** *Compt. rend.* 225, 392-4 (1947).—*C.A.* 42, 3025*f*.

The interior medium of estuary slimes contained no dissolved O_2. The surrounding pellicle of these slimes, on the other hand, was the seat of photosynthesis which offset in part the high reducing power of these org. sediments and the O_2 consumption by bacteria.

7185. FULMER, J. O. JR. **Production and maintenance of water quality at Easton.** *J. Penna. Water Works Operators' Assoc.* 19, 72-5 (1947). —*C.A.* 42, 2697*f*.

Chloramine was replaced by activated carbon, added at the mixing chamber and at the filters, and postchlorination, with dosages from 6.8 to 7.3 p.p.m. Cl, to provide H_2O with free available Cl of 2.5-3.5 p.p.m.

7186. GILWOOD, M. E. **Symposium on silica removal by ion exchange.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 7, 94-98 (1947).

Silica may be removed from waters contg. low dissolved solids cheaply, if demineralizing treatment was not desired. Demineralized silica-free water was available by commercial processes. It was now possible to supply boiler-makeup water having virtually the same quality as distilled water. However, before deciding which treatment should be recommended for a given boiler plant, it was necessary in each case to make a complete engineering-economic study to det. which process resulted in the most economical over-all boiler and water plant operation.

7187. GILWOOD, M. E. **Five ways to remove dissolved silica from boiler feed water.** *Power* 91, No. 8, 86-9 (1947).—*C.A.* 41, 7022*e*.

The ways outlined were with ferric sulfate, with Mg salts, by fluosilicate anion-exchange reactions, by direct absorption in exchange reactions, and by combination treatment.

7188. HALVORSEN, GORDON G. **Diatomaceous filter aids for paper-mill waters and effluents.** *Paper Trade J.* 125, No. 18, 37-41 (1947).—*C.A.* 42, 367*e*.

Filtration cycles of 3-8 hrs at 30 gal/ft^2/hr with 4-16 lb filter-aid/1000 gal and filtration pressures up to 16 p.s.i. could be obtained on av. mill white waters. Lower quantities of the filter aid and longer cycles were obtained on white waters contg. stock from the manuf. of higher-quality boards and paper. Filtration of well or river water were accomplished by using extremely small quantities of diatomaceous earth; this assured pos. clarified waters which will give satisfactory operation on low-vol. type showers.

7189. HANEY, PAUL D. **Disposal of water-purification and -softening plant wastes. Brine disposal from sodium zeolite softeners.** *J. Am. Water Works Assoc.* 39, 1215-19 (1947).—*C.A.* 42, 2041*a*.

Evapn., brine-disposal wells, and uncontrolled and controlled diln. were the methods under consideration; controlled diln. seemed to offer the generally best means at present.

7190. HAUCK, CHAS. F. **Current trends in the re-use of water.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 7, 155-60 (1947).

Re-use practices were divided on the basis of first use: (1) re-use of process waters; (2) water from cooling and heating circuits; (3) re-use of sewage plant effluent.

7191. HEERTJES, P. M. AND HEKMAN, E. E. **Purification of the waste water from plants manufacturing potato starch, by treatment with a cation-exchanger.** *Chem. Weekblad* 43, 789-96 (1947).—*C.A.* 42, 5699*b*.

The potatoes were grated, and the juice obtained therefrom was analyzed for total nitrogen and albumin contents. The sap was then treated with the exchanger. Two methods of procedure were utilized—treatment of small samples and treatment of a continuously flowing column. If the cation-exchanger method can be adapted to practical large-scale operations, the purification problem will be solved.

7192. HOOT, R. A. **Mathematical calculation of phenol value of an activated carbon.** *Water & Sewage Works* 94, 402-4(1947).—*C.A.* 42, 8445*d*.

The phenol value for an activated carbon can be calculated instead of detd. graphically, by applying the method of least squares to Freundlich's equation. Use of an elec. calculator reduced the time required in the method presented.

7193. JUKKOLA, W. W. AND THOMPSON, R. B. **Symposium on silica removal by ion exchange.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 7, 89-94 (1947).

Silica was removed by ion exchange with the available exchange resins. For small plants with moderate amts. of SiO_2, addn. of fluorides to the raw water appeared to be an economical soln. When either high silica waters were encountered or high vols. involved, the cost of silica removal may be materially lowered by employing a cyclic process which involved the recovery and re-use of the fluorides.

7194. LEAF, WALTER. **Silica removal.** *Mech. Eng.* 69, No. 2, 156-7 (1947).—*C.A.* 41, 2186*i*.

Hydrated Fe_2O_3 was found to be effective for removal of SiO_2 from H_2O. In one treatment plant it was found impossible to secure continuous rusting of steel shavings, probably because the high SiO_2 content of the water formed a protective film. Better results were secured with cast Fe chips, which rusted readily, but cemented together to form a solid mass that had to be broken up with a fork.

7195. LUR'E, YU YU AND STEFANOVICH, S. N. **Use of organolites in the analysis of water.** *Zavodskaya Lab.* 13, 660-3(1947).—*C.A.* 42, 7464*f*.

Cation organolites were used to eliminate Ca and Mg in natural and sewer water. Extd. Ca and Mg were recovered by adding HCl (1:9) and (1:4), resp. Loss in extn. was approx. 2%. Sulfate was detd. by titrating the filtrate with 0.1 *N* NaOH (methyl orange indicator).

7196. MAIER, F. J. **Methods of removing fluorides from water.** *Am. J. Pub. Health* 37, 1559-66(1947).—*C.A.* 42, 2371*i*.

7197. McDILL, BRUCE M. **Industrial wastes. Beet-sugar industry.** *Ind. Eng. Chem.* 39, 657-69 (1947).—*C.A.* 41, 4259*f*.

The wastes were of large vol., high in solids and org. matter, and produced during a short period of late autumn and early winter. Changes in process to effect economics in waste disposal appeared logical.

7198. MERRILL, REYNOLD AND BOLTON, HARRY L. **Activated silica, a new chemical-engineering tool.** *Chem. Eng. Progress* 1, No. 1, 27-32 (1947).—*C.A.* 41, 2213*a*.

Activated silica sols were effective in improving coagulation. They were used for treating raw H_2O, white H_2O from paper mills, sewage, and oil-refinery waste. The method used had some bearing on the properties of the finished product. The silica sols would be a valuable tool in any application where a highly charged, readily adsorbed, neg. lyophilic colloid was needed.

7199. MIEDENDORP, HENRY. **Quality textile products demand pure, clean and soft water.** *Rayon Textile Monthly* 28, 80 (1947).

The selection of the zeolite depended upon many factors: (a) durability of zeolite as to pH rating silica, iron, suspended matter, and temperature, (b) ratio of capacity, price, and bulk of zeolite, (c) type and amount of regenerate used, (d) auxiliary treatment.

7200. MILLER, LEWIS B. **Process water treatment for rayon manufacture.** *Rayon Textile Monthly* 28, 133 (1947).

Several types of water treatment used extensively by rayon plants for the treatment of raw waters were discussed: water clarification for turbidity removal; softening of water; iron and manganese removal; color removal.

7201. MINDLER, A. B. AND GILWOOD, M. E. **Ion exchange in the treatment of wastes.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 7, 181-2 (1947).

Harmful electrolytes present in extremely low concns. were removed by ion exchange, subsequently recovering the electrolytes in relatively high concns. from the exchange material. The recovery of metals or org. acids were examples. A valuable product arising from the removal of harmful electrolytes from a waste soln. may be concd. for sale. The demineralization of pineapple mill juice for the production of a sugar syrup was the example.

7202. MORRISON, W. S. **Symposium on silica removal by ion exchange.** *Proc. Ann. Water Conf., Engrs. Soc. West. Penna.* 7, 103-108 (1947).

Waters contg. 8 to 10 p.p.m. of silica could be successfully treated to remove all but a trace of this troublesome substance from hard water supplies. Silica and silicic acid were converted to the highly ionizable fluosilicic acid H_2SiF_6 and was adsorbed on the anion resin. The possibility of slurrying the hydrogen exchange resin with CaF_2 for silica removal was studied. The cation resin so treated not only removed metal ions, but tended in its acid state to react with CaF_2 to form hydrofluoride for silica removal.

7203. NESSLER, R. L. **Soft water for silk hosiery mill with zeolite water conditioning.** *Rayon Textile Monthly* 28, 286 (1947).

After several years of continuous service at full boiler capacities, recent internal inspection of the boilers revealed no evidence of corrosion. Thus was indicated the effectiveness of the deaerating heater in removing the dissolved oxygen and the large amount of carbon dioxide from the feedwater.

7204. OWENS, F. R. **Silica deposits in steam turbines from softening of makeup through natural zeolite.** *Combustion* 19, 37-9(1947).—*C.A.* 41, 7022*g*.

In steam turbines operating at pressures of 600 p.s.i. or less, when greensand was used as water softener, SiO_2 deposits were found; samples from 3 plants contained, resp., SiO_2 93.89, 88.10, and 88.01; Fe_2O_3 2.56, 6.00, and 4.20; SO_4^{-} 1.40, 0.42, and 3.46; Cl 0.37, 1.27, and 0.96; OH none, none, none; CO_3^{--} none, 0.42, and none; P_2O_5 none, 0.49, and 0.94; CaO 0.29, none, and 0.12; MgO 0.96, none, none; Na_2O 1.01, 1.65, and 1.42. The loss of SiO_2 from greensand increased with OH concn. and with total ion concn. in a water supply.

7205. PEACEMAN, DONALD. **Demineralization of water.** *City Coll. Vector (N.Y.)* 10, 38-9, 53 (1947).—*C.A.* 41, 7020*g*.

A review of processes for removing minerals from water.

7206. RUCHHOFT, C. C. AND ETTINGER, M. B. **Tastes and odors in water resulting from industrial wastes.** *Proc. 3rd Ind. Waste Conf., Purdue Univ. Eng. Bull., Extension Ser. No.* 64, 321-50(1947).—*C.A.* 43, 4794*c*.

Satisfactory phenolic-waste treatment depends upon plant-recovery practices, although phenols in dild. wastes were handled by trickling filters, since biochem. oxidation with proper seeding was the major dissipating agent. Tastes and odors from phenolic compds. in chlorinated H_2O can be removed by activated carbon, chloramine treatment, ClO_2, and breakpoint chlorination.

7207. SALAC, VÂCLAV. **Correction of water with Wofatite.** *Congr. intern. inds. fermentations Confs. et communs.* 1947, 514-25.—*C.A.* 42, 8378*i*.

Since 1943, Wofatite resins have been employed for softening water in a brewery. Wofatite K(H exchanger), a phenol-HCHO resin and Wofatite M(OH exchanger), a polyamine-type resin, were used. Compared to beer made from boiled water, that from resin-purified water showed notable improvement in taste. Harder water could be used; e.g., a water of 42.1° total hardness and 22.3° temporary hardness was reduced, resp., to 21.3 and 5.7°.

7208. SIGWORTH, E. A. **Taste and odor control with activated carbon.** *Water & Sewage Works, Reference & Data sect. Pt. 1*, 94, No. 7, R-135-6 (1947).—*C.A.* 42, 8377*b*.

7209. STORRIE, WILLIAM. **Toronto water-works extensions—a general description of the system with details of some outstanding features.** *J. New Engl. Water Works Assoc.* 61, 1-33 (1947).—*C.A.* 41, 3889*h*.

The supply (Lake Ontario) was chlorinated and sometimes superchlorinated. Dechlorination with SO_2 for taste removal will be practiced when necessary. A water-purification plant was planned which will include mixing, coagulation, addition of activated carbon, and use of both Cl_2 and SO_2.

7210. STREATFIELD, E. L. **Anthracite as a water filter medium.** *Paper-Maker* (London) 113, TS5-6 (1947)—*C.A.* 43, 5139*e*.

Comparative data for anthracite and sand-filters used for a river H_2O treated with $Al_2(SO_4)_3$ showed that the filter areas of 336 ft^2, bed depths 2 ft, filtration rates 120-128 and 128 $gal/ft^2/hr$, and effective particle sizes 0.6 and 0.5 mm, resp., the av. lengths of the runs obtainable were 5 and 1 hr, resp. A 5-min. air scour of 2.7 $ft^3/min./ft^2$ of filter area with back-washing (3000 gal/min.) for 4 min. cleaned the anthracite filter but after similar air scour and back-washing for 6-7 min. the sand filter was still unworkable.

7211. STREICHER, L.; PEARSON, H. E., AND BOWERS, A. E. **Operating characteristics of synthetic siliceous zeolite.** *J. Am. Water Works Assoc.* 39, 1133-51 (1947).—*C.A.* 42, 1679*f*.

The principal causes of zeolite aging were mech. attrition and loss of silica by soln. in the softened water. The effects of pH and the influence of fluorides, as well as other salts in the water on soln., were discussed. Operation control was important, especially control of brine concn. and contact time of brine with zeolite during regeneration.

7212. TAYLOR, ELBERT J. **Water-works improvements for Philadelphia.** *J. Am. Water Works Assoc.* 39, 123-7 (1947).—*C.A.* 41, 2512*e*.

A high bacterial load, tastes, odors, and corrosion made the present supply, largely from the Schuylkill River, objectionable and difficult to treat. The new recommended supply will be the Delaware River taken above the Delaware Water Gap. Treatment will include activated carbon, preozonation, and free residual chlorination.

7213. THOMPSON, J. AND MCGARVEY, F. X. **Some practical aspects of deionization.** *Proc., 8th Annual Water Conf. Engrs's Soc. of West. Penna.* 1947.

Operational procedures and problems arising in the operation of ion exchange beds were discussed. Data were presented to show head losses, leakage, backwash effects, and regeneration treatments with various materials.

7214. THOMPSON, RUDOLPH E. **Diatomite filtration.** *Water and Sewage* 85, No. 9, 31, 57-8, 60 (1947). —*C.A.* 41, 7591*b*.

Diatomite filters and their use in the American Army were described. Similar units are now employed for swimming pools.

7215. VOSLOO, P. B. B. **Rapid sand filtration of sewage works effluents without coagulants.** *Inst. Sewage Purif., J. and Proc.* 1947, Pt. I, 204-9.—*C.A.* 44, 250*i*.

For slow sand filters treating humus tank effluent, the av. rate of filtration was 3 gals/ft^2/hr, and the filters were out of service 2/3rds of the time for cleaning. Expts. on pressure filtration with 20-30 mesh sand as the top layer showed that practically all the suspended matter was removed at rates of filtration at least up to 200 gals/ft^2/hr. The amt. of effluent filtered between backwashes was not dependent on the rate of filtration, provided the conditions of head and rate at the end of the run were fixed.

7216. WAMSLEY, ROBERT AND JONES, W. E. **Fluoride removal.** *Water & Sewage Works* 94, 272-6(1947). —*C.A.* 42, 8377*c*.

Underground H_2O, contg. 80-250 p.p.m. total hardness, variable turbidity, high SO_4^{--} content, and 14 p.p.m.F, was treated at a rate of 300,000 gals/day, screening, softening with lime, soda ash, and $NaAlO_2$; rapid sand filtration; and recarbonation; followed by $Ca_3(PO_4)_2$ filters for F removal. The phosphate filter was regenerated with 1% NaOH and CO_2 obtained from dry ice. F was reduced to 0.5 to 0.7 p.p.m., and total hardness to 75 to 96 p.p.m.

7217. WEDGWOOD, PHILIP. **Practical progress in water treatment.** *Gas World* 126, 688-91(1947); *Gas J.* 250, 453, 455, 457-8.—*C.A.* 41, 5238*h*.

The water to the plant boilers was treated in lime-soda softening unit, and then by-passed through a synthetic zeolite. The av. hardness of the raw water was 18.2 grains per gal temporary, and 0.7 grain permanent (expressed as $CaCO_3$). The treated water over a 6 months' period had an av. hardness of 0.59 grains per gal, and an alky. to phenolphthalein of 0.47 and to methyl orange of 4.3.

7218. WICKERT, K. **Conditioning and checking of boiler feedwater.** *Arch. Metalkunde* 1, 499-521(1947).—*C.A.* 42, 8379*f*.

After removal of coarse contaminants feedwater was usually passed through a gravel filter. Depending upon types of contamination, different purification filters may follow: e.g. activated carbon for oil and aeration for Fe (in form of bicarbonate or sulfate). Some purification operations were necessary for the protection of the water-softening app. Various softening methods were described, including the alkali exchange, chem., and thermal methods.

7219. WILEY, JOHN T.; DELONEY, JOE E., AND DENTON, S. WALTER. **Accurate particle-size determination of fluid catalyst by coordination of Roller analysis and microscopic examination.** *Proc. Am. Petroleum Inst.* 27, Sect. III 23-8(1947).—*C.A.* 42, 5723*h*.

A novel filter trap and adapter were used with a Roller Analyzer which measured with a precision of ±1.3%. Necessary precautions and factors affecting the results were listed.

7220. WILLIAMS, W. L. **Microbial fouling of zeolite water softeners.** *J. Am. Water Works Assoc.* 39, 779-82 (1947).—*C.A.* 41, 7022*b*.

A plant was described, using pre-softening ahead of Zeo-Karb softeners. When well water became short, Ohio River water was used. This was highly polluted and the zeolite was soon contaminated with org. growths. High-Cl_2 residuals, removal of filter material, and cleaning were necessary before the trouble was overcome.

7221. WINDEN, F. J. V. D. **Use of an ion-exchange softener for softening of scrubbing water in a Berkhuysen ammonia washer.** *Het Gas* 67, 31-5 (1947).—*C.A.* 41 7704*g*.

The hardness of the water should be below 2° to prevent plugging of sprays. An installation was described for treatment of some 300 liters water/hr used to remove NH_3 practically completely from 3000m^3/hr of gas, the effluent NH_3 liquor being up to 8° Bé. An open aerator-gravel filter treatment was used for Fe removal followed by a set of carbonaceous zeolite washers (375 kg Thymharsite each).

7222. BAUMAN, W. C.; SKIDMORE, J. R., AND OSMUM, R. H. **Dowex 50.** *Ind. Eng. Chem.* 40, 1350-5 (1948).—*C.A.* 42, 8379*i*.

Dowex 50 exhibited properties of high capacity and chem. stability when applied to the softening and demineralization of H_2O. River H_2O contg. 3 grains/gal hardness and total solids of 350 p.p.m. and receiving sedimentation and adjustment to pH 8.5 with H_2SO_4, was treated to a hardness of less than 1 p.p.m. and a turbidity of 0.5 p.p.m. A resin bed of 300 ft^3 capacity operated successfully through 176 cycles over a period of 22 months, treating 1,250,000 gals/ft^3 or 2,000,000 gal/cycle, with a cycle time of 33 hrs. The regeneration was accomplished by 16 lb NaCl/kilograin $CaCO_3$.

7223. Bliss, Harding. **Developing a waste-disposal process. Examples from the copper and brass industry.** *Chem. Eng. Progress* 44, 887-94(1948).—*C.A.* 43, 7885*g*.

A discussion of the nature of specific copper and brass industry wastes and flow sheets for treatment thereof involving ion-exchange, electrochem., and electrolytic methods.

7224. Blumer, M. **A field method for water investigation with ion exchangers.** *Experientiz* 4, 351(1948).—*C.A.* 43, 791*f*.

After measurement of the pH and titration for alky., the cations were exchanged for H ions in a resin-exchange column. Titration with NaOH showed the total cation content, with an error not exceeding 1%. Free CO_2, and permanent and temporary hardness could be estd. from the 3 values.

7225. Bogdanchenko, A. G. **Multiple-action sand filter.** *Zavodskaya Lab.* 14, 119-23(1948).—*C.A.* 43, 909*d*.

Details were given for prepg. multiple-action quartz sand filters for solns which were to be used for vol. analysis. Sketches, vols., and wts of sand fractions were given and results from paper and sand filters compared.

7226. Calise, V. J. and Lane, M. **Silica removal by an improved ion-exchange process. A comparison with the fluosilicic acid method.** *Chem. Eng. Progr.* 44, No. 4, *Trans. Am. Inst. Chem. Engrs.* 269-74 (1948).—*C.A.* 42, 3624*e*.

A comparison was made of silica removal by ion-exchange processes with the fluosilicic acid method in reference to operating results, plant design and construction, removal of CO_2, necessary material of construction and treatment costs.

7227. Colebaugh, David C. **Taste and odor control.** *Proc. 11th Ann. Short Course Water and Sewerage Plant Supts. and Operators,* **1948**; *Louisiana State Univ. Eng. Expt. Sta., Bull., Ser. No.* 16, 37-40 (1949).—*C.A.* 43, 6343*c*.

Plant practice, particularly in the application of activated carbon, was reviewed.

7228. Gandenberger, Wilhelm. **Water purification at the Gallenklinge Waterworks, Stuttgart.** *Gas- u Wasserfach* 89, 305-10 (1948).—*C.A.* 43, 1885*g*.

Prior to the settling basin, addns./m^3 included 3 to 5 g of Cl_2; 60 g aluminum sulfate, and up to 60 g of clay (added only when necessary). Before filtration, the following chemicals were added (per m^3) 20-40 g hydrated lime and 4 to 6 g of powd. active carbon; after filtration 1 to 2 g Cl_2/m^3 was added, with final Cl_2 removal by means of active carbon filters, which had a relatively long life. A very satisfactory water, free from chlorophenol taste, was secured.

7229. Grove, C. S. Jr. and Casey, Robert S. **Deionized water for writing-ink manufacture.** *Chem. Eng. Progr.* 44, 733-6(1948).—*C.A.* 43, 336*a*.

A plant for purifying water by deionization, which produced from 3600 to 4800 gal/day, was described and the operating procedure and costs discussed. The raw water had an av. cond. of 300 micromhos (about 10 grains/gal of NaCl equiv.), from which a purified water of less than 3 micromhos cond. was produced.

7230. Hey, Raimund. **"Microspur," a new means of sterilizing drinking water.** *Zentr. Bakt. Parasitenk. I. Abt. Orig.* 152, 327-33(1948).—*C.A.* 43, 790*d*.

"Microspur" is a complex mixt. of Ag salts. Ordinary tap water was sterilized in 6 hrs, but if turbid 24 hrs may be required. If a combination of "microspur" and the activator was used, clear water would be sterilized in 1 hr. Turbid waters should first be pptd. and filtered.

7231. Hock, Heinz. **Determination of the total cation content of water.** *Chimia (Switz)* 2, 227-9 (1948).—*C.A.* 43, 2715*h*.

The metallic ions were detd. with Amberlite IR-100. A glass tube 15 mm in diam. and 350 mm high contained the exchanger to a height of about 270 mm. Three hundred cc. of H_2O was passed through the exchanger bed at the rate of about 20 cc./min. The first 200 cc. was discarded and the final 100 cc. titrated with 0.1 *N* NaOH to the yellow-end-point of methyl orange.

7232. Kominek, E. G. **Evaluation of demineralization methods.** *Chem. Eng. Progr.* 44, No. 9, 697-702 (1948).—*C.A.* 42, 8380*d*.

Demineralization by means of ion-exchangers afforded the most economical means of providing a low-solids water provided that the raw water contained less than about 40 grains/gal of dissolved solids. Distn. was superior to demineralization in ion-exchangers where a pyrogen-free water or where removal of unionized solids was required. Compression distn. merited consideration for removal of solids from a highly mineralized water.

7233. Kortschak, Hugo P. and Payne, John H. **Hydrolysis regeneration of an anion-exchange resin.** *J. Am. Chem. Soc.* 70, 3139-40 (1948).—*C.A.* 43, 2067*a*.

Water, run through Amberlite IR-4B which had been exhausted with HCl, caused appreciable hydrolysis of the resin (200 liter water hydrolyzed the resin to 70% of total capacity). The Freundlich equation was applicable at acid concns. below 0.01 N and the mechanism of acid removal by this resin was one of adsorption, not ion exchange.

7234. Kullgren, Carl. **Testing and purification of distilled water.** *Svensk Kem. Tid.* 60, 169-76(1948).—*C.A.* 43, 790*f*.

A filter made from defibered kraft sulfite cellulose (3 g) was treated with 200 ml 0.3 *N* HCl (5-6 portions) and washed with 400 ml distd. H_2O. In a test, the filter was washed with the water to be tested until 2 successive washings (150 ml each) showed the same acidity. At this point, the developed acidity corresponded to the cation-exchange between the filter and the water to be tested and was, therefore, a measure of the impurities in it.

7235. Leaf, Walter B. **Silica removal with iron shavings.** *J. Am. Water Works Assoc.* 40, 980-9(1948).—*C.A.* 43, 1127*g*.

The high adsorptive capacity of ferrous iron for silica was used after other methods of silica removal had proved unsatisfactory. Cast iron chips were more satisfactory than steel lathe turnings. Silica removal was a function of the amt. of rust formed, and the iron to be effective must be in a colloidal form.

7236. MacDuff, Harry W. **Home zeolite service.** *J. Am. Water Works Assoc.* 40, 309-12 (1948). —*C.A.* 42, 3107*c*.

Two systems of home zeolite service were considered and construction details given. Control and costs of the service were studied. Such home service should be considered as supplementing rather than replacing municipal softening.

7237. Merrill, Reynold C. **Activated silica sols in water treatment.** *Ind. Eng. Chem.* 40, 1355-9 (1948).—*C.A.* 42, 8376*b*.

Activated silica sols were prepd. by the reaction of a com. 41° Bé. sodium silicate soln. with either H_2SO_4, HCl, $Al_2(SO_4)_3$, $FeSO_4$, $(NH_4)_2SO_4$, Cl_2, $NaHCO_3$, CO_2, $Na_2B_4O_7$, $NaAlO_2$, or dil. solns. of metal salts capable of forming insol. silicates, followed by aging to incipient gelation, and either prompt use or diln. for stable storage. The cost of H_2O treatment varied from 35 to 50 cents p.p.m. SiO_2/million gals. Advantages obtained included increased size, toughness, and density of the floc, decreased time required for floc formation, settling time, turbidity, and color, resulting in clearer H_2O and lengthened filter runs. In addn. to H_2O treatment, these sols were used for the treatment of sewage and various industrial wastes.

7238. Miedendorp, Henry. **Water purification and waste disposal.** *Rayon Textile Monthly* 29, 86, (1948).

In the Zeolite process water was filtered through a bed of small, hard particles called "zeolite," which were composed principally of Na and Al silicates. The Na was exchanged for Ca and Mg. The removal of these elements resulted in the water being "soft," and soft water will not form a curd with soap in the dye bath and will not allow scale to form in piping or boilers.

7239. Miklyutin, V. N. **Softening of water with natural coal.** *Energet. Byull.* 1948, No. 5, 10-14.—*C.A.* 43, 5139*h*.

Soft coal contg. 15-19% humic acid had an ion-exchange capacity comparable to that of best grades of glauconite, and was successfully used for softening water. In filtration through 0.3-1.5-mm grain size, increase of the height of the column from 20 to 90 cm doubled the efficiency. The efficiency was proportional to the temp. of the water, and at 93°C was about 3.5-4.0 times that at 12°-15°C.

7240. Morris, J. Carrell and Carritt, Jeanne B. **Contamination of water supplies by radioactive substances.** *J. New Engl. Water Works Assoc.* 62, 1-9 (1948).—*C.A.* 42, 3882*d*.

Water contamination could be due to induced radioactivity, presence of radioactive chem. wastes, at. bomb explosion, or sabotage. Possible methods of removal were suggested, such as ion-exchange treatment with filtration and deaeration. Modifications of coagulation processes were mentioned.

7241. Oda, Ryohei; Shimizu, Hiroshi, and Nakayama, Yoshio. **Ion-exchange synthetic resins. XI. Purification of water by cation-exchange resin from natural rubber. XII. Purification of water by *p*-phenolsulfonic acid-formaldehyde resin.** *Chem. High Polymers* 5, 112-13, 113-15 (1948).—*C.A.* 46, 1185*e*.

In the purification of water by cation-exchange resin (KH-1) prepd. from natural rubber, Na-Ca and H-Ca exchange, regeneration, and flow velocity were studied. The highest cation-exchange capacity was 3.57 milliequiv./g, break-through capacity for Na-Ca exchange was 3.2 milliequiv./g, break-through ratio 0.89, regeneration effect with 0.5 *N* NaCl (500% of the theoretical amt.) was 61%, and regeneration efficiency was 12.2%. For the synthetic resin the cation-exchange capacity was 3.15 milliequiv./g, break-through capacity for Na-Ca exchange 2.8 milliequiv./g, break-through ratio 0.89, regeneration effect with 0.5 *N* NaCl (500% of the theoretical amt.) 61%, and regeneration efficiency 12.2%.

7242. Olson, H. M. **A review of soft water services.** *J. Am. Water Works Assoc.* 40, 301-8 (1948).—*C.A.* 42, 3107*c*.

Several types of residential base-exchange softeners were discussed as to care, operation, and cost.

7243. Pavlish, Louis A. **De-ionized water for porcelain enamel mill rooms.** *Enamelist* 25, 21-6 (1948).

Enamel defects often can be attributed to water hardness. By the use of de-ionizers, hard water can be economically and efficiently treated to reduce rejects, improve quality, and control another variable in the Porcelain enameling plant.

7244. Richheimer, Charles E. **Sea water regeneration of zeolite water-treatment plants.** *Southern Power and Ind.* 66, No. 7, 67-9, 124, 126-8, 130 (1948).—*C.A.* 42, 6477*f*.

About 0.35 to 0.45 lb of NaCl were required per 1000 grains of hardness removed. Filtered and chlorinated sea water could be used for regeneration; the sea water should contain at least 17,000 p.p.m. of NaCl, but short periods of operation at 14,000 p.p.m. were carried out.

7245. Riley, F. R. and Day, H. M. **Ion-exchange demineralizing of solutions.** *Chem. Eng. Progress* 44, No. 5; *Trans. Am. Inst. Chem. Engrs.* 353-8 (1948).—*C.A.* 42, 4004*g*.

Water treatment is still the largest user of ion exchange. Demineralized H_2O which was usually chemically equiv. to distd. H_2O could ordinarily be produced. Improvements in operating technique and new resins have increased the versatility and flexibility of the demineralizing process until it was possible to demineralize H_2O and other aq. solns. on a scale and for purposes recently considered impractical. Demineralizing plants have been installed with capacities ranging from a few gal to millions of gal/day.

7246. Schilling, Karl. **The fine filtration of waters used in textile processing through Magno filters.** *Textil-Praxis* 3, 185-6(1948). —*C.A.* 46, 7334*f*.

The water was filtered through partially burned dolomite. The Magno mass (either the natural Magno-Dol or the synthetic, uniformly grained Magno-Syn) removed acid and Fe without softening the water. When the Mn:Fe ratio was not less than 1:5, Mn was also removed. The increase in pH stopped troublesome algae growth.

7247. Thibon, Honoré. **The nature of alumina hydrate precipitated from solutions sodium aluminate.** *Bull. soc. chim. France* 1948, 870-1.—*C.A.* 43, 55*e*.

Pptn. of Al_2O_3 by carbonation of $NaAlO_2$ soln. with a mol. ratio of $Na_2O:Al_2O_3$ equal to 1.95 was studied for Al_2O_3 concns. of 1-100 g per liter at 25° and 70-75°C. The ppt. was washed, dried at 100°C, and ground to pass a no. 200 sieve. Diffraction patterns indicated that boehmite was the stable phase up to 20 g Al_2O_3 per liter, though samples at 5 g per liter showed a trace of bayerite.

7248. Walker, J. Geoffrey. **The line-zeolite process. A method of water treatment which is finding increasing application.** *Chemistry & Industry* 1948, 695-7.—*C.A.* 43, 1507*b*.

7249. Webb, Thomas L. B. and Yoder, Joseph D. **Hydrogen-zeolite treated water dissolves boiler, super-heater scale.** *Power* 92, No. 1 99-101, 140, 142, 143(1948).—*C.A.* 42, 2372*e*.

Uninhibited 0.01-0.03% acid, such as might be prepd. by passing a normal water through hydrogen-zeolite softeners was used successfully to remove superheater scale. It was also used in boilers and for external cleaning.

7250. Wise, William S. **The industrial waste problem. IV. Brass and copper, electroplating, and textile wastes.** *Sewage Works J.* 20, 96-102 (1948).—*C.A.* 42, 3882*g*.

Brass and copper mill wastes contained H_2SO_4, Cu, Zn, and Cr. Those wastes were treated by equalization, reduction of Cr^{+6} with SO_2, neutralization with high-Mg lime, flocculation, sedimentation, and vacuum filtration of the sludge. Expts. in progress used ion-exchange beds to remove the Cu, Zn, and Cr, and treatment of the regenerating soln. to recover $NaCrO_4$ by roasting and extg., and the Cu and Zn electrolytically. Electroplating wastes, containing Cu, Ni, Cr, Fe, and CN^-, were treated with $FeSO_4$ and CaO followed by sedimentation, lagooning, and Cl_2 to destroy CN^-.

7251. Zufniček, Jiří. **Water softening by means of brown coal.** *Paliva a voda* 28, 230-4 (1948). —*C.A.* 42 8378*c*.

The samples of brown coal of different mines in Czechoslovakia were checked as to their ion-exchange ability. The hardness of the entering unsoftened water was 7.5 German degrees and the hardness of the exiting softened water was 0.15 in the beginning and rose to 3 German degrees by the end of the expt. The ion-exchange ability of coal depended on the humate and similar materials. The price was approx. 10% of that of Permutit.

7252. Aultman, William W. **Fresh water from salt.** *Eng. and Sci. Monthly*, 12, No. 2 (1949).

The more frequently proposed methods of demineralization were reviewed.

7253. Beohner, H. L. and Mindler, A. B. **Ion-exchange in waste treatment.** *Ing. Eng. Chem.* 41, 448-52 (1949).—*C.A.* 43, 3668*c*.

The general principles of ion exchange and their application in waste treatment were discussed. Illustrative examples included the recovery of Cu, Cu and Cr, org. acids and bases, the softening of sulfate waste liquors, the manuf. of high-grade pectin from waste grapefruit peel, and the demineralization of waste-sugar solns.

7254. Bermejo Martínez, F. **Artificial zeolites and permutites. I.** *Anales real soc. españ. fís. y quím.* 45B, 533-60 (1949). —*C.A.* 46, 8291*a*.

A permutite of NH_2-NH_2 reacts with H_2O_2 to give a permutite of H_2O_2 without base-exchange capacity. Treatment of this with liquid SO_2 gives a permutite of SO_2 of similar properties. Originally Na permutites were used in prepn. of Ca permutites, which were used to remove alkalies from molasses; use in water softening came later.

7255. Bermejo Martínez, F. J. **Artificial zeolites and permutites. II.** *Anales real soc. españ. fís. y quím.* 45B, 735-48(1949).—*C.A.* 46, 8291*c*.

"Wet" prepn. methods were used to obtain permutites having good exchange properties and a high SiO_2/Al_2O_3 ratio (SiO_2 was cheaper than Al compds.). The general method employed (3 variations given) was to add a Na aluminate soln. (about 2.5% Al_2O_3 from $AlCl_3$ and NaOH) to a Na silicate soln. (about 5% SiO_2). A voluminous ppt. forms. After 24 hrs the mother liquors were drained; the gel was broken and dried for 24 hrs. Chloride ion was removed by washing.

7256. Besozzi, Leo and Vaughn, J. C. **Experimental studies of odor control at Whiting, Indiana.** *J. Am. Water Works Assoc.* 41, 1035-45 (1949).—*C.A.* 44 1631*f*.

Dry fuller's earth and chlorinated copperas successfully removed the oil film on, and the dissolved oil content of, the water. The combination also assisted in removing the oily taste. ClO_2, O_3, and granular activated carbon were not considered successful. Activated carbon seemed to give the best results, but the handling was difficult.

7257. BOYNTON, PERKINS AND GAY, HENRY. **Maintenance of zeolite filters.** *J. Am. Water Works Assoc.* 41, 187-8(1949).—*C.A.* 43, 3122*a*.
Replacement of greensand and frequent drying resulted in satisfactory operation.

7258. BRADBURY, G. F. **Diatomite filtration as developed by the Canadian Army.** *Water and Sewage* 87, No. 1, 20-1, 42, 44, 46 (1949).—*C.A.* 43, 3545*i*.
Mobile units used during the late war were described with photographs and drawings.

7259. CALISE, V. J. **Operating experience with resin zeolites on the hydrogen cycle.** *Tenth Ann. Water Conf. Engs. Soc. West. Penna.* October 18 (1949).
The performance characteristics of ion exchange resins regenerated with acid were given. The quality of effluent water produced, the amount of acid regenerant required, the capacity of the resin, the long-term life of the exchanger, and the ease and convenience of its operation were discussed.

7260. CALLAHAM, JOHN R. **Synthetic zeolite.** *Chem. Eng.* 56, No. 9, 92-3, 140-3 (1949).—*C.A.* 43, 8577*g*.
The production of synthetic zeolite ($Na_2O.Al_2O_3.6SiO_2.xH_2O$) for use in home H_2O softeners was described.

7261. CLOUGH, J. **Water treatment: operation, maintenance, and costs.** *J. Inst. Water Engrs.* 3, 41-66(1949).—*C.A.* 43, 3545*e*.
The water from the Taff Fawr catchment area was collected in two reservoirs and filtered at pretreatment plants. Alum was used as coagulant and activated carbon, Na aluminate, $Al_2(SO_4)_3$, and lime was applied as needed. Lime was better than Na_2CO_3. The filtered water was again filtered on slow sand filters.

7262. COLAS, R. **Aggressive waters.** *Eau* 36, 105-9, 121-4 (1949).—*C.A.* 43, 8582*f*.
The published studies of $CaCO_3$-H_2CO_3 equil. have produced a practical method of estn. of aggressiveness, but have dealt with details and not with the problem as a whole. The pH as a criterion rests on faulty interpretation; the notion of aggressive CO_2 and the presumed effect of alky. depended on inexact results.

7263. COLEBAUGH, DAVID C. JR. AND HASSLER, JOHN W. **Removal of tastes and odors from water supplies by active carbon.** *Taste Odor Control J.* 15, No. 1, 1-15 (1949).—*C.A.* 43, 4403*i*.
With phenolic contaminants, the addition of 4 p.p.m. active carbon, in one case to the untreated water, pH 7.5-8.0, instead of after lime settling, pH 10.0 and in another case application of active carbon before chlorination produced palatable waters. To remove the musty-moldy odor caused by a predominance of *Anabaena* with some *Melosirae* and *Tabellaria* present, the active carbon dosage was increased from 8 p.p.m. to 20 p.p.m. and added later in the sedimentation basin.

7264. COX, GERALD J. **Optimum fluorine level in drinking water.** *Chem. Eng. News* 27, 2956 (1949).—*C.A.* 44, 249*c*.
About 0.9 p.p.m. of F^- in drinking water may cause mottled enamel under certain conditions, but it also prevented tooth decay. Data were given for the no. of cases of mottled enamel, dental caries, and concn. of F^- in the drinking water of a no. of cities. Climatic conditions could account for certain inconsistencies in the data on F^- concn. and the prevalence of dental fluorosis. The concn. of F^- in city water supplies should be decreased during the summer months.

7265. CROTOGINO, H. **Recent experiences in the waste-water treatment of coal-hydrogenation plants.** *Vom Wasser* 17, 49-61(1949).—*C.A.* 44, 8089*i*.
The final purification of the combined waters after individual pretreatments was particularly difficult because of a relatively high residual phenol content (3000 kg per hr). A modified biol. purification method combined with activated carbon treatment was developed which gave satisfactory results at reasonable operating costs. The biol. treatment was improved by addn. of asbestos which resulted in increased capacity and stabilization of the operating conditions.

7266. EDELSHTEIN, S. A. AND PETATSKII, V. I. **Determination of excess of phosphates in boiler water by using cation-exchange agents.** *Zavodskaya Lab.* 15, 850-1(1949).—*C.A.* 44, 776*c*.
Cation-exchange resins (unstated nature) were used to adsorb Ca and Mg from boiler water in a vertical column (gravity feed) with elution successively by 50 ml 5% HCl and 50 ml H_2O; the eluate was neutralized to phenolphthalein by NaOH and hardness detd. by the eleate method. The phosphate excess was calcd. by (P_2O_5) excess $= (P_2O_5)$ total—10(hardness), where hardness was expressed in degrees.

7267. FRASCHINA, K. **Filter-paper method for suspended solids determination.** *Sewage Works J.* 21, 221-7 (1949).—*C.A.* 43, 8582*d*.
The rate of sorption of moisture in the lab. air by dried filter papers was studied. All filter papers including a blank were wetted, sucked dry, dried at 103°C for 1 hr, and cooled in the lab. air near the balance to absorb moisture. Filter a sample of sewage through one of the papers in a Büchner funnel, and wash the residue and paper. Treat the blank paper in the same way with distd. water. Dry the sample and the blank at 103°C and cool in the lab. air before weighing. The method was more adaptable to wastes which were hard to filter through the small area of a Gooch crucible.

7268. GREGOR, HARRY P. AND SHERMAN, N. N. **Demineralization of photographic wash water by ion exchange.** *J. Soc. Motion Picture Engrs.* 53, 183-92 (1949).—*C.A.* 43, 7359*h*.
An ion-exchange system was developed to purify photographic wash water and allow its re-use.

The effluent from a print-washing machine was cycled through a cation- and then an anion-exchange resin bed, and returned to the machine. The purity of the water obtained approached that of distd. water.

7269. GUSTAFSON, H. B. **Ion exchange in water treatment.** *Ind. Eng. Chem.* **41**, 464-6(1949).—*C.A.* 43, 4404*f*.

Water-treatment processes consumed most of the material manufd. in 1946. Na Al silicate was the largest product, ion-exchange softening the largest application, anion-exchanger production a small fraction of the total ion-exchanger production, about 2% of the phys. and 10% of the dollar vol., the house-hold softener the largest use of ion exchangers, and the Na cycle for softening water the largest use by industry.

7270. HANEY, PAUL D. **Brine disposal from cation-exchange softeners.** *J. Am. Water Works Assoc.* **41**, 829-36 (1949).—*C.A.* 43, 8587*e*.

The disposal of cation-exchange softener brine was difficult. The methods suggested and discussed were: evapn., controlled or uncontrolled diln., and brine-disposal wells.

7271. HEFFELFINGER, DONALD. **Alliance, Ohio, adopts zeolite softening.** *Am. City* **44**, No. 4, 88-9(1949).—*C.A.* 43, 4794*e*.

A municipal H_2O supply, with a total hardness of 200-300 p.p.m., pumping 6 million gal/day was softened with zeolite filters to a total hardness of 90 p.p.m. The filters were regenerated with brine contg. 3.5% NaCl pumped from a 650 ft well. Split treatment was followed, with 75% of the supply treated and mixed with the remaining 25% raw H_2O.

7272. HILFIGER, J. P. **Rapid method for determining total solids in water.** *Chim. anal.* **31**, 226-7(1949).—*C.A.* 44, 775*i*.

Pass the sample through a column of properly treated exchange resin and titrate the acid liberated by the adsorption of the cations. Calc. the equiv. NaCl.

7273. HOFFMAN, ROSS E. **Control of oil pollution.** *Public Works* **80**, No. 9, 26-7 (1949).—*C.A.* 43, 8587*h*.

Layers of oil accumulating on H_2O surfaces were eliminated by applying finely divided sand coated with carbon. The hydrophobic properties of the carbonized sand allow it to float and to form a stable oil-solid suspension which could be submerged and removed from the H_2O surface.

7274. JACKSON, LEON W. **Varied chemical dosage easy in new Phoenix water plant.** *Eng. News-Record* **142**, No. 21, 47-8 (1949).—*C.A.* 43, 7167*c*.

The new 30-million gallon per day filtration and softening plant, treating Verde River water, provided for mech. grit removal, flocculation and sedimentation, recarbonation, rapid sand filtration, and chlorination. The 8 filters contained 27 in. of sand with an effective size of 0.5 mm and uniformity coeff. of 1.68, and the max rate of filtration would be 3 gallons/ft^2/min. The backwash system included rotary surface agitation and was designed to give a vertical rise of 30 in./min. Flexibility was provided in feeding facilities for lime, activated carbon, Cl_2, and, for coagulation, alum or $Fe_2(SO_4)_3$, either dry or in soln.

7275. KIKER, JOHN E. JR. **Diatomite filters for swimming pools.** *J. Am. Water Works Assoc.* **41**, 801-9 (1949).—*C.A.* 43, 8584*e*.

Where the turbidity was low, filters of diatomaceous earth could be used without added coagulants. Reuse without treatment was possible.

7276. LECLERC, EDM. AND BEECKMANS, IVAN. **Residual water at sugar refineries.** *Conf. faite assemblée gén. soc. tech. et chim. sucrerie Belg.* **1949**, 40 pp.—*C.A.* 43, 9307*d*.

7277. LORIO, NEZEM J. **Odor and taste control in a lower Mississippi River supply.** *Proc. 12th Ann. Short Course Water and Sewerage Plant Supts. and Operators*, **1949**; *Louisiana State Univ. Eng. Expt. Sta. Bull. Ser. No.* **18**, 35-6 (1950).—*C.A.* 44, 5041*g*.

Taste and odor problems, nil until 5 yrs ago, have increased. For the past 3 summers and autumns at low river stages, a medicinal taste, with threshold odor from 10 to 40, was controlled best by activated carbon split before coagulation with alum and lime, and after floc formation. Early in the winter of 1949, with turbidities from 400 to 700 p.p.m., a medicinal taste was corrected by adding all carbon after flocculation to prevent absorption of carbon by turbidity particles.

7278. MIDDLETON, A. B. **Practical applications of activated silica sols as coagulant aids.** *Proc. Ann. Conf. Maryland-Delaware Water Sewerage Assoc.* **22**, 45-9 (1949).—*C.A.* 45, 8173*a*.

7279. ODA, RYOHEI AND SHIMIZU, HIROSHI. **Cation-exchange resin from natural rubber. VIII. Fundamental studies on water purification. XXI. Elimination of fluorine from water by anion-exchange resins.** *Chem. High Polymers* (Japan) **6**, 31-5, 337-46 (1949).—*C.A.* 46, 1184*i*, 1186*e*.

The break-through capacity of H-Ca exchange was 0.799 mol. Ca/kg. Removal of Ca was complete and the break-through point sharp. Elimination of F from water was accomplished with a HCl salt of an anion-exchange resin. The resin was reactivated by either dil. NaCl soln. or sea water.

7280. RAGOZINA, T. A. **Hydrolysis and hydration of calcium β-orthosilicate in solutions of salts.** *Zhur. Priklad. Khim. (J. Applied Chem.)* **22**, 545-52(1949).—*C.A.* 45, 4017*c*.

In hydrolysis and hydration tests, 2-g ground samples were shaken for 6 hrs to 6 months with 200 ml of water and various salt solns. in the absence of CO_2 and in the presence of the normal amt. of CO_2 in air and in solns. The soly. and hydration are increased by Na_2SO_4 and $CaCl_2$. $CaSO_4$ and NaCl have no significant influence on soly. and process of hydration. $MgSO_4$ and $MgCl_2$ favor hydrolysis.

7281. SHERRATT, J. GRAHAM. **Experience in silica-assisted coagulation of polluted surface water.** *J. Soc. Chem. Ind. (London)* 68, 158-62 (1949). —*C.A.* 43, 7169*e*.

In the treatment of rivers Mersey and Irwell water, 6 and 3 million gal/day, resp., for industrial purposes, the Baylis method which used activated silica with $Al_2(SO_4)_3$ in the ratio 0.25-0.30 to 1 improved coagulation, org. purification, and color removal. A lower dose of $Al_2(SO_4)_3$ was required, time for clarification shortened, after-pptn. of alum in filtered H_2O prevented, the pH range for clarification extended, and the retardation of coagulation at low temp. counteracted.

7282. SIGWORTH, E. A. **Taste and odor control.** *J. New Engl. Water Works Assoc.* 63, 238-49 (1949).—*C.A.* 43, 9304*i*.

The conditions producing tastes and odors were discussed. Five cases were studied in which a final addn. of activated carbon was necessary to produce a satisfactory supply. The proper time and point of application were important.

7283. STASSART, M. **The elimination of silica from water by means of strongly basic anion-exchange resins.** *Bull. centre belge étude et document. eaux* (Liége) No. 6, 371-6, (1949) No. 7, 393-5 (1950).—*C.A.* 46, 3687*c*.

Strongly basic ion-exchange resins had made the direct elimination of ionized SiO_2 possible. Owing to the fact that strongly basic resins eliminated both strong and weak acids, resulting in the formation of anionic layers in the resin which were proportionate to the strength and concn. of the acids, the demineralization in most cases was carried out in several stages. Exptl. data were presented showing the effect of various factors on the efficiency of the SiO_2 removal, e.g. initial SiO_2 concn. and contact time as a function of particle diam., flow rate, and thickness of the resin bed. An appraisal was made of the cost of SiO_2 removal from water.

7284. THOMPSON, JOSEPH AND MCGARVEY, FRANCIS X. **Backwashing of ion exchangers.** *Water & Sewage Works* 96, 182-3(1949).—*C.A.* 43, 5139*g*.

Ion-exchanger units should be backwashed to produce a bed expansion of 50%. Efficiency of backwashing was increased by maintenance of proper ratio of temp. to flow rate, by "bumping" in combating progressive capacity reduction, and by applying surface wash units. Deposition of bacterial growths was eliminated by applying 5 p.p.m. Cl_2 to the wash H_2O.

7285. VERÉBESTEL, J. **Removal of iron, lead, and manganese from water.** *Bull. centre belge étude et document. eaux* **1949**, 307-10.—*C.A.* 44, 9090*d*.

Mn and Fe in water (0.1 to 0.3 mg/liter) were removed by oxidation and alkalizing. When Mn exceeded 0.2 to 0.3 mg/liter, two separate operations became necessary. Filtering may be interfered with by org. matter, in which case the unit must be dried out. Oxidation was effected by aeration or O_3 combined with Cl_2, $KMnO_4$, NaOCl treatment. For alkalizing, $Ca(OH)_2$, NaOH, $NaAlO_2$, Na_2SiO_3, $CaMg(CO_3)_2$ were used. Bakelite filters, activated carbon, or Magno was preferred. Permutit was difficult to regenerate.

7286. WILLIAMS, D. B. **A new method of odor control.** *J. Am. Water Works Assoc.* 41, 441-9 (1949).—*C.A.* 43, 5522*b*.

NCl_3 was described, as were the conditions under which it would form, methods for its identification, and methods for its removal. The use of activated carbon or aeration to bring about removal was discussed.

7287. YODER, J. D. **Removal of silica from boiler feedwater by the sludge blanket hot-process softener and exchange methods.** *Blast Furnace Steel Plant*, 37, 1228-30, 1258 (1949). —*C.A.* 44, 250*a*.

$Fe(OH)_3$ served as a coagulant and color remover. Its disadvantage was that it increased the total solids and did not reduce the SiO_2 to as low a figure as otherwise obtainable. $Mg(OH)_2$ was more effective at high temp. By hot-process treatment SiO_2 could be reduced to a lower figure than by $Fe(OH)_3$, but not so low as by demineralization.

7288. YORSTON, F. H. **Studies on sulfite waste liquor. I. The action of anion exchangers.** *Pulp Paper Mag. Can.* 50, No. 12, 108-11, 111-13 (Nov. 1949).—*C.A.* 44, 4247*g*.

Sulfite waste liquor was deashed with cation-exchange resin Amberlite IR120. The deashed liquor was passed through columns contg. Amberlite IR4B and IRA400. Both weak-base and strong-base exchangers adsorbed sulfuric, sulfurous, and acetic acids and other acidic substances of low mol. wt, leaving sulfonic acids to be separated from one another by other physical and chem. means. Seventy percent of the copper-reducing substances in sulfite waste liquors may be adsorbed consistently on the strongly basic resin and eluted by means of dilute weak acid.

7289. ANDERSON, J. W. **Conditioning boiler feed waters by the ion-exchange process.** *Modern Power and Eng.* 44, No. 9, 83-7, 152 (1950).—*C.A.* 44, 10972*d*.

The various types of ion exchangers were discussed and their applications pointed out, as well as complete demineralizers and silica-removal plants.

7290. ANON. **Tentative standard specifications for bauxite. First printing.** *J. Am. Water Works Assoc.* 42, 707-14(1950).—*C.A.* 44, 9595*b*.

Methods of sampling and testing were carefully covered, as well as the calcn. of the results obtained.

7291. ARGANT, HENRI. **Demineralization of water by cation-anion exchange at the central power station at Villers-Saint-Paul.** *Chimie & industrie* 64, 57-8(1950).—*C.A.* 45, 792*h*.

Ninety tons per hr of water from the Oise was treated.

7292. AULTMAN, WM. W. **Desalting sea water for domestic use.** *J. Am. Water Works Assoc.* 42, 786-96(1950).—*C.A.* 44, 9595*e*.

Mech. processes, which include various types of distn. including vapor-compression distn., chem. processes, in org. anion and cation exchangers were used, and electrolytic demineralization were considered as to efficiency and cost. These methods were not considered desirable or economical. The seriousness of the scale and corrosion problems confronted in the thermo (vapor) compression distn. method were described.

7293. BARTLETT, LUIS H. **Principles of ion exchange in water treatment.** *Proc. 13th Ann. Short Course Water and Sewerage Plant Supts. and Operators*, **1950**, *Louisiana State Univ., Eng. Expt. Sta. Bull. Ser.* No. **21**, 31-5.—*C.A.* 45, 4380*f*.
A review.

7294. BLASZKOWSKA, Z. AND TATUR, H. **Laboratory plant for demineralization of water.** *Przemysl Chem.* 6, 423-30 (1950).—*C.A.* 46, 8297*e*.
App. based on the action of ion exchangers lowered the inorg. solute content of tap water from 161 to 0.8 p.p.m.

7295. BLOODGOOD, DON E. AND STRICKLAND, AUBREY. **Chromium removal by ion exchange.** *Water & Sewage Works* 96, 28-32(1950).—*C.A.* 44, 2678*f*.
In studying the elimination of toxic Cr from plating wastes, a K_2CrO_4 soln., contg. 100 p.p.m. CrO^{2-}, was passed through anion- and cation-exchange beds and removed 99% of the chromates. Only partial regeneration of exchanger beds was accomplished by direct replacement reactions.

7296. BÖRNER, H. **Akdolit, a modern filter material of dolomitic origin.** *Vom Wasser* **18**, 340-5(1950-51).—*C.A.* 46, 7260*h*.
A filter material was prepd. from dolomite in a rotating kiln. This material, Akdolit, was characterized by a MgO content of 26-28%, and an alky. no. of about 95. Electron-microscope examn. showed the presence of MgO cubes; chem. analysis showed that $MgCO_3$ was not present. $CaCO_3$ was dispersed very finely in the Akdolit and provided the mass with the proper specific surface for filtration and phys.-chem. adsorption.

7297. BROWN, HORACE A. **Bold triple chlorination now standard practice at Ottumwa.** *Water and Sewage Works* 97, 267-9(1950).—*C.A.* 44, 8573*a*.
Incoming H_2O from a surface supply is chlorinated to a residual of 10 to 25 p.p.m.; settled for 1.5 hrs; dosed with $FeSO_4$, Na_2CO_3, and $Ca(OH)_2$; flocculated for 45 min.; settled for 6 hrs; dosed with CO_2 and activated carbon; settled for 4 hrs; recarbonated; filtered; and collected in a clear well. SO_2 was applied to remove all residual Cl_2; the H_2O was filtered through a carbon filter; and dosed with Na_2CO_3, NH_3, and Cl_2 to produce a Cl_2 residual of 1 p.p.m.

7298. BRYSON, J. L.; EDWARDS, G., AND TAYLOR, A. W. **Silica-assisted coagulation.** *Chemistry & Industry* 1950, 626.—*C.A.* 47, 6583*c*.
In the purification of H_2O with Na_2SiO_3 partially neutralized with H_2SO_4, the percent neutralization of the Na_2O was more important than the residual alky. in prepg. a stable sol. Thus, 85% of the alky. of com. Na_2SiO_3, having a SiO_2/Na_2O ratio of 3.22, was neutralized. The sol. had a residual alky. of 1100-1350 p.p.m. and was stable for some hrs.

7299. CALISE, V. J. **Hot zeolite softening.** *Power Eng.* 54, No. 9, 54-9(1950).—*C.A.* 44, 10221*e*.
The advantages of using styrenebase resin softeners as second-stage treatment following first-stage hot-process pptn. softeners was discussed. Hot phosphate, in particular, for second-stage treatment was considered.

7300. COOPER, J. E. **How to dispose of acid wastes.** *Chem. Inds.* 66, 684-5 (1950).—*C.A.* 46, 9754*a*.
Spent pickling liquors were best disposed of by diln. and discharge to a stream or municipal sewage system. For neutralization in limestone beds, the acid strength must be $< 0.5\%$ H_2SO_4 to maintain the $CaSO_4$ in soln. and prevent coating of the bed, and flow rates should be 0.5-1.0 gal (down-flow beds) or 40-50 gal (up-flow beds) /ft^2 of bed area/min. High-Ca limestones ($CaCO_3$ 95%) gave higher reaction rates than did dolomites.

7301. DUPONT, A. **Use of activated silica in coagulation and vacuum filtration of sewage sludge.** *Chem. Weekblad* 46, 545-50 (1950).—*C.A.* 45, 3536*d*.
If a 2% silica sol. was added (15 cc./200 cc. sludge) prior to $Al_2(SO_4)_3$ addn. (15 cc. of 5.58% soln.) the rate of filtration was up to 2.5 times better than with $Al_2(SO_4)_3$ addn. alone. Nylon filter cloth was recommended over woolen cloth. All expts. were performed with a Buchner filter, 55-cm Hg vacuum with 200 cc. sludge, a mixt. of fresh and active sludge in equal quantities after finished fermentation.

7302. ECKSTEIN, HORST. **Decarbolith, a new water purifier from West German dolomite.** *Bergbau u. Energiewirt.* 3, 326-7(1950).—*C.A.* 45, 4856*g*.
Prepn. of a new water purifier from dolomite ore was described.

7303. EHEMMAN, GEORGE C.; BURNETT, L. K., AND WADDELL, JOHN C. **Application of the OCO water system to paper-mill white-water recovery.** *Pulp & Paper Mag. Can.* **51**, No. 7, 107-11 (1950).—*C.A.* 44, 8655*c*.
The OCO water system utilized a plate and frame filter press with diatomaceous earth filter aid to filter low-solids H_2O from the board machine. The filtered water was used in low-vol., high-pressure showers. The filter cake was used in filler stock prepn., as was all high-solids white water from the machine.

7304. ENDLER, A. S. AND GRUENWALD, F. **Cationic softeners (chemical types and recent improvements).** *Rayon and Synthetic Textiles* 31, No. 8, 73-5(1950).—*C.A.* 46, 8297*f*.
The constitution of several cationic softeners was discussed and the development of a simple test to rate the oxidation-resistance of softeners was described.

7305. GROMBACH, H. **Rapid filters.** *Schweiz. Ver. Gas- u. Wasserfach. Monats-Bull.* **30**, 297-301 (1950).—*C.A.* **45**, 9780*a*.

Water samples were taken at depths of 15, 40, 65, 90, 115, and 140 cm below the surface of a rapid sand filter installation at the Mannedorf waterworks, the filtration rate of which was 5 m per hr. The tests extended over a 19-hr uninterrupted filtration period. The general conclusion is that the surface filtration effect is negligible. *Oscillatoria* appear after a throughput of 100 m^3/m^2 surface.

7306. IWANOWSKI. **Equipment and methods for treatment of river water.** *Vom Wasser* **18**, 220-5 (1950-51).—*C.A.* **46**, 8296*i*.

Rhine river water was treated with Cl_2, $FeCl_3$, lime, and activated carbon to give high-quality drinking water for the city of Weisbaden.

7307. KAKIHANA, HIDETAKE. **A new method for the analysis of aqueous solutions or natural waters with ion-exchange resins.** *J. Chem. Soc. Japan,* Pure Chem. Sect., 71, 481(1950).—*C.A.* **45**, 6125*c*.

The sample was passed through the cation exchanger and all the cations adsorbed; the effluent contained H^+ and all anions. By titrating the effluent the acid concn. and Cl^- were detd. The resin was washed with 0.1 *N* HCl and all the univalent cations were washed out. This soln. was evapd. to dryness and the wts of alkali chlorides were detd. Finally the resin was washed with *N* HCl and all the multivalent cations eluted.

7308. KEEFER, C. E. **Oil waste exclusion from sewers.** *Water & Sewage Works* 97, R123 (1950). —*C.A.* **46**, 7262*h*.

In Baltimore, waste oil and grease were collected and treated in bulk. Oil was pumped to a dehydrating tank with steam coils. After evapn. for 5-8 hrs the wastes were further dehydrated with H_2SO_4. Clay was added and the oil cooked with steam at 600°F for 8-10 hrs. Kerosine, naphthalene, and alcs. were distd. off and used as fuel in the steam-generating plant.

7309. KEMMER, F. N. **Conditioning makeup by high-temperature, sodium-ion exchange, excess-calcium, hot lime-zeolite process.** *Combustion* **21**, No. 10, 59-62(1950).—*C.A.* **44**, 10221*f*.

The development of the sulfonated-styrene resin exchangers able to resist attack at high temps. in a caustic environment made available a new process for treatment of boiler makeup as well as a supplementary second-stage treatment after the hot lime softener. Further advantages included a greater decrease in silica, an effluent having a turbidity below 10 p.p.m. without a coagulant, a saving in salt because of lower hardness from the lime treatment, and the lack of need for acid or hexametaphosphate for zeolite protection against after-reactions as with the cold process.

7310. KNIGHT, A. G.; AITKEN, R. W., AND MERCER, D. **The measurement of turbidity in water.** *J. Inst. Water Engr.* 4, 449-56 (1950); **5**, 328-30, 633-4 (1951).—*C.A.* **46**, 666*i*.

The basic measure of turbidity should be a suspension such that a depth of 150 mm would absorb 10% of the light falling on it and that this suspension should be given the value of 10. Light extinction was measured without the use of an arbitrary instrument such as the Jackson Turbidimeter or the necessity of weighing the material in suspension. A method of calibration was proposed. Calcns. gave results not far from the actual suspension values obtained.

7311. LATTRE, ANDRÉ DE. **Lead removal by means of a resin.** *Bull. centre belge étude et document. eaux* (Liége) No. 7, 415-20 (1950/I).—*C.A.* **46**, 1679*f*.

Pb removal by ion-exchange methods was studied with a view toward purification of industrial waste prior to disposal in rivers or toward reduction of excessive Pb from drinking water. A rapid microanalytical method for Pb was adopted, consisting in concn. of the Pb in a small vol. by extn. with dithizone, and polarographic detn. of the Pb after extn. with aq. AcOH. Better than 50% of the Pb could be removed from a hard water contg. approx. 100 g/liter of Pb in spite of the concurrent elution effect of the Ca. The fixation capacity of the resin for Pb was found to be enormous.

7312. LECLERC, EDM. AND BEAUJEAN, P. **Filtration study.** *Centre belge étude et document. eaux, J. mens.* No. 9, 131-3(1950).—*C.A.* **45**, 10445*d*.

The comparative efficacy and clarification obtained with sintered glass, charcoal, asbestos, cellulose, and filter paper was studied on river and sewage water and industrial effluents.

7313. LEICK, J. **Regeneration of base-exchange materials with sodium chloride.** *Vom Wasser* **18**, 346-59(1950-51).—*C.A.* **46**, 7260*e*.

The min. requirement for brine concn. is 20-40 g NaCl/liter. Concns. can be used up to 100 g/liter. The min. requirement will be adequate to regenerate a resin that will remove 7 g CaO/liter from the raw water. The salt and the brine soln. should be free of insol. impurities; a high content of alkali earths in the brine reduces the exchange capacity, and compensation must be made by increasing the salt and the brine concn.

7314. LEICK, J. **Processes in hydrogen-exchange filters and research on hydrogen-exchange filters in the laboratory.** *Vom Wasser* **18**, 380-407(1950-51).—*C.A.* **46**, 7260*a*.

Three methods were described for ion exchange on the H-cycle: (1) Begin the operation of deionizing with the filtrate having a residual hardness less than that of the combined mineral acid content of the raw H_2O and ending with an increase of alky. in the filtrate. (2) Begin the deionization with the filtrate having a residual hardness under 0.1°d. (1°d. = 1 part CaO per 100,000 parts of H_2O) and ending with a residual hardness over 0.1°d. (3) Begin the operation with an acid value of the filtrate equal to the mineral acid content of the raw H_2O and ending with an acid-value smaller than the mineral acid content. Data were given for the regeneration of Group A resins, sulfonate-type resins, and Group B resins, carboxylic-type resins, with strong acids.

7315. LEX, WALTER. **Technology of graphite as a boiler scale preventive.** *Bergbau u. Energiewirt.* 3, 191-2(1950).—*C.A.* 45, 327*b*.

Colloidal graphite used for boiler scale prevention had a very large surface and a high adsorptive power, and was effective in both boiler scale prevention and removal. A proprietary form of colloidal graphite was also claimed to inhibit corrosion owing to CO_2, O_2, and chlorides. A coating of graphite on boiler tubes was suggested as a means of preventing scale formation; however, such coatings would reduce heat transfer to the same extent as a very much thicker layer of scale.

7316. LINDSAY, F. K. **High-capacity cation exchangers.** *J. Am. Water Works Assoc.* 42, 75-80 (1950).—*C.A.* 44, 2150*c*.

Among the many types of materials used in cation-exchange, the nonphenolic (styrene base) resins had capacities far greater than any of the others. These resins were also capable of removing sol. Fe and Mn during the softening cycle. Sea water and natural brines had been successfully used for regeneration.

7317. LÜNEBURG, H. **Boiler-water treatment for fisheries.** *Vom Wasser* 18, 416-19(1950-51).—*C.A.* 46, 8297*h*.

Graphite added to boiler water formed a heat-conducting layer in the boiler and prevented the formation of scale.

7318. MAIER, F. J. **Fluoridation of public water supplies.** *J. Am. Water Works Assoc.* 42, 1120-32(1950).—*C.A.* 45, 2121*f*.

The use of fluorides in water supplies was discussed. The dosage, ranging between 0.5 and 1.5 p.p.m. fluoride, should be the result of careful study. Feeding and point of application were important, as well as sampling and control.

7319. MANSFIELD, MYRON G. **Philadelphia improvement program.** *J. Am. Water Works Assoc.* 42, 645-53(1950).—*C.A.* 44, 9593*g*.

The program, planned and started in 1940, provided for complete rehabilitation of various existing plants, control of tastes, odors, and color, also purification, etc.

7320. MCGARVEY, JOSEPH AND MCGARVEY, FRANCIS X. **Silica removal by ion exchange.** *Power* 94, No. 2, 93-5, 170 (1950).—*C.A.* 44, 2149*e*.

A strongly basic anion-exchange resin was found that was satisfactory. As all waters were not alike, several combinations were listed to fit the various kinds of supply.

7321. MONET, G. P. **Cost of ion exchange.** *Chem. Eng.* 57, No. 3, 106-7(1950).—*C.A.* 44, 6057*a*.

Ion-exchange equipment, for demineralizing raw water or process water, was discussed.

7322. NEIHOF, REX AND SOLLNER, KARL. **A quantitative electrochemical theory of the electrolyte permeability of mosaic membranes composed of selectively anion-permeable and selectively cation-permeable parts and its experimental verification. I. An outline of the theory and its quantitative test in model systems with auxiliary electrodes.** *J. Phys. & Colloid Chem.* 54, 157-76(1950).—*C.A.* 44, 4802*g*.

In an "all-electrolyte elec. circuit" or ring system, |dil. soln. | anion-selective membrane| concd. soln. | cation-selective membrane|, cations moved from concd. to dil. solns. across the cation-selective membrane and an equiv. no. of anions through the anion-permeable membrane. Intensity of current depended on the e.m.f. of the system, the sum of the membrane potentials, and its resistance. Since movement of ions and flow of current were different aspects of the same process, the no. of equivs. of electrolyte penetrating the membranes were equal to the no. of faradays which flowed during a given period.

7323. PAGE, C. H. AND WANTZ, JOHN F. **Ion-exchange resin takes residual hardness from hot lime-soda effluent.** *Power* 94, No. 3, 104-6 (1950).—*C.A.* 44, 4170*i*.

The best hot lime-soda softening rarely removed all residual hardness. A polystyrene resin was described which was not affected by heat and wide variations in pH.

7324. PEGG, EDWIN S. **Diatomite filters turn out safe, clean water.** *Eng. News-Record* 144, No. 20, 35-7 (1950).—*C.A.* 44, 9091*g*.

Raw water, drawn from an impounding reservoir, was treated with 0.5 p.p.m. Cl_2 before passing to the 2 filter units. The latter consisted of plastic-lined steel shells 3 ft in diam. and 8 ft high, each contg. 45 Al_2O_3 tube elements providing 94 ft^2 of filtering area. Diatomaceous earth slurry was used to precoat the elements and also fed continuously to the applied water. The effluent pressure decreased from 34 to 5 p.s.i. in 2-5 days. The raw water contained up to 60 p.p.m. turbidity. The filtered water turbidity was practically 0, the bacterial count consistently low and coliforms were absent.

7325. RUBINOV, YU. S. **Modification of filters for chemical purification of water.** *Sakharnaya Prom.* 24, No. 5, 24-7 (1950).—*C.A.* 45, 2609*i*.

Sulfonated carbon in cation filters was recommended since it had large absorptive capacity and required less frequent regeneration. Quartz sand was replaced by anthracite, which required less washing and had a porosity which was higher than that of quartz sand by 13-15% and increased the cycle of filter by 25-40%.

7326. SABATIER, G. **Chemical purification of water by filtration. Artificial zeolites and permutites.** *Rev. gén. sci.* 57, 54-63(1950).—*C.A.* 44, 7467*h*.

The mechanism of softening water by using permutites was explained.

7327. SCHOONENBEEK, P. W. **Water softening by Dusarit.** *Chem. & Pharm. Tech. (Dordrecht)* 5, 165-9(1950).—*C.A.* 44, 6058*d*.

Ion-exchange process was described for demineralization of water by using synthetic resins in a "Dusarit" unit and an "Asmit" unit. The former converted salts into the corresponding acids; in the latter the acids were fixed, CO_2 being expelled by mineral acid and removed by intense aeration. "Asmit" was reactivated by NaOH, Na_2CO_3, or NH_3.

7328. SHIMIZU, HIROSHI. **Ion-exchange synthetic resins. XXIV. Determination of fluorine in water.** *Chem. High Polymers* (Japan) 7, 108-14 (1950).—*C.A.* 45, 7725*g*.
Fe and Ca ions in water were first removed by a cation exchanger and then F was detd. colorimetrically with Al and hematoxylin.

7329. SPIEGLER, K. S. AND HELLINGER, ESTHER. **Effect of partial demineralization of water on bacteria.** *J. Am. Water Works Assoc.* 42, 409-12 (1950).—*C.A.* 44, 5503*d*.
Initial examn. showed cation exchangers removed bacteria, and anion exchangers did not. Tests were described to det. the effect of exchange softening on a contaminated, brackish water. At the beginning of a run complete destruction of bacteria took place, and as the unit neared exhaustion contamination occurred.

7330. SPLITTGERBER, A. **Technology of graphite as a boiler scale preventive.** *Bergbau u. Energiewirt.* 3, 192-3(1950).—*C.A.* 45, 327*c*.
Coatings on boiler tubes were not very permanent and were useful mainly in shut-down boilers. Many of the boiler scale preventives contained tannic acid in addn. to the colloidal graphite, with or without org. or inorg. protective colloids.

7331. STREICHER, LEE AND BOWERS, A. E. **Cation exchanges for municipal water softening.** *J. Am. Water Works Assoc.* 42, 81-92 (1950).—*C.A.* 44, 2150*a*.
The exchangers tested included synthetic siliceous zeolites, carbonaceous exchangers, and phenolic and polystyrene resins. Siliceous zeolites lost material because of Si soln. and attrition; carbonaceous exchangers were lost largely because of particle size; phenolic resins were oxidized by Cl_2 in the influent water. Polystyrene resins, on the other hand, seemed stable and did not tend to lose capacity.

7332. THOMPSON, J. AND MCGARVEY, F. X. **Silica removal by ion exchange.** *Power* 94, No. 2, 93-95, 170 (1950).
Until recently, anion exchange resins were not basic enough to remove silica directly. Now, however, by the use of a strongly basic resin, the weak silicic acid may be removed directly through any one of four methods used in conjunction with deionization procedures.

7333. TOMPKINS, P. C.; BIZZELL, O. M., AND WATSON, C. D. **Practical aspects of surface decontamination.** *Nucleonics* 7, No. 2, 42-54, 87(1950).—*C.A.* 45, 3722*i*.
Methods of removing radioactive residues from various types of lab. surfaces and protective coatings were reported. The test contaminants were solns. of $H_3P^{32}O_4$, $Ba^{140}Cl_2$, and NaI^{131}. Decontaminable surfaces must be nonporous, chemically resistant, and H_2O-repellent.

7334. ULLRICH, A. H. **Water-treating experiences. IV. Handling soft lake-water at Fort Smith, Arkansas.** *Water & Sewage Works* 97, 323-5 (1950).—*C.A.* 46, 9751*a*.
Experiences were reported in the treatment of this water with coagulants, chloramine, $(NaPO_3)_6$, and activated carbon. The water was very soft; low in alky., dissolved solids, and pH; and had practically no buffering capacity.

7335. WADE, I. L. **Demineralizer produces plant savings.** *Power* 94, No. 10, 88-91 (1950).
Two identical sets of cation-, anion-, and silica-removing elements—with one aerating tower for the removal of carbon dioxide—make up the deionizing system. Made possible by the advent of strong-base anion exchange resins, the first complete plant to deionize boiler makeup water in the central station was installed recently in Waukegan, Ill.

7336. WHEATON, H. J. AND WALKER, J. GEOFFREY. **Activated silica as an aid to coagulation in water-treatment processes. I.** *Chemistry & Industry* 1950, 710-16.—*C.A.* 45, 2122*e*.
The application and directions for operation of the method were reviewed.

7337. WHEATON, H. J. AND WALKER, J. GEOFFREY. **Activated silica as an aid to coagulation in water treatment processes. II.** *Chemistry & Industry* 1950, 802-5.—*C.A.* 45, 4380*e*.
The effect of activated silica on coagulation with reagents other than alum, the removal of color, and factors in process selection were discussed. Other uses of activated silica such as coagulation of sewage, white H_2O coagulation, and petroleum coagulation were described.

7338. WINKLER, WILLIBALD. **Purification of water in the Austrian pharmacy.** *Österr. Apoth.-Ztg.* 4, 585-6(1950).—*C.A.* 45, 1296*i*.
The acceptance of aqua depurata (prepd. by deionization) and aqua pro injectione (prepd. by distn.) was proposed.

7339. AKEROYD, E. I. **Production of distilled water by deionization.** *Chemistry & Industry* 1951, 1187-8.—*C.A.* 47, 3497*e*.
The mixed-bed deionization process produced H_2O with less than 1 p.p.m. dissolved solids, less than 0.2 p.p.m. SiO_2, and cond. of less than 1 micromho/cc. The economics of the following processes were compared: (1) 2-stage deionization; (2) direct deionization by mixed bed; (3) bicarbonate removal, mixed-bed deionization; and (4) 2-stage deionization, CO_2 removal with mixed bed to remove the last traces of dissolved solids.

7340. ALDRICH, E. H. **A new water supply for the Alexandria water company.** *J. Am. Water Works Assoc.* 43, 332-48 (1951).—*C.A.* 45, 6323*g*.
Surface (Occoquan Creek) water was treated with alum, lime, carbon, and Cl_2 as required. The treating plant, control house, and purification units were described.

7341. APPLEBAUM, S. B. **New hot lime-zeolite process.** *Power* 95, No. 2, 114-17 (1951).—*C.A.* 45, 2121*i*.
Hot lime-sodium zeolite softening was compared with other methods for prepg. water for use in high-pressure boilers. Properly adjusted hot lime-zeolite softening will remove silica, eliminate hardness, and keep soda solids low.

7342. ASHIZAWA, TAKASHI. **Flocculation value of mineral waters.** *Repts. Balneol. Lab. Okayama Univ.* **1951**, No. 5, 82-3(English summary).—*C.A.* **46**, 8295*e*.

The flocculation values of 24 Japanese mineral waters were measured by use of a positively charged colloidal soln. of iron hydroxide prepd. by adding 3 g of $FeCl_3$ to 500 ml of boiling H_2O. One ml of this soln. contained 1.2 mg Fe. Two ml of this soln. was dild. to 10 ml with distd. water, and the mineral water added until the flocculation occurred. There exists a neg. correlation between the log of sulfate ion concn. of the mineral waters and the flocculation value.

7343. AYRES, JOHN A. **Treatment of radioactive waste by ion exchange.** *Ind. Eng. Chem.* **43**, 1526-31(1951).—*C.A.* **45**, 9205*c*.

Three ion-exchange procedures were evaluated for treatment of liquid lab. wastes contg. radioactive contaminants. A 2-bed system consisting of columns of cation-and anion-exchange resins in series gave a decontamination factor of approx. 10^5 corresponding to an effluent with undetectable radioactivity for most wastes. An addnl. concn. by a factor of approx. 16 can be obtained by ashing the org. exchangers. Evaluations were made of the effectiveness of various cation exchangers for removal of Na, Ba, and La ions from synthetic wastes, the behavior of anions, particularly of Te, Mo, and Ru on anion exchangers, of radio colloids and of the effects of pptg. or complexing agents.

7344. BATTAREL. **Experimental study of the properties of permutite exchangers of hydrogen ions.** *Rev. ind. minérale* **32**, 76-81(1951).—*C.A.* **45**, 10446*a*.

The method of treating water from a coal mine, and contg. much H_2SO_4, was described. After passing through the H-ion exchangers the water contained a considerable amt. of H_2SO_4, which could not be eliminated by degassing as was the case with H_2CO_3. The neutralization must be accomplished by the water from the Na-ion exchanger; the amt. of the residual acid must therefore be known exactly. This was measured with an app. contg. 400 g of permutite, through which the water flowed.

7345. BAYLIS, JOHN R. **Chicago controls the taste with carbon slurries.** *Am. City* **66**, No. 12, 108-9 (1951).—*C.A.* **46**, 3186*h*.

The application of activated carbon in the form of a slurry (produced by mixing powdered carbon in tanks fitted with paddle mixers and at dosage rates up to 70 lbs activated carbon/million gal H_2O) removed tastes from H_2O received from a lake supply.

7346. BRAUS, HARRY; MIDDLETON, F. M., AND WALTON, GRAHAM. **Organic chemical compounds in raw and filtered surface waters.** *Anal. Chem.* 23, 1160-4 (1951).—*C.A.* **45**, 10445*h*.

A metered vol. of water was passed through a small portable filter contg. activated carbon. The carbon was removed, air-dried, and extd. in a Soxhlet app. with ether. The ether was evapd., and the residue dried in a vacuum over $CaCl_2$ and weighed. The org. residue was sepd. into 5 groups and a modification of the Shriner and Fuson method was used.

7347. BRINDISI, PAUL. **Water-softening methods. I. Zeolites.** *Power* **95**, No. 11, 84-5, 210, 12, 14 (1951).—*C.A.* **46**, 1192*g*.

A general study of the materials available was presented. Discussed in some detail were: (1) Na-cycle operation, (2) H-cycle operation, and (3) demineralization.

7348. CHRISTENSON, C. W.; ETTINGER, M. B.; ROBECK, GORDON G.; HERMANN, E. R.; KOHR, K. C., AND NEWELL, J. F. **Removal of plutonium from laboratory wastes.** *Ind. Eng. Chem.* **43**, 1509-16 (1951).—*C.A.* **45**, 8685*e*.

Several methods were studied for removing Pu from liquid lab. wastes which varied from 200-25,000 counts/min. liter in concn. and from 2 to 13 in pH and contained as much as 100 p.p.m. of F and widely divergent amts. of mineral and org. matter. Although effective, inorg. adsorbents, such as celite, kaolin, pumice and volcanic tuff, would require serial treatment and result in large quantities of radioactive sludges. The rate of adsorption on activated carbon was low and conditions including pH and presence of complexing agents such as citrates were critical. Coagulation with iron and lime was the preferred method.

7349. CLARKE, FRANK E. **The distinguishing characteristics of water-formed deposits.** *J. Am. Soc. Naval Engrs.* **63**, 153-60(1951).—*C.A.* **45**, 3535*h*.

A discussion of scale, sludge, corrosion products, high temp. oxides, and biol. deposits.

7350. COLEBAUGH, D.; FILICKY, J., AND HYNDSHAW, A. **Factors influencing the efficiency of activated carbon.** *J. Am. Water Works Assoc.* **43**, 322-6(1951).—*C.A.* **45**, 5848*a*.

The factors considered include pH, contact time, Cl_2, ClO_2, chloramines, coagulation, filtration, and the handling of the carbon itself.

7351. CONLON, R. B. **How to protect stand-by boilers.** *Paper Ind.* **33**, 799-800(1951).—*C.A.* **46**, 1193*c*.

"Dry storage" of idle boilers may involve the introduction of CaO, silica gel, and Al_2O_3. "In wet storage," mixts. of Na_2SO_3 and aq. NaOH, or aq. solns. of $Na_2Cr_2O_7$ (at pH 7.5-9.5) can be used.

7352. DAVIDSON, J. H. **Color removal of process waters.** *Tappi* **34**, 407-9(1951).—*C.A.* **46**, 1193*e*.

By using 2 precipitators and 5 gravity filters, the color of 15,000,000 gal/day of water was reduced from 40-80 to 2-4 p.p.m. The use of 2.25 g/gal of alum and 1.5 g/gal lime plus, when required, 1 to 2 g/gal of clay was required.

7353. ECKSTEIN, HORST. **A year's operating experience with Decarbolith.** *Bergbau u. Energiewirt.* **4**, 175-7(1951).—*C.A.* **45**, 9777*c*.

This new water-purification reagent, prepd. by controlled calcining of West German dolomite, was effective for deacidification of water, and Fe and Mn removal. The calcination of the dolomite should be controlled so that the product has a loss on ignition of at least 30% and not over 32%. Before use, the product should be hydrated under water for some time, to insure complete removal of Fe and Mn. The filter should be washed only with purified water, or if necessary, only with raw water with low Fe and CO_2 content.

7354. GOETZ, ALEXANDER AND TSUNEISHI, NOEL. **Application of molecular filter membranes to the bacteriological analysis of water.** *J. Am. Water Works Assoc.* 43, 943-69, discussion, 969-84(1951).—*C.A.* 46, 3188*a*.

Cellulose nitrate and cellulose acetate membranes were used. The filter was highly efficient in retaining bacteria. Several nutrients were discussed, also possible variations in procedure. Several colonies, under differing conditions, were grown on the same filter. A lucite plate and "selector disk" for comparative work were described.

7355. GUTZEIT, G. AND ENYART, GLENN. **Tank-car wastes treated by chemiadsorption.** *Wastes Eng.* 23, 18-22(1951).—*C.A.* 46, 2724*g*.

The treatment was based on adsorption at the surface of hydrophobic solids of toxic materials, such as phenols, cresols, and naphthalenes, and of emulsified oils. The size of the absorption medium (coal) and temp. were varied with the type of material to be removed from wastes. Phenol (208-406 p.p.m.) in raw wastes was reduced 64-74% by chem. treatment and to 99.7-99.8% on trickling filter, leaving 0.2 p.p.m. in the effluent.

7356. HAMMAN, CECIL A. **Illinois water-flood plant uses closed water system.** *Oil and Gas J.* 50, No. 19, 114, 116 (1951).—*C.A.* 45, 10549*c*.

Water was treated (500 barrels per day from a Pennsylvania sand 800 ft deep) with Calgon to prevent the pptn. of Fe or a carbonate and a bactericide to inhibit anaerobic bacteria. The treated water was filtered through diatomaceous-earth filters and injected into the water zone of an oil-bearing formation.

7357. HARLOW, J.; CALISE, V. J., AND LANE, M. **Boiler feedwater treatment for a high-pressure, high-makeup, power and steam producing plant.** *Proc. Midwest Power Conf.*, XIII, 290-303(1951).

The factors which entered into the selection of a silica-removing deionizing system were evaluated. Careful consideration was given to cost of various methods of water conditioning. The major units in the installation were: four hydrogen cation exchange units, height 14 ft, diam. 11 ft; four strongly basic anion exchange units, height 12 ft, diam. 11 ft; and two 10 foot diameter by 16 foot height degasifying towers.

7358. HARTUNG, H. O.; BEHRMAN, A. S.; HAYWOOD, R. W. JR.; KNOX, W. H.; KRAMER, W. A., AND SPAULDING, C. H. **Capacity and loadings of suspended solids contact units.** *J. Am. Water Works Assoc.* 43, 263-91 (1951).—*C.A.* 45, 5849*b*.

Eight available "suspended solids contact softeners" were carefully described. The general theories behind their operation were discussed.

7359. HYNDSHAW, A.; FILICKY, J., AND COLEBAUGH, D. **Factors influencing the efficiency of activated carbon.** *Munic. Utilities* 89, No. 8, 32, 38, 40, 42-3 (1951).—*C.A.* 45, 10544*i*.

7360. KNIGHT, A. G. **The photometric estimation of color in turbid waters.** *J. Inst. Water Engrs.* 5, 623-33(1951).—*C.A.* 46, 667*b*.

Color in a turbid water can be estd. photometrically without the disturbing facts of filtration or other clarifications by using the differential absorption of the water in this spectral region. The instrument must be calibrated at the pH value to be used.

7361. KNOP, E. **The sedimentation process in filter beds.** *Gesundh.-Ing.* 72, 144-9(1951).—*C.A.* 45, 8173*c*.

The settling of industrial and domestic waste waters in filter-beds, especially carbon was investigated. For the deposition of large particles the surface load (quantity of water per hr, divided by the surface of the filter-bed) was the important quantity. As the settling of the fine dust was the longest operation, this process, as well as the compn. and origin of the waste water, were the detg. factors in the planning of a filter-bed.

7362. KRAPF, G. H. **Conversion of filters to zeolite softeners.** *Iron Steel Engr.* 28, No. 11, 98-102(1951).—*C.A.* 46, 669*g*.

7363. LAMOUREUX, V. C. **Biological warfare and water supplies.** *Southwest Waterworks J.* 33, No. 9, 4-5(1951).—*C.A.* 46, 6296*g*.

Suitable agents can be selected because of infectivity, casualty effectiveness, availability, resistance, mode of transmission, epidemicity, specific immunization, therapy, detection, and retroactivity. Agents offering most chance of success are botulinus toxin, leptospirosis, and bacillary dysentery (amoebic). Brucellosis and tularemia may be water-borne. Sedimentation, coagulation, filtration, and disinfection will reduce chances of effective infection to practically nothing.

7364. LAUDERDALE, R. A. AND EMMONS, A. H. **A method for decontaminating small volumes of radioactive water.** *J. Am. Water Works Assoc.* 43, 327-31(1951).—*C.A.* 45, 6329*c*.

Extremely radioactive water was improved to about one-hundredth of the max. concn. considered acceptable for emergency use. The materials used, arranged in series, were steel wool, burnt clay, activated carbon, and a mixture of ion-exchange resins (strong base and strong acid). Each material listed had some particular property in the removal of the different objectionable elements.

7365. LEETS, C.A.; BATCHMAN, R.F., AND JARRETT, H.W. **Procedure for washing and testing steam generators on locomotives other than steam.** *Proc. Master Boiler Makers' Assoc.* 1951, 186-201.—*C.A.* 46, 5751*h*.

Acid washing with suitable inhibitor followed by alkali rinse should be done as required to maintain clean surfaces. Demineralizing water treatment with Na zeolite was recommended as next preferable.

7366. Lindsay, F.K.; Wirth, L.F. Jr., and Durinski, A.M. **Ion exchange in high-temperature applications.** *Ind. Eng. Chem.* 43, 1062-5 (1951).—*C.A.* 45, 7730*i*.

Nalcite HCR was examd. under operating conditions at 110°C. Back-wash rates must be in the magnitude of 12 gal/ft^2 of bed and must be started at a low rate of flow and increased to the high rate in order to remove the light, readily removable turbidity. The capacity at high temp. remained high with frequent backwashing. There was no evidence that thermal shock had any effect on the resin. Slightly higher operating rates may be employed, and regenerating was most effective at 8% NaCl soln. for 30 min.

7367. Martin, Edward M. **Portable diatomite filters for emergency use.** *Water and Sewage Works* 98, 485-7(1951).—*C.A.* 46, 3188*d*.

Filter units ranging from 0.5 to 150 ft.^{2} of filter area, utilizing a deposition of diatomaceous earth from slurry on porous septums, and providing a rate of flow from 1 to 300 gal/min. can be mounted on trucks to provide emergency H_2O filtration.

7368. McGarvey, Francis X. and Thompson, Joseph. **Carboxylic cation exchange resin in water conditioning. Hydrogen cycle.** *Ind. Eng. Chem.* 43, 741-6(1951).—*C.A.* 45, 4380*g*.

IRC-50, the carboxylic exchanger, was found to possess a greater degree of selectivity for bivalent ions over univalent ions than sulfonic acid resins. Studies with solns. of $Ca(HCO_3)_2$, Na_2CO_3-$NaHCO_3$, and with mixed influents show that this exchanger was excellent for removing large amts. Ca and Mg in HCO_3. The carboxylic resin was more economical than a sulfonic-type exchanger for this application.

7369. Moiseev, S.V. **Experimental studies on removal of fluorine from water.** *Gigiena i Sanit.* **1951**, No. 1,49-51.—*C.A.* 45, 5848*e*.

Removal of F from drinking water was satisfactory if the dosage of the coagulant was carefully selected and if the pH range was held closely (8.4 for river and artesian water). Below 15°C the dosage of Al coagulant was 40 or 50 mg/liter at higher temp. The removal was effective if F concn. was below 5 mg/liter.

7370. Moore, Edward W. **Desalting of saline waters; a review of the present status.** *J. New Engl. Water Works Assoc.* 65, 319-37(1951).—*C.A.* 46, 3185*h*.

The objectionable characteristics of saline water were stated. For desalting, evapn. and ion exchange were the only methods economically feasible. Above 2,500 p.p.m. total salts, evapn. processes become apparently more effective and economical.

7371. Muto, Satoru. **Application of cation-exchange resin for the separation of boric acid from some cations.** *J. Chem. Soc. Japan,* Pure Chem. Sect. 72, 976-9(1951).—*C.A.* 46, 6996*a*.

In detg. H_3BO_3 contained in natural waters, its sepn. from Fe^{+++}, Al^{+++}, Zn^{++}, and NH_4^+ by a cation exchanger was studied with good results. H_3BO_3 was not adsorbed by H- or Na-resin and could be titrated with NaOH in the presence of mannitol.

7372. Newell, John F. and Christenson, C.W. **Radioactive waste disposal.** *Sewage and Ind. Wastes* 23, 861-7(1951).—*C.A.* 46, 1679*d*.

Radio-active material discharged to streams, rivers, and lakes will tend to concentrate in aquatic life which apparently was not harmed by the radioactivity normally present in wastes. Natural ground and surface waters have been found to contain some Ra.

7373. Newell, John F. and Christenson, C.W. **What treatment for radioactive wastes?** *Eng. News-Record* 147, No. 19, 37-8(1951).—*C.A.* 46, 2211*i*.

The Pu content of composite daily samples of Los Alamos wastes varied from 200 to 25,000 counts per min. per liter (C/M/L), the pH varied from 2 to 13 and total solids from 230 to over 15,000 p.p.m. Of the adsorptive agents tried, celite, kaolin, pumice, tuff, and activated carbon, the latter was most effective, 500 p.p.m. removing 99% of the activity from artificially polluted tap water. Activated sludge removed 90-95% of the Pu. Of chem. coagulants, $FeCl_3$ and lime gave best results. Substitution of NaOH for lime for neutralization reduced the vol. of sludge somewhat. About 20 p.p.m. Fe was added as $FeCl_3$ and sufficient lime to maintain the pH at or near 8.

7374. Osmun, Roy and Wirth, Louis Jr. **Silica removal with highly basic anion-exchange resins.** *Ind. Eng. Chem.* 43, 1076-9 (1951).—*C.A.* 45, 7731*a*.

SiO_2 in the effluent was less than 0.05 p.p.m. and the total solids was less than 0.5 p.p.m. Regeneration of the anion exchanger was most efficient at 35°C with 2.5 lb of caustic/ft^3 for a contact period of 1 hr. Rinsing with 50 gallons of H_2O at a rate of 5 gallons/ft^2/min. at a temp. of 5°C gave the best results. The position of the ions in an exhausted bed of Dowex 2 showed that the SiO_2 was concd. near the bottom of the bed.

7375. Reents, A.C. and Kahler, F.H. **Mixed-bed deionization.** *Ind. Eng. Chem.* 43, 730-4(1951).—*C.A.* 45, 4380*h*.

The availability of low d. anion-exchange resins and higher d. cation-exchange resins made possible operation of mixed-bed deionizing units in which the resins could be regenerated in the same unit. Comparison of the mixed-bed technique with the conventional two-bed deionization showed that the mixed-bed technique was superior with respect to saving in H_2O consumption, time of regeneration, economy of space required, efficiency of operation with respect to length of time of operation after standing, and resistivity of the effluent of the unit.

7376. Rose, H.E. **The analysis of water by the assessment of turbidity.** *J. Inst. Water Engrs.* 5, 521-45(1951).—*C.A.* 45, 10443*d*.

A photo-extinction app. was devised which gave abs. results. Calibration was not required.

7377. Rösl, Robert. **Water in industry. II.** *Seifen-Öle-Fette-Wachse* 77, 539-41, 563-6, 587-9(1951).—*C.A.* 46, 11519*b*.

Processes were described for removing impurities in dispersion and in soln. (carbonate and noncarbonate hardness, $CaSO_4$, $MgSO_4$, Na_2SO_4, free CO_2, Fe, Mn, SiO_2, dissolved O_2 and CO_2). Ion exchange and phosphate treatment were included.

7378. Sanchis, Joseph M. and Merrell, John C. Jr. **Studies on diatomaceous earth filtration.** *J. Am. Water Works Assoc.* 43, 475-93, discussion, 494-5(1951).—*C.A.* 45, 9203*i*.

The control of plankton growths, and the taste and odor problems they create, was responsible for the work done on diatomaceous earth filtration. Horizontal filtration with diatomaceous silica as a "filter aid" was possible and saved much space. Coarser products gave the longest runs. Water quality was satisfactory. Addn. of activated carbon did not interfere.

7379. Showell, E.B. **Ion exchange for water treatment.** *J. Am. Water Works Assoc.* 43, 522-38 (1951).—*C.A.* 45, 9203*d*.

Many details of ion-exchange were discussed. Typical analyses from many points were included, also relative costs.

7380. Shvidenko, A.A. **Coagulation of water by bentonite.** *Gigiena i Sanit*, 1951, No. 7, 19. —*C.A.* 46, 667*d*.

Treatment of water with Askan bentonite required a dosage of 60-100 mg/liter to give a water with transparency of 3-11 cm; it was best done at 16°C with pH not below 7.5 and moderate noncarbonate hardness. Addn. of 30-100 mg/liter of lime to the bentonite improved the effectiveness of the coagulation.

7381. Šmíd, Jaromír. **Review of methods for purifying phenolic wastes.** *Paliva* 31, 35-6(1951). —*C.A.* 45, 9782*d*.

The main extn. solvents were BuOAc, tritolyl phosphate, and C_6H_6 and similar hydrocarbons. Phenolic matter could be destroyed or removed by biol., phys.-chem., oxidative, or chem. methods. The biol. method depended on bacterial oxidation in an aerated system, promoted by the addn. of ammonium phosphate or nitrogenous wastes. Asbestos or paper pulp could be used as bacterial carrier. The phys.-chem. method depended upon adsorption on solid agents such as activated charcoal. Oil and tar prevent regeneration of the charcoal with C_6H_6 and must be absent.

7382. Smith, R.I. and Denton, J.R. **Preparing water for evaporator feed.** *Power* 95, No. 8, 80-3 (1951).—*C.A.* 45, 9203*g*.

A satisfactory evaporator feedwater was obtained by treating raw water in a cation-exchange system, operating on the H-cycle with upflow regeneration and pH control by the addition of caustic soda. An evaporator vapor of high quality could be produced from this water. The nonscaling character of the treated water resulted in low evaporator maintenance.

7383. Spaulding, Charles H.; Lowe, Harry N. Jr., and Schmitt, Richard P. **Improved coagulation by the use of pulverized limestone.** *J. Am. Water Works Assoc.* 43, 793-802(1951).—*C.A.* 46, 1191*e*.

Solid $CaCO_3$ was found to possess unique properties in promoting isoelec. conditions. The equipment for conducting the investigation was described. Limestone was pulverized so that over 90% would pass a 100-mesh sieve. In the field, the suspended solids contact-procedure was applied and described.

7384. Stomquist, D.M. and Reents, A.C. **Removal of cations from chromic acid solutions.** *Proc. 6th Ind. Waste Conf., Purdue Univ. Eng. Bull., Extension Ser.*, No. 76, 181-9(1951).—*C.A.* 46, 10974*d*.

Chromium plating or anodizing solns. contaminated with metallic ions and unsuitable for plating operations was processed for reuse in a system including a diln. tank for reduction of CrO_3 to 125 g/liter, an ion-exchange bed of the styrene type, and an evaporator to concentrate the exchanger effluent to plating-bath strength.

7385. Straub, Conrad P. **Removal of radioactive materials from waste solutions.** *Sewage and Ind. Wastes* 23, 188-93 (1951).—*C.A.* 46, 355*c*.

Evapn. would remove all activity from the liquid portion and conc. it in the sludge or slurry. Coagulation with alum removed 10% I^{131}, 98% P^{32}, 10 of Sr^{89}, 45-98 of Y^{91}, 98 of Ce^{144}, 98 of Y^{90}, and 10 of Sr^{90}. Phosphate coagulation gave results as follows : Zn^{65}, 99; Sr^{89}, 98; Y^{91}, 99; Sb^{124}, 67; Ce^{144}, 99; W^{185}, 10. Sand filtration removed 85-98% P^{32} and only 1-25% I^{131}. Ion-exchange materials were effective; activated sludge removed 96% Pu and about the same amt. I^{131}.

7386. Straub, Conrad P.; Morton, Roy J., and Placak, Oliver R. **Oak Ridge reports results on water decontamination study.** *Eng. News-Record* 147, No. 7, 38-41 (1951).—*C.A.* 45, 10448*i*.

Removal of radioactive contaminants was studied in a 250-gallon-per-day exptl. rapid sand filtration plant and by means of jar tests. Tap water contg. about 100 p.p.m. turbidity, added as clay slurry, was used as raw water, and to this was added radioactive material. Addn. of 4 p.p.m. activated carbon increased the removal to 26%. Using a synthetic fission product mixt. simulating the elements and products remaining 1 month after a bomb blast, coagulation and sedimentation removed 46% and filtration 44-50% of the remainder, the overall removal being 70-3%. Removal of specific radioisotopes varied considerably. Addn. of clay influenced removal by coagulation. A combination of steel wool, burnt clay, activated carbon and synthetic anion and cation exchange materials reduced radioactivity from 2.5 to $< 10^{-4}$ microcuries per cc., i.e., >99.996%.

7387. Straub, Conrad P.; Morton, Roy J., and Placak, Oliver R. **Studies on the removal of radioactive contaminants from water.** *J. Am. Water Works Assoc.* 43, 773-92 (1951).—*C.A.* 46, 1191*i*.

Conventional methods of water treatment were used, including phosphate coagulation and clay adsorption, in lab. and pilot plant procedures. The isotopes treated were P^{32} as phosphate, Ce^{144}, Y^{91}, Sr^{89}, and Ru^{106}, as chlorides, I^{131}, as iodide, and Zr^{95}, and Nb^{95}, as oxalates. The use of NaOH and Na_2CO_3, especially Na_2CO_3, with alum or Fe improved results. Results with $FeCl_3$ were slightly better than with alum. Approx. 70% of the radioactive material can be removed by coagulation, sedimentation, and filtration.

7388. Thornton, H.A. and Moore, J.R. **Adsorbents in waste water treatment-dye adsorption and recovery studies.** *Sewage and Ind. Wastes* **23**, 497-504(1951). —*C.A.* 46, 670*g*.

The capacity of fuller's earth and activated bauxite for removal of dyes from waste waters was investigated. Economical use of these materials would require regeneration and re-use. Regeneration of the absorbent and recovery of the dye by means of solvents were feasible for some dyes.

7389. Troitskiĭ, Yu. A. and Protserov, B.M. **Characteristics of drinking water containing iron.** *Gigiena i Sanit.* 1951, No. 7, 19.—*C.A.* 46, 666 *g*.

Water of the Khabarovsk area may contain as much as 36 mg/liter Fe, especially in very deep wells. Aeration served to remove 50-60% of the Fe content. Coagulation effectively removed the ferric form, while overchlorination removed all forms quite satisfactorily. Pptd. Fe and its compds. were removable by filter beds (charcoal or sand).

7390. Tyler, Richard G.; Maske, William, and Westin, Milton J. **Treatment of chromium waste by ion exchange.** *Sewage and Ind. Wastes* **23**, 1032-5 (1951); *Proc. 6th Ind. Waste Conf., Purdue Univ. Eng. Bull., Extension Ser.*, No. 76, 135-40 (1951).—*C.A.* 46, 2724*e*; 10974*i*.

Removal of Cr by Zeo-Karb indicated that the material acted as an adsorbent rather than as an ion-exchange medium. Regeneration with alkali resulted in recovery of sexivalent Cr. Acid regeneration produced the less toxic trivalent Cr and would therefore be more satisfactory for discharge into a stream. However, the large quantities of acid required for regeneration would in themselves produce a pollution problem unless neutralized.

7391. Ullrich, A.H. and Smith, Mansel W. **The biosorption process of sewage and waste treatment.** *Sewage and Ind. Wastes* **23**, 1248-53(1951). —*C.A.* 46, 3189*g*.

The process was an accelerated high-rate treatment process in which activated sludge was mixed intimately for a brief period with raw sewage adsorbing a high percentage of suspended and dissolved material. The mixed liquor was settled in a clarifier and sludge pumped to an aeration compartment where it was aerobically digested.

7392. Venkataramanan, K.; Krishnaswamy, N. and Ramakrishnan, T. **Removal of fluorides from water. I. The use of ion-exchange resins. II. Use of Alum-treated ion-exchange resin.** *Indian J. Med. Research* **39**, 211-17, 218-22 (1951).—*C.A.* 46, 3686*g*.

A cation-exchange resin was prepd. by refluxing a sulfited ext. of Avaram bark with CH_2O, promoting gel formation by adding a small quantity of acid, air-drying the gel, powdering, boiling with acid, washing thoroughly, and drying. A two-bed system with "Amberlite IR-4" as the anion exchanger was efficient in removing F from H_2O contg. up to 5 p.p.m. Treating the cation-exchanger with alum made it an effective material for removing F from H_2O, with the advantages of an one-bed system easily regenerated with alum.

7393. Veselov, M.P. and Iovlev, V.M. **Multiple-passage tap for sodium-cationite filters.** *Za Ekon. Topliva* **8**, No. 3, 33-4(1951).—*C.A.* 46, 1305*e*.

The design of the tap was such that according to the setting it (1) fed the water downward through the cationite and conveyed the treated water to storage, (2) pushed the water upward through the cationite to loosen it, and (3) fed a NaCl soln. through the filter to regenerate the latter.

7394. Villar, G.E. **Contamination of surface waters by refinery wastes.** *Rev. ing.* (Montevideo) No. 515, 13 pp. (1951).—*C.A.* **46**, 3739*h*.

Petroleum refinery contamination of surface waters was reviewed under the following headings: general characteristics of refinery wastes, harmful effects of contamination by these wastes, general requirements for treating liquid refinery wastes, legal considerations in prevention of contamination, and conclusions.

7395. Weiss, Charles M. **Adsorption of** *Escherichia coli* **in river and estuarine silts.** *Sewage and Ind. Wastes* **23**, 227-37 (1951). —*C.A.* 46, 667*i*.

In the range of turbidities usually encountered in natural water *E. coli* was adsorbed to the particulate matter and the degree of adsorption was characteristic of the origin and particle size. Adsorption to silt particles increased the rate of sedimentation of bacterial cells. Dild. sea water increased the rate of flocculation of silts.

7396. Willard, B.J. and McCaleb, T.L. **Water treatment in natural-gasoline plants.** *Oil Gas J.* **49**, 78-84 (1951).—*C.A.* 45, 5916*e*.

The treatment of waters for heating, power, and cooling was discussed. The control of scale, algae, slime, and corrosion as well as reduction of foaming and carryover, was discussed. Methods of water conditioning by ion exchange were given.

7397. Wirth, Louis Jr. **Hot lime-zeoline—A versatile water treatment process.** *Southern Pulp Paper Mfr.* **14**, 14-18 (1951).

The new method, involving a primary hot lime process followed by secondary hot zeolite softening, accomplished the following: (1) Hardness reduction to "zero", (2) alkalinity reduction to as low as 15 p.p.m. without the use of acids, (3) silica reduction to tolerable limits, (4) dissolved solids reduction equal to the total alkalinity minus about 30 p.p.m. and (5) clarification to "zero" turbidity. Successful operation at 275°-285°F was claimed.

7398. Wirth, L.F. Jr. and Butler, W.S. **Hot lime zeolite proves practical.** *Power* **95**, No. 3, 110-13, 174, 176 (1951).—*C.A.* **45**, 3535*h*.

The advantages were simplified control, improved Si removal, lower softener turbidities, hardness reduction, and reduction of CO_2 in the steam. A hot-lime-aluminate-styrene-type exchange softener was used. Total hardness of raw water was reduced from 167 p.p.m. to 0.5 p.p.m. Silica concentration dropped from 3 p.p.m. in the primary softener influent to 0.5 p.p.m. in the secondary effluent. Turbidity at the effluent of the primary softener averaged 0.7 p.p.m. Carbon dioxide ran 1.0 p.p.m. in this period.

7399. Yokovleva, M.N. **Use of bentonite and other clay coagulants as substitutes for aluminum sulfate in water purification.** *Gigiena i Sanit.* **1951**, No. 7, 20-1.—*C.A.* 46, 667*h*.

Some 20 specimens of bentonites, subbentonites, and active clays showed effective action only if total water hardness was above 7°. Cloudiness was decreased and color reduced only by the removal of suspended matter; the ppt. formed with bentonites amounted to 1-5% by vol.

7400. Baylis, John R. **Slurry feeding of activated carbon.** *J. Am. Water Works Assoc.* 44, 1161-8(1952).—*C.A.* 47, 1314*f*.

Unloading carbon directly into water and then, when wet, making a slurry, was considered satisfactory. One to 1.25 pounds/gal is the proper concn. Several days were frequently required. Steel tanks holding the slurry must have a protective coating.

7401. Brindisi, Paul. **Water-softening methods. 3: Combined treatments.** *Power* 96, No. 2, 86-7, 216, 218 (1952).—*C.A.* 46, 3688*a*.

In combining lime soda with zeolite, selection of coagulants, and advantages of phosphate addn. were studied. It was felt that combined treatment gave the best results.

7402. Brines, M.E. **Demineralization builds up an excellent operating record.** *Power Eng.* 56, No. 6, 82, 114-7 (1952); *Power* 96, No. 6, 94-7, 206-8 (1952).—*C.A.* 46, 7260*d*.

Diagrams and cuts helped explain the operating procedure in Dow's Midland, Mich. plant where combined cation and anion exchangers were in use. Both cation and anion exchangers were described. This treatment, however, did not always remove insol. colloidal silica, although analysis of the finished water did not show its presence.

7403. Brooke, Maxey and Holbrook, Marvin. **Determination of hardness of waters containing polyphosphates.** *Chemist Analyst* 41, 80-1 (1952).—*C.A.* 47, 2405*g*.

An ion-exchange method was found successful in detg. hardness in waters contg. polyphosphates. Amberlite IR-4B served as an exchanger. The water to be tested was passed through the exchange column at the rate of 5-10 ml per min.

7404. Butler, William S. **Dow's hot-lime-zeolite system after 18 months.** *Power Eng.* 56, No. 1, 80-2 (1952).—*C.A.* 46, 3186*i*.

The quality of water, before and after treatment, operating details, and costs were tabulated. Lime and sodium aluminate were fed to the primary softener and a pH of approx. 10 maintained.

7405. Cillie, G.G. **Defluoridation of water supplies using an activated superphosphate.** *Chemistry & Industry* **1952**, 856-7.—*C.A.* 47, 1876*c*.

Com. lime superphosphate (1 g) was stirred 24 hrs with 6 ml of 5% NaOH, the liquid decanted, and the solid washed. H_2O contg. 10 p.p.m. of F^- at pH 6-7 (maintained by the addn. of CO_2 to the feed) was passed at 30 ml/min. through a filter of 30 g, giving an effluent contg. 1-2 p.p.m. of F^-. The capacity was 2.4 mg of F^-/g/cycle over 10 cycles.

7406. Dutton, L.F. **Few customers, large pumpage at Groton water works.** *Public Works* 83, No. 9, 53-5(1952).—*C.A.* 46, 10498*a*.

A H_2O supply was obtained from a reservoir fed in part from ground-H_2O storage and treated in a plant providing dosage with $Al_2(SO_4)_3$, CaO, and activated carbon; coagulation; sedimentation; filtration; chlorination; and corrosion control with $Ca(OH)_2$.

7407. Emmerson, George S. **Filters will deoil your boiler feedwater.** *Power Eng.* 56, No. 4, 67-70; No. 7, 66-8 (1952).—*C.A.* 46, 5750*i*, 10503*e*.

Filter design and materials of construction used in oil filtration were considered. Diatomaceous earth was considered the most successful filter aid. Methods of operation for the best results were discussed.

7408. Emmons, A.H. and Lauderdale, R.A. **Low levels of radioactive contaminants in water.** *Nucleonics* 10, No. 6, 22-3(1952).—*C.A.* 46, 9434*h*.

A 20-cm silvered-glass-cathode Geiger-Müller tube was embedded vertically in a cation-exchange resin column and fission products from water or liquid wastes passed through it. The resin was easily regenerated. A continuous system was obtained by alternating between 2 identical columns.

7409. Erdei, Joseph F.; Lee, George S.; Louis, Leo, and Sampson, James A. **Taste and odor problems during spring runoff.** *J. Am. Water Works Assoc.* 44, 112-43, (1952).—*C.A.* 47, 1314*h*.

Four sources of tastes and odors were listed. An effort to det. color from the tannin content was not satisfactory. Activated carbon, prechlorination, and ClO_2 all have been used with varying success.

7410. Finney, J. Wiley Jr. **Turbidity and odor problems overcome in filter-plant design.** *Public Works* 83, No. 11, 60-1(1952).—*C.A.* 47, 2406*g*.

H_2O from a surface supply was treated to produce a satisfactory effluent in a plant including aeration, coagulation with alum and lime, flocculation, sedimentation, treatment with activated carbon, filtration, and chlorination.

7411. Gemmell, Lee. **Efficiency of filter beds for treating radioactive waste.** *Nucleonics* 10, No. 10, 40-2(1952).—*C.A.* 47, 2046*f*.

Combined sanitary sewage, ordinary lab. wastes, and low-level radioactive wastes flowed through a settling tank and 1 of 6 intermittent sand and gravel filters of about 1 acre area each. The 12-month av. flow was 223,000 gal/day. Some filter performance tests with sep. solns. of 6-month-old mixed fission products, radio-P as H_3PO_4, radioiodide, and radio-Sr chloride showed 88-99% removal of the activities, while pile canal water, whose main radioactive component was anionic, showed 47% removal.

7412. Gilwood, M.E.; Calmon, Calvin, and Greer, A.H. **Silica-removal characteristics of highly basic anion exchangers.** *J. Am. Water Works Assoc.* 44, 1057-64(1952).—*C.A.* 47, 1314*e*.

Two types of quaternary ammonium, highly basic, anion-exchange resins, one of which was not as stable as the other, were described. In the two-step demineralization, and also in the mixed-bed process, they reduced SiO_2 to substantially the same low levels of 0.01-0.05 p.p.m.

7413. Hamlin, G.H. **The taste had to be better.** *Am. City* 67, No. 7, 104-5 (1952).—*C.A.* 46, 10501*d*.

Water from a reservoir with algae-induced taste and odor problems was treated in a plant consisting of a mixing chamber, a flocculation chamber, a clarifier, and sand filters, with $Al_2(SO_4)_3$, CaO, and activated carbon used in treatment. Wash H_2O for filter backwashing was recovered, stored in a reservoir, and refiltered to save H_2O and to conform to a restriction against draining wash water into adjacent streams.

7414. Hanya, Takahisa. **Suspending matters in natural waters. II. Change of turbidity.** *J. Chem. Soc. Japan*, Pure Chem. Sect. 73, 288-90(1952).—*C.A.* 47, 2913*g*.

The turbidity of natural waters changed its value within ±50% after 5 days' standing. The turbidity of sea water contg. large amts. of org. substances was apt to increase, while that of fresh water contg. much inorg. matter showed the tendency to decrease. Stability of turbidity was defined as the ratio of turbidity after standing to that at the time of sampling.

7415. Harlow, J.H. **Two-bed demineralizer installed at Schuylkill electric generating station for the supply of steam to the district-heating system.** *Bull. Natl. District Heating Assoc.* 38, No. 1, 11-13, 20-2(1952).—*C.A.* 47, 1315*d*.

The use of a two-bed ion-exchange unit to demineralize boiler feed water was described.

7416. Heide, F. **The geochemistry of fresh waters.** *Chem. Erde* 16, 1-21(1952).—*C.A.* 47, 2913*b*.

A discussion of the major factors in the geochem. cycle, including problems of sampling, inhomogeneity of stream compn., secular variation, changes in compn. on standing, and problems of the content of elements present largely as adsorbed particles on suspended matter in streams.

7417. Heinecke, Georg. **Processes for removal of iron from water for drinking and for other purposes.** *Bau u. Betrieb* (Suppl. to Gas- u. Wasserfach) 4, No. 2, 1-2(1952).—*C.A.* 46, 4152*g*.

Open and closed filters for removal of Fe were described and illustrated. These were filled with coke, quartz sand, etc. Two-stage closed filters were used where filtration was difficult, the first filter used comparatively coarse material, and the second sand.

7418. Henry, Clarence R. **Stability and activity of activated silica sols.** *J. Am. Water Works Assoc.* 44, 49-57(1952).—*C.A.* 46, 3687*b*.

The experimental work described involved the preparation and storage of sols used in water treatment. The measurement and improvement of activity, stability, and turbidity was part of the study.

7419. Hiester, Nevin K. and Vermeulen, Theodore. **Saturation performance of ion-exchange and adsorption columns.** *Chem. Eng. Progress* 48, 505-16(1952).—*C.A.* 46, 10701*c*.

Regenerative operations in fixed beds were inherently more difficult to explain and calc. than the common steady-state counterflow operations. The use of suitable dimensionless parameters made it possible to represent the complete family of concn.-history curves, at any one value of an equil. parameter, as a contour plot in terms of a column-capacity parameter and a soln.-capacity parameter. Numerical solutions can be used by methods outlined to predict column behavior over substantial ranges of operating conditions.

7420. Howe, Everett D. **Sea water as a source of fresh water.** *J. Am. Water Works Assoc.* 44, 690-700 (1952).—*C.A.* 46, 10495*f*.

The Diesel-waste heat method, the temp.-difference method, and the solar-distn. method were discussed. Figures showed recommended plant design. The solar-distn. method seemed most promising.

7421. Hyndshaw, A.Y. **Removal of chlorine from water by active carbon.** *Munic. Utilities* 90, No. 5, 27, 48, 50, 52, 54 (1952).—*C.A.* 46, 11519*e*.

Active carbon was found to be an effective dechlorinating agent. It also removed remaining tastes and odors.

7422. Hyndshaw, A.Y.; Laughlin, H.F.; Colebaugh, D.C. Jr., and Filicky, J.G. **Factors influencing the efficiency of activated carbon.** *J. New Engl. Water Works Assoc.* 66, 36-42 (1952).—*C.A.* 46, 5232*c*.

Activated carbon was most efficient at pH 8.5 or lower. Increasing the time, with low dosages, improved results. The carbon should be added prior to chlorination. Monochloramine was least adsorbed by carbon. Heavy floc formation reduced carbon efficiency. ClO_2 was more efficient in removal of medicinal tastes and odors while carbon was most effective with algae.

7423. Janssen, C. and Mijnken, J.W. **Composition of water for high-pressure boilers.** *Ingenieur* 64, CH67-9(1952).—*C.A.* 47, 6075*h*.

For boilers with pressures of 70 atm. or more the pH had to be 10.4-11.0 and SiO_2 less than 5 mg/liter. Some phosphate must be present to ppt. Ca (as hydroxyapatite). The pH could be reached with phosphates or lye. Phosphates may cause a Mg ppt. on the boiler wall.

7424. Krick, Irving P. **Increasing water resources through weather modification.** *J. Am. Water Works Assoc.* 44, 996-1020(1952).—*C.A.* 47, 1460*e*.

The principles involved in nucleation and drop formation where outlined. The action of AgI was studied as well as the methods necessary to get it into its most efficient form for use. The ultimate effect on weather was discussed.

7425. KRUSE, HEINRICH. **Membrane filter.** *Gas- u Wasserfach* 93, 712-15(1952).—*C.A.* 47, 4017*b*.
Membrane filters were prepd. by evapg. a definite quantity of a soln. of nitrocellulose on a horizontal plate; the filter porosity varied with the state of polymerization of the nitrocellulose as well as with humidity and temp. at which it was used. The pore size of these filters was estd. by the air pressure required to bubble air through a layer of water over the horizontal filter. They could be sterilized with flowing steam in a layer of alternate membrane filters and filter papers, weighted down. A membrane of this type will retain bacteria of a much smaller size than the pore size and could be used for the quant. removal of bacteria from relatively large amts. of water or dil. sewage (up to 1 liter or more).

7426. LACY, W.J. **Removal of radioactive material from water by slurrying with powdered metal.** *J. Am. Water Works Assoc.* 44, 824-8 (1952).—*C.A.* 46, 10501*h*.
Tap water was artificially contaminated with radioactive materials and then mixed with powd. metal, as Fe, Cu, Al, and Zn. Adsorption was rapid. Conventional coagulation and filtration resulted in removal of contaminants to a safe tolerance level for emergency drinking purposes.

7427. LALLI, G. AND ORLANDI, A. **Biological depuration of waters subjected to demineralization by ion-exchange resins.** *Riv. med. aeronaut.* 15, 231-60(1952).—*C.A.* 47, 4016*d*.
Weak cation-exchange resins, as Amberlite IRC-50, were practically inactive; Amberlite IR-120 was inactive on *E. coli* in H_2O but strongly active against acid-sensible germs contained in water with a considerable salt content; weak anion-exchange resins, as Amberlite IR-4B, were scarcely active; Amberlite IRA-400, was intensely active against all germs contained in natural waters.

7428. LANGELIER, WILFRED F. **The electrochemical desalting of sea water with permselective membranes; a hypothetical process.** *J. Am. Water Works Assoc.* 44, 845-8(1952).—*C.A.* 46, 11519*f*.
A demineralizing unit was presented involving elementary electro-chem. theory. Only the basic principles involved were shown.

7429. LARSON, T.E. **Hardness reduction vs. removal—a critical evaluation.** *Water and Sewage Works* 99, 226-9(1952).—*C.A.* 46, 10502*f*.
Municipal hardness reduction, home service and home-owned hardness removal, and detergents were vital factors in water-treatment practices, with municipal softening to a hardness of 5 grains/gal providing more hardness reduction per unit cost to the user. Individual softening units could be adapted for final treatment at relatively low cost.

7430. LEE, JAMES A. **Cheap way to remove fluorides from water.** *Chem. Eng.* 59, No. 7, 211, 400-1(1952).—*C.A.* 46, 9237*i*.
Raw water was treated with activated Al_2O_3, which adsorbs or absorbs the fluorides; the Al_2O_3 was then regenerated by washing successively with dil. NaOH and dil. H_2SO_4.

7431. MARTIN, OWEN. **Water demineralization by mixed-bed ion exchange.** *Ind. Chemist*, 28, 448-50(1952).—*C.A.* 47, 4016*f*.

7432. McCOY, JAMES W. **Some applications of ion exchange to water analysis.** *Anal. Chim. Acta* 6, 259-66(1952)(in English).—*C.A.* 46, 7685*f*.
A system for the sepn. of the various ions found in cooling waters was described based on the use of ion-exchange resins. These sepns. made possible the use of rapid colorimetric methods and saved considerable time in the routine analysis of industrial waters.

7433. McGARVEY, F.X.; TENHOOR, R.E., AND NEVERS, R.P. **Cation exchangers for metals concentrations from pickle rinse waters.** *Ind. Eng. Chem.* 44, 534-41 (1952).
The recovery and disposal of Cu and brass alloy metals from wash waters might be accomplished with strongly acidic cation exchange resins of high capacity. H-cycle operation was more economical than Na-cycle. Major factors influencing capacity for Cu and Zn were the relative amounts of Ca and Mg hardness in the raw water, particularly where Cu concentration was low in the rinse water. Advantages of Na-cycle operation were: greater capacity, less sensitivity to total hardness in rinse water, greater concentration of toxic metals in regenerant, more complete removal of trivalent chromium, and reduced acidity.

7434. MEYER-EPPLER, WERNER AND WESSEL, BERT. **A process for fine screening of ceramic masses by using vibrations of sound frequency.** *Sprechsaal* 85, 557-9 (1952).—*C.A.* 47, 2446*d*.
Screening was expedited with a min. of water by using screens that were vibrated at sound frequency, and rubber rakes vibrating at low frequency.

7435. MIDDLETON, F.M.; BRAUS, HARRY, AND RUCHHOFT, C.C. **Fundamental studies of taste and odor in water supplies.** *J. Am. Water Works Assoc.* 44, 538-46(1952).—*C.A.* 46, 10498*h*.
Carbon filter technique developed for the concn. and estn. of the small quantities of org. chemicals responsible for tastes and odors in water was discussed. Two types of activated carbon were used, i.e. Cliffchar and Nuchar. Diagrams of sand and carbon and activated carbon filter assemblies are included. In several cases activated carbon was especially successful.

7436. MORENO, J.R. AND BURLAGE, HENRY M. **Ion exchange in water conditioning.** *Am. Profess. Pharmacist* 18, 783-9, 823-6(1952).—*C.A.* 47, 802*g*.
Various methods of water conditioning were described with special emphasis on the use of ion-exchange resins.

7437. MÜLLER, JOSEF. **Contamination of ground water supplies by gasoline.** *Gas- u. Wasserfach* 93, 205-9 (1952).—*C.A.* 46, 6295*h*.

With a lowering of ground-water level, the lighter gasoline was absorbed by the soil in one instance, to be evident again during high water. Gasoline in the soil appeared to be oxidized first by atm. O_2 and then by means of nitrate with the aid of a catalytic or biol. process. CO_2 and N were formed, the former reacting with Ca compds. to increase alky. and hardness of the water. When only slight traces of gasoline remained in the water, active carbon filters were successfully used to purify the water for domestic purposes.

7438. PAPP, SZ. **Removal of iron from industrial and potable waters.** *Acta Tech. Acad. Sci. Hung.* 5, 437-61(1952)(in German).—*C.A.* 47, 5589*e*.

Fermago, a filter material prepd. from sintered MgO contg. Fe_2O_3 and quartz fines, removed Fe and Mn and increased alky. Iron pipes in chilled wells were given a protective coating by treating with a mixt. of Na_2CO_3, CaO, and $Ca(OCl)_2$. The Fe content of the water was greatly reduced, and the life of the pipes increased.

7439. PAULSON, C.F. **Wastes recovery by ion exchange.** *Wastes Eng.* 23, 208-9 (1952).—*C.A.* 46, 4927*h*.

Cr from baths employed for anodizing Al, Cr plating, and Cu stripping could be recovered by ion-exchange resins at a cost less than that of disposal; cation-exchange app. was incorporated in plating lines.

7440. PIS'MEROVA, O.V. AND KALMYKOVA, A.I. **Use of cation accumulation in the analysis of steam and condensate under industrial conditions.** *Izvest. Vsesoyuz. Teplotekh. Inst. im. Feliksa Dzherzhinskogo* 21, No. 2, 23-5 (1952).—*C.A.* 46, 6297*b*.

The use of ion exchange in a power-generating station was described.

7441. POLUKAROVA, E.I. **Increasing the efficiency of cationic filters.** *Izvest. Vsesoyuz. Teplotekh. Inst. im. Feliksa Dzhershinskogo* 21, No. 1, 22(1952).—*C.A.* 46, 6298*a*.

Design and mech. improvements of water-softening filters were described. By virtue of these improvements the exchange capacity of the cationite rose from 500°-600° to 800°-900°C/m^3.

7442. QUENTIN, K.E. **Paper chromatographic isolation and colorimetric determination of boron in mineral waters.** *Z. Lebensm.-Untersuch. u. - Forsch.* 95, 305-13 (1952).—*C.A.* 47, 2082*f*.

The color obtained with turmeric soln. was made semiquant. by standardizing technique and comparing the color developed with that from standards with 0.1, 1, 5, and 10γB. In the quant. method 5 chromatographs were developed with samples contg. about 5γB. The B portions of 3 of the papers contg. B were cut up so that the B test spot was in the upper 1/3of the paper. The 3 samples were cut and washed 4 hrs. in a dish contg. water.

7443. RAMAKRISHNAN, T. AND VENKATRAMANAN, K. **Fluorine removal by tricalcium phosphate.** *J. Indian Inst. Sci.* 34, 119-22(1952).—*C.A.* 47, 441*i*.

The removal of NaF from aq. soln. (2-8 p.p.m.) by treatment with varying quantities of $Ca_3(PO_4)_2$ was studied. The reaction was complex, involving anion exchange of F^- for $PO_4{}^{3-}$, total mol. absorption of NaF, and possibly the partial replacement of Ca by Na in the phosphate.

7444. RENNER, G. LYALL. **Lime treatment and the Halifax water supply.** *Eng. Contract Record* 65. No. 5, 112, 114, 116, 118, 120, 122, 124, 126, 128, 130, 132(1952).—*C.A.* 46, 9237*h*.

The supply contained about 30 p.p.m. total solids and 5 p.p.m. hardness, a pH value of 4.5-6.5, and was very corrosive. After pilot plant tests on treatment with lime, Na silicate, and Na hexametaphosphate and lime, and large-scale tests with the first two, lime treatment was adopted. About 5-6 p.p.m. was required to increase the pH to 7 or slightly higher. The av. Pb content of the delivered water was reduced from 1.18 to 0.14 p.p.m. About 19% more Cl_2, which was applied following the lime, was required to maintain a residual of 0.2 p.p.m.

7445. RENSHAW, ARNOLD. **Emergency method of water sterilization.** *Farm. Chilena* 26, 351-3 (1952).—*C.A.* 47, 4528*d*.

I_2 added at a diln. of 1:20,000 destroyed most pathogenic germs in 10 min. An excess of I_2 could be removed by filtration through active charcoal.

7446. ROBINSON, M.P. **Water treatment by zeolites. A general view.** *Water and Sewage Works* 99, 152-6(1952).—*C.A.* 46, 10502*d*.

7447. SHOGENJI, TADASHI; TAKAHASHI, HIDEO, AND AKASHI, KANEMICHI. **The cold alkaline purification of sulfite pulp. Use of ion-exchange resin for the analysis of waste liquor and some information on alkali consumption.** *J. Japan. Tech. Assoc. Pulp Paper Ind.* 6, 201-11(1952) (English summary).—*C.A.* 46, 9304*b*.

The waste liquors were analyzed for total alkali by conductometric titration and for combined alkali by potentiometric and conductometric titration after treating with Amberlite IR-120 to remove the greater part of free alkali which interfered with the titration end point.

7448. SIMPSON, A.D. **Hot lime zeolite, a 287°F installation.** *Combustion* 23, No. 12, 49-51 (1952).—*C.A.* 46, 9308*h*.

A hot lime zeolite installation economically extended the capacity of existing conventional H_2O-treatment facilities in a paper mill by 35%. Hardness as $CaCO_3$ was reduced from 10 to 1.2 p.p.m. To avoid costly modifications and eliminate the secondary softener (Na_2HPO_4 treatment) with its undesired Mg and $PO_4{}^{3-}$ combination, styrene cation-resin ion-exchange units supplement the primary softener. Stability of the resin at 140°C appeared satisfactory after 60 days.

7449. SIMPSON, D. AND WHELAN, P.F. **Anthracite filter media.** *Chem. Trade J.* **130**, 1461-3(1952). —*C.A.* 46, 7827*d*.

The testing machine consisted of a cylindrical steel tank 10 in. high by 6 in. in diam. equipped with a 3-bladed propeller, 3 in. in diam. Above the propeller was supported a short standpipe which caused the circulating pulp to pass down the standpipe and up the outer space to overflow again inwards. The following test conditions were used: the charge was 1 kg of anthracite and 2.5 liter of H_2O, sample size was 1-2 mm, speed was 1000 r.p.m., and time of test was 4 hrs.

7450. SIMPSON, R.W.; DUKE, E.T., AND THOMPSON, K. **Asbestos paper wastes treatment.** *Water and Sewage Works* **99**, 286-91(1952).—*C.A.* 46, 9754*b*.

Wastes from asbestos-paper manuf. contg. asbestos fibers, unbleached sulfite screenings, bleached sulfite, pulverized limestone, starch, mixed paper, Na silicate, $Ca(OH_2)$, cattle hair, and NaOH neither vacuum nor pressure filtration provided satisfactory treatment, but flocculation and sedimentation was applicable. A plant of the high-rate clarification type, with $Al_2(SO_4)_3$ and activated silica for flocculation, provided removal of 95.8% suspended solids, 74.5% total solids, 89.9% turbidity, and 47.5% B.O.D.

7451. SPIEGLER, K.S.; JUDA, WALTER, AND CARRON, MORRIS. **Counterflow regeneration of cation exchanger in partial demineralization of brackish waters.** *J. Am. Water Works Assoc.* **44**, 80-8 (1952).—*C.A.* 46, 3687*g*.

The work, based on pilot-plant operation, was done to reduce the cost of purified water lost in regeneration and washing. Following a base-exchange softener were two pairs of demineralizers, a strongly acid cation, and a weakly basic anion, exchanger. H_2SO_4, as regenerant, was passed down through the cation exchangers and subsequently passed the exchanger in the opposite direction. Results are considered highly successful and economical. Dissolved salts were reduced from 2000 to 500 p.p.m. Na_2SO_4 was recovered.

7452. SUSSMAN, SIDNEY AND PORTNOY, IRVING L. **Determination of heavy metals and silica in chromate-treated cooling waters.** *Anal. Chem.* **24**, 1644-6(1952).—*C.A.* 47, 802*f*.

By means of the cation-exchange resin Dowex-50 (and probably any other sulfonated, polystyrene-type exchange resin) it was possible to remove Cu^{2+} and Fe^{3+} from cooling waters contg. chromate, although erratic results were obtained when the Fe content exceeded 12 p.p.m. To det. Si, an anion-exchange resin was used to prevent interference of CrO_4^{2-}. The cation-exchange resin could be easily regenerated by treatment with 5% HCl, but it was often more convenient in the SiO_2 detn. to use less resin and discard it after using.

7453. THOMPSON, J. **Ion exchange resins.--A new approach to water conditioning.** *Laundry Age* **1952**, 59-63(Sept.), 62-65(Oct.)

The water softening process and the advantages of ion exchange treatment of wash and boiler feed water were considered.

7454. VALIN, A.T. **The measurement of the color of water and the decolorization of water supplies.** *Water and Water Eng.* 56, 267-9(1952). —*C.A.* 46, 10498*h*.

The various methods for the detn. of color in water supplies as well as color removal by coagulation, chlorination, and ozonization were discussed.

7455. WAL, S.S. VAN DER. **Removal of iron from ground water by adsorption.** *Water* (Neth.) 36, (Jan. 31, 1952).—*C.A.* 46, 5229*e*.

It was difficult to remove Fe and Mn without floc formation and use of filter material only. If removal was insufficient, about 0.5 p.p.m. of Cu could be added. The activating action of the Cu was two-fold: Cu acted catalytically by the oxidation of Fe; Cu aided adsorption on the filter material.

7456. WHEELER, R.T. **Water-treating plants for secondary recovery and waste disposal (California) I. Methods of design. II.** *Oil Gas J.* **51**, No. 7, 95-6, No. 8, 66, 69. (1952). —*C.A.* 46, 8358*b*.

The advantages of a closed water-treating system, sand and diatomaceous earth filters, capacity of filtered-water storage, injection pumps, chem. treatment, and scale control were discussed. Considerable down time and expensive maintenance could be avoided by proper engineering and design of the water plant.

7457. WHEELER, R.T. **The design and maintenance of water-treating plants for secondary recovery and waste disposal in California.** *Calif. Oil World* **45**, No. 13, 4, 6, 8, 10, 12(1952).—*C.A.* **46**, 10598*e*.

A plant provided for the treatment of waste brine from petroleum operations by injecting it into the producing formation to drive the remaining oil to the producing wells. In the closed system corrosion was minimized, airborne bacteria excluded, dissolved Fe kept in soln., and H_2S gas not oxidized. If filtration was needed, diatomaceous earth filters had several definite advantages over sand filters.

7458. WILLIAMS, D.B. **How to solve odor problems in water-chlorination practice.** *Water and Sewage Works* **99**, 358-64(1952).—*C.A.* 46, 10501*e*.

Odors arising from free residual chlorination are chiefly due to NCl_3, which may be controlled by elevation of pH to 8.5 to 9, aeration, addn. of NH_3, addn. of activated carbon, or dechlorination with SO_2.

7459. YODER, J.D. **Demineralization by ion exchange.** *Paper Mill News* 75, 83-84, 86, 130 (Dec. 6, 1952).

The demineralization of feed water for high-pressure boilers was accomplished by means of the new ion-exchange resins. The higher the amount of the mineral solids to be removed, the more expensive the demineralizing equipment will be; however, the quality of the treated water justified the higher cost.

7460. ANON. **Dealkalization—without acid.** *Power Eng.* 57, 68, 117-119 (1953).

Dealkalization by a two step process not requiring acid was discussed. Influent water was first passed through a conventional softener (cation exchanger in the Na form), then through a strongly basic anion exchange resin in the Cl form. Chloride anions from the second exchanger replaced other anions in the sodium salt effluent from the softening step. Treatment for elimination of carbon dioxide was still necessary.

7461. ANON. **Iron removal and iron retention.** *The Betz Indicator* 22, No. 7 pp. 3-8 (1953).

Objectionable amounts of iron in water could be either removed, in the case of drinking water, etc., or treated so that it was not deposited, in the case of cooling water, etc. Iron retention by stabilization of the ions was secured by the use of surface-active agents such as polyphosphates or organic sequestrants.

7462. ANON. **Deionization yields low-silica feed water.** *Power Eng.* 57, No. 2, 60-1, 114, 117, 119(1953).—*C.A.* 47, 4527*h*.

A deionizing system delivered a 500,000-ohm-resistant water with a Si content of 0.05 p.p.m. or less. The plant (4 cation-exchange units) was covered in detail. Operation had been uninterrupted for 2 years.

7463. APPLEBAUM, S.B. **Demineralization passes in review.** *Power* 97, No. 8, 88-91, 196, 198, 202, 204(1953).—*C.A.* 47, 11610*h*.

Silica removal and complete demineralization, which was essential, was described. Advantages and disadvantages of mixed-bed demineralization were listed.

7464. BICKELL, L.K. AND TRETHEWEY, G.D. **A recovery method for sodium-base sulfite liquor.** *Pulp Paper Mag. Can.* 54, No. 13, 110-16 (1953). —*C.A.* 48, 3684*a*.

By a cyclic process, Na-base sulfite waste liquor was used economically to effect chem. and heat recovery, increase yield, and eliminate stream pollution. By means of ion exchangers, e.g. Amberlite IRC-50, Na was recovered from the smelt, and simultaneously sulfide S recovered as H_2S, which was burnt to give SO_2. The ion exchanger in the Na form was stripped with H_2SO_3 to give raw acid ready for cooking.

7465. BURGER, A.A. **At last plenty of water for Cleveland.** *Am. City* 68, No. 2, 83-5(1953).—*C.A.* 47, 4527*d*.

A municipal H_2O supply was increased in capacity by obtaining H_2O from a lake with turbidity of 2 to 200 p.p.m., alky. of 85 to 95, hardness of 115 to 125, and a coliform index in the range of 200 to 10000 per 100 ml. Treatment included the use of activated carbon for taste and odor control, $Ca(OH)_2$ for coagulation and corrosion control, $Al_2(SO_4)_3$ for coagulation, and Cl_2 for disinfection.

7466. FITZPATRICK, L.W. **Water-treatment engineering. Raw water treatment.** *Power Eng.* 57, No. 3, 70-3(1953).—*C.A.* 47, 4527*f*.

The advantages of deionization with ion exchange resins, softening with exchangers, and lime-soda softening were considered; advantages of the first two techniques were enumerated in tabular form. Rapid tests and calculations for correct softener operation, and chemical equations illustrating the reactions occurring with the systems were described.

7467. GILWOOD, M.E. AND CALMON, C. **Mixed-bed vs. two-step demineralizing.** *Power* 97, No. 5, 73-6(1953).—*C.A.* 47, 6582*e*.

Two-step demineralization with a degassifier and mixed-bed treatment with no degassifier were discussed. For waters of low mineral content the mixed-bed had advantages.

7468. LARSON, T.E. **Municipal and home water softening.** *J. Am. Water Works Assoc.* 45, 557-61(1953).—*C.A.* 47, 10780*b*.

The cost of softening hard water to 85 p.p.m. by a municipal softening plant was about 0.1 cent per p.p.m. hardness removed. Home owned softeners average 0.11 cent per p.p.m. and the domestic service type about 0.65 cent per p.p.m. Soap costs average 0.21 cent per p.p.m. All values are cent/p.p.m./1000 gals.

7469. MIDDLETON, A.B. **Activated silica treatment of raw and waste waters.** *Water & Sewage Works* 100, 85-7(1953).—*C.A.* 47, 4529*c*.

Municipal and industrial applications demonstrated the economy of improved flocculation.

7470. RIESS, C. **Water treatment by the threshold method.** *Mitt. chem. Forsch.-Inst. Wirtsch. Österr.* 7, 1-6(1953).—*C.A.* 47, 6584*h*.

Curves were given for the influence of metaphosphate on the pptn. and stabilization of the $CaCO_3$ hardness. Ultramicroscopic studies have shown that the $CaCO_3$ did not pass into the colloidal state. The colloidal state was not stabilized by phosphates. The ppts. contained Ca and P in an almost const. ratio of 300: 1 for an application of more than 0.6 mg metaphosphate/liter.

7471. SAUNDERS, MAX D. **Water for education.** *Water and Sewage Works* 100, 142-5(1953).—*C.A.* 47, 6582*d*.

The H_2O requirements were met by a surface supply treated in a plant consisting of dosage with $Al_2(SO_4)_3$, activated carbon, and CaO; flash mixing; prechlorination; flocculation; sedimentation; postchlorination; filtration; and dosage with $Ca(OH)_2$ for corrosion control.

7472. SMITH, JAMES BOYD. **Water impurities and electroplating.** *Metal Finishing* 51, No. 2, 69-72, 74, No. 3, 65-9(1953).—*C.A.* 47, 4226*a*.

The effect of various impurities, which may be found in water supplies, on various types of plating baths was described.

7473. THOMPSON, JOSEPH AND MCGARVEY, FRANCIS X. **Ion-exchange treatment of water supplies.** *J. Am. Water Works Assoc.* 45, 145-52 (1953).—*C.A.* 47, 4527*e*.

The availability of a variety of new resins, in ion-and cation-exchange, made possible improved softening, fluoride removal, alky. reduction, and H_2S removal.

7474. Valley, E.E. and Hanlon, R.T. **Modification of the feedwater treatment system at Port Arthur Division, Provincial Paper Ltd.** *Pulp & Paper Mag. Can.* 54, No. 3, 190-4, 201 (1953). —*C.A.* 47, 9616^d.

The acid-cycle cation exchange system, followed by a lignin deriv., NaOH, and an amine, was found to be most suitable for softening and decarbonating the Lake Superior water used in the mill.

7475. Yoder, J.D. **Demineralization—makeup water for steam power plants.** *Southern Power and Ind.* 71, No. 5, 74-8, 114, 116(1953).—*C.A.* 47, 6075^c.

The water was treated first in the cation exchanger, Permutit Q (a sulfonated styrenetype resin), or Zeo-Karb (a sulfonated, granulated, and suitably prepd. bituminous coal). Both materials were usually regenerated with H_2SO_4. With carbonate-contg. waters the effluent from this exchanger contained CO_2, which was more economically removed by means of an aerator or vacuum deaerator than by anion exchange. The demineralized water is somewhat corrosive to steel; if it is to be handled in steel the pH should be increased to 9.2 by the addn. of NaOH soln.; this is especially important with mixed-bed demineralization.

V-5. Refining of Petroleum Products

7476. Burrell, G.A.; Oberfell, G.G., and Voress, C.L. **Gasoline by the charcoal absorption process.** *Chem. & Met. Eng.* 24, 156-60(1921).

The properties of activated charcoal suitable for use in the recovery of gasoline were described. The heat effects in the absorption process, subsequent distillation with superheated steams, and condensation of the gasoline vapors were discussed. The gasoline recovered by the charcoal process was compared to that recovered by oil absorption.

7477. Fitzsimons, Ogden. **Fuller's earth and bauxite type adsorbents compared.** *Natl. Petroleum News* **29**, No. 24, 60-3, 67 (1937).

A comparison of costs showed the advantages of Fuller's earth over bauxite type adsorbents. Comparing filter houses of equal volume capacity (for example, 500 tons capacity of Fuller's earth and 850 tons of bauxite since bauxite was 1.7 to 1.9 times heavier), an annual cost of $60,900 was computed for Fuller's earth as compared with $85,980 for activated bauxite. Bauxite had a little higher loss rate but no discard.

7478. Trauffer, W.E. **Bentonite for oil refineries.** *Pit & Quarry* 29, (June) 60-2, 66(1937)

The equipment and processing methods of the Filtral plant at Jackson, Mississippi, was described. Placed in operation in 1936, the plant had a capacity of 75 tons of acid-treated bentonite bleaching agent (Super Filtrol) for cottonseed, linseed, and petroleum oils. A wet slurry was treated with H_2SO_4 and brought to the b.p. by steam. Details of the washing, drying, milling, and packing processes were given.

7479. Anon. **Filtering with bauxite produces economies in the lube processing.** *Natl. Petroleum News* 30, (April 20) R195-96 (1938)

The bauxite called "X-YTE" was compared with standard Fuller's earth. The bauxite was a high Al_2O_3 earth produced by calcining, activating, and sizing a selected bauxite. A decolorizing efficiency of 80 to 90% of the original material could be retained in regeneration. The average dustloss per burn was between 1% and 2%.

7480. Hubbell, R.H. Jr. and Ferguson, R.P. **Revivification characteristics of bauxite used in filtration.** *Oil Gas J.* 37, 135-39(Nov. 18, 1938).

The average adsorption efficiency of bauxite (compared with new material or with Fuller's earth) varied with the source, type of stock to be filtered, and the method of filtration. While fresh bauxite exerted a pronounced "solvent" action, this effect diminished with continued revivification. Improved gravity and carbon were obtainable with only the low-numbered bauxites, and only then at the sacrifice of viscosity. The selection of absorbent for a given service remained an individual problem.

7481. Egloff, Gustav; Morrell, J.C.; Thomas, Charles L., and Bloch, Herman S. **Catalytic cracking of aliphatic hydrocarbons.** *J. Am. Chem. Soc.* 61, 3571-80(1939).—*C.A.* 34, 1467^8.

A no. of hydrocarbons were cracked at atm. pressure in the presence of an activated SiO_2-Al_2O_3 catalyst. A mixt. of butenes underwent extensive catalytic isomerization to isobutene in the range 385-600°C, accompanied by polymerization and cracking; between 450 and 600°C the isobutene content of the C_4 product was 24.1 ± 1.5%. Pentenes showed reactions similar to those of the butenes, yielding 50% of isopentenes at 400°. A mixt. of octenes underwent both catalytic isomerization to isoöctenes and catalytic cracking to gaseous products consisting principally of equal amts. of butene and isobutene. The results were consistent with the theory that isomerization preceded cracking.

7482. Williams, Neil. **Atlantic Refinery on Gulf Coast.** *Oil Gas J.* 37, 70-1, 75, 78, 82 (February 23, 1939).

Two dehydrator towers containing activated alumina were described as part of the auxiliary equipment in the cracking and polymerization plant at Atrew, Texas.

7483. Harteck, P. **Purification and separation of hydrocarbons with the aid of desorption.** *Reichsamt Wirtschaftsaubau, Prüf-Nr.* 43, (PB 52003), 121-8 (1940).—*C.A.* 41, 6492*c*.

Selective adsorption of hydrocarbons on silica gel was described. In the sepn. studies approx. 1 g silica gel adsorbed 0.1 g hydrocarbon. In the sepn., the hydrocarbon gases were adsorbed on the silica gel, and the mass cooled to liquid-air temps. and the system evacuated. The stepwise desorption of the hydrocarbons was carefully followed. Graphs were shown for the sepn. of

C_2H_6-C_3H_8, C_2H_6-C_2H_4, and C_3H_8-C_3H_6 mixts with activated charcoal and silica gel.

7484. Roper, William N. **Natural gas progress.** *Natl. Petroleum News* 32, R398-9 (October 30, 1940).

Improvements in the design and operation of gasoline plants refrigeration units for the recovery of natural gasoline was made practical by the use of suitable de-hydration units. Freezing and the formation of petroleum hydrates was prevented.

7485. Tiddy, W. and Miller, M.J. **Light oil recovery from coke oven gas.** *Am. Gas Journal* 153, (Sept.) 7-10, 46 (1940).

The adsorption plant at Beckton, England, was described, including operation and plant results. Several objections were given to the adsorption system applied to American practice: (1) deterioration and replacement of charcoal; (2) corrosion of adsorbers; (3) intermittent operation; (4) higher sulfur content of the recovered crude benzol as compared with oil washing process.

7486. Hamai, Senzo **The velocity of sedimentation of the catalyst in the process of washing from it adsorbed ions.** *Science (Japan)* **11**, 518-19(1941).—*C.A.* 44, 10962*d*.

The catalyst of the Co group contg. Fuller's earth and some accelerators (for manuf. of synthetic petroleum) must be washed free of adsorbed ions. The sedimentation velocity of the catalyst in decantation was markedly affected by the temp.; washing with hot water (77-81°C) was advisable. The adsorbed ion studied was nitrate.

7487. Randolph, J.R. **Gas-gathering and discharge systems.** *Oil Gas J.* **40**, 46, 49, 51 (September 25, 1941).

Adsorption-type dehydrator units, filled with 3 tons of activated alumina as the adsorbing agent, were described, These were used at the Taylor Gasoline Plant and the Dove pressure-maintenance plant of the Carter Oil Co.

7488. Schulze, W.A.; Morris, L.C., and Alden, R.C. **Reducing internal corrosion of gasoline pipe lines.** *Oil Gas J.* **40**, 172-75 (Nov. 6, 1941).

The rate of internal corrosion of gasoline pipe lines was reduced: (1) removal of O_2 from the gasoline by injection of an aq. soln. of sodium sulfite into the line; (2) removal of entrained and some dissolved H_2O from the oil by passage over dehydrated beds of commercial bauxite; (3) use of mercaptobenzothiazole as a corrosion inhibitor.

7489. Ferns, J.L. **Deacidification of transformer oil.** *Elec. Times* **102**, 824-6 (1942).—*C.A.* 37, 5851^9.

A cylinder contg. 6 lb of activated Al_2O_3 was connected to a 500 kv.-amp. transformer contg. 170 gal of oil. After 4 months, during which 4 charges of Al_2O_3 were used, the acid value was lowered from 0.9 to 0.4.

7490. Hesse, Gerhard and Tschachotin, B. **Adsorption analysis of gases and vapors.** *Naturwissenschaften* 30, 387-92 (1942).—*C.A.* 37, 6211^4.

The mixt. was vaporized, and passed with a carrier gas into a heated adsorption tube contg. silica gel. The vapor passing through was condensed and analyzed. The method was applied to the sepn. of C_6H_6 and cyclohexane. The sepn. of a C_6H_6-cyclohexene mixt. was difficult, but with a greater quantity of adsorbent, 25% of C_6H_6-cyclohexene was obtained optically pure. C_6H_6 and CCl_4 were easily sepd.; iso-PrOH and *tert*-BuOH could not be sepd.; *cis*- and *trans*-$C_2H_4Cl_2$ were partly sepd. Silica gel was a better adsorbent than activated charcoal.

7491. Rossini, Frederick D.; Mair, Beveridge J.; Forziati, Alphonse F.; Glasgow, Augustus R. Jr., and Willingham, Charles B. **Method for analyzing the gasoline fraction of petroleum, with preliminary results on East Texas and Oklahoma crudes.** *Petroleum Refiner* **21**, 377-82 (1942); *Proc. Am. Petroleum Inst.* **23**, III, 7-14 (1942).—*C.A.* 37, 1249^6.

The fractionating processes of adsorption and distillation was applied to the naphtha fraction. Preliminary results on the naphtha fractions from East Texas and Oklahoma crude oils were presented with results of a test experiment on a mixture of 17 known hydrocarbons b. 60-174°C.

7492. Simpson, T.P.; Evans, L.P.; Hornberg, C.V., and Payne, J.W. **The Thermofor catalytic cracking process.** *Natl. Petroleum News* 34, No. 47, R427-31 (1942); *Petroleum Refiner* **21**, 401-5 (1942); *Oil Gas J.* **41**, No. 27, 96, 99, 100, 102, 104 (1942); *Proc. Am. Petroleum Inst.*, Sect. III, **24**, 83-8 (1943).—*C.A.* 37, 1250^5, 6862^3; 38, 1625^5.

The methods in the principal catalytic cracking processes for handling catalyst, bringing oil and catalyst into contact, and regenerating were discussed in general and in detail for the Thermofor process.

7493. Stanisavlievici, Louis. **Removal of organic sulfur compounds from city gas by wood charcoal.** *Gas u. Wasserfach* **85**, 353-9(1942).—*C.A.* 37, 3908^9.

A simple procedure employing passage of the gas over charcoal was described suitable for the removal of org. S compds. from S-rich distn. gases and other fuel gases. The following factors were critically studied as regards the efficiency of S removal by the charcoal: (1) particle size of the charcoal, (2) concn. of CS_2 in the gas, (3) rate of gas flow through the adsorber, (4) moisture of the charcoal, (5) steaming out as in regeneration, (6) residual loading, (7) decrease in thermal value of the gas due to adsorption, (8) temp. and (9) make of charcoal.

7494. Stourdze, Yvonne E. **Bleaching earths and their activation; technology, analysis and applications.** *Rév. brasil. quim (Sao Paulo)* 13, 290-2 (1942).—*C.A.* 37, 503^9.

The use of earths and clays in refining oils was discussed.

7495. Amero, R.C. and Capell, R.G. **Effect of high-pressure extrusion on the adsorption capacity of floridin.** *Petroleum Refiner* **22**, 22-6 (1943).—*C.A.* 37, 1250^8.

Floridin (Fuller's earth), the most widely used oil decolorizing medium in the U.S., was improved about 30% in 10 years, largely through the addition of an extrusion step in processing. Extrusion brought about profound changes in the microscopic and possibly the submicroscopic character of the clay.

7496. BYRNS, A. C.; BRADLEY, W.E., AND LEE, M.W. **Catalytic desulfurization of gasolines by cobalt molybdate process.** *Ind. Eng. Chem.* 35, 1160-7 (1943).—*C.A.* 37, 6862[9].

Thiophenes, thiophanes, thioethers and mercaptans were decompd. to H_2S and hydrocarbons by passing straight-run or cracked stocks with H_2over a Co molybdate at 750°F and a pressure of 100-250 lb per in^2. The S content was reduced from 3.0% to less than 0.01% in favorable cases.

7497. FERNS, J.L. **Deacidification of transformer oil by activated alumina.** *Petroleum (London)* 6, 34-6 (1943).—*C.A.* 37, 6867[9].

Alumina was recommended for reclaiming transformer, turbine, circuit breaker and other oils, which were subject to relatively rapid breakdown and oxidation.

7498. HARTECK, P. AND SUHR, KL. A. **Separation of hydrocarbons by means of fractional desorption. III.** *Die Chemie* 56, 120-3 (1943).—*C.A.* 37, 5227[9].

Exptl. data were presented for the sepn. of hydrocarbons b. between 60° and 145°C. The exptl. app. was shown, and conditions given for a no. of expts., together with variations in the sepn. factor with progressive desorption. For the analysis of gasolines prefractionation into 10° cuts was recommended.

7499. KOMAREWSKY, V.I. AND RIESZ, C.H. **Catalytic reforming of straight-run gasoline increases aromatic content.** *Oil Gas J.* 42, No. 7, 90-3, 119 (1943).—*C.A.* 37, 6862[3].

Cuts from Pennsylvania straight-run gasoline were used as charging stock for catalytic aromatization. The methods studied were (a) two-stage, two-catalyst procedure with Ni alumina or Pt-alumina followed by chromia (Cr_2O_3) alumina at 310° and 450°C resp.; (b) two-stage single catalyst of Ni, chromia and alumina with temp. of 300°-450°C; and (c) a single-stage Ni, chromia, alumina catalyst at high temp.

7500. MURPHREE, E.V.; BROWN, C.L.; FISCHER, H.G.M.; GOHR, E.J., AND SWEENEY, W.J. **Fluid catalyst process. Catalytic cracking of petroleum.** *Ind. Eng. Chem.* 35, 768-73 (1943). —*C.A.* 37, 5227[4].

The fluid catalyst cracking process was described, and information was given on the production of the motor gasoline from 4 charge stocks.

7501. PEMSEL, H. **Estimation of the value of bleaching earths.** *Chem.-Ztg.* 67, 305-6 (1943). —*C.A.* 38, 1852[7].

These estns. were correctly made only by including the colorimetric value of the unbleached oil and the amts. of oil lost with the bleaching earth. A graphic method for comparing oils was given.

7502. PRICKETT, T.B. AND NEWTON, R.H. **Recent developments in Houdry fixed-bed catalytic processes.** *Petroleum Refiner* 22, 377-8 (1943); *Natl. Petroleum News* 35, R568 (1943); *Proc. Am. Petroleum Inst.*, Sect. III, 24, 89-90 (1943). —*C.A.* 38, 637[1], 1625[9].

A résumé of how the original fixed-bed Houdry process was adapted to the production of base stock for aviation gasoline.

7503. TURNER, NELSON C. **The analysis of hydrocarbon gases by adsorption fractionation.** *Natl. Petroleum News* 35, No. 18, R234-7(1943); *Petroleum Refiner* 22, 140-4(1943); *Oil Gas J.* 41, No. 51, 48, 51, 52, 69 (1943).—*C.A.* 37, 3914[4], 6860[6].

Adsorption fractionation for the analysis of light hydrocarbons was described. The analysis was made by taking advantage of the difference in compn. of the adsorbed and unadsorbed phases existing in equil. in a system with activated charcoal as the adsorbing agent.

7504. WHEELDON, HARRY. **Recycling-plant design and operation.** *Gas* 19, No. 3, 31-3 (1943).—*C.A.* 37, 2549[2].

Wet gas was first passed through a separator and then to a high-pressure oil absorber, before returning to the formation. The procedure used in determining the possible yield from wells involved the use of an experimental separator, with a meter and charcoal tube on the residue-gas side.

7505. WHITLATCH, GEO. I. **Probable new bentonitic clay horizon in Eocene of West Tennessee.** *J. Tenn. Acad. Sci.* 18, 280-4 (1943).—*C.A.* 38, 41[5].

A 22 ft vein of bentonitic clay on sample tests indicated favorable results for use in oil bleaching.

7506. BLOCH, HERMAN S. AND THOMAS, CHARLES L. **Hydrocarbon reactions in the presence of cracking catalysts. III. Cyclohexene, decalin and tetralin.** *J. Am. Chem. Soc.* 66, 1589-94 (1944).—*C.A.* 38, 6529[6].

A study was made of the reactions, at atm. pres., of cyclohexene in the presence of a synthetic SiO_2- Al_2O_3-ThO_2 catalyst at 250-400°C; of tetralin with a SiO_2-Al_2O_3-ZrO_2 catalyst at 400-500°C; and of decalin with the latter catalyst in both the fresh and partially spent state at 400-500°C.

7507. CAPELL, R.G.; HAMMERSCHMIDT, E.G., AND DESCHNER, W.W. **Dehydration of commercial gases by solid adsorbents.** *Ind. Eng. Chem.* 36, 779-84(1944).—*C.A.* 38, 5659[9].

Operating and lab. data were presented on the solid adsorption dehydration of natural gases. The adsorptive capacities of the 4 solid adsorbents tested declined with continued use and reactivation, and the loss in adsorptive capacity of the adsorbents was given as a function of the no. of reactivations. Dehydration of some gases was made difficult by H_2S or compds. forming polymers of high mol. wt. Lab. data on accelerated fouling of adsorbents showed the effect of reactivation atms. on the decline in adsorptive capacity. Florite desiccant was used continuously for 2 years in a com. plant for dehydrating natural gas under reasonably favorable operating conditions, and has dehydrated 2 million ft^3 of gas per lb of adsorbent.

7508. KLISHINA, V.E. **Experimental treatment of tar oils with alkali and decolorizing clays.** *Lesnaya Prom.* 1944, No. 6, 22-3.—*C.A.* 39, 4214^4.

Tar oils treated with alkali (NaOH or $Ca(OH)_2$) or with various decolorizing clays showed increased acidity and ash. It was recommended that the automotive-lubricant fraction of the tar be topped under reduced pressure, and that chem. treatments be avoided.

7509. MAIR, BEVERIDGE J. AND FORZIATI, ALPHONSE F. **Analytical determination of aromatic hydrocarbons by adsorption.** *J. Research Natl. Bur. Standards* 32, 151-64 (1944) (Research Paper No. 1582).—*C.A.* 38, 3569^9.

Filtration through a column of silica gel gave a filtrate free of aromatic hydrocarbons. The concn. of aromatic hydrocarbon in an unknown soln. (gasoline) was detd. by means of a calibration curve which showed the amt. of filtrate produced by the standard adsorbent from solns. of various concns. of the aromatic hydrocarbon. Results of expts. were given for several concns. of 8 binary solns. of an aromatic hydrocarbon with a paraffin or a naphthene hydrocarbon and for 3 concns. of a soln. consisting of an aromatic hydrocarbon with a paraffin and an olefin.

7510. MAIR, BEVERIDGE J. AND FORZIATI, ALPHONSE F. **Separation and recovery of aromatic hydrocarbons from paraffins and naphthenes by adsorption.** *J. Research Natl. Bur Standards* 32, 165-83 (1944) *(Research Paper No. 1583)*.—*C.A.* 38, 3570^2.

The mixt. was introduced into the top of a column contg. an excess of adsorbent [silica gel, charcoal, MgO, Al_2O_3, filtrol and Florisil]. A low-boiling paraffin hydrocarbon, such as pentane, butane or propane, was added in sufficient quantity to remove the paraffin and naphthene hydrocarbons from the column but not the aromatic hydrocarbons. These were removed by adding an appropriate desorbing liquid, such as MeOH. The paraffins, naphthenes and pentane were thus obtained as a mixt. from which the pentane was easily removed by distn. The aromatic hydrocarbons were obtained as a mixt. with pentane and MeOH. The MeOH was removed by extn. with H_2O and the pentane by distn.

7511. THOMAS, CHARLES L. **Hydrocarbon reactions in the presence of cracking catalysts. II. Hydrogen transfer.** *J. Am. Chem. Soc.* 66, 1586-9 (1944); *Natl. Petroleum News* 36, R320-2 (1944).—*C.A.* 38, 6529^3.

Some of the H needed to convert the olefins to paraffins was made available by the formation of a H-deficient catalyst deposit. Octenes were subjected to the action of a cracking catalyst under conditions which gave chiefly paraffinic products. The catalyst caused H-transfer in the absence of added cycloparaffins. This H-transfer resulted in the formation of paraffin and aromatic hydrocarbons and a carbonaceous catalyst deposit poor in H. At least 50% of the H needed to account for the paraffins found came from the catalyst deposit.

7512. BAI, ARMANDO VERGARA. **Dehydration of petroleum by means of activated clays (bentonite).** *Bol. informaciones petroleras (Buenos Aires)* 22, No. 254, 239-48(1945).—*C.A.* 40, 2609^7.

Lab. and large scale tests established that ground, calcined bentonite was an effective deemulsifier for the dehydration of petroleum. Bentonite ground to 200-325 mesh and calcined at 350-400°C, in concn. 1-3 parts per thousand, agitated for 5 min., at 60-70°C, gave best results.

7513. BARRER, R.M. AND BELCHETZ, L. **Separation of mixtures using zeolites as molecular sieves. II. The use of zeolite to resolve hydrocarbon mixtures.** *J. Soc. Chem. Ind.* 64, 131-3(1945).—*C.A.* 39, 4790^1.

Chabazite was used to sep. gaseous and liquid hydrocarbon mixts. Hydrocarbons with 1 or 2 C atoms can be sepd. from higher paraffin and cyclic hydrocarbons at room temp. or below, and at higher temps. quant. sepns. of normal paraffins from admixt. with isoparaffins and aromatic hydrocarbons were effected.

7514. BARRER, R.M. **Separation of mixtures using zeolites as molecular sieves. III. The use of zeolites to separate polar molecules from mixtures containing them.** *J. Soc. Chem. Ind.* 64, 133-5(1945).—*C.A.* 39, 4790^2.

Specific sepns. were effected, quantitatively or semiquantitatively, of polar mols. with the zeolites. Mixts. whose components had nearly the same b.p., and others that were azeotropic were sepd. The scope and possible uses of the method were discussed.

7515. HARWOOD, J. AND DAVIES, W. CULE. **Activated alumina.** *Power & Works Engr.* 40, 59-62(1945).—*C.A.* 39, 5415^8.

Applications in drying gases, liquids, and solids in the oil industry were discussed.

7516. MYERS, H.C. AND OWEN, R.M. **Economic survey of Thermofor installations in Socony-Vacuum lubricating oil refineries.** *Oil Gas J.* 44, No. 13, 93-7(1945).—*C.A.* 39, 4745^4.

An economic comparison of Thermofor kiln and other methods of adsorbent regeneration, including labor, repairs, maintenance, and utility costs for kilns of varying capacities. The installation of Thermofor kilns resulted in substantial reductions in filter-plant-operating expenses primarily as a result of reduced adsorbent purchases.

7517. REID, LAURANCE S. **Dehydration of supply gas is successful in preventing freeze-ups of pilot regulators on natural gas pipe lines.** *Petroleum Engr.* 16, No. 4, 194-7(1945).—*C.A.* 40, 3868^8.

Small-scale equipment for dehydrating natural gas with activated alumina was described.

7518. SUEN, TSENG-JOU AND YAO, FENG-HSIEN. **Some Chinese clays as adsorbing agents for treatment of gasoline and lubricating oil.** *J. Inst. Petroleum* 31, 179-87 (1945); *J. Chem. Eng. China* 12, 1-10 (1945).—*C.A.* 39, 5073^9; 40, 2964^9.

Two clays of Nanchuan, one of them classified as *collyrite*, the other as *cimolite*, and a *Tsunyi halloysite* sample were tested as to their ability to reduce the gum content of gasoline made by cracking tung oil. The *collyrite* was treated with H_2SO_4 and with HCl, and the addn. of Fe, Al, and Mg salts was also tried as a means of increasing the adsorptive power. Gasolines, rapeseed oils, and lubricating oils required different temps. for the best results in decolorization.

7519. WILLIAMS, K.A. **Peroxide values and the chromatographic separation of oxidation products as a guide to the aging of a turbine oil.** *Analyst* 70, 409-11(1945).—*C.A.* 40, 1012^2.

Turbine oils had low peroxide values during their long period of usefulness. By peroxide detns. and chromatogenic sepn. of the oxidized products, the course of the deterioration of oil in use was shown to be similar to that of the atm. oxidation of fatty oils.

7520. ALDEN, R.C. **Conversion of natural gas to liquid fuels.** *Oil Gas J.* 45, No. 27, 79-82, 97-8 (1946).—*C.A.* 41, 264*b*.

The German development of the Fischer-Tropsch process and the American refinements to use natural gas as raw material were reviewed. Natural gas was cheaper raw material, simpler to handle, and desulfurization was easier than with coal.

7521. ARTEMENKO, A.V. **Regeneration of lubricating oils with adsorbents activated by ammonia.** *Elektricheskie Stantsii* 17, No. 7, 26-8 (1946). —*C.A.* 41, 2563*f*.

The adsorptive capacity of silica gel for products of oil aging were increased by treating the gel with NH_3 vapor. Thus-treated silica gel was more effective in regenerating lubricating oils than gel not treated.

7522. EVANS, L.P. **Comparison of bead and clay catalysts.** *Oil Gas J.* 44, No. 47, 167-83 (1946).—*C.A.* 40, 4503^1.

Data were presented showing 4-8% more 10# RVP motor gasoline was obtained under the same general operating conditions of a Thermofor cracking unit by using bead catalysts as compared with clay catalyst. Clay catalyst tended to be poisoned by S and N_2 compds. in charge stocks, sometimes to a prohibitive rate of decrease in gasoline yield and increase in gas and coke formation, whereas bead catalyst was not affected in efficiency by such stocks.

7523. GRIFFITHS, J.C. **Clay research and oil-development problems.** *J. Inst. Petroleum* 32, 18-31 (1946).—*C.A.* 40, 4499^9.

Montmorillonite was the largest absorber of water. Na clays took up most water, Ca and Mg clays next, and H clays least. Montmorillonite was the most active of the clays in base exchange, in which the above-named and similar bases replaced each other, ion for ion, without destroying the lattice structure. Hence, it was possible, as an aid in oil production, to replace an unfavorable ion by a more favorable one by means of a simple soln. Substitution of Ca for Na in a clay usually means an increase of permeability.

7524. HANSON, E.A.; RADFORD, D., AND SEED, R. **The revivification of purifying material.** *Natl. Gas Bull. Australia* 10, July-Aug., 25-8 (1946).—*C.A.* 41, 2227*b*.

Analyses were made on oxide samples taken from various parts of a purifier box immediately after opening the box and for several days thereafter. The rate of revivification of dropped oxide proceeded at about one pound of S per week. Considerable revivification was effected during operation by the oxygen contained in the gas being purified. The exptl. evidence gathered indicated that a box of fouled oxide could be revivified in place by opening it to the air for a three-day period.

7525. KEITH, P.C. **Gasoline from natural gas. The development of the Hydrocol plant to convert natural gas to gasoline and the effect of new processes on the national fuel economy.** *Am. Gas J.* 164, No. 6, 11-15 (1946); *Gas* 22, No. 6, 21-6 (1946).—*C.A.* 40, 4873^6.

The Hydrocol process consisted in the conversion of natural gas to a mixt. of CO and H, followed by their catalytic reaction to produce liquid hydrocarbons boiling sustantially within the range of gasoline. Diesel oil and oxygenated compds., such as alcs., were by-products.

7526. LANE, JOHN C. AND WEIL, B.H. **Synthine (Fischer-Tropsch) process. I. Introduction, synthesis gas production and purification.** *Petroleum Refiner* 25, No. 8, 87-98 (1946).—*C.A.* 42, 9118*f*.

The ratio of H_2 to CO ranged from 2 to 1 to less than 1 to 1. Underground gasification of coal by (1) the chamber, (2) the stream, and (3) the percolation methods was discussed in some detail. Synthesis gas could also be obtained by means of the reaction: $CH_4 + H_2O \rightarrow 3H_2 + CO$ or $CH_4 + CO_2 \rightarrow 2CO + 2H_2$. Yields, catalysts, and manufg. procedures were given for these two reactions. Controlled oxidation of methane to give H_2 and CO was also economical and catalysts and reaction conditions were discussed. Regardless of its source, synthesis gas must be purified of S and its compds.

7527. LOVE, FRANK H. **Solid-adsorbent-type dehydration plant placed in operation in Carthage Field [Texas].** *Petroleum Engr.* 17, No. 5, 151-6(1946).—*C.A.* 40, 5545^9.

An activated bauxite contg. 60-70% Al_2O_3 was used to adsorb water from natural gas. The dew point of the gas was reduced from 32° to -1°C. The desiccant was regenerated by passing a flow of inlet gas through the bauxite bed that has been heated to 163°C.

7528. MAPSTONE, GEORGE E. **Some notes on the desulfurization of gasoline by adsorption.** *Australian Chem. Inst. J. & Proc.* 14, 61-7 (1946).—*C.A.* 41, 4913*b*.

The total S content of gasoline passed through a bed of adsorbent silica gel was first reduced and then increased; this subsequent desorption of some of the S compds. appears to have been overlooked by previous workers. Mercaptans were completely removed at first, the removal subsequently giving an adsorption isotherm; they did not appear to be desorbed again as were some of the less polar S compds.

7529. Papok, K.K. and Saranchuk, L.I. **Effect of refining on the thermal stability of Emba aviation oils.** *Neftyanoe Koz.* **24**, No. 9/10, 51-8 (1946).—*C.A.* **41**, 3948*g*.

Clay treatment of the oil after refining with H_2SO_4 sharply decreased its thermal stability regardless of the type of treatment preceding the acid treatment (alkali treatment, oxidation, or extn. with nitrobenzene). With increase in percentage of the clay used, the stability decreased to a min. at 20-25% of clay and remained unchanged thereafter. Clay treatment had no adverse effect on stability if it followed directly after extn. with nitrobenzene. The best results with respect to stability were always obtained when the acid treatment was last and followed by neutralization with alkali.

7530. Ramsey, L.L. and Patterson, W.I. **Separation and purification of some constituents of commercial hexachlorocyclohexane.** *J. Assoc. Official Agr. Chem.* **29**, 337-46(1946).—*C.A.* **41**, 831*b*.

By means of partition chromatography, using silicic acid as the column medium, nitromethane as the immobile solvent, and n-hexane as the mobile solvent, tech. hexachlorocyclohexane (benzene hexachloride or "666") was sepd. into its known isomers, alpha, beta, gamma, delta; in addn. 2 other cryst. compds. were isolated, one having the empirical formula of heptachlorocyclohexane and the other with the compn. of octachlorocyclohexane. This general technique shows some promise for the sepn. and purification of the minor and more sol. constituents of complex chem. mixts.

7531. Rytslin, A.M. **Use of silica gel for regeneration of transformer oil.** *Elektricheskie Stantsii* **17**, No. 8, 56 (1946).—*C.A.* **41**, 2563*g*.

Silica gel prepd. at the power-generating station from equal vols. of a 1.3 sp. gr. Na silicate soln. and 50% HCl was fully satisfactory for continuous regeneration (thermosiphon method) of transformer oil.

7532. Terwilliger, P.L. and Yuster, S.T. **Chemical agents in water flooding.** *Tenth Tech. Conf. in Petroleum Production in Penna. State Coll. Mineral Inds. Expt. Sta., Bull.* No. **45**, 41-51 (1946) (Pub. 1947); *Oil Weekly* **126**, No. 1, 54-6 (1947).—*C.A.* **41**, 7081*i*, 5287*e*.

At present H_2O flooding is an inefficient process because 25% of the oil is left in the sand after the flood. Expts. showed that there would be a slight increase in recovery if SO_2 were forced into a sand before a H_2O-flood was begun and a small decrease if NH_3 were used. There was no appreciable difference in recovery when H_2O-sol. surface-inactive compds. such as borax, Na_2CO_3, NaOH, and Na_2SO_3 were used as compared to the results with distd. H_2O. The oil-sol. wetting agents did not increase recovery and were adsorbed by the sand surface; this would make their use impractical.

7533. Ventura, Manuel Mateus. **Adsorbent earths from the Northeast of Brazil.** *Rév. soc. brasil quím.* **15**, 11-29(1946).—*C.A.* **41**, 6739*d*.

Four different earths were compared in adsorbing power to frankonite; 2 of them were found to have good qualities as adsorbing agents of pigments extd. during the bleaching process of oils.

7534. Amero, R.C. and Wood, W.H. **Catalytic desulfurization of cracked and straight-run gasolines.** *Oil Gas J.* **46**, No. 3, 82-5, 99(1947).—*C.A.* **41**, 4913*d*.

Lab. investigations were reported which showed that the relative efficiencies of fuller's earth and bauxite as desulfurizing catalysts depended upon the characteristics of the stock being treated. Where the 2 had equal abilities, Fuller's earth had an economic advantage.

7535. Augustin, Stéphane. **Decolorizing earths.** *Tech et appl. pétrole* **2**, 297-8 (1947).—*C.A.* **41**, 6030*a*.

7536. Berg, Clyde. **Hypersorption; a process for separation of light gases.** *Gas* **23**, No. 1, 32-7 (1947).—*C.A.* **41**, 1412*g*.

A moving bed of activated charcoal adsorbed hydrocarbons from lean gas streams: C_2H_4 from gases produced in cracking, C_3H_8 from heavier components of natural gas, sepn. of CH_4 from H_2, and similar applications. Activated charcoal descended through a cooler section, in which H_2O was removed by a gas current, then through the adsorption section, countercurrent to the gas to be stripped, then through the rectifying section, where it was contacted with a reflux of heavy constituents liberated by the stripper at the bottom of the unit. Steam introduced below the stripper passed countercurrent to the charcoal in the vertical stripper tubes, through the steaming section, and was discharged with the bottom-product gas. A small parallel stream of charcoal was activated by a high-temp, steam stripping operation to remove heavy residual hydrocarbons.

7537. Bogulovskaya, M.A. and Velikovskii, A.S. **The adsorption method of producing oils and determining their composition.** *Neftyanoe Khoz.* **25**, No. 3, 52-60(1947).—*C.A.* **41**, 7083*a*.

The group compn. of a fraction from naphthene-base crude oil was detd. by passing a sample dild. with a low-boiling paraffin hydrocarbon into a tall column of silica gel until completely adsorbed, then adding more of the low-boiling paraffin and collecting successive portions of the ext. soln. This yielded a series of naphthenic and aromatic fractions, in which the aromatic content was detd. by sulfonation and by measuring the sp dispersion. The resins were extd. from the silica gel with Me Et ketone and finally in a Soxhlet app. with acetone, but not investigated.

7538. Corigan, Brian. **Oil purification, filtration reclamation.** *Iron Age* **159**, No. 14, 56-62 (1947).—*C.A.* **41**, 3606*b*.

Lubricating oil could be purified by 3 basic methods: gravity purification methods; filtering, and reclaiming methods. Oil was reclaimed by chem. treatment in connection with clay treatment by either of the following methods: treatment with alk. or caustic solns.; acid treatment followed by caustic or clay neutralization. Details of these treatments were given.

7539. DEED, DONALD W.; SCHUTZ, P.W., AND DREW, THOMAS. **Comparison of rectification and desorption in packed columns.** *Ind. Eng. Chem.* 39, 766-74 (1947).—*C.A.* 41, 4970*d*.

Rectification and desorption expts. were performed in the same packed tower in order to det. whether the height of a transfer unit was the same for both processes. On the basis of these expts. and those of other authors, no clear evidence of any difference was found, but the results were not sufficiently accurate to be conclusive.

7540. DINNEEN, G.U.; BAILEY, C.W.; SMITH, J.R., AND BALL, JOHN S. **Shale-oil naphthas. Analysis of small samples by the silica gel adsorption method.** *Anal. Chem.* 19, 992-8(1947).—*C.A.* 42, 3941*g*.

The sample free of tar was passed through 50 g of silica gel (passed No. 150 U.S. standard sieve) in a column consisting of two sections, 1.3 cm inside diam. by 40 cm and 0.6 cm inside diam. by 85 cm. The components of the sample were arranged along the silica in order of decreasing adsorbability. With samples boiling below 200°C, 2-propanol was used as the desorbing solvent. N_2 pressure was used to force the sample and solvent through. If a paraffin and naphthene were present in equal concns., the compd. having the greater no. of C atoms emerged first. Aliphatic olefins emerged in order of decreasing mol. wt, followed by cyclic olefins. Difficulties arose when the aromatic compds. had a lower viscosity than the two other groups.

7541. DONALDSON, JOHN A.; LOOMIS, RAY J., AND KRCHMA, L.C. **The measurement of aggregate absorption.** *Proc. Assoc. Asphalt Paving Technol.* **16**, 353-72 (1947).—*C.A.* 43, 7207*e*.

An adapted Centrifuge Kerosene Equivalent test was used as a quant. measure of absorption. The procedure measured the kerosene absorbed and retained on the surface of the known nonabsorptive aggregate (Platte River gravel) of the same gradation.

7542. GANDYRUINA, A.I. **Study of the filtration process in purification of lubricating oils with clays.** *Azerbaidzhanskoe Neftyanoe Khoz.* 26, No. 5, 21-3 (1947).—*C.A.* 43, 3182*i*.

For the purpose of studying their effect on filtration, oil was freed of all surface-active components, such as naphthenic acids and tars. Then these substances were added in controlled quantities, the oil was stirred with clay, and the time of filtration noted. The surface-active compds. added to the oil impeded filtration and the time of filtration was prolonged 4-5 fold. Sulfonic acids and tars were most active in this respect.

7543. GOL'DBERG, D.O. **Improving oil purification with activated gumbrin.** *Azerbaĭdzhanskoe Neftyanoe Khoz.* 26, No. 11, 24-6(1947).—*C.A.* 43, 3996*i*.

The effect of acid concn. on the activation of gumbrin clay (a floridin type of bleaching clay) was studied. Up to 20% strength, the quantity of acid was immaterial, above 20% excess quantity lowered the effectiveness of the clay. The recommended procedure was to use 10% strong H_2SO_4 taking 25%, calcd. as monohydrate, of the quantity of clay.

7544. HALL, C.C. **The production of oil from coal by the Fischer-Tropsch process.** *J. Junior Inst. Engrs. (London)* 57, 309-34 (1947).—*C.A.* 42, 2743*d*.

A discussion of the history, the main steps of the process, the reaction products, and costs.

7545. HIRSCHLER, ALFRED E. AND AMON, SENTA. **Adsorption - a tool in the preparation of high-purity saturated hydrocarbons.** *Ind. Eng. Chem.* 39, 1585-96 (1947).—*C.A.* 42, 1102*i*.

Sepn. by adsorption of isomeric hydrocarbons was accomplished, including geometric isomers, and many binary mixts. of the paraffin-paraffin, paraffin-naphthene, and naphthene-naphthene types. Unsatd. and high-mol.-wt hydrocarbons were also examd. The adsorbents studied were silica gel, activated carbon, and activated alumina, the latter giving very little sepn. Most of the systems had S-type isotherms on silica gel whereas on activated carbon the majority had U-type isotherms. Adsorbability in the liquid phase on silica and carbon was in part a function of mol. wt, and in a homologous series appeared to decrease with increased mol. wt for silica gel, whereas carbon exhibited the reverse effect.

7546. HORNBERG, C.V.; KEIPER, E.D., AND CHESNEY, R.M. **Use of bead catalyst in commercial Houdry units.** *Oil Gas J.* 46, No. 12, 214-16, 242-3(1947).—*C.A.* 41, 6697*c*.

The performance record of bead catalyst in the first year of service in the Socony-Vacuum Houdry unit at Paulsboro was excellent. Outstanding from the operators' viewpoint were the relative freedom from orifice plugging and the smooth regeneration characteristics.

7547. KING, J.G. **The control of chemical reactions on a large scale.** *Gas Times* **51**, 369-72 (1947); *Inst. Gas Engrs., Commun.* No. 315, *Gas World* **126**, 779-86, 808; **127**, 93-8 (1947).—*C.A.* 41, 7015*e*.

Fluid catalyst process of oil refining, downflow system, control of flow of solids, applications of the "fluidized" technique, catalytic reactions, and gas-solid reaction technique were discussed.

7548. LANE, JOHN C. AND WEIL, B.H. Synthine **(Fischer-Tropsch) process. II. The catalytic synthesis, including catalysts and reaction mechanisms. III. Products, by-products, and**

special topics. IV. Basic economics and the current situation. *Petroleum Refiner* **28**, No. 9, 423-34; No. 10, 493-504; No. 11, 587-98 (1947).—*C.A.* **42**, 9118*i*.

Two main reactions took place: (1) $n\mathrm{CO} + (2n+1)\mathrm{H_2} \rightarrow \mathrm{C}_n\mathrm{H}_{2n\pm2} + n\mathrm{H_2O}$; (2) $n\mathrm{CO} + 2n\mathrm{H_2} \rightarrow \mathrm{C}_n\mathrm{H}_{2n} + n\mathrm{H_2O}$. Since the reaction was exothermic and involved a reduction in vol., relatively low temps. and elevated pressures favored the reaction. Temps. ranged from 375°C with Ni or Co catalysts to 465°C with Fe catalysts, and pressures varied from atm. pressure to 150 $\mathrm{lb/in^2}$. The synthesis gas was passed through reaction chambers in one or more stages, with or without recycle of the unconverted portion. The heavier products were condensed from the residual gas and the lighter products were adsorbed on charcoal or in oil.

7549. LEE, JAMES A. **Esso's fluid catalyst modifies Fischer-Tropsch.** *Chem. Eng.* **54**, No. 10, 105-7(1947).—*C.A.* **44**, 5075*h*.

By use of a fluid catalyst contg. Fe as against the original solid Co type, the efficiency of the Fischer-Tropsch process in pilot and full-scale production was much increased. Natural gas was used as the raw material and the gasoline produced had a relatively high octane no.

7550. MAMEDLI, M. G. **Catalytic purification of gasolines.** *Doklady Akad. Nauk Azerbaĭdzhan. S.S.R.* 3, No. 1, 8-9 (1947).—*C.A.* **46**, 1743*g*.

Desulfurization of Karachukhursk gasoline by means of clays at 400°C to the extent of 69-70% was reported, the starting material having 0.041% S. Four specimens of local clay, gumbrin, and Tula bauxite proved to be identical in effectiveness.

7551. MURPHREE, E.V.; GOHR, E.J., AND KAULAKIS, A.F. **The fluid-solids technique; applications in the petroleum industry.** *J. Inst. Petroleum* 33, 608-20 (1947).—*C.A.* 42, 3162*i*.

This technique has proven to be so successful in catalytic cracking to produce gasoline of high antiknock rating that the work capacity of cracking by the method was 1,000,000 bbl./day, or 60% of the total catalytic cracking capacity. Flow of catalyst was continuous through both the reactor and the regenerator. The oil products passed out of the reactor at the top, the spent catalyst was drawn out from the bottom and forced by a stream of air into the regenerator. The regenerated catalyst and the fresh oil to be charged entered the reactor near the bottom with the aid of steam.

7552. NELSON, J.A. **The filtration of Diesel lubricating oils.** *Power Plant Eng.* **51**, No. 4, 122-6 (1947).—*C.A.* **41**, 3606*f*.

The cleaning of the oil should include removal of solids, such as dirt, fuel soot, and metal particles, as well as water. The use of adsorbent earths was not recommended, partly because such use frequently removed "additives" which were especially valuable in heavy-duty oils.

7553. PRETTRE, M. **Methane as a reactant in hydrocarbon syntheses.** *Conf. réunion soc. belge étude pétrole, dérivés et succédanes (Brussels)* **1947**, 16 pp.; *Rév. inst. franc. pétrole et Ann. combustibles liquides* **2**, 131-40, 195-200 (1947).—*C.A.* **42**, 6084*c*.

Hydrogenating and cracking reaction mixts. contg. $\mathrm{CH_4}$ yielded considerable amts. of $\mathrm{CH_4}$ after completion of the process. The used contact catalyst contained considerable amts. of adsorbed $\mathrm{CH_4}$. Only a small portion of the Me radicals in the adsorbed phase on the catalyst was found as $\mathrm{CH_4}$ in the reaction products; by far the greater part of the radicals reacted with adsorbed hydrocarbons or their radicals to form either straight-chain or branch homologs.

7554. ROBERTS, GEORGE JR. AND PHINNEY, J.A. **Manufacture of synthetic gasoline nearing commercial application in U.S.** *Oil Gas J.* **45**, No. 45, 72-3, 139-41(1947).—*C.A.* **41**, 4286*h*.

The engineering aspects of the com. synthetic gasoline plants in Germany and of the proposed plants in the U.S. were outlined. An Fe catalyst replaced the German Co catalyst. Another improvement was the fluidized catalyst technique.

7555. SALDAÑA, LUIS ALVA. **The activation of bentonite from Paracas for decolorizing of oils.** *Bol. soc. quím. Peru* **12**, 197-210(1947).—*C.A.* **42**, 1031*c*.

The bentonite was treated with $\mathrm{H_2SO_4}$ under various conditions and the ability of the product to decolorize a neutral crude oil was studied. The best results were obtained with bentonite from which 25% of the basic constituents was removed. The activated bentonite was obtained by treatment with 98% $\mathrm{H_2SO_4}$ (1 hr, 200°C), or with dil. acid over longer periods of time.

7556. SNUGGS, JOHN F. **Regeneration of spent catalyst in fluid catalytic cracking.** *Petroleum Engr.* **18**, No. 6, 230-6 (1947); *Oil Gas J.* 45, 88-91 (1947).—*C.A.* **41**, 3283*b*, 4296*f*.

The regeneration of spent cracking catalyst was accomplished by burning 1-2 wt % of carbonaceous material from the catalyst under closely controlled operating conditions. The large amt. of heat produced by this combustion was used to support the reaction in the catalytic conversion zone and to produce steam. A description of the facilities used for regeneration and the integration of these facilities with the rest of the catalytic plant was presented.

7557. SULLIVAN, FREDERICK W. JR. **Fuel synthesis by-products as a source of chemicals.** *Chem. Eng. Prog.* 43, No. 12, 13-17 (1947).

The Hydrocol process for the production of liquid fuels from natural gas was described. The various chemicals which would be available in large quantities were outlined.

7558. VAN DORNICK, E. **Modern fluid catalytic cracking.** *Petroleum Engr.* **18**, No. 7, 149-54 (1947).—*C.A* **41**, 3945*i*.

The operation and advantages of fluid catalytic cracking were described and economic considerations discussed.

7559. VELIKOVSKII, A.S.; PAVLOVA, S.N. GOFMAN, P.S., AND DRIATSKAYA, Z.V. **Use of the adsorption method in determining the chemical composition of straight-run gasoline and kerosene.** *Neftyanoe Khoz.* 25, No. 9, 30-9(1947).—*C.A.* 42, 3941*b*.

The sepn. of artificial binary and ternary mixts. of hydrocarbons and of straight-run gasolines and kerosenes into aromatic and non-aromatic hydrocarbons by passage through a column packed with silica gel gave results comparable to those obtained by treatment with H_2SO_4. With an aromatic content as high as 20%, only 25-28 g of silica gel was needed to obtain 3.2-3.5 ml of filtrate free from aromatic hydrocarbons. After these preliminary expts. columns contg. 1000 g and 150 g silica gel were set up for handling a charge of 300 and 50 ml, resp. The procedure used in packing them, feeding the charge and the desorbent liquid (alc. or H_2O), collecting the fractions, and regeneration of the silica gel was described in detail.

7560. BARROW, D.N. **Natural-gas dehydration.** *Petroleum Refiner* 27, No. 12, 645-8(1948).—*C.A.* 43, 3171*i*.

The most satisfactory method of removing moisture was by the use of liquid or solid desiccants. Flow diagrams were given for processes in which diethylene glycol and activated Al_2O_3 were used. Both methods gave a wide range of throughput capacity. A graph of moisture content of satd. gas vs. temp. and pressure was also included.

7561. CARNEY, W. M.; NOLL, HENRY D., AND HOGE, A. WESLEY. **Thermofor catalytic cracking unit catalytically processes sour gas oil.** *Petroleum Engr.* 20, No. 2, 246-50; *Petroleum Times* 52, 974-6(1948).—*C.A.* 43, 840*i*.

A charging stock contg. 1.7% S was successfully processed. Less than 5% of the total S present in the reactor charge appeared in the gasoline produced.

7562. CONRAD, ANNE L. **Determination of aromatic compounds in petroleum products. Chromato-graphic method.** *Anal. Chem.* 20, 725-6 (1948).—*C.A.* 43, 3179*c*.

A rapid (45-min.) method was described which employed columns of silica gel. A hydrocarbonsol fluorescent material was added to the sample (2- to 5-ml) which was developed on a 9-mm internal-diam. column with 2 vol. of EtOH or iso-PrOH. Ultraviolet illumination permitted accurate measurement of the fluorescent (aromatic) band. A precision with ± 2% was claimed.

7563. FOSTER, ARCH. L. **Hypersorption - this process provides precise concentration-separation of gases.** *Oil Gas J.* 47, No. 15, 90-100 (1948).—*C.A.* 42, 8448*f*.

The process employed the principle of selective adsorption of hydrocarbons by a moving bed of activated charcoal, with the subsequent removal of the adsorbed hydrocarbons by heat and steam. It was applied to the recovery of C_2H_4 found in relatively low concns. in natural gas, where high recoveries and high concns. of the product were desired. The details of a com. operation were discussed.

7564. GARD, C.D. **The extraction of carbon dioxide gas from natural gas and the manufacture of Dry Ice.** *Calif. Oil World* 41, No. 24, 3-15 (1948).—*C.A.* 43, 1882*d*.

Natural gas from the petroleum field was purged of CO_2 with a 20% soln. of monoethanolamine and H_2O. It was purified by extg. the H_2S with Fe_2O_3-soda ash soln. The gas was dried with activated alumina.

7565. HELMERS, C.J. AND BROONER, G.M. **Catalytic desulfurization and reforming of naphthas over bauxite.** *Petroleum Processing* 3, 133-8(1948). —*C.A.* 42, 9142*c*.

Catalytic desulfurization of both straight-run and cracked naphthas offered a means of improving the clear and leaded octane rating. Even though S-content of a cracked gasoline was relatively low, it was treated over bauxite at normal desulfurizing conditions since a part of the octane-improvement of cracked stocks was due to olefin isomerization. Catalytic reforming of naphtha over bauxite differed from catalytic desulfurization in that a higher temp. level was required, some gaseous products produced, and the unleaded octane rating improved from 5 to 15 octane nos.

7566. HOLM, ULLA AND WODE, GUNNAR. **A spectrophotometric study of oils.** *Arkiv. Kemi, Mineral. Geol* 26A, No. 29 10 pp. (in English) (1948).—*C.A.* 43, 4873*i*.

Crude, oxidized, and refined oils were chromatographically fractionated into 2 adsorbed fractions and a percolate, and studied spectrophoto-metrically. Peroxides were concentrated by adsorption on Al_2O_3 to make possible more accurate detn. of the peroxide value of fat with low peroxide content than did the direct method. The results on crude cottonseed oil showed a low content of conjugated trienes and no max. at 2300 A. (i.e. no dienes). Chromatographically adsorbed portions of the oil had a high percentage of dienes. Bleaching decreased dienes and increased trienes. Deodorization decreased both, owing probably to polymerization.

7567. HUBBARD, RETHEL L. AND STANFIELD, K.E. **Determination of asphaltenes, oils, and resins in asphalt.** *Anal. Chem.* 20, 460-5(1948). —*C.A.* 42, 6098*i*.

About 1.5 g of asphalt was dispersed in pentane and allowed to stand overnight, pptg. the insol. asphaltene fraction. The concd. pentane ext. was adsorbed on anhyd. Al_2O_3 and extd. first with pentane to give an oil fraction and then with a 10:90 vol. mixt. of MeOH and C_6H_6 to obtain the resin fraction.

7568. JOHNSTON, R.W.B.; APPLEBY, W.G., AND BAKER M.O. **Determination of olefins in gasoline. Application of infrared spectroscopy.** *Anal. Chem.* 20, 805-12(1948).—*C.A.* 43, 383*a*.

Synthetic blends of pure olefins in n-C_7H_{16} were used to prep. calibration curves for the semiquant detn. of α olefin types and other olefin types in gasolines. The method was best applied to an olefin concentrate prepd. by adsorption of the sample on silica gel, the olefin fraction being desorbed between the satd. and aromatic compds. The method was applied to catalytically cracked, thermally cracked, and reformed gasolines.

7569. KEHDE, HOWARD; FAIRFIELD, R.G.; FRANK, JOSEPH C., AND ZAHNSTECHER, L.W. **Ethylene recovery. Commercial hypersorption operation.** *Chem. Eng. Progress* 44, No. 8, 575-82 (1948).—*C.A.* 42, 8149*g*.

The first plant was built in 1947 for the Dow Chemical Co. to recover small concns. of C_2H_4 from a H_2- CH_4 stream at 75 p.s.i. From a feed gas contg. 4.5-6.0 vol. % C_2H_2, an ethylene product was obtained of 92-93% purity and 0.1% max. CH_4 contamination. The H_2-CH_4 overhead stream contained less than 0.1% C_2H_4. During its operation the unit ability to absorb increased in C_2H_4 content of the feed as high as 400% of the design compn. for several hrs before appreciable quantities of C_2H_4 were lost overhead in the discharge gas.

7570. KIPP, E.M. **Filtration of insulating oils through adsorbent materials.** *Lubrication Eng.* 4, 122-4(1948).—*C.A.* 44, 6110*c*.

By means of a modified ASTM turbine oil oxidation cell from which the oil was by-passed through an adsorbent, it was shown that sludging was inhibited and, as a result, the life of the oil was greatly prolonged. Application to elec. power systems was discussed.

7571. LATTA, JAMES E. AND WALKER, SCOTT W. **Commercial application of hydrocarbon synthesis in the United States.** *Chem. Eng. Prog.* 44, No. 2, 173-6 (1948).

Two commercial plants to synthesize hydrocarbons and oxygenated derivatives of hydrocarbons were mentioned. The synthesis feed gas was prepd. by the partial combustion of natural gas with O_2 at 20 atm. The synthesis reaction was conducted over a cheap Fe catalyst in a fluid bed yielding hydrocarbons as the principal products, with smaller amounts of oxygenated derivatives as byproducts. Operability of the fluid iron catalyst process was confirmed in pilot plants, but much research work was required to det. the many effects of changes in the reaction variables.

7572. LECUTIER, EDMOND; LE BARBIER; DUBREUIL, RENÉ, AND DUBOIS. **Conditions of temperature and humidity in chemical gas purification with iron oxide.** *Compt. rend. congr. ind. gaz Paris* (Assoc. tech. ind. gaz France) 65, 333-81 (1948).—*C.A.* 46, 10585*a*.

An elaborate study of temp. and humidity conditions in purification boxes with many examples, heat balances, etc.

7573. MAIR, BEVERIDGE J. **Fractionation and analysis of hydrocarbons by adsorption.** *Ann. N. Y. Acad. Sci.* 49, 218-19(1948).—*C.A.* 42, 5378*e*.

7574. MALQUORI, ALBERTO. **The surface activity of argillaceous materials. I. Colloidal phenomena due to the adsorption of sulfur on various types of clays. II. Reactivity of sulfur adsorbed on various types of clay and the factors that affect it.** *Ann. chim. applicata* 38, 137-45, 146-51(1948).—*C.A.* 45, 6898*g*.

The *thixotropic index* (TI) of a clay was defined as the vol. of H_2O per g of clay just sufficient to prevent flow if the sample tube is inverted after resting 1 min. vertically. Less adsorbed S dissolved in lime water when the sample was aged in a humid atm. than when the sample was freshly prepd.

7575. O'CONNOR, BUELL. **Silica gel percolation. Application to synthol.** *Ind. Eng. Chem.* 40, 2102-3(1948).—*C.A.* 43, 1169*e*.

The classes of compds. were detd. by n_D^{20} measurement after sepn. by passage through silica gel columns (75% of particles restrained by 325 mesh) in heptane with MeOH as the eluting agent and a pressure of 35 p.s.i. In the presence of oxygenated materials the addn. of a red azo dye permitted detn. of hydrocarbon and oxygenated fractions in synthol, since the dye would not pass through until the hydrocarbon fraction was through.

7576. ROSS, DONALD W. **A method of evaluating bleaching clays.** *U.S. Bur. Mines, Repts. Invest. No.* 4295, 26 pp. (1948).—*C.A.* 42, 6522*c*.

Petroleum oils were decolorized or clarified by activated clays. Decolorizing capacities were detd. by modified percolation and contact methods at room and elevated temps. on air-dry clay, clay, clay dried at various temps., and on both activated and unactivated materials. The decolorizing capacity of any given clay increased as its absorbed H_2O content decreased. No decolorizing capacity figure had a definite meaning unless the remaining absorbed moisture was also indicated. The activation treatment consisted of actively boiling for 1 hr 50 g of dry clay plus 30 ml of 95%, 1.84-gravity H_2SO_4, plus enough distd. H_2O to make a total vol. of 300 ml in a 600-ml beaker.

7577. SMIT, W. M. **Application of adsorptive percolation to the analysis of hydrocarbon mixtures.** *Anal. Chim. Acta* 2, 671-80 (1948) (in English).—*C.A.* 43, 7868*d*.

An empirical factor, called the "transport factor," was defined as the ratio of the wt of the adsorbent in a column to the volume of developer necessary to transport the front of the adsorption band of a certain substance from the top of the column to the bottom. Transport factors of 5 hydrocarbons, on SiO_2 gel in a combination with several developers, were detd. and a sepn. of the mixt. carried out with three developers.

7578. VERGARA, A. A. **Dehydration of petroleum with activated clays.** *Experimenta* (Mendoza) 1, 48-61(1948).—*C.A.* 45, 8236*h*.

Calcined and finely ground bentonite was used as absorbent or adsorbent under varying conditions. The optimum concn. of bentonite was 1-3 g per liter of petroleum; fineness grade 200-325-mesh (U.S. standard); calcination temp. 350-400°C; and optimum temp. of petroleum from 55 to 60°C. Bentonite proved more effective than did chem. agents hitherto used. Tests on an industrial scale were described.

7579. BACKHOUSE, T. AND HAM, A. J. **A study of the relationship between composition and ignition quality of nonolefinic gas oils.** *Fuel* 28, 246-52 (1949).—*C.A.* 44, 827*e*.

An adsorption technique was developed to sep. a nonolefinic gas oil into two distinct fractions, one aromatic and the other entirely satd. Percolation of a gas oil through silica gel removed the S compds. along with the aromatic components. In each series of blends of a particular gas oil and its sep. fractions there was a linear relationship between the cetane no. and the percentage of satd. compds. present.

7580. BERG, CLYDE; FAIRFIELD, R. G.; IMHOFF, D. H., AND MULTER, H. J. **The hypersorption process for separation of gases and vapors.** *Petroleum Refiner* 28, No. 11, 113-20(1949).—*C.A.* 44, 3746*d*.

The present status and possible applications of the process were reviewed.

7581. BROOKS, BENJAMIN T. **Active-surface catalysts in formation of petroleum. II.** *Bull. Am. Assoc. Petrol. Geol.* 33, 1600-12 (1949).—*C.A.* 44, 6107*a*.

The tendency of oils with more light constituents and less heavy residue to correspond with greater age and depth was not as regular as previously thought.

7582. BROWN, BAHNGRELL W. **The effect of sodium carboxymethylcellulose on bentonite.** *World Oil* 129, No. 6, 122, 124 (1949).—*C.A.* 43, 8652*g*.

Na carboxymethylcellulose had considerable viscosity in aq. soln. and imparted viscosity and gel strength to certain clays far out of proportion to its phys. properties. The response of a given clay was in the largest part a function of the clay itself.

7583. CLARK, ALFRED; ANDREWS, ANTHONY, AND FLEMING, HAROLD W. **Composition of a synthetic gasoline.** *Ind. Eng. Chem.* 41, 1527-32 (1949).—*C.A.* 43, 7211*h*.

A synthetic gasoline prepd. by reaction of CO and H_2 with a fluidized Fe catalyst of the synthetic-NH_3 type was debutanized and sepd. by distn. into 8 fractions—C_5 to C_{12} inclusive. Br_2 no., hydroxyl no., carbonyl no., and acid no. were detd. on each fraction, and each was sepd. into paraffins, olefins, aromatic, and oxygenated compds. by percolation at 0°C through silica gel, with abs. EtOH as the desorbing liquid.

7584. DOBRYANSKIĬ, A. F.; BOGOMOLOV, A. I., AND SHKLYAR, I. V. **Catalytic effect of geological formations on the composition of petroleum.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 22, 1124-32(1949).—*C.A.* 45, 3583*b*.

Heating of wide fractions of cylinder oil with bentonite-glass ring packing in a Cu vessel at 250°C, 70 hrs resulted in significant decyclization. The reactions which involve H-transfer can be correlated with similar effects in nature.

7585. EAGLE, S. AND SCOTT, J. W. **Refining by adsorption. New cyclic adsorption process separates high-purity aromatics and olefins from petroleum.** *Petroleum Processing* 4, 881-4 (1949).—*C.A.* 44, 1680*h*.

A novel cyclic procedure utilized a plurality of adsorption columns, each contg. fine particle size adsorbent. Cyclic operation was secured by automatically shifting the adsorption columns countercurrent to the feed injection point and product-withdrawal points. Premium kerosene, Diesel fuels, spray oils and lubricating oils as well as high-purity aromatics and olefins were readily prepd.

7586. FUNAKUBO, EIICHI AND KAWASAKI, GENICHI. **Fractionation of coal-tar components by chromatography. I. II.** *Coal Tar* (J. Japan Tar Ind. Assoc.) 1, 193-5, 319-24 (1949).—*C.A.* 46, 7740*c*.

Two samples of anthracene, purified by fusion and H_2SO_4 treatment were analyzed by chromatography. The former contained anthracene 85.3, anthraquinone 8-12, and unknown substances 2% or more. The latter contained anthracene 85.46, anthraquinone 1.2-4.85, carbazole 2.60-5.48, and unknown substances 3.7% or more. No measurable amount of anthraquinone was formed during the chromatography.

7587. GODLEWICZ, M. **A new method for the separation of hydrocarbons by selective adsorption.** *Nature* 164, 1132-3(1949).—*C.A.* 44, 3396*f*.

The method was based on the use of indicators such as trinitrobenzene, deposited on silica gel. These produced a color which was dependent mainly on the structure of the hydrocarbon.

7588. HARESNAPE, DOROTHY; FIDLER, F. A., AND LOWRY, R. A. **Separation of sulfur compounds by adsorption on silica gel.** *Ind. Eng. Chem.* 41, 2691-7 (1949).—*C.A.* 44, 2214*c*.

S compds. were sepd. from each other and from aromatic hydrocarbons by adsorption on silica gel. Abs. EtOH was used as the eluent in most cases. Toluene was separable in all cases, but sepn. from BuSH and $(EtS)_2$ was best done at 0°C and was not sharp. The relative adsorbabilities were given in increasing order: aromatic hydrocarbons, thiophenes, alkanethiols, alkane disulfides, aromatic and cycloalkanethiols, alkane sulfides, and cyclic sulfides.

7589. HENNIKER, J. C. AND McBAIN, J. W. **Flow in a thin glass capillary as affected by wetting the exterior of the capillary.** *Science* 109, 286 (1949).

The particularly marked retardation in the flow of crude petroleum might occur if the apparatus or the oil was exposed to radiant energy during a measurement, or if the room temperature rose just before a measurement. Either of these variations would have warmed the dry capillary or reservoir of oil more rapidly than the capillary surrounded by a relatively large mass of water, and would then have led to a faster flow in the dry tube than in the wet.

7590. HIBBARD, R. R. **Silica gel fractionation of 300-viscosity lubricating oil.** *Ind. Eng. Chem.* 41, 197-200 (1949).—*C.A.* 43, 6400*h*.

A chromatographic fractionation was run to resolve a 300-viscosity red oil into its hydrocarbon types. A large no. of fractions were taken and phys. and chem. properties detd. on many of them. Blends contg. 10% of the various aromatic fractions were run in the Sohio oxidation test and the tendencies of these fractions to form sludge, pentane insolubles, and acids have been related to hydrocarbon type.

7591. HOGE, A. W. AND TERNAN, WM. **Ashland modernizes wartime Thermofor catalytic cracking unit.** *Petroleum Engr.* 21C, No. 4, 7-10(1949). —*C.A.* 43, 4839*b*.

Conversion of the reactor from countercurrent to concurrent flow and modification of catalyst-handling facilities increased the gasoline yield and furnace oil yield of a cracking unit by 50 and 20%, resp.

7592. HRÁDEK, VÁCLAV. **Conversion of light hydrocarbons into carbon monoxide and hydrogen.** *Paliva a voda* 29, 100-2, 122-6 (1949); 31, 266-77, 303-18, 371-5 (1951).—*C.A.* 46, 5290*g*.

CH_4 and other light hydrocarbons could be converted into gases rich in H_2 by heating (1) with H_2O (endothermic) to give CO or CO_2 and H_2, depending on the ratio of CH_4 to H_2O, or (2) with a limited supply of air (exothermic) to give CO or CO_2 and H_2. Reaction (2) can supply the heat required for (1). Ni and Co oxides, activated with alk.-earth metal oxides on Al_2O_3-SiO_2 carriers were used as catalysts.

7593. KAMIEŃSKI, B. **Potentiometric chromatography. II. A microelement for the detection of weak acids and bases in gasoline solutions.** *Bull. intern. acad. polon. sci., Classe sci. math. nat.* 1949A, 75-80.—*C.A.* 44, 8098*e*.

A micro cell consisted of 2 concentric tubes: the center one contained a Pt wire sealed in a glass tube and tipped with a thin adsorption layer of silica gel contg. quinhydrone, and the outer tube was a micro calomel electrode tipped with a sintered glass filter satd. with KCl soln. The output, as measured on a Lindeman quadrant electrometer, when the cell was immersed successively in gasoline-cinchonidine and gasoline-caproic acid concn. of about 0.05%, 40 mv. at 0.005%, and 22 mv. at 0.0005%.

7594. LAWRENCE, A. S. C. AND BARBY, D. **Chromatographic fractionation of black oils.** *Discussions Faraday Soc.* 1949, No. 7, 255-8.—*C.A.* 45, 1755*b*.

A fuel oil from Venezuela was sepd. by vacuum distn. into 4 volatile fractions and a residuum. Each fraction and the original oil were chromatographed and compared. Al_2O_3 was used as the adsorbent. Samples were placed on the column as a 2% soln. in hexane (optimum). This was followed by cyclohexane, toluene, and $CHCl_3$. The sepn. of the black oils into hydrocarbon types was feasible.

7595. MAIR, BEVERIDGE J.; SWEETMAN, ALBERT J., AND ROSSINI, FREDERICK D. **Separation of gas-oil and wax fractions of petroleum by adsorption.** *Ind. Eng. Chem.* 41, 2224-30 (1949).—*C.A.* 44, 825*e*.

In a single pass through silica gel, the gas-oil fraction of petroleum could be sepd. into 3 portions: (1) a mixt. of paraffins and naphthenes, (2) largely mononuclear aromatic compds., and (3) largely polynuclear aromatic compds. A simple analogy between fractionation by adsorption and fractionation by distn. was drawn.

7596. MOOS, JOSEF. **The determination of asphalt in crude oil and crude oil products.** *Erdöl u. Kohle* 2, 345-57 (1949).—*C.A.* 43, 9421*i*.

Results of the adsorption analysis showed that Fuller's earth was unsuitable for a quant. analysis, silica gel unsatisfactory, Al oxide satisfactory. It was necessary to shield the adsorption column against light to prevent photochem. action. For eluting, CCl_4 was unsatisfactory; petr. ether (30/50) was better than benzene, methylcyclohexane or cyclohexane. Small amts. of water or the use of N_2 did not affect the results.

7597. NEDERBRAGT, G. W. **Separation of long-chain and compact molecules by adsorption on attapulgite-containing clays.** *Clay Minerals Bull.* 3, 72-5(1949).—*C.A.* 47, 6215*d*.

Binary mixts. of hexadecane, tetracosane, octadecylcyclohexane, and di-sec-butyldechydronaphthalene dissolved in a little pentane were passed through a column of Floridin earth. Large quantities of pentane were added. Elongated and compact mols. were well sepd. The results were discussed with reference to the structure of attapulgite which contained channels of cross-section approx. 4 × 6.5 A.

7598. OHTSUKA, HIROSHI. **Solid phosphoric acid as polymerization catalyst for olefin gases. III.** *Mem. Faculty Eng., Hokkaido Univ.* 8, 38-66(1949).—*C.A.* 44, 7466*d*.

Kieselguhr from Okayama Pref. was the best carrier available for its large surface area, strong adsorption, and inactivity with H_3PO_4. The best catalyst was made from 90% H_3PO_4 400, kieselguhr 100, and graphite powder 30 parts by drying at 200°C, molding into pills, and heating at 300-50°C for a few hrs.

7599. OHTSUKA, HIROSHI. **Solid phosphoric acid as polymerization catalyst for olefin gases. IV.** *Mem. Faculty Eng., Hokkaido Univ.* 8, 67-122(1949).—*C.A.* 44, 7466*e*.

For the activation of the catalyst heating at 200°C combined with steaming at 300°-50°C were found most effective (for stripping H_2O mols. adhering on the surface, converting H_3PO_4 into active $H_4P_2O_7$ but not allowing much dehydration of $H_4P_2O_7$ to inactive HPO_3). Reactivation of the catalyst from 50 to 90% was possible by heating at 350°C with an inert gas contg. 2% O_2 for a few hrs, but this was not industrially feasible.

7600. PEAVY, C. C.; WEINRICH, W.; HORNADAY, G. F., AND NOLL, H. D. **Various refinery applications of Houdriflow catalytic cracking.** *Petroleum Refiner* 28, No. 6, 117-23(1949).—*C.A.* 43, 8656*g*.

The economics of catalytic cracking was discussed as applied to (1) thermal cracking and (2) catalytic cracking combined with vacuum distn., visbreaking, and delayed coking of the reduced crude oil. Calcns. were based on processing 10,000 barrels per day of East Texas crude oil.

7601. PICHLER, HELMUT. **Development of gasoline synthesis in the United States. The Hydrocol process.** *Brennstoff-Chem.* 30, 105-9 (1949).—*C.A.* 43, 7664*b*.

Stress was laid on the use of a fluidized catalyst (alkalized Fe) and the use of a highly efficient external heat exchanger to remove the heat of reaction; this avoided the use of numerous small internally cooled catalyst chambers as in Germany. The catalyst was poisoned by S, but was not affected by the formation of small amts. of C, although excessive amts. of C reduced its efficiency.

7602. Rampton, H. C. **The hydrocarbon-type composition of cracked gasolines.** *J. Inst. Petroleum* 35, 42-60 (1949).—*C.A.* 43, 3998*e*.
The procedures included the sepn. of naphthenes and paraffins from olefins and aromatics by selective adsorption followed by naphthene and paraffin detn. on fractions of selected boiling range and removal of aromatics in hydrogenated cracked gasoline by selective adsorption followed by paraffin and naphthene detn. on fractions of selected boiling range.

7603. Reeves, E. J. and Turkleson, R. E. **Cycle washing of percolation filters.** *Petroleum Refiner* 28, No. 3, 135-7(1949).—*C.A.* 43, 7218*b*.
If filters contg. adsorbent used for decolorizing lubricating oil were washed with a portion of the oil-naphtha mixt. from a previous filter, the vol. of fresh naphtha required was 75% below that required when fresh naphtha was used exclusively. The vol. of oil removed per vol. of wash naphtha was independent of the initial oil content of the recycle naphtha within the range of 0 to 40% oil.

7604. Reis, T. **The theoretical and experimental study of fluidized catalyst systems.** *Bull. assoc. franc. tech. pétrole No.* 76, 3-44 (1949). —*C.A.* 43, 8830*g*.
The behavior of finely divided solid catalyst in disperse suspension in a gas was investigated by the use of an optical system wherein a beam of light of controlled intensity passed laterally through the glass reaction tube and was reflected onto a photoelec. cell connected with an oscillograph circuit. The difference in intensities on the oscillograph curve was proportional to the concn. of solid particles in suspension.

7605. Richardson, R. W.; Johnson, F. B., and Robbins, L. V. Jr. **Fluid catalyst cracking with silica-magnesia.** *Ind. Eng. Chem.* 41, 1729-33 (1949).—*C.A.* 43, 8656*c*.
The over-all results obtained with silica-magnesia in lab. and in large-scale fluid catalyst pilot plants indicated that with respect to gasoline yield this catalyst was superior to silica-alumina and natural clay catalysts. The gasoline octane nos. were lower than those obtained with silica-alumina catalyst but approached those obtained with natural clay catalyst; C formation was equiv. to that with silica-alumina, but dry gas and butane-butene yields were lower; silica-magnesia was superior to silica-alumina from the standpoint of activity maintenance.

7606. Schneider, K. W. **Investigation of northwest German crude oils by means of chromatographic analysis.** *Erdöl u. Kohle* 2, 87-94 (1949).—*C.A.* 43, 5175*c*.
In the chromatographic analysis the light fraction b. 150°C (15 mm) was discarded. Two ml of the remaining oil was dild. with 20 ml of petr. ether and after 24 hrs the pptd. asphalt was filtered off. The filtrate was analyzed in a 400 cm column filled with 120 g of "standardized" Al_2O_3. It was found that the oil closest to the surface had a greater amt. of oxygenated compds. (resins) as well as high mol. wt and polar compds. than the lower layers.

7607. Smit, W. M. **The conservation equation of chromatography.** *Discussions Faraday Soc.* 1949 No. 7, 38-45.—*C.A.* 44, 9772*a*.
The conservation equation was derived for a single solute. A correction was introduced for the vol. of the adsorbed phase, and applied to the derivation of a fundamental equation of chromatography. A mixt. of cetane and cetene could be partly separated by silica gel previously wetted with benzene, using benzene as developing liquid. The total vol. of "developer" necessary to collect all the solutes at the bottom of the column was smaller than the interstitial vol. of the column.

7608. Smit, W. M. **Chromatography of petroleum hydrocarbons.** *Discussions Faraday Soc.* 1949, No. 7, 248-55.—*C.A.* 45, 1753*i*.
Displacement development was favored for nonquant. sepn., frontal analysis for the detn. of not too complex mixts., and elution development for complex hydrocarbon mixts. or where the aim was complete sepn. Silica gel was quite effective as an adsorbent for the sepn. of aromatic from aliphatic compds. and certain mixts. of satd. hydrocarbons. Activated earths may give better sepn. between paraffins and naphthenes. Alumina could be used for the sepn. of individual aromatic compds. Prewetting with the first developing soln. diminished irreversible adsorption.

7609. Suehiro, Yoshiyuki. **Preparation of activated clay and the properties of tabular catalyst for catalytic cracking.** *J. Chem. Soc. Japan, Ind. Chem. Sect.* 52, 16-17(1949).—*C.A.* 45, 1756*b*.
The effect was shown of the rate of catalytic decompn. of light oil, of independent variables such as size of tabular catalyst, concn. of activating H_2SO_4, remaining amt. of SO_4^{--}, intensity of catalyst, temp. of ignition of catalyst after acid treatment, and duration of catalytic action of catalyst.

7610. Thomas, Charles L. **Chemistry of cracking catalysts.** *Ind. Eng. Chem.* 41, 2564-73 (1949). —*C.A.* 44, 2218*i*.
Catalytic activity was attributable to H ions which served to balance the valence and coordination no. within an at. network contg. 2 different metals and O. The catalytic activity and ability to neutralize KOH was detd. for a series of $SiO_2Al_2O_3$ gel prepd. by hydrolyzing graded solns. of Al isopropoxide in ethyl orthosilicate. The catalytic activity reached a max. at an Al/Si at. ratio of 1 to 2 and the ability to neutralize KOH reached a max. at Al/Si = 1. SiO_2-MgO, SiO_2-ZrO_2, Al_2O_3-boria, and titania-boria catalysts were briefly discussed and a carbonium ion mechanism for catalytic cracking presented.

7611. Bellet, Edgard and Levert, Pierre. **Curious example of adsorption and purification in the solid phase.** *Compt. rend.* 231, 1484-5 (1950). —*C.A.* 45, 5393*i*.

Clay materials were employed in the decolorization, clarification, and purification of solid hydrocarbons produced from industrial gases. An intimate mixt. was made at ordinary temps. of a stream of naphthalene with approx. 10% of a decolorizing clay such as Clarsil. The mass took on a rose color which developed on the surface. When the clay was filtered it was found that the clay alone was colored and that the napthalene was purified to the extent that the m.p. became 79.6°C.

7612. Clerc, R. J.; Kincannon, C. B., and Wier, T. P. Jr. **Chromatographic analysis of gas oils for hydrocarbon types—examination of techniques.** *Anal. Chem.* 22, 864-7(1950).—*C.A.* 44, 9663*g*.

Gas-oil samples were suitably fractionated in a column of silica gel by the technique of elution development. An excess of a weak developer, methylcyclohexane, displaced the saturate band and eluted several aromatic bands; subsequent developers (toluene in methylcyclohexane, toluene, and acetone) sepd. the monocyclic, bicyclic, and tricyclic aromatic hydrocarbons.

7613. Conn, A. L.; Meehan, W. F., and Shankland, R. V. **Silica-magnesia cracking catalyst. Commercial performance.** *Chem. Eng. Progress* 46, No. 4, 176-86 (1950).—*C.A.* 44, 5085*c*.

The first significant com. operation of the fluid-catalyst cracking process employing silica-magnesia catalyst was carried out for a 315-day period in a 25,000 bbl./day unit by the Standard Oil Co. (Ind.) With this catalyst, higher gasoline yields, lower butane and gas yields, and lower octane nos. were obtained compared with silica-alumina. An unfavorable trend toward decreased regeneration efficiency was observed which ultimately resulted in the termination of the operation.

7614. Cox, Ben B. **Influence of clay in oil production.** *World Oil* 131, No. 7, 174, 176, 180-2(1950).—*C.A.* 45, 1330*c*.

Depending on the kind of clay in the reservoir strata and the cations brought into contact with it, clay may be a binder of unconsolidated sediments, a disrupting material, or a plugging material in a sand.

7615. Dinneen, G. U.; Thompson, C. J.; Smith, J. R., and Ball, John S. **Adsorption analysis by displacement techniques—applied to shale-oil distillates.** *Anal. Chem.* 22, 871-6(1950). —*C.A.* 44, 10305*f*.

Special app. and methods were described which enabled quant. analyses of small samples containing satd. compds., olefins, and aromatics of the 200° to 325°C boiling range. Criteria were given for the choice of suitable adsorbents. A diln. procedure was described that aided in the analysis of samples for which the adsorptogram showed poor sepn. between adjacent groups of compds., e.g. paraffin-cycloparaffin and satd.-compd.-olefin mixts.

7616. Eagle, Sam and Rudy, Charles E. Jr. **Separation and desulfurization of cracked naphtha. Application of cyclic adsorption process.** *Ind. Eng. Chem.* 42, 1294-9(1950).—*C.A.* 44, 9140*i*.

Preliminary sepn. of cracked naphtha into paraffin-naphthene-olefin raffinate and a high-S aromatic ext. was accomplished by use of a cyclic 8-column pilot unit packed with 28-200 or 48-80 mesh silica gel and operated during adsorption at 70°F. Each packed column was shifted in counter-direction to liquid flow on regular cycle through the successive zones of raffinate refining, ext. enriching, hot stripping, and cooling. Stripping was accomplished with pentane at 200-250°F. Operating at 0.08 gal. of feed per lb. of silica gel regenerated, 0.7 vol. recycle, and 2.0 vols. of strippant per column vol. reduced the S content of cracked naphtha from 1.22% to less than 0.05%, with 75-80% raffinate yield, and an adsorbant life exceeding 6 months.

7617. Eagle, Sam and Scott, John W. **Liquid-phase adsorption equilibrium and kinetics.** *Ind. Eng. Chem.* 42, 1287-94 (1950).—*C.A.* 44, 8732*g*.

The binary liquid system toluene-isoöctane was recommended for evaluation of suitable adsorbents for petroleum refining. Isotherms, *x-y* diagrams, selective adsorption capacities, diffusion coeffs., and fracture resistance of adsorbents, such as silica gel, silica-alumina, silica-MgO, alumina, and charcoal were reported. Measurements of butane surface area, sp pore vol., bulk d., and av. pore diam. for most of the adsorbents were detd.

7618. Ebrey, G. O. **Re-refining of used mineral oils by treatment with activated clay and heat.** *Lubrication Eng.* 6, 267-71(1950).—*C.A.* 45, 1758*d*.

7619. Endell, Joachim. **Clays in petroleum industry.** *Erdöl u. Kohle* 3, 105-9(1950).—*C.A.* 46, 7745*h*.

Electron micrographs of kaolinite with adsorbed particles of colloidal Au, of bentonite, of Fuller's earth, and of micaceous clay were shown. The swelling and thixotropy of bentonite in H_2O were due to the large no. of exchangeable cations held between the silicate layers. Activation of bentonite with acid replaced the basic ions by H ions which by reacting with coloring matters assist the bleaching of oils.

7620. Fink, D. F.; Lewis, R. W., and Weiss, F. T. **Separation of cracked gasolines by chromatographic adsorption-adsorbent characteristics and regeneration techniques.** *Anal. Chem.* 22, 850-7 (1950).—*C.A.* 44, 9662*i*.

The adsorptive capacities at 25°C of various silica gels, activated alumina, bauxite, bentonite, and Fuller's earth for toluene from a 20% soln. in isoöctane were detd. Toluene, *o*-xylene, *m*-xylene, *p*-xylene, propylbenzene, cumene, *tert*-butylbenzene, p-cymene and phenylcyclohexane are adsorbed to the same extent by silica gel. The capacity of the gel for toluene from 0 to 60% solns. decreased with the type of solvent in the order isoöctane, *trans*-3-heptene, diisobutylene, cyclohexene. The capacity at 2°C of silica gel for toluene from 20% solns. in pentane, heptane, nonane, and 2,3,4-trimethylbutane is 18.3 ml/100 g; from soln. in methylcyclohexane it was 15.5.

7621. FINK, D. F.; LEWIS, R. W., AND WEISS, F. T. **Separation of cracked gasolines by chromatographic adsorption-factors affecting efficiency of separation.** *Anal. Chem.* 22, 858-63(1950). —*C.A.* 44, 9663*d*.

Silica gel of 28- to 200-mesh gave a 74% recovery of pure toluene and gel of 100- to 325-mesh an 89% recovery when 50% by vol. solns. of toluene in isoöctane were percolated through identical columns of the gel. The efficiency of sepn. of the components in solns. of cyclohexene in isoöctane and of toluene and cyclohexene in isoöctane was directly proportional to the length (L) and inversely to the square of the diam. (D^2) of the column. Columns having an L/D^2 (cm/cm^2) of 80, if "through 200-mesh" gel was used, or of 230, if 100- to 200-mesh was used, were necessary for suitable sepn. of catalytically cracked gasolines into saturates, olefins, and aromatic hydrocarbons.

7622. FURBY, NEAL W. **Evaluating petroleum residua and lubricating-oil distillates; adsorption method.** *Anal. Chem.* 22, 876-81(1950). —*C.A.* 44, 10306*h*.

A fractionation method was described which employed: . (1) pptn. of asphatenes, (2) adsorption of resins on Fuller's earth, (3) dewaxing of the oil, and (4) fractionation of dewaxed oil by chromatographic adsorption on silica gel or Thermofor cracking catalyst. By blending the fractions; oils were obtained for entire range of compn. from very low to very high viscosity index.

7623. HIBSHMAN, HENRY J. **Separation of iso- and normal paraffins by adsorption.** *Ind. Eng. Chem.* 42, 1310-14(1950).—*C.A.* 44, 9143*b*.

Activated charcoal selectively adsorbed n-C_5, -C_6, and -C_7 paraffins from iso-octane at room temp. Based on exptl. data a flow plan for a continuous sepn. of iso-octane and heptane was presented by using fluidized solids technique. Charcoal introduced at the top of a column fell countercurrently to the feed and liquid reflux streams introduced at the center and bottom, resp. The charcoal withdrawn at the bottom contained heptane in high purity which was removed by washing with pentane, the pentane and heptane being sepd. by distn.

7624. JEFFRIES, ROBERT S. **Dehydration system is designed to end storage field withdrawal freeze-ups.** *Am. Gas J.* 173, No. 5, 10-12 (1950).—*C.A.* 45, 1324*b*.

The natural gas from the storage field was dehydrated by passing through beds of Florite. A wet bed was regenerated by passing gas which had been preheated to approx. 190°C through the bed. Regeneration was stopped when the gas leaving the bed reached approx. 149°C.

7625. JEWELL, J. W. JR. AND CONNOR, J. P. **Economics of petroleum coking for "cat cracking" feed preparation.** *Petroleum Processing* 5, 1199-1202(1950).—*C.A.* 45, 2189*i*.

The relative economic advantages of delayed coking, vacuum flashing, visbreaking, and propane decarbonizing in prepg. catalytic cracking feed stocks from reduced crude oil were discussed. The delayed coking process was shown to have superior earning power in a market in which the supply of fuel oil exceeded the demand, and also in a good and stable coke market.

7626. KRÁLIK, ZSÓFIA AND VAJTA, LÁSZLÓ. **Selective adsorption investigation of lubricating oils.** *Magyar Kém. Folyóirat* 56, 38-41(1950). —*C.A.* 45, 3587*f*.

A cotton disk 2 cm thick and 350 g Fuller's earth (dried previously at 105°C) were located on a porcelain filter disk in a glass tube of 5 cm diam., 60 cm length. 1600 ml of 60/90 gasoline served as the solvent and eluent. The color of eluates varied from colorless to light yellow and red (with a greenish fluorescence). A linear correlation was observed between index of refraction and sp. gr.; this can be utilized for the detn. of the sp. gr. of very minute amts. of eluates.

7627. MAIR, BEVERIDGE J. **Petroleum hydrocarbons. Separation and analysis by adsorption.** *Ind. Eng. Chem.* 42, 1355-60 (1950).—*C.A.* 44, 8097*e*.

Adsorption on silica gel (60% between 200 and 325 mesh) was used for the sepn. of aromatics from paraffins and cycloparaffins, mononuclear from polynuclear aromatics, and olefins, from paraffins and cycloparaffins. The method was also used for the sepn. of hydrocarbons from compds. contg. O, S, and N. The method has been applied to hydrocarbons of gasoline to lubricating-oil boiling range. The equipment varied from small glass columns, 1.25 m length, 2 cm diam., to steel columns, 16 m length, 2 cm diam.

7628. MAIR, BEVERIDGE J.; WESTHAVER, JAMES W., AND ROSSINI, FREDERICK D. **Theoretical analysis of fractionating process of adsorption.** *Ind. Eng. Chem.* 42, 1279-86 (1950).—*C.A.* 44, 8733*f*.

Fundamental equations were obtained for the treatment of adsorption fractionation in a manner analogous to distn. fractionation. The column height equiv. to a unit theoretical stage of sepn. was evaluated. Exptl. results were given for the sepn. factor a (on silica-gel columns) as a function of concn.

7629. MCKEAN, R. A. AND GRANDEY, L. F. **Conversion in Thermofor catalytic cracking.** *Chem. Eng. Progress* 46, No. 5, 245-8(1950).—*C.A.* 44, 6107*g*.

In the past few years catalytic cracking has assumed an increasingly important role in petroleum refining. An improved correlation of feed-stock conversion with space velocity and catalyst-to-oil ratio was presented, based on an empirical formula tested with pilot-plant and com. data.

7630. PRONINA, M. V. **Separation of neutral oxygen compounds from fractions of low-temperature tars and other complex mixtures.** *Doklady Akad. Nauk S.S.S.R.* 74, 115-17 (1950).—*C.A.* 45, 4023*a*.
The tar fractions were dild. with double their vol. of petr. ether and percolated through columns of silica gel (65-115 mesh) until all O and N compds. were removed. S compds. were incompletely removed. This purification reduced gum formation on storage. Part of the adsorbed compds. were eluted from the silica gel with benzene and the rest with acetone.

7631. RILEY, MAX L. **Operating and design features of adsorption-type dehydrators.** *World Oil* **130**, No. 1, 184-6 (1950).—*C.A.* 44, 1288*e*.
Design and selection of dehydrators for specific applications in the dehydration of gas.

7632. SCHLEGEL, C. A. **The cyclic catalytic reforming process for reforming natural gas.** *Gas* **26**, No. 2, 26-9 (1950).—*C.A.* 44, 2731*d*.
This process used preferably a two-shell set, one shell provided with a combustion chamber to burn natural gas for heating the catalyst layer in the second shell; a com. Ni catalyst was used which showed practically no deterioration in 4.5 months' operation. The H-content of the gas varied up to a max. of about 55% and the heating value of the reformed gas over wide limits.

7633. SHERWOOD, PETER W. **High-pressure hydrogenation of carbonaceous matter. V. The liquid phase in industry.** *Petroleum Refiner* **29**, No. 5, 123-7(1950).—*C.A.* 44, 7509*e*.
Various methods of processing the residue obtained from high-pressure hydrogenation of carbonaceous materials were discussed. Standard procedure consisted of centrifuging followed by low-temp. carbonization. The residue could also be processed by filtration; this led to various specialty products.

7634. SITTIG, MARSHALL. **Catalytic cracking. III.** *Petroleum Refiner* **29**, No. 10, 130-6 (1950).—*C.A.* 45, 1331*h*.
The history and development of the fluid catalytic cracking process to its present status were reviewed.

7635. SMITH, J. R.; SMITH, C. R. JR., AND DINEEN, G. U. **Separation of nitrogen compounds by adsorption from shale oil.** *Anal. Chem.* 22, 867-70(1950).—*C.A.* 44, 10304*h*.
A complete description was given of the adsorption app. and procedure for the sepn. of shale-oil distillates. Florisil, a synthetic Mg silicate, was an efficient adsorbent for this sepn.; its capacity for N compds. decreased when it was activated above 1200°F. Pentane eluted the hydrocarbon fraction; abs. MeOH eluted the predominantly non-hydrocarbon fraction which contains 95% of the N.

7636. SPENGLER, GUNTER AND KRENKLER, KARL. **Selective adsorption of hydrocarbons. II.** *Erdöl u. Kohle* 3, 317-21 (1950).—*C.A.* 44, 9768*f*.
Adsorption curves were given for benzene, cyclohexene, and benzene-cyclohexene mixts. in hexane as a solvent on silica gel; for mixts. of cetane and α-methylnaphthalene on active charcoal and silica gel; and for 12 gasolines dild. with hexane in the ratio of 1:3 on active charcoal and silica gel. The adsorption column was 1.5 cm in diam. and 30 cm long. Both adsorbents were specially treated. The aromatic and olefin content could be detd. and a qual. statement made as to whether the remainder consisted principally of n-paraffins, isoparaffins, or naphthenes.

7637. THORNTON, D. P. JR. **New Houdriflow cracking unit has high catalyst-oil ratio, low preheat requirements.** *Petroleum Processing* **5**, 601-5(1950).—*C.A.* 45, 339*a*.
The 4500 barrel per stream day unit at Drumright, Okla. had a max. catalyst-to-oil ratio of 8 to 1. The catalyst circulation capacity was 250 tons, and the system capacity 280 tons.

7638. UHL, WM. C. **T.C.C. (Thermofor catalytic cracking) unit gives high liquid recovery by operating on vapor-liquid feeds.** *Petroleum Processing* **5**, 950-2(1950).—*C.A.* 45, 338*i*.
A modified unit handled a mixed-phase feed stock consisting of total gas oil from crude stills, ranging from heating fuel to asphalt. Vapor feed was fed into the reactor in the usual manner from the furnace plus all possible vapor and liquid from the tar separator. The latter feed entered the reactor through a special distributing nozzle which sprayed it downward into the catalyst bed.

7639. WEBER, GEO. **Double-duty catalyst.** *Oil Gas J.* **49**, No. 24, 78-9, 118-20(1950).—*C.A.* **45**, 1756*c*.
Clay used by Sinclair Refining Co. for treatment of lubricating oil was used as a fluid cracking catalyst.

7640. WILSON, JOHN F. **Analysis of a high-sulfur cracked distillate.** *Proc. Mid-Year Meeting, Am. Petroleum Inst.* **30M** (III), 16-23 (1950). —*C.A.* 45, 3151*g*.
The gasoline fraction from a high-S cracked distillate from coking of Santa Maria Valley crude oil was analyzed by means of fractional distn. followed by silica-gel adsorption. Refractive dispersions were used to interpret the adsorption analyses.

7641. ZEN, C. W.; CHAO, C. S., AND LIU, C. H. **Decolorizing power of clay found in Taiwan.** *Chinese Chem. Ind. Eng.* **1**, No. 1/2, 5-12 (1950)(English summary).—*C.A.* 47, 1370*h*.
The decolorizing power of clay found in different parts of Taiwan was compared according to the efficiency of removing color from kerosine soln. colored with asphalt. One after treatment with 20% H_2SO_4 for 5 hrs, gave the best results.

7642. ZHIGACH, K. F.; KISTER, E. G., AND ZLOTNIK, D. E. **Clay preparations for drilling.** *Doklady Akad. Nauk S.S.S.R.* 72, 1103-6(1950). —*C.A.* 45, 9839*h*.
Air-dried briquets were made from mixts. of subbentonite clay, caustic soda, and alk. peat humates. The briquets were used alone or as admixts. to increase colloidal characteristics of local clays. Use of briquets reduced clay con-

sumption to 30-35 tons per well and increased speed of drilling.

7643. AMES, C. B. **Natural-gas dehydration is robotized in 15 solid desiccant-type plants. Skid-mounted solid desiccant dehydrators built for Transco.** *Am. Gas J.* 174, No. 2, 11-13 (1951); *Gas* 27, No. 4, 102, 104 (1951). —*C.A.* 45, 3579*b*, 4428*c*.

The plants employed florite, and were designed to dehydrate the gas to a dew point of 25°F. The cyclic operations were automatically controlled.

7644. ANDERSON, T. H. JR. AND COLBURN, W. E. **Liquid recovery from hydrocarbon gases.** *Calif. Oil World* 44, No. 23, 3, 5, 6, 8(1951). —*C.A.* 46, 4206d.

The recovery of liquids from wet gas by adsorption, condensation, gas fractionation, and absorption was discussed. Adsorption was undesirable except in the case of ethane or ethylene recovery where the Hypersorption process may prove desirable.

7645. ARDERN, D. B.; DART, J. C., AND LASSIAT, R. C. **Process in petroleum technology.** *Advances Chem. Ser. No.* 5, 13-29 (1951).—*C.A.* 45, 10557*b*.

The development of the fixed-bed process and of the Houdriflow and Thermofor processes was described; it included improvements in reactor and kiln design, use of gas lift for the catalyst, effect of operating conditions upon yield and quality of the products, and characteristics of the catalysts used. Prospects for improvements in the moving-bed catalytic cracking process appear to be in the direction of improved catalysts.

7646. ARNOLD, G. B.; FRASCATI, E. P., AND CARTER, N. D. **High-pressure fixed-bed catalytic unit.** *Ind. Eng. Chem.* 43, 1013-18(1951). —*C.A.* 45, 6372*i*.

A versatile fixed-bed catalytic pilot plant capable of operating at pressures up to 5000 lb/in^2 at 538°C was described. Catalyst capacity of the reactor was 320 ml.

7647. BLAIR, CHARLES M. JR. **Some applications of organic corrosion inhibitors in the petroleum industry.** *Corrosion* 7, 189-95(1951).—*C.A.* 45, 6147*b*.

Properly selected and applied semipolar org. inhibitors were capable of greatly reducing corrosion in oil wells, gas wells, and many other installations handling petroleum and natural brines. The action of such inhibitors appeared to result from surface adsorption which inactivated a portion of the metal and imposed a barrier to migration of the corrosion medium to the metal surface.

7648. BOBROVNIK, D. P. **Bleaching clay from Molodyatyno.** *Doklády Akad. Nauk S.S.S.R.* 80, 933-6(1951).—*C.A.* 47, 6577*e*.

The clay behaved like a mixt. of 62% montmorillonite with 38% amorphous SiO_2 (sol. in 10% Na_2CO_3 soln.) of the empirical formula $0.2\ Na_2O.0.3\ MgO.(Al,\ Fe^{III})_2O_3.4SiO_2$; the ratio $SiO_2:Al_2O_3$ was 5.7, as in many Fuller's earths. The Molodyatyno earth was suitable for bleaching paraffin, added in amts. of 4%.

7649. BRANSON, UZZELL S. JR. **Measurement and use of relative permeability data.** *World Oil* 133, No. 1, 184, 188-9, 190, 193(1951).—*C.A.* 45, 8747*d*.

Relative permeabilities to oil, gas, and water of small core samples were detd. in the lab. by a test in which the sample was cleaned and then treated with the saturating fluid under standardized conditions.

7650. BROOK, J. H. T. AND MATTHEWS, J. B. **Iron and copper as catalysts in oxidation of hydrocarbon lubricating oils.** *Discussions Faraday Soc.* **1951**, No. 10, 298-307.—*C.A.* 46, 3381*a*.

With the rate of absorption of O_2 as a measure of reaction velocity, the kinetics of the oxidation of lubricating oil in the liquid phase was studied. The catalytic activity of Fe, Cu, and "crankcase catalyst" was due to dissolved compds. of Fe and Cu formed by corrosion. The Fe compds. were chain-branching and the Cu compds. chain-initiation catalysts.

7651. COLTEN, O. A. AND JONNARD, A. **Aliphatic chemicals.** *Advances Chem. Ser. No.* 5, 287-98 (1951).—*C.A.* 45, 10560*b*.

Among the newer developments were the direct oxidation of hydrocarbons to produce aldehydes, acids, and alcs.; the partial combustion of CH_4 for a C_2H_2 manuf.; and the Fischer-Tropsch and oxo syntheses to yield oxygenated chemicals. Complicated interprocess and interproduct competition characterized this field, and the concns. of their end use in the more rapidly expanding chem. product segments was pointed out as one of the causes for the rapid growth of aliphatic chemicals.

7652. CRIDDLE, DEAN W. AND LETOURNEAU, ROBERT L. **Fluorescent-indicator absorption method for hydrocarbon-type analysis.** *Anal. Chem.* 23, 1620-4(1951).—*C.A.* 46, 5827*c*.

A simplified procedure based on fluorescent dyes which made the principal hydrocarbon-type boundaries clearly visible was given for chromatographic sepn. of hydrocarbons by silica gel. These new dyes completely resolved the olefin fraction in cracked petroleum stocks by the direct displacement procedure. The adsorption column had an upper adsorption section for receiving the sample and performing the initial sepn. The silica gel found to give best results was of uniform mesh size (100-200 mesh). The silica gel was able to adsorb selectively some of the color bodies in petroleum fractions.

7653. DEIBNER, LÉONCE. **Laboratory techniques utilized in the study of the chemical activation, acid or alkaline, of clay. Essential properties of the final activated products.** *Chim. anal.* 33, 18-23, 51-8, 95-100, 138-42 (1951).—*C.A.* 45, 3531*b*, 5487*b*.

7654. EDEL'MAN, L. I. AND REBINDER, P. A. **Structure formation and elastic-plastic properties of structures in oil and aqueous suspensions of aluminum oxide.** *Kolloid. Zhur.* 13, 64-77(1951).—*C.A.* 45, 3685*d*.

Suspensions of Al_2O_3 in paraffin oil were elastic-brittle bodies and showed elastic after-effect. Their modulus of elasticity E_1, modulus of elastic after-effect E_2, viscosity of the after-effect η_2, and max. shearing stress P did not depend on the measuring app. Aq. suspensions of Al_2O_3 were stable only between 36 and 42 vol. %. Colloidal Al_2O_3 increased the sedimentation vol. of the suspensions.

7655. EFENDIEV, F. M. **Basic principles of a systematic method of luminescence investigation of petroleum and bitumen.** *Izvest. Akad. Nauk S.S.S.R., Ser. Fiz.* 15, 782-7(1951).—*C.A.* 46, 6816*h*.

Chromatographic luminescence methods allowed better differentiation of bitumens and oil than chem. methods. Quant. methods were developed (1) without standards (*a*) by detn. of the lowest concn. at which luminescence can be observed; (*b*) estn. of luminescence intensity; (2) with standards; (3) by photometry.

7656. FOWLE, M. J.; BENT, R. D.; CIAPETTA, F. G.; PITTS, P. M., AND LEUM, L. N. **Process in petroleum technology. Development of a reforming catalyst.** *Advances Chem. Ser. No.* 5, 76-82 (1951).—*C.A.* 45, 10557*g*.

This development started with a catalyst for the isomerization of paraffin and naphthene hydrocarbons, which consisted of a hydrogenating component, e.g. Ni or Pt, deposited on silica-alumina. By markedly decreasing the surface area of the silica-alumina component, a reforming catalyst was developed that gave the proper balance and direction for the main reactions of reforming: isomerization, dehydrogenation, and hydrocracking.

7657. GEE, W. P. AND GROSS, H. H. **Process in petroleum technology. Dewaxing and deasphalting.** *Advances Chem. Ser. No.* 5, 160-76(1951). —*C.A.* 45, 10558*h*.

Most of the lubricating oil is dewaxed today by the use of a solvent composed of a ketone and an aromatic hydrocarbon or by the use of liquid propane. Solvents were used also for deoiling wax. Adsorption with clay and chem. treatment were also used to some extent.

7658. GLESPEN, G. L. **New synthetic catalyst plant to supply 450,000 barrels per day cracking capacity.** *Petroleum Refiner* 30, No. 12, 134-6(1951).—*C.A.* 46, 2275*c*.

Design and operating details were given for American Cyanamid's new plant at Michigan City. It produced a silica-alumina catalyst of 40 or 60 microns in size.

7659. GRIM, RALPH E. **Clay mineralogy and the petroleum industry.** *World Oil* 132, No. 4, 61-2, 66, 68(1951).—*C.A.* 45, 4431*i*.

Lines of clay-mineral researches that should yield valuable results in relation to the recovery and discovery of petroleum were pointed out.

7660. GUTHRIE, V. B. **Aromatics by adsorption.** *Petroleum Processing* 6, 833-5(1951).—*C.A.* 46, 716*d*.

A stream contg. benzene and toluene produced by catalytic naphthene dehydrogenation was passed through a static bed of silica gel. The aromatics were adsorbed. The charge was immediately followed by a low-boiling paraffin desorbent (butane) which displaced the unadsorbed (satd.) part of the charge from the bed. A second desorbent (xylenes) was next added which displaced from the silica gel the adsorbed aromatics of the charge.

7661. HAENSEL, VLADIMIR AND DONALDSON, GEORGE R. **Platforming of pure hydrocarbons.** *Ind. Eng. Chem.* 43, 2102-4 (1951).—*C.A.* 46, 8837*h*.

The platforming process for the conversion of hydrocarbons was carried out in the presence of recycled H_2 and a catalyst contg. Pt. At 459°C, a pressure of 500 p.s.i. and *n*-heptane as feed stock, the reaction was principally one of isomerization (52 mole % C_7 isomers), although hydrocracking occurred whereby propane and isobutane were formed. The next major reaction was the formation of all the isomeric trimethylbenzenes and ethyltoluenes.

7662. HOPKINS, R. L. **Continuous stripper for adsorption column effluent streams.** *Ind. Eng. Chem.* 43, 1456-8 (1951).—*C.A.* 45, 7388*c*.

Large-scale lab. adsorption operations were reported in which pentane, benzene, and iso-PrOH were used and must subsequently be removed from the solvent. This permitted the collection of oil fractions of any desired size, and provided for the direct observation of the oil-to-solvent ratio at all times.

7663. KATS, M. L. AND SIDOROV, N. K. **Fluorescence spectra of petroleum and its fractions in liquid condition and in a chromatographic column.** *Izvest. Akad. Nauk S.S.S.R., Ser. Fiz.*, 15, 777-81(1951).—*C.A.* 46, 6816*f*.

In crude oil and in the distn. residue above 400°C, the fluorescence maxima occurred at 472, 510, 539, and 625 mμ with intensities depending on the type of the oil. In fractions 200-400°C these maxima were absent and 2 maxima for each fraction, 431-445 and 454-458 mμ, appeared, the max. shifted slightly to longer waves with increased distn. temp. In the spectra of crude oil adsorbed on Al_2O_3 in a chromatographic column all lines appeared.

7664. KINNEY, P. T. AND NIELSEN, R. F. **Wettability in oil recovery.** *World Oil* 132, No. 4, 145-6, 148, 150, 154(1951).—*C.A.* 45, 4433*d*.

The relation of wettability to fluid mobility was demonstrated by the flooding behavior of a synthetic and a natural core before and after a treatment that would render the internal surfaces oil wet. The percentage of recoverable oil produced before water break-through was greater in a preferentially water-wet porous medium than in a preferentially oil-wet porous medium. Analogous results were obtained when water was driven by oil.

7665. MCGRATH, HENRY G. **The application of fluid hydroforming.** *Petroleum Refiner* 30, No. 12, 102-8(1951).—*C.A.* 46, 2275*f*.

Catalyst activity was maintained at a const. level indefinitely by periodic addns. of fresh catalyst if activity declined with age. Some of the heat produced in the regeneration can be used to supply endothermic reaction heat, thus reducing preheater duty and thermal cracking in the preheater. Variation in catalyst level in the reactor and the regenerative nature of the process gave addnl. flexibility.

7666. McGrath, Henry G. **Catalytic upgrading by hydroforming.** *Oil and Gas J.* **50**, No. 34, 78-81(1951).—*C.A.* **46**, 2787*a*.
Reactions, effect of catalyst, effect of operating variables, and economics of fluid hydroforming were discussed.

7667. McGrath, Henry G. and Hill, Luther R. **Process in petroleum technology. Intermittent and fluid catalytic reforming of naphthas.** *Advances Chem. Ser. No.* 5, 39-57 (1951).—*C.A.* **45**, 10557*d*.
Typical pilot-plant data on fluid vs. fixed-bed hydroforming of various naphthas were presented. Besides a higher gasoline yield, the fluid process offered savings through elimination of multiple reactors and accessories, simplified regeneration, and longer on stream time.

7668. Mondria, H. **Continuous filtration. Calculation of cake impurity and liquid yield.** *Chem. Eng. Sci.* **1**, 20-35(1951).—*C.A.* **46**, 3332*e*.
Developed relations were applied to the dewaxing of lubricating oils with butanone-benzene mixts. and good agreement with practical results was obtained.

7669. Murphree, E. V. **Process in petroleum technology. Fluid catalytic cracking process.** *Advances Chem. Ser. No.* 5, 30-8 (1951).—*C.A.* **45**, 10557*c*.
The Fluid process represented the first widespread application of a new chem. engineering unit operation—the fluid-solids technique. The development of the process and equipment was described. The possibility existed of integrating fluid catalytic cracking units into refinery operations as a whole.

7670. Murphree, E. V. **Fundamentals of fluid hydroforming.** *Petroleum Refiner* **30**, No. 12, 97-101(1951).—*C.A.* **46**, 2275*d*.
Fluid hydroforming provided an economical means for reforming low-octane-no. naphthas and straight-run gasolines into high-octane-no. gasoline components. Fluid hydroforming with molybdena-alumina gel catalyst was so superior to thermal reforming both from the standpoint of yield and cost that substitution of the former for the latter was attractive.

7671. Nowak, T. J. and Krueger, R. F. **The effect of mud filtrates and mud particles upon the permeabilities of cores.** *World Oil* **133**, No. 1, 125-6, 128, 130; No. 3, 152, 154, 156, 158, 161-2 (1951).—*C.A.* **45**, 8747*b*.
Fresh water and filtrates from fresh water-base muds significantly reduced the effective oil permeabilities of the cores. Oil-base mud filtrate had essentially no effect on the effective oil permeability of the cores. Preliminary tests were run on alundum cores mudded off at high temp. and pressure. Greater improvement of permeability to oil may result from the interaction of fluids with water-sensitive cores than from mud-particle invasion into the interstices of inert cores.

7672. Padovani, C.; Girelli, A., and Sinibamed, C. **A possible catalytic process utilizing bauxite for the improvement of Middle Eastern gasoline.** *Riv. combustibili* **5**, 591-608(1951).—*C.A.* **46**, 10593*g*.
The low octane nos. and Pb susceptibilities of some light distillates from Middle Eastern crude oils were improved by vapor-phase desulfurization over bauxite catalyst. Temps. of 350-550°C and space velocities of 0.24-1.7 were used.

7673. Preston, F. W. and Calhoun, J. C. **Applications of chromatography to petroleum production research.** *15th Tech. Conf. on Petroleum Production, Mineral inds. Expt. Sta., Penna. State Coll., Bull.* No. 59, 36-51 (1951); *Producers Monthly* **16**, No. 5, 22-5 (1952).—*C.A.* **46**, 3247*a*.
Chromatography, or adsorption analysis, was one phase of the general subject of mass transfer within porous materials, and its theory should provide background for study of any reservoir mass-transfer problem.

7674. Resen, F. Lawrence. **Magnolia's Beaument (Thermofor catalytic cracking) units employ catalyst air-lift system developed by Socony-Vacuum Oil Co., Inc.** *Oil Gas J.* **50**, No. 8, 66-7, 91, 93 (1951).—*C.A.* **45**, 9251*e*.
The modified air-lift Thermofor catalytic cracking units incorporated an air-lift for the catalysts. The catalytic section of these latter units could be erected entirely within a 195-ft oil-field-type derrick, which served as a construction rig.

7675. Rodriguez, Ariel F. **The identification of Pennsylvania oils.** *Quimica ind.* (Uruguay) **2**, 112-14(1951).—*C.A.* **46**, 7310*h*.
A chromatographic sepn. of paraffins, olefins, and aromatics was made in a 100-ml buret filled with silica gel. Twenty-five g oil was dild. with 25 ml isopentane and charged to the previously wetted gel and the bands developed with isopentane, benzene, and alc. in that order. Thirteen cuts of 6 ml each were taken; the solvent was evapd. and their *n* measured.

7676. Schuldiner, Jacob A. **Identification of petroleum products by chromatographic fluorescence methods.** *Anal. Chem.* **23**, 1676-80 (1951).—*C.A.* **46**, 7310*i*.
Various crude, semirefined, and refined petroleum products gave characteristic spot chromatograms on white, unbacked blotting paper. A few drops of a sample of an oil slick were placed on the paper and allowed to spread. The relative areas covered by the central spot, the sequence of ring formation, the scalloped effects, and ray formations were characteristic of the sample.

7677. Teutsch, A. **New experiments in gas detoxification with the simultaneous production of liquid fuels.** *Schweiz. Ver. Gas- u. Wassfach., Monats-Bull.* **31**, 345-51 (1951); *Gas- u. Wasserfach* **93**, 374-5 (1952).—*C.A.* **46**, 9284*i*.

The CO content of Bern city gas was reduced by means of a pilot plant operating on a process similar to the Fischer-Tropsch synthesis. An active charcoal adsorber was used to remove light oils and gum-formers from the gas after other liquid products have been removed. The CO content was reduced to 1 to 2%, with a slight decrease in heating value of the treated gas; this could be raised to a higher value than that of the initial gas by scrubbing out CO_2.

7678. Thomas, Charles L. **Petroleum coke and coking.** *Advances Chem. Ser.* No. 5, 278-86 (1951).—*C.A.* **45**, 10560*d*.

The current production of petroleum coke was 3.4 million tons per year, almost all of which was produced in "delayed coker" type drums and removed by various mech. means. Coking may be combined with thermal cracking or Polyforming. Application of the Thermofor cracking and of the fluidized solids principle was tried out, both being in the pilot or semicom. stages. Use of the coke as fuel has declined, but its use as anode material in Al production is growing.

7679. Thornton, D. P. Jr. **Hydrogen fluoride alkylation today.** *Petroleum Processing* **6**, 488-91 (1951).—*C.A.* **45**, 8751*a*.

The reactor effluent hydrocarbon after removal of the acid was deisobutanized and depropanized before destruction of low-mol. org. fluorides; thus, these were recycled to the contactor with the isobutane. Higher-mol. fluorides were destroyed over bauxite ahead of the butane tower. Formation of SiF_4 in treaters was alleviated by the inclusion of $Ca(OH)_2$ in the bauxite. Thorough drying of feed streams was important.

7680. Tománek, Vladimír. **Regeneration of mineral oils with clay from north-western Bohemia.** *Paliva* **31**, 261-2 (1951).—*C.A.* **46**, 1237*a*.

An absorptive clay (SiO_2 46.50, Al_2O_3 31.96, Fe_2O_3 0.95, TiO_2 nil, CaO 0.34, MgO trace) compared favorably with German bleaching earth for the regeneration of lubricating oil. The oil was heated to 90°C and mixed with 15% of the powd. and dried clay, filtered, and analyzed.

7681. Vahrman, M. **Rapid estimation of hydrocarbons in primary tars from coals of low rank.** *Fuel* **30**, 79-82(1951).—*C.A.* **45**, 4428*f*.

A few g of the dewatered tar was adsorbed onto a steam-heated column of silica gel. Chromatography can then be carried out in the normal way, for at temps. above 50°C the tars used form a single liquid phase. The hydrocarbons were completely eluted from the column by means of light petroleum (100-120°C) and were recovered by distg. off the solvent under a water-pump vacuum.

7682. Voreck, W. E. Jr.; Carroll, W. C., and Zurcher, Paul. **Extraction of mercaptans by means of adsorption.** *Petroleum Refiner* **30**, No. 3, 126-9 (1951).—*C.A.* **45**, 5395*d*.

Pilot and semicom. plant tests indicated that sour cracked distillates could be sweetened by percolation through activated charcoal impregnated with NaOH. Primary mercaptans were most readily removed, tertiary mercaptans least. The adsorbent was regenerated with steam or with steam and air. Study of the adsorption isotherms indicated that chem. reaction and adsorption took place simultaneously, and after completion of the chem. reaction, adsorption alone continued.

7683. Wedgwood, Philip and Cooper, R. L. **Detection and determination of small quantities of polynuclear hydrocarbons by a combination of chromatography and absorption spectroscopy.** *Chemistry & Industry* **1951**, 1066-7.—*C.A.* **46**, 3897*b*.

Gas-works and sewage effluents, petroleum, and tar oils were chromatographed (alumina column) and the successive filtrates analyzed by absorption spectroscopy. Hydrocarbons (such as pyrene, fluoranthrene, benzopyrene, perylene, and ananthrene) and chlorophylls were identified.

7684. Weil, Herbert. **Industrial petroleum chromatography. I. Principles and origin. II. History and technology 1914-1934. Analytical and process applications of petroleum chromatography.** *Petroleum* (London) **14**, 5-12, 16, 205-10 (1951); *Brennstoff-Chem.* **32**, 357-66 (1951).—*C.A.* **45**, 2183*f*, 8749*c*; **46**, 2786*c*.

Literature on chromatography was reviewed, with special reference to the sepn. of petroleum components.

7685. Weyl, W. A. and Hauser, E. A. **Formation and structure of silica gel.** *Kolloid-Z.* **124**, 72-6 (1951).—*C.A.* **46**, 2879*d*.

The polymerization of silicic acid and relation of some of the properties of the system, $SiO_2.H_2O$, to its constitution were studied. The formation of silica gel was based on 2 fundamentally different reactions, polymerization and condensation. The former led to the formation of macromols.; condensation led to mech. stresses. Polymerization was based on satisfying the coördinate requirements, and condensation was based on the splitting off of H_2O between 2 closely adjacent OH-ions. Depending on the individual speed of the 2 reactions and on their interaction, silica gels with extraordinarily varying properties could be obtained.

7686. Wilson, Robert E. **Process in petroleum technology. Scope of the symposium.** *Advances Chem. Ser.* No. 5, 1-2(1951).—*C.A.* **45**, 10556*h*.

The two principal developments were: (1) the great increase in tech. knowledge gained by research and (2) the catalytic revolution.

7687. Zahner, R. J. and Swann, W. B. **Chromatographic separation of phenol from cresylic acids.** *Anal. Chem.* **23**, 1093-5(1951).—*C.A.* **45**, 10143*c*.

A silica-gel column with H_2O as the stationary solvent and cyclohexane as a mobile solvent effectively sepd. phenol from its homologs, cresols and cresylic acids. Phenol was the last of these to leave the column. The column was standardized with a mixt. of phenol and *m*-cresol and the specific absorption coeff. of the phenol in cyclohexane detd. experimentally in the region of 270 mμ in a Beckman spectrophotometer.

7688. ANON. **New Autofining process.** *Petroleum Processing* 7, 467-9(1952).—*C.A.* 46, 5827*g*.

Autofining was the name applied to catalytic desulfurization of petroleum-distillate fractions, wherein the H required to remove the S as H_2S was supplied by a minor amount of naphthene dehydrogenation. The process operated at pressures of 50 to 200 p.s.i. and at 700-800°F, with a Co molybdate catalyst. Gasolines and kerosines can be desulfurized to the extent of 98-99%; light gas oils 60-70%.

7689. ARNOLD, ROBERT C.; LAUNER, PHILIP J., AND LIEN, ARTHUR P. **Identification of cyclohexanethiol in virgin naphtha.** *Anal. Chem.* 24, 1741-4(1952).—*C.A.* 47, 5673*a*.

By a combination of techniques involving chem. sepn., distn., chromatography, and infrared spectroscopy the presence of naphthenic thiols was disclosed as a major constituent of petroleum thiols.

7690. BERGMAN, W. E. **Effect of calcium sulfate on properties of a bentonite suspension.** *World Oil* 134, No. 5, 170-2, 174, 177-8, No. 6, 122, 124, 126, 128, 130, 133(1952).—*C.A.* 46, 6367*h*.

The effects of $CaSO_4$ in amts. of 0-5 lb/bbl. upon the phys. properties of an aq. bentonite suspension pretreated with variable amts. of NaOH with 1, 3, and 5 lb quebracho/bbl. were detd. in lab. expts. The effects of time and temp. of aging were correlated with changes that occur in the concns. of Ca^{++} and SO_4^{--} in the filtrate from the mud.

7691. BOEHM, J. C. **Conditioning of natural gas.** *Mech. Eng.* 74, 563-7 (1952).—*C.A.* 46, 7736*h*.

The glycol and adsorbent dehydration processes were described; Transcontinental used the latter, with "fluorite," an activated bauxite, as the adsorbent. The largest unit, handling 30,000,000 ft^3 of gas per day, required 15,100 lb. About 5 lb of water was removed per million ft^3 of gas. The adsorbent was regenerated by passing gas, heated to about 375°F, through the adsorber for 4-5 hrs; cold gas was then passed through the adsorber for the remainder of an 8-hr period.

7692. BOELHOUWER, C.; RIEMSDIJK, A. J. VAN; STEENIS, J. VAN, AND WATERMAN, H. I. **Chromatographic analysis of mineral oils.** *Anal. Chim. Acta* 6, 476-82(1952)(in English).—*C.A.* 46, 8356*e*.

A simple *fraction-collector* for chromatographic work was used in the analysis of a no. of oil fractions, allowing a sepn. into 3 main groups contg., resp., the nonaromatic, monoaromatic, and diaromatic compds. Sepns. between nonaromatics and aromatics were very sharp.

7693. BURTIS, T. A. AND NOLL, H. D. **Houdriforming, its place in the refining of petroleum.** *Petroleum Engr.* 24, No. 6, C39-44(1952).—*C.A.* 46, 7750*b*.

The economics of unit construction and of process operation was shown for several typical combinations of thermal and catalytic cracking, thermal and catalytic reforming, and catalytic polymerization.

7694. CABLE, CHARLES R.; TURCOTTE, P. A., AND DOTTERWEICH, FRANK H. **Properties of natural gas odorants.** *Am. Gas J.* 177, No. 2, 12-13, 34 (1952).—*C.A.* 46, 9827*d*.

The sorptive properties of a no. of soils were detd. by lab. and pilot-plant tests, in which natural gas contg. 0.5 lb concd. odorant/million ft^3 was passed at various rates through standard columns of the soil under test. Adsorption was a major factor in removal of the odorant from the gas by the soil. The odor lost by the natural gas varied directly with the amt. and colloid content of the soil through which it escaped.

7695. CHATENEVER, ALFRED AND CALHOUN, JOHN C. JR. **Visual examinations of fluid behavior in porous media. I.** *Trans. Am. Inst. Mining Met. Engrs.* 195, *Tech. Pub.* No. 3310(in *J. Petroleum Technol.* 4, No. 6, 149-56)(1952).—*C.A.* 46, 9367*e*.

App. and techniques were developed so that microscopic phenomena could be recorded on color movie film as well as be observed visually. The observation flow cells were essentially single-layered matrixes of spheres between plates, sometimes all-glass, sometimes all-Lucite and sometimes a combination of the two. The fluids were limited to H_2O and a filtered crude oil. Channel flow and slug flow were observed.

7696. CULBERTSON, LEROY AND CONNORS, J. S. **How to prevent formation of gas hydrates.** *Oil Gas J.* 51, No. 15, 114, 116 (1952).—*C.A.* 46, 10586*b*.

A comparison was given between the absorption or glycol method of dehydrating natural gas and the adsorption or solid desiccant method. Flow diagrams were given for a typical plant of each type. A disadvantage of solid desiccants was "poisoning" or loss of activity of the desiccant on repeated regeneration.

7697. CULBERTSON, LEROY AND CONNORS, J. S. **How to rid natural gas of undesirable sulfur compounds.** *Oil Gas J.* 51, No. 14, 114-15, 117 (1952).—*C.A.* 46, 10586*c*.

The removal of H_2S and (or) CO_2 was accomplished with NaOH, Fe oxide, Na_2CO_3, 2-stage phenolate, phosphate gas, and aq. amine treatment.

7698. DAVIS, W. H.; HARPER, J. I., AND WEATHERLY, E. R. **The Arosorb Process, a new refining tool.** *Oil Gas J.* 51, No. 2, 112-14, 116, 119-20 (1952).—*C.A.* 46, 7312*b*.

Aromatic hydrocarbons can be sepd. from the accompanying satd. hydrocarbons by selectively adsorbing the aromatics on silica gel and then desorbing them with other aromatic hydrocarbons having a boiling range sufficiently different to permit subsequent sepn. by distn. When relatively low-boiling charge stocks were used, a desorbent having a higher boiling range than the charge stock was used, while desorbents used for removing relatively high-boiling materials from the gel had boiling ranges below these materials.

7699. DODD, CHARLES G.; MOORE, JOHN W., AND DENEKAS, MILTON O. **Metalliferous substances adsorbed at crude petroleum-water interfaces.** *Ind. Eng. Chem.* 44, 2585-90(1952).—*C.A.* 47, 1366*i*.

Zn, Cu, Ni, Ti, Ca, Mg, V, and Fe were found as oil-sol. compds., possibly as porphyrin-metal chelate complexes or complexes with N-contg. compds. Film-forming fractions consisted of proteins, waxes, and resins stabilized by oriented porphyrin rings.

7700. FOWLE, M. J.; BENT, R. D.; MILNER, B. E., AND MASOLOGITES, G. P. **It's the catalyst that counts.** *Petroleum Engr.* **24**, No. 5, C40-4 (1952).—*C.A.* 46, 6369*g*.

The 3 essential properties of a catalyst for reforming straight-run gasoline, selectivity, stability, and stamina were discussed briefly.

7701. GALL, D.; GIBSON, E. J., AND HALL, C. C. **Distribution of alcohols in the products of Fischer-Tropsch synthesis.** *J. Appl. Chem.* (London) 2, 371-80(1952).—*C.A.* 47, 7191*h*.

Evidence was presented that alcs. were precursors of hydrocarbons in the Fischer-Tropsch synthesis. The proportion of MeOH was very low, EtOH was present in the largest proportion, and the proportions of the alcs. higher than PrOH decreased with increasing C no. The proportion of PrOH was less than that of BuOH or AmOH so that the C no. distribution curve for the alcs. showed a marked deflection in the C_3-C_4 region.

7702. GRANQUIST, W. T. AND STREICH, H. J. **Percolation decolorization of a lubricating-oil fraction by Fuller's earth.** *Ind. Eng. Chem.* 44, 2898-2903 (1952).—*C.A.* 47, 2967*d*.

Expts. with percolation of a Pennsylvania steam-refined cylinder stock mixed 40% by vol. with a heavy naphtha, b.p. 300-400°F, through a 10-ft column of Fuller's earth were reported. A general decrease in the amt. and increase in the mol. wt of resin adsorbed was indicated as the activating temp. of the clay was increased from 600° to 1400°F. The decrease in total adsorption was explained on the basis of an assumed irreversible adsorption of an essentially polar compd. A plot of log $V(Do - Dc)/W$ against log D/Do was found to give a linear curve, D = optical d. of effluent, Do = optical d. of feed, Dc = optical d. of the composite, V = the yield, W = weight of clay used.

7703. GUTIERREZ RIOS, ENRIQUE AND LOPEZ-GONZALES, JUAN DE DIOS. **Action of strong acids on the silicates of the isomorphic montmorillonite-beidellite series. III. Industrial applications of acid-treated bentonites.** *Anales edafol. y fisio. vegetal* **11**, 539-51 (1952).—*C.A.* 47, 4254*e*.

Spanish bentonites activated with strong acids were used in the study of mineral lubricating-oil decolorization. Decolorization went up sharply with increase of free SiO_2, indicating fundamental differences in the 2 processes. The amt. of free SiO_2 was not the only factor concerned, however, since 2 samples with equal percentages may have different decolorizing properties.

7704. HACHMUTH, KARL H. **Industrial viewpoints on separation processes. I.** *Chem. Eng. Progress* 48, 523-27(1952).—*C.A.* 46, 10701*e*.

Sepn. processes, such as fractional distn., solvent extn., and others, are basically analogous. Industrial application of new sepn. processes to old sepns. or of familiar sepn. processes to new sepns. became easier to visualize when the inherent similarities were realized.

7705. HARPER, JAMES I.; OLSEN, JOHN LEE, AND SHUMAN, FRANK R. JR. **The Arosorb Process.** *Chem. Eng. Progress* 48, 276-80(1952).—*C.A.* 46, 7311*i*.

Underlying principles of com. hydrocarbon sepn. by silica gel were presented, and the factors involved in setting up a silica-gel case cycle for a typical feed stock were covered. The influence of percolation rate, pressure drop, height, diam., and no. of cases was considered in relation to the shape of silica-gel beds.

7706. HICKERSON, J. F. **Static charge causes flash fire in silica-gel column.** *Chem. Eng. News* 30, 2942-3(1952).—*C.A.* 46, 9845*f*.

Aromatic contaminants were removed from isoöctane by pouring through a glass column contg. silica gel. The gel was charged into the column through a partially enameled funnel. The use of a well grounded all-metal funnel was recommended.

7707. HUBBARD, RETHEL L.; STANFIELD, K. E., AND KOMMES, W. C. **Anhydrous alumina as adsorbent in constituent analysis of asphalt.** *Anal. Chem.* 24, 1490-1 (1952).—*C.A.* 47, 1370*i*.

The adsorption properties of anhyd. cryst. aluminas varied with the source and method of prepn. Samples of the same alumina should be used to compare constituent analyses of a series of different asphalts. The yield of resins increased in proportion to the γ-alumina content of the adsorbent.

7708. KREULEN, D. J. W. **The influence of metal, especially copper, on the oxidation of white oil.** *J. Inst. Petroleum* 38, 449-57 (1952).—*C.A.* 46, 9293*e*.

An adsorption phenomenon was probably involved, with the adsorption of antioxidants on the Cu surface. Sn, with a lower relative adsorption affinity than Cu, was less active in shortening the length of the induction period. When very large quantities of Cu were added, an induction period reappeared. Up to about 500 cm^2 of Cu surface added to 250 ml of oil did not affect the reaction velocity appreciably.

7709. MELPOLDER, F. W.; BROWN, R. A.; YOUNG, W. S., AND HEADINGTON, C. E. **Composition of naphtha from fluid catalytic cracking.** *Ind. Eng. Chem.* 44, 1142-6(1952).—*C.A.* 46, 6370*b*.

Mass, ultraviolet, and infrared spectroscopy and fractional distn., adsorption and hydrogenation were used to det. as many as possible of the chem. components in a naphtha produced by catalytic cracking. Ninety-two individual hydrocarbons, including 21 olefins, were detd.

7710. METCALF, E. L. **Production of aromatic compounds from aliphatic petroleum sources.** *Paint, Oil Chem. Rev.* 115, No. 10, 12-14 (1952).—*C.A.* 46, 6368*c*.

By using a molybdena-on-alumina fixed bed catalyst operating at 900°-1000°F and 200-300 lb/in^2, the Hydroforming Process converted straight-run raw gasoline, paraffinic and naphthenic, to an aromatic naphtha which was fractionated into benzene, toluene, xylene, and heavy aromatic solvents. The Thermofor catalytic reforming process employed a movable bed of copptd. chromia and alumina which was regenerated in sep. kilns. Platforming used a supported Pt catalyst. Houdryforming employed a dual-function catalyst to dehydrogenate and isomerize.

7711. MIDLAN, E. W. AND DORSEY, J. D. **Lube-oil processing and instrumentation.** *Instruments* 25, 1568-70, *et seq.* (1952).—*C.A.* 47, 4590*f*.

The 3 lightest distillates were refined with furfural, dewaxed with methyl ethyl ketone, and treated with clay. Paraffin waxes from 3 lightest distillates were blended, bauxite percolated, slabbed, and packaged. About 800 instruments and 450 diaphragm motor valves were required.

7712. MORGAN, B. E. AND DUMBAULD, G. K. **Use of activated charcoal in cement to combat effects of contamination by drilling muds.** *Trans. Am. Inst. Mining Engrs.* 195, *Tech. Pub.* No. 3396 (in *J. Petroleum Technol.* 4, No. 9, 225-32) (1952).—*C.A.* 46, 10589*i*.

Less than 0.5% charcoal was not satisfactory in accelerating the strength development of exptl. slurry-mud mixts., while increase of charcoal content up to 10% resulted in increase of early strength. It appeared that the optimum charcoal concn. was about 5% by wt of dry cement.

7713. MORGAN, L. O.; PRUSICK, J. H., AND TORREY, PAUL D. **Application of surface chemistry to oil recovery.** *Producers Monthly* 16, No. 9, 18-24(1952).—*C.A.* 46, 9829*h*.

The discussion covered the following topics: (1) nature and classification of clays in reservoir rocks, (2) reservoir-rock texture and pore pattern, (3) nature and utility of org. surface-active agents, (4) principles of surface chemistry, and (5) role of surface-active agents in injection waters.

7714. PALENI, ANDREA. **Decolorization of oils with Fuller's earths.** *Olearia* 6, 19-25(1952). —*C.A.* 47, 888*g*.

7715. PAYNE, J. W.; EVANS, L. P.; BERGSTROM, E. V., AND BOWLES, V. O. **Thermofor catalytic reforming (TCR).** *Petroleum Engr.* 24, No. 6, C10-20(1952).—*C.A.* 46, 7750*c*.

Premium fuels in the F-1 octane no. range of 100 were produced. Almost complete removal of S was effected simultaneously, chiefly as H_2S. Butane yields were low, permitting the use of outside butanes to meet vapor-pressure requirements. The catalyst was chromia-alumina gel in a bead form. The process was a regenerative moving-bed type which employed a single pressure reactor and an atm. Thermofor catalytic cracking-type kiln. Catalyst circulated at a low rate through the system and was regenerated continuously.

7716. POSPELOV, V. **Regeneration of lubricating oils.** *Molochnaya Prom.* 13, No. 10, 28-30 (1952).—*C.A.* 47, 1921*a*.

A description with diagrams was presented for ordinary settling-filtration-type oil-regeneration installation and for an installation in which volatile combustibles were distd. from used oils. Use of such devices as a means for conservation of lubricating oils used in dairy machinery was advised.

7717. PUTSCHER, RICHARD E. **Isolation of olefins from Bradford crude oil.** *Anal. Chem.* 24, 1551-8(1952).—*C.A.* 47, 1366*h*.

Trans-olefins were isolated from the gasoline fraction of a Pennsylvania crude oil. The sepn. was effected by fractional distn. and silica gel adsorption. The fractionation was followed by means of infrared absorption at 10.3 μ and by Br no. The presence of *trans*-heptenes and *trans*-octenes was shown.

7718. REIDEL, JOHN C. **Cities Service puts first Orthoflow cat cracker in United States on stream at Ponca City (Okla.).** *Oil Gas J.* 50, No. 46, 200-3(1952).—*C.A.* 46, 6369*e*.

This unit had a fresh-feed throughput of 8,350 barrels per day. The Orthoflow process operated on the same basic principles as the conventional Fluid catalytic cracking process with somewhat different mech. design intended to reduce the total height of the unit.

7719. SAUER, R. W.; MELPOLDER, F. W., AND BROWN, R. A. **Nitrogen compounds in domestic heating-oil distillates.** *Ind. Eng. Chem.* 44, 2606-9 (1952).—*C.A.* 47, 1368*h*.

Catalytically cracked and virgin Kuwait heating-oil distillates were fractionated by chromatography with activated alumina, and the fractions analyzed with the mass spectrometer to det. nonbasic N. Carbazoles, indoles, pyrroles, pyridines, and quinolines were present in both distillates in amts. of about 0.001-0.1%.

7720. SCHALL, J. W. AND DART, J. C. **Catalytic cracking of high-nitrogen charge stock. I. Presentation of experimental data.** *Petroleum Refiner* 31, No. 3, 101-3(1952).—*C.A.* 46, 5827*b*.

The results were given for a moving-bed catalytic-cracking pilot-plant investigation to det. the cracking characteristics of (1) a charge stock contg. 0.4 wt % N and having an A.P.I. grade of 21.2° and an end point of 910°F, and (2) a 1st-pass catalytic gas oil obtained from moving-bed cracking of the virgin heavy gas oil.

7721. SEEBOLD, JAMES E.; BERTETTI, J. W.; SNUGGS, J. F., AND BOCK, J. A. **Fluid hydroforming; full-scale unit; first to use the fluidized catalyst technique.** *Oil Gas J.* 51, No. 2, 111, 135-6 (1952).—*C.A.* 46, 7311*d*.

Design process conditions were: temp. 930°F; naphtha preheat 940°F; recycle-gas preheat max. temp. 1300°F; pressure 250 lb/in^2; space velocity 0.45 lb of naphtha per hr per lb of catalyst in reactor; catalyst-to-oil ratio 0.35 lb of catalyst circulated per lb of naphtha; recycle-gas rate 6000 standard ft^3 per barrel of naphtha; recycle-gas H content 60 mol. %; regeneration conditions 1100°F temp., and 260 lb/in^2 pressure.

7722. SEMENOV, A. P. **Effect of surface films on the agglomeration of aluminum.** *Doklady Akad. Nauk S.S.S.R.* 86, 357-9 (1952).—*C.A.* 47, 1557*h*.
Adsorbed films preventing agglomeration can be most effectively removed by heating in air 30 min. at 450°C; other methods, such as treatment with solvents, or electrolytic degreasing, failed to give reproducible results. The effectiveness of an oil in preventing agglomeration through stamping and compression can be taken as a direct measure of the lubricating quality of the oil. A no. of oils and liquids were tested from this point of view.

7723. TOMKINS, R. V. **Recent research on Saskatchewan bentonites.** *Trans. Can. Inst. Mining Met.* 55(in *Can. Mining Met. Bull.* No. 478, 110-12)(1952).—*C.A.* 46, 5491*c*.
Properly activated bentonites from 2 deposits produced good oil-decolorizing clays. Modified bentonites from 2 other deposits were suitable for drilling gels.

7724. WEIL, HERBERT. **Fifty years of petroleum chromatography. I. Empirical and scientific eras.** *Petroleum Processing* 7, 812-14(1952).—*C.A.* 46, 8356*e*.

7725. WESTGATE, MARK W. AND CHRISTIAN, MARJORIE R. **Detector for aromatic hydrocarbons.** *Natl. Paint, Varnish Lacquer Assoc., Sci. Sect., Circ.* No. 757, 110-15(1952).—*C.A.* 47, 3049*c*.
The instrument, which depended on development of a brown stain on a gel surface, was capable of detecting separately benzene, toluene, or xylene in air at or below the concns. involved in good industrial hygiene practices. Vapors of nonaromatic solvents did not interfere with the tests.

7726. YOSHIDA, TAKATOSHI; FUJII, KYŪZŌ, AND KITA, YOSHIZO. **Separation of paraffin from gas-generator tar.** *Coal Tar* 4, 188(1952).—*C.A.* 46, 8830*d*.
Gas-generator tar (2500 g), gathered from the surface of washing water, was fractionated and from the fraction, b. 280-360°C, 369 g of paraffin was sepd. by refrigeration. After recrystn. from benzene and treatment with activated acid clay, 126 g (yield, 5.04%), m 56.4°C, was obtained.

7727. BONDI, A. AND PENTHER, C. J. **Electrical properties of colloidal suspensions in oils.** *J. Phys. Chem.* 57, 72-9 (1953).—*C.A.* 47, 4692*i*.
By use of a capacitor with a rotating electrode, studies were made on the degree of flocculation of soap fibers, silica, Fe powder, and carbon black in a nonaq. medium. The decrease in dielec. const. was ascribed to flow orientation of the particles. For all suspensions of nonconducting particles there was an increase in the d. c. cond. and the appearance of an electrokinetic potential during shearing. The deformation of particle aggregates in these systems was attributed to essentially elastic restorable short-range forces.

7728. BUCHWALD, HERBERT AND WOOD, L. G. **Determination of copper in mineral oils using an ion-exchange technique.** *Anal. Chem.* 25, 664-5 (1953).—*C.A.* 47, 6639*g*.
A 10-ml sample of oil was dild. with 10 ml of 2-propanol and percolated through a 30 × 1 cm column of the H form of Zeo-Carb 215, prewashed with 60 ml of 2-propanol. The column was washed with 70 ml of 2-propanol followed by 60 ml of distd. water. The Cu was eluted with 60 ml of 10% H_2SO_4 followed by 20 ml of distd. water and detd. colorimetrically with $Et_2NC(S)SNa$.

7729. DEBRUYNE, H. **Recovery of oils from decolorizing earth.** *Bull. mens. inform. ITERG* 7, 109-11 (1953).—*C.A.* 47, 6155*d*.
One kg of earth contg. 32.5% of oil was boiled with agitation in 5 liters of water contg. 150 g of a mixt. of Na_2CO_3 with sulfonated cetyl and oleyl alc. for 15 min. Up to 93% of the oil from the earth could be skimmed off. The aq. soln. could be employed for subsequent batches.

7730. DIEKMAN, ROBERT AND FORSYTHE, W. L. JR. **Laboratory prediction of flow properties of fluidized solids.** *Ind. Eng. Chem.* 45, 1174-7 (1953).—*C.A.* 47, 9065*h*.
Successful circulation depended on keeping the solids aerated. The method involved measurements of viscosity and deaeration rate of a fluidized bed. Natural clay and used synthetic, SiO_2-Al_2O_3 cracking catalysts were the test solids. Av. particle size was the controlling factor.

7731. EISLER, STANLEY L. **Radiometric study of the adsorption characteristics of stearic acid.** *Corrosion* 9, 91-4(1953).—*C.A.* 47, 3781*h*.
A radiometric test method to measure the amt. of adsorption of polar org. rust inhibitors was developed. Stearic acid (tagged with C^{14}) was chosen because of its known adsorption characteristics. The amt. of stearic acid adsorbed increased with time of immersion, when coupons were agitated as compared with quiescent immersion, and also with increased stearic acid content of the soln. The amt. of stearic acid adsorbed was found to be independent of the drainage time and temp.

7732. GUNNESS, R. C. **Fluidized-solids technique in the petroleum industry.** *Chem. Eng. Progr.* 49, 113-20(1953).—*C.A.* 47, 4591*f*.
In bringing gases into contact with solid reactants or catalysts, use of a fluidized bed of solid particles led to uniform temps. throughout the bed, high reaction rates, and better yields. The solid particles could be easily added to and withdrawn from the reactor; circulation of the solids was effectively used for heat transfer. Other industries beginning to make use of this tool were: the synthesis of phthalic anhydride, the manuf. of activated charcoal, the calcining of limestone, and the roasting of ores.

7733. JOHANSEN, R. T.; LORENZ, P. B.; DODD, C. G.; PIDGEON, FRANCES D., AND DAVIS, J. W. **The permeation of water and isoöctane through plugs of microscopic particles of crushed quartz.** *J. Phys. Chem.* 57, 40-5 (1953).—*C.A.* 47, 5212*g*.
Surface areas by N_2 adsorption and permeation of water and isoöctane through plugs of 4 differ-

ent samples of crushed quartz were measured. Calcn. of the surface area by the Kozeny-Carmen equation from water permeability gave areas from 0.70 to 0.75 that of the B.E.T. area; isoöctane permeation about 0.6.

7734. KOEPKE, BOYD F. AND STOWE, V. M. **With proper care, you can use desiccants years longer.** *Gas* 29, No. 3, 100, 102 (1953).—*C.A.* 47, 4062*d*.

Activated alumina and other desiccants were widely used for drying gases, vapors, and liquids. While activated alumina was resistant to H_2S, traces of O_2 will cause the deposition of S. Any carryover of caustic solns. will seriously impair the capacity of any of the commonly used desiccants; mist extractors should be used here. Activated alumina should be reactivated at the recommended temp. of 350°F and not at lower temps. This reactivation should be carried out promptly after the adsorber is taken out of service.

7735. MARTIN, C. C. AND SANKIN, ALBERT. **Determination of aromatic and naphthene rings in aromatics from petroleum fractions.** *Anal. Chem.* 25, 206-14(1953).—*C.A.* 47, 5672*h*.

The av. no. of aromatic rings and no. of naphthene rings per mol. in aromatic hydrocarbons concd. were detd. by means of silica gel adsorption or solvent extn. from straight-run or cracked petroleum fractions. The required properties were density, specific dispersion, and mol. wt.

7736. MILBERGER, E. C. AND SWATIK, LORRAINE J. **Preparation and properties of silica aerogel-thickened greases.** *Inst. Spokesman* 16, No. 10, 18-29 (1953).—*C.A.* 47, 2967*i*.

Com. silica aerogels consisted of agglomerated particles of 3-5 μ in size which formed from primary particles of β-crystobolite about 8 A. in diam. The worked penetration of lubricating greases prepd. from silica aerogels decreased as the oil viscosity increased and was also affected by processing temps., milling, or homogenization. When suitable additives were incorporated, greases could be made which were highly water-resistant.

7737. OHME, WOLFRAM. **Desulfurization of Diesel fuels.** *Erdöl. u. Kohle* 6, 8-10(1953).—*C.A.* 47, 5103*c*.

Fuller's earth treatment, reduced the initial S content of 1.91% to 0.97% on the av. between 454 and 460°C. Temps. lower than 450-460° gave a residual S content > 1%. Fuller's earth used in other refining operations was as effective as new earth. Fresh earth reduced the S content in the treated Diesel fuel to as low as 0.5%. After reaching the highest permissible S value in the Diesel fuel, the fuller's earth was regenerated by burning in air, but the regenerated earth was not quite as effective as the new.

V-6. Solvent Recovery and Protection From Toxic Gases, Air Conditioning

7738. BOWER, JOHN H. **Comparative efficiencies of various dehydrating agents used for drying gases (Survey of commercial drying agents).** *J. Research Natl. Bur. Standards* 12, 241-8 (1934) Research Paper 649.

The comparative efficiencies were determined by aspirating properly conditioned air through a train of U-tubes containing the drying materials. The amounts of residual water (mg per liter of air dried) in the order of increasing efficiency at 30°C were: $CuSO_4$ (anhydrous) (2.8); $CaCl_2$ (granular) (1.5); $CaCl_2$ ("Technical anhydrous") (1.25); $ZnCl_2$ (sticks) (0.98); $Ba(ClO_4)_2$ (0.82); NaOH (sticks) (0.80); $CaCl_2$ (granular) (dehydrated) (0.36); $Mg(ClO_4)_2 \cdot 3H_2O$ (0.031); silica gel (0.030); KOH (sticks) (0.014); Al_2O_3 (0.005); $CaSO_4$ (anhydrous) (0.005); CaO (0.003); $Mg(ClO_4)_2$ (0.002); BaO (0.00065).

7739. LEDOUX, EDWARD. **Ventilation and drying of underground chambers.** *Le Genie Civil*, 109, 308-10, 334-7 (1936).

Three general methods were discussed: (1) closed recirculation through reconditioning apparatus; (2) partly closed circuit, with intake from outside air; (3) outside air intake and complete discard of foul air. Refrigeration and adsorption on silica gel were discussed as means of lowering the relative humidity.

7740. LEDOUX, EDWARD. **Drying materials by forced air draft at low temperatures.** *Chaleur et ind.* 18, 159-64 (1937).

Methods employed for drying air were discussed, e.g., cooling and treatment with H_2O adsorbents.

7741. ANON. **Air conditioning helps smash the atom.** *Heating & Ventilating* 35, 18-19 (December) 1938.

A dehumidifying unit of the activated alumina type was employed to dry the compressed air in the high voltage chamber at the Atomic Physics Observatory of the Dept. of Terrestrial Magnetism of the Carnegie Institution of Washington. It was important to maintain a relative humidity of 20% or less at all times when the unit was operating.

7742. FONDA, BAYARD P. **Desirability of adsorption dehumidifiers in air conditioning.** *Heating & Ventilating* 35, 37-39 (May, 1938).

Adsorption dehumidifiers were largely confined to those situations where the moisture load was great relative to the total heat to be removed. Adsorbents may be used in a machine for producing dry air and the dry air made available for a great variety of industrial applications.

7743. ANON. **Air conditioning in testing aviation instruments.** *Heating & Ventilating* 37, 36-37 (Nov. 1940).

A silica gel dehumidifier for moisture removal and a refrigeration condensing unit for sensible heat removal was installed in a test room to insure exact humidity control in the testing of aviation instruments.

7744. HOOGEVEEN, A. P. J. **Detection of small quantities of war gases (Dijkstra's method).** *Chemistry & Industry* 1940, 550-6.—*C.A.* 34, 7215^9.

Traces of war gases were volatilized by heating the sample in a slow air current and adsorbed on activated charcoal or on silica gel. The tests could be carried out either directly on the granules or on the gases recovered from the granules by heating them. Test papers were prepd.: (1) from $Cu(OAc)_2$ + benzidine acetate, (2) $CuSO_4$ + NH_4Cl + $NH_2OH.HCl$ + NH_3 + water, (3) dimethylaniline in EtOH, (4) 0.01% fluorescein in 50% EtOH, (5) 0.1% fuchsin in water + 5% $NaHSO_3$, (6) 0.25% $AuCl_3$ soln., (7) 0.5% mercurochrome (chiefly $C_{20}H_{48}O_6Br_2Na_2Hg$), (8) satd. Na_2S soln. and (9) 5 g *p*-dimethylaminobenzaldehyde and 5 g diphenylamine in 96% EtOH.

7745. McNally, Dana R. **Silica-gel air dehumidifiers.** *Heating & Ventilating*, 37, 37-40, (August, 1940).

Ten gas-fired silica gel dehumidifiers removed 2 tons of water from air in the production and storage of candy products. A condition of 65 to 70°F at 40% to 45% relative humidity was maintained. Many production problems which had been attributed to too high temperatures were solved when the proper relative humidity was maintained.

7746. Patterson, James C. **Choice of dehydration methods.** *Chem. & Met. Eng.* 47, 313-15 (1940).

The choice between a solid adsorbent or a liquid absorbent depended: (1) degree of hydration desired; (2) kind of application; (3) temperature and cost of available water; (4) availability and cost of the utility service (gas, steam, etc.) (5) geographic and climatic conditions.

7747. Smith, Adrian C.; Lowe, Charles S., and Fulton, George P. **Development of rancidity in Stoddard dry-cleaning solvent.** *Ind. Eng. Chem.* 32, 454-60 (1940).—*C.A.* 34, 3099^1.

Fatty matter accumulated in dry-cleaning solvent primarily from the soap used and secondarily from soil in the garments which were cleaned. If not removed from the solvent, this became rancid and caused an objectionable odor in the garments that were cleaned later. A series of practical runs were made during which only filtration and adsorption methods of treating the solvent were used.

7748. Anon. **Protection against sulfur dioxide at Utah Smelting Co.** *Heating & Ventilating*, 38, 41 (May), 1941.

Dorex odor adsorber-units employing canisters of activated coconut shell charcoal were installed in crane cabs. The air was constantly recirculated and the unit could be housed within the cab.

7749. Berger, Wilfried. **Obtaining fluid gas and benzene by the activated-carbon process.** *Z. kompr. flüss. Gase* 36, 113-18 (1941).—*C.A.* 37, 3249^5.

A comprehensive report on the scientific and technical state of the process, based upon the literature.

7750. Dubinin, M. M. **Resistance to air flow of layers of granular materials. II.** *J. Applied Chem.* (U.S.S.R.) 14, 906-13 (German summary) (1941).—*C.A.* 39, 3979^3.

The Chilton-Colburn method was used to calc. air-flow resistance in charcoal adsorption installations. Exptl. and theoretical values for spherical particles agreed well, but irregular particles required a nondimensional coeff. for agreement.

7751. Hartman, F. W. **Dehumidifier used for drying blood plasma.** *Heating & Ventilating*, 38, 57, (September, 1941).

Dehumidified air was used to dehydrate blood samples. A Bryant silica gel dehumidifier was adapted to the operation.

7752. Lowe, Charles S. and Smith, Adrian C. **Reclamation of Stoddard dry-cleaning solvent.** *Ind. Eng. Chem.* 33, 762-8(1941).—*C.A.* 35, 4962^2.

Lab. and plant tests were made with activated carbon, magnesium silicate, or fuller's earths. The adsorbents were compared on the basis of peroxide value, acid no., aldehydes, odor, color and Kreis test of the purified solvent. Activated carbon was the most satisfactory with magnesium silicate a good second and the two Fuller's earths a poor third and fourth.

7753. Philippot, E. **Arresting power of active carbon for arsine.** *Rev. Universelle Mines* 17, 212-23 (1941).—*C.A.* 37, 5159^8.

Air contg. AsH_3 (1 g/m^3) was passed at a rate of 1500 liters/hr through boxes contg. active charcoal, and a filter, and the times before break-through of AsH_3 were measured. Ordinary active charcoal was effective for 5-10 min., but anhyd. active charcoal was about 5 times as effective. The provision of a silica gel container for preventing access of H_2O to the active charcoal was recommended in masks worn by workers in atm. likely to contain AsH_3.

7754. Smith, Harry W. Jr. **Dehumidification in candy manufacturing plants.** *Heating & Ventilating*, 38, 24-27 (June) 1941.

Dehumidification equipment employing silica gel and that employing activated alumina were described.

7755. Alekseevskiĭ, E. V. and Kuznetsova-Kharina, O. M. **Sorption of acetylene.** *J. Gen. Chem. (U.S.S.R.)* 12, 296-304 (in English, 304-5) (1942).—*C.A.* 37, 2843^8.

The suitability was investigated of a variety of commercial carbons, charcoals, silica gel and $Fe(OH)_3$ gel and a variety of carbons treated with numerous inorganic salts, as packing for gas-masks or respirators for protection against acetylene; all of these materials were found to be totally unsuitable. Only cellulose and acetylstearoÿlcellulose were found to have appreciably large sorption of C_2H_2.

7756. Anon. **Odor removal at hog station.** *Heating & Ventilating* 39, 58, (May) 1942.

An installation of Dorex odor-eliminator was described employing 144 canisters of charcoal. The treated air was in the neighborhood of 4000 ft^3/min.

7757. ANON. **Air conditioning in handling hygroscopic pharmaceuticals.** *Heating & Ventilating* 39, 78-80 (January) (1942).

The dehumidifying was provided by a Pittsburgh Lectrodryer unit employing activated alumina. Several installations at Sharp & Dohme, Inc. in Philadelphia were described.

7758. AVERY, LESTER T. **Control of humidity in production of safety glass.** *Heating & Ventilating*, 39, 45-7, (January) (1942).

A regenerative dehumidifying unit employing silica gel was used to dry the plastic sheet used in the manufacture of safety glass at the Libbey-Owens-Ford Glass Co. Where low relative and absolute humidities were required, the silica gel machine proved economical.

7759. BRAGGER, H. J. **Dehydration equipment in the manufacture of vitamin capsules.** *Heating & Ventilating*, 39, 86-89, (January) (1942).

A silica gel dehydrator was described at the American Pharmaceutical Co. The air left the dehydrator at 120°F and was cooled by a water cooler. Silica gel or other solid adsorption dehydrators were essentially heat converters changing latent heat into sensible heat which appeared in the dry air at elevated temps. This necessitated the cooling system.

7760. CACHO, J. AND ARIAS, F. **Gas masks and their control in the laboratory.** *Rev. aeronautica* 3, 99-106, 178-82 (1942).—*C.A.* 37, 5511^4.

A description of the gas mask, its various parts and recent development, lab. tests, tests for lens breakage, detn. of field of view, investigation of breather valve, tightness tests, detn. of dead space, chem. permeability tests with benzyl bromide and yperite, cartridge tests with Cl_2, $COCl_2$, chloropicrin and HCN.

7761. FIGEN, MILTON. **Dehumidifiers in permanent wave pad manufacturing.** *Heating & Ventilating*, 39, 35-36, (March) (1942).

The heating pad consisted of a powdered chemical compd. which generated heat on addition of water. Humidities of less than 30% were maintained in the manufacture of the chemical by a silica gel dehumidifying unit. Air from the silica gel averaged between 95° and 100°F and was cooled by water coils cooled with well water.

7762. HARMS, ARTHUR G. **Constant humidity in grinding and packing dehydrated foods.** *Heating & Ventilating*, 39, 76, (January) (1942).

A Bryant silica gel dehumidifier (automatically controlled) was used to maintain 24% relative humidity in grinding and packing operations.

7763. LEDOUX, EDWARD. **Humidity control in underground bombproof spaces.** *Heating, Piping, and Air Conditioning* 14 (No. 1) 6-8 (1942).

Adsorption processes appeared to be the only system which produced a low enough dew point. If the net heat of adsorption was dissipated outside the spaces, dehumidification was ''adiabatic''. The wall evaporation should be used to the full limit of availability.

7764. MEEK, GEORGE W. **Conservation in heating and air conditioning work.** *Heating, Piping and Air Conditioning* 14, 463-66 (August 1942).

The ventilation requirements per person were reviewed. An odor adsorbing unit may be required when the indicated sizable savings were put into practice.

7765. WHITE, D. E. **Chemistry of gas warfare.** *Australian Chem. Inst., J. & Proc.* 9, 143-50 (1942).—*C.A.* 37, 4821^5.

7766. HOWELL, A. K. **Benzole recovery by active carbon.** *Gas J. (London)* 242, 337 (Sept. 15 1943).

The automatic plant at the Manchester Gas Department consisted of four adsorbing vessels. All the benzole and some 60-70% of the S-compds. in the gas were adsorbed. The steam for removing the benzole was introduced countercurrent to the gas flow. The cooling or drying process was accomplished by re-circulating stripped coal gas through an indirect steam heater and then to the adsorbing chamber. The carbon must be dried and cooled before it efficiently adsorbed more benzole.

7767. LEAKE, CHAUNCEY D. AND MARSH, DAVID F. **Action of war gases.** *J. Chem. Education* 20, 339-43, 357 (1943).—*C.A.* 37, 4821^6.

7768. LEDOUX, EDWARD. **Determining the coefficient of evaporation of humidifiers.** *Chem. Met. Eng.* 50 (No. 6) 124-6 (1943).

The general formula was derived for the coefficient of evapn. for broken solids such as a coke-packed tower wetted without excess. The units were in lb/sec and ft^3 of packing per lb absolute humidity difference.

7769. LEDOUX, EDWARD. **Humidity control in underground bombproof spaces.** *Heating, Piping and Air Conditioning* 15, (No. 1) 34-6 (1943); 14 (No. 6) 364-66(1942).

The evapn. of water from walls in underground chambers was discussed. This source of humidity was usually underestimated due to the dry appearance of the walls.

7770. MOFFETT, T. F. J. **Solvent recovery in a rotogravure printing plant.** *Heating & Ventilating* 40, 33-6(April) 1943.

A Columbia activated carbon unit was described which recovered over 300,000 gallons annually of ink-solvent. The solvent was recovered from the exhaust air withdrawn over the presses by adsorption on coconut shell charcoal. The adsorbed solvent was then steamed out of the charcoal. The mechanical problems of the installation were discussed.

7771. SCHRENK, H. H. AND PEARCE, S. J. **Selection, use and maintenance of respiratory protective devices.** *U. S. Bur. Mines, Circ.* 7236, 12pp. (1943).—*C.A.* 37, 4821^7.

7772. SMOCK, R. M. **The influence of stored apples on the ripening of other apples stored with them.** *New York Agr. Expt. Station Cornell Bull.* 799, 1-36, (1943).

A number of absorbents and adsorbents were tested in trying to "air condition" the storage atmosphere to remove the stimulatory emanations. Among the ineffective absorbents and adsorbents were activated lignite charcoal, H_2SO_4, activated H_2SO_4, sodium bisulfite, certain oils, and water. The only really effective adsorbent was Br_2 adsorbed on the surface of activated charcoal.

7773. ZIEL, HERBERT E. AND SLEIK, HENRY. **The economic factors in converting recirculated air for ventilation.** *Heating, Piping and Air Conditioning* 15, 367-72 (1943).

Adsorption on activated charcoal supplemented by adequate filtration of particulate substance and, where warranted, bacteria control, will requalify vitiated room air for re-use as a ventilation medium. The overall average adsorption efficiency of nut charcoal when employed to treat recirculated air was found to be not less than 95% up to the point where the carbon's saturation did not exceed 15% by wt, independent of moisture. Also, with the low concn. encountered, a satn. of 15% represented an exposure of from six months to two years depending upon the nature and condition of service.

7774. CHAPUIS, ALBERT. **Use of adsorption for solvent recovery.** *Chimie & industrie* 52, 52-63 (1944); *Crops gras, savons* 2, 79-80 (1944). —*C.A.* 40, 2701^1, 5548^1.

The properties and the manufacture of activated charcoal were described. The adsorption properties of activated charcoal in the recovery of solvents were reviewed with a few practical examples.

7775. WALKER, C. R.; APPLEBEE, H. C., AND HOWELL, A. K. **Benzene recovery by activated charcoal.** *Gas J.* 243, 310-346, 379 (1944).— *C.A.* 38, 2469^8.

A benzene-recovery plant in Manchester used activated charcoal in 4 adsorbers, each holding approx. 1 ton of 12- to 20- mesh charcoal. Adsorption cycle was about 60 min., steaming, 30 min., and drying, 30 min. The life of the first batch of charcoal was 7 months, it was then sent away for reactivation. The loss during the adsorption period was negligible. The S content of the light oil was between 1.2 and 1.4% by wt, 0.9 to 1% was CS_2, the balance thiophene and other compds. When the charcoal was fresh, the S in the gas was reduced approx. 64%. With increase in age the efficiency of removal dropped to as low as 40%.

7776. ALEKSEEVSKIĬ, E. V. AND VANYUSHINA, Z. S. **Recovery of vapors of volatile solvents on solid sorbents. X. Temperature and kinetic changes in charcoal charge during sorption of water vapor.** *J. Applied Chem. (U.S.S.R.)* 18, 377-80 (1945)(English summary).—*C.A.* 40, 4581^6.

During sorption of water vapor by charcoal AP at 100-3°C a temp. rise of the charcoal mass was observed to 124°C. The amt. of H_2O adsorbed varied from a max. in the leading layer and dropping to a min. in the rear section. The amt. of H_2O adsorbed by the charcoal was less than that obtained under otherwise analogous conditions.

7777. DERINGER, H. **Benzene recovery from city gas. Process Sulzer Brothers, Winterthur. Studies on activated carbon.** *Schweiz. Ver. Gas-Wasserfach Monatsbull.* 25, 261-72 (1945). —*C.A.* 40, 7569^9.

The process was characterized by desorption with cycling inert gas rather than steam, the gas being heated prior to contact with the charcoal, cooled for recovery of benzene. The temp. of the inert gas entering the adsorber was 150°C. The adsorber was preceded in the gas stream with a surface-active filter to remove gum. Advantages of this system over the steam desorption were outlined. Data were given on the life of various types of charcoal.

7778. ZHUKHOVITSKIĬ, A.A.; ZABEZHINSKIĬ, YA. L., AND TIKHONOV, A.N. **Occlusion of gas from an air current by a bed of grains.** *J. Phys. Chem. (U.S.S.R.)* 19, 253-61 (1945); *Acta Physicochim. U.R.S.S.* 21, 345-57 (1946).—*C.A.* 40, 510^9, 1715^5, 6316^3.

The rate of adsorption of a gas much dild. with air was detd. The diffusion within the grains took place in the adsorption layer and was rapid. The rate was proportional to $(c-y)$, c being the av. gas concn. in the given layer of the adsorbent bed and y the concn. in equil. with the amt. adsorbed at a given moment. If the service time was known for definite bed length, grain size, gas concn., and speed of air flow, the equation permitted calcn. of the service time for another set of conditions.

7779. DIJK, J.A. VAN. **Final purification of city gas by benzene recovery.** *Het Gas* 66, 26-32 (1946).—*C.A.* 40, 4868^6.

The economics of benzene recovery from city gas were discussed at some length. Activated charcoal extn. was preferred for auxiliary removal of other gas impurities.

7780. DOWDING, GUY F. AND WARD, STANLEY G. **Modern practice in activated-carbon solvent-recovery plants.** *Eng. J. (Can.)* 29, 719-21 (1946).—*C.A.* 41, 3667^d.

Activated-charcoal plants for recovering solvents were employed in British plants dealing with the manuf. of rubber goods, leather cloth, rubber or balata belting, transparent paper, rayon, films, cables, edible oil, dry cleaning, etc. The C_6H_6-recovery plants in the gas industry were a most valuable source of C_6H_6 and resulted in complete extn. of naphthalene and a considerable reduction of org. S compds. in the treated gas.

7781. DUBININ, M.M. **N. D. Zelinskii, creator of the charcoal gas mask.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* 1946, 345-50 (in Russian)

Zelinskii's contributions to the production of gas masks in Russia during World War I were reviewed.

7782. KLOTZ, IRVING M. **The adsorption wave.** **Chem. Rev.** 39, 241-68 (1946).—*C.A.* 41, 234^e.

The nature of the steps involved in the removal of a toxic gas from air by a granular adsorbent were stated. Where the rate-controlling process was a single one of these steps, it was possible, within recognized restrictions, to develop a complete analytical expression for the adsorption wave. Where 2 steps contributed to the rate of removal, a complete theory was still lacking.

7783. Sillén, Lars Gunnar. **Filtration through a sorbent layer. I. An attempt at a simple mathematical treatment.** *Arkiv. Kemi, Mineral Geol.* **A22**, No. 15, 22 pp. (1946) (in English).—*C.A.* 41, 4682*c*.

Equations were derived for ion exchange, chromatography, and adsorption processes in which a small amt. of a component *A* was removed from a gaseous or liquid mixt. by passing the mixt. through a granular sorbent. The equation for a gas-mask sorbent was: $t_r=B/c_0v_0(V-V_d)$ in which $V_d=Kv_0\log c_0/c_r$. The time of resistance, t_r, was the time in min. required for the poison *A* in the outflowing gas to reach a certain concn. c_r, when the air contg. *A* in concn. c_0 (mg per liter) was passed through the sorbent at velocity v_0 (liter per min.). V_d was the dead vol., *B* the capacity of the sorbent for *A* in mg/cc.

7784. Sleik, Henry. **Scientific air recovery. Purification by activated carbon recovers costly conditioned air.** *Modern Power and Engineering* **40**, 59-62, 112, 114(1946).—*C.A.* **40**, 5168^9.

Active charcoal air filters in air-conditioning systems permitted the recirculation of a greater fraction of the conditioned air, thus economizing in power or fuel for heating or cooling, as well as removing objectionable odors. The active charcoal can be used in canisters or in panels or frames of conventional air filter size, contg. one or more rows of evenly spaced, perforated, tubes housed in a metal frame.

7785. Tartarini, G. **The recovery of volatile solvents in industry.** *Chimica e industria (Milan)* **28**, 117-22 (1946).—*C.A.* **41**, 1355*g*.

The various types of processes for the recovery of volatile solvents were summarized.

7786. Tikhonov, A.N.; Zhukhovitskii, A.A., and Zabezhinskii, Ya. L. **Adsorption of gas from an air current by a layer of granular material. II.** *J. Phys. Chem. (U.S.S.R.)* **20**, 1113-26 (1946) (in Russian); *Acta Physicochim. U.R.S.S.* **22**, 121-36 (1947) (in English).—*C.A.* **41**, 2958*e*, 6791*c*.

The math. theory was extended to systems in which the adsorption isotherm was concave toward the axis of pressure, such as the Langmuir isotherm.

7787. Yavorovskaya, S.F. **Comparative evaluation of solid and liquid mercury adsorbers (de-mercurizers).** *Gigiena i Sanit.* **11**, No. 6, 27-33 (1946).—*C.A.* **41**, 3233*d*.

Pumice, active carbon, silica gel, active MnO_2 (granules 2-4 mm in diam.) coated with a mixt. of $CuI + I_2$, and active iodized carbon were studied. De-mercurization proceeded according to $Hg + I_2 = HgI_2$ and $CuI + HgI_2 = [CuI\ HgI_2]$. Active MnO_2 was prepd. by pptg. MnO_2 on mixing solns. of $KMnO_4$ and $MnCl_2$, drying and granulating; traces of Cl remain adsorbed. The new sorbents were prepd. by mixing active carbon or silica gel with a satd. soln. of $CuSO_4$, letting stand for several hrs, decanting the soln., adding a satd. soln. of KI, letting stand for 2 hrs, decanting, and drying at 70-80°C.

7788. Amero, R.C.; Moore, J.W. and Capell, R.G. **Design and use of adsorptive drying units.** *Chem. Eng. Progress* 43, No. 7, *Trans. Am. Inst. Chem. Engrs.*, 349-70 (1947).—*C.A.* 41, 4972*i*.

Drying units employing granular desiccants were used on a wide varity of fluids. The effect of fluid temp., pressure, and compn. on desiccant performance was discussed. A discussion of regeneration procedures was included.

7789. Anon. **Solvent recovery with activated carbon.** *Chem. Eng.* 54, No. 1, 136-9(1947).—*C.A.* 41, 2181*d*.

7790. Deringer, H. **A steam-saving process for benzene extraction in gas-works and coke ovens supplying town gas and for solvent recovery by means of activated carbon.** *Trans. Fuel Economy Conf., World Power Conf., Sect.* A4, *Paper No.* 4, 7 pp. (1947).—*C.A.* 42, 739*c*.

The process used an inert gas, free or almost free from air, such as coal gas or internal-combustion engine exhaust gas, for removing the adsorbed vapors. Both the adsorber and the gas were heated by indirect steam during the recovery process. Steam requirements for this process averaged 2.2 kg per kg of light oil, even without recovery of the heat liberated by the light oil during condensation, about half of the steam requirements for the direct steam process.

7791. Gross, C.R.; Hall, G.O., and Smock, R.M. **Odor sources in egg storage and methods of removal.** *Food Inds.* **19**, 919-21, 1028, 1030. —*C.A.* **41**, 7556*d*.

Storage at very high humidity resulted in mold and bacterial growth on eggs which made them unmarketable. Treatment of eggs with mineral oil reduced the storage odor of eggs to some extent, but air purification with activated charcoal was most effective. Ozone did not remove volatile odors evolved by case materials but did control mold growth.

7792. Katz, S.H. **Status of the U.S. Army service gas masks.** *Chem. Corps J.* 2, 32-40(1947). —*C.A.* 42, 299*b*.

The service gas masks of the U.S. Army were briefly described and their characteristics given.

7793. Priestley, J.J. and Morris, H.G. **Organic sulfur compounds in town gas. Experimental plant for their removal.** *Gas World* **126**, 390-2 (1947).—*C.A.* **41**, 3278*a*.

The full-scale exptl. plant, erected at Mirfield, for removal of org. S from manufd. gas by use of a thiomolybdate catalyst was described.

7794. Trägårdh, Uno. **Recovery of solvents by adsorption.** *Tekn. Tids*, 77, 345-56 (1947).—*C.A.* **41**, 4338*b*.

Methods were reviewed.

7795. BENSON, R.E. AND COUROULEAU, P.H. **Activated carbon. Manufacture, capacity of adsorption, and use in solvent recovery. European practice.** *Chem. Eng.* **55**, No. 3, 112-15 (1948); *Chem. Eng. Progress* **44**, 459-68 (1948).—*C.A.* 42, 3932*c*, 5236*i*.

A general description was given. Factors were discussed involved in recovery of solvents in the printing industry, particularly in Europe and South America.

7796. GOSHORN, JOHN C. **Use of adsorbents for protection against ammonia.** *J. Ind. Hyg. Toxicol.* **30**, 201-4 (1948).—*C.A.* 42, 6022*i*.

A special gas mask was required for protection against high concns. of ammonia encountered in the operation of ice plants, in the handling of ammonia cylinders, and in miscellaneous chem. plants. The canister for the ammonia mask was filled with 1100 ml of an ammonia adsorbent. The most efficient adsorbents thus far developed are Kupramite, $CoCl_2.6H_2O$ impregnated pumice, silica gel, and pumice impregnated with 40-50% of acids such as oxalic or phosphoric. Charcoal impregnated with weak acids was the most promising adsorbent.

7797. GUYE, F. **Desirable desiccant properties for refrigerant water removal.** *Refrig. Eng.* **54**, 550-3, 584-5 (1947).—*C.A.* 44, 2805*g*.

The desiccant must be able to remove water from the refrigeration system efficiently, be physically strong, nondeliquescent, and chemically inert. Several materials meeting these requirements in varying degrees were commercially available: silica gels, activated Al_2O_3 and $CaSO_4$.

7798. KATZ, SIDNEY H. AND MACRAE, DUNCAN. **Filtration of aerosols by granular charcoal.** *J. Phys. & Colloid Chem.* **52**, 695-7(1948).—*C.A.* 42, 3876*f*.

The adsorption of vapors by gas-mask charcoal was known to be characterized by a const. that was proportional to the 0.41 power of the product of the particle diam., mass rate of flow, and fluidity of the vapor. Data for the adsorption of a dioctyl phthalate aerosol with particle diam. of 0.3μ gave a similar const. proportional to the 0.41 power of the same product. The agreement indicated that granular charcoal filtered aerosol particles and vapor mols. by much the same mechanism, even though the diffusion const. involved differed by a factor of 100,000.

7799. LEDOUX, EDWARD. **Avoiding destructive velocity through adsorbent beds.** *Chem. Eng.* **55**, No. 3, 118-19 (1948).—*C.A.* 42, 3221*i*.

A dimensionless expression was derived for the max. safe mass velocity of the gas, G, which would not cause motion of the adsorbent bed, with attendant reduction in size due to abrasion. The equation was: $G^2=0.0167\ Dgd_gd_a$, where D was diam. of av. particle, g acceleration of gravity, d_g d. of the gas, and d_a apparent d. of the adsorbent bed. The const., 0.0167, was detd. from industrial experience.

7800. LEDOUX, EDWARD. **Vacuum concentration by adsorption.** *Chem. Eng.* **55**, No. 7, 102-4(1948).—*C.A.* 42, 6587*h*.

Replacing condenser with an adsorber permitted operation of vacuum at lower temp. using the same power.

7801. MUNKELT, F.H. **Air purification and deodorization by use of activated carbon.** *Refrig. Eng.* **56**, 222(1948).—*C.A.* 44, 4609*i*.

7802. OTHMER, DONALD F. AND JOSEFOWITZ, SAMUEL. **Correlating adsorption data.** *Ind. Eng. Chem.* **40**, 723-5 (1948).—*C.A.* 42, 4422*d*.

A method was developed to allow the detn. of adsorption (accurately enough for engineering calcn.) over a full range of temp. and pressures from exptl. data at one temp. and from the vapor pressure of the adsorbate. When ln (P_o/P) was plotted against $1/T$, the slope of the line equaled $\Delta F/R$. The change in free energy was const. for a moderate range below the crit. temp. The use of the equation was tested for the adsorption of acetone on charcoal.

7803. PADOVANI, C.; BUTTAZZONI, A., AND LOTTERI, A. **Extreme desulfurization of illuminating gas.** *Riv. combustibili* **2**, 13-22 (1948).—*C.A.* 43, 3172*i*.

Finely divided Ni, Fe, Cu, Sn, Pb, Bi, Fe, Cu, and especially Ni were very active desulfurizers; the activity reached a max. after an initiation period in which only partial desulfurization was observed. The activity reached finally an equil. value with a residual S of 4-5 g per 100 m^3. The catalysts were regenerated to max. activity by air or steam. Best results were obtained at 450°C and 4.5 sec contact time. Excellent results were obtained with Cu, Ni, or Co oxides. Desulfurization on active carbon was unsatisfactory. On reduction over Ni and adsorption on active carbon the residual S content was 1.1 g per 100 m^3.

7804. SMOCK, R.M. AND SOUTHWICK, F.W. **Air purification in apple storage.** *Agr. Expt. Sta. Bull.* **843**, 3-51(1948).—*C.A.* 43, 3537*d*.

Activated coconut shell charcoal removed scald gases when a single variety was in the room. When several varieties were present, reduction, but not control in all cases, was observed. Air purification gave about the same reduction with mixed varieties as did the use of shredded oiled paper. Air purification added about 3 weeks to the storage life of the apples.

7805. VYLOMOV, V.S. **Carbon monoxide indicator.** *Zavodskaya Lab.* **14**, 1134-5(1948).—*C.A.* 43, 4596*f*.

Pump the sample of air successively through activated charcoal (to take up heavier hydrocarbons, etc.), then silica gel or alumina gel (to take up moisture), into a chamber with hopcalite-silica gel mixt. A thermocouple was introduced for measuring the heat effect. The exit gas was passed through a meter for measurement. The app. was portable and weighed 5 lbs.

7806. WELLS, GEORGE C. **The importance of controlled humidity in long time preservation.** *Corrosion and Material Protec.* **5**, No. 5, 4-9 (1948).—*C.A.* 43, 96*c*.

The dehumidifiers employed solid desiccants and elec. energy used for reactivating the satd.

beds. Appropriate thin-film rust preventative compds. were applied to the interior working surfaces of the machinery. As humidity was increased to approximately 60% relative, there was but small increase in the tendency toward deterioration by corrosion. There was, however, a more definite increase in the tendency of mildew and mold to form on animal and vegetable materials. The general appearance of a ship laid up in accordance with the principles herein presented was impressively excellent.

7807. AMSTUZ, JOHN O. **Solvent-vapor control.** *Mech. Eng.* 71, No. 2, 143-7, 149(1949).—*C.A.* 43, 2342*e*.

A procedure was given for lab. detn. of the rate of solvent evapn. for a given process; data obtained in this way were used to calc. the amt. of solvent evapd. per hr. Sufficient air should be introduced for ventilation so that the solvent concn. never exceeds 40% of the lower explosive limit.

7808. BARTOL, J.H. **Clear the air with activated carbon.** *Safety Eng.* 98, No. 4, 84-6(1949).—*C.A.* 44, 8573*i*.

An air-purification canister contg. activated charcoal was described and a wide range of uses listed. In a Chicago meat-packing plant 450 charcoal-filled canisters filtering 13,000 ft^3 of air/min. removed 150 lb of noxious gases in 18 months.

7809. CROUZET, J. **An evaluation of purifying materials.** *Compt. rend. congr. ind. gaz, Lyon* 66, 508-28(1949).—*C.A.* 46, 6808*h*.

A comparison was made of various Fe oxide mixts., both naturally occurring and prepd. experimentally as to their ability to absorb H_2S from coke gas. The absorption capacity speed of absorption, sensitivity to humidity and temp., ease of regeneration, and loss of charge were investigated. The absorption tests were performed with a column 10 cm high and 29 mm wide through which a pure, deoxygenated coke gas contg. 10 g H_2S/m^3 was charged at 5 mm/sec.

7810. PRING, R.T.; KNUDSEN, J.F., AND DENNIS, RICHARD. **Design of exhaust ventilation for solid materials handling—fundamental considerations.** *Ind. Eng. Chem.* 41, 2442-50(1949). —*C.A.* 44, 1761*i*.

In order to reduce dust abrasion and to avoid loss of and inconvenience to recovering the product removed, the amt. of material carried into the exhaust ducts must be minimized. To permit the settling out of coarser particles, the vol. of effluent air must also be kept at a min. by restricting the ingress of air. Exhaust connections must be so located as to remove the contaminated air near its point of dislodgement from the solids.

7811. BARTOL, J.H. **Planning for deodorizing equipment.** *Eng. News-Record* 144, No. 24, 35-6 (1950).—*C.A.* 44, 8172*b*.

Recirculation of air, conditioned in regard to temp. and humidity, through activated charcoal to remove odors resulted in considerable savings in refrigeration and heating costs. A hypothetical example showed a reduction in capital cost from $950 to $178 and in yearly operating costs from $169 to $33 for a system supplying 1000 ft^3 air per min. When the adsorbed impurities are 20% of the wt of the charcoal the latter was reactivated.

7812. DZHIGIT, O.M.; KISELEV, A.V., AND KRASIL'NIKOV, K.G. **Effect of the structure of the silica gel on the velocity of the sorption of calcium hydroxide from aqueous solutions.** *Doklady Akad. Nauk S.S.S.R.* 71, 77-9(1950).—*C.A.* 44, 5180*i*.

The amts. of $Ca(OH)_2$ sorbed from a clear aq. soln. in a stated time (1 hr to 30 days), were plotted against the concn. after sorption. The isotherms were substantially different for a coarsely-porous silica gel, characterized by marked capillary condensation and considerable hysteresis in the sorption of C_5H_{12} vapor at 20°C, and a finely-porous silica gel showing no capillary condensation under the same conditions. Sorption of $Ca(OH)_2$ was detd. with fractions of the silica gels remaining after sifting with 10,000 mesh/cm^2, and heated 4 hrs at 350°C. The coarse-pore gel permitted ready diffusion of $Ca(OH)_2$, and the Ca silicate formed did not prevent its access to the surface of yet unreacted SiO_2.

7813. FIELDER, H.J. **Benzene recovery by active carbon.** *Gas Times* 62, No. 704, 185-6, 191, 194, 197; *Gas World* 131, 270-1, 276 (1950).—*C.A.* 44, 4654*a*.

The plant consisted of 4 charcoal adsorbers, arranged in two units, each unit with an automatic controller; each unit was operated independently, with a capacity of 3 million ft^3 per day. Two adsorbers adsorbed while one was steamed and the other dried. Each adsorber was a cylindrical vessel, 8 ft 6 in. high and 5 ft diam. The adsorption period varied from 80 min. with new charcoal to 30 min. just before changing. Steaming for recovery was countercurrent to the direction of gas passage for adsorption. The adsorptive capacity of a charcoal was tested with CCl_4, as the break point was easier to det.

7814. KATZ, S.H. **Filtration law for aerosols.** *Armed Forces Chem. J.* 3, No. 7, 14-16(1950). —*C.A.* 44, 3333*d*.

The math. expressions of several investigators were equiv., the simplest form being $Q = q^b$. Data obtained by visually estg. light scattered from smoke-penetrating filters deviated more from the filtration law than data obtained from photoelec. measurements. The better agreement between such measurements and the filtration law was attributed to the greater sensitivity of the photoelec. cell.

7815. SHAW, FRED B. JR. **Packing incendiary bomb clusters. A container problem.** *Armed Forces Chem. J.* 3, No. 8, 20-1, 40(1950).—*C.A.* 44, 5038*h*.

The use of a moisture-proof drum and silica gel dehydrating agent materially reduced the moisture deterioration of Mg and incendiary-oil bombs.

7816. ANON. **Activated carbon in solvent recovery.** *Can. Chem. Process Inds.* 35, 376-7, 411 (1951). —*C.A.* 45, 6321*e*.

A solvent-recovery plant used activated charcoal as adsorbent and resulted in the collection of about 1,000 lb of gasoline per hr from the air, and delivered it ready for use. Ninety-nine % gasoline was recovered.

7817. AUDAS, F.G. **A continuous dry process for the removal of hydrogen sulfide from industrial gases.** *Coke and Gas* 13, 229-34(1951).—*C.A.* 46, 11638*i*.

According to the following reaction: $2H_2S + SO_2 \rightleftharpoons 2H_2O + 3S$, H_2S was removed by adding SO_2 in small excess of the above reaction and passing the mixt. through a bed of alumina at 60-90°C at such a rate that it emerged from the chamber contg. the bed completely free of H_2S. The spent alumina was continuously withdrawn from the bottom of the reaction chamber for regenerative treatment, while regenerated material was continuously added at the top. Regeneration of spent alumina consisted of heating at 500°C by passing hot gases through the bed of alumina in the regenerating vessel.

7818. DAVANZO, P. **Dehydration of natural gas.** *Riv. combustibili* 5, 5-41(1951).—*C.A.* 45, 6821*h*.

Dehydration of natural gas by solid (Al_2O_3, SiO_2) and liquid adsorbents (concd. solns. of diethylene and triethylene glycol) necessary for economical pipeline operation were reviewed. Flow diagrams and operational characteristics of dehydrating plants were reported.

7819. HENDRY, R. **The control of the moisture content of air.** *Proc. Inst. Refrig.* (London) 48, 82-8(1951-52).—*C.A.* 47, 6193*c*.

Where the humidity was too low, it was recommended that a portion of the room air be passed through a heater and an adiabatic humidifier. If the humidity was too high, it could be reduced by wet cooling coils, absorption in $CaCl_2$ soln., or adsorption on silica gel or activated alumina.

7820. HORMATS, SAUL. **Charcoal for military respirators.** *Armed Forces Chem. J.* 5, No. 1, 34-6(1951).—*C.A.*, 45, 10437*b*.

Activation by $ZnCl_2$, K_2S, KCNS, and various gases was discussed and charcoal impregnation methods described.

7821. JESSOP, STUART M. **Dry fibrous filters.** *Armed Forces Chem. J.* 5, No. 1, 45(1951).—*C.A.* 45, 9921*i*.

Filters developed by the Chem. Corps for removing dust, toxic smokes, bacteria, spores, and radioactive particulates were described.

7822. PALTRIDGE, R.M. **Possible improvements in oxide purification practice.** *Natl. Gas Bull.* (Australia) 15, 5-9(Nov.-Dec., 1951).—*C.A.* 46, 7736*b*.

Boxes should be filled with an Fe_2O_3-sawdust mixt. of min. bulk d. and the moisture content adjusted to 15-20% by means of wetting agents, and kept as const. as possible by humidity control of the inlet gas and by water sprays *in situ* if necessary. The O_2 content of the inlet gas should be low and a backward rotation of boxes with second-box air admission used. Pelleted oxides were favored for high throughputs where back pressure rather than fouling causes purifier failure.

7823. SCHULTZ, ROBERT F. **Air-pollution-abatement activities.** *Proc. Air Pollution Smoke Prévention Assoc. Am.* 44, 107-10(1951).—*C.A.* 46, 5820*f*.

Fly-ash evolution from the boiler house was controlled by the installation of Aerotec collectors. The atm. in the sewer was tested by drawing samples through active charcoal or a cold trap. The liquid recovered contained large amts. of aromatic and chlorinated hydrocarbons, as well as some very odoriferous aliphatic high-boiling material contg. no Cl, and some aliphatic low-boiling compds.

7824. FAY, J.W.J. **Safe disposal of contaminated extract air from radioactive laboratories.** *Atomics* 3, 143-8(1952).—*C.A.* 46, 8532*b*.

As little as 1-10 p.p.m. of the total activity handled became airborne. Inhibition could be effected by the use of coarse filters and long air stacks. A filter which removed particles to 10μ normally will be sufficient to prevent deposition hazards. The dominant factor thus became the regulation of release of non-settling activity so as to not give rise to a breathing hazard, e.g., emission of not more than 50 mc. of Sr^{90} per day, or the equiv., from a 25-m stack. In the case of 0.5 mc. Pu^{239} the same stack could be used.

7825. FÖRCH, J.H. **Extracted blue earth as a filling for gas purifiers.** *Chem. Weekblad* 48, 88-90(1952).—*C.A.* 46, 6363*i*.

Extd. blue earth was made from exhausted Fe oxide used in the purification of coke-oven gas. Water treatment removed sol. thiocyanides, thiosulfates, and sulfites. After conversion with CaO and extn. of the $Ca_2Fe(CN)_6$ with water, the resulting $Fe(OH)_3$ was well suited for the absorption of H_2S.

7826. RATHMELL, B.L. AND BATEMAN, P.J. **Air drying by solid granular adsorbents.** *J. Inst. Heating Ventilating Engrs.* 19, 471-505, discussions 505-23(1952).—*C.A.* 46, 10704*g*.

Large com. driers with silica gel and activated alumina were described.

7827. THOMPSON, R.J.S. **Continental practice in the treatment of coal gas.** *Gas World* 135, No. 3529 Coking Sect., 37-41(1952).—*C.A.* 46, 5292*d*.

An account of Continental practice, largely German, including tar decantation under pressure, horizontal-tube primary coolers, centrifugal exhausters, and removal of H_2S from the gas. Dry purification was used for removing H_2S from the largest proportion of the gas.

7828. TURK, AMOS; SLEIK, HENRY, AND MESSER, PHILIP J. **Determination of gaseous air pollution by carbon adsorption.** *Am. Ind. Hyg. Assoc. Quart.* 13, 23-8(1952).—*C.A.* 46, 4709*f*.

A dual perforated, blower-canister unit, charged with activated charcoal of 6-14-mesh particle size with hardness of 80 and apparent d. of 0.42 g/ml, operated at a rate of 40 ft^3/min. could be used to sample gaseous atm. contaminants.

The concns. of single compds. could be calcd. from a detn. of the wt increased. Adsorbed material could be removed with steam for analysis of mixts. of compds. collected.

7829. GALLILY, I. **The adsorption of active gases from streaming air.** *Bull. Research Council Israel* 3, No. 1/2, 56-66 (1953).—*C.A.* 48, 5594^g.

The efficiency of adsorption of noxious gases (Cl_2) streaming through a bed of activated charcoal was tested under the special conditions of gas mask. Part of the mixt. of air + Cl was passed (at predetd. times) through appropriate absorption bottles where the Cl was bubbled through an aq. soln. of $Na_2S_2O_3$ + KI + starch.

V-7. Biochemical, Medical, and Pharmaceutical Applications

7830. BRUNNER, OTTO; BARONI, EUGEN, AND KLEINAU, WOLRAD. **Visual purple.** *Z. physiol. Chem.* 236, 257-62(1935).—*C.A.* 30, 117^3.

Freshly dissected retinas from the eyes of steers and pigs were extd. with abs. MeOH while carefully excluding air, the ext. was treated with an equal vol. of benzine and the soln. sepd. into 2 layers by addn. of H_2O. The benzine soln. of the pigment was adsorbed on Al_2O_3 and the pigment identified as β-carotene. The color change during adsorption and the light sensitivity of the adsorbate suggested the desirability of a comparison with visual purple.

7831. INGRAHAM, MARY A. AND STEENBOCK, HARRY. **The relation of microorganisms to carotenoids and vitamin A. II. The production of carotenoids by Mycobacterium phlei.** *Biochem. J.* 29, 2553-62(1935).—*C.A.* 30, 3461^2.

Chromatographic sepn. of the pigment in MgO gave at least a dozen bands. Kryptoxanthin, α- and B-carotene were identified and the presence of esters of lutein, zeaxanthin and azafrin was established.

7832. KARRER, P. AND SOLMSSEN, U. **Carotenoids of purple bacteria. I.** *Helv. Chim. Acta.* 18, 1306-15(1935).—*C.A.* 30, 1830^1.

The purple bacteria contained an entire series of previously unknown carotenoids which was sepd. into its components by chromatogrammatic analysis. The alc.-washed bacterial mass was extd. with CS_2 and the deep-red ext. was concd. and taken up in a ligroin-MeOH mixt. The insol. violet residue was crystd. from benzene and yielded 20 mg of glittering violet crystals of a new carotenoid, rhodoviolascin.

7833. WALDENSTROM, JAN. **An investigation of urinary pigments, especially the porphyrins by means of chromatographic analysis.** *Deut. Arch. klin. Med.* 178, 38-48 (1935).—*C.A.* 30, 8276^8.

The dark-red urine of a patient with acute porphyria was acidified with HOAc and extd. with ether. The brown ppt. was removed by filtration, and the urine filtered through a column of Al_2O_3 or talc. The first 10-20 ml came through colorless; the rest had the color of normal urine. The pigments were fractionally removed from the filter column by washing it first with 20% HOAc and then with 12% NH_3; the sepn. formed different colored zones.

7834. ACKERMANN, D. AND FUCHS, H.G. **Adsorption of nitrogeneous substances from aqueous solutions.** *Z. physiol. Chem.* 240, 198(1936).—*C.A.* 30, 5093^2.

Lloyd's reagent adsorbed nitrogenous substances from solns. contg. 5% H_2SO_4, thereby affording a sepn. about as effective as pptn. by phosphotungstic acid. The advantage of this reagent was its cheapness, especially if large quantities were to be used.

7835. BECKER, ERICH AND SCHOPF, CLEMENS. **Microchemical tests for pterins in insects.** *Ann.* 524, 124-44 (1936).—*C.A.* 30, 8166^5.

Xanthopterin was characterized by its adsorption behavior from 0.01% MeOH-HCl and aq. 0.004 *N* HCl on Al_2O_3 (a special microadsorption tube was described); this may be used as a semiquant. method. A further test was its behavior toward 20% H_2SO_4, in which it showed a slight but pos. red fluorescence. Differentiation from lactoflavin was also discussed. Erythropterin may be detected by adsorption from 0.004 *N* aq. HCl soln. (better than MeOH-HCl solns.)

7836. BROCKMANN, HANS. **The isolation of antirachitic vitamin from tuna fish liver oil.** *Z. physiol. Chem.* 241, 104-15(1936).—*C.A.* 30, 6423^1.

Vitamin D was obtained in concd. form from tuna-fish livers by 2 partitions between MeOH (90%, then 95%) and benzine, followed by adsorption on $Al(OH)_3$ in the presence of Indicator Red 33 which had the same adsorption properties as the vitamin and served as a marker in the chromatogram. Adsorption on $Al(OH)_3$ in the presence of Indicator Red, whereby a sharply defined colored zone was obtained, concentrated the vitamin D to a content of 25-30%.

7837. BROCKMANN, HANS AND HAASE, RUDOLF. **Dracorubin, the red pigment of "dragon's blood." I.** *Ber.* 69B, 1950-4 (1936).—*C.A.* 30, 6751^1.

Merck's pulverized Indian dragon's blood was first freed from insol. black-brown constituents by extn. with hot benzene. The deep yellow benzene soln. showed 3 absorption bands, by means of which the concn. of the pigment could be followed. The isolation of dracorubin was effected by chromatography. The greater part of it was adsorbed from benzene soln. in the upper section of the column, from which it was recovered as a violet-red powder. The bright red soln. of this crude product in $CHCl_3$ was further purified by another filtration through Al_2O_3.

7838. Dam, Henrik and Schonheyder, Fritz. **The occurrence and chemical nature of vitamin K.** *Biochem. J.* **30**, 897-901 (1936).—*C.A.* **30**, 5633^9.

A series of vegetables and animal tissues was tested quant. for vitamin K. Green vegetables were particularly good sources. The vitamin was concd. by removal of inactive materials from a light-petroleum ext. with 90% MeOH. By adsorption on $CaCO_3$ or sucrose, the vitamin was obtained in concns. up to 600,000 - 1,000,000 units per g.

7839. Daniel, E.V. and Beres, T. **Lipochrome in human blood serum.** *Z. physiol. Chem.* **238**, 160-2(1936).—*C.A.* **30**, 2210^2.

Chromatographic adsorption of the *epiphasic lipochrome* from 3 liters of serum on $Ca(OH)_2$ gave 4 bands, yellowish brown, rose, bright yellow and orange-yellow, resp. Since blood serum contained lycopene and other pigments, the colorimetric detn. of carotene was likely to give high values unless a chromatographic sepn. was performed.

7840. Euler, Hans v. and Malmberg, Maj. **Vitamins and catalysts in wheat embryo.** *Arkiv Kemi, Mineral. Geol.* **12B**, No. 14, 6 pp. (1936). —*C.A.* **30**, 3860^2.

Daily addns. of 1 g of embryo gave 1.8 g daily wt increase and the feeding of 0.5 g produced a definite growth. Chromatographic analysis and Lovibond detns. showed the presence of 5γ of carotenoid per g of embryo contg. scarcely more than 0.05γ of carotene, a quantity that is too small to account for the growth observed.

7841. Greene, R.D. and Black, A. **Extraction of vitamin B_1 from adsorbates.** *Science* **84**, 185-6 (1936).—*C.A.* **31**, 5827^1.

The best yields (not less than 90%) of vitamin from the adsorbate obtained in Seidell's method occurred when aq., aq.- EtOH or EtOH solns. of acid salts of C_5H_5N, quinoline, NH_2Ph, etc., were used as extractants. The salt solns. had an effect greater than that of acid or base alone.

7842. Heilbron, I.M. and Lythgoe, B. **Chemistry of the algae. II. The carotenoid pigments of Oscillatoria rubrescens.** *J. Chem. Soc.* **1936**, 1376-80.—*C.A.* **30**, 8230^2.

A convenient source of Myxoxanthin was the freshwater species *Oscillatoria* rubrescens. The epiphasic (petr. ether) carotenoids, on chromatographic analysis gave 3 pigmented zones, from the lowest of which β-carotene was isolated. The deep red zone on Al_2O_3 was changed to violet by washing with C_6H_6; color reactions were given.

7843. Koschara, W. **Isolation of a yellow pigment (uropterin) from human urine.** *Z. physiol. Chem.* **240**, 127-51 (1936).—*C.A.* **30**, 4878^6.

The urine was acidified and treated with Fuller's earth which adsorbed the greater part of the purines. Elution with 20% pyridine and evapn. of the eluate gave a brownish red ppt. of "purine fraction" which served as the starting material for the isolation of pigment. The isolation was effected by extn. with *N* NaOH, acidifying with HCl to ppt. uric acid, adsorption on Fuller's earth and elution with pyridine, pptn. with $AgNO_3 + NH_4OH$, then with $AgNO_3$, extn. with *N* HCl, adsorption and elution as before, evapn. of the pyridine, dissolving in phosphate buffer of pH 7.6, and chromatographic adsorption on frankonite KL.

7844. Lederer, E. and Moore, T. **Echinenone as a provitamin A.** *Nature* **137**, 996(1936).—*C.A.* **30**, 6042^1.

Echinenone, a pigment isolated from the sex glands of the sea urchin, was probably a monoketone occupying an intermediate position between β-carotene and semi-β-carotene. After preliminary sepn. from carotene by adsorption on Al_2O_3 and further purification, it was examd. for biol. activity as a provitamin A.

7845. Strain, Harold H. **Leaf xanthophylls.** *Science* **83**, 241-2 (1936).—*C.A.* **30**, 3026^2.

A mixt. of xanthophylls in aq. alc. was sepd. on Tswett columns.

7846. Willstaedt, Harry. **The pigments of the true orange agaric** *(Lactarius deliciosus L.).* **II.** *Ber.* **69B**, 997-1001 (1936).—*C.A.* **30**, 4852^3.

The blue pigment found in the fungus, along with the red-violet lactaro-violin, was prepd. in larger quantities but all attempts to make it crystallize failed. *Lactarius azulene* with some other natural *azulene*, and a soln. of the *camomile azulene (Chamazulene)* was prepd. by chromatography on Al_2O_3 of a petr. ether soln. of camomile oil. A mixt. of the 2 azulenes could not be sepd. in the Al_2O_3 chromatogram.

7847. Willstaedt, H. and Lindqvist, T. **The carotenoids of human serum and liver. I.** *Z. physiol. Chem.* **240**, 10-18(1936).—*C.A.* **30**, 5279^3.

The carotenoids from large quantities of serum (140-250 cc.) in 12 cases, and those of the liver in 4 of these cases, were sepd. chromatographically. Detns. of the yellow pigments in serum did not disclose the actual quantity of β-carotene unless recourse was had to chromatography.

7848. Zechmeister, L. and Tuzson, P. **The lipochrome of the water frog** *(Rana esculenta).* *Z. physiol. Chem.* **238**, 197-203 (1936).—*C.A.* **30**, 2644^5.

Chromatographic studies were reported on the carotenoid mixts. present in the liver, skin, ovary and *corpus adiposum* of the frog. The liver contained β-carotene, lutein and zeaxanthin, the skin carotene and xanthophyll esters, the ovary carotene, lutein and zeaxanthin, and the fat body mainly xanthophyll esters.

7849. Zechmeister, L. and Tuzson, P. **Mandarin pigment. II.** *Z. physiol. Chem.* **240**, 191-4 (1936).—*C.A.* **30**, 5262^2.

Further examn. of mandarin peels by an improved technique confirmed the finding of carotene, but the chief pigment was cryptoxanthin, $C_{40}H_{56}O$. The latter was spectroscopically indistinguishable from the polyene hydrocarbon but was readily sepd. and obtained cryst. by means of the Tswett column.

7850. Euler, H.v. and Schlenk, F. **Cozymase.** *Z. physiol. Chem.* **246**, 64-82 (1937).—*C.A.* **31**, 4349^9.

A cozymase prepn. was further purified by chromatographic adsorption or by pptn. of further impurities by $Pb(OAc)_2$ followed by pptn. of the cozymase with alc. The material was pure white, completely sol. in H_2O, showed no green fluorescence in alk. soln. and no blue fluoresence in acid soln.

7851. FISCHER, HANS AND HOFMANN, HANS J. **Porphyrins. XLI. The constitution of uro- and mussel-shell porphyrins. Proof of uroporphyrin III in congential porphyrinuria.** *Z. physiol. Chem.* 246, 15-30(1937).—*C.A.* 31, 4334^8.
The uroporphyrin from a case (petry) of *congential porphyrinuria* was shown by chromatographic analysis and comparison of m.p. to be a mixt. of uroporphyrins I and III.

7852. GRUNDMANN, CHRISTOPH AND TAKEDA, YOSHIHARU. **A new bacterial carotenoid leprotine.** *Naturwissenschaften* 25, 27(1937).—*C.A.* 31, 3955^7.
Leprotine was prepd. from acid-fast bacteria found in infectious material of a lepra case. The bacteria in glycerol-bouillon culture, killed at 60°C for 10 min., washed and dried over P_2O_5, ground and extd. with acetone gave a pigment which was sepd. after sapon. with alc. KOH by chromatographic analysis in benzine with Al_2O_3. The eluate of the main purple zone gave from benzene-MeOH thin copper-red needles of a hydrocarbon m.p. 198-200°C.

7853. BINKLEY, S.B.; MACCORQUODALE, D.W.; THAYER, SIDNEY A., AND DOISY, E.A. **The isolation of vitamin K₁.** *J. Biol. Chem.* 130, 219-34(1939).—*C.A.* 33, 8718^4.
Vitamin K_1 was isolated from artificially dried alfalfa meal or leaf meal in practically pure form. Decalso, Permutit and Darco were used as adsorbents and crystn. at low temps. or distn. and crystn. gave the pure vitamin.

7854. FRACHE, G. **The chromatographic method and its application in legal medicine.** *Zacchia* 3, Ser. 2, 330-47 (1939).—*C.A.* 38, 699^6.
Chromatographic adsorption and techniques were discussed. The chromatographic method permitted identification of traces of blood, by microscopic examn. of the spectrum produced by the adsorbed hematochromogen.

7855. HENNESSY, DOUGLAS J. AND CERECEDO, LEOPOLD R. **Determination of free and phosphorylated thiamine by a modified thiochrome assay.** *J. Am. Chem. Soc.* 61, 179-83(1939).—*C.A.* 33, 2164^8.
Materials interfering in the thiochrome method for detg. vitamin B_1 activity were efficiently removed by the use of a base-exchanging zeolite. The use of a more sensitive fluorometer allowed the accurate detn. of 0.1 μ g.

7856. IGA, YASUO. **The adsorption of dye on the blood corpuscles.** *Okayama Igakkai Zassi (Mitt. med. Ges. Okayama)* 51, 773-82(in Japanese)(in German, 783)(1939).—*C.A.* 37, 655^9.
Cattle blood corpuscles, centrifuged after defibrination of the blood, were washed several times with isotonic dextrose solution. These washed corpuscles were suspended in isotonic dye-sugar solution for 10 minutes, then centrifuged. The dye adsorbed by the corpuscles was estimated colorimetrically by determining the difference between the dye concentration of the original dye solution and that of the centrifuged clear supernatant liquid after removal of the corpuscles.

7857. IGA, YASUO. **Electrophysical studies on cell staining.** *Okayama Igakkai Zassi (Mitt. med. Ges. Okayama)* 51, 784-91(in Japanese)(in German, 791-2)(1939).—*C.A.* 37, 657^1.
The electrical charge of the blood corpuscles was diminished by dye adsorption. The absolute amount of dye in the diluted acid dye solution, which was adsorbed on the cells, was proportional to the molecular weight of the dye, the dynamic surface energy and the electrical conductivity of the solution or the diffusion potential of the dye in water, and was inversely proportional to the molecular concentration.

7858. OKAMURA, NAGAWO. **The isolation of adsorbed adrenaline from the blood corpuscles and the determination of adrenaline in the blood.** *Okayama Igakkai Zassi (Mitt. med. Ges. Okayama)* 51, 1047-62(in Japanese)(in German, 1062-4)(1939).—*C.A.* 37, 658^9.
Adrenaline was firmly adsorbed on the blood corpuscles both *in vitro* and *in vivo*. This bound adrenaline was not removed by a single washing but could be partially removed by repeated washing or under various experimental conditions.

7859. OKAMURA, NAGAWO. **The adsorption of adrenaline by erythrocytes in vivo and the concomitant regulation of the concentration of adrenaline in the blood.** *Okayama Igakkai Zassi (Mitt. med. Ges. Okayama)* 51, 1064-86, 1211-27 (in Japanese)(in German, 1087-8, 1227-9) (1939).—*C.A.* 37, $683^{2,6}$.
Intravenously injected adrenaline remained intact in the blood for a fairly long time. The adrenaline was adsorbed by the *erythrocytes* which played a large role as adrenaline regulators in the living organism.

7860. ALMQUIST, H.J. AND ZANDER, D. **Adsorbing charcoals in chick diets.** *Proc. Soc. Exptl. Biol. Med.* 45, 303-5(1940).—*C.A.* 35, 776^4.
The charcoal interfered more or less with the adsorption of the gizzard factor and vitamins A, G and K in the intestine.

7861. CANNAN, R.K. **The estimation of the dicarboxylic amino acids in protein hydrolysates.** *J. Biol. Chem.* 152, 401-10 (1940).
Amberlite IR-4 was used to separate the dicarboxylic amino acids from protein hydrolysates. The essential steps were the adsorption of the acids from the hydrolysate of a protein by a basic resin, followed by their elution from the resin with HCl. The soln. obtained contained no more than traces of amino acids other than the dicarboxylic acids.

7862. FERREBEE, JOSEPH W. **The urinary excretion of riboflavin; fluorometric methods for its estimation.** *J. Clin. Investigation* 19, 251-56 (1940).
Riboflavin, Vitamin B_2, occurred in urine in the form of uroflavin. An adsorption column (30 mesh floridin) procedure was presented for measuring the uroflavin content of urines. A vol of 1

to 10 cc. urine was required. The adsorbed uroflavin was eluted from the column with 20 ml aq. soln. of 20% pyridine in 2% acetic acid and detd. by its intense greenish-yellow fluorescence.

7863. Rosenthaler, L. **The effect of the concentration of the material and the acid content on the form of crystalline precipitates.** *Pharm. Acta Helv.* 15, 257-65 (1940).—*C.A.* 37, 4608^3.

In the pptn. of cryst. org. substances, especially *basic medicinals*, with $K_4Fe(CN)_6$, ppts. of different crystal form or amorphous ppts. were obtained, depending upon the conditions of pptn. The amorphous forms were obtained especially in concd. solns. contg. large amts. of acid.

7864. Waldschmidt-Leitz, Ernst and Turba, Fritz. **Method for the separation of peptide mixtures.** *J. prakt. chem.* 156, 55-64(1940).—*C.A.* 35, 1823^8.

The cleavage products of proteins were sepd. by means of adsorption through a column (60 mm high and 24 mm in diam.) of Filtrol-Neutrol and extn. with 3 parts C_5H_5N and 7 parts 2 *N* H_2SO_4 or 1 part of C_5H_5N and 9 parts of 0.66 *N* H_2SO_4; elution was continued until the ninhydrin reaction was absent and the arginine reaction was neg.

7865. Abkin, G.L. **The theory of protecting lyophobe with lyophile colloids.** *Trudy Moskov. Tekhnol. Inst. Legkoĭ Prom. im. L. M. Kaganóvicha* 1941, No. 2, 117-20.—*C.A.* 40, 2059^4.

The nucleus of a suspended colloidal particle was not covered entirely by either ions or mols. of a stabilizer. If the entire surface of the nucleus were covered either by ions or by protective particles, colloidal suspensions would be true solns. and would not age. When collision occurred between protected surfaces, the particles would rebound. The particles would not aggregate when an unprotected area of one collided with a protected area of the other; only when two unprotected areas collided would the particles aggregate.

7866. Cook, Elton S.; Walter, Elsie M.; Waring, Sister Mary Grace; Eilert, Sister Mary Redempta, and Rack, Frank J. **Effect of pH on adsorption by charcoal of factors increasing the respiration of yeast and liver.** *Studies Inst. Divi Thomae* 3, 139-45 (1941).—*C.A.* 38, 1760^6.

The factor in aq.-alc. exts. of bakers' yeast which stimulated respiration of rat liver slices was adsorbed on activated (Norit) charcoal from water at acid pH. It was readily eluted by alkali. The properties of the factor which stimulated respiration of yeast were more indefinite.

7867. Dubnoff, Jacob W. **A micromethod for the determination of arginine.** *J. Biol. Chem.* 141, 711-16(1941).—*C.A.* 36, 1627^8.

Arginine, sepd. from glycocyamine by adsorption on Permutit, was eluted by 3% NaCl and detd. colorimetrically by means of the Sakaguchi reaction. Elution was optimum with 2-5% NaCl. No interference from glycocyamine, NH_3 histidine, tyrosine, tryptophan, creatine or urea within stated limits was found.

7868. Hennessy, Douglas J. **Chemical methods for the determination of vitamin B_1.** *Ind. Eng. Chem., Anal. Ed.* 13, 216-18 (1941).—*C.A.* 35, 4050^1.

Accurate and rapid chem. methods were available for the detn. of vitamin B_1. The use of the synthetic zeolite, Decalso, as a preliminary step effectively eliminated interfering materials.

7869. Jensen, K. Kromann. **The production of stable charcoal tablets.** *Arch. Pharm. Chemi* 48, 33-5(1941).—*C.A.* 38, 2794^1.

The elaboration of a prescription for the production, by means of *Sterculia mucilage*, of charcoal tablets which retained their adsorptive power (tested with methylene blue).

7870. Kobozev, N.I. **Mechanism of the catalyzing influence of various catalysts. Catalytic activity and structure.** *J. Phys. Chem.* (U.S.S.R.) 15, 882-917(1941).—*C.A.* 36, 6070^7.

Catalysts were classified according to a structural principle developed from the theory of the active ensemble. The abs. activities and free energies of 22 catalysts were calcd. from their affinity for O_2 and the decompn. consts. of the products formed. The peculiar position of catalase and the relations between catalase, oxidase and peroxidase functions were discussed.

7871. Mitchell, Herschel K.; Snell, Esmond E., and Williams, Roger J. **Concentration of "folic acid".** *J. Am. Chem. Soc.* 63, 2284 (1941).—*C.A.* 35, 6608^8.

The term *"folic acid"* was applied to a product which had been isolated from spinach by adsorption on charcoal, pptn. with Pb and Ag salts and chromatographic adsorption on Fuller's earth; it contained N (no S or P) and had a mol. wt of about 500.

7872. Paget, Marcel and Tilly, Francois. **Adsorption of barbiturates by activated charcoals and its analytical application.** *Tráv. membres soc. chim. biol.* 23, 1381-2 (1941).—*C.A.* 37, 659^4.

Norit in 3 grades readily adsorbed barbiturates from urine. The adsorbed compound could be eluted with Et_2O or Me_2CO.

7873. Reichstein, T. and Euw, J. v. **Constituents of the adrenal cortex and related compounds. LIV. Separation methods, isolation of substance U and its partial synthesis from substance E.** *Helv. Chim. Acta* 24, 247-64E(1941).—*C.A.* 36, 5181^7.

After the isolation of more than 20 members of a series of related steroids from adrenal cortex exts., the sepn. of other related compds. became more difficult. Improvements in sepn. were obtained by chromatographing after acetylation. Previous chromatographic sepn. methods were improved by the use of very pure AcOEt for extn. and the sapon. of concentrates by $KHCO_3$ in aq. MeOH at room temp. to cleave any esters that might be present.

7874. TISELIUS, ARNE. **Adsorption analysis of amino acids and peptides.** *Arkiv. Kemi, Mineral. Geol.* 15B, No. 6, 5pp. (1941).—*C.A.* 36, 369².

About 35 amino acids and peptides were passed in 0.5% solns., and in the presence of NaCl, Na_2SO_4 or glycine buffer soln. of pH 9.9, through various prepns. of active charcoal and the specific retardation vol. (ml/g) of adsorbent detd. The values obtained varied from 0 for glycine to 122 for hippuric acid. A mixt. of 0.5% solns. of leucine, valine and alanine was troublesome to analyze by other methods, but the adsorption method of analysis gave a distinct sepn.

7875. TURBA, FRITZ. **The adsorption behavior of protein-degradation products. I. Chromatographic adsorption of basic amino acids on bleaching earths.** *Ber.* 74B, 1829-38 (1941).—*C.A.* 36, 5494⁷.

Diamino acids may be sepd. from other amino acids by chromatographic adsorption on activated bleaching earth (Filtrol-Neutrol); Floridin XXF extra could be used also with arginine and lysine. The eluting agent was an aq. soln. of C_5H_5N and H_2SO_4; an alk. soln. (e.g., $Ba(OH)_2$) could be used if only qual. data were desired.

7876. WALDSCHMIDT-LEITZ, ERNST; RATZER, JOHANN, AND TURBA, FRITZ. **Chromatographic separation of clupein according to its degradation stages.** *J. prakt. chem.* 158, 72-8 (1941).—*C.A.* 36, 503⁸.

A soln. (3.5 g of the dry cleavage products in 93 cc. water) was passed through a column of Filtrol-Neutrol, from which were then obtained fractions of the cleavage products by extn. with phosphate buffer solns., by extn. with pyridine-H_2SO_4 solns. of pH 4, or by division of the column of Filtrol-Neutrol. Three fractions were finally obtained, which had const. N/NH_2 quotients of approx. 17 (28.8% yield), approx. 9 (56.6% yield) and approx. 5 (13.4% yield). Four fractions had been obtained previously from the tryptic cleavage products of clupein, having N/NH_2 quotients of approx. 18, approx. 13, approx. 9 and approx. 5.

7877. AMAT, MIGUEL. **Colloidal chromic hydroxide and its precipitating properties.** *Rev. real acad. cienc. exact. fis. y nat.* (Madrid) 36, 62-5(1942).—*C.A.* 45, 4999*d*.

A large quantity of $Cr(OH)_3$, obtained by pptg. with NH_4OH, was added to a soln. of $Cr(ClO_4)_3$, then dialyzed until the outer liquid gave practically no test for perchlorate. The resulting prepn. could be concd. by evapn. at approx. 50°C, by keeping over concd. H_2SO_4, or by freezing. The final product may appear as a moist, compact mass, having a dull green color. When it was again brought into contact with water it yielded a perfect colloidal soln. which was transparent, and exhibited a beautiful deep-green color by reflection.

7878. BERGMANN, FELIX. **The mechanism of tumor production by chemical agents.** *Cancer Research* 2, 660-3 (1942).—*C.A.* 37, 938⁷.

The form and size of a carcinogenic hydrocarbon and its related heterocyclic compounds detd. its activity and substances which more or less closely resembled a given parent structure and also resembled it in action. The carcinogens were adsorbed in the living cell by an acceptor possessing a definite adsorption area, which detd. the upper limit for dimensions of active compds. The lower limit was detd. by the decrease in adsorbability with decreasing size of the molecule.

7879. BLOCK, RICHARD J. **A new method for separation of the basic amino acids from protein hydrolyzates.** *Proc. Soc. Exptl. Biol. Med.* 51, 252-3(1942).—*C.A.* 37, 899¹.

A method was described for sepn. of NH_3, arginine, histidine and lysine from the other constituents of protein hydrolyzates by use of synthetic ion-exchange resins (Amberlites). The bases were subsequently eluted from the resins with 7% HCl.

7880. BROWN, ETHAN A. AND BENOTTI, NORBERT. **The chemistry of pollen extracts. I. Studies with activated charcoal and ragweed pollen extract.** *Ohio State Med. J.* 38, 1011-12 (1942).—*C.A.* 37, 1151⁹.

7881. BUXTON, L.O. **Effect of carbon treatment of fish-liver oils. Vitamin-A destruction and peroxide formation.** *Ind. Eng. Chem.* 34, 1486-9 (1942).—*C.A.* 37, 1009⁶.

The destruction of vitamin A, as affected by the increase in rate and degree of peroxidation of fish-liver oils treated with activated carbon, was investigated. Samples of shark-, halibut-, and tuna-liver oils were treated with various percentages of activated carbon and the effects of the treatment on the vitamin-A potency and color were determined. The antioxidant content of fish-liver oils played a major role in their resistance to atmospheric oxidation.

7882. CEITHAML, JOSEPH J. AND KOCH, F.C. **Comparative gonadotropin assays and use of calcium phosphate as an adsorbent in concentration of follicle-stimulating activity from pituitary gland.** *Endocrinology* 31, 249-60 (1942).—*C.A.* 37, 432⁹.

Three pituitary preparations were studied: acetone-desiccated sheet pituitary powder (DSP); powder A, prepared by adding 4 volumes of ethanol to a 0.02 *N* NH_4OH extract to DSP at pH 5.0 to 5.4; powder EB prepared from A by adsorption on tribasic calcium phosphate, elution with dilute NaOH, and fractional precipitation with ethanol. Both A and EB were found free of glucuronic acid, but gave positive tests for common protein and amino acid tests, especially for reduced S.

7883. FREUDENBERG, KARL; WALCH, HANS, AND MOLTER, H. **The separation of sugars, amino sugars and amino acids. Its application to the blood group A-specific substance.** *Naturwissenschaften* 30, 87 (1942).—*C.A.* 37, 658³.

When a mixt. of glucose and glucosamine hydrochloride was passed through a column of the acid-exchange material Wofatit K or KS, glucosamine was adsorbed quant., while glucose was not adsorbed. All amino acids were adsorbed by acid exchangers, while base exchangers (Wofatit M) adsorbed only acid amino acids. Thus alanine and aspartic acid could be sepd. quant. Neutral and acid amino acids were eluted by dil. pyridine, glucosamine and basic amino acids by excess HCl and pyridine-HCl, or by NH_3.

7884. Gyani, B.P. and Ganguly, P.B. **Adsorption in relation to constitution. I. Adsorption of alkaloids by silica gel.** *J. Indian Chem. Soc.* 19, 453-60 (1942).—*C.A.* 37, 3990[4].

Alc. solns. (25 ml) of morphine, nicotine, brucine, quinidine, cinchonidine, quinine, piperine, caffeine (0.5 g in 100 cc. abs. alc.) and strychnine (satd. soln.) were shaken with 2-5 g silica gel, left until equil. was attained, and analyzed. The gel was activated by water washing for several days, drying at 100°C and heating to about 300°C for 3 hrs in a current of CO_2-free air. About 90% of the adsorption took place within 24 hrs. The exptl. results were not caused by chem. changes in the system (alc. was not oxidized to acids in the procedure adopted). The adsorption of the alkaloids followed Freundlich's equation. The temp. coeffs. of adsorption were detd. at 30°, 35°, 40°, and 45° C and the adsorption values were found to decrease by 30-50% for a temp. rise of 10°C.

7885. Hennessy, D.J. **A standard thiochrome assay for the determination of thiamine in cereal products.** *Cereal Chemists' Bull.* 2, No. 2, 25-9 (1942).—*C.A.* 39, 5343[8].

Thiamine from the filtered ext. was absorbed on Decalso in the described base-exchange tubes. Thiamine was removed from the Decalso by washing with KCl in dil. HCl. A portion of the effluent was put into separatory centrifuge tubes for conversion of thiamine to thiochrome by addn. of $NaOH\text{-}K_3Fe(CN)_6$ soln. and another portion for blank with addn. of NaOH.

7886. Henry, A.J. and Grindley, D.N. **Florescence and adsorption of stilbamidine and its estimation in biological fluids.** *Ann. Trop. Med. Parasit.* 36, 102-12 (1942).—*C.A.* 37, 2030[6].

By the use of filter paper or cellulose pulp and the markedly fluorescent properties of stilbamidine (4,4'-diamidinostilbene), method of detection and estn. was evolved for biol. fluid, the filter paper spotting method being subject to an av. error of 25%. The adsorption by cellulose pulp was a reversible adsorption process involving the free base only.

7887. Hoffmann, Walter. **The ultrachromatographic identification of quinosol and of halogen-substituted quinoline compounds in pharmaceutical preparations. The possibility and limitations of establishing a chromatographic system of medicinal products.** *Arch. Pharm.* 280, 442-51(1942).—*C.A.* 39, 1249[6].

Hydroxyquinoline was adsorbed from a soln. in EtOH in the upper layer of an Al_2O_3 column. The adsorption layer showed in ultraviolet light a yellow-green fluorescence, characteristic for the compd. and suitable for detn. Since quiniophene (yatren) and vioform give a similar adsorption band, hydroxyquinoline must be sepd. from mixts. by steam distn. from the neutral. soln.

7888. Némedy, Imre. **Decrease in value of tablets of medicinal charcoal dependent upon the pressure used in compression.** *Ber. ungar. pharm. Ges.* 18, 27-35 (1942).—*C.A.* 37, 5193[6].

Activated charcoal lost some of its activity in tablet form and this loss was dependent upon the pressure used and also on the solns. used in granulation. The loss was least if it was granulated with a soln. of acacia, H_2O and alc.

7889. Parfentjev, I.A.; Waldschmidt, A., and Weil, A.J. **Absorption of bacterial antigen from diphtheric toxin and toxoid by magnesium hydroxide.** *J. Immunol.* 44, 325-8 (1942).—*C.A.* 37, 179[7].

By treatment of diphtheric toxin and toxoid with suspensions of $Mg(OH)_2$, a selective absorption of bacterial antigen was effected without substantial loss of toxin or toxoid and without impairment of antigenicity.

7890. Roberts, James L. and Baldwin, I.L. **Spore formation by *Bacillus subtilis* in peptone solutions altered by treatment with activated charcoal.** *J. Bact.* 44, 653-9 (1942).—*C.A.* 37, 1464[6].

A greater percentage of *B. subtilis cells* sporulated in "Bacto" peptone broth treated with charcoal than in untreated peptone broth. The percentage of cells in the spore state was independent of the concn. of the treated peptone. The percentage of sporulation could also be increased by adsorption of the medium with kaolin, ferric hydroxide or Al hydroxide. Most effective adsorption by charcoal occurred at a pH of 3.0-5.0.

7891. Seddon, H.J. and Florey, H.W. **Filter cloth for controlling smell from plasters.** *Lancet* 242, 755 (1942).

Cloth treated with activated carbon dust prevented the diffusion of smell from wounds treated by the closed-plaster method. If, therefore, the affected part was completely enclosed in a bag made from the cloth, unpleasant smell was eliminated.

7892. Wieland, Theodor. **Quantitative separation of amino acids by exchange adsorption on aluminum oxide.** *Z. physiol. Chem.* 273, 24-30 (1942).—*C.A.* 37, 4364[8].

The effect of aq. solns. of cations of basic amino acids (carrying 2 pos. and 1 neg. charge) on Al_2O_3 was studied. If an aq. soln. of lysine or arginine, exactly neutralized with HCl, was passed through an Al_2O_3 column, the filtrate did not give a ninhydrin reaction, even on washing. The entire amt. of amino acids was adsorbed in the form of its cations. In application to org. acids, an Al oxide column pretreated with HCl was used. Aspartic and glutamic acids, in aq. solns. of their Na salts, were absorbed in certain narrow zones of the column. The neutral and basic amino acids, however, passed through the column readily.

7893. Wieland, Theodor. **Glutamic acid from tumors.** *Ber.* 75B, 1001-7 (1942).—*C.A.* 37, 4793[2].

The protein of the tumor was hydrolyzed with 3 parts of concd. HCl for 7 hrs, the soln. evapd.

to dryness *in vacuo*, the residue taken up to H_2O, neutralized and filtered from pptd. humus; the filtrate was chromatographed through acid Al_2O_3, which was freed from absorbed cystine by H_2S. The column was eluted with cold satd. $Ba(OH)_2$ and the Ba removed by H_2SO_4; the soln. was concd. and 2 fractions of glutamic acid—HCl were sepd.

7894. Wieland, Theodor. **Application of acidic and basic alumina columns to analysis of protein hydrolyzates.** *Naturwissenschaften* **30**, 374-6(1942).—*C.A.* 37, 5432^{8}.

The method was based on the adsorption of only aminodicarboxylic acids by (HCl-treated) Al_2O_3 and of only diaminocarboxylic acids by untreated Al_2O_3, neutral amino acids and histidine being unadsorbed. The Na salts of amino acids in 80% EtOH were adsorbed on the acidic Al_2O_3 and could be sepd. from glucose, which was not adsorbed under similar conditions. Application of the method to the hydrolyzates of caseinogen and other proteins yielded by boiling with 20% H_2SO_4 for 20 hrs or with concd. HCl for 12 hrs was described.

7895. Barton, D.H.R. and Jones, E.R.H. **Sterol group. XLV. Investigation of the homogeneity of sitosterol by oxidation with the Oppenauer reagent.** *J. Chem. Soc.* **1943**, 599-602.—*C.A.* 38, 1513^{8}.

Tall oil sitosterol was oxidized by the Oppenauer reagent [$(tert\text{-}BuO)_3$ Al in C_6H_6 and Me_2CO, refluxing 18 hrs]. The oxidized products were sepd. by chromatograph on a 3.6 × 150-cm column of Al_2O_3, good sepn. was obtained only by the use of 100 times as much adsorbent as adsorbate. Oppenauer oxidation, followed by chromatographic analysis of the ketones, was of considerable value for examg. the homogeneity of sitosterol and, in particular, for detg. the approx. proportion of sitostanol present.

7896. Fischer, R. and Iwanoff, W. **The use of various adsorbents for the detection, determination, and purification of organic, mainly physiologically active, compounds.** *Arch. Pharm.* **281**, 361-77 (1943).—*C.A.* 39, 5208^{7}.

The adsorption properties were detd. for 115 substances classified as alkaloids, sedatives, local anesthetics, plant exts., and miscellaneous on charcoal, Al_2O_3, Frankonite, Floridin, $CaCO_3$, koalin, talc, and lactose adsorbents from the solvents Et_2O, $CHCl_3$, C_6H_6, $(CH_3)_2CO$, EtOH, and H_2O in 1% soln. by use of 1-2 mg substance and 0.5 g adsorbent. The properties were usefully applied in the purification of substances in toxicological analysis.

7897. Gordon, A.H.; Martin, A.J.P., and Synge, R.L.M. **Partition chromatography in the study of protein constituents.** *Biochem. J.* 37, 79-86 (1943).—*C.A.* 37, 5436^{6}.

Acetylated amino acids and peptides were partitioned chromatographically. Analyses of the amino acid compn. of gelatin and wool were recorded.

7898. Gordon, A.H.; Martin, A.J.P., and Synge, R.L.M. **The amino acid composition of tyrocidin.** *Biochem. J.* 37, 313-18 (1943).—*C.A.* 38, 127^{5}.

With the method of chromatographic partition, the following amino acids were isolated (and identified as acetyl derivs.) from an acid hydrolyzate of tyrocidin: phenylalanine, leucine, proline, valine, tyrosine, ornithine and glutamic acid. In addn., tryptophan and aspartic acid were found also.

7899. Holford, Frances E.; Ludden, J.B., and Stevens, W.H. **Antibody response to hemoglobin adsorbed on aluminum hydroxide.** *J. Immunol.* 46, 47-58 (1943).—*C.A.* 37, 2805^{8}.

Human, sheep, rabbit, dog, and guinea-pig hemoglobins were adsorbed by $Al(OH)_3$. The degree of adsorption was detd. chiefly by the relative amounts in the mixt., secondarily by the pH and the character of the adsorbent (sulfate-containing preparations having less adsorptive capacity than sulfate-free).

7900. Karrer, P.; Keller, R., and Szonyi, G. **The reaction products of azobenzene-4-carbonyl chloride and α-amino carboxylic acids or their esters.** *Helv. Chim. Acta* 26, 38-50 (1943).—*C.A.* 37, 5969^{6}.

In chromatographic adsorption on basic $ZnCO_3$ from a 95% ligroin-5% C_6H_6 soln. the zones in order from the top of the column were Me ester of N-*p*-phenylazobenzoylglycine, Me ester of N-*p*-phenylazobenzoylalanine, leucine and Me ester of N-*p*-phenylazobenzoylvaline.

7901. Katzman, P.A.; Godfrid, M.; Cain, C.K., and Doisy, E.A. **The preparation of chorionic gonadotropin by chromatographic adsorption.** *J. Biol. Chem.* **148**, 501-7(1943).—*C.A.* 37, 5772^{7}.

Urine was acidified to pH 3.5 by glacial AcOH and percolated through a column contg. Permutit. Adsorption was complete if 10 liters of urine per hour passed through a column having a diam. of 4 in. and contg. 2 kg of Permutit. Elution was by 38% EtOH contg. 10% NH_4Ac. The hormone was pptd. from the eluate by 70-5% EtOH.

7902. Reimers, F. and Gottlieb, K.R. **Chromatographic analysis of alkaloid salts.** *Dansk Tids. Farm.* 17, 54-71(1943).—*C.A.* 38, 5640^{6}.

The following compds. were analyzed: the hydrochlorides of emetine, physostigmine, cocaine, pilocarpine, ethylmorphine, the hydrobromide of scopolamine with certain and quick results; the hydrochlorides of ephedrine, quinine, codeine, atropine sulfate, quinine sulfate, strychnine nitrate with a somewhat different method; narcotine, papaverine, codeine phosphate and oxydrine tartrate gave too high, apomorphine too low, results.

7903. Sakurai, Yoshito and Hori, Hiroe. **Adsorption capacity of acid clay. I. Adsorption of vitamin B_1.** *Bull. Inst. Phys. Chem. Research (Tokyo)* 22, 760-8 (1943).—*C.A.* 43, 7774*d*.

The amt. of impurities, temp., pH of the soln. and presence of org. solvents were considered as factors affecting the capacity of acid clay to adsorb vitamin B_1. The optimum conditions were pH 4.5, temp. as low as possible, and absence of of org. solvents.

7904. Sklow, Joachim. **Prolongation of sex hormone effects by adsorption on powdered carbon.** *Endocrinology* 32, 109-13 (1943).—*C.A.* 37, 1754^9.

Experiments with animal and plant carbons, kaolin, kieselguhr, Fuller's earth, Ca carbonate, benzoic acid, flexible collodion and Lloyd's reagent showed that only the carbons promised success. Estrone, estradiol benzoate and diethylstilbestol, 0.01 mg each, were dissolved in 2 cc. 96% Et alc., 4 mg carbon was added, and the solns. were evapd. to dryness during continuous agitation.

7905. Sollner, Karl and Carr, Charles W. **The structure of the collodion membrane and its electrical behavior. V. The influence of the thickness of dried collodion membranes upon their electromotive behavior.** *J. Gen. Physiol.* 26, 309-23 (1943).—*C.A.* 37, 1638^2.

In a series of detns. of concn. potentials across dried collodion membranes of varying thickness (3 to 160μ), the electromotive properties of the membranes depended upon the thickness. With electrochemically active collodion the thermodynamically possible max. concn. potentials were obtained with membranes only 10 μ thick, whereas with inactive collodion the concn. potentials increased from about 30 mv. to about 42 mv. as the membrane thickness increased from 3 to 20 μ, with no appreciable increase for thicker membranes.

7906. Swain, Lyle A. **Adsorption of vitamin A from fish-liver oils.** *J. Fisheries Research Board Can.* 6, 1131-8 (1943).—*C.A.* 37, 6822^9.

Liver oil of the dog fish *(Squalus suckleyi)* was used which had been washed with MeOH to remove any vitamin A alcohol that might be present. The wt of the material eluted was detd. after evapn. of the solvent. The alc. form of vitamin A was much more easily adsorbed than its esters, or than glyceryl and other esters of fat acids.

7907. Turba, Fritz; Richter, Margit, and Kuchar, Ferdinand. **Quantitative chromatographic separation of the monoaminomonocarboxylic acids.** *Naturwissenschaften* 31, 508-10 (1943).—*C.A.* 38, 4631^3.

Tryptophan was removed from the mixt. of aromatic and aliphatic acids by adsorption on "Wofatit M," a synthetic exchange resin. Tyrosine and phenylalanine were sepd. by adsorption on active charcoal; 0.5 g charcoal, pretreated with 1% HCN, was used for 5 mg of each amino acid. The aliphatic amino acid mixt. was sepd. by Al_2O_3 treatments. Glycine and serine were held by acid-treated Al_2O_3 if adsorbed from a HCOH (10%) soln. (Schramm method). Proline and alanine were sepd. by 50 g Al_2O_3 treated with 1 *N* AcOH and washed with 1:1 H_2O-EtOH at pH 7.0 (140 cc.). Valine-leucine mixts. were adsorbed by 4 g animal charcoal, treated with 1% HCN and valine eluted by 300 cc. M/15 phosphate buffer (pH 5.6).

7908. Ulrix, Forent. **Chromatography in the service of pharmacy.** *Bull. soc. roy. sci. Liège* 12, 108-23 (1943).—*C.A.* 42, 7486*h*.

The identification of pharmacologically active plant exts., tinctures, or dried materials, utilized a micro-chromatographic technique. A glass tube 6 cm by 2 mm, plugged with a 7-mm wad of cotton at one end, was inverted and filled by suction to a height of 2 cm with a paste prepd. from 20 g Al_2O_3 and 35 cc. alc. at 70°C. Tinctures were added to a height of 3 cm, while a 1-cm height of ext. was used. The solvent was drawn down by suction until it was flush with the top of the Al_2O_3 column, and the resulting color spectrum obtained served to identify the material.

7909. Wieland, Theodor and Wirth, Liselotte. **Quantitative separation of aspartic and glutamic acids with the acid aluminum oxide column.** *Ber.* 76B, 823-5 (1943).—*C.A.* 38, 2060^5.

Glutamic acid was eluted from the acid Al_2O_3 column by 0.5 *N* HCl more rapidly than aspartic acid, but the difference in elution velocities was not sufficient for a quant. sepn. With 0.5 *N* AcOH, however, glutamic acid was completely eluted when aspartic acid traveled down only a small fraction of a relatively short column. Al_2O_3 (Merck, standardized according to Brockmann) was filled (10 g) with gentle suction upon a little cotton in a 10-mm tube, 200 mm high, and the mixt. of glutamic and asparatic acids in a little water was run through it, followed by 0.5 *N* AcOH until the filtrate measured 50 cc., and the column washed with water. The AcOH filtrate was evapd. to dryness *in vacuo* and the residue taken up to 3.0 or 5.0 cc. of 2 *N* AcOH and the analysis made. The washed column was eluted with 0.5 *N* NaOH and the eluate (20 cc.), after acidification with a few drops of concd. HCl, was likewise evapd. *in vacuo* and the residue, taken up in 3.0 cc. water, analyzed.

7910. Andersen, A. Harrestrup. **Medicinal carbon.** *Dansk Tids. Farm.* 18, 21-47(1944).—*C.A.* 39, 4430^8.

As an antidote for ingested poisons, Merck's medicinal carbon had twice the adsorptive capacity of that of the Danish Pharm. Poisons, especially strychnine nitrate, morphine-HCl, atropine sulfate, nicotine, $HgCl_2$, and diethylbarbituric acid, were well and rapidly adsorbed. Sulfanilamide was adsorbed best at its isoelec. point.

7911. Applezweig, Norman. **Cinchona alkaloids prepared by ion exchange.** *J. Am. Chem. Soc.* 66, 1990(1944).—*C.A.* 39, 158^6.

The capacity of a 200-ml bed of Zeo-Karb for quinine from 1% H_2SO_4 was between 7 and 8 g before break-through; EtOH-NH_4OH was used as a combined regenerant and elution solvent. A crude totaquinine ppt. (20 g), purified by ion exchange, yeilded 2.5 g of white cryst. material.

7912. Archibald, Reginald M. **Determination of citrulline and allantoin and demonstration of citrulline in blood plasma.** *J. Biol. Chem.* 156, 121-42(1944).—*C.A.* 39, 721^4.

In the colorimetric detn. of citrulline with biacetyl monoxime errors were introduced by the presence of allantoin and urea. Interference by allantoin was prevented by adsorbing the citrulline with Amberlite at pH 6 to 7; allantoin was not adsorbed. The difference in chromogenic material before and after adsorption was a measure of the citrulline.

7913. CANNAN, R. KEITH. **The estimation of the dicarboxylic amino acids in protein hydrolyzates.** *J. Biol. Chem.* **152**, 401-10 (1944).—*C.A.* **38**, 2679[1].

A HCl-protein hydrolyzate was treated with Amberlite IR-4 until the mixt. had a pH of 7. The adsorbed dicarboxylic acids were eluted from the resin with 0.25 *M* HCl, the eluate contg. only traces of amino acids other than dicarboxylic was concd. *in vacuo*, clarified with Norit and evapd. to dryness. From this residue glutamic acid was obtained by crystn. Cryst. egg albumin, β-lactoglobulin and edestin were analyzed by this method.

7914. DEY, HEINRICH AND HAAR, HUGO. **Adsorption of atropine in drug mixtures.** *Arch. exptl. Path. Pharmakol.* **203**, 188-93 (1944).—*C.A.* 39, 3879[9].

Belladonna ext. and powd. belladonna leaves were ground with 10-300 times their wt of kaolin, MgO, "Adsorgan," or "Gastro-Sil." The mixts. were treated with 0.1 *N* HCl to simulate the action of gastric juice. Not all of the atropine was recovered.

7915. EDMAN, P.V. **The purification of hypertensin (angiotonin).** *Arkiv Kemi, Mineral. Geol.* **18B**, No. 2, 4 pp. (1944); *Nature*, **155**, 756 (1945).—*C.A.* 39, 3803[6].

Crude hypertensin was purified by chromatography on Al_2O_3. Before adsorption the crude material was extd. with glacial AcOH, the insol. residue was discarded. Al_2O_3 was prepd. by shaking 1 part with 5 parts of 1 *N* HCl, decanting the acid, and washing with H_2O until washings were neutral. The adsorbent was dried by suction and heated at 200°C for 1 hr for complete removal of HCl. The 90% MeOH soln. of hypertensin was adsorbed on a column 25 cm in height.

7916. ENGLIS, D.T. AND FIESS, H.A. **Conduct of amino acids in synthetic ion exchangers.** *Ind. Eng. Chem.* 36, 604-9 (1944).—*C.A.* 38, 3879[5].

The adsorption by column and by static methods of asparagine, glutamic acid, glycine, hydroxyproline, leucine, lysine. HCl, norleucine, phenylalanine and tryptophan was studied with the carbonaceous cation-exchanger, Zeo-Karb H, the resin cation-exchangers, Amberlite IR-1 and Amberlite IR-100, and the synthetic anion-exchangers, Amberlite IR-4 and De-Acidite. The H form of the cation exchangers adsorbed all of the amino acids; the Ca and Na forms showed little adsorption. Adsorption decreased at lowered pH. Anion-exchangers react with dicarboxylic but not with monocarboxylic monoamino acids, and a sepn. of these 2 groups of acids may be expected.

7917. FRIEDEN, EDWARD H.; MITCHELL, HERSCHEL K., AND WILLIAMS, ROGER J. **Folic Acid. II. Studies on adsorption.** *J. Am. Chem. Soc.* **66**, 269-71 (1944).—*C.A.* 38, 1547[5].

Elution of folic acid after adsorption from crude prepns. was much easier than from relatively pure solns. This behavior was apparently due to the presence of interfering substances which affected the manner of adsorption. A study of the adsorption isotherms of folic acid, riboflavin and thiochrome upon charcoal at low concns. showed that the adsorption process was of a dual nature, because the slopes of the isotherms changed markedly in the range covered.

7918. KOCH, JOHN M. **Analysis of petroleum oil-soluble sodium sulfonates by adsorption.** *Ind. Eng. Chem., Anal. Ed.* **16**, 25-8 (1944).—*C.A.* **38**, 698[4].

Percolation expts. showed that Na sulfonates could be adsorbed selectively from naphtha soln. and subsequently displaced completely from the adsorbent by MeOH. The sample was dissolved in petroleum naphtha, run through a column of calcined Attapulgus clay and the percolate evapd. and weighed to find the oil content. Results obtained on known blends of white oil and Na sulfonates showed good agreement.

7919. MCCREADY, R. M. AND HASSID, W. Z. **The preparation and purification of glucose 1-phosphate by the aid of ion-exchange adsorbents.** *J. Am. Chem. Soc.* **66**, 560-3(1944).—*C.A.* 38, 2633[8].

The phosphorolysis of starch in the presence of phosphate buffer and the pptn. of the inorg. phosphate were carried out, but the purification of the ester was accomplished by ion-exchange adsorbents. The reaction mixt. contg. the ester was first passed through a column of cation-exchange adsorbent. The effluent was then run through an aid adsorbing column. In this operation the Cori ester, being a strong acid with a high exchange capacity, was adsorbed, while the sol. impurities, including dextrins, proteins and weak org. acids, passed through unchanged. The glucose 1-phosphate was then eluted from the adsorbent with dil. alkali and isolated as the cryst. di-K salt.

7920. MITCHELL, HERSCHEL K.; SMELL, ESMOND E., AND WILLIAMS, ROGER J. **Folic acid. I. Concentration from spinach.** *J. Am. Chem. Soc.* 66, 267-8 (1944).—*C.A.* 38, 1547[3].

Details were given for adsorption on 3 charcoals, Lloyd reagent and Al_2O_3 and pptn. with Ag and Pb (many other adsorbents and precipitants were tested). All samples having a potency of 110,000 or greater pptd. in an amorphous state from acid soln., and recryst. attempts from warm H_2O also gave amorphous products. Quinine, brucine or even NH_4 salts gave semi-cryst. material on evapn. of the solvent on samples of potency 20,000 and up. Adsorption and fractionation from Al_2O_3 was a highly effective means of concn. only after the preliminary steps. Higher potency samples were readily adsorbed by Al_2O_3 but were not easily eluted.

7921. NAJJAR, VICTOR A. **Laboratory diagnosis of nicotinic acid deficiency. An improved method for the determination of F_2 (N-methylnicotinamide derivative) in urine.** *Bull. Johns Hopkins Hosp.* 74, 392-9 (1944).—*C.A.* **38**, 5519[8]

Inactive interfering material was adsorbed with charcoal from acid urine (HOAc). F_2 was adsorbed by activated zeolite and was eluted with KCl, and extd. from the KCl eluated with 1-butanol and KOH.

7922. Polis, B. D. and Reinhold, John G. **Determination of total base of serum by ion exchange reactions of synthetic resins.** *J. Biol. Chem.* 156, 231-6(1944).—*C.A.* 39, 721[9].

A cation-adsorbing resin (Amberlite IR-100), converted to the H-form produced upon contact with the cations in serum, an exchange in which H^+ ions from the resin were liberated in proportion to the cations taken up from the serum. The resulting soln. was distinctly acid and contained chloride, bicarbonate, phosphate, protein, etc., in the form of acid anions. This soln. was titrated with standard base, after aeration with CO_2-free air to remove any CO_2 present. Base present as bicarbonate was detd. separately by gasometric measurement of the CO_2-combining capacity of the serum.

7923. Potts, Albert M. and Gallagher, T. F. **Separation of oxytocic and pressor principles of posterior pituitary extracts.** *J. Biol. Chem.* 154, 349-56(1944).—*C.A.* 38, 5520[7].

A simple procedure was described for sepn. of the oxytocic and pressor principles from aq. ext. of desiccated posterior pituitary lobe. The pressor principle could be adsorbed on 70-mesh Decalso, whereas the oxytocic principle was not adsorbed. The pressor fractions were eluted with 10% NaCl soln. High yields of both pressor and oxytocic fractions could be obtained.

7924. Regna, Peter P. **The stability of penicillin during the stages of recovery.** *Trans. Am. Inst. Chem. Engrs.* 40, 759-65 (1944).—*C.A.* 39, 1018[4].

The penicillin in the broth was almost completely adsorbed on activated carbon and eluted with an 80% soln. of acetone in water. After filtration from the carbon, the acetone was removed by a water-immiscible solvent, the concd. aq. phase then acidified and the penicillin acid extd. into $CHCl_3$.

7925. Steinberg, Arthur. **New method of preventing blood coagulation.** *Proc. Soc. Exptl. Biol. Med.* 56, 124-7(1944).—*C.A.* 38, 5240[6].

A cation-exchanging phenol-formaldehyde resin with a polyhydric phenol base (Amberlite IR-100) was used to remove Ca from blood. The resin was treated with several successive portions of 5% NaCl soln. It was sterilized by autoclaving without affecting its activity. Twenty g of the resin was sufficient to prevent clotting of 150 cc. of blood. The used resin could be repeatedly regenerated for re-use by washing it with 2% Na_2CO_3 soln., then stirring it with 5% NaCl soln.

7926. Sweet, Walter J. and Sweeney, O. R. **Modification of blood by zeolites for transfusion purposes.** *Proc. Iowa Acad. Sci.* 51, 299-300 (1944).—*C.A.* 40, 2877[4].

Blood passed through a bed of zeolite entirely lost its property of coagulation. When examd. under a microscope it showed no evidence of having a corpuscular suspension structure, but was homogeneous. A sample of the zeolite-treated blood was set aside, under sterile conditions, and allowed to stand for several weeks at room temp. (summer heat, often as high as 100°F). There was no evidence of deterioration, and the blood appeared to be exactly the same as when set aside.

7927. Synge, R. L. M. **Analysis of a partial hydrolyzate of gramicidin by partition chromatography with starch.** *Biochem. J.* 38, 285-94 (1944).—*C.A.* 39, 1895[2].

Partition chromatography on silica gel gave poor quant. sepn., but the amino acids were found to travel as quite sharp bands in column chromatograms made with raw potato starch and developed with butanol satd. with water. Preliminary data were given on this technique. There were no indications that optical antipodes or racemates of any compd. travel at any different rates. Band rates for known samples of dipeptides in paper chromatography were tabulated.

7928. Taub, Abraham. **Surface active agents as germicides.** *Merck Rept.* 53, No. 3, 28-31 (1944).—*C.A.* 38, 6046[9].

When cationic agents (compds. in which the lipophilic groups are part of the pos. ion) were adsorbed upon bacteria, they exerted an inhibitor effect upon the metabolism and viability of the organisms. Recent studies indicated that bacteria function somewhat analogously to the base-exchange substances like Permutit and other zeolites. Experience showed that the cationic agents could not be utilized by the oral or parenteral route. The blood proteins, probably through ionic interaction, readily inactivated the cationic agents.

7929. Welsh, Llewellyn H. **Chromatographic purification and some properties of atebrin base.** *J. Am. Pharm. Assoc.* 33, 318-20(1944).—*C.A.* 38, 6499[2].

Purification of atebrin, prepd. from the com. $2HCl.2H_2O$ salt, was advantageously carried out chromatographically by allowing the free base to be adsorbed on activated Al_2O_3 from a C_6H_6 soln. Ultraviolet irradiation of the base produced a brownish to orange discoloration, shown chromatographically to be due to the formation of traces of several substances.

7930. Wieland, Theodor. **Separation of basic amino acids by adsorption on "Wofatit-C."** *Ber.* 77B, 539-41(1944).—*C.A.* 40, 5021[2].

In the adsorption of hexonic bases on strong acidic Wofatite -K or -KS, contg. SO_3H groups, all amino acids were adsorbed as cations. The acidity of Wofatite-C, contg. the CO_2H group, was so weakened that only basic amino acids were adsorbed, while neutral and acidic acids passed readily through the column. The sepn. was very specific. The column was eluted with dil. mineral acids, and, after removing the excess acid with H_2O, the column was ready for the next adsorption. Histidine, though uncharged, was adsorbed from a neutral soln. on basic Al_2O_3, the Na ions of the adsorbent reacting as Permutit, whereas arginine and lysine, present as cations, were interchanged with the Na ions.

7931. Wieland, Theodor and Fremercy, Herta. **Separation of the neutral amino acids through the Cu complexes by partition chromatography.** *Ber.* 77B, 234-7 (1944).—*C.A.* 39, 3256[3].

The partition coeff. of Cu valine between PhOH-$CHCl_3$ satd. with H_2O and H_2O-satd. PhOH-$CHCl_3$ (1:1) in 1% soln. was 0.1, that of Cu alanine 2.85. Hence, when a mixt. of a few mg of the 2 complexes in the least possible amt. of PhOH-$CHCl_3$ was poured on a column packed with 1 g silica-gel powder moistened with 1 cc. of PhOH-satd. water and suspended in a solvent mixt. richer in phenol, on development with the same mixt. there soon appeared 2 sharply defined blue zones which traveled down the column with different velocities. Iodometric Cu detns. of the more rapidly traveling zone, which emerged in 1-2 cc. as a deep blue soln., showed valine quantitatively.

7932. ARCHIBALD, REGINALD M. **Reported formation of urea from glutamine by liver extracts, and the preparation of glutamine free from arginine.** *J. Biol. Chem.* 159, 693-4(1945).—*C.A.* 40, 102^9.

A previous statement that small amts. of urea were formed on incubation of glutamine with liver ext. was wrong. The urea formed was due to the presence of some arginine in the glutamine prepn. Glutamine solns. free of arginine could be prepd. by an adsorption procedure using a column of Decalso.

7933. BALOCK, J. W. AND STARR, D. F. **Adsorption of methyl bromide and its residual effect on fruitfly mortality.** *J. Econ. Entomol.* 38, 481-3(1945).—*C.A.* 39, 5362^2.

In a steel drum with painted walls contg. wooden boxes and charged with MeBr at 3 lbs per 1000 ft^3, the wood adsorbed 36%, the paint 20% and the walls of the drum, when paint-free, about 5% MeBr. Window glass and asbestos board gave neg. adsorption values. A steel drum that had been charged with 3 lbs MeBr per 1000 cu. ft. was aired for various periods. Then adult Mexican fruitflies *(Anastrepha ludens)* were placed in the drum for 15 hrs. The mortality after a 3-day airing was 95%; after a 23-day airing it was 58%.

7934. BROWNLEE, G. W. **The assay of alkaloidal galenicals using the chromatograph. I. Preparations of** *belladonna, stramonium,* **and** *nux vomica. Quart. J. Pharm. Pharmacol.* 18, 163-71 (1945).—*C.A.* 40, 2270^9.

Chromatographic methods, using alumina for the assay of *belladonna, stramonium,* and *nux vomica* prepns., gave liquids for analysis which were cleaner, easier to manipulate, and readily extd. by solvents without emulsification. Analytical results compared favorably with those from official methods.

7935. BUC, SAUL R.; FORD, JARED H., AND WISE, E. C. **Improved synthesis of β-alanine.** *J. Am. Chem. Soc.* 67, 92-4 (1945).—*C.A.* 39, 1392^4.

Details were given of the liberation of the base from $H_2NCH_2CH_2CO_2H.HCl$ by passing the aq. soln. through a bed of De-Acidite or Amberlite IR-4; the yield of $H_2NCH_2CH_2CO_2H$ was 82-6% (based on $H_2NCH_2CH_2CO_2H.HCl$).

7936. CARTER, HERBERT E.; CLARK, R. K. JR.; DICKMAN, S. R.; LOO, Y. H.; SKELL, P. S., AND STRONG, W. A. **Isolation and purification of streptomycin.** *J. Biol. Chem.* 160, 337-42 (1945).—*C.A.* 40, 3485^8.

The prepn. of streptomycin-Cl and streptomycin-SO_4 as white, amorphous powders with activity of 600-900 units per mg was described. Surface culture filtrates of *Streptomyces griseus* with activity of 100-180 units per cc. served as starting material. This was clarified at pH 2 with 0.5% of carbon and the activity removed at pH 7 with 1% of carbon. The carbon was washed successively with H_2O, neutral EtOH, and neutral MeOH, and the activity then eluted by 2 or 3 extns. with 0.1 *N* HCl in MeOH. The active material could be pptd. directly from the combined HCl + MeOH as a light brown amorphous powder. This material was fractionated on a column: A faintly acid soln. (pH 6.3) of crude streptomycin-Cl in 70-80% MeOH was percolated over a H_2SO_4-washed alumina column (pH 5-6).

7937. CLEAVER, CHARLES S.; HARDY, ROBERT A. JR., AND CASSIDY, HAROLD G. **Chromatographic adsorption of amino acids on organic exchange-resins.** *J. Am. Chem. Soc.* 67, 1343-52(1945).—*C.A.* 39, 4844^8.

The responses toward several amino acids (glycine, alanine, arginine, histidine, and glutamic acid) of a cation-exchange and an acid-binding synthetic organic resin (Amberlite IR-100 and IR-4) were reported. The influence of the following factors was investigated: type of resin, particle size, length of adsorption column, rate of flow, and concn. of amino acid and H-ion in soln. The work included several binary and 2 ternary mixts., evidence regarding their separability being reported.

7938. CRUZ-COKE, E.; GONZALEZ, F., AND HULSEN, W. **The use of ionic exchange resins for the purification of penicillin and hypertensin.** *Science* 101, 340(1945).—*C.A.* 39, 2381^3.

By treating the crude hypertensin with the anionic resin Ionic A, several inactive substances (chromogens, polypeptides) were removed without affecting significantly the hypertensive activity. The cationic resin Ionic C adsorbed the active principle of hypertensin. By filtering the crude penicillin, first through Ionic C at pH 6-7, then through Ionic A at the same pH, a product was obtained which retained all the penicillin activity of the original material.

7939. DARLING, SVEN. **Chromatographic method for the determination of glutamic and aspartic acid in mixtures of different amino acids.** *Acta Physiol. Scand.* 10, 91-6 (1945).—*C.A.* 40, 2182^9.

Shake 2 g Al_2O_3 for 5 min. with 6 cc. *N* HCl, remove supernatant, and shake ppt. with H_2O until neutral to litmus. Fill an adsorption tube with the treated Al_2O_3. The amino acid soln. or a CCl_3CO_2H filtrate was neutralized to phenolphthalein with KOH and transferred to the adsorption tube. Suck through at a rate of about 30 drops per min. and rinse column with 15 cc. H_2O. The column was eluated with 3 cc. 3 *N* KOH and 20 cc. 0.05 *N* KOH and sucked dry. The eluate contained the dicarboxylic amino acids. By this procedure 503- micromol. amino acid could be detd.

7940. EWING, CLARE OLIN; POLITI, FRANK W., AND SHACKELFORD, CHARLES H. **Bentonite U.S.P. and magma bentonite N.F.** *J. Am. Pharm. Assoc.* 34, 129-34(1945).—*C.A.* 39, 3121^5.

The viscosity of bentonite suspensions was standardized: place 100 cc. of distd. water in a 250-cc. Erlenmeyer flask, add 5.00 g bentonite in divided portions, allowing each to settle before adding the next, stopper, shake vigorously to break up lumps; let stand 24 hrs, shaking occasionally to ensure uniform dispersion, bring to 25°C and shake vigorously for 1 min.; draw the suspension up to the base of the upper stem of a 10-cc. volumetric pipet and allow to discharge to the top of the lower stem; the time required should not be less than that required for similarly discharging at 50% by vol. soln. of glycerol in distd. water at 25°C.

7941. FULTON, J. D. AND GOODWIN, T. W. **The estimation, adsorption, and precipitation of stilbamidine (4,4'-diamidinostilbene).** *J. Pharmacol.* 84, 34-41(1945).—*C.A.* 39, 4431^9.

Stilbamidine was adsorbed little if any by blood cells. Stilbamidine in aq. soln. was pptd. more or less, depending on conditions, by serum proteins, Na citrate, CCl_3CO_2H, $HClO_4$, and HPO_3.

7942. GEMMELL, D. H. O. AND TODD, J. P. **Activated carbon for pharmaceutical purposes.** *Pharm. J.* 154, 126(1945).—*C.A.* 39, 2379^7.

Studies on charcoal indicated that the heavy-metals test of the U.S.P. was too severe and that a simple extn. and test was sufficient. Any charcoal would be sufficiently pure for pharm. purposes if it did not yield to the treated substances any impurities which would interfere with the purity of the same substances. The use of activated charcoal for the removal of pyrogens from parenteral solns. was discussed.

7943. GROLLMAN, ARTHUR. **Preparation of extracts from oxidized marine and other oils for reducing the blood pressure in experimental and human chronic hypertension.** *J. Pharmacol.* 84, 128-35(1945).—*C.A.* 39, 4686^7.

Fractional sepn. of the oil by distn. *in vacuo*, freezing, or distribution between 80% aq. EtOH and a hydrocarbon solvent partially effected a concn. of the active agent. By adsorption on a synthetic ion-exchanger resin (Amberlite IR-100) and desorption with 2% aq. NaOH after washing the resin free from oil with petr. ether, it was possible to obtain the active principle in aq. soln.

7944. HERR, DONALD S. **Synthetic ion exchange resins in the separation, recovery, and concentration of thiamine.** *Ind. Eng. Chem.* 37, 631-4 (1945).—*C.A.* 39, 3627^8.

Aq. thiamine (250 p.p.m.) was completely removed by passage through a 10-cm column of the ion-exchange resin Amberlite IR-100-H. The capacity of Amberlite IR-100-H for thiamine was about 168 mg/g. Complete adsorption of thiamine was also obtained with a synthetic zeolite, but activated alumina and Amberlite IR-4 adsorbed little or no thiamine. Riboflavin was nearly completely adsorbed on Fuller's earth and was adsorbed by Amberlite IR-100-H in a static, but not in a dynamic system. Complete sepn. of thiamine and riboflavin was, therefore, possible by flowing a soln. of the mixt. through Amberlite IR-100-H.

7945. HOCHBERG, MELVIN; MELNICK, DANIEL, AND OSER, BERNARD L. **Chemical determination and urinary excretion of the metabolite N^I-methylnicotinamide.** *J. Biol. Chem.* 158, 265-78 (1945).—*C.A.* 39, 2776^5.

Quant. recovery of added N^I-methylnicotinamide made use of adsorption on an activated zeolite column, elution with KCl, alkalinization of eluate, fluorescence development in BuOH, and measurement in fluorometer against standard similarly treated. Fifteen urine samples can be tested by a single analyst in one day.

7946. ISBELL, HARRIS. **The use of charcoal-treated peptone in microbiological assays.** *Science* 102, 671-2(1945).—*C.A.* 40, 2173^5.

Charcoal-treated peptone satisfactorily replaced the casein hydrolyzate in media used for assays of biotin, niacin, and pantothenic acid. Bacto-Difco peptone (100 g) was dissolved in 800 cc. distd. water. The pH was adjusted to 3.0 with concd. HCl. Activated charcoal (20 g) was added with stirring for 1 hr, the soln. filtered, and the pH readjusted to 3.0 with HCl. The process was repeated with 10 g of charcoal and the final filtrate should have no more than a faint tinge of color. The vol. was adjusted to 1 liter and the soln. preserved with toluene. Ten cc. of this soln. could be substituted for 5 cc. of casein hydrolyzate.

7947. KEMP, C. R. AND BANDELIN, F. J. **Modified base-exchange procedure and apparatus for determination of thiamine and riboflavin.** *J. Am. Pharm. Assoc.* 34, 306-9 (1945).—*C.A.* 40, 1192^4.

A portable cabinet with controlled lighting for use in base-exchange procedures was described The equipment needed for isolation of thiamine and riboflavin from mixts. was listed. Detailed directions were given for conducting the base exchange, and the advantages over the original procedure pointed out.

7948. KRASNOVA, V. S. **Chromatographic luminescent method of separation of cinchona alkaloids.** *J. Applied Chem. (U.S.S.R.)* 18, 86-9 (1945).—*C.A.* 39, 5399^7.

The cinchona alkaloids could be sepd. by chromatographic adsorption on silica gel; the quinine fraction may contain some quinidine. The method was rapid; prepn. of the chromatogram required 20-5 min., and the sepn. of quinine about 1 hr. The adsorption was made from $CHCl_3$-benzene solns. with examn. by ultraviolet light. Developing solns. were benzene-$CHCl_3$ or $CHCl_3$ with a few drops of EtOH.

7949. MATET, A. (MME.) AND MATET, J. **Diets containing active charcoal for rapid production of avitaminosis A; preparation of vitamin A-free diets.** *Bull. soc. chim. biol.* 27, 513-18 (1945).—*C.A.* 40, 5116[4].

Two % of "Prolabo" active charcoal added to ordinary rat diets readily produced avitaminosis A.

7950. MAYER, GERDA GERNSHEIM AND SOBOTKA, HARRY. **The color reaction of vitamin A on Acid Earths.** *Science* 102, 158 (1945).

In 1939 Emmerie and Engel discovered that vitamin A gave a dark blue color, and carotenoids a bluish green color, when adsorbed on Floridin SX used for the removal of vitamin A and carotenoids from serum extracts prior to the reductometric colorimetry of tocopherol. When adapting the above method to a photoelectric procedure, this observation was confirmed.

7951. MCCOLLOCH, R. J. AND KERTESZ, Z. I. **Pectic enzymes. VI. The use of an ion-exchange resin for the complete removal of pectin methylesterase from commercial pectinases.** *J. Biol. Chem.* 160, 149-54 (1945).—*C.A.* 40, 615[3].

Pectin methylesterase was removed from 2 com. pectinase prepns. by the action of a cation-exchange resin, and varying proportions of pectin polygalacturonase were recovered.

7952. MELNICK, DANIEL; HOCHBERG, MELVIN, AND OSER, BERNARD L. **Physiological availability of the vitamins. VI. The effect of adsorbents on thiamine.** *J. Nutrition* 30, 233-8 (1945).—*C.A.* 40, 1203[4].

The influence of the concomitant ingestion of Fuller's earth and of kaolin on the availability of thiamine to man was investigated. These materials were shown to adsorb the vitamin very readily from aq. soln. Human studies showed that whereas the availability of thiamine was markedly reduced by the Fuller's earth, no interference occurred when kaolin was taken along with thiamine. The latter adsorbent appeared to protect the vitamin during its passage through the gastrointestinal tract.

7953. SANGER, F. **Free amino groups of insulin.** *Biochem. J.* 39, 507-15 (1945).—*C.A.* 40, 5399[3].

The free amino groups of proteins and peptides readily formed derivs. with 2,4-$(O_2N)_2C_6H_3F$ at room temp. Since these derivs. were relatively stable to acid hydrolysis, hydrolysis of the substituted protein enabled isolation of 2,4-dinitrophenyl amino acid derivs. which were separable by partition chromatography. This was the basis of a new method which was applied to the identification and estn. of the free amino groups in insulin.

7954. SEGAL, HARRY L.; HODGE, HAROLD; WATSON, JAMES S. JR., AND SCOTT, W. J. MERLE. **A polyamine-formaldehyde resin. I. Its effect upon the pH of acidified solutions and the pH and pepsin of gastric juice in vitro. II. Its toxicity in rats: preliminary feeding tests.** *Gastroenterology* 4, 484-96 (1945).

Amberlite IR-4 was studied for its effect upon the pH of HCl, acidified milk, acidified colloidal $Al(OH)_3$ and gastric juice in vitro. The inactivation of pepsin by the resin depended upon the effect of the resin on the pH of the solution and not upon any intrinsic action on pepsin.

7955. SIMS, E. A. H. **Microdetermination of glycocyamine and arginine by means of a synthetic ion-exchange resin for chromatographic separation.** *J. Biol. Chem.* 158, 239-45(1945). —*C.A.* 39, 2776[4].

A micromethod for the detn. of glycocyamine and arginine in biol. fluids made use of the Sakaguchi reaction and employed ion-exchange resins with uniform properties. A special device to regulate small column down-flow was described which made possible chromatographic procedures involving the use of coarse-textured adsorbents.

7956. SPITZER, H. **Silica gel for the preservation of plant material.** *Australian J. Sci.* 8, 83-4(1945).—*C.A.* 40, 3564[9].

Activated silica gel was used successfully for dehydrating and preserving alkaloid-bearing leaves. An amt. of silica gel approx. 20 times the wt of the leaf sample was required.

7957. SUSSMAN, SIDNEY; MINDLER, A. B., AND WOOD, W. **Recovery of alkaloids by ion exchange.** *Chem. Industries* 57, 455, 549(1945).—*C.A.* 40, 429[3].

Recoveries of totaquine from cinchona bark and scopolamine from datura plants were effected by bringing the alkaloid-contg. ext. into contact with a cation exchanger, then treating the cation exchanger with aq. alkali and a solvent.

7958. VORONINA, L. G. **Comparative evaluation of medicinal charcoals from German army supplies.** *Farmakol. i Toksikol.* 8, No. 2, 43-6 (1945).—*C.A.* 40, 5883[1].

Of 5 German medicinal charcoals, only one met the German Pharmacopeia adsorption test. Two were able to detoxify strychnine, one only feebly. Granular carbons had lower adsorption capacity than the same carbons as fine powders.

7959. YEN, PIN CHUN. **Ammonium sulfate from urine by base-exchange method.** *J. Chinese Chem. Soc.* 12, 19-23(1945).—*C.A.* 40, 4183[6].

Natural and artifically prepd. zeolites were examd. by passing standard NH_4OH soln. through a vertical glass tube contg. the base-exchange material. Treated Chungking coal showed 6-7 times the exchange capacity of either of the zeolites. Urine was first treated with urease, then with the base-exchange material, acidified, filtered, and evapd. The yield was 80% $(NH_4)_2SO_4$, based on the original N-content of the urine.

7960. ALEXANDER, JEROME. **Catalysis in industry, biology, and medicine.** *Sci. Monthly* 62, 407-16(1946).—*C.A.* 40, 4157[2].

The discussion included: catalysts in living units and in inheritance, genic and non-genic; differentiation as explained by catalyst changes; heritable catalyst changes as a basis of evolution, or in the development of diseases, including cancer.

7961. ANDERSEN, A. HARRESTRUP. **The pharmacology of activated charcoal. I. Adsorption power of charcoal in aqueous solutions.** *Acta pharmacol. et toxicol.* 2, 69-78(1946).—*C.A.* 40, 7415^3.

From aq. soln. 1 g of *Carbo medicinalis Merck* adsorbed 1800 mg $HgCl_2$, 1000 mg sulfanilamide, 950 mg strychnine nitrate, 800 mg morphine-HCl, 700 mg atropine sulfate, 700 mg nicotine, 700 mg veronal, 150 mg medinal, 300-350 mg phenobarbital, 300-350 mg Na alurate, 300-350 mg dial, 300-350 mg Na evipal, 300-350 mg Ca phanodorn, 550 mg salicylic acid, 400 mg phenol, 300 mg alc., or 25 mg KCN from dil. soln. Of these amts. 90% was adsorbed in 1 min.

7962. APPLEZWEIG, NORMAN AND RONZONE, SILVIO E. **Ion exchange for extracting cinchona alkaloids.** *Ind. Eng. Chem.* 38, 576-9(1946).—*C.A.* 40, 4175^5.

Com. dried cinchona bark was macerated with 0.1 *N* H_2SO_4, which was repeatedly cycled through a sulfonated coal cation exchanger and back into the maceration tank. The exchanger was regenerated with 0.5 *N* NaOH and stripped with alc., the crude alkaloid being recovered by evapn. Rectified totaquine was obtained by pptn. from aq. soln. and over-all yield of 81.2% within 82 hrs obtained.

7963. AXON, ARNOLD. **Sterile cream bases using bentonite.** *Pharm. J.* 157, 377-8(1946).—*C.A.* 43, 2367*g*.

Addn. of 2% of bentonite to ointments allowed their sterilization without sepn. of oils, caused little change in pH, and hindered formation of ice on cooling to -5°C.

7964. BLOCK, RICHARD J. **The isolation and synthesis of the naturally occurring α-amino acids.** *Chem. Rev.* 38, 501-71 (1946).—*C.A.* 40, 5701^5.

A review of the methods which were being used or showed promise of use for large-scale prepn. of the naturally occurring α-amino acids.

7965. BLOCK, RICHARD J. **A new method for the preparation of basic amino acid concentrates from protein hydrolyzates.** *Arch. Biochem.* 11, 235-48 (1946).—*C.A.* 41, 1007*f*.

Concentrates of the basic amino acids were prepd. from the hydrolyzates of blood meal, casein, fibrin, whey residue, and alkali-sol. soy protein. The concentrates were obtained by using ion-exchange resins. Detailed studies were reported with several commercially available ion-exchange resins.

7966. DENT, C. E. **Detection of amino acids in urine and other fluids.** *Lancet* 251, 637-9 (1946).—*C.A.* 42, 6395*h*.

A 1-dimensional chromatographic method employing phenol as a solvent and adapted for use with body fluids was described; 25 mm^3 of urine or other fluid was applied across a strip of filter paper immersed in molten phenol. After the solvent had crept about 25 cm past the urine level, the paper was dried at 100°C, sprayed with 1% ninhydrin in BuOH, and heated at 100°C for 10 min.

7967. DOCK, W. **Sodium depletion as a therapeutic procedure: the value of ion-exchange resins in withdrawing sodium from the body.** *Trans. Assoc. Am. Physicians* 59, 282-5(1946).—*C.A.* 42, 4273*e*.

Rats, on a diet contg. less than 0.2% Na, excreted 3.3-5.1 mg Na daily in the feces. Addn. of Ionac C284 resin to make up 10-25% of the diet increased the daily fecal loss to 34-64 mg. The Na uptake in the gut was 20-30 mg/g of resin.

7968. ELSDEN, S. R. **Application of the silica gel partition chromatogram to the estimation of volatile fatty acids.** *Biochem. J.* 40, 252-6(1946).—*C.A.* 40, 6534^2.

A $CHCl_3$ soln. of several fatty acids (formic, acetic, propionic, butyric and valeric) could be resolved by a silica-gel partition chromatogram, with bromocresol green as indicator. This procedure could be used for the identification as well as detn. in mixts. of acetic, propionic, and butyric acids. Formic acid could not be detd. by the procedure and must be removed before the soln. was analyzed.

7969. EYSTER, H. C. **Effect of auxins on the action of diastase in vitro.** *Plant Physiol.* 21, 68-74 (1946).—*C.A.* 40, 1900^6.

The interaction of auxins and diastase of malt was investigated in vitro, both in isolated and activated charcoal systems. 3-Indolepropionic acid, 3-indolebutyric acid, 3-indoleacetic acid and a-naphthaleneacetic acid were used in concns. of 25 and 50 p.p.m. at 25°C. In the activated-charcoal systems 1 ml of 1% diastase was adsorbed upon 1 g of Norit A. Auxins retarded the action of isolated diastase and accelerated the action of diastase adsorbed on charcoal in the same order.

7970. FISCHBACH, HENRY; MUNDELL, MERLIN, AND EBLE, THOMAS E. **Determination of penicillin K by partition chromatography.** *Science* 104, 84-5 (1946).—*C.A.* 40, 5792^1.

Silica gel (25 g) was thoroughly macerated with 12.5-16.5 ml 20% K phosphate buffer of pH 6.4. Washed $CHCl_3$ was added to the mixt. which was then poured into a glass cylinder of 22 mm inside diam. The column was used at 10°C. Aliquots of the penicillins, extd. into $CHCl_3$ from pH 2.0 buffer at 0°C, were passed through the column, followed by cold $CHCl_3$ to give 2 50-ml aliquots of eluate. Anesthesia ether satd. with H_2O was used as further eluent in 25-ml portions. Progress of elution was followed by iodometric assay.

7971. GOODALL, R. R. AND LEVI, A. A. **A microchromatographic method for the detection and approximate determination of the different penicillins in a mixture.** *Nature* 158, 675-6 (1946).

A modified partition chromatogram for penicillin using a 30% phosphate buffer of pH 6-7 as the stationary phase was adapted to microscale. The apparatus must be kept at 0-5°C. After 20-24 hrs the disposition and approximate amount of each invisible penicillin zone was determined by biological technique.

7972. HELBIG, W. A. **Adsorption and elution as a concentrating process. Appendix II.** *Colloid Chemistry* 6, 1176-9(1946).—*C.A.* 40, 2039[5].

A large-scale com. application in production of penicillin was described.

7973. LJUNGBERG, SIXTEN. **Chromatographic assay of fluid extract of cinchona.** *Svensk Farm. Tid.* 50, 197-202, 219-22, 237-43(1946).—*C.A.* 40, 5206[9].

Dil. 1.5 g of the cinchona prepn. with 10 cc. 95% EtOH. Suck this soln. through 10 g Al_2O_3 in a glass tube 1 cm in diam. Elute with four 5-cc. portions of the same alc., dil. with an equal vol. of H_2O, and titrate with 0.1 *N* HCl using bromocresol green as indicator to a green intermediate color. Use a buffer soln. of pH 4.3 for color comparison.

7974. MARTIN, GUSTAV J. AND WILKINSON, JOHN. **The neutralization of gastric acidity with anion exchange resins.** *Gastroenterology* 6, 315-23 (1946).—*C.A.* 41, 6583*h*.

Amberlite IR-4 brought about 80% inactivation of pepsin at the pH of 0.1 *N* HCl and 64% inactivation of trypsin in vitro. It did not adsorb thiamine-HCl or riboflavin at the pH of the normal human stomach or intestinal tract (i.e., 1.5 and 8.5, resp.). Ascorbic acid was adsorbed at pH 1.5 but desorption was complete at the pH of the normal intestinal tract. Amberlite IR-4 showed a pronounced "mol." adsorption of NaCl (in HNO_3 but not in HCl) and of Na_3PO_4 (in HCl) at pH 1.5. This adsorption was reversible; at pH approx. 8.5, recovery was apparently quant.

7975. MUKHERJEE, S. AND DAS GUPTA, K. K. **Pharmacopeial kaolin.** *Quart. J. Pharm. Pharmacol.* 19, 21-7 (1946).—*C.A.* 40, 4478[7].

Numerous kaolin samples from different sources have been tested and found to differ greatly from one another in respect to adsorptive power, dispersibility, and sedimentation vol. The differences were due, at least in part, to the presence of other minerals in the kaolin samples. Kaolin for oral administration should have a strong adsorptive power. Actual measurement of the adsorbing capacity, e.g., for methylene blue, would be necessary, before a kaolin sample could be deemed to be of value for oral use.

7976. MUKHERJEE, S.; DAS GUPTA, K. K., AND BANERJEE, R. P. **Characteristics of magnesium trisilicate.** *Quart. J. Pharm. Pharmacol.* 19, 14-21 (1946).—*C.A.* 40, 4478[4].

The total antacid powers of samples of magnesium trisilicate and of mixts. of hydrated magnesia and silicic acid, detd. by the pharmacopeial method, were, in all cases, found to be concordant with the total basicities derived from the MgO contents. Synthetic magnesium trisilicate possessed a higher adsorbing power for methylene blue than for mixts. Silicic acid possessed weaker adsorptive power than either of them.

7977. MUTCH, N. **Dried alumina.** *Quart. J. Pharm. Pharmacol.* 19, 490-519 (1946).—*C.A.* 41, 3259*b*.

The potency of alumina as an anti-acid substance for clinical use in the stomach was defined in terms of its ability to raise the pH of 0.1 *N* HCl. The desiccant power of alumina was assayed in terms of its heat-reversible water content under standard conditions of humidity. Alumina sorbed acidic dyes freely but had little affinity for basic compds. With azurine the sorbate of γ-Al_2O_3 was red, that of bauxite was blue. When amorphous bauxite was treated with an aq. soln. of acidic dye, double decompn. took place with the release of Al and the formation of a simple Al compd. of the dye. This compd. imparted a characteristic color to the sorbate.

7978. RÉGNIER, JEAN AND BAZIN, SUZANNE. **Fixation by charcoal, without agitation, of salts of 2-diethylaminoethyl p-aminobenzoate mixed with sodium salts. Determination of the bases and of the acids.** *Ann. pharm. franc.* 4, 94-6 (1946).—*C.A.* 41, 2958*a*.

Two groups of solns. were studied: (1) 2-diethylaminoethyl p-aminobenzoate -HCl and Na isobutyrate, and (2) 2-diethylaminoethyl p-aminobenzoate isobutyrate and NaCl. With both single salts and mixts. the phenomena was governed by the simple rule of the necessity of neutralization of the elec. charges which, in the single salts, resulted in fixation in the mol. state.

7979. RÉGNIER, JEAN; BAZIN, SUZANNE, AND FÉRÉ, JACQUELINE. **Fixation of various salts of 2-diethylaminoethyl p-aminobenzoate by myocardium powder. Determination of the base and of the acid radicals.** *Ann. pharm. franc.* 4, 153-6 (1946).—*C.A.* 41, 4021*e*.

By using the same technique as previously, except for the substitution of myocardium powder for carbon as substrate, it was found that fixations of the base and acid were not parallel; at all concns. for the hydrochloride and at the lowest concns. for the isobutyrate, the base was adsorbed to a greater extent than the acids; the reverse was true with β-phenylpropionate and citrate. In addn. to the ionization of the adsorbing protein, a certain combination between anion and cation may be a contributing factor.

7980. SHAW, F. H. AND FORSHAW, A. **Estimation of adrenaline.** *Australian J. Exptl. Biol. Med. Sci.* 24, 53-5 (1946).—*C.A.* 40, 4849[6].

Previous biol. estns. of adrenaline were complicated by the presence of other pharmacologically active principles, and chem. estn. lacked specificity. Adrenaline was sepd. from accompanying drugs by selective adsorption on $Al(OH)_3$, and assayed both biologically and chemically. The method applied to adrenaline concns. from 0.2 to 1.0 μg.

7981. SILBERMAN, HENRYK AND SILBERMAN-MARTYNCEWA, SOFIA. **Chromatographic separation of bile acids. I. Separation of cholic and desoxycholic acids.** *J. Biol. Chem.* 165, 359-63 (1946).—*C.A.* 41, 58*f*.

A suitable chromophoric reagent for the esterification of the —COOH group was ω-bromo-*p*-methylazobenzene, which reacted with the Na salts of the acids with a yield of 85% or more of the corresponding esters. $MgCO_3$ proved a very satisfactory adsorbent for the colored esters dissolved in benzene. In the chromatogram, the ester of cholic acid was adsorbed on top as an orange-colored band; the desoxycholic ester was placed below and was lighter in color. A narrow, almost white band developed between these 2 bands of esters.

7982. SILCOX, HERBERT. **Production of streptomycin.** *Chem. Eng. News* 24, 2762-4(1946).—*C.A.* 41, 252*c*.

Streptomycin was produced by aerobic fermentation in 15,000-gal fermenters and filtered on pressure rotary precoat filters with advancing knives and H_2O washing. The filtrate was admixed with activated carbon and refiltered. The streptomycin-rich charcoal adsorbate was then washed with EtOH and eluted with acid-EtOH soln. The acid eluate was neutralized and concd., and the streptomycin pptd. by solvents as the crude hydrochloride, which was further purified to eliminate pyrogens and other toxic and undesirable constitutents.

7983. SPERBER, ERIK. **Electrolytic separation of basic, neutral, and acidic amino acids in protein hydrolyzates.** *J. Biol. Chem.* 166, 75-7 (1946).—*C.A.* 41, 1264*f*.

A procedure was presented for sepg. the different classes of amino acids by combining the adsorption procedure and electrophoresis. For the adsorption a protein hydrolyzate freed from acid was adsorbed with Amberlite IR-4 resin. This was placed in the middle cell of the app. By the addn. of more resin it was possible to prevent the pH from falling below 4.5. An example of a synthetic hydrolyzate contg. arginine, histidine, glycine, and glutamic acid was described. Losses of amino acids were very small. Ordinarily 2 runs were sufficient to complete the sepn. into acid, neutral, and basic amino acids.

7984. WILKINSON, JOHN AND MARTIN, GUSTAV J. **Physicochemical aspects of the action of anion exchange resins in biochemical systems.** *Arch. Biochem.* 10, 205-14(1946).—*C.A.* 40, 6510^2.

Peptic activity was markedly reduced in the presence of an amine-formaldehyde resin. The reduction in peptic activity was presumed to be due in part to the removal of pepsin by adsorption. The adsorption of chloride, phosphate, ascorbic acid, methylene blue by the resin was not of the "exchange" type, but rather of a "molecular" type, e.g., a typical Freundlich adsorption isotherm was obtained.

7985. ANDERSEN, A. HARRESTRUP. **The pharmacology of activated charcoal. II. Effect of pH on adsorption by charcoal from aqueous solutions.** *Acta Pharmacol. Toxicol.* 3, 199-218 (1947)(in English).—*C.A.* 42, 5557*d*.

Weak bases such as nicotine were most effectively adsorbed by medicinal charcoal (Merck) from dil. aq. solns. at an alk. pH. Weak acids (phenols, diethylbarbituric acid, salicylic acid) were best adsorbed at an acid pH. Ampholytes such as sulfanilamide were best adsorbed at the isoelec. point. The adsorption of a nonelectrolyte (EtOH) was unaffected by changes in pH. Weakly dissocd. metallic salts such as $HgCl_2$ were adsorbed least at strongly acid reactions where formation of complex ions was favored.

7986. BJÖRLING, CARL OLOF. **Adsorption analysis of alkaloid salts of multivalent acids.** *Acta. Chem. Scand.* 1, 392-402(1947)(in English).—*C.A.* 42, 5614*b*.

Adsorption of procaine-HCl (0.1200 g) in alc. (5 ml) on Al_2O_3, followed by elution with successive 5 ml portions of alc. (total 10-20 ml), gave quant. yields of the free base; the acid was retained by the adsorbent. Salts of procaine with HCl, HNO_3, AcOH, $CH_2ClCOOH$, PhCOOH, H_3BO_3 (1:1) gave quant. results. The salts of H_2SO_4, $(COOH)_2$, citric, and tartaric acids did not give complete recovery even after prolonged elution; this may be due to firmer binding between Al_2O_3 and the salts of polybasic acids. Addn. of equiv. amts. (0.25 ml) of 2 *M* aq. HCl or HNO_3 to the alc. soln. of procaine tartrate before adsorption yielded quant. elution. NaOH, KOH, and NH_4OH facilitated elution but yielded alkali-insol. tartrates which prolonged the time of elution.

7987. BOULET, M.; NELSON, J. A., AND MCFARLANE, W. D. **A rapid colorimetric method for the determination of lysine in protein hydrolyzates.** *Can. J. Research* 25B, 540-7 (1947); *Federation Proc.* 5, 148 (1946).—*C.A.* 42, 2302*h*.

Weigh out 700 mg Decalso, wash 3 times by decantation with 3% NaCl soln. then with water until free of Cl. Pour 25 ml water through a 75-mm funnel upon a pledget of cotton near the tip, follow with a suspension of the Decalso and place another pledget on top of the 10-cm column, and wash with 5 ml 10% pyridine. Reflux enough protein to contain 2-15 mg lysine for 24 hrs with 10 ml 6 *N* HCl for 24 hrs. Evap. to dryness under vacuum, take up in 10.00 ml 10% pyridine and filter. Pass 1.00 ml of this through the column. When a depth of 1 mm remains above the column pass 3 one-ml portions of 10% pyridine through the column, follow with 100 ml 10% pyridine and then with 4 ml water. All the amino acids will have passed through the column while lysine and arginine, which gives no color with the reagent, have been adsorbed.

7988. BRAECKMAN, P. **Suspensions of barium sulfate for x-ray work.** *Pharm. Weekblad* 82, 709-19 (1947) (English summary).—*C.A.* 42, 3133*d*.

The sedimentation velocity of $BaSO_4$ in solns. of 0.94-7.5% gum arabic in 0.01 *N* Na citrate showed that the peptizing agent had the strongest influence on the sedimentation of the smaller particles, while the viscosity of the medium played the most important role for the coarser ones. Better results were obtained if the $BaSO_4$ was evapd. together with the gum soln., and the residue powdered and suspended in the proper amt. of solvent. At pH 3 a mixt. of 10 parts $BaSO_4$ with 1 part of gum arabic gave best results.

7989. CHRISTENSEN, G. LINDHARD AND NENSEN, B. K. **A chromatographic-colorimetric method of identification of tinctures.** *Dansk Tids. Farm.* 21, 68-73 (1947).—*C.A.* 41, 4611*i*.

The conventional chromatographic technique was adapted for the chromatography of tinctures. Most of the tinctures of the *Pharmacopeia Danica* have been chromatographed and color reproductions given to aid in the identification of the respective prepns.

7990. DAGLISH, C. **Adsorption of vitamin B_1 from solutions of the pure substance.** *Quart. J. Pharm. Pharmacol.* 20, 257-63(1947).—*C.A.* 42, 1386*i*.

The conditions under which aneurine (vitamin B_1) could be quantitatively adsorbed and eluted from columns of zeolite appeared to have very wide limits. The zeolite must be activated by boiling, or treatment with hot AcOH and KCl solns. The KCl could be replaced by NaCl in the activation step provided the K salt was used in the eluting soln. The reverse was not true. Neither could Ca replace K in the eluting soln. Higher recoveries were obtained if activated zeolite columns were pretreated *in situ* with 5 ml of 3% AcOH immediately prior to the adsorption of the aneurine soln. Activated zeolites could be stored equally well dry or under water without loss of efficiency.

7991. DENT, C. E. **The aminoaciduria in Fanconi syndrome. A study making extensive use of techniques based on paper partition chromatography.** *Biochem. J.* 41, 240-53 (1947).—*C.A.* 42, 663*d*.

The developments in the technique of paper chromatography were discussed. The following free amino acids were found in the urine with the approx. amts. in a 24-hr specimen: cystine, aspartic acid, glutamic acid, serine (0.25 g), glycine (0.8 g), threonine (0.5 g), alanine (1.0 g), valine (0.5 g), leucine and (or) isoleucine (0.4 g), methionine (0.34 g), phenylalanine, tyrosine (0.5 g), arginine, citrulline, histidine, proline, hydroxyproline, and α-aminobutyric acid. Considerable amts. of a compd., probably serylglycylglycine, were also found.

7992. DUVE, C. DE AND SOMER, P. DE. **Treatment of penicillin solutions with adsorbent charcoals.** *Bull. soc. chim. biol.* 29, 367-9 (1947).—*C.A.* 41, 7684*e*.

Penicillin produced in a modified Czapek-Dox medium was more completely adsorbed from the medium at pH 5 by adsorbent charcoals and more completely eluted by org. solvents than was the case with penicillin produced in a corn steep liquor medium. If the corn steep liquor was treated with 2% of Norit and filtered before use, the rate of growth of the mold on the medium was nearly doubled, but the penicillin production was decreased 10-20%.

7993. FISCHBACH, HENRY; EBLE, THOS. E., AND MUNDELL, MERLIN. **Separation of penicillin by partition chromatography.** *J. Am. Pharm. Assoc., Sci. Ed.* 36, 220-3(1947).—*C.A.* 41, 7661*h*.

By use of the previously described partition chromatography procedure, penicillin K was detd. in a mixt. of penicillins. There was sufficient resolution of the other penicillins to permit the isolation and purification of a penicillin F. The results indicated that, at best, recoveries of 80-85% of penicillin dihydro F could be obtained under the conditions necessary for optimum resolution of all the penicillins, there being an unaccountable destruction of some of the penicillin dihydro F. Under standardized conditions the method gave reproducible results ± 2% for penicillin K.

7994. FUCHS, L. AND RIZZI, A. **Form of carbon unsuitable for medical uses.** *Scientia pharm.* 15, 21-4 (1947).—*C.A.* 42, 2401*g*.

Carbon intended for gas masks was unsuitable for medical use, because of its low adsorptive power and its content of Cu and water-sol. substances.

7995. GOODALL, R. R. AND LEVI, A. A. **A microchromatographic method for the detection and approximate determination of the different penicillins in a mixture.** *Analyst* 72, 277-90 (1947).

Various penicillins in a mixt. were sepd. by a micro partition chromatographic technique, based on differences in distribution of the penicillins between ether (mobile phase) and phosphate buffer (stationary phase) supported on a strip of filter paper. The sepd. penicillins were invisible, but after incubation in contact with an agar sheet, pre-inoculated with *B. subtilis* spore suspension, elliptical zones free from bacterial growth were clearly visible in the neighborhood of each active component. The technique was highly sensitive, 1 μl. of soln. (1 to 30 international units) being adequate for a qual. sepn.

7996. HAAS, ELISABETH. **Atropine and adsorbents in vivo.** *Arch. exptl. Path. Pharmakol.* 204, 369-74 (1947).—*C.A.* 44, 4195*g*.

Previous investigations have shown that atropine, l-hyoscyamine was destroyed by adsorbents, although even before its destruction it was so firmly held that only a slight amt. was released by 0.1 *N* HCl. Expts. were carried out on rats to det. to what extent l-hyoscyamine remained effective when administered with adsorbing powders. Results reported showed that, at most, half of the activity was retained.

7997. JOHNSTON, CARTER D. **Identification and chromatography of androgens as their 2,4-dinitrophenylhydrazones.** *Science* 106, 91 (1947).—*C.A.* 41, 6597*a*.

The 2,4-dinitrophenylhydrazones of testosterone, testosterone propionate, methyltestosterone, androsterone and dehydroisoandrosterone colored red, red, orange, yellow, and yellow, resp., were prepd. in 95-100% yield. When a mixt. of the hydrazones of testosterone and testosterone propionate was subjected to chromatographic adsorption, the constituents were readily sepd. and recovered in yields of 97 and 91% resp., the fractions being identified by m.p. after recrystn.

7998. KASHINSKIĬ, P. A. AND VESELOVSKIĬ, N. V. **Scheme for analysis of medicinal mud and the form of recording its results.** *Gidrokhim. Materialy (Hydrochem. Materials)* 13, 3-21 (in English, 21-2) (1947).—*C.A.* 45, 4405*b*.

The following inadequacies of the Shchukarev method were: (1) the amts. of "decompn. products of siliceous particles" were low by 30-70% or more, because silicic acid sepd. as a gel was not included; (2) results of mech. analysis were too high because of silicic acid gel; and (3) the contents of the adsorbed cations given were unreliable. Results of analysis obtained by several investigators were provided and a modified scheme of analysis, based on the Shchukarev method was presented.

7999. KOBOZEV, N. I. **The principle of ensemble and aggravation in catalysis. III. A superstructure factor of activity. (Aggravation effect in catalysis and kinetics.)** *J. Phys. Chem.* (U.S.S.R.) 21, 1413-33(1947)(in Russian). —*C.A.* 42, 5319*e*.

The catalytic activity of Fe^{+++} increased from the complex $Fe_3O_4.Al_2O_3$ to hemin-imidazole, the carboxylase activity of amines increased from CH_3NH_2 to carboxylase in which NH_2 was attached to a protein residue, etc. In gaseous unimol. reactions the reaction const. increased, and the energy of activation decreased, when the mol. wt increased. The effect of aggravation was proportional to $e\beta^M$, β being a const. and M the mol. wt of aggravating substance. The greater M, the smaller is the mass necessary for the given action.

8000. KOCHOLATY, WALTER AND JUNOWICZ-KOCHOLATY, RENATE. **Use of cation exchangers for the concentration and purification of antibiotics of basic nature.** *Arch. Biochem.* 15, 55-64(1947). —*C.A.* 42, 3020*b*.

Streptothricin was concd. by adsorption on Decalso, Amberlite, or Permutit. It was then eluted with NaCl soln. and the soln. was evapd. to dryness under reduced pressure. The residue was taken up in MeOH, and streptothricin was pptd. on the addn. of ether. The ppt. was taken up in H_2O, decolorized with charcoal, and lyophilized.

8001. KRAEMER, MANFRED. **A new antacid for peptic ulcers.** *Postgraduate Medicine* 2, 431-37 (1947).

Synthetic antacid resins did not have any untoward effect on the digestive tract. They caused neither constipation nor diarrhea. Since they were not absorbed, they did not alter the acid base balance of the body.

8002. KRAEMER, MANFRED AND LEHMAN, DAVID J. JR. **The treatment of peptic ulcer with anion exchange resins. A preliminary report.** *Gastroenterology* 8, 202-4 (1947).

It seems probable that synthetic resins will find a place in the treatment of peptic ulcer. They showed no ill-effects upon the gastrointestinal tract and were valuable substances for controlling gastric hyperacidity without the annoying side-effects of constipation and diarrhea. They cannot upset the acid-base balance of the blood.

8003. MARTIN, GUSTAV J. AND WILKINSON, JOHN. **Absorption by ion-exchange materials of putrefactive chemicals.** *Arch. Biochem.* 12, 95-100 (1947).—*C.A.* 41, 3137*f*.

Putrescine, histamine, pyramine, indole, and skatole were strongly absorbed on Amberlite IR-4 and on zeolite. The absorption curves followed the Freundlich isotherm. Adding Amberlite and zeolite to the diet of rats which contained indole and guanidine acetate, resp., reduced the no. of deaths from approx. 60 to 20%.

8004. MUKHERJEE, S. **Standards of pharmacopeial charcoal.** *Pharm. J.* 158, 66-7 (1947).—*C.A.* 41, 2537*i*.

Max. limit for ash should be higher than in the U.S.P., i.e., 7%, the upper limit of acid-sol. fraction should not be more than 2.0%. The U.S.P. XII method for testing for heavy metals was preferred to the Codex method; adsorption tests for water vapor, methylene blue, iodine, strychnine, and caramel should be incorporated. The standards for adsorptive power of 0.1 g charcoal should be complete adsorption from 20 cc. of 0.1% soln. of methylene blue and from 25 cc. of 2% caramel.

8005. OPPIKOFER, FRANZ. **The influence of an adsorbent (carbon) on the biological activity of garlic. An incompatibility to avoid.** *Schweiz. Apoth. Ztg.* 85, 849-50(1947).—*C.A.* 42, 2398*g*.

In the presence of moisture, allicine (the active constituent of garlic) was unstable. The juice of garlic when preserved, at 4°C, in a bottle with a glass stopper showed, at the end of 15 days, bacteriostatic activity of about 22.8 Oxford Units per cc. The effect of the juice on the growth of *Staphylococcus aureus* and *Escherichia* was completely annulled by the addn. of 5% carbon, but the odor of the juice was practically unaffected.

8006. PAPAGEORGE, EVANGELINE AND LAMAR, MARGARET VOGT. **A comparison of three thiochrome methods for urinary thiamine by a simplified base-exchange procedure.** *Arch. Biochem.* 14, 310-24 (1947).—*C.A.* 42, 1619*d*.

The detn. of thiamine by the thiochrome method was carried out by adsorption, elution, oxidation and extn. successively in the same vessel.

8007. QUICK, ARMAND J. **The quantitative relationship between calcium and prothrombin.** *Am. J. Physiol.* 148, 211-21 (1947).—*C.A.* 41, 2149*f*.

The Ca of dog and human blood was removed by means of Amberlite IR-100. With the plasma thus obtained, a direct quant. study of the effect of added Ca salts was made. The min. concn. of $CaCl_2$ required for max. prothrombin activity of human plasma was approx. 0.0012 M and for dog plasma 0.0004 M. The optimum or critical concns. for both human and dog plasma were below the level of the free or ionized Ca.

8008. SEGAL, HARRY L.; HODGE, HAROLD C.; WATSON, JAMES S. JR., AND COATES, HILDA A. **A polyamine-formaldehyde resin. III. Chronic-toxicity experiment in rats.** *Gastroenterology* 8, 199-201 (1947).—*C.A.* 41, 5988*b*.

Groups of rats were fed diets contg. 0, 0.5, 2, and 20% of Amberlite IR-4 for 8 months. Wt curves, urinary and blood studies, and autopsy observations indicated that in concns. of 0.5 and 2% of the diet the purified resin exhibited a very low order of toxicity. The rats receiving the 20% resin diet were essentially normal, with the exception of 3 rats in which changes were found in the mucosa and submucosa of the stomach. The over-all toxicity for rats of this resin appeared to be negligible.

8009. Smith, W. **Assay of Fuller's earth for montmorillonite content.** *Quart. J. Pharm. Pharmacol.* **20**, 367-72(1947).—*C.A.* **42**, 1396*g*.

A method of differentiating between genuine Fuller's earth and other types of earth, such as kaolin, by means of base-exchange capacity was given. Results were given for various earths submitted to the above test.

8010. Spears, Mary M. and Pfeiffer, Mildred C. J. **Anion exchange resin and peptic ulcer pain.** *Gastroenterology* **8**, 191-98 (1947).

The effect on peptic ulcer pain of an anion exchange resin was studied in a group of 30 patients, all but one experiencing pain relief. Relief of pain was not synonymous with healing of the ulcer. No serious toxic effects from the use of the resin were noted. An insoluble, non-absorbable anion exchange resin had speedy action and acid neutralizing powers, which inhibited pepsin activity, caused no acid rebound, no constipation and no removal of phosphate or chloride ions from the body fluids.

8011. Tappi, Guido. **The chromatographic separation of *p*-aminobenzoic acid from procaine.** *Gazz. chim. ital.* **77**, 115-16 (1947).—*C.A.* **41**, 7655*h*.

In neutral medium, silica gel did not adsorb *p*-$H_2NC_6H_4CO_2H$ but did adsorb procaine almost completely, even when their concns. were very different. Elution of procaine was easily carried out by dil. acids. Silica gel (through a sieve of 900 meshes/cm^2 and sepd. from too fine particles by silk of 8100 meshes/cm^2) was treated with boiling 5% H_2SO_4 for 15 min., washed with distd. water, placed in a column 20 ml long and 1 cm^2 cross-section; pass 5-30 ml of soln., to which had been added 0.5-3 ml of aq. phosphate buffer, through at the rate of 2 drops per min., washed by percolating distd. water, and detd. the *p*-$H_2NC_6H_4CO_2H$ in an aliquot part of the combined percolated liquor and wash water. Eluted the procaine with 2/3 *N* H_2SO_4 (3 treatments of 5 ml each, followed by washing with water).

8012. Wolfrom, M. L.; Weisbalt, V. I.; Kaiabinos, J. V., and Keller, O. **A galactogen from beef lung.** *Arch. Biochem.* **14**, 1-6 (1947).—*C.A.* **42**, 233*g*.

A galactogen ($[\alpha]_D$ + 18°C, H_2O) had been isolated from beef lungs by pptn. with EtOH. The prepn. was water-sol. (25.0 g/100 g H_2O) and had a relative viscosity of 1.43 (25°C, c 5, H_2O). Chromatographic and hydrolysis studies indicated that galactose was the only carbohydrate in the galactogen.

8013. Bennett, Edward L. and Niemann, Carl. **The use of ion-exchange resins in the isolation of blood group A-specific substances from hog gastric mucin.** *J. Biol. Chem.* **176**, 969-75 (1948).—*C.A.* **43**, 4316*e*.

"De Acidite" (Permutit) mucin gave undegraded "A" as active as that obtained from the same source by EtOH fractionation. The resins removed some of the assocd. substances leaving "A" in soln.

8014. Bersin, Th. and Loheyde, Inge. **Exchange adsorption in nonaqueous solutions. II.** ***cis*- and *trans*- Estradiol.** *Z. Physiol. Chem.* **283**, 275-6 (1948).—*C.A.* **44**, 6468*b*.

Dimethylaminoazobenzene-*Bolus alba* adsorbate (200 mg) was shaken with a 0.001 *M* soln. of both *cis*- and *trans*-estradiol in abs. benzene, centrifuged, and the extinction coeff. of the displaced dye detd. in a photometer. The cis form showed about 30% greater adsorption than did the trans.

8015. Chargaff, Erwin; Levine, Celia, and Green, Charlotte. **Techniques for the demonstration by chromatography of nitrogenous lipide constituents, sulfur-containing amino acids, and reducing sugars.** *J. Biol. Chem.* **175**, 67-71 (1948).—*C.A.* **43**, 264*g*.

For lipide constituents, hydrolyzates of the phosphatides were chilled, filtered, dried *in vacuo*, the residues taken up in various solvents, adjusted to pH 7, and 0.01 cc. submitted to unidimensional chromatography on filter paper strips. Presence of choline was shown by its conversion to choline phosphomolybdate followed by reduction to Mo blue, using butanol as a solvent. For serine and ethanolamine, the solvent butanol with ninhydrine was used, producing colored spots. Presence of reducing sugars was shown by the production of brightly fluorescent spots by condensation of these sugars with *m*-phenylenediamine, using various solvents (butanol, collidine, pyridine, or diacetone alc.). As little as 10 γ showed spots under a quartz lamp.

8016. Dasler, Waldemar. **Hydrolysis of steroid esters on activated alumina.** *Science* **107**, 369 (1948).

Partial hydrolysis of steroid esters during chromatography has been frequently encountered without being recognized. Recent work indicated that the *p*-phenylazobenzoates of sterols were more resistant to hydrolysis than some of the other esters when chromatographed on activated alumina.

8017. Dent, C. E. **Paper chromatography of amino-acids.** *Biochem. J.* **43**, 169 (1948).

The 2-dimensional filter-paper method of partition chromatography was applied, using solvents phenol and "collidine". The positions taken up by these substances on the paper square were shown. With additional tests the method could be applied to the identification of all the ninhydrin-reacting substances likely to be present in biological fluids. The ninhydrin color reaction as used here was pos. for many aliphatic amines and also for β-, γ-, δ-, and ε-amino-acids.

8018. Elmore, D. T. **Separation of pyrimidine nucleosides by synthetic resin ion-exchangers.** *Nature* **161**, 931 (1948).—*C.A.* **43**, 3423*h*.

Cytidine and uridine were sepd. from the aq. pyridine hydrolyzate of yeast ribonucleic acid using a column of the cation-exchange resin "Zeo-Karb 215.". Cryst. cytidine (71-78% recovery), was obtained by elution from the column with 0.1 *N* aq. NH_4OH and evapn. Cryst. uridine (about 99% recovery), was obtained from the percolate and aq. washing by evapn.

8019. EVANS, W. C. AND PARTRIDGE, M. W. **Partition chromatography of alkoloids I. Solanaceous alkoloids.** *Quart. J. Pharm. Pharmacol.* 21, 126-37 (1948).—*C.A.* 42, 7486*i*.

A simple method for the sepn. of hyoscine and hyocyamine by partition chromatography was described. The scope of the method when applied to the total alkaloids of *Datura stramonium* and *Atropa belladonna* was indicated. *Datura ferox* contained as principal alkoloids, hyoscine and meteloidine. A rapid method for the detn. of the thiocyanate radical in reineckates was described.

8020. GAGE, THOMAS B.; DOUGLASS, CARL D., AND WENDER, SIMON H. **The purification and estimation of quercetin by paper-partition chromatography.** *Proc. Okla. Acad. Sci.* 29, 64-7 (1948)(Pub. 1950).—*C.A.* 46, 3908*b*.

Sepn. of quercetin from a crude prepn. by paper chromatography in BuOH-AcOH-H_2O, leaching with EtOH, and spectrophotometric detn. via the absorption max. at 375 mμ gave a quant. recovery of quercetin within 2-3%. Interference by an impurity in the paper or solvents was noted.

8021. GAGE, THOMAS B.; GALLEMORE, CLARA, AND WENDER, SIMON H. **Chromatographic adsorption studies on certain flavones.** *Proc. Okla. Acad. Sci.* 29, 71-3(1948)(Pub. 1950).—*C.A.* 46, 3828*e*.

Talk, magnesol, silica gel, Al_2O_3, and $BaSO_4$ were tested chromatographically as adsorbents for one or more of the following flavones: quercetin, quercitrin, rhamnetin, xanthorhamnin, homoeriodictyol, *d*-catechol, rutin, and naringin. Al_2O_3 gave irreversible adsorption and talc none; the other three were satisfactory.

8022. GALAT, ALEXANDER. **Nicotinamide from nicotinonitrile by catalytic hydration.** *J. Am. Chem. Soc.* 70, 3945 (1948).—*C.A.* 43, 1411*c*.

IRA-400 (washed with 5% NaOH and freed of alkali), 10.4 g nicotinonitrile, and 75 ml H_2O, refluxed 1 hr, gave 86-90% nicotinamide, m.p. 128.5-9.5°C.

8023. GRIDGEMAN, N. T.; GIBSON, G. P., AND SAVAGE, J. P. **Chromatographic estimation of vitamin A in whale-liver oil.** *Analyst* 73, 662-8(1948).—*C.A.* 43, 3565*a*.

The chromatographic column consisted of a glass tube about 45 cm long and of 6-7 mm internal diameter drawn out and plugged with cotton wool at one end. The adsorbent was 100-200 mesh activated Al_2O_3. The unsaponifiable matter developed in well-defined zones. One zone consisted of vitamin A only. It was eluted by seriatim with polar solvents.

8024. HARRIS, R. J. C. AND THOMAS, J. F. **Isolation and separation of the pyrimidine nucleosides of yeast ribosenucleic acid.** *Nature* **161**, 931 (1948); *J. Chem. Soc.* **1948**, 1936-9.—*C.A.* 43, 144*e*, 2666*g*.

Uridine was sepd. from a nucleoside solution in one operation by an ion exchange method using a zeo-carb column. When a mixture of cytidine and uridine was percolated through the exchanger, cytidine was retained by the resin, and uridine alone appeared in the effluent. Washing with water recovered the uridine quantitatively, and the cytidine may subsequently be recovered by treatment of the resin with 2% aqueous pyridine.

8025. HATA, TOJU; KIKUCHI, TSUNEO, AND OGUCHI, HIROSHI. **Purification of penicillin by a chromatographic method. I. Chromatographic method with alumina. II. Chromatogram with silica gel.** *Kitasato Arch. Exptl. Med.* **21**, 246-50, 251-5 (1948).—*C.A.* **45**, 310*b*.

A single passage of a Q-176 strain of penicillin ext. through alumina (BL6-Nippon Alumina Co.) increased the γ/mg content from 264 to 984 and from 956 to 1210. Repeated passages gave no increase. The Nippon alumina was equal to alumina (Merck) for this purpose. Silica gel satd. with pH 6 phosphate buffer was inferior to alumina for the isolation of penicillin. The order of sepn. in the silica gel tower was, from top to bottom, penicillins X, G, F, and K.

8026. HOFMANN, H. AND NEUBAUER, M. **Medicinal charcoal and the differences in adsorption capacity of various charcoal preparations.** *Pharmazie* 3, 529-31(1948).—*C.A.* 43, 3974*f*.

The adsorption capacity of various animal and vegetable charcoals was compared with the I_2 and the methylene blue adsorption methods. The *in vivo* potency was based on the detoxifying power of coadministration with strychnine in frogs. The animal charcoals proved superior.

8027. HORNE, RAYMOND E. JR. AND POLLARD, ARTHUR L. **Identification of streptomycin on paper strip chromatograms.** *J. Bacteriol.* 55, 231-34 (1948).

The chromatographic method was apparently highly selective for streptomycin. The mechanism involved was a salting-out process. The paper strip method of studying salting-out effects at low salt concns. might be useful in biochem. fields other than antibiotics.

8028. INAGAKI, CHOTEN. **Use of thiamine of sweet potato.** *Shokuryô no Kagaku* (Sci. of Foods) 2, 2-3(1948).—*C.A.* 47, 2431*b*.

In one method of storing sweet potato by coarsely cutting it and pressing, pressed juice was left, from which thiamine was concd. by adsorbing on acid clay. Addn. of 0.2% acid clay to the centrifuged sweet potato juice produced after 1 hr an almost colorless dried concentrate contg. 300 γ thiamine per g clay.

8029. KARNOVSKY, M. L.; RAPSON, W. S., AND VAN RENSBURG, N. J. **The transesterification and chromatographic treatment of fish liver oils as a means of concentrating vitamin A.** *J. Am. Oil Chemists' Soc.* 25, 36-8 (1948).—*C.A.* 42, 4309*i*.

In the chromatographic sepn. of vitamin A the material (1 g) was dissolved in pure dry benzene (50 ml) and passed through a column of alumina 20 cm high and 8 cm in diam. for 1 hr. The column was washed until 65 ml of benzene had been collected in a 100-ml flask and after changing this for a tared receiver, a mixt. of 5% EtOH in benzene was then passed down the column. The solvent was removed under vacuum until const. wt was attained. The vitamin A content was then detd.

8030. Kasdon, S. Charles. **Anion exchange resins in the treatment of heartburn during pregnancy.** *New Engl. J. Med.* **239**, 575-7 (1948).

An anion exchange resin, identical to that used in the treatment of peptic ulcers, was investigated as a means of eliminating heartburn during pregnancy. Eighty-eight percent of patients treated experienced complete relief.

8031. Khorama, M. L. and Motiwala, D. K. **Anthelmintics. Isolation of calycopterin from** *calycopteris floribunda. Indian J. Pharm.* **10**, 98-9(1948).—*C.A.* 43, 3565*i*.

Benzene solns of pure calycopterin were chromatographed on various adsorbents with the following results: (1) Na_2CO_3, no adsorption. (2) Activated charcoal, all coloring matter, including calycopterin, was adsorbed and the filtrate was colorless. (3) Activated MgO; four zones were obtained: dark green, red, brown, and yellow. The filtrate was colorless. (4) Activated alumina; a dark brownish green zone was obtained and the filtrate was yellow. (5) Wood ash; the filtrate was yellow. All other colors, including calycopterin, were adsorbed.

8032. Kingsbury, A. W.; Mindler, A. B., and Gilwood, M. E. **Recovery of nicotine by ion exchange.** *Chem. Eng. Progress* **44**, No. 7, *Trans. Am. Inst. Chem. Engrs.* 497-500 (1948). —*C.A.* 42, 6060*e*.

Cigaret tobacco drier gases were passed through a scrubbing tower, the H_2O being recirculated to build up the concn. of nicotine. The soln. was then passed through a H-cation exchanger bed where the nicotine was removed. The nicotine was then extd. from the H-exchanger by a one-step recovery process or used directly as Nicotine Zeo-Karb, an insecticide. Nicotine alkaloid recoveries of 75% were reported. Virtually 100% of the nicotine was removed from the drier waste gases.

8033. Moss, J. N. and Martin, Gustav J. **Inhibition of lysozyme activity.** *Am. J. Digestive Disease* **15**, 412-14 (1948).—*C.A.* 43, 8405*h*.

Large quantities of lysozyme in human gastric juice taken from patients with peptic ulcers were inhibited by the adsorbents bentonite, activated carbon, a polyamine and ion exchange resin.

8034. Muirhead, E. E. and Reid, Allen F. **A resin artificial kidney.** *J. Lab. Clin. Med.* **33**, 841-44 (1948).

The artificial kidney consisted of a resin bed composed of nine parts of Amberlite IR-100 H and one part of Deacidite. The Amberlite was a typical cation exchange resin with exchange activity on $-O^-$, $-COO^-$, and $-SO_3^-$ groups. The Deacidite was a typical anion exchange resin with exchange activity on $\equiv N(H_3O)^+$ groups. A simple technique removed nitrogenous waste products. Removal of excessive amounts of cations may be attained by varying the conditioning of the resin.

8035. Naftalin, L. **Quantitative chromatographic estimation of α-amino acids.** *Nature* **161**, 763 (1948).—*C.A.* 42, 5938*g*.

The α-amino acids were estd. in quantities of 0.2μ in serum and blood by a procedure using filter paper treated with ninhydrin. The spots were cut out, dried, heated to various temps., extd., and the amino acid estd. in the Hilger Spekker absorptiometer.

8036. Newberger, S. H. **Analysis of mixtures of hydrocarbons, beeswax, and spermaceti.** *J. Soc. Cosmetic Chem.* **1**, 95-102(1948).—*C.A.* 42, 5167*i*.

A method and procedure for the analysis of mixts. of hydrocarbons, beeswax, and spermaceti based on chromatography were described and results of typical sepns. given. The method may be useful in detecting adulteration of beeswax or spermaceti by hydrocarbons.

8037. Oda, Hyohei; Shimizu, Hiroshi, and Nakayama, Yoshio. **Ion exchange synthetic resins. XIV. Separation of vitamin B_1.** *Chem. High Polymers* (Japan) **5**, 142-5 (1948).—*C.A.* 46, 1185*h*.

Vitamin B_1 was sepd. from rice-bran ext. by RCOONa-type resin (phenoxyacetate-HCHO). The simple adsorption capacity was 200 γ/g and adsorption efficiency 85%. H_2SO_4 (10 *N*) was the best desorbing liquid.

8038. Omote, Yoshimori. **Vitamins A and D and related substances by molecular distillation. I. Catalytic action of metals on Vitamin A.** *J. Chem. Soc. Japan, Ind. Chem. Sect.*, **51**, 115-16(1948).—*C.A.* 44, 9634*g*.

Squalus suckleyi liver oil, 3 cc., (acid value 0.5, I value 140, vitamin A units 5.9) was heated 10 min. at 200°C at a pressure of 10^{-2}—10^{-3} mm Hg with different metal plates (1 × 1 × 0.1 cm) immersed in the oil. The order of rates of catalytic decompn. of vitamin A was: Cr < Ni < duralumin, Al, Sn, P bronze < Ag, Cu, and Fe < brass, Pb < Zn.

8039. Phillips, D. M. P. **Rapid R_F measurement in chromatography.** *Nature* **162**, 29 (1948).

A device useful for the rapid measurement of R_F values on paper partition chromatograms was described.

8040. Phillips, Ralph W. and Van Huysen, Grant. **Dentifrices and the tooth surface.** *Am. Perfumer* **51**, 33-7(1948).—*C.A.* 42, 2401*h*.

$CaCO_3$, both extra heavy and standard drug, produced a marked abrasion of the tooth surface and therefore had little polishing action; $Ca_3(PO_4)_2$ and dicalcium phosphate were relatively inert in their polishing action. A mixt. consisting of Na metaphosphate and Ca phosphate proved superior in its ability to polish tooth enamel.

8041. Pratt, John J. Jr. and Auclair, Jacques L. **Sensitivity of the ninhydrin reaction in paper partion chromatography.** *Science* **108**, 213-14 (1948).—*C.A.* 42, 8237*f*.

Solns. were placed on the filter paper, run 28 hrs in water-satd. phenol in one dimension, dried, run for 60 hrs in the 2nd dimension in a water-satd. 1:1 mixt. of γ-collidine and 2,4-lutidine, and again dried. The paper was then sprayed with a 0.1% soln. of ninhydrin in BuOH and heated in an oven at 80°-100°C for 5 min. Data were tabulated on the min. quantity of compd. detectable (0.1 to 25γ), color of spot, and R_f (distance compd. moved along paper/distance the solvent moved) for both solvent systems and both directions.

8042. RAUEN, H. M. AND WOLF, L. **The adsorption of glutamic acid on aluminum oxide.** *Z. Physiol. Chem.* 283, 233-42(1948).—*C.A.* 44, 6228*a*.

Anionotropic Al_2O_3 had an adsorbing power of 1 glutamic acid unit when 1 g of dry substance adsorbed 1 mg glutamic acid. Different prepns. of Al_2O_3 had different adsorptive powers. The adsorption power could be increased 2.7-3.4 times by adding $AlCl_3$ to the Al_2O_3. The optimum adsorption towards glutamic acid was attained when the Al_2O_3 was treated with 6 *N* HCl and washed at pH 2.5-2.7. The rate of flow of the glutamic acid through the tube did not significantly affect the adsorption, but the concn. did. The optimum temp. was 16°-18°C.

8043. RILEY, VERNON T. **Application of chromatography to segregation studies of the agent of chicken tumor I (Rous sarcoma virus).** *Science* 107, 573-5 (1948).—*C.A.* 42, 6392*i*.

The virus-like agent of chicken tumor was sepd. from morphologically similar normal constituents of the ext. by means of a chromatographic system. The tumor agent was strongly but reversibly adsorbed on diatomaceous earth (Celite) in the presence of physiol. concns. of NaCl. The partially purified chick tumor ext. was prepd. in 0.9% saline (-0.8 log molar), adsorbed in microcolumns, then eluted with dil. NaCl solns. The virus agent showed typical chromatographic banding, being concd. at the top of the column, while N unassocd. with virus activity was distributed throughout the column and in the filtrate, producing further segregation.

8044. TOMARELLI, RUDOLPH M. AND FLOREY, KLAUS. **Use of papergrams in the study of the urinary excretion of radioactive sulfur compounds.** *Science* 107, 630-1 (1948).—*C.A.* 42, 6873*d*.

Urine (0.06 ml) was deposited (in 0.01 ml aliquots) on filter paper within an area 1 cm in diam. The paper partition chromatogram (papergram) was developed overnight with liquefied phenol, the phenol traveling down 11-14 inches from the top of the paper. After removal of the phenol by heating, the paper was treated with ninhydrin to outline the pathway followed by the urinary constituents. A strip 1 inch wide, enclosing all the colored areas, was then cut from the paper, mounted on a specially constructed slotted metal base, and the distribution of radioactivity along the strip detd. by means of a Geiger counter.

8045. UCHIDA, SHUN-ICHI. **Adsorption of penicillin from broth with active charcoal and its elution with acetone.** *J. Pencillin (Japan)* I, 566-7 (1948).—*C.A.* 43, 6789*d*.

Consts. for Japanese charcoals were given.

8046. VISCHER, ERNST AND CHARGAFF, ERWIN. **The separation and estimation of purines and pyrimidines in minute amounts.** *J. Biol. Chem.* 176, 703-14 (1948).—*C.A.* 43, 2668*a*.

The mixts. were sepd. by means of chromatography on paper strips; the no. and position of sepd. compds. was demonstrated by conversion to metallic salts; and the sepd. purines and pyrimidines were identified by the shapes of their ultraviolet absorption curves, and detd. by the extinction values. For development, the paper sheets were air-dried, and sprayed with 0.25 *M* $Hg(NO_3)_2$ in 0.5 *M* HNO_3, and placed in a bath of 0.5 *M* HNO_3 through which a stream of H_2O passed, or $Hg(OAc)_2$ might have been used instead of $Hg(NO_3)_2$. When the excess Hg salt was removed the strip was passed through $(NH_4)_2S$ soln.; well-defined black spots of HgS indicated presence of the purines.

8047. VOTA, ALEJANDOR SANTA PAU AND YUFERS, EDUARDO PRIMO. **Preliminary note on the preparation of alkaloids from Atropa belladona by chemical adsorption (ion exchange).** *Anales real soc. espan. fis. y quim.* 44B, 621-30 (1948).—*C.A.* 42, 8422*b*.

Four liters of 0.1 *N* H_2SO_4 were circulated 30 hrs through 500 g of the plant, the H_2SO_4 passed through towers contg. an ion-exchange resin, and returned to the circuit. Extn. of alkaloid was 95-97.5% complete. The alkaloid was removed from the resin by NaOH.

8048. WEISS, J. **Treatment of gastric and duodenal ulcers with anion exchange resins.** *Rev. of Gastroenterol.* 15, 826 (1948).

Clinical trials of an anion exchange resin on forty-four patients at the New York Montefiore Hospital for Chronic Diseases have added evidence of the value of a resin antacid in peptic ulcer therapy.

8049. ALPERT, SIDNEY AND MARTIN, GUSTAV J. **A comparative study of the inhibitory action of chemical agents on peptic activity.** *Am. J. Digestive Disease* 16, 10-14 (1949).—*C.A.* 43, 8405*g*.

The specific inhibitory power of an insoluble polyamine ion exchange resin was enhanced by the addition of small amounts of sodium alkyl sulfate, principally lauryl.

8050. ALVAREZ, DE LA VEGA, F. **Chromatography in galenical pharmaceutics.** *Galenica Acta (Madrid) Año* 2, 85-118 (1949).—*C.A.* 43, 8094*g*.

App., reagents, and methods in general were described and the various applications used in the detn. of alkaloids, glucosides, and other substances found in galenical prepns. were given in detail. A short outline was given for vitamins A, B, and C, estrone, barbiturates, and penicillin.

8051. BARDI, E. **Colloidal clays and their use in cosmetics.** *Riv. ital. essenze, profumi, piante offic., olii vegetali, saponi* 31, 210-12(1949).—*C.A.* 45, 4886*a*.

Methods of controlling the purity of montmorillonite clays were described.

8052. BERSIN, THEODOR AND LOHEYDE, INGE. **Exchange adsorption in nonaqueous solutions. III. Steroid hormones.** *Z. Naturforsch.* 4b, 195-9(1949).—*C.A.* 46, 10775*c*.

The exchange adsorption of steroids was detd. by means of the displacement of dimethylaminoazobenzene which had been adsorbed on bolus alba.

The amt. of the dye displaced by a soln. of the steroid in C_6H_6 was used as a measure of the basicity of the steroid. The activity of the polar groups in the binding of mols. could be arranged in the following series: carbonyl > carbonylalkoxyl > HO > ether.

8053. Bull, Henry B.; Hahn, J. Wilfrid, and Baptist, Victor R. **Filter-paper chromatography.** *J. Am. Chem. Soc.* 71, 550-3 (1949). —*C.A.* 43, 3057*c*.

Schleicher and Schüll 507 paper was used; 80% PhOH was the solvent and the max. color intensity was developed by using a soln. of 0.4 g ninhydrin, 10 g PhOH, and 90 g BuOH, followed by drying 10 min. at 90°C, and by placing the strip over a steam bath for 5 min. Each amino acid was identified by its R_F value. Arginine, serine, valine, glutamic acid, leucine, threonine, alanine, and lysine gave the same micromolar color values (within the pH range of 4-7.5) and 0.67 to 13.5 γ of these acids could be detd. with a probable error of ± 8.82%.

8054. Charonnat, R. and Leclerc, J. **Determination of the adsorbing power of activated charcoal.** *Ann. pharm. franc.* 7, 625-7(1949).—*C.A.* 44, 3765*i*.

The most accurate values in comparative tests were obtained when the concn. was so chosen that about 50% of the dissolved material was adsorbed: Dry the charcoal at 100°C, add 0.1 g to 10 cc. of an I_2 soln. and shake 30 min. Centrifuge, decant, add H_2O, and centrifuge again. Titrate the I_2 in the combined liquids. By use of I_2 solns. of different concns., the soln. giving 50% adsorption was detd. Charcoals of high activity corresponded to high concns.

8055. Chervenka, Charles H. and Wender, Simon H. **Preliminary studies on the use of amberlite resins in locoweed investigations.** *Proc. Okla. Acad. Sci.* 30, 150-3(1949)(Pub. 1951).—*C.A.* 46, 4177*i*.

Aq. locoweed exts., purified by dialysis, dehydration with alc. and C_6H_6, and chilling to remove resins, were passed through ion-exchange resins (Amberlite IRC-50 and IRC-400) and regenerated thence. Ultraviolet absorption spectra of the products indicated two or more substances present.

8056. Dernehl, C. U.; Nau, Carl A.; Frank, T. M., and Neidhardt, H. W. **Experimental studies on the action of silica gel catalyst administered to guinea pigs by inhalation.** *J. Ind. Hyg. Taxicol.* 31, 32-40(1949).—*C.A.* 43, 4401*b*.

When guinea pigs were exposed to an atm. contg. 450-500 million particles/ft^3 of air silica gel-Al_2O_3 dust, as used as a catalyst in petroleum processing, no silicotic fibrosis was produced; this indicated classification of the dust as physiologically inert.

8057. Di Gangi, Frank E. and Rogers, Charles H. **Adsorption studies of aureomycin hydrochloride on aluminum hydroxide gel.** *J. Am. Pharm. Assoc.* 38, 646-7 (1949).—*C.A.* 44, 1653*b*.

Colorimetric detns. of aureomycin-HCl were made by a Fisher Electrophotometer with a filter cell having a spectral band of approx. 425 mμ. It was found that $Al(OH)_3$ gel, given to control nausea and vomiting, adsorbed practically 100% of the aureomycin-HCl administered.

8058. Evans, W. C. and Partridge, M. W. **Partition chromatography of alkaloids. II. Australian Datura ferox and Indian henbane.** *J. Pharm. Pharmacol.* 1, 593-8 (1949).—*C.A.* 43, 9379*g*.

Australian-grown *Datura ferox* contained the alkaloids, hyoscine (0.06%) and meteloidine. The chief alkaloidal constituents of Indian henbane were hyoscine (0.016%), hyoscyamine (0.01%), and tropine (0.0015%). *Hyoscyamus niger* yielded hyoscine (0.028%), hyoscyamine (0.041%), and tropine (0.0025%).

8059. Foster, G. E.; Macdonald, J., and Jones, T. S. G. **Separation and identification of ergot alkaloids by paper partition chromatography.** *J. Pharm. Pharmacol.* 1, 802-10 (1949).—*C.A.* 44, 1229*h*.

The alkaloids were removed by extn. with 5% lactic acid and adjusted to 100 ml. The ext. was dild. with 1% lactic acid until 0.05 ml placed on a No. 1 Whatman strip and developed with BuOH-AcOH-H_2O mixt. gave a fluorescent spot approx. equal in intensity to that obtained with a erogonovine standard contg. 0.2-0.5 γ in 0.05 ml. Results with a series of standards on the same paper allowed estn. of the erogonovine content of the ergot.

8060. Fujiwara, M. and Shimuzu, H. **Microdetermination of riboflavin by synthetic ion exchange resin.** *Anal. Chem.* 21, 8, 1009-1011 (1949).

It was necessary to remove as completely as possible other fluorescing substances, which interfered with the yellow-green fluorescence due to riboflavin. For this purpose, a synthetic cation exchange resin was employed to adsorb riboflavin.

8061. Granberg, C. Boyd and Benton, B. E. **The use of dried bentonite as a disintergrating agent in compressed tablets of thyroid.** *J. Am. Pharm. Assoc.* 38, 648-51 (1949).—*C.A.* 44, 1645*i*.

Dried bentonite was found superior to starch as a disintergrating agent for thyroid tablets. Tests indicated that the presence of bentonite did not hinder the liberation of I_2 from its combination with thyroid.

8062. Haas, Karl. **The influence of adsorption on the concentration of homeopathic dilutions prepared by different methods.** *Pharm. Acta Helv.* 24, 265-310(1949).—*C.A.* 44, 2699*i*.

A review of previously reported work was given.

8063. Hill, Joseph M.; Haberman, Sol, and Guy, Ruth. **Further evidence for antibodies of the third order. Fractionation of agglutinins, blocking antibodies, and cryptoagglutinoids by physicochemical methods.** *Am. J. Clin. Path.* 19, 134-40 (1949).—*C.A.* 43, 3920*a*.

The globulins of Rh antibody-contg. serums were pptd. by ion-exchange resins. The globulin subfractions desired were obtained by dissolving the ppt. from 50 cc. of original serum in selected solns. of NaCl.

8064. Horrocks, R. H. and Manning, G. B. **Partition chromatography on paper. Identification of reducing substances in urine.** *Lancet* 256, 1042-5 (1949).—*C.A.* 43, 8426*h*.

Reducing substances found in the urine in clinical practice were identified and roughly estd. by means of partition chromatography with a butanol-acetic acid-H_2O mixt. Spots of urine were placed on strips of filter paper and allowed to stand in contact with the solvent for either descending or ascending chromatography for 24 hrs. Color was developed by spraying with benzidine, ammoniacal $AgNO_3$, aniline-hydrogen oxalate, or phloroglucinol reagents.

8065. Irwin, Leslie; Berger, Eugene Y.; Rosenberg, Benjamin, and Jackenthal, Roslyn. **The effect of a cation exchange resin on electrolyte balance and its use in edematous states.** *J. Clin. Invest.* 28, Part 2, 1403-11 (1949).

Cation exchange resins taken orally reduced the absorption of Na from the intestine. With such resins, a patient may satisfy his appetite for salt within reasonable limits without absorbing excessive amts. of Na and without accumulating edema. Its use in congestive heart failure and cirrhosis of the liver resulted in a diuresis of existing depots of fluid which did not reaccumulate while the resin was administered. K depletion and acidosis must be considered as possible hazards.

8066. Jindra, A. **Determination of alkaloids by exchange of ions.** *J. Pharm. Pharmacol.* 1, 87-94(1949).—*C.A.* 43, 4809*i*.

Dissolve 0.1-0.2 g of alkaloidal salt in 20 ml of alc. and pass through a prepd. column of Amberlite IR-4B synthetic resin. Wash the flask and the column with 50 cc. of alc. at 50°C. Titrate the alkaloid in the alc. with 0.1 *N* HCl. The method was applied to strychnine nitrate; atropine and ephedrine sulfates; morphine, brucine, quinine, and cinchonine hydrochlorides.

8067. Karnovsky, M. L. and Johnson, M. J. **Filter-paper chromatography of penicillin broths.** *Anal. Chem.* 21, 1125-32 (1949).—*C.A.* 43, 9366*g*.

Conditions for optimal resolution of individual penicillins were investigated. Whatman No. 1 filter paper ribbons 1.25 cm wide and about 45 cm long (below the spotting point) were impregnated with 20% K_2HPO_4 buffer of pH 6.2. Development of the chromatogram with water-satd. ether was carried out for 20 hrs in which time the ether front reached the end of a paper twice as long as the one actually used. Under these conditions the fastest moving common cryst. penicillin traveled approx. 35 cm. Humidification of the ribbons at room temp. for 15 min. was satisfactory.

8068. Kawanc, Yoshio. **Adsorption of penicillin with activated carbon.** *J. Fermentation Technol.* (Japan) 27, 177-81(1949).—*C.A.* 47, 1897*d*.

The adsorption of penicillin to activated charcoal followed the Freundlich's adsorption isothermal equation. Employment of 1-1.5% charcoal was satisfactory for 99% adsorption of penicillin from a broth of 200-300 u./cc. The adsorption equil. was reached in a short time; 99% in 10 min. with a broth of 200 u./cc., and in 10-20 min. with 500 u./cc. Activated charcoal (1 g) adsorbed at pH 6.0 in 40 min. 8151 u. penicillin (99.6%) from 100 cc. soln. of 81.81 u./cc. and 218,100 u. (26.6%) from 8181.0 u./cc.

8069. Kluener, R. G. **A paper chromatographic method for the quantitative estimation of penicillin entities.** *J. Bact.* 57, 101-9 (1949).—*C.A.* 43, 4322*e*.

The various penicillins possessed different distribution coeffs. between ether and phosphate buffer at a given pH, hence could be sepd. by paper strip partition chromatography. A direct visual result was obtained by incubating the ether-developed strips on agar seeded with *Staphylococcus aureus* 209 for 16 hrs at 37°C.

8070. Lecomte, J. and Fischer, P. **Estimation of arterenol in presence of adrenaline.** *Compt. rend. soc. biol.* 143, 1294-6(1949).—*C.A.* 44, 8054*h*.

The sample soln., contg. 200γ or more of adrenaline or arterenol was passed through a loose column of neutral permutite (Decalso) and the column washed with distd. water. Then 5 cc. of 0.1 *N* I_2 in K-phthalate buffer of pH 4 was passed through the column in 15 sec or less. The adrenaline was oxidized to iodoadrenochrome, and the latter washed out of the column and detd. photometrically. If the I_2 soln. passed through the column too slowly, some of the arterenol may be also oxidized.

8071. Leigh, T. **Partition chromatography of the tertiary amine salts of the penicillins.** *Discussions Faraday Soc.* 7, 311-16(1949).—*C.A.* 44, 10268*d*.

Mixed penicillins could be sepd. by partition chromatography between a stationary phase of H_2O and a tertiary amine on a silica gel column and an org. solvent as mobile phase. The acids were converted into amine salts and emerged in nearly pure form. Owing to instability of penicillin toward primary and secondary amines, only the tertiary amines Et_3N, 1-ethylpiperidine, and 1-ethylhexamethylenimine were used, and $(CH_2Cl)_2$, $CHCl_3$, AcOEt, and BuOH were tried as eluting agents. A suspension of 500 g silica gel in 1500 ml AcOEt was treated with 350 ml H_2O and 25 ml 1-ethylhexamethylenimine, the suspension charged into a chromatogram tube, and after settling (1 hr) 15 g cryst. penicillins in 100 ml AcOEt was added.

8072. Meyer, Kurt H. and Gibbons, G. C. **Starch. XLVI. Purification of amylopectin.** *Helv. Chim. Acta* 33, 210-13 (1949).—*C.A.* 44, 4274*d*.

Partially purified amylopectin could be freed of amylose by selective adsorption of amylose on stearic acid.

8073. Munier, Roger and Macheboeuf, Michael. **Microchromatography of the separation of alkaloids and of various biological nitrogen bases. I.** *Bull. soc. chim. biol.* 31, 1144-62(1949). —*C.A.* 44, 10259*g*.

Sepn. microchromatography on paper was applicable to the study of alkaloids under certain conditions. Certain non-alkaloid substances such as choline, betaine, and nicotinic acid formed spots also, but these were easily differentiated from the alkaloids because their partition coeffs. (R_f) were different. All alkaloids except the xanthines and trigonelline formed spots on paper in the presence of I_2 vapor. Three methods of detection were possible on the same paper: (1) examn. in ultraviolet light, (2) action of I_2 vapor, and (3) action of a reagent after evapn. of the I_2 vapor. The choice of solvent depended on the R_f of the alkaloid between the solvent phase and the aq. equilibrated phase.

8074. NICHOLAS, R. E. H. AND RIMINGTON, C. **Qualitative analysis of the porphyrins by partition chromatography.** *Scand. J. Clin. & Lab. Invest.* 1, 12-18 (1949).—*C.A.* 44, 2065*c*.

Paper partition chromatography was applied to the examn. of porphyrins. The most suitable solvent was lutidine in the presence of NH_3 vapor. The sepn. occurred according to the no. of carboxyl groups in the mol.

8075. PARTRIDGE, S. M. AND BRIMLEY, R. C. **Displacement chromatography on synthetic ion-exchange resins. II. The separation of organic acids and acidic amino acids by the use of anion-exchange resins.** *Biochem. J.* 44, 513-21 (1949).—*C.A.* 43, 8807*a*.

Three anion-exchange resins (Amberlite IR-4, Wofatit M, and D-Acidite B) in packed columns gave with glutamic acid boundary widths which were practically inversely proportional to the adsorptive capacity of the resins. With very slow rates of flow, some sepn. between glutamic and aspartic acids could be obtained with De-Acidite B, but the results were of doubtful value.

8076. PARTRIDGE, S. M. **Displacement chromatography on synthetic ion-exchange resins. III. Fractionation of a protein hydrolyzate.** *Biochem. J.* 44, 521-7 (1949).—*C.A.* 43, 8807*b*.

Tyrosine and phenylalanine together with sol. humin were first removed from the protein hydrolyzate by adsorption on ion-exchange resins. The 2 amino acids were later eluted with aq. phenol-acetic acid. Hydrolyzed com. egg albumin was fractionated on Zeo-Karb 215 by displacement with NH_4OH soln. and resolved on a flowing filter-paper chromatogram into 7 bands: (1) aspartic acid; (2) glutamic acid, serine, and threonine; (3) glycine and alanine; (4) valine and proline; (5) leucine, isoleucine, methionine, and cystine; (6) histidine and unidentified amino acids; and (7) lysine.

8077. PARTRIDGE, S. M. **Aniline hydrogen phthalate as a spraying reagent for chromatography of sugars.** *Nature* 164, 443(1949).—*C.A.* 44, 487*a*.

This reagent was much more selective for sugars than ammoniacal $AgNO_3$ and was extremely sensitive to *aldo-pentoses* and *aldo-hexoses*. Since it may be dissolved in moist butanol, migration of the sugar spots during the spraying process could be avoided. To prep. the reagent add aniline 0.93 g and phthalic acid 1.66 g to 100 ml of water-satd. butanol. After spraying, the chromatogram was heated for 5 min. at 105°C to develop the color.

8078. PARTRIDGE, S. M. **Separation of bases and amino acids by displacement chromatography on ion-exchange.** *Discussions Faraday Soc. No.* 7, 296-305 (1949).—*C.A.* 44, 7921*h*.

Amino acids could be sepd. on a preparative scale by displacement chromatography on a column of Zeo-Karb 215, a sulfonated phenolic cation-exchange resin. An amino acid mixt. sufficient to saturate about 0.5 of the column was adsorbed and then displaced with a soln. of a base having a higher affinity for the resin than any components of the mixt. The adsorption of the various amino acids on resin depended on the pH of the soln., and all naturally occurring amino acids were adsorbed.

8079. POETSCH, CHESTER E.; HIGUCHI, TAKERU, AND PARKS, LLOYD M. **Sabadilla alkaloids. II. Alkaloidal components of the petroleum ether extract.** *J. Am. Pharm. Assoc.* 38, 525-30 (1949).—*C.A.* 43, 9384*e*.

Some of the fractions were sepd. and purified by selective adsorption and elution from Al_2O_3 column and absorption spectra indicated fractions different from any previously reported alkaloids of sabadilla.

8080. RABINOVICH, M. S. AND KONOVALOVA, R. A. **Adsorption method of isolation of anabasine.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 22, 995-1001(1949).—*C.A.* 45, 3560*g*.

Anabasine could be adsorbed from aq. media by numerous adsorbents affording a sepn. from resinous materials that accompanied the alkaloid in aq. exts. of *Anabasis aphylla*. The most active substances were silica gel, infusorial earth, gumbrin (Caucasian), and mid-Asiatic bentonite; kaolin was almost ineffective as is Permutit. Desorption was best done by treatment with dil. H_2SO_4, which after 3 cycles with $2N$ H_2SO_4 could desorb 84% of the base giving solns. contg. up to 6% of the alkaloid; the solns. acquired addnl. purification in this step, showing a considerable loss of color.

8081. REICHSTEIN, P. AND SHOPPEE, C. W. **Chromatography of steroids and other colorless substances by the method of fractional elution.** *Discussions Faraday Soc. No.* 7, 305-11(1949). —*C.A.* 44, 8286*g*.

The technique of fractional elution was described for the chromatographic sepn. of colorless substances. This was used with great success in the field of steroid chemistry, with Al_2O_3 as adsorbent. In a few cases difficulties were encountered: 17-Hydroxy 20-ketones, especially those of the 17-isopregnane series, undergo molecular rearrangement to give D-homoketones. This could largely be avoided by use of neutralized Al_2O_3 of low activity and dry solvents or by use of the 17-acetates.

8082. RILEY, VERNON T.; HESSELBACH, MARIE L.; FIALA, SILVIO; WOODS, M. W., AND BURK, DEAN. **Application of chromatography to the separation of subcellular, enzymatically active granules.** *Science* 109, 361 (1949).

Melanized granules (varying in size from 0.2 to 0.6 μ or more) of the Cloudman S91 and Harding-Passey mouse melanomas could be reversibly adsorbed on Celite Columns. The adaptation of chromatography to particulates ranging from virus to mitochondrial and bacterial size provided another method for separation and characterization of the particulate components of the cell.

8083. Schubert, Jack; Russell, Edwin R., and Farabee, Lawrence B. **Use of ion exchange for the determination of radioelements in large volumes of urine.** *Science* 109, 316-17, (1949). —*C.A.* 43, 4724*f*.

Radioyttrium $Y^{91}(10^{-4}M)$ was removed from 1 liter of urine with a recovery of $85 \pm 5\%$ by a 2-step method with a cation exchange resin.

8084. Smith, Arnold and Moxon, Alvin L. **Paper-partition chromatography for the separation of analogs of sulfur amino acids.** *Proc. S. Dakota Acad. Sci.* 28, 46-9(1949).—*C.A.* 45, 7920*b*.

Chromatograms were made of cystine, Se-cystine, methionine, and Se-methionine with phenol or BuOH as solvents. The *n*-BuOH mixt. did not move the cystine or Se-cystine from the origin, but was better than phenol for sepg. methionine from Se-methionine. In phenol the av. R_f (ratio of distance traveled by the amino acid to that traveled by the solvent) placed the Se analogs at an R_f value 0.02 higher than the S compds. Collidine and lutidine used as solvents showed greater R_f differences for both sets of analogs on one paper, but the actual vertical distance was small since the compds. rose only a short distance.

8085. Smith, E. Lester. **Biologically active substances in liver extract.** *Discussions Faraday Soc. No.* 7, 317-21 (1949).—*C.A.* 44, 7922*g*.

Chromatographic procedures used in the isolation of vitamin B^{12} were described. For adsorption from a crude aq. soln., shallow beds of charcoal only a few cm deep and up to 1 m or more in diam. were convenient on account of their capacity for rapid treatment of very large vols. contg. valuable but unstable compds. Partition chromatography on moist silica (60% H_2O) with BuOH (11-12% H_2O) or PrOH (10-25% H_2O) gave very satisfactory chromatograms of solns. contg. several % of B^{12}.

8086. Svendsen, A. Baerheim and Jensen, K. Briseid. **Chromatographic separation of aloin.** *Scientia Pharm.* 17, 118-20(1949).—*C.A.* 44, 5537*a*.

Warming aloin in air formed a red-violet material which did not give the tests for anthranol or for anthraquinone, but did give a sugar reaction. It was easily sol. in H_2O, moderately sol. in alc., and insol. in $CHCl_3$ and Et_2O. On chromatographic analysis of aloin dissolved in $CHCl_3$-Me_2CHOH mixt. with an Al_2O_3-H_2O column, the red-violet material was strongly adsorbed and only removed by MeOH.

8087. Vischer, Ernst; Zamenhof, Stephen, and Chargaff, Erwin. **Microbial nucleic acids: the desoxypentose nucleic acids of avian tubercle bacilli and yeast.** *J. Biol. Chem.* 177, 429-38 (1949).—*C.A.* 43, 3063*c*.

Cytosine, thymine, guanine, and adenine were detected, in different molar proportions, in avian tubercle bacilli and yeast by using chromatographic sepn. and spectrographic analysis.

8088. Voĭtko, L. M. and Kharin, A. N. **Investigation of the dynamics of sorption of essential oil of coriander from aqueous solutions on different kinds of carbon.** *Zhur. Priklad. Khim.* 22, 1237-48(1949).—*C.A.* 46, 5929*d*.

The static sorption of oil of coriander on 2 types of carbon was studied. Rates of feeding of the aq. solns. of coriander oil and the diam. of the carbon grains were the variables studied. In addn., expts. were made on carbon of mixed particle size under conditions approaching those found in industrial operations. The kinetic coeffs. of sorption of coriander oil on different kinds of carbon (birchwood, anthracite, and charcoal) obeyed the same relation to the sp. rate of feeding of soln. and to diam. of carbon particle, viz., $\beta = 0.0252\ (\alpha^{0.05}/d)$.

8089. Wenusch, Adolf. **What hopes can be based on nicotine filters?** *Rev. intern. tabacs* 24, 136, 142(1949).—*C.A.* 43, 9383*a*.

Filters of clay, cellulose, or silica gel were considered to hold back the nicotine contained in the smoke because the smoke had a lower physiol. effect. However, nicotine freely passed these filters. A combined action of nicotine and microparticles of resins in the smoke was postulated.

8090. Winters, James C. and Kunin, Robert. **Ion exchange in the pharmaceutical field.** *Ind. Eng. Chem.* 41, 460-3(1949).—*C.A.* 43, 4423*g*.

Amberlite IRC-50, a carboxylic-acid type cation exchanger, and IRA-400, a strongly basic anion exchanger, not only made it feasible to follow Cannan's method for separating amino acids into groups of the same charge type, and into acidic, basic, and neutral groups, but also provided a technique for sepg. the basic amino acids from each other.

8091. Albans, J.W. and Baker, P.B. **Paper chromatography in penicillin production control.** *Analyst* 75, 657-62(1950).—*C.A.* 45, 2147*f*.

The application of the method to culture filtrates and similar process samples was discussed. The construction of a large vessel for multiple analyses was shown.

8092. Awapara, Jorge; Landua, Alton J., and Fuerst, Robert. **Free aminoethylphosphoric ester in rat organs and human tumors.** *J. Biol. Chem.* 183, 545-8 (1950).—*C.A.* 44, 5997*f*.

Aminoethylphosphoric ester was identified in 23 organs of the rat and in several human tumors. It was isolated from beef spleen by means of paper chromatography and identified by the same means.

8093. Baker, P.B.; Dobson, F., and Martin, A.J.P. **Analysis of penicillin mixtures by paper chromatography of the hydroxamic acid derivatives.** *Analyst* 75, 651-6(1950).—*C.A.* 45, 2147*d*.

The method was based on the fact that the relatively stable hydroxamic acid derivs. of the various penicillins showed different partition coeffs. between isopropyl ether and isopropyl alc. and phthalate buffer, at a given pH, and could be sepd. by paper chromatography. A new app. for use with volatile solvents and heavily buffered papers was described. A direct qual. result was obtained by developing the chromatogram with dil. $FeCl_3$ soln.

8094. Bentley, H.R. and Whitehead, J.K. **Water-miscible solvents in the separation of amino acids by paper chromatography.** *Biochem. J.* 46, 341-5(1950).—*C.A.* 44, 10446*d*.

Aq. mixts. of relatively nonvolatile solvents (furfuryl and tetrahydrofurfuryl alc.) gave small sharp spots, but with more volatile solvents (lower alc., acetone, pyridine, tetrahydrofuran) satisfactory results could be obtained by capillary ascent. With solvents only partially miscible with water the compn. of the flowing solvent and of the cellulose-water complex varied within fixed limits and the effect becomes practically a true partition between solvent and water.

8095. Brink, Norman G.; Meisinger, Melvin A.P., and Folkers, Karl. **The activity of a hydrolyzate of adrenocorticotropic hormone in rheumatoid arthritis.** *J. Am. Chem. Soc.* 72, 1040-1(1950).—*C.A.* 45, 2633*d*.

Adrenocorticotropic hormone concentrate (1.233 g) digested in 250 cc. 0.05 *N* HCl with 132 mg pepsin and dialyzed 5 days against distd. water, yielded a clinically active product (0.605 g). Paper chromatograms of the dialyzate showed no pos. ninhydrin tests.

8096. Brody, Theodore M.; Voigt, Ralph F., and Maher, Frank T. **A chromatographic study of the anthraquinone derivatives of** ***Curaçao aloe.*** *J. Am. Pharm. Assoc.* 39, 666-9(1950).—*C.A.* 45, 1730*g*.

The trihydroxymethylanthraquinones have been isolated and sepd. from *Curaçao aloe* by the adaptation of existing chromatographic methods. The differentiation of an ext. on a magnesia-celite column was found to be a function of the concn. of that ext. and the compn. of the adsorbent mixt. Under identical conditions, exts. of aloin showed chromatograms similar to those of *Curaçao aloe* but socotrine and Cape aloe exts. could not be satisfactorily differentiated on the chromatographic column used.

8097. Brown, F. **Separation of the lower fatty acids as anions by paper chromatography.** *Biochem. J.* 47, 598-600(1950).—*C.A.* 45, 2821*i*.

Lower fatty acids as Na salts were placed on filter paper and the chromatogram allowed to run for several hrs (until the solvent boundary is about 20 cm below the starting line). After drying the position of the anions was revealed by spraying the paper with 0.04% bromothymol of pH 7.5. The anions gave yellow spots and the cations deep blue. The development mixts. consisted of alcs. with aq. NH_4OH.

8098. Brunner, Richard and Freidrich, Wilhelm. **The preparation of penicillin from penicillin-containing crude solutions by adsorption.** *Österr. Chem.-Ztg.* 51, 237-41(1950).—*C.A.* 45, 4410*i*.

The penicillin was adsorbed from the crude soln. at a pH of 3.0 and the adjustment to this value was made after the addn. of Carboraffin. A shaking time of a few min. was usually sufficient. A pronounced dependence on temp. was not observed; however, an adsorption at low temp. (5-10°C) was recommended. The presence of alcs. in the penicillin soln. increased the Carboraffin requirements. For the following elution of the penicillin the pH was increased and the range of 7.0-7.2 proved to be best. Butanol and acetone were used satisfactorily as extg. solvents. When the Carboraffin was pretreated with CO_2, better yields resulted.

8099. Bynyaeva, M.K. **Purification of penicillin by chromatographic method.** *Trudy Leningrad. Sanit. Gigien. Med. Inst.* 5, 138-48(1950).—*C.A.* 46, 10550*d*.

With suitable adsorbent it was possible to achieve a 3-fold purification of crude penicillin. Specially prepd. Al_2O_3 was used as the adsorbent, with either $CHCl_3$ or Et_2O as the solvent. The former gave dark brown, yellow, brown, and orange-yellow zones, while the latter gave dark brown, light brown, orange, and yellow zones. The dark brown zone carried no activity, while the light brown zone carried almost all penicillin activity. The orange zone had very little activity; the yellow zone was similar. The loss of penicillin in the chromatographic purification did not exceed 13-30%, especially at a low temp. (3°C).

8100. Carey, Z.E.; Markam, A.E.; Toomey, R.D., and McCarthy, J.L. **Separation of amino acids by ion exchange.** *Trend* 23, 17-20(1950).—*C.A.* 46, 7474*f*.

Arginine, cystine, and glutamic acid were sepd. on a sulfonated polystyrene. The capacity of the resin was 4.93 meq. of the exchangeable ion per g of oven-dried resin. In equil. expts., 100 ml of amino acid soln. contg 0.5 to 2.0 millimoles of amino acid was treated with 0.5 g of air-dried resin in the presence of 1 ml of toluene in rotating 250-ml bottles at 25° for 24 hrs. The soln. was then sepd. from the resin and the pH and amino acid concns. were detd. In the column expts. amino acids were dissolved in HCl at pH 1.5 and the soln. was passed through a resin column.

8101. Chilton, J. and Partridge, M.W. **Partition chromatography of alkaloids. III. Alkaloids of** ***Punica granatum.*** *J. Pharm. and Pharmacol.* 2, 784-95(1950).—*C.A.* 45, 3555*f*.

Substitution of Pyrex glass in No. 60 powder (7 g of glass for 1 ml of phosphate buffer) for kieselguhr permitted better chromatographic sepn. of the alkaloids from the adsorption column. Different samples of *Punica granatum* contained widely different proportions of pelletierine, pseudopelletierine, and methylisopelletierine.

8102. Cremer, Hans Diedrich and Tiselius, Arne. **Electophoresis of protein in filter paper.** *Biochem. Z.* 320, 273-83(1950).—*C.A.* 44, 7376*e*.

A method was described for studying 0.03-0.04 ml serum electrophoretically on filter paper. The paper was kept submerged under chlorobenzene. The rate of migration could be detd. and the various fractions sepd.

8103. Dalal, V.D. and Khorana, M.L. **Ephedra. II. Estimation of total alkaloids by chromatography.** *Indian J. Pharm.* 12, 173-4(1950).—*C.A.* 44, 11023*b*.

A chromatographic method was given which was less time-consuming than the B.P. 1949 method. Al_2O_3 was used as adsorbent and 90% EtOH as eluent.

8104. Davies, R.E.M. **Properties and uses of bentonite.** *Chemist & Druggist* 154, 458-60 (1950).—*C.A.* 45, 2148*c*.

8105. Doery, H.M.; Mason, E.C., and Weiss, D.E. **Estimation of streptomycin in fermentation broths.** *Anal. Chem.* 22, 1038-9 (1950).—*C.A.* 44, 11024*f*.

The procedure, suitable for plant control purposes, made use of the cation exchange resin, Amberlite IRC-50, combined with the maltol assay method. Adsorption at pH 9, and measurement of ultraviolet absorption at 322 mμ before and after hydrolysis with 4 *N* NaOH, yeilded results agreeing with biol. assays to within ±5%.

8106. Ebert, L. and Dircherl, A. **Quantitative microanalysis of gold-oleo solutions.** *Mikrochemie ver. Mikrochim. Acta* 35, 346-52(1950).—*C.A.* 44, 7711*d*.

For some years gold-oleo solns. have been used in therapy. The detn. of the Au content was made by dissolving about 0.9 g of sample in 10 ml of benzene, added in small portions, shaking with about 0.5 g of suitable Al_2O_3 to adsorb the Au sol, eventual soln. of the Au in HCl + $KClO_3$ with final iodometric detn. of the Au^{+++}. Excellent results were obtained in samples contg. about 0.3 mg of Au.

8107. Elkinton, J.R.; Clark, J.K.; Squires, R.D.; Bluemle, L.W. Jr., and Crosley, A.P. Jr. **Treatment of potassium retention in anuria with cation exchange resin.** *Am. J. Med. Sci.* 220, 547-52 (1950).

Cation exchange resins, administered orally or by rectum, lowered elevated serum K concentrations in 3 patients with renal insufficiency and obliguria or anuria. When the resin was not tolerated in the upper gastrointestinal tract, it may be given as an enema and significant amounts of K removed. Oral administration of $Al(OH)_3$, injection of Ca to prevent tetany during alkali therapy, and support of the circulation during treatment with the resins were indicated.

8108. Espen, J. van. **Chromatography. Its use in medicinal analysis.** *J. phar. Belg.* [*N.S.*] 5, 130-8(1950).—*C.A.* 44, 8054*b*.

8109. Fischer, Robert and Buchegger, E. **The determination of strychnine along with brucine (separately) in** *Semen Strychni* **by adsorption analysis.** *Pharm. Zentralhalle* 89, 146-50 (1950).—*C.A.* 46, 11582*g*.

Strychnine and brucine were detd. separately in 2-g samples of the drugs, *Semen Struchni* and *Faba Ignatii*, after extn. with $CHCl_3$ and alkali or with water and acid. The 2 alkaloids were adsorbed from trichloroethylene soln. on 10 g Al_2O_3 (Merck, series no. 95,581). Strychnine was then eluted with 70 cc. CCl_4 contg. 9% acetone and brucine with 25 cc. alc.

8110. Fischer, Robert and Buchegger, E. **Adsorption-analytical determination of cocaine-procaine mixture.** *Pharm. Zentralhalle* 89, 185-6(1950).—*C.A.* 45, 816*f*.

The sepn. of cocaine and procaine was possible with approx. 20 mg of the mixt. dissolved in CCl_4 and adsorbed over 5 g Al_2O_3 contained in an adsorption column of 9 mm diam. Then cocaine was eluted with 20 cc. of a mixt. of CCl_4 with 4.5% acetone, and procaine extd. by means of 20 cc. $CHCl_3$.

8111. Fischer, R. and Gull, H. **Use of adsorption agents in toxicological analysis.** *Mikrochemie ver. Mikrochim. Acta* 35, 63-79 (1950).—*C.A.* 44, 4827*e*.

Numerous expts. were made in detecting poisonous materials from biol. and partly decompd. materials with the idea that purification by adsorption might be accomplished to advantage. With active carbon moistened with glacial AcOH, excellent results were obtained with atropine, cocaine, strychnine, brucine, morphine, and its derivs., and veratrine. Al_2O_3 was excellent for colchicine (codeine and morphine) and Wofatit was good for aconitine.

8112. Franklin, A.E. and Quastel, J.H. **Paper chromatography of protein mixtures and blood plasmas.** *Proc. Soc. Exptl. Biol. Med.* 74, 803-8 (1950).—*C.A.* 44, 10001*i*.

Sepns. of protein components in two-dimensional chromatography were greatly facilitated by addn. of surface-active substances such as the "Tweens" or "Spans" or "Elvinols". Hemin was used as a protein marker, and 0.1 *M* sucrose soln. was used in the first dimension and 0.1 *M* NaK tartrate in the second dimension.

8113. Fujiwara, Motonori and Shimizu, Hiroshi. **Ion-exchange synthetic resins. XXVIII. Determination of vitamin B_2 by synthetic cation-exchange resin. Elution of vitamin B_2. XXIX. Determination of vitamin B_2 by synthetic cation-exchange resin. Removal of nonriboflavin fluorescent substances.** *Chem. High Polymers (Japan)* 7, 436-9; 440-3 (1950).—*C.A.* 46, 6692*g*.

Exptl. details for elution with pyridine were described. A process for the removal of nonriboflavin fluorescent substs. was described in detail.

8114. Gibbons, G.C. and Boissonnas, R.A. **Starch. XLVIII. The position of branching glycogen and amylopectin.** *Helv. Chim. Acta* 33, 1477-81 (1950).—*C.A.* 45, 887*e*.

By HIO_4 oxidation, followed by hydrolysis and detn. of the liberated glucose by paper chromatography, it was shown that amylopectin and glycogen contained less than one branching in the 2 or 3 positions for 40 branchings in the 6 position.

8115. Gilbert, G.A. and Swallow, A.J. **Dialysis. I. Application of ion-exchanger resins.** *Biochem. J.* 47, 502-5 (1950).—*C.A.* 45, 3436*f*.

To prep. resin cellophane, boil cellophane 1 min. in 10% (wt/vol.) aq. *m*-phenylene-diamine and allow to cool 45 min. Place in a 1:1 (vol.) mixt. of 40% HCOH and 10 *N* HCl at 0°C. Wash the cellophane in running water and rub off any resin formed. Immerse the cellophane in 0.5% (wt/vol.) $K_2Cr_2O_7$ contg. 0.15 *N* HCl for 30 min., then in *N* NH_4OH for 30 min. and wash in H_2O.

8116. GLISTER, G.A. AND GRAINGER, A. **Modified rapid technique for the separation and determination of penicillin types by partition chromatography on paper.** *Analyst* 75, 310-14(1950). —*C.A.* 44, 8056*f*.

Microstrips of filter paper impregnated with K phosphate buffer of pH 6.2 and a dose of 5 units penicillin per strip proved satisfactory . The strips can be developed with Et_2O satd. with water, 3-4 hrs at room temp.

8117. HAGDAHL, LENNART AND HOLMAN, RALPH T. **Displacement analysis of lipides. II. Increased separability of fatty acids by depressed solubility.** *J. Am. Chem. Soc.* 72, 701-5(1950).—*C.A.* 44, 4695*e*.

Adsorption isotherms for lauric and myristic acids in 95% alc. on a series of varied adsorbents were made. The depression of soly. of lauric, myristic, butyric, caproic, capric, and caprylic acids in alc. by admixture with water, or by lowering temp., increased adsorption and spread the isotherms. The lowered soly. caused by addn. of water increased separability of fatty acids as shown in frontal and displacement analysis. The best displacer found thus far for a fatty acid was its nearest homolog of lower soly. in a solvent which just dissolved the desired concn. of displacer.

8118. HALL, A.A. AND HORNISHER, C.J. **The effect of anion exchange resin on the healing time of duodenal ulcers.** *Gastroenterology* 16, No. 1, 181-87 (1950).

Of a group of fifty patients with duodenal ulcer craters, 33 were treated with a weak base anion exchanger (in ethical drug form) and 17 in the customary Sippy (colloidal aluminum hydroxide) regime. All fifty patients were treated similarly in all other respects. The av. healing time of the craters in the "anion exchange" patients was 19 days; for the control group, 33.7 days.

8119. HEDÉN, C.G. **A method for large-scale separation of amino acids on filter paper.** *Nature* 166, 999-1000(1950).—*C.A.* 45, 5073*c*.

Protein hydrolyzate (5 g) could be resolved to yield sufficient amts. of amino acids for detn. The hydrolyzate soln. was spotted along the edge of a large sheet and run at 5°C with BuOH:H_2O: AcOH, 5:5:1. The dried sheet was cut parallel to the solvent front into small sheets carrying suitable groups of amino acids. The banded amino acids in a small sheet were re-collected by eluting with H_2O till they formed a single band, lying at right angles to the original solvent front, near the side of the sheet.

8120. HUSSEY, C.V.; QUICK, ARMAND J.; STEFANINI, MARIO; CONSOLAZIO, C.F., AND SARGENT, FREDERICK, 2ND. **Effect of sodium citrate and heparin on removal of calcium from blood and serum by Amberlite.** *J. Biol. Chem.* 184, 105-8 (1950).—*C.A.* 44, 7448*f*.

Ca was completely removed from normal serum or $CaCl_2$ soln. by passing through a column of purified Amberlite IR-100. Adsorption of Ca was inhibited by Na citrate in proportion to its concn.; only about 25% of the Ca was removed in the presence of 0.04 *M* citrate. Heparin did not interfere with Ca adsorption.

8121. HUYCK, C. LEE. **Colloidal magnesium aluminum silicate as a suspending agent.** *J. Am. Pharm. Assoc., Pract. Pharm. Ed.* 11, 170-2 (1950).—*C.A.* 44, 6081*h*.

Bentonite and Mg Al silicate magmas were tested as suspending agents in calamine lotion and chalk mixt. When 4% Mg Al silicate magma was used in the lotion 10% H_2O sepd. and the relative viscosity was 3 in contrast to 17% H_2O sepn. and a relative viscosity of 2 when 5% bentonite was used. When the 4% magma was used in chalk mixt. 0.5% H_2O sepd. and the relative viscosity was 1 in contrast to 11% and a relative viscosity of 1 when the 5% bentonite magma was used.

8122. HUYCK, C. LEE. **Adsorption and liberation of ephedrine from ion-exchange resins.** *Am. J. Pharm.* 122, 228-30 (1950).—*C.A.* 44, 9626*f*.

Amberlite IRC-50 was a good adsorbing medium for a weak base such as ephedrine, while Dowex 50 was unsatisfactory for adsorption of ephedrine base.

8123. INOUE, YOSHIYUKI, AND NODA, MANJIRÔ. **Separation and identification of fatty acids. IX. Paper partition chromatography of hydroxamic acids.** *J. Agr. Chem. Soc. Japan*, 18, 294-8 (1950).—*C.A.* 45, 8449*f*.

As the chromogenic reagent, 10% $FeCl_3$ in EtOH was used. BuOH, EtOAc, and butyrone were convenient solvents. R_f values for 13 hydroxamic acids derived from the C_2-C_{22} satd, aliphatic acids (among them valerohydroxamic acid, light yellow, noncrystalizable syrup, a new compd.) were given with BuOH.

8124. JAMES, W.O. AND KILBEY, NATALIE. **Separation of noradrenaline and adrenaline.** *Nature* 166, 67-8(1950).—*C.A.* 45, 817*e*.

The bases were sepd. on paper chromatograms with a solvent prepd. by shaking 4 parts of BuOH, 1 part of glacial AcOH, and 5 parts of H_2O or from 5 g of CCl_3CO_2H, 100 ml H_2O, and 80 ml BuOH; the lower layer being rejected in each case. The indicator was 0.44% $K_3Fe(CN)_6$ dissolved in 0.2 *M* Na phosphate to give a pH of 8.3. The colors were pink with adrenaline and mauve with noradrenaline.

8125. JENSEN, K. BRISEID AND SVENDSEN, A. BAERHEIM. **Partition chromatography and quantitative separation strychnine and brucine.** *Pharm. Acta Helv.* 25, 31-6(1950).—*C.A.* 44, 5532*h*.

A procedure for the chromatographic sepn. and a detn. of strychnine and brucine in pure substances and in drug exts. was offered. The following were used in the detn: 25 mg of the alkaloids dissolved in 2 cc. $CHCl_3$-Et_2O mixt., 10 g kieselguhr, 3 cc. 0.2 *M* phosphate buffer (pH 7) as immobile phase, Et_2O as the mobile phase for the strychnine fractions and $CHCl_3$ for the brucine fractions, elution time 2-3 min. for 10 cc. After sepn., the alkaloids were titrated with 0.01 *N* HCl with bromocresol green as indicator.

8126. Jermstad, Axel and Jensen, Kjell Briseid. **Paper chromatographic separation and identification of organic plant acids with special reference to the acids occurring in Aconitum septentrionale.** *Pharm. Acta Helv.* 25, 209-29 (1950).—*C.A.* 45, 1726*c*.

Using a one-dimensional chromatographic sepn. on Whatman filter paper No. 1, the R_f values for the following org. plant acids in butanol-formic acid-H_2O and ethyl acetate-formic acid-H_2O were detd.: oxalic, tartaric, quinic, citric, malic, malonic, chlorogenic, succinic, aconitinic, fumaric, caffeic, anthranilic, and salicylic. The acids in concns. of 70-80 γ were identified by spraying the chromatograms with an alc. soln. of of Bromphenol Blue and also treating with solns. of $FeCl_3$, $KMnO_4$, and ammoniacal $AgNO_3$. The roots of *Aconitum septentrionale* were extd. and the following acids identified: aconitinic, malic, quinic, chlorogenic, and caffeic.

8127. Jindra, A. and Pohorský, J. **Determination of alkaloids by exchange of ions.** *J. Pharm. Pharmacol.* 2, 361-3 (1950); *Časopis Českého Lékárnictva* 63, 57-75(1950).—*C.A.* 44, 8054*c*; 46, 5785*c*.

Methods depending on ion exchange by chromatography with Amberlite IR4B were used for the detn. of arecoline-HBr, atropine-H_2SO_4, cocaine-HCl, codeine-H_3PO_4, homatropine-HBr, morphine-HCl, papaverine-HCl, pilocarpine-HCl, quinine-HCl and -H_2SO_4, scopolamine-HBr, and strychnine-HNO_3. Larger quantities of active constituent in galenical prepns. used in a semimicro method enabled a more accurate reading of the 0.01 *N* HCl consumed.

8128. Jones, Tudor S.G. **Paper chromatography. II.** *Chemist and Druggist* 153, 375-8(1950).—*C.A.* 44, 7708*e*.

Applications were discussed.

8129. Kawahara, Fred K. and Dutton, Herbert J. **Adsorption analysis of lipides. IV. Fractionation of cholesterol and ergosterol.** *J. Am. Oil Chemists' Soc.* 27, 161-4 (1950).—*C.A.* 44, 6169*e*.

The adsorption analysis of the cholesterol-ergosterol system was studied. Since previous purified substances were shown to be multicomponent by adsorption analysis on Al_2O_3, calcn. of the degree of sepn. of their mixt. involved certain approximations. Of the cholesterol originally placed on the column, it was calcd. that 48.4% was recovered with a purity of 98%.

8130. Kent, F.H. Naim and Amengual, B. Mateu. **Identification and separation of minute quantities of alkaloids by microchromatography on paper.** *Arch. farm. bioquím. Tucumán* 4, 333-43 (1950).—*C.A.* 45, 1724*b*.

The alkaloid or mixt., 1-50 γ, was deposited on the upper end of the paper strip with the aid of $CHCl_3$ and developed by downward traverse using a mixt. of BuOH 45, MeOH 5, and distd. H_2O 50% by vol. The dried strip was then sprayed with Dragendorff's reagent, Bouchardat's reagent, or other suitable reagent to locate the spots.

8131. Klose, A.A.; Stark, J.B.; Purvis, G.G.; Peat, Jean, and Fevold, H.L. **Ascorbic acid from walnut hulls.** *Ind. Eng. Chem.* 42, 387-91 (1950).—*C.A.* 44, 4638*c*.

Recovery of ascorbic acid from waste green walnut hulls produced an over-all yield of 25% (cryst ascorbic acid). Continuous, countercurrent extn. of the hulls was made in dil. aq SO_2 soln. The ext. was preserved with 0.2% SO_2 by wt. Amberlite IR-4 was used to adsorb the ascorbic acid from the ext. and elution with 0.1 *N* HCl acid soln. recovered 70% of the ascorbic acid in the ext. The eluates were concd. to 40 to 60% solids, decolorized with Norit A. A decolorized eluate contg. 23 g of ascorbic acid, at a purity of 36%, was concd. to 70% solids, and allowed to crystallize at 40°F for several days. Data on the feasibility of economically operating this process commercially for walnut-hull utilization were presented.

8132. Konovalova, A.A.; Platonova, T.F., and Konovalova, R.A. **Adsorption method of isolating cytisine.** *Zhur. Priklad. Khim.* 23, 506-11(1950); *J. Applied Chem. U.S.S.R.* 23, 529-34 (1950) (Engl. translation).—*C.A.* 46, 7288*h*.

Preliminary studies with several adsorbents showed that pure cytisine in 1% aq. soln. at pH 8.4 was best adsorbed (95.2%) by 20% (calcd. on wt of the soln.) bentonite, previously activated by heating with 20% H_2SO_4. Equil. was attained within 15 min. at 10°C. Over the pH range 2.4-8.4 adsorption was maximal (95.2-96.4%), but at pH 14 adsorption was only 41% complete. Data on mixed alkaloids from liquors prepd. by infusion of plant tissue showed as good adsorption as with solns. of pure cytisine. Cytisine was desorbed from bentonite; not at all by EtOH or $CHCl_3$; 5% by *N* HCl or H_2SO_4; ~ 60% by *N* NaOH or NH_4OH.

8133. Konovalova, A.A.; Platonova, T.F., and Konovalova, R.A. **Isolation of alkaloids by the adsorption method.** *J. Applied Chem. U.S.S.R.* 23, 927-31(1950) (Engl. translation). —*C.A.* 46, 4176*f*.

Salsoline and salsolidine were adsorbed from 0.5-1% aq. solns., pH 0.56, 6.1 and 8.8, by 20% (calcd. on vol. of the soln.) bentonite, activated by heating with H_2SO_4, giving 4% satn. of the adsorbent; adsorption was achieved by mech. shaking of the soln. with bentonite. Adsorption of alkaloids from liquors prepd. by infusion of pulverized above-ground portions of *Salsola richteri* with 1% H_2SO_4, required (for 0.33% soln.) 25-30% bentonite to give 1.2%.

8134. Kornberg, A. and Pricer, W.E., Jr. **The structure of triphosphopyridine nucleotide.** *J. Biol. Chem.* 186, 557-67 (1950).—*C.A.* 45, 195*g*.

A strong-base, quaternary-ammonium-type anion exchange resin was used to resolve the structure of triphosphopyridine nucleotide (TPN) by first purifying an adenosinemonophosphate fragment from the TPN by ion exchange chromatography. Ion exchange chromatography was also used to show that the adenosinemonophosphate was identical with adenylic acid (prob. adenosine-2-phosphate) and different from adenosine-3-phosphate.

8135. Kretovich, V.L. and Bundel, A.A. **Chromatographic separate determination of aspartic and glutamic acids.** *Doklady Akad. Nauk S.S.S.R.* 73, 137-40(1950).—*C.A.* 44, 10603*a*.

Samples (1 g) were treated with hot 96% EtOH. The anionotropic Al_2O_3 was prepd. from 10 g Al_2O_3 which was treated with 30 ml 6 *N* HCl, and washed to pH 2.5-2.7. The final product was heated with almost as much $AlCl_3$ for 24 hrs at 700°C to give the most active product. Adsorption was done in a (60 cm X 8-10 mm) packed tube at 16°-18°C, using 2-4 ml ext., washing with 50 ml H_2O satd. by H_2S, then H_2O, followed by elution of glutamic acid by 55 ml 0.5 *N* AcOH, then H_2O, and elution of aspartic acid by 5 ml 3 *N* KOH then 40 ml 0.05 *N* KOH. The separate eluates were decompd. as usual and the micro-detn. of N performed.

8136. Kritchevsky, David and Calvin, Melvin. **Paper chromatography of steroids.** *J. Am. Chem. Soc.* 72, 4330 (1950).—*C.A.* 45, 1840*d*.

Sepn. of cholesterol and cholestenone was achieved by using paper impregnated with Quilon (stearato chromic chloride) as the stationary phase and simple alcs. as solvents (MeOH, EtOH, and 8:2 EtOH-H_2O).

8137. LoGrippo, Gerald A. **Partial purification of viruses with an anion-exchange resin.** *Proc. Soc. Exptl. Biol. Med.* 74, 208-11 (1950).—*C.A.* 44, 7915*g*.

Ten g of dry Amberlite XE-67 (fine powder) added to 100 cc. of a 1% homogenized suspension of central nervous system tissue of mice infected with Lansing virus was shaken 20 min. and filtered. The filtrate was non-infective. The bulk of extraneous material was thereby removed quickly, simply, and without lengthy chemical procedures. The method was also applicable to the extraction of poliomyelitis virus from human feces.

8138. Lynam, C.G. and Weil, H. **A chromatographic repetition plant.** *Mfg. Chemist* 21, 288-90, 302(1950).—*C.A.* 44, 9590*f*.

Chromatography in industry was reviewed with a critical evaluation of the methods used to promote efficiency and reduce costs. Details were given for a system of radial chromatography, recycling, and elution which gave nearly continuous operation.

8139. Macció, Isidro. **Paper chromatography applied to the study of alkaloid-containing extracts.** *Rev. farm.* (Buenos Aires) 92, 107-8 (1950).—*C.A.* 45, 6347*d*.

EtOH exts. of *Bocconia pearcei* were fractionated on Whatman No. 1 paper and eluted with BuOH shaken with dil. AcOH. Three alkaloids were differentiated by their behavior in Wood's light and reactivity with Dragendorff reagent.

8140. Markham., R. and Smith, J.D. **Chromatographic studies on nucleic acids. III. Nucleic acids of five strains of tobacco mosaic virus.** *Biochem. J.* 46, 513-17 (1950).—*C.A.* 44, 10010*d*.

The purine bound sugar in 2 strains was shown by paper chromatography to be identical with ribose from yeast nucleic acid, and all the nucleic acids contained only adenine, guanine, cytosine, and uracil.

8141. Martin, Gustav J. and Alpert, Sidney. **Comparative capacity of adsorptive agents for endogenously produced toxic chemicals.** *Am. J. Digestive Diseases* 17, 151-4(1950).—*C.A.* 45, 825*i*.

—Adsorbents for skatole, indole, tyramine, putrescine-2 HCl, and histamine-2 HCl were studied.

8142. McChesney, E.W. and McAuliff, J.P. **Effects of some ion exchange resins on the mineral metabolism of rats.** *Am. J. Physiol.* 160, 264 (1950).—*C.A.* 44, 4948*i*.

All cationic exchange resins bound some Na and K in the intestine; when fed in the H^+ cycle they also bound some Ca, but this was not true of the resin fed in the NH_4^+ cycle. About 20 to 25% of the total capacity of the resin was utilized, with the ratio of binding of Na:K being nearly 2:1. It seemed likely that resins acted to relieve edema almost entirely by binding exogenous Na.

8143. Mesnard, P. and Devze, J. **Paper chromatography of digitalin.** *Bull. trav. soc. pharm. Bordeaux* 88, 109-14, 114-19 (1950).—*C.A.* 45, 7300*i*.

The method used was a modification of the reaction of Sanchez (without vanillin) by using HCl fumes to develop the color. The concd. HCl was warmed in a dish covered with an inverted funnel, at a distance of 4-5 cm. from it. The paper became brittle but was kept between 2 sheets of cellophane. With a solvent mixt. of AcOEt 20, and eucalyptol 1 part, digitalin Nativelle (com. digitoxin) gave 2 spots with R_f values 0 and 0.88 resp. If the chromatogram was developed again by using Me_2CO as solvent in a 2nd dimension, spot No. 1 was sepd. into 2 spots; representing the original heterosides and gitoxoside.

8144. Milne, G.R. and Todd, G.M. **Preparation of liquid human plasma by the kaolin process.** *J. Pharm. and Pharmacol.* 2, 831-4 (1950).—*C.A.* 45, 3555*a*.

Protein up to 1.54 g % was lost by adsorption on the kaolin, and 0.35 g % lost by passage through sterilizing asbestos pads. The min. standard for protein content in the British Pharmacopeia should be revised if the kaolin process is approved.

8145. Miura, Kazuo. **Paper-partition chromatography of amino acids. I. Copper salts of amino acids.** *J. Agr. Chem. Soc. Japan* 24, 369-71 (1950-51).—*C.A.* 46, 11040*a*.

Cu salts of amino acids were sepd. on a paper chromatogram with lutidine satd. with H_2O as the solvent. Spots on the chromatogram were detected by spraying successively 30% AcOH, and a soln. contg. *o*-toluidine 0.2 g, and NH_4SCN 0.5 g in 50 cc. Me_2CO. H_2O-insol. amino acids were tested in H_2O-pyridine (1:1) solns.; the presence of pyridine did not affect R_f values, but Cu pyridine gave an obscure spot. R_f values were: glycine 0.29, alanine 0.43, *DL*-valine 0.63, *L*-leucine 0.71, *D*-arginine 0.06, *L*-ornithine 0.04, *D*-lysine

0.05, *L*-histidine 0.15, *L*-proline 0.50, *L*-hydroxyproline 0.43, *L*-glutamic acid 0.44, *L*-aspartic acid 0.46, *L*-cystine 0.60, *L*-tryptophan 0.82, *DL*-methionine 0.64, *L*-phenylalanine 0.75.

8146. MULLER, ROBERT H. **Application of ion-exchange resins to the purification of certain viruses.** *Proc. Soc. Exptl. Biol. Med.* **73**, 239-41 (1950).—*C.A.* **44**, 5946*i*.

Nitrogenous impurities from suspensions of several neurotropic viruses by treatment were removed with Amberlite cation exchange resin.

8147. MUNIER, ROGER AND MACHEBOEUF, MICHEL. **Microchromatographic separation of alkaloids and various biological nitrogenous bases. II. Utilization of an acid solvent phase. Importance of the dissociation constants of alkaloids in chromatography.** *Bull. soc. chim. biol.* **32**, 192-212 (1950); *Compt. rend.* **230**, 1177-9 (1950).—*C.A.* **44**, 10260*a*; 8054*i*.

Alkaloid mixts. contg. bases whose dissocn. consts. lie between 10^{-3} and 10^{-10} form diffused and elongated spots in paper-adsorption sepns. with neutral solvents. Small addns. to the solvent of acids whose dissocn. consts. were close to those of the bases to be sepd. round the spots without increasing the R_f^{20} to values too close to 1. For the sepn. of scopolamine, atropine, and hyoscyamine (dissocn. const. 10^{-5}), a solvent contg. 100 ml BuOH, 14 ml AcOH, and sufficient water for satn. was used.

8148. MUNIER, ROGER AND MACHEBOEUF, MICHEL. **Preliminary experiments on paper microchromatography of various alkaloids with the use of liquid phases miscible with water.** *Bull. soc. chim. biol.* **32**, 904-7(1950).—*C.A.* **45**, 4881*f*.

A preliminary report on the sepn. of a mixt. of caffeine, theophylline, theobromine, xanthine, and trigonelline and of a mixt. of morphine, codeine, thebaine, atropine, scopolamine, brucine, and strychnine with an acidified 2:1 PrOH-H_2O mixt., a 3:1 Me_2CO-H_2O mixt., and dil. aq. NH_4OH as developing fluids.

8149. NOVELLIE, L. **Quantitative paper chromatography of amino acids.** *Nature* **166**, 1000(1950). —*C.A.* **45**, 5073*a*.

A study was made of several factors affecting recoveries from paper chromatograms, as detd. colorimetrically (ninhydrin method) after elution. The high variable blanks of untreated paper were avoided by extg. it 4 times with boiling 1% alkali hydroxide prior to chromatography. In the absence of solvent, the effect of heat on amino acids in chromatograms was negligible at 100°C, but at 150°C may lead to losses of 20-25%. In the presence of phenol, heating at 150°C for 15 min. led to considerable losses; at 100°C losses were still appreciable; but at 50°C recoveries were satisfactory.

8150. PARTRIDGE, S.M.; BRIMLEY, R.C. AND PEPPER, K.W. **Displacement chromatography on synthetic ion-exchange resins. V. Separation of basic amino acids.** *Biochem. J.* **46**, 334-40(1950).—*C.A.* **44**, 10446*e*.

Sulfonated cross-linked polystyrene resins proved of particular value for sepn. of histidine, lysine, and arginine, but not all resin samples were effective. Two resins with low degree of crosslinking gave sharp boundaries and showed excessive shrinking. Following certain expedients, columns were made by means of which leucine, histidine, lysine, and arginine were successfully sepd.

8151. PARTRIDGE, S.M. AND SWAIN, T. **A reversed-phase partition chromatogram using chlorinated rubber.** *Nature* **166**, 272-3 (1950).—*C.A.* **45**, 6456*h*.

N-2,4-Dinitrophenyl derivs. of various amino acids were sepd. by partition chromatography with 0.2 *M* citrate-phosphate buffer as the flowing solvent on columns prepd. by filtering a slurry of 10 g chlorinated rubber (Alloprene) in 4 cc. of a suspension of BuOH in buffer satd. with BuOH. Rates of movement depended on pH.

8152. PATSCHKY, A. **Chromatographic determination of vitamin C.** *Angew. Chem.* **62**, 50 (1950).—*C.A.* **46**, 9790*e*.

The 2,4-dinitrophenylosazones of ascorbic acid and accompanying sugars, etc., were adsorbed from acetone-alc. soln. on filter paper and developed by chlorobenzene and $CHCl_3$. The vitamosazone thus sepd was detd. colorimetrically in AcOH soln.

8153. PERNOUX, EMILE. **Use of the electron microscope in the study of catalyst supports.** *J. chim. phys.* **47**, 233(1950).—*C.A.* **44**, 7635*e*.

Treatment of kieselguhr with HNO_3 and HCl caused the formation of a silica gel. The gel was completely removed by reaction with 5% Na_2CO_3. Alk. treatment of raw kieselguhr dissolved only the smallest particles.

8154. RENFREW, ALICE G. AND PIATT, PAULINE C. **Paper chromatography of some synthetic pteridines.** *J. Am. Pharm. Assoc.* **39**, 657-9 (1950). —*C.A.* **45**, 1840*c*.

Partition chromatography on filter paper was used as a means for identification of synthetic pteridines, mainly substituted isoxanthopterins. In general, sepns. of 4-hydroxy and 4-amino analogs were possible. Xanthopterin dihydroxanthopterin, and leucopterin gave approx. R_F values of 0.5, 0.5, and 0.23, resp., on development with butanol-morpholine-H_2O and 0.7, 0.7, and 0.3, resp., with 3% NH_4Cl.

8155. ROMANO, CARLO. **Qualitative toxicological analysis of some alkaloids by paper chromatography.** *Minerva medicolegale* **70**, 172-4(1950).—*C.A.* **46**, 4741*b*.

A chromatographical method was suggested to detect aconitine, atropine, brucine, quinine, cocaine, ethylmorphine, morphine, sparteine, and strychnine. The alkaloids were used as their hydrochlorides dissolved in butanol contg. *N* HCl. The color of the stains was red-brown. Sensitivity: 70-80 γ; the specificity values (R_f) were 1.27, 1.06, 0.80, 0.90, 1.08, 1.02, 0.70, 0.50, and 1.02, resp.

8156. SAPARA, V. **Chromatographic separation of opium alkaloids.** *Časopis Českého Lékárnictva* **63**, 293-7(1950)(English summary).—*C.A.* **46**, 7709*f*.

Brockman's alumina sepd. codeine and morphine, narcotine, narceine, and thebaine which could be eluted with ether, chloroform, and methanol either alone or in mixts. The method was particularly suitable for sepn. of small quantities of alkaloids.

8157. Saunders, L. and Srivastava, R. **The adsorption of quinine by a carboxylic acid ion-exchange resin.** *J. Chem. Soc.* **1950**, 2915-19. —*C.A.* **45**, 1839*c*.

Adsorption of quinine on Amberlite IRC-50 in acid form, detd. polarimetrically with time, followed the relation $dx/dt = ka(a-x)/x^2$, where a was initial soln. concn. in millimoles/100 ml, x millimoles adsorbed by 5 g of resin, and t time in hrs. Data were obtained batchwise over 7 days and from column studies. Rate of adsorption depended on a and x, nature of solvent (50% EtOH solns. gave more rapid adsorption than pure EtOH), method of prepn. of acid form (alc. 2-*N*-acid being more effective than aq. 2-*N*-acid solns.), stirring, particle size of resin, and initial pH of soln. Alc. acid eluted more effectively than aq. solns. and *N* and 2 *N* NH_4OH solns. in 50% EtOH gave complete elution in a short time. The rate of adsorption of quinine was largely controlled by the rate of diffusion of quinine mols. through the resin.

8158. Segal, H.L.; Friedman, H.A.; Ellis, E.E., and Watson, J.S. **A polyamine formaldehyde resin. IV. Clinical evaluation in the treatment of duodenal ulcer.** *Am. J. Digest Diseases* **17**, 293-96 (1950).

Lab. studies indicated that an av. dose of 2 g of the weak base anion exchange resin employed was required to raise the gastric pH. Smaller doses might be effective with respect to the crit. pH and pepsin activity in the first part of the duodenum. Clinical remission of ulcer symptoms was experienced by 17 of 26 patients; three patients were benefited during treatment only.

8159. Segal, Harry L.; Miller, Leon L., and Morton, John J. **Determination of gastric acidity without intubation by use of cation-exchange indicator compounds.** *Proc. Soc. Exptl. Biol. Med.* **74**, 218-20 (1950).—*C.A.* **44**, 7915*i*.

A special cation was combined with a cation-exchange resin (Amberlite IRC-50 or Amberlite XE-96). This cation was displaceable only or mainly by H^+ and was readily absorbed from the stomach or small intestine, it was nontoxic and easily detectable in the blood, urine, or saliva. The prepn. of such a complex with quinine as the cation was described. The quinine was liberated and made available for absorption by gastric juice of pH 3 or lower. If quinine appeared in the urine within 2 hrs after ingestion of the complex the gastric juice contained free HCl, if it did not appear until later free HCl was absent.

8160. Solanki, Vithal N. and Basu, N.K. **Chromatographic assay of tincture cinchona.** *J. Sci. Research Benares Hindu Univ.* **1**, 149-52 (1950-51).—*C.A.* **46**, 4743*a*.

Add 10 ml of unknown to top of column filled with chromatographic alumina, and elute with 90% alc. till a few drops of elutriate, tested with Meyer's reagent, gave no turbidity. Conc. the elutriate and treat in accordance with The British Pharmacopeia, 1932.

8161. Svendsen, Anders B. and Jensen, Kjell B. **Paper chromatography of digitalis glycosides.** *Pharm. Acta Helv.* **25**, 241-7(1950).—*C.A.* **45**, 1726*a*.

The fluorescent reactions of 14 glycosides were reported. The R_f values for the same glycoside in $CHCl_3$, MeOH, and H_2O were given.

8162. Takagi, Seishi; Suzuka, Tomoji, and Imaeda, Kazuo. **Identification of sulfa drugs by paper partition chromatography.** *Japan. J. Pharm. & Chem.* **22**, 145(1950).—*C.A.* **45**, 4884*c*.

Utilizing the fact that sulfa drugs give peculiar coloration as Cu salts. a means was devised by which various sulfas could be isolated by paper partition chromatography, then identified by the application of $CuSO_4$. Sulfa drugs were dissolved in 10% NaOH, the Na salts pptd. by the addn. of EtOH and recrystd. from H_2O. Na salt solns. were dropped at one end of a filter paper 2 × 50 cm and developed by hydrous MeOH at approx. 25° by the ascending method. After development and drying, a 1% $CuSO_4$ soln. was sprayed from which colors developed. The observations were made easier by irradiation of ultraviolet rays.

8163. Thomas, Georges; Ransy, J.; Roland, P. and Bulcke, A. vanden. **Separation of ternary mixtures of sulfonamides by paper chromatography.** *J. pharm. Belg.* [N.S.], **5**, 263-9(1950).—*C.A.* **45**, 4406*f*.

The NH_3 soln. contg. 1 to 3 of the compds. sulfadiazine, sulfamerazine, sulfathiazole, and sulfamethazine was dropped from a weighing pipet (10-20 mg of soln. contg. about 30 γ of each compd.) onto a filter paper which was dried and placed over a dish contg. BuOH + NH_4OH. After 2-4 hrs the paper was placed over another dish contg. 2-3 cc. *N* HCl for 6-12 hrs. The zones can be compared with known chromatographs. The sepd. zones were eluted separately with 5 cc. *N* HCl immediately after addn. of the developer (1% *p*-dimethylaminobenzaldehyde in 3% HCl).

8164. Tschapek, W. and Garbosky, A.J. **The principles of adsorption of the Azotobacter.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* **3**, 102-4(1950).—*C.A.* **46**, 5768*d*.

The adsorption of *Azotobacter* by dispersed sand was investigated as a function of agitation time, bacterial nos., adsorbent quantity, pH, and electrolyte concn. The adsorption depended primarily on the electrokinetic potential of the bacteria and this potential depended on the pH of the soln. Hence, on pH > 7.2 when the electrokinetic potential was > 30 mv., the adsorption does not take place, but in the presence of the electrolytes which diminish the value of this potential the adsorption occurs with the same pH.

8165. Udenfriend, Sidney. **Identification of γ-aminobutyric acid in brain by the isotope derivative method.** *J. Biol. Chem.* **187**, 65-9 (1950).—*C.A.* **45**, 3446*c*.

Paper chromatograms of each of the radioactive derivs. were developed with BuOH satd. with *N* NH_4OH. The bands were located by radioautography, and each band was cut into several transverse segments. Each segment was eluted with water, transferred to a planchette, and dried. The elutions need not have been quant. since calcns.

were based on the ratio of one isotope to the other.

8166. Vaisman, G.A. and Yampol'skaya, M.M. **Use of organic exchange resins for quantitative determination of salts of organic acids in pharmaceutical analysis.** *Zavodskaya Lab.* **16**, 621-2 (1950).—*C.A.* **44**, 9624*g*.

Sulfophenolic resins were used for analyses of typical org. acid salts by passing the latter in aq. soln. over the cationite and titrating the free org. acid in the filtrate. Gluconic (titration in a closed vessel), sulfoguaiacolic (titrate using methyl orange), lactic, salicylic, and benzoic acids (use EtOH wash to remove the last 2 from the column) were readily detd.

8167. Vitte, G. and Boussemart, E. **Separation of vanillin and methylvanillin by paper chromatography.** *Bull. trav. soc. pharm. Bordeaux* **88**, 177-80 (1950).—*C.A.* **45**, 6971*f*.

Prep. the solvent from BuOH equilibrated with an equal vol. of 2% HCN soln. with 3 drops of NH_3 added to the sepd. clear BuOH layer. Centrifuge if not clear. Sat. the atm. with NH_3 from 15 cc. of concd. NH_3 in a beaker in the chamber. Allow the chromatogram to develop for 20 hrs at 20°, dry for 2 hrs at room temp., and treat to reveal the spots with $AgNO_3$ at 110°. The R_f values are 0.39 for vanillin and 0.57 for methylvanillin.

8168. Votá, Alejandro Santa Pau and Yúfera, Eduardo Primo. **Obtaining alkaloids by treatment with resins. I. Alkaloids of the belladonna.** *Farmacognosia* **10**, 81-99 (1950).—*C.A.* **45**, 309*d*.

Alkaloids were fixed by Zeo-Karb which was capable of fixing alkaloids at low pH. The alkaloid was displaced with 0.5 *N* NaOH soln., dissolved in 96% EtOH, and purified after distn. of EtOH. Recovery of alkaloid was 80-85%.

8169. Williams, T.I. **Chromatography in industry.** *Discovery* **1950**, 396-8.—*C.A.* **45**, 2117*g*.

Chromatography provided a convenient means of sepg. suitable mixts. E.g., castor oil could be freed from ricinoleic acid at the rate of 70 gal/hr in a suitable column. By pumping hexane through grasses, chlorophyll, β-carotene, and xanthophyll, could be sepd. Other uses were in the prepn. of streptomycin and in isotope sepn.

8170. Winters, J.C. **The ion exchange process. A new unit operation for the drug manufacturer.** *Drug and Allied Inds.* **36**, 19-24 (July, 1950).

New synthetic resin adsorbents have extended the usefulness of the unit operation beyond the treatment of water alone-largely because of their greater versatility, physical resistance, and exchange capacity. Advances in the production of amino acids, antibiotics, vitamins, alkaloids, proteins, enzymes, and hormones have been made.

8171. Wirts, C. Wilmer; Rehfuss, Martin E., and Wass, Beatrice. **The effect of an anion-exchange resin on gastric and duodenal secretions and gastric emptying.** *J. Clin. Invest.* **29**, 37-45 (1950).—*C.A.* **44**, 7445*d*.

The anion-exchange resin (Amerlite IR-4) was effective in neutralizing acid and inactivating pepsin in the gastric juice of both ulcer and nonulcer subjects after insulin and repeated histamine stimulation.

8172. Woodruff, H. Boyd and Foster, John C. **Analysis for vitamin B_{12} and vitamin B_{12a} by paper-strip chromatography.** *J. Biol. Chem.* **183**, 569-76 (1950).—*C.A.* **44**, 6467*a*.

Vitamins B_{12} and B_{12a} were estd. by combined microbiol. assay and paper-strip chromatography. A small correction factor was required to compensate for conversion of B_{12} to B_{12a} which might have taken place during the analysis.

8173. Barr, Martin and Guth, Earl P. **The preparation of five cation-saturated bentonites and the determination of their exchangeable cations.** *J. Am. Pharm. Assoc.* **40**, 9-12 (1951).—*C.A.* **45**, 3531*h*.

The cation-satd. bentonites of Na, K, Ca, Mg, and H were prepd. by ion exchange by using the appropriate acetate. The exchangeable cations were detd. by a modification of Mehlich's method.

8174. Barr, Martin and Guth, Earl P. **Cation-saturated bentonites as constituents of ointment bases.** *J. Am. Pharm. Assoc.* **40**, 13-16 (1951).—*C.A.* **45**, 3554*i*.

Ointment bases were prepd. with Na, K, Ca, Mg, H, and Volclay bentonites as major constituents. Sulfathiazole, phenol, and ammoniated Hg showed greater activity when incorporated in H bentonite than in the other bentonite bases.

8175. Bárta, Rudolf and Šatava, Vl. **Fine silica for pharmaceutical industry.** *Chem. Prumysl* **1** (26), 282-4 (1951).—*C.A.* **46**, 9792*e*.

A substitute for fissan-colloid (SiO_2 of 1-100 μ particle size, contg. 5% of adsorbed F) was found in the wastes in the manuf. of H_2SiF_6. After removing the excessive H_2SiO_6 and Fe and drying at 100°C, a fine powder of particle size slightly larger than fissan was obtained. It can be used by the pharmaceutical industry.

8176. Beran, Miloš and Šícho, Vladislav. **Paper chromatography of vitamin B_1.** *Chem. Listy* **45**, 154-6 (1951).—*C.A.* **45**, 9589*b*.

Vitamin B_1 in the paper chromatogram was transformed to thiochrome by treatment with NaOH and $K_3Fe(CN)_6$ and was detected by ultraviolet irradiation (blue fluorescence).

8177. Bergström, Sune and Sjövall, Jan. **Separation of adrenaline and noradrenaline by partition chromatography on a preparative scale.** *Acta Physiol. Scand.* **23**, 91-4 (1951).—*C.A.* **46**, 687*g*.

Add 0.1 *N* HCl to freshly distd. phenol. Mix 60 g Hyflo Super-Cel with 30 ml of the HCl phase to a homogeneous state; add about 250 ml of the phenol phase and pour the resulting slurry into a chromatographic tube. Apply gentle suction until the top of the column begins to dry. Pour sand on top (about 1 cm) and pipet the material to be chromatographed onto the sand. Add a mixt. of adrenaline and noradrenaline to the phenolic phase and an equiv. amt. of concd. HCl, shake well, and pour into the column. Fractions were collected every 15 min. The presence of adrenaline or noradrenaline in the fractions was ascertained by chromatography with phenol satd.

with 0.1 *N* HCl, and after drying the paper sprayed with $K_4Fe(CN)_6$.

8178. Bernstein, Theodore B.; Mosher, Anne L., and Mariella, Raymond P. **Purification of the active principle of short ragweed pollen.** *Science* **113**, 377-8 (1951).—*C.A.* **46**, 3217*h*.

The pollen (*Ambrosia elatior*) was dried, extd. with Et_2O, then with H_2O at 5°C for 18 hrs. The filtered aq. ext. was chromatographed on alumina, pH 5 to 6, then washed with H_2O and 11 fractions collected.

8179. Bevenue, Arthur and Williams, Kenneth T. **Further evidence indicating the specificity of the orcinol spray reagent for ketoheptoses on paper chromatograms.** *Arch. Biochem. Biophys.* **34**, 225-7(1951).—*C.A.* **46**, 9020*b*.

The colors produced by the modified Bial's reagent with 62 compds. representing a complete carbohydrate range were tabulated. Ketoheptoses gave a blue color and all other ketose sugars tested gave a yellow color. Aldoheptoses and all other compds. tested gave no color.

8180. Böhme, H. and Lampe, H. **Behavior of alkaloid salt solutions on alumina columns. I. Quinine hydrochloride.** *Arch. Pharm.* **284**, 227-39(1951).—*C.A.* **46**, 9260*f*.

Aq. quinine-HCl solns. were passed through columns of several com. Al_2O_3 samples. The filtrates were analyzed gravimetrically for alkaloid, Na^+, and Cl^-. Most of the Al_2O_3 samples were alk.; these held back the quinine as the result of the cation-exchange reaction,: $AlONa + [BH]^+ Cl^- \rightarrow$: $AlO[BH] + Na^+ + Cl^-$. Practically neutral aluminate-free Al_2O_3 columns retained the Cl^- from MeOH solns. of quinine; this is probably due to an anion-exchange reaction involving some AlOH groups on the surface of the absorbent.

8181. Bouchardy, M. **A study of some nonofficial tinctures with the aid of paper chromatography.** *Pharm. Acta Helv.* **26**, 360-9(1951).—*C.A.* **46**, 3213*i*.

With a suitable solvent (solns. of salts, acids, and mixts. of org. solvents and the soln.) for each tincture, chromatograms could be obtained which permitted the identification of the prepn. by paper chromatography. Chromatograms for the following prepns. were described: tinctures of crataegus, mistletoe, Indian chestnut, drosera, passion flower, and artichoke and dialyzates of artichoke and of hydrastis.

8182. Boulanger, Paul and Montreuil, Jean. **Nucleic acid studies. I. Quantitative paper chromatography of ribonucleotides. II. Quantitative paper chromatography of the pentose nucleotides of the nucleic acids of yeast and pancreas.** *Bull. soc. chim. biol.* **33**, 784-99 (1951).—*C.A.* **46**, 1608*i*.

The successful application of the method was described.

8183. Brady, Roscoe O. **Biosynthesis of radioactive testosterone in vitro.** *J. Biol. Chem.* **193**, 145-48 (1951).

Aliquots contg. approx. 50 γ of the recovered testosterone were chromatographed on paper. The combination of alumina chromatography and descending paper chromatograms performed with ligroin satd. with propylene glycol effected excellent sepn. from a large no. of related steroids.

8184. Bremner, J.M. **Alkaline decomposition of amino acids.** *Nature* **168**, 518(1951).—*C.A.* **47**, 245*g*.

In the course of an examn. of amino acid compn. of soil hydrolyzates by the paper chromatography technique, it was noticed that alk. hydrolyzates of soil contained greater amts. of α-aminobutyric acid and glycine than did acid hydrolyzates. Further studies of the effect of hot NaOH and $Ba(OH)_2$ on amino acids showed that threonine yielded glycine and α-aminobutyric acid, servine yielded glycine and alanine, and cysteine and cystine yielded alanine.

8185. Brindle, H.; Carless, J.E., and Woodhead, H.B. **Separation of alkaloids by paper chromatography. I. Solanaceous alkaloids. II. Water-insoluble alkaloids of ergot.** *J. Pharm. Pharmacol.* **3**, 793-813, discussion, 813-14(1951).—*C.A.* **46**, 1710*d*.

Paper buffered with .066 *M* citrate or phosphate was satisfactory for the sepn. of mixts. of atropine, hyoscine, and apoatropine with BuOH. The alkaloids were detected on the chromatograms by a soln. of 0.5% I in 1% KI or by a modified Dragendorff reagent. Certain solvent mixts. of $CHCl_3$, CCl_4, and (or) light petroleum gave R_f values for hyoscine near to unity while the atropine was only slightly sol. in the moving org. phase. Hyoscine accounted for 2-3% of the total alkaloids. With paper buffered between pH 2 to 5 with Et_2O as solvent ergometrine, ergometrinine, and the lysergic acids remained stationary while the water-insol. alkaloids of ergot were widely sepd. Ascending development was most suitable for quant. procedures.

8186. Brockmann, Hans and Musso, Hans. **Paper chromatography of glycine peptides.** *Naturwissenschaften* **38**, 11-12(1951).—*C.A.* **46**, 1841*a*.

In butanol, BuOH-AcOH, and BzOH the R_f values decreased with increasing no. of glycine groups, in PhOH the R_f values increased In cresol the sequence of increasing values was tri-, di-, tetra-, mono-, pentapeptide. In all cases the paper strip was sprayed with 0.1% soln. of ninhydrin in BuOH and heated to 100°C to develop the color. The glycine spot appeared first (violet); the others are at first yellow and change after 20 mins. to violet. The color intensity decreases with increasing chain length. Complete sepn. of the zones was obtained with cresol.

8187. Brüggemann, Johannes; Krauss, Walter, and Tiews, Jürgen. **Chromatographic separation of vitamins A and D.** *Naturwissenschaften* **38**, 562(1951).—*C.A.* **46**, 11586*d*.

Talcum, soaked in a $CHCl_3$soln. of $SbCl_3$ contg. some $SbCl_5$ and dried for 20 min. at 100°C, was used as adsorbent in a 6-cm height and 2-cm diam. column, supported by 16-cm height of potato starch. Potato starch held $SbCl_3$ back and allowed vitamins to go on. The column was moistened with $CHCl_3$ and the unknown mixt. freed of sterols by digitonin pptn., dissolved in 5 cc. $CHCl_3$, was run through the column. After washing with

$CHCl_3$ vitamin D was found in the eluate (91-97%) and vitamin A appeared as a sharp blue layer in the column.

8188. Brush, Miriam K.; Boutwell, R.K.; Barton, A.D., and Heidelberger, Charles. **Destruction of amino acids during filter paper chromatography.** *Science* **113**, 4-6 (1951).—*C.A.* **45**, 2523*b*.

Chromatograms of amino acids run with PhOH should not be dried above 27°C since drying at 60-105°C for 5 min. led to marked destruction. Radioautographs of 2-dimensional chromatograms of alanine-2-C^{14}, glycine-2-C^{14}, and tryptophan-β-C^{14} run with PhOH followed by lutidine showed that the amino acids were converted to compds. having high R_f values in both PhOH and lutidine.

8189. Capone, Antonio. **Colorimetric and chromatographic determination of ephedrine in combinations with other pharmaceutical products**. *Boll. chim. farm.* **90**, 465-72(1951).—*C.A.* **46**, 4743*e*.

Paper chromatography was successful by using for aq. solns. a perfusing liquid of BuOH satd. with H_2O and contg. 25 cc. EtOH/100 cc.; for solns. in oil a mixt. of equal parts BuOH, EtOH, and H_2O. The chromatogram was developed by exposure to I_2 vapors for 12 hrs. The following substances modified the ephedrine chromatogram: K sulfoguaiacolate; Ca camphosulfonate; Na benzoate; lactic acid; Na glycerophosphate; and KI. KBr, $CaCl_2$, $MgCl_2$, starch, talc, lactose, phenyldimethylisopyrazolone, Na_2HPO_4, barbital, KI, and Ca gluconate had no influence.

8190. Carless, J.E. and Woodhead, H.B. **Separation of alkaloids by paper chromatography.** *Nature* **168**, 203(1951).—*C.A.* **46**, 4741*f*.

The strongly basic solanaceous alkaloids and the feebly basic water-insol. alkaloids of ergot could be sepd. with buffered filter paper. Quant. estn. by elution of the alkaloid was not satisfactory.

8191. Carrasco, F. and Martín Panizo, F. **Extraction of ascorbic acid from fruits grown in Spain by means of anion-exchange resins.** *Anales real soc. españ. fís. y. quím.* **47B**, 751-8(1951).—*C.A.* **47**, 792*d*.

Two exchange resins, "Wolfatite M" (I.G. Farbenindustrie A.-G.) and "Ionac A-300" (American Cyanamide and Chem. Co.) were compared. Adsorption isotherms for HCl, HOAc, and oxalic acid were prepd. and similar general tests were used for comparison. Then comparisons were made of the take-up of ascorbic acid from a soln. protected against oxidation with SO_2. The second resin proved the more effective.

8192. Crokaert, R.; Moore, S., and Bigwood, E.J. **Chromatographic study of urinary pantothenic acid.** *Bull. soc. chim. biol.* **33**, 1209-13 (1951).—*C.A.* **46**, 6178*b*.

The pantothenic acid content of urine was estd. by detn. of the β-alanine liberated from it by acid hydrolysis. The sample was first passed through a column of acid-phase Dowex resin to remove pigments, metallic cations, org. bases, and peptides, then acidified to pH 1 with HCl and heated 60 min. at 100°C to hydrolyze the pantothenic acid. The soln. was evapd. to dryness and the residue, dissolved in buffer soln. of pH 3-5, was passed through a column of Na-phase Dowex resin to adsorb the β-alanine. The β-alanine was then eluted and detd.

8193. Dalsgaard, A. Torstensen and Olsen, Otto M. **Sterilization of medicinal charcoal.** *Svensk Farm. Tid.* **55**, 557-61(1951).—*C.A.* **45**, 9795*d*.

Charcoal could not be sterilized by heating in air at 140-60°C since it began to smoulder and smoke. It could be sterilized by autoclaving at 120°C for 20 min. or by heat-treatment in 61% alc. in closed containers at 100° for 30 min. After each method of sterilization, it must be dried at 60°C. The treatments did not affect the adsorption capacity.

8194. Denoël, A.; Jaminet, F.; Philippot, E., and Dallemagne, M.J. **Chemical and pharmacodynamic study of some alkaloids of Strychnos angolensis.** *Arch. intern. physiol.* **59**, 341-7 (1951).—*C.A.* **47**, 5627*f*.

The bark and roots of *S. angolensis* contained about 0.6% total alkaloids extractable with ammoniacal $CHCl_3$. After concn. *in vacuo* the residue was extd. with 0.5 *N* H_2SO_4, and this ext. was then made ammoniacal which caused an amorphous fraction A to ppt. The filtrate was re-extd. with $CHCl_3$, yielding fraction B. Upon paper chromatography with a BuOH-HCl-H_2O 50:7.5:17 solvent fraction A gave 2 spots with R_f values of 0.07 and 0.35. R_f values of pure alkaloids were: genostrychnine 0.86; brucine 0.7; α- and β-colubrine 0.87 and 0.84; vomicine 0.86; holstiine 0.91; retuline 0.94; tubocurarine 0.46; and hyaphorine, 0.85. Fraction A was richest in the component of R_f 0.07.

8195. Deuel, H.; Anyas-Weisz, L., and Solms, J. **Concerning the contact ion exchange between ion exchangers.** *Experientia* 7, 297-98 (1951)

A strongly acidic cation exchanger and a weakly basic anion exchanger were employed. The results showed a regenerative effect when the chloride form of the anion exchange resin was in contact with satd. solutions of CO_2. These models indicated that the generation of HCl from NaCl by weak acids could be effective only if selectivity existed between the ions.

8196. Dixon, H.B.F.; Moore, Stanford; Stack-Dunne, M.P., and Young, F.G. **Chromatography of adrenotropic hormone on ion-exchange columns.** *Nature* **168**, 1044-5(1951).—*C.A.* **46**, 6322*h*.

Active materials from adrenotropic hormone were satisfactorily chromatographed on Amberlite IRC-50 columns at a neutral pH and room temp. The chromatographic results showed that the ascorbic acid-depleting factor was a highly active, basic substance, readily separable under nonhydrolytic conditions from the protein which were the major constituents of the early prepns. of the hormone.

8197. FLANAGAN, T.L. JR.; SAX, M.F., AND HEMING A.E. **Toxicity studies on Amberlite XE-96, a carboxylic type exchange resin.** *J. Pharmacol. Exptl. Therap.* 103, 215-21 (1951).—*C.A.* 46, 630*d*.

Subacute and chronic toxicity studies were made on dogs and rats fed 3 to 5 g/kg daily doses of the purified ammonium salt of a carboxylic acid cation exchanger. No physiological changes were apparent after periods varying from one week to six months.

8198. FLECKENSTEIN, A.; GÜNTHER, H., AND WINKER, H.J. **Adsorption and cohesiveness of pharmacologically active alkaloid cations on the collodion membrane. Basic physicochemical experiment for "competitive inhibition."** *Arch. exptl. Path. Pharmakol.* 214, 38-54(1951).—*C.A.* 47, 2430*i*.

The potential across a collodion membrane contg. 0.01 *M* KCl and immersed in 0.001 *M* KCl was greatly decreased by a wide, variety of compds. Washing out the membrane restored the potential to more pos. values, the rate of restoration varying with the classes of compds. and within the groups. Sympathomimetic drugs, acetylcholine and related compds., histamine, coniine, veratrine, and nicotine were easily washed off the membranes, while sympatholytics, acetylcholine antagonists, antihistaminics, and local anesthetics were strongly held.

8199. FREEMAN, G. **Methods of obtaining large yields of human platelets as by-product of blood collection.** *Science* 114, 527-28 (1951).

Clinical and exptl. use of platelets has been limited by the expense and impracticality of obtaining them in quantity. Previous studies have indicated that when passed through a strongly acidic cation exchanger, the blood was rendered incoagulable, but that the platelets deposited on the resin bed. Now, by elution with saline soln., it was possible to recover the platelets. Morphological and physiological integrity of the platelets were preserved.

8200. FUCHS, L. AND PÖHM, M. **Paper-chromatographic investigation of the alkaloid mixtures of ergot. Preliminary report.** *Scientia Pharm.* 19, 232-5(1951).—*C.A.* 46, 4172*f*.

After chromatographic sepn. of the various alkaloid types, the ergotoxin group could be hydrolyzed and identified by the amino acids given on hydrolysis. A good solvent for the sepn. of iso-$BuCH(NH_2)CO_2H$ and $PhCH_2CH(NH_2)CO_2H$ was BuOH 1, $PhCH_2OH$ 1, H_2O 2.

8201. GIRI, K.V. **Circular paper chromotography for the separation of amino acids.** *Current Sci.* (India) 20, 295-6(1951).—*C.A.* 46, 6999*e*.

The Rutter disk technique was modified and applied to amino acids. Multiple development was effective in the sepn. of those not resolved by one solvent run.

8202. GIRI, K.V. AND PRASAD, A.L.N. **Detection of enzymes by the agar-plate method and its application to paper chromatography.** *Nature* 167, 859-60 (1951).—*C.A.* 45, 8586*i*.

Amylases were chromatographed on paper strips by the descending technique with EtOH or aq. Me_2CO as solvents. The enzyme on the dried, developed paper chromatogram was located by placing the strip on a thin layer of 2% agar contg. 1% starch, incubating 2 to 8 hrs, flooding the agar with 0.01 *N* I_2, and noting the position, in relation to the solvent boundary and starting positions, of violet or clear spots against the blue background.

8203. GLAZKO, A.J. AND DILL, W.A. **Color reaction distinguishing between adrenaline and noradrenaline on paper chromatograms.** *Nature* 168, 32,(1951).—*C.A.* 45, 10489*f*.

Samples were dissolved in CH_3OH contg. a min. quantity of HCl and then chromatographed. H_2O-satd. phenol was used as developer in a HCl atm. Paper chromatograms were dried and sprayed with a fresh prepn. of 0.5 g Na-β-naphthoquinone-4-sulfonate dissolved in 100 ml 0.2 *M* borate buffer of pH 8.9; the soln. had a final pH of 8.6. Noradrenaline gave an intense blue color in 15-30 min., adrenaline a pink color, and dihydroxyphenylalanine a yellow color.

8204. GRAF, E. **Adsorbent for the chromatographic determination of alkaloids.** *Arzneimittel-Forsch.* 1, 257-66(1951).—*C.A.* 46, 1710*b*.

Chromatographic detn. of alkaloids in alc. solns. was possible only under conditions that were not strictly reproducible. The adsorbent was sensitive to moisture, air, temp., and the normal plant constituents such as alkali nitrates, NH_4 salts, and amines. The total alkaloid content was liberated by means of alkali, the whole mass triturated to dryness with an adsorbent, preferably Al_2O_3, and finally eluted with a suitable solvent, preferably $CHCl_3$.

8205. GRAF, E. **Chromatographic determination of alkaloids.** *Deut. Apoth.-Ztg.* 91, 797-802 (1951).—*C.A.* 46, 1710*c*.

Chromatographic adsorption of alkaloids from alc. or dil. alc. solns. was unreliable. A combined adsorption-partition chromatographic method has been worked out for the German Pharmacopeia.

8206. HAKIM, ANWAR AND MIRIMANOFF, ANDRÉ. **Paper chromatography of some alkaloidal tinctures of the Swiss Pharmacopeia V.** *Arch. sci.* (Soc. phys. hist. nat. Genève) 4, 335-40(1951)(in French).—*C.A.* 46, 5258*h*.

Tinctures of nux vomica, hyoscyamus, belladonna, stramonium, aconite tuber, lobelia, and valerian were sepd. into their components by ascending uni-or bidimensional paper chromatography. The R_f values were talulated. In bidimensional work best results were obtained when the same solvent was reused for resolving in the second direction. Excellent sepn. of brucine and strychnine was achieved. R_f values were given for pure strychnine, brucine, atropine, scopolamine (XV), and hyoscyamine.

8207. HALPERN, A.; POWERS, J.V., AND BRODNEY, C.H. **Pharmaceutical properties of the kaolins.** *Bull. Natl. Formulary Comm.* 19, 33-41(1951).—*C.A.* 45, 8720*f*.

The present official standards for kaolin were not sufficient to properly classify and define it since variations were observed in four different samples, each of which met all of the official standards. Additional criteria to limit contamination, grit, and particle size distribution should be considered. Osmo-kaolin, an electrically purified product approached the ideal kaolin and was found to be superior in all tests.

8208. HAUSER, ERNST A. **Canamin clay and its properties. I, II.** *Can. Chem. Process Inds.* 34, 979(1950); 35, 123(1951).—*C.A.* 45, 7749*h*.

Particle size of this British Columbia colloidal clay (studied from a colloid. chem., medical, and veterinary viewpoint) was too small to permit well-defined electron photomicrographs. Its adsorption properties explain its reported healing effects. The natural deposit of Canamin clay was not of uniform compn., but contained, besides this highly colloidal Al silicate, some comparatively coarse quartz and mica particles.

8209. HEINÄNEN, PEKKA; NYYSSÖNEN, SAARA, AND TUDERMAN, LEO. **Paper chromatographic isolation of sulfonamides.** *Farm. Aikakauslehti* No. 5, 84-98(1951).—*C.A.* 46, 7286*g*.

The applicability of paper chromatography for detection of sulfonamides was demonstrated. R_f values were reported for a no. of sulfonamides, by using ascending chromatography, Whatman No. 1 paper, and a 3% ammoniacal butanol-water solvent. Vanillin-HCl served as the color developer. With addn. of NH_3 to the solvent, sharper spots were obtained and tailing was eliminated.

8210. HENNIG, ARNOLD J.; HIGUCHI, TAKERU, AND PARKS, LLOYD M. **Sabadilla alkaloids. III. Chromatographic separation of the water-soluble fraction. Isolation of a new crystalline alkaloid, sabatine.** *J. Am. Pharm. Assoc.* 40, 168-72(1951).—*C.A.* 45, 4889*f*.

The H_2O-sol. portion of sabadilla alkaloids was sepd. into 5 fractions by partition chromatography and from one of these fractions a new cryst. alkaloid was isolated and named *sabatine*. The alkanolamine was prepd. by hydrolysis and named *sabine*.

8211. HOLM-JENSEN IB. **Mercury-vapor-absorbing paint.** *Acta Pharmacol. et Toxicol.* 7, 201-19 (1951).—*C.A.* 45, 9888*h*.

Numerous substances were tested for ability to absorb Hg vapor from air at room temp. A water paint contg. pptd. ZnS was the most effective. It was superior to Au foil. The influence of variations in the method of prepg. the ZnS on its absorbent property was discussed.

8212. HUYCK, C. LEE. **Colloidal magnesium aluminum silicate as a suspending agent.** *J. Ala. Acad. Sci.* 21/22, 39-41(1951).—*C.A.* 46, 9252*g*.

Suspensions of 5, 4, and 2 1/2% colloidal Mg Al silicate were substituted for 5, 4, and 2 1/2 aq. magmas of bentonite in two pharmaceutical prepns. requiring suspending agents. The two test prepns. were Calamine Lotion and Chalk Mixt. (U.S.P.).

8213. ICE, CLARK H.; GAGE, THOMAS B., AND WENDER, SIMON H. **The use of filter-paper pulp in the separation of certain flavonoid compounds.** *Proc. Okla. Acad. Sci.* 32, 99-100 (1951).—*C.A.* 47, 5212*c*.

A mixt. of 2 flavonol glycosides (R_f values in BuOH-AcOH-H_2O 0.90 and 0.78) was sepd. by chromatography on a paper-pulp column with Me_2CO or preferably EtOAc as solvent and aq. solvent as eluent. Such columns were cumbersome for large-scale use.

8214. JAMINET, F. **Separation of local anesthetics by paper chromatography.** *J. pharm. Belg.* 6, 81-5 (1951).—*C.A.* 45, 9801*c*.

Anesthesine, stovaine, cocaine, pantocaine, and novacaine were subjected as HCl salts to ascending chromatography with iso-BuOH 50 cc. equilibrated with HCl 7.5 cc. and H_2O 13.5 cc., with the aq. acid layer to sat. the atm. After 19 hrs at 20° the R_f values detd. were 0.94, 0.96, 0.83, 0.54, and 0.21, resp.

8215. JINDRA, A. AND POHORSKY, J. **The determination of alkaloids by exchange of ions.** *J. Pharm. Pharmacol.* 3, 344-50(1951).—*C.A.* 45, 7299*b*.

Detailed descriptions of the app., reagents, prepn. of the ion-exchange column, and general micro and semimicro methods of assay were given. The methods were applied to cinchona bark, ipecac root, nux vomica seeds, belladonna herb, hyoscyamus herb, and their prepns.

8216. KANTOR, NATHAN; LEVINE, JOSEPH, AND FISHBACH, HENRY. **The role of anions on cation-exchange media.** *Antibiotics and Chemotherapy* 1, 586-7(1951).—*C.A.* 46, 6460*d*.

Histamine was displaced from an ion exchanger of cotton-acid succinate by maltol, Na ions, HCl, benzoic acid, and trichloroacetic acid; H_2SO_4, citric acid, and succinic acid were without effect.

8217. KARIYONE, TATSUO AND HASHIMOTO, YOHEI. **Microchemical detection of plant components. VI. Detection and colorimetry of flavonol derivatives.** *J. Pharm. Soc. Japan* 71, 433-6 (1951).—*C.A.* 45, 9799*a*.

Flavonol derivs., e.g., rutin, produce with Al^{+++} a sensitive yellow coloration which showed max. absorption at 2740 and 4160 A. The yellow coloration of flavonol was detd. by adding 0.75% $Al(AcO)_3$ at pH 3.74 and comparing with a standard K_2CrO_4 soln. Partition paper chromatography of flavonols, e.g., rutin, myricitrin, quercetin, quercitrin, myricetin, and morin, was carried out. After development with solvents (BuOH:H_2O:AcOH = 5:4:1 or PhOH:H_2O:AcOH = 40:9:1), flavonol spots were sprayed with 2.5% $(AcO)_3Al$, dried, and their R_f values measured.

8218. KARIYONE, TATSUO AND HASHIMOTO, YOHEI. **Microchemical detection of plant components. VII. Detection of alkaloids by paper chromatography.** *J. Pharm. Soc. Japan* 71, 436-8 (1951).—*C.A.* 45, 9799*b*.

Over 50 kinds of basic compds. were tested by paper partition chromatography with BuOH:H_2O:AcOH = 5:4:1 or PhOH:H_2O:AcOH = 40:9:1 as developing solvents. The paper was dried and sprayed with Dragendorf's reagent which had been dild. to 5 vols. for estn. of R_f values. Since some primary, secondary, and tertiary bases did not ppt. with this reagent, MeOH-KOH (5%) and MeOH-Me_2SO_4 (10%) were sprayed consecutively and heated at 70°C for

30 min. to complete *N*-methylation. This was then sprayed with 10% AcOH to neutralize excess alkali, followed by Dragendorf's reagent. All the bases could be identified in this way.

8219. KARIYONE, TATSUO AND HASHIMOTO, YOHEI. **Microchemical detection of plant components. VIII. Detection of organic dibasic acids by paper chromatography.** *J. Pharm. Soc. Japan.* 71, 439-41 (1951).—*C.A.* 45, 9799*d*.

Take 0.05-0.1 mg org. dibasic acid in a small test tube with 1-2 mg polyphenol, e.g., resorcinol, catechol, hydroquinone, phloroglucinol, or pyrogallol, add 1 drop concd. H_2SO_4, heat 5 min. in an oil bath at 130°C, dissolve with a small amt. of alkali, submit to paper-partition chromatography with the solvent BuOH:H_2O:AcOH = 5:4:1, and let stand for 4-5 days. The strongest fluorescence was shown by 1,2-dicarboxylic acids (citric, meleic, phthalic, succinic, and tartaric acids) and resorcinol.

8220. KATO, MASARU AND SHIMIZU, HIROSHI. **Fluorometric determination of nicotinamide by use of synthetic ion-exchange resins.** *Science* 114, 12-14(1951).—*C.A.* 46, 3459*g*.

Interfering substances were removed by successive purification with a carboxylic-type cation-exchange resin KH-4B and a strong-base-type anion-exchange resin IRA-400. Special tubes were described for carrying out the exchange reactions.

8221. KAWERAU, E. AND WIELAND, T. **Conservation of amino acid chromatograms.** *Nature* 168, 77-8(1951).—*C.A.* 46, 382*h*.

Stable chromatograms of amino acids were prepd. by developing the spots with ninhydrin in the usual manner and then spraying the blue spots with a Cu salt soln. to form stable red complexes. The red spots were exposed momentarily to NH_3 vapor to neutralize traces of free acid and the paper was dipped into a methyl methacrylate polymer. The ninhydrin reagent should not contain ions which can dissociate the Cu complex, i.e. citrate.

8222. KERR, S. E.; SERAIDARIAN, K., AND BROWN, G. B. **The utilization of purines and their ribose derivatives by yeast.** *J. Biol. Chem.* 188, 207-16 (1951).—*C.A.* 45, 4305*a*.

Strongly basic and strongly acidic ion exchange resins were employed for several purification steps. The cation exchanger removed excess alkali from dried yeast residue. In the sepn. of adenosine from soln., precipitation as the picrate was employed. The picrate was then dissolved by contacting it with the strongly basic anion exchanger. The incorporation of the purines, adenine and guanine, into the ribonucleic acid of rapidly growing yeast when offered as "labeled" purines, their nucleosides, or nucleotides was discussed.

8223. KORZYBSKI, T. **Paper chromatography of penicillins by means of simple equipment.** *Med. Doświadczalna i Mikrobiol.* 3, 16-24(1951). —*C.A.* 45, 7749*b*.

Rutter's method was applied to the sepn. of com. penicillin G and K.

8224. KROEGER, RUTH MOOTE AND DEKAY, H. GEO. **Measurement of gravity filtration.** *J. Am. Pharm. Assoc.* 40, 213-15(1951).—*C.A.* 45, 4970*e*.

A new app. was described for detg. the filtration speed of filter papers which approximated the normal filtration process and was satisfactory since any error factors could be standardized leaving the filter paper as the only variable affecting the filtration time.

8225. KUBO, TAKASHI. **Relation between the action of drugs and the adsorption activity.** *Folia Pharmacol. Japon.* 47, No. 2, 48 (1951). —*C.A.* 47, 4164*i*.

The adsorptive activities of active carbon, animal charcoal, alumina, and acid-clay toward methylene blue and $HgCl_2$ were studied. The activity of any mixed adsorbent was always larger than the sum of the individual activities. Diln. had little effect when the diln. was in the range of ± 20%. Addn. of tannic acid increased both the pigment and $HgCl_2$ adsorption by all of these adsorbents in the acidic region but in the neutral region it slightly increased that of alumina. Alum increased the pigment adsorption remarkably but decreased the $HgCl_2$ adsorption except that of active carbon. Ca lactate and $MgSO_4$ activated the pigment adsorption, particularly that of acid clay.

8226. LARGENT, EDWARD J.; BOVARD, PAUL G., AND HEYROTH, FRANCIS F. **Röntgenographic changes and urinary fluoride excretion among workmen engaged in the manufacture of inorganic fluorides.** *Am. J. Roentgenol. Radium Therapy* 65, 42-8(1951).—*C.A.* 45, 2605*b*.

Samples of urine obtained from employees of 2 factories in which inorg. fluorides were manufd. contained fluoride in concns. that ranged from normal levels of less than 1 mg per liter to abnormal levels as high as 28 mg per liter. Five workmen out of 16 who were examd. röntgenologically showed increases in bony d. These men had excessively and consistently higher concns. of fluoride in samples of their urine than did the employees whose bones were normal in d.

8227. LEACH, BYRON E. AND TEETERS, CHARLOTTE M. **Neamine, an antibacterial degradation product of neomycin.** *J. Am. Chem. Soc.* 73, 2794-7 (1951).—*C.A.* 45, 8595*h*.

Acid hydrolysis of neomycin, adsorption of the product on Amberlite IRC-50, elution, and chromatography yielded at least 33% *neamine*, $C_6H_{12-14}N_2O_3$ or possibly the dimer $C_{12}H_{26}N_4O_6$. Countercurrent distribution and paper chromatographic studies were made.

8228. LE GALLIC, PIERRE. **Influence of various adsorbents on the vitamin A activity of a diet containing casein and lard and devoid of any detectable carotenoids.** *Compt. rend. soc. biol.* 145, 1657-9(1951).—*C.A.* 46, 8731*c*.

Addn. of activated charcoal, Al_2O_3, or montmorillonite to the diet did not decrease the vitamin A effect.

8229. LUSSMAN, DONALD J.; KIRCH, ERNST R., AND WEBSTER, GEORGE L. **The separation of some of the cinchona alkaloids by paper partition**

chromatography. *J. Am. Pharm. Assoc.* 40, 368-70 (1951).—*C.A.* 45, 9219*d*.

The major alkaloids of cinchona were sepd. by paper partition chromatography, cyclohexanol or cyclohexanone being used with HCl as the solvent mixt. Identification was accomplished by means of R_F values detd. with pure samples and by fluorescence (quinine and quinidine) or the development of a colored compd. with K iodoplatinate reagent (cinchonine and cinchonidine).

8230. MARSH, MAX M. AND KUZEL, NORBERT R. **Separation and determination of crystalline vitamin B_{12} in synthetic vitamin mixtures.** *Anal. Chem.* 23, 1773-6 (1951).—*C.A.* 46, 3222*h*.

A mixture of a strongly basic anion and strongly acidic cation exchange resin was used to remove interfering materials from an aq. soln. of the vitamins prior to spectrophotometric determination. Removal of interferences by this technique was also employed following photodecompn. and heat decompn. of the mixts.

8231. MATHES, P. AND KLEMENTSCHITZ, W. **Paper chromatographic separation of tropine from its esters.** *Scientia Pharm.* 19, 235-6(1951).—*C.A.* 46, 4175*b*.

Old samples of tropine esters could be checked for hydrolysis since tropine differed markedly in R_f value. By using Schleicher and Schüll paper No. 598g, a mixt. of $EtO(CH_2)_2OH$ 70 and H_2O 30 parts, and an NH_3 atm., the following R_f values were obtained: tropine, 0.75; lactyltropine, 0.85; atropine, l-hyoscyamine, and homatropine, 0.90. From 12 to 15 hrs were required.

8232. MCCHESNEY, EVAN W. **Cation-exchange resins; their optimal potassium content for clinical use.** *J. Lab. Clin. Med.* 38, 199-209(1951).—*C.A.* 46, 3602*i*.

The effective *in vitro* capacity of a no. of commercially available cation-exchange resins was detd. by shaking them with 0.2 *N* phosphate buffer solns. of pH 6.4. Their effect in neutralizing gastric juice and their power to exchange alkali ions in this medium was also studied.

8233. MCCHESNEY, EVAN W.; DOCK, W., AND TAINTER, M. L. **Ion-exchange resins in edema.** *Medicine* 30, 183-95 (1951).—*C.A.* 45, 9741*b*.

Cation-exchange resins of carboxylic and sulfonic types, if ingested shortly before, after, or with the food, diverted from absorption, on a normal diet, about 28 mg Na, 39 mg K/g, and some Ca. These cations were exchanged for H or ammonium ions, producing a state of compensated metabolic acidosis. Resin feeding at a level of 50 to 100 g/day, in conjunction with a moderate Na intake, promptly alleviated cardiac edema, even where diuretics had failed.

8234. MESNARD, PIERRE AND DEVEZE, JACQUES. **Study of hydrolytic products of officinal digitaline by paper chromatography.** *Bull. soc. pharm. Bordeaux* 89, 85-91(1951).—*C.A.* 46, 2750*i*.

Digitoxose spots were sprayed with the reagent (*p*-dimethylaminobenzaldehyde 1, $Cl_3C_2O_2H$ 2 g, AcOH 80 cc., HCl 10 drops, H_2SO_4 15 drops), dried, and heated at 85-90°C to obtain a violet color on a yellow background. The reaction was sensitive to 1 γ. R_f values with 11 different developing solvents were given. The hydrolyzed heterosides could not be sepd. from the unhydrolyzed ones by paper chromatography.

8235. MOORE, STANFORD AND STEIN, W. H. **Chromatography of amino acids on sulfonated polystyrene resins.** *J. Biol. Chem.* 192, 663-81 (1951).—*C.A.* 46, 2119*c*.

On a 0.9 × 100-cm. column of Dowex-50, operated in the Na form, amino acids were eluted by the use of buffers of progressively increasing pH, from 3.4 to 11. In expts. with mixts. of amino acids simulating protein hydrolyzates, a sequence of buffers was developed which yields in a single chromatogram an effluent curve in which every component emerges as a discrete peak. The position of emergence of some of the less common amino acids and related compds. was detd. The resin columns had higher resolving power than starch columns and were more convenient to operate.

8236. MÜLLER, HELMUT. **Medicinal activated charcoals.** *Pharmazie* 6, 197-9(1951).—*C.A.* 45, 10503*i*.

For medicinal use the activated charcoals made from plant raw materials were better than those prepd. from animal raw materials.

8237. MUNIER, ROGER; MACHEBOEUF, MICHEL, AND CHERRIER, NICOLE. **Microchromatography of alkaloids and biological nitrogenous bases on paper previously treated with salts. I. Preliminary trials with phosphate-treated paper. II. Improvement of the acid solvent phase technique. Use of paper impregnated with a salt having the same anion as the acid acidifying the solvent phase.** *Bull. soc. chim. biol.* 33, 1919-29(1951); 34, 204-14 (1952).—*C.A.* 46, 9255*a*.

Filter paper was soaked in KH_2PO_4 soln. and dried, then used with the various solvent mixts. reported in previous papers. The sepn. of certain mixts. of alkaloids or other org. bases was improved in many cases. Paper previously soaked in 0.2 *M* NaOAc or 0.5 *M* KCl and dried gave improved results (more sharply defined spots) with BuOH contg. AcOH or HCl, resp., as solvent.

8238. NAGHSKI, J.; FENSKE, C. S. JR., AND COUCH, J. F. **Use of paper chromatography for the estimation of quercetin in rutin.** *J. Am. Pharm. Assoc.* 40, 613-16(1951).—*C.A.* 46, 1924*h*.

Quercetin was sepd. from rutin by its rapid mobility during paper chromatography and detd. spectrophotometrically in the eluate after reaction with $AlCl_3$. Modification of the developing solvent prevented interference by related flavonal compds.

8239. NYC, JOSEPH F.; MARON, DOROTHY M.; GARST, JOSEPHINE B., AND FRIEDGOOD, HARRY B. **Chromatographic separation of estrone, estradiol, and estriol.** *Proc. Soc. Exptl. Biol. Med.* 77, 466-9(1951).—*C.A.* 45, 8942*g*.

The 3 estrogens were adsorbed on a column of specially prepd. powd. vulcanized rubber (details given), then successively eluted with $MeOH\text{-}H_2O$ mixts. of different concns.

8240. PATTON, A. R. AND CHISM, PATRICIA. **Paper chromatography of browning reaction fluorogens.** *Nature* 167, 406(1951).—*C.A.* 45, 5057*g*.

Various combinations of glycine and D-glucose were refluxed and the paper chromatograms of the resulting browned solutions were prepd. Colorless bands, fluorescing in the ultraviolet, were detected. The bands did not coincide with glycine or glucose.

8241. PATTON, A. R. AND CHISM, PATRICIA. **Quantitative paper chromatography of amino acids.** *Anal. Chem.* 23, 1683-5 (1951).—*C.A.* 46, 2443*a*.

EtOH was superior to *n*-BuOH as a solvent for ninhydrin because the max. color development was faster, more uniform for different amino acids, and the rate of fading was the same for all amino acids. Max. color d. was obtained by spraying with 0.2% ninhydrin and drying in the dark for 18 hrs at room temp. Samples were detd. by comparison with known amts. of amino acids with a probe densitometer (Welch Densichron) in detg. the peak color d. by scanning a spot.

8242. PENMAN, W. R. **The use of a cation exchange resin in the management of the fluid retentions of normal and toxemic pregnancies: preliminary report.** *Am. J. Med. Sci.* 222, 193-96 (1951).

Eleven patients having fluid retention of pregnancy were treated with a blend of the ammonium and potassium salts of a pharmaceutical grade of a weakly acidic carboxylic cation exchanger. Fluid mobilization was achieved without limiting the patients' daily ingestion of sodium below two to three g.

8243. PROCHÁZKA, ŽELIMÍR AND KOŘÍSTEK, STANISLAV. **Bound form of ascorbic acid. III. A study of some properties of ascorbigene by means of paper chromatography.** *Chem. Listy* 45, 415-19 (1951).—*C.A.* 46, 4171*f*.

Aq. ext. of fresh cabbage was treated with activated charcoal which was then extd. with a mixt. of $CHCl_3$-EtOH (7:3). The ext. was evapd., the residue extd. with water, centrifuged, and evapd. *in vacuo* below 40°C. Ascorbigene contained in the ext. was identified on a paper chromatogram after hydrolysis with HCl as ascorbic acid (by means of I_2-starch reagent). Paper chromatography was carried out mostly in the system BuOH-AcOH-H_2O and in H_2O.

8244. RAO, P. S. AND BERI, R. M. **Analysis of sugars using paper chromatography (horizontal migration).** *Proc. Indian Acad. Sci.* 33A, 368-72 (1951).—*C.A.* 46, 9020*e*.

Two parallel cuts, 2 mm apart and 2 cm in length, were made equidistant from the center of a circular Whatman No. 1 filter paper connected by a single end cut, thus forming a tail, which was folded perpendicular to the plane of the paper and then clipped to a length of 1.5 cm. The appropriate sugar soln. was placed as a microdrop on the joint and air-dried. The solvent used for irrigation was placed in a Petri dish 15 cm in diam. and the center placed over this so that the tail could dip into the solvent. A glass plate covered the paper. The set-up was held at a definite temp. Various solvents were used, and R_f values for glucose, galactose, mannose, fructose, xylose, arabinose, rhamnose, lactose, and maltose were given (at 35°C, and in the case of PhOH at 20°C). Movement was very rapid and development required only 0.5-1.5 hrs (depending on the solvent).

8245. RAO, P. S.; BERI, R. M., AND RAO, P. RAMACHANDRA. **Analysis of sugars and uronic acids using paper chromatography (horizontal migration).** *Proc. Indian Acad. Sci.* 34A, 236-9(1951).—*C.A.* 46, 9020*g*.

The sepn. of glucuronic and galacturonic acids and their Ba salts was made. The solvents used were H_2O contg. PhOH, BuOH, *s*-collidine, *p*-cresol, and EtCOMe.

8246. REID, ALLEN F. AND JONES, FRANCES. **Fractionation of blood plasma proteins using ion-exchange resins.** *Ind. Eng. Chem.* 43, 1074-5 (1951).—*C.A.* 45, 7625*i*.

Large scale fractionation of blood plasma proteins previously involved low temp. A mixt. of a strong acid cation exchange resin in the H-form and a strong base anion exchange resin was employed. This mixt. removed the salts from a soln. of blood serum proteins at room temp. and at constant pH. As the salts were progressively removed, the various globulin fractions were precipitated. Laboratory tests indicated that the serum protein fractions were not denatured. Batchwise or multiplate column arrangement was suggested to permit commercial application.

8247. ROBERTSON, R. H. S. AND WARD, R. M. **Assay of pharmaceutical clays.** *J. Pharm. Pharmacol.* 3, 27-35(1951).—*C.A.* 45, 4882*f*.

Adsorption of methylene blue gave more reliable results in the detn. of cation exchange capacity than did the test with Ba^{++} exchange. Measurement of the apparent sp. gr. of the clay and observation of its color and reaction with a universal indicator soln. gave enough information to reduce the no. of dye adsorption tests required to establish the cation-exchange capacity. The chem. impurities in the highest grades of dye were not believed to be large or variable enough to invalidate a method which showed promise in the pharmaceutical assay of clays. Only the moisture content of the dye need be estd.

8248. ROBINSON, R. **Identification of sulfonamides by paper-partition chromatography.** *Nature* 168, 512-13(1951).—*C.A.* 46, 4747*f*.

Sulfonamides were chromatographed in acidic and basic solvents contg. *p*-dimethylaminobenzaldehyde. Identification was accomplished by comparing known and unknown sulfonamide spots on both chromatograms.

8249. RUDRA, M. N. AND CHOUDHURY, L. M. **Colorimetric determination of methionine.** *Analyst* 76, 432-3(1951).—*C.A.* 45, 8408*e*.

Hydrolyze the material by gently boiling 1 g of finely powd., air-dry sample with 5 ml of 6 *N* HCl for 24 hrs under reflux condensation. For pptg. basic amino acids, use pure phosphotungstic acid. Clarify with activated carbon. After the second centrifugation from the ice bath, decant off all of the supernatant liquid and neutralize to a light green color with bromocresol green indicator, by adding 5 *N* NaOH. Dil. to a known vol. (8 or 10 ml); filter through a dry filter, and use an aliquot for the test. To the aliquot portion add 2 ml of 5 *N* NaOH, 1 ml of 1% $Na_2Fe(CN)_5NO.H_2O$ soln., and heat 8 min. in a water bath at 40°C. Cool in an ice bath for 5 min. and add 2 ml of concd. HCl to develop a red color and detn. in a photoelec. colorimeter with filter no. 530.

8250. Sannie, Charles; Heitz, Suzanne, and Lapin, Henri. **Paper partition chromatography of steroid sapogenins.** *Compt. rend.* 233, 1670-2 (1951).—*C.A.* 47, 5627*b*.

Color reactions were given of steroid sapogenins with aromatic aldehydes or $SbCl_3$ by use of one dimensional chromatograms. Color developed by anisaldehyde, cinnamaldehyde, or vanillin was a yellow spot on white background, whereas with *p*-dimethylaminobenzaldehyde a rose spot on yellow-green background was formed. Cholesterol and ergosterol gave red or blue spots and the cardiac heterosides (cymarin and digitalin) gave blue spots.

8251. Schill, Göran and Ågren, Allan. **Evaluation of belladonna preparations.** *Svensk Farm Tid.* 55, 781-8, 797-805, 825-33 (1951).—*C.A.* 46, 6323*f*.

Partition chromatography offered the best possibility. As substrate for the stationary phase, columns of silicic acid, talcum, starch, SiO_2 and Kieselguhr were tried. The latter was found to be best.

8252. Schute, J. B. **Theory of paper chromatography.** *Pharm. Weekblad* 86, 33-42 (1951).—*C.A.* 45, 4113*d*.

The stationary phase, bound on a carrier, did not necessarily have the same properties as in the free state. Applied to paper chromatography this point of view extended the theory of Hanes and Isherwood.

8253. Schute, J. B. **Paper chromatography of alkaloids.** *Pharm. Weekblad* 86, 201-12 (1951).—*C.A.* 45, 8203*c*.

Results were given of chromatographic analyses of mixts. of atropine, apoatropine, scopolamine, and belladonnine; 5% NH_4OH was the mobile phase. The type of paper used and the moisture content of the paper were of great importance in the results. Temp., concn. of the substance, and degree of soaking of the paper had little effect on R_f; the water content was significant. If the paper was satd. in the vapor phase, the R_f was considerably lower than when the paper was air-dry. In using I_2 vapor to demonstrate alkaloids, several types of paper were so strongly colored by the I_2 vapor that the characteristic color of the alkaloid was masked.

8254. Scott, Dwight B. McNair and Cohen, Seymour S. **Enzymic formation of pentose phosphate from 6-phosphogluconate.** *J. Biol. Chem.* 188, 509-30 (1951).—*C.A.* 45, 4781*c*.

A weak base anion exchanger was employed to separate neutral and acidic carbohydrates produced in the enzymatic formation of pentose phosphate from 6-phosphogluconate. Fairly sharp separation of gluconic and 2-ketogluconic acids was obtained using 0.1 *N* HCl as eluant. The acids of various diphosphenylated fractions were adsorbed and eluted at pH 2 to give separations of gluconic and various reducing acids.

8255. St. John, C. V.; Flick, D. E., and Tepe, J. B. **Streptomycin and mannosidostreptomycin in fermentation broths.** *Anal. Chem.* 23, 1289-91 (1951).—*C.A.* 46, 691*e*.

Streptomycin and mannosidostreptomycin were rapidly sepd. from fermentation broths by the cation-exchange resin Amberlite IRC-50.

8256. Šugović, Mateja. **A new method for obtaining aluminum hydroxide gel for the preparation of adsorbed vaccine.** *Bull. soc. chim. Belgrade* 16, 105-17(1951)(French summary).—*C.A.* 46, 4324*i*.

Heat 88.0 g $(NH_4)_2SO_4$ in 10.5 liter H_2O to 78°C, add 1.940 liter of exactly 10% NH_4OH all at once, heat to 67-9°C, add 1534.0 g $Al(NH_4)(SO_4)_2.12H_2O$ in 5 liter H_2O, previously heated to 78°C, all at once, stir 5-10 min., allow to settle at 71-5°C and, after 15 min., filter *in vacuo* through cotton cloth, using several funnels; wash with H_2O at 65°C to remove SO_4^{--}, transfer the ppt. to a clean flask, adjust the vol. to 12.250 liter with H_2O, shake, and homogenize. The $Al(OH)_3$ gel had a pH of 7, an adsorbing power of 99.7% (on shaking, 17.50 ml of 0.077% aq. Congo red soln. was almost completely decolorized by 1 ml hydrogel, i.e., 1 ml hydrogel adsorbs 0.0134 g dye) and gave 1.88% ash.

8257. Suzutani, Toru. **Polarographic studies on adsorption from solutions; discontinuities in adsorption isotherms and the application of this phenomenon to the molecular-weight determination of proteins.** *Japan. J. Physiol.* 1, 213-32 (1951); *Sbornik Mezinarod. Polarograf. Sjezdu Praze, 1st. Congr., Pt.* I, 425-49 (1951)(in English).—*C.A.* 45, 6895*h*; 46, 9931*i*.

$Pb(NO_3)_2$ at several concns. was adsorbed by charcoal (0.35% suspension) and 0.1% suspensions of egg albumin, hemoglobin, and gelatin. Upon completion of adsorption (20 hrs. or more), free Pb ions were detd. polarographically (pH 7.0, Temp. 20.0 ± 0.1°). Adsorption isotherms for all proteins studied were steplike.

8258. Svendsen, Anders Baerheim. **Paper chromatography and determination of morphine in opium.** *Pharm. Acta Helv.* 26, 323-33(1951).—*C.A.* 46, 2751*e*.

The paper chromatographic-colorimetric method outlined for detn. of morphine in opium and tincture of opium was based upon the following principles: tincture of opium or an ext. of opium was paper chromatographed, and morphine eluted from the chromatogram and detd. colorimetrically with nitrite and ammonia.

8259. Svobodová, Sylva. **Paper chromatography of degradation products of riboflavin. III. Photolysis of lumiflavin.** *Chem. Listy* 45, 225-6 (1951).—*C.A.* 46, 373*e*.

Degradation of lumiflavin with light and oxidants was followed by paper chromatography. Several unidentified fluorescent spots were noticed in both cases.

8260. TAYLOR, R. G. **Filtration through sintered glass, with special reference to possible loss of medicament.** *Australasian J. Pharm.* 32, 118 (1951).—*C.A.* 46, 3213*c*.

Expts. showed that filtration of NaCl, $NaHCO_3$, and strychnine-HCl solns. in concns. normally used for injection, through sintered-glass filters of a grade used for clarification, did not appreciably lower the concn. Ca gluconate solns. were slightly weakened owing to crystn. on the filter. In all cases there was a small loss of total soln., lessened at reduced pressure.

8261. TORIBIO, ARTURO MOSQUEIRA AND OLLER, B. MARTINEZ. **New antiacid preparations.** *Anales real acad. farm.* 17, 491-502 (1951).—*C.A.* 46, 8326*f*.

Various methods were tried in the prepn. of an $Al(OH)_3$ sample suitable in antiacid medication. The spontaneous hydrolysis in moist air of a pure sample of $(EtO)_3Al$ was found to give a white powder of $Al(OH)_3$, 1 g of which neutralized 257 cc. of 0.1 *N* HCl following the procedure prescribed by U.S.P. XIII. The neutralization capacity of a mixt. (1 g) contg. 1 part of Mg trisilicate to 2 parts of $Al(OH)_3$ as prepd. above, was detd. The same method was used for a mixt. of 15 parts glycine and 35 parts $CaCO_3$. A mixt. of $CaCO_3$, $MgCO_3$, Mg trisilicate, and glycine was studied.

8262. VALENTIN, JOHANNES AND KIRCHÜBEL, GERTRAUDE. **Chromatographic adsorption analysis in pharmacy. VII. New method for determining the degree of activity of aluminum oxide. Separation of some colorless compounds.** *Arch. Pharm.* 284, 114-22(1951).—*C.A.* 45, 10488*e*.

The degree of activity of Al_2O_3 was detd. by passing a 0.1% petr. ether soln. of Sudan Red through it and measuring the width of the colored zone which was inversely proportional to the activity of the adsorbant. Org. compds. which react with $FeCl_3$ to give colored compds. could be made visible by first satg. the Al_2O_3 with an Et_2O soln. of $FeCl_3$.

8263. VENKATESH, D. S. AND SREENIVASAYA, M. **Ultramicropapyrography.** *Current Sci.* (India) 20, 156-7(1951).—*C.A.* 46, 4418*i*.

Partition chromatography of the order of 0.05 unit of penicillin was achieved by a cotton thread ascending chromatographic assembly. The thread was treated with benzene, water, takadiastase, water, alc., and ether successively, and then treated with 0.066 *M* phosphate buffer of pH 6.2, and air-dried. The thread was weighted, spotted with the test soln. about 10 mm above the bottom end, and placed in a solvent-satd. chamber. After equilibration, the thread was lowered to touch the elutant and development commenced. Bioassay of the air-dried developed thread was accomplished by bioautographic technique.

8264. VERHAAR, G. **Adsorption of cinchona alkaloids.** *Cinchona* (Arch. Kinacultuur) 11, No. 1, 150 pp. (1951).—*C.A.* 45, 9800*b*.

Tests of the adsorption of quinine sulfate, quinine-dihydrochloride, and cinchonine bisulfate on Norit charcoal showed that the highest capacity was reached by Medicinal Norit (x/m 400), next Supra Norit 150, and Norit PKO. The adsorption capacity reached the highest value in very dil. acid. Lowering the initial pH to 2.6 caused a decline in alkaloid adsorption. Activated Al_2O_3 and silica gel had very low adsorption values. In connection with the adsorption of quinine, cinchonine, quinidine, and cinchonidine on Norit Venale in C_6H_6, $CHCl_3$, and EtOH, the greatest adsorption occurred in C_6H_6 and the least in $CHCl_3$. In all cases Freundlich's rule proved valid. A study of the behavior of cinchona alkaloids in an adsorption column in the intermittent treatment of the column with an alkaloid soln. and dil. acid was made.

8265. VIRTANEN, ARTTURI I. AND MIETTINEN, JORMA K. **Estimation of volatile fatty acids and ammonia in silage by paper chromatography.** *Nature* 168, 294-5(1951).—*C.A.* 46, 1179*g*.

Butyric acid in silage could be detd. quite well from the effluent by means of paper chromatography, producing slightly more intense color than pure butyric acid in H_2O soln. To det. AcOH, distn. was necessary to eliminate lactic acid. Valeric, caproic, and propionic acids also might occur. NH_3 could be roughly detd. in optimum concn. between 1 and 10 γ with 2 vols. butanol and 1 vol. 6 *N* HCl for the solvent, drawing the strip rapidly through Nessler's reagent to develop the color.

8266. VITTE, G. AND BOUSSEMART, E. **Separation of local anesthetics by paper chromatography.** *Bull. trav. soc. pharm. Bordeaux* 88, 181(1951). —*C.A.* 45, 7299*g*.

Novocaine, butelline, cocaine, and orthoform were sepd. by ascending paper chromatography by using as the mobile solvent the alc. layer of a well-shaken mixt. of BuOH 50, AcOH 15, and H_2O 45 parts. The lower aq. layer was used to sat. the atm. in the chamber. The R_f values were 0.69, 0.90, 0.82, and 0.82 resp. The spots were revealed with Draggendorf's reagent and orthoform was identified with dild. $Fe(ClO_4)_3$ soln.

8267. VITTE, G. AND BOUSSEMART, E. **Separation of the alkaloidal constituents of a sirup by paper chromatography.** *Bull. soc. pharm. Bordeaux* 89, 83-5(1951).—*C.A.* 46, 2750*h*.

Ext. the alkalized sirup with 3 portions of Et_2O, wash the exts. with H_2O, and evap. Chromatographic development of spots deposited on paper showed that instead of codethyline and codeine the sirup contained only codeine.

8268. VOĬTKO, L. M. AND KHARIN, A. N. **Mechanism of the changing conditions of layers of carbon under different conditions of dynamic sorption of some essential oils from aqueous solutions.** *Zhur. Priklad. Khim.* 24, 509-19(1951); *J. Applied Chem. U.S.S.R.* 24, 557-67(1951)(English trans.).—*C.A.* 46, 8460*d*.

The range was detd. of a and d, for the sorption of essential oils from aq. solns., where a was the rate of flow of soln. and d the av. diam. of the carbon particles.

8269. WERLE, E. AND KOCH, J. **Separation of tobacco alkaloids by paper chromatography.** *Naturwissenschaften* 38, 333(1951).—*C.A.* 46, 3214*e*.

Mixts. of tobacco alkaloids dissolved in BuOH, satd. with H_2O, or in BuOH, iso-BuOH, or iso-PrOH with 10% AcOH and 20% H_2O were sepd. by chromatography in a vertical strip of filter paper. PhCH, collidine, or picoline were unsatisfactory as solvents. All solns. were adjusted to pH 7 with *N* HCl. The solns. were used in 1:100 concn., after 16 to 24 hrs contact (some at 0° to avoid evapn. of the alkaloid), the strips were dried, held for 10-20 min. in bromocyanogen vapor, and sprayed with 2% aniline in 0.066 *M* phosphate buffer soln. A more stable color resulted from 0.25% benzidine in 50% EtOH.

8270. WHITE, W. F.; FIERCE, W. L., AND LESH, J. B. **Pituitary adrenocorticotropin. II. Paper chromatography of pepsin-treated materials.** *Proc. Soc. Exptl. Biol. Med.* 78, 616-19(1951).—*C.A.* 46, 3220*e*.

Pepsin-treated adrenocorticotropic material was fractionated on paper with the system BuOH-AcOH-H_2O. The activity was found to be assocd. with a slow-moving ninhydrin-pos. area from which fractions having potencies of about 50 times standard were recovered. No further chromatographic resolution of these fractions was obtained by use of several other solvent systems commonly used for sepn. of amino acids and peptides.

8271. YONEHARA, HIROSHI; TOYAMA, TERUHIKO, AND SUMIKI, YUSUKE. **Purification of streptomycin. II Purification with cation-exchange resin.** *J. Antibiotics*(Japan) 4, Suppl. A, 14-19(1951). —*C.A.* 45, 9224*b*.

Phenolsulfonic type cation-exchange resin was treated with 10 times its vol. of *N* HCl and washed with distd. water. Streptomycin was adsorbed by the resin at pH 8.0 and the max. adsorption was 150 mg per g resin. It was eluted with *N* K_2SO_4 or KCl. The max. concn. in fractions of elutates was 5-10 times higher than the original soln.; however, the yield in these fractions was less than 50% and the other part appeared in further fractions at low concn.

8272. ALGERI, ELVERA J. AND WALKER, JOSEPH T. **Paper chromatography for identification of the common barbiturates.** *Am. J. Clin. Path.* 22, 37-40(1952).—*C.A.* 46, 3215*a*.

A study of the filter-paper chromatography of 10 commonly used barbiturates indicated that this method was useful for distinguishing individual barbiturates after quantitation by prevailing spectrophotometric procedures. The system found to be most satisfactory consisted of BuOH satd. with 5 *N* NH_4OH. The R_f values together with the mode of location of the spots served to characterize the barbiturate.

8273. ALLOUF, RAYMOND AND MUNIER, ROGER. **Microchromatographic separation on paper of nicotinic acid derivatives and *N*-methylpyridones.** *Bull. soc. chim. biol.* 34, 196-203(1952).—*C.A.* 47, 447*e*.

A method was described for the 2-dimensional chromatographic sepn. of nicotinic acid and amide, *N*-methylnicotinamide, trigonelline, tryptophan, *p*-aminobenzoic acid, *N*-methyl-2-pyridone-5-carboxylic acid and amide, and *N*-methyl-2-pyridone-3-carboxylic acid and amide.

8274. AOYAMA, MASATARO. **Indirect estn. of the genuine vitamin A content.** *Kitasato Arch. Exptl. Med.* 24, 415 (1952).—*C.A.* 47, 830*c*.

Chromatographic development on "BL6" Al_2O_3 of the unsaponifiable fraction of liver oil gave 5 absorption zones, the third of which corresponded to vitamin A alc. Each zone was fluorescent and showed blue to violet color on addn. of the Carr-Price reagent. The genuine vitamin A content was obtained by subtracting the total fluorescence of glycerol dichlorohydrin of the non-vitamin A fractions from that of the total unsaponifiable fraction. Since this development required 1.5 to 2 hrs, the vitamin A was largely lost while the non-vitamin A fractions remained unchanged.

8275. ASPINALL, G. O. AND TELFER, R. G. J. **The isolation of sucrose from the partial hydrolysis of the fructosan from Lolium perenne.** *Chemistry & Industry* 1952, 1244-5.—*C.A.* 47, 5706*i*.

Heating an aq. soln. of fructosan from perennial rye grass at 100°C for several hrs followed by sepn. of products first on charcoal columns and secondly on cellulose columns gave glucose, fructose, a mixt. of disaccharides, and a mixt. of higher oligosaccharides. The disaccharides were further sepd. on Whatman·3MM sheets yielding sucrose (not depressed with authentic sample of sucrose) and formed octaacetate. On graded hydrolysis and chromatographic sepn. a non-reducing trisaccharide gave fructose, sucrose, and a fructose contg. disaccharide.

8276. BAGGESGAARD-RASMUSSEN, H.; FUCHS, D., AND LUNDBERG, LISE. **Use of ion exchangers in analysis of salts of weak organic acids and bases.** *J. Pharm. Pharmacol.* 4, 566-72(1952). —*C.A.* 46, 9254*g*.

Strongly basic Amberlite IRA-400 was used for salts of alkaloids, antihistamines, and other weak org. bases. The eluted base was titrated with 0.1 *N* HCl in 50% EtOH medium with Bromophenol Blue indicator. Amberlite IR-100H was used for Na and Ca salts of org. acids. The eluted acid was titrated with 0.1 *N* alkali with phenolphthalein as indicator. Solvents for development and elution, and percentage recoveries were tabulated. The presence of neutral salts, e.g. NaCl, affected the results. Unsatisfactory results were obtained with physostigmine salicylate, histamine, carbacholine, homatropine-MeBr, and morphine.

8277. BERG, A. M. **Paper-chromotographic investigation of ergotoxine and ergotinine.** *Pharm. Weekblad* 87, 282-3(1952).—*C.A.* 46, 8325*d*.

A sepn. of ergotoxine into 3 components was obtained by means of circular chromotography with buffered filter paper (Schleicher and Schull 2043 B, McIlvaine buffer, pH = 3) and benzene with a soln. of 10% EtOH in H_2O. The bands were identified by comparison with similar bands of ergocryptine, ergocristine, and ergocornine. By the chromotographic analysis of ergotinine a band was discovered, identical with that produced by ergocristinine.

8278. BLASS, JUDITH. **Chromatographic study of Nuoc-Mam.** *Ann. inst. Pasteur* 83, 791-9 (1952). —*C. A.* 47, 3488*c*.

Nuoc-Mam was a fish hydrolyzate used as a condiment and food. All of the amino acids except histidine were detected by paper chromatography. Also 3 spots, probably of bacterial origin, which corresponded to α-aminobutyric acid, γ-aminobutyric acid, and possibly 5-aminopentanoic acid were detected. Another weak spot may be histamine. Before chromatography the salt was removed by pptn. with Me_2CO and acidified with HCl.

8279. BÖHME, H. AND LAMPE, H. **Behavior of alkaloid salts on aluminum oxide columns. II. The hydrochlorides of papaverine, narcotine, codeine, and atropine.** *Arch. Pharm.* 285, 175-87(1952).—*C. A.* 46, 10534*h*.

The behavior of the HCl salts of atropine ($K_b = 4.5 \times 10^{-5}$), quinine ($K_b = 1.0 \times 10^{-6}$), codeine ($K_b = 9.0 \times 10^{-7}$), narcotine ($K_b = 1.5 \times 10^{-8}$), and papaverine ($K_b = 8.0 \times 10^{-9}$), on Al_2O_3 columns was investigated to elucidate the relation between the base strength of an alkaloid and its reaction with Al_2O_3. The equil. $[BH]^+ + H_2O \rightleftharpoons B + [H_3O]^+$ (where *B* represented the alkaloid base) was displaced to the right to an extent which was inversely proportional to the K_b of the alkaloid. The soly. of the free base in the solvent was important; if the base was very sol., it would not be pptd. on the column.

8280. BORENSZTAJN, D. AND KURYLOWICZ, W. **Preparation of vitamin B_{12} concentrates from fermentation of Streptomyces strains.** *Med. Doświadczalna i Mikrobiol.* 4, 483-518(1952).—*C. A.* 47, 4551*i*.

Vitamin B_{12} was sepd. by adjusting the pH of the fermentation medium to 2.5-3.0 (with 3% H_2SO_4), heating at 65°C for 10 min., and centrifuging. The supernatant was filtered, mixed for 1/2 hr with 1% active charcoal, then centrifuged. This step was repeated. The charcoal, washed with 10 vol. H_2O, was eluted 4 times with 75% Me_2CO at pH 9.3 (adjusted with 1 *N* NaOH). The final vol. of Me_2CO was 1/5 of vol. of fermentation medium. Me_2CO was distd. after adjusting the pH to 7 (with H_2SO_4), the soln. concd. on a water bath, and filtered through a Seitz filter. Use of ion exchangers to remove excess of salts led to further concn. of the product which contained no pyrogens, proteins, and had no antigenic and no local irritating properties. The purity was demonstrated by paper chromatography.

8281. BOSCOTT, RONALD J. **The use of hydrotropic agents and electrolytes in paper chromatography.** *Chemistry & Industry* 1952, 472-3.—*C. A.* 46, 9010*h*.

Satd. aq. Na *p*-toluenesulfonate was used as the stationary phase for the paper chromatography of steroids to increase their water soly. for better sepn. A 20% KCl soln. at 34°C and at room temp. was found useful in sepg. acidic and phenolic compds.

8282. BRAUNSBERG, HANNELORE. **Purification of commercial samples of estrone.** *Nature* 169, 967-8(1952).—*C. A.* 46, 9798*d*.

Paper chromatography of the (*p*-nitrophenylazo) dimethoxyaniline ("Fast Black Salt *K*") derivs. of 2 com. samples of estrone showed small traces of an impurity which appeared as a blue spot with lower R_f value than the pink estrone dye. This substance could be removed from the estrone by means of partition chromatography on a "Celite" -NaOH column. Paper chromatograms, run before and after purification by our technique, showed that the impurity was completely removed by this means.

8283. BREUER, H. AND SCHREIBER, F. W. **The analysis of ammoniated dentifrices.** *Proc. Sci. Sect., Toilet Goods Assoc.* 17, 28-9(1952).—*C. A.* 46, 9785*a*.

A complete description of the method of analysis and procedure based on the use of an ion-exchange resin was given. The method offered a practical and simple way to separate NH_4 salts from urea in ammoniated dentifrices.

8284. BROWN, F. **Estimation of vitamin E. Separation of tocopherol mixtures occurring in natural products by paper chromatography.** *Biochem. J.* 51, 237-9(1952).—*C. A.* 46, 8326*b*.

Mixts. of racemic tocopherols were readily sepd. by using aq. EtOH (75% wt/vol.) as the mobile phase and Vaseline-coated paper as the stationary phase. The latter was prepd. by dipping Whatman No. 1. filter paper in a 2.5% (wt/vol.) of Vaseline in ether, and drying in the air. The β- and γ-isomers could not be sepd. since the R_f values were: α 0.50; β 0.72; γ 0.72; δ 0.84, but this was not serious. The β compd. was found only in wheat-germ oil. The presence of δ-tocopherol in soyabean oil was established by the chromatographic method. On the other hand, a substance in cocksfoot grass, which gave a color with diazotized *o*-dianisidine, was shown to be different from any known tocopherol, while in wheat germ oil a nontocopherol ferric-reducing substance was found which was not removed by sapon., adsorption, or crystn.

8285. BRÜGGEMANN, JOHANNES AND BRONSCH, KURT. **Model experiments for the use of adsorption agents in veterinary medicine.** *Monatsh. prakt. Tierheilk.* 4, 246-58(1952).—*C. A.* 46, 9805*c*.

Models were used to det. which physiol. important capillary materials were adsorbed by various types of charcoal. In addn. to bacteria and toxins other surface-active agents, such as intestinal content, trypsin, tryptophan, and carotene were always adsorbed by the adsorbents which, therefore, may be damaging to the patient.

8286. BUSH, I. E. AND TAYLOR, D. A. H. **Paper chromatographic examination of the cardiac aglycones of Strophanthus seeds.** *Biochem. J.* 52, 643-8(1952).—*C. A.* 47, 2938*f*.

Grind 1 g of the seed, ext. for 2 hrs with 150 ml MeOH in a Soxhlet, evap. to 25 ml, dil. with 5 ml H_2O, and ext. 3 times with 25 ml light petroleum. Reflux for 30 min. the aq. soln. dild. with 30 ml 0.1 *N* H_2SO_4, cool, ext. twice with 50 ml $CHCl_3$, and evap. to 5 ml. One drop of the ext. was sufficient for paper chromatography, in which aq. MeOH was used as the stationary phase. The spots were developed with a 1% 3,5-dinitrobenzoic acid in 0.5 *N* 50% (vol./vol.) aq. MeOH KOH.

8287. Castagnou, R. and Quilichini, R. **Chromatographic study of apiine and apiol.** *Bull. soc. pharm. Bordeaux* 90, 16-19, 20-4(1952).—*C.A.* 46, 7283*i*.

Color reactions of apiine and apiol were reviewed and applied to paper chromatographs prepd. by ascending development with different simple and mixed solvents. R_f values were detd. for apiine and apiol separately and in mixts.

8288. Chambers, M. A.; Zill, L. P., and Noggle, G. R. **The use of ion-exchange resins with glycosides.** *J. Am. Pharm. Assoc.* 41, 461-4 (1952).—*C.A.* 46, 11588*f*.

The sepn. of glycosides was due to the adsorption of the aglycon moiety rather than ion-exchange adsorption of the borate complexes.

8289. Chang, Hson Mou. **Separation of menthol from mint oils by fractional distillation and by chromatographic adsorption.** *Iowa State Coll. J. Sci.* 26, 181-2(1952).—*C.A.* 47, 2434*c*.

Crude menthol was sepd. from the resins in the residue by steam distn. Then digestion with H_2O produced U.S.P. menthol in 85% yield compared to 40-50% by freezing out. By chromatographic sepn. almost 100% of both menthone and menthol could be recovered. Mint oil was adsorbed on 100-200 mesh activated carbon and washed successively with: (1) 80 parts Skellysolve D to 20 parts CCl_4; (2) CCl_4; (3) CCl_4 + 10% menthol.

8290. D'Aló, F. and D'Aló, G. **Considerations on the mechanism of the enhancement of the activity of steroids by aluminum phosphate gel.** *Riv. ist. sieroterap. ital.* 27, 146-8(1952).—*C.A.* 46, 10548*i*.

According to recent studies on the activity of steroids (testosterone, testosterone propionate, methylandrostenediol) adsorbed on Al phosphate gel, the enhancement of the activity seemed to be related to some unknown factor, besides the adsorption rate and the degree of soly.

8291. Davis, Richard B.; McMahon, John M., and Kalnitsky, George. **Separation of D vitamins from other sterols by paper chromatography and the quantitative determination of 7-dehydrocholesterol.** *J. Am. Chem. Soc.* 74, 4483-4 (1952).—*C.A.* 47, 3520*h*.

The sepn. of the vitamins D_2 and D_3 (in 40-γ quantities) from a mixt. of cholesterol, 7-dehydrocholesterol, ergosterol, and sitosterol by chromatography on Whatman no. 1 filter paper impregnated with Quilon was described.

8292. Deshusses, J. and Desbaumes, P. **Determination of dyes in lip rouge, face paints, ointments, and brilliantines by chromatography with alumina disks.** *Mitt. Gebiete Lebensm. u. Hyg.* 43, 501-4(1952)(in French).—*C.A.* 47, 5076*a*.

The dyes in cosmetic fats were sepd. by using chromatography with Al_2O_3 disks.

8293. Doman, N. G. and Kagan, Z. S. **Determination of phosphorus esters by chromatographic distribution on filter paper.** *Biokhimiya* 17, 719-24(1952).—*C.A.* 47, 4795*f*.

The P esters were hydrolyzed directly on the chromatogram (linen filter paper) with alk. phosphatase prepd. from the duodenum of cattle. The best solvent for the chromatograms was a mixt. of 80 ml MeOH, 12.5 ml of 1.2*N* NH_4OH, and 27.5 ml H_2O. This solvent did not sep. glucose 1-phosphate and fructose 6-phosphate. Inorg. salts and impurities found in leaf exts. did not interfere. By developing parallel chromatograms, with and without enzymes, it was possible to differentiate between easily and difficultly hydrolyzable P esters.

8294. Dowler, M. Wilhelmina and Laughland, D. H. **Application of chromatography to estimation of vitamin A in low-potency fish oils.** *Anal. Chem.* 24, 1047-9(1952).—*C.A.* 46, 9790*d*.

A soln. of fish oil in Skellysolve B was placed on a 6 × 20 mm column of 120-mesh bone meal, previously extd. with Skellysolve B and acetone and dried at 110°C. Vitamin A esters were eluted with Skellysolve B and the free alc. with a soln. of 20% Me_2CO in Skellysolve B. Vitamin A content of the eluates was estd. from the absorption at 325 mμ.

8295. El Ridi, M. S. and Khalifa, K. **Chromatographic purification and ultraviolet spectrophotometric assay of strychnine in galenicals.** *J. Pharm. and Pharmacol.* 4, 190-6(1952).—*C.A.* 46, 5259*f*.

Pack 15 g of active Al_2O_3 to form a 14-cm adsorption column in a tube 25-30 cm × 1.3 cm, connect with suction, pour in 2 ml of liquid ext., apply gentle suction, and before the liquid begins to disappear from above the column add 86% EtOH in small portions to wash down the sides of the tube, then wash the column with larger amts. of 86% EtOH until the percolate was alkaloid-free (about 50 ml. of 86% EtOH). Transfer to a 100-ml flask, make to vol. with 96% EtOH, distil a 20-30 ml aliquot, dissolve the residue in 10 ml of 3% H_2SO_4, dissolve 0.5 g of $K_2S_2O_8$ (used to oxidize brucine) in the soln. by shaking, keep in a water bath at 60-70° for 1 hr, cool, transfer to a 100-ml flask with H_2O, mix, and filter through a dry paper and funnel into a dry flask. Det. the strychnine by measurement at 254 mμ.

8296. Erbring, H. and Wulf, W. **Paper chromatographic analysis as an aid in the investigation of the contents of plants. I. The contents of Hydrastis canadensis (together with the paper chromatographic analysis of the alkaloids berberin, hydrastin, hydrastinin, canadin).** *Kolloid-Z.* 125, 99-105(1952).—*C.A.* 46, 6326*f*.

Directions were given for the construction of a chromatographic chamber for 1 and 2 dimensional presentations. Fluorescence was used to investigate the variables in the detn.

8297. EVANS, W. C. AND PARTRIDGE, M. W. **Partition chromatography of alkaloids. IV. Assay of solanaceous drugs.** *J. Pharm. and Pharmacol.* **4**, 769-79, discussion, 779-80(1952).—*C. A.* 47, 1333*c*.

To det. hyoscine and hyoscyamine, remove the alkaloids from the crude drug mixed with $Ca(OH)_2$ by percolation with Et_2O. Evap. the Et_2O, dissolve in CCl_4, and develop on a column of kieselguhr (Hyflo Super-Cel or Celite No. 545) mixed with phosphate buffer pH 5.9-6.2 and CCl_4. Elute the hyoscine with Et_2O and then elute the hyoscyamine with $CHCl_3$. Det. the amt. of alkaloids by titration in Et_2O soln. with 0.005 *N* H_2SO_4 with const. stirring and with bromocresol green indicator.

8298. FRÉREJACQUE, MARCEL. **The digitalic poison of Menabea venenata.** *Compt. rend.* **234**, 1802-4(1952).—*C. A.* 46, 9262*i*.

By extg. dried, powd. roots with "soln. B," acetone recrystn., and chromatography, a white cryst., non-acid, non-acetylatable, non-reducing body was obtained. It gave no color tests of digitalics. MeOH extn. of roots gave a H_2O-sol. ext. This was extd. with ether, then $CHCl_3$; all 3 portions gave color tests of digitalics. Fractions were separately hydrolyzed, Al_2O_3 chromatographed, and every one yielded about 10% of digitoxigenin.

8299. FUJISE, SHINICHIRO AND TATSUTA, HARUO. **Paper chromatography of flavanones and related compounds.** *J. Chem. Soc. Japan*, Pure Chem. Sect. **73**, 35-6(1952).—*C. A.* 47, 3525*g*.

Paper chromatograms were examd. on liquiritin, hesperidin, sakuranin, isosakuranin, rutin, quercetin, and more than 20 samples of hydroxy chalcones and flavanones. The solvents used were $CHCl_3$ satd. with H_2O, AcOEt, BuOH + AcOH (4:1), PhOH, xylene + AcOH (1:3 and 3:1). The spraying reagents were aq. Na_2CO_3, aq. $FeCl_3$, Na_2CO_3, and diazotized $PhNH_2$, etc.

8300. GIRI, K. V.; KRISHNAMURTHY, K., AND VENKATASUBRAMANIAN, T. A. **Separation and identification of amino acids from protein hydrolyzates by circular paper chromatography.** *Current Sci.* (India) **21**, 11-12(1952).—*C. A.* 46, 6999*d*.

Circular paper chromatography was applicable to protein hydrolyzates when modified so that the butanol-AcOH was supplied by a small wick in a hole at the center of the paper. Histidine, aspartic acid, proline, leucine, lysine, threonine, phenylalanine, arginine, methionine, glutamic acid, glycine, serine, valine, isoleucine, alanine, cystine, and tyrosine were identified in a casein acid hydrolyzate.

8301. GIRI, K. V. AND RAO, N. A. N. **Circular paper chromatography. I. A technique for the separation and identification of amino acids.** *J. Indian Inst. Sci.* **34**, 95-105(1952). —*C. A.* 46, 9019*f*.

8302. GORE, D. N. AND ADSHEAD, J. M. **Observations on the paper partition chromatogram as applied to the detection of alkaloids.** *J. Pharm. and Pharmacol.* **4**, 803-9; discussion 809-10(1952).—*C. A.* 47, 1894*d*.

By using the descending technique and solvent systems contg. BuOH 40-AcOH 10-H_2O 50, BuOH 10-HCO_2H 1-H_2O 10, and BuOH 10-$C_2H_5CO_2H$ 1-H_2O 10, R_f values were reported for the following alkaloids and a salt of each: atropine, brucine, cocaine, codeine, diamorphine, homatropine, hyoscine, hyoscyamine, physostigmine, pilocarpine, quinine, and strychnine. The alkaloids were revealed by spraying the chromatogram with 0.2% I soln. Fading rates, colors, and other characteristics of the developed spots were discussed.

8303. GRIEG, ARNE. **Paper chromatographic separation of barbituric acids.** *Nature* **170**, 845 (1952).—*C. A.* 47, 3759*a*.

After development of chromatograms the dried paper was sprayed with 0.5 *N* NaOH and dried again. It was then brought in firm contact with a fluorescent screen and placed in front of an ultraviolet lamp with the paper facing the light. A low-pressure Hg lamp and a filter letting through a monochromatic light of about 2537 A. and a screen which fluoresced in this light was used. Since the barbituric acids absorbed very highly at a pH 9-10, the zones were seen as dark spots on the fluorescent screen. The method was very sensitive and could be used for the detection of other substances absorbing ultraviolet light.

8304. GRIFFON, HENRI AND ROMANO, CARLO. **Toxicology of strychnine and brucine. I. Chromatographic separation of strychnine from some of its derivatives and from brucine.** *Ann. pharm. franc.* **10**, 497-514 (1952).—*C. A.* 47, 2938*d*.

Unidimensional paper chromatography with ascending solvent was combined with bidimensional treatment, in which the undeveloped chromatogram from the first method was dried and subjected to chromatography by turning the paper at an angle of 90° and using another solvent. The solvent in the first case was Me_2CO 150, Et_2NH 10, and H_2O 40 cc. To prep. a solvent that fixed strychnine but permitted chromatography of brucine, mix a soln. of 30 cc. HCl in 200 cc. of BuOH with a soln. of 10% $K_4Fe(CN)_6$ 50, glycerol 5, and EtOAc 5 cc. and, after standing, filter the upper, org. layer. Bidimensional chromatography was carried out with Me_2CO and BuOH.

8305. HALL, NATHAN A. **Clarification of glycyrrhiza fluidextract U.S.P.** *Am. J. Pharm.* **124**, 43-7(1952).—*C. A.* 46, 6321*g*.

Sedimentation with bentonite 1:1500 resulted in a clear percolate, easily filterable without the use of filter-aid. Comparison of finished fluidexts. made with and without the use of clarifying agents revealed no marked difference in appearance or taste when clarifying agents were used. Bentonite clarification also seemed to improve the stability of the finished fluidext.

8306. HIGUCHI, T. AND PATEL, K. P. **Separation and analysis of aspirin-phenacetin-caffeine combination by partition chromatography.** *J. Am. Pharm. Assoc.* **41**, 171-3(1952).—*C. A.* 46, 6323*d*.

Phenacetin and caffeine were sepd. by a chromatographic column and detd. spectrophotometrically in the eluate.

8307. Higuchi, T.; Patel, K. P.; Bonow, E. R., and Landsman, J. **Chromatographic separation and determination of mixtures of *p*-hydroxybenzoate esters.** *J. Am. Pharm. Assoc.* 41, 293-5(1952).—*C. A.* 46, 7940*f*.

A method of sepg. and detg. constituents of these mixts. was based on their preliminary extn. from the product, sepn. of the component esters by chromatography, and detn. of the individual constituents by ultraviolet spectrophotometry.

8308. Husa, W. J. and Littlejohn, Oliver M. **Some pharmaceutical uses of activated charcoal.** *J. Am. Pharm. Assoc., Pract. Pharm. Ed.* 13, 412-14(1952).—*C. A.* 46, 9251*h*.

There was a definite relationship between the packing of the sample into a capsule and the settling of the sample in a graduate. Trituration of the charcoal seemed to make the particles repel each other more, and less could then be packed into a capsule. In charcoal and pepsin combinations, pepsin was adsorbed to some extent on the charcoal, which will still meet the National Formulary requirements. Charcoal could be wetted with propylene glycol (37.5 cc. per 100 g of charcoal) and then be easily packed into a smaller capsule by the "punching" method.

8309. Hüter, Friedrich. **Differentiation between adrenaline and arterenol in the paper chromatogram with the aid of fluorescence analysis.** *Arzneimittel-Forsch.* 2, 91-2(1952).—*C. A.* 47, 6605*i*.

Autoxidation of adrenaline in very dil. soln. gave adrenochrome. This was then oxidized to the colorless 1-methyl-3,5,6-trihydroxyindole, which had in very small amts. (1 γ or less) a bluish and in larger amts. a green, fluorescence. Arterenol gave an oxidation product with blue fluorescence.

8310. Izmaĭlov, N. A. and Shostenko, Yu. V. **Adsorption method of isolation of substances from dilute solutions. II. Some peculiarities of molecular adsorption from a stream of solution.** *Zhur. Priklad. Khim.* 25, 602-9 (1952).—*C. A.* 47, 6706*c*.

The adsorption of caffeine from aq. soln. on granulated anthracite coal showed that the process was in accord, within wide limits of velocity of the flowing soln., with the laws established for adsorption of gases. For a caffeine soln. there existed a limiting rate of flow of the soln. past the adsorbent at which the max. satn. of the adsorbent still corresponded to its static activity; there also existed a critical flow rate above which the max. adsorption no longer depended on flow rate. The processes appeared to be connected with diffusion within the pores of the adsorbents. The independence of max. adsorption of flow rate appeared in the present case to arise above 2400 liters/hr/m^2.

8311. Jakubec, J. **Identification of sulfonamides by paper chromatography.** *Čzechoslov. Farm.* 1, 43-7(1952).—*C. A.* 46, 9789*c*.

The sepns. obtained by BuOH alk. with 1% NH_3 and BuOH alk. with 0.1% Et_2NH and by acidified BuOH were compared. Alkalization of BuOH with Et_2NH was more effective than with volatile NH_3. The R_f values of the following prepns. were given: sulfadiazine, sulfadimidine, sulfaguanidine, sulfanilacetamide, sulfanilamide, sulfanilcarbamide, sulfapyridine, and sulfathiazole.

8312. Jensen, Kjell Briseid. **Paper chromatographic separation and fluorometric determination of gitoxigenin, gitoxin, and purpurea glycoside B.** *Acta Pharmacol. et Toxicol.* 8, 110-16(1952).—*C. A.* 46, 10538*c*.

The compds. were sepd. by one-dimensional chromatography on filter paper by using a 5:5:1 $CHCl_3$-H_2O-MeOH mixt. At 22°C gitoxin and gitoxigenin traveled together; at 17°C all 3 substances sepd.

8313. Jentzsch, K. **Paper chromatographic separation of solanum alkaloids. Separation of atropine (hyocyamine), scopolamine, tropine, and scopoline.** *Scientia Pharm.* 20, 216-23 (1952).—*C. A.* 47, 4552*e*.

The alkaloids were sepd. downward for 12 hrs on Whatman No. 1 paper in an atm. satd. with concd. HCl (dild. 1:1) which had been shaken with a 1:1 mixt. of $CHCl_3$ and BuOH. At 23°C the R_f values were for atropine 0.89, scopolamine 0.79, tropine 0.50, and scopoline 0.30. The least observable amt. was about 10 γ. The developer was a modified Dragendorff's reagent made by dissolving 7 g of KI and 1.5 g of $BiONO_3$ in a boiling mixt. of 18 ml H_2O and 3 ml 4 *N* HCl, cooling, adding 1.5 g I, and dilg. with an equal vol. of H_2O. Before use, 2 ml of this soln. was mixed with 3 ml 25% HCl and made up to 130 ml with H_2O.

8314. Jermstad, Axel and Waaler, Tor. **Paper partition chromatography of analgesics and antipyretics.** *Dansk Tidsskr. Farm.* 26, 205-11 (1952).—*C. A.* 47, 4551*g*.

Paper chromatographic analyses of acetanilide, acetylsalicylic acid, aminopyrine, phenazone, and phenacetin were described. As solvent system was used a mixt. of petr. ether (b.p. 65-70°C) 25, MeOH 10, C_6H_6 20, and H_2O 0.5 parts by weight. The following R_f values were found: acetanilide 0.4, acetylsalicylic acid 0.05, aminophenazone 0.67, phenacetin 0.45, and phenazone 0.32. The spots were developed either with $FeCl_3$ or Millons reagent.

8315. Jindra, A. and Motl, O. **The determination of antihistaminics by means of ion-exchange chromatographic method.** *Československ. farm.* 1, 632-7(1952).—*C. A.* 47, 5071*e*.

Some ethanolamines (antihistamine, Substance III(325), and Probedryl) and some ethylendiamines (Antistine, Neo-Antergan, and Phenergan) were detd. with Amberlite IRA-400 and by titration of the free bases.

8316. Jindra, A. and Rentz, J. **Determination of local anesthetics by ion exchange.** *J. Pharm. Pharmacol.* 4, 645-7(1952).—*C. A.* 46, 10540*d*.

The acid component of local anesthetics (20-50 mg) was adsorbed on a column of 8-10 g of Amberlite IRA-400 from soln. in 20 ml of a mixt. of H_2O 5, and 95% EtOH 15 ml, and the bases were eluted with 30 ml of hot EtOH(96%) and titrated with 0.1 *N* HCl. The method was applied successfully to procaine, larocaine, tutocaine, nupercaine, amylocaine, amethocaine, and diocaine. Most deviations from the theoretical content were less than 0.5%.

8317. Jindra, A. and Rentz, J. **The determination of sympathomimetic amines by exchange of ions.** *Českoslov. farm.* 1, 625-30(1952).—*C. A.* 47, 5071*g*.

Ephedrine, amphetamine, Privine, ephetonal, and Pervitin were estd. on Amberlite IRA-400. Amines contg. a phenolic OH could not be estd. in that way.

8318. Klementschitz, W. and Mathes, P. **Paper-chromatographic separation of some coca alkaloids.** *Scientia Pharm.* **20**, 65-9 (1952).—*C. A.* 46, 9781*g*.

If cocaine and ecgonine were chromatographed upward together on Schleicher and Schüll paper No. 2043a in a 6-liter chamber at 20°C (5° changes produced only ± 3% changes in R_f) with mixts. of H_2O and $(CH_2OH)_2$ no sepn. was obtained in an atm. satd. with H_2O alone. To sep. cocaine-HCl, ecgonine, benzoylecgonine, and tropacocaine-HCl, Schleicher and Shüll paper No. 2043b and a mixt. of MeCOEt 30, H_2O 5, C_5H_5N 0.5, H_2O and $(CH_2OH)_2$ 1.5, and ligroine 3.5 parts were used. The atm. was satd. with the solvent mixt. The atm. made a difference.

8319. Kopaczewski, Wladislas. **The role of biochemical factors in the passage of hydrosols through a lipide barrier.** *Compt. rend.* 234, 1491-3 (1952).—*C. A.* 46, 6464*d*.

The capillary ascension of aq. solns. on filter paper through a 6 cm layer of oil was studied. Concns. of 0.1-0.5% of the following compds. were used: Quillaja saponin, Na gentisate, thiosinamine, acetylcholine chloride, tannin (in EtOH soln.), atropine H_2SO_4, camphor, nicotine, pilocarpine-H_2SO_4, adrenaline, Na salicylate, methyl-4-esculoside, and *L*-ascorbic acid.

8320. Koštíř, J. V. and Přistoupil, T. I. **Separation of creatinine and glycocyamidine by paper chromatography.** *Českoslov. farm.* 1, 647-9(1952).—*C. A.* 47, 5071*c*.

A mixt. of PhOH (satd. with H_2O), BuOH, and H_2O (1:1:2) and Whatman 1 or Schleicher-Schüll 605 paper were used for sepn. of creatinine, glycocyamidine, creatine, and Na pyruvate. Detection was made by means of Jaffé reaction.

8321. Koštíř, J. V.; Rybář, D. J.; Oulehla, B.; Hais, I. M., and Beran, M. **Alkaloids of ergot. VII. Distinguishing ergot containing ergotamine from that containing ergotoxine by means of chromatography of hydrolyzates of alkaloids.** *Českoslov. farm.* 1, 621-5(1952).—*C. A.* 47, 5071*h*.

The isolated raw alkaloids were hydrolyzed with NaOH, and the resulting keto acids were identified by paper chromatography either free (mixt. of BuOH and NH_3 as solvent, detection with a soln. of o-$C_6H_4(NH_2)_2$ in Cl_3CCOOH) or after conversion into 2,4-dinitrophenylhydrazones (mixt. of EtOH and $C_6H_5CH_2Cl$ as solvent, detection with NaOH). Dimethylpyruvic acid in the hydrolyzate proved that the alkaloids were of the ergotoxine group and the pyruvic acid of the ergotamine group.

8322. Kressman, T. R. E. **The practical possibilities of ion exchange. I. The separation of ions. II. Ion exchangers in chemical analysis. III. Ion exchange in the organic, biochemical, and medical fields. IV. New processes and materials.** *Mfg. Chemist* 23, 93-5, 98, 149-51, 160, 194-7, 241-3 (1952).—*C. A.* 46, 8903*e*.

Separation of rare earths and fission products, amino-acids, those depending upon differences in ionic size, and dyes were discussed. The characterization and preparation of some ionic species for analysis were outlined.

8323. Lawday, Dorothy. **Detection of digitalis glycosides on paper chromatograms.** *Nature* 170, 415-16(1952).—*C. A.* 47, 5075*e*.

The glycoside soln. was applied to the starting line with a micropipet in a spot not more than 0.5 cm in diam. The chromatogram was then developed until the solvent front had run 30 cm. The dried chromatogram was treated with a 20% soln. of $SbCl_3$ in dry, alc.-free $CHCl_3$, and the paper was heated for 3-5 min. at 70°C. The glycoside color and sensitivity (γ) in visible light and color and sensitivity (γ) in ultraviolet light were given: digitoxin, red-mauve, 0.75, red, 0.25; gitoxin, mauve to gray, 0.75, apple green, 0.25; digitoxigenin, pale turquoise blue 1.0, neg.,—; gitoxigenin, orange-yellow, 0.75, bright orange, 0.25.

8324. Lederer, M. and Siberman, H. **The separation of thiouracil and some of its alkyl homologs by paper chromatography.** *Anal. Chim. Acta* 6, 133-4(1952)(in English).—*C. A.* 46, 7476*b*.

A mixt. of thiouracil, methylthiouracil, and propylthiouracil could be sepd. by paper chromatography with AmOH/water, and the spots shown up with I_2 vapors or by spraying with dichlorobenzoquinonechloroimide and alkali.

8325. Lens, J.; Wijmenga, H. G.; Wolff, R.; Karlin, R.; Winkler, K. C., and Haan, P. G. de. **Vitamin B_{12}. III. The assay of vitamin B_{12}.** *Biochim. et Biophys. Acta* **8**, 56-65(1952).—*C. A.* 46, 6325*c*.

It was found that after the addn. of KCN, purified liver-exts. could be chromatographed on Al_2O_3, the vitamin B_{12} being collected as a single band which could be measured spectrophotometrically.

8326. Levi, Leo and Farmilo, Charles G. **Determination of narcotics by ion-exchange.** *Can. J. Chem.* 30, 793-9 (1952).—*C. A.* 47, 3518*e*.

Codeine, phosphate, morphine sulfate, methorphinan hydrobromide, and the hydrochlorides of methadone, phenadoxone, alphaprodine, cocaine, pethidine, diamorphine, dilaudid, morphine, and papaverine were quantitatively detd. with a precision of ± 1.6% by ion-exchange chromatography. A weakly basic anion exchanger (Amberlite IR-4B) was employed. The method was found to be applicable to pharmaceutical preparations and narcotic seizures, provided these did not contain additional ionizable material.

8327. Ludwig, B. J.; Holfeld, W. T., and Berger, F. M. **Cation-exchange properties of alginic acid.** *Proc. Soc. Exptl. Biol. Med.* 79, 176-9 (1952).—*C.A.* 46, 4319*c*.

Alginic acid possessed Na- and K-ion exchange properties that compared favorably with those of a carboxylic-type cationic exchange resin. *In vitro* at pH 7.6 it took up 4.2 milliequiv. Na$^+$/g. The total cation adsorption from solns. contg. K$^+$ and Na$^+$ was also 4.2 milliequiv./g and the ratio of Na/K taken up approximated that present in the soln. The adsorption of Ca^{++} by alginic acid was irreversible and independent of pH.

8328. Luis, Policarpo. **A case of detection of DDT in viscera.** *Rev. asoc. bioquím. argentina* 17, 334-8(1952).—*C.A.* 47, 6821*c*.

The viscera of a poisoned person did not contain alkaloids but an aromatic residue of insecticidic properties. Chromatography on alumina: sodium trisilicate left a soln. of a pure substance which gave the tests for DDT and which after recrystn. from Me$_2$CO:AcOH:H$_2$O 1:1:1 had the microcrystallographic properties of DDT.

8329. Mariella, Raymond P.; Bernstein, Theodore B., and Mosher, Anne L. **Some purification studies on ragweed pollen.** *Bol. col. quím. Puerto Rico* 9, 15-24(1952)(in English).—*C.A.* 47, 1331*f*.

The dry, clean pollen of short ragweed, *Artemisia artemisiaefolia elatior,* and of giant ragweed, *A. trifida*, contained, resp., nonvolatile Et$_2$O-sol. lipides 11.8 and 15.3, water-sol. ext. 26.4-27.0 and 18.5%. The nonsaponifiable portion of the lipides was chromatographed on basic alumina from petr. ether. It amounted to 1.8 and 2.0% of the lipides. The aq. exts. were chromatographed on acidic alumina; the coloring material was adsorbed; the colorless, active material ran through. It was arbitrarily cut into fractions which were tested for skin-activity and N content.

8330. McChesney, Evan W. **Neutrality regulation mechanisms in rats receiving sulfonic ion-exchange resin.** *Proc. Soc. Exptl. Biol. Med.* 79, 531-4 (1952).—*C.A.* 46, 5718*b*.

Rats receiving acid-form sulfonic resin responded by increasing their urinary output of acid phosphate and NH$_3$, but not in amts. sufficient to compensate for their fecal alkali loss. Those receiving moderate amts. of K-form resin showed little change in acid-base balance, while those on high K-resin intakes showed a partially compensated alkali retention.

8331. Melichar, M.; Žáček, H., and Smečka, V. **Bentonite of Czechoslovakia.** *Československ. farm.* 1, 203-4(1952).—*C.A.* 46, 10541*g*.

The Czechoslovakian product differed from bentonite USP XIII in its darker color and in pH of its suspensions.

8332. Merklen, Félix Pierre and Masseyeff, René. **Adsorption of albumin as a cause of error in the quantitative estimation of serum proteins by electrophoresis on filter paper.** *Compt. rend. soc. biol.* 146, 1905-8 (1952).—*C.A.* 47, 10601*a*.

Some of the albumin fraction was adsorbed and firmly held by the paper; this resulted in trailing throughout the length of the path of protein travel. The effect was greater with the thicker papers. A thin paper such as Whatman No. 1 was preferred.

8333. Miller, Howard and Kraemer, D. M. **Benzidine reagent in paper chromatography.** *Anal. Chem.* 24, 1371-2(1952).—*C.A.* 46, 11017*d*.

The R_f values and colors produced by spraying paper chromatograms of 20 inorg. compds. and 19 org. compds. (sugars and related compds.) with benzidine were given. The sprayed chromatograms were dried for 30 min. at 85°C to bring out the colors. Compds. were listed which did not react with benzidine: inorg. compds. (17), carbohydrates (10), amino acids and derivs. (38), and miscellaneous (30).

8334. Mizuno, Kimiaki. **Detection and determination of sulfapyrimidines by means of partition chromatography.** *Ann. Repts. Takeda Research Lab.* 11, 1-7(1952).—*C.A.* 47, 4796*c*.

A mixt. of sulfapyrimidines could be sepd. into each component by paper partition chromatography when Atkin's buffer soln. (pH 10 with H$_3$BO$_3$ and Na$_2$CO$_3$) was used as a stationary phase and BuOH with the buffer soln. as a mobile phase; it was also made by starch column partition chromatography with the same solvent system with exptl. error ± 5%.

8335. Morice, Isobel M. and Shorland, F. B. **The isolation from shark (Galeorhinus Australis)-liver oil of a multibranched C_{18}-saturated fatty acid fraction.** *Chemistry & Industry* 1952, 1267-8.—*C.A.* 47, 4048*g*.

Repeated crystn. of approx. 800 g hydrogenated Me esters from Me$_2$CO at −35°C, and the sol. portion fractionated at approx. 0.1 mm gave a fraction whose equiv. corresponded to a *Me ester of a C_{18}-satd. acid.* The fraction was chromatographed on Al$_2$O$_3$, eluted with light petr., and gave a first fraction, 2.82 g, which was saponified (some unsatd. unsaponifiable material was removed) to give 2.29 g of acid.

8336. Mukerji, B.; Ghosh, B.; Karkun, J. N., and Sadhu, D. P. **The chromatophorotropic hormone of the pituitary. I. Preliminary studies on the source and properties of the hormone.** *Indian J. Med. Research* 40, 243-9(1952).—*C.A.* 47, 2941*a*.

Melanophore hormone (intermedin) was assayed by an *in vitro* method employing isolated frog skin. The activity in an ext. representing 1 mg of a dried whole pituitary powder per cc., was chosen to equal 100 units of the hormone. Kaolin and charcoal adsorbed the hormone completely and Ca phosphate only slightly. Fuller's earth, Permutit, and kieselguhr accentuated the activity.

8337. Müting, Dieter. **Qualitative color reaction for the differentiation of amino acids on filter paper.** *Naturwissenschaften* 39, 303 (1952).—*C.A.* 47, 6820*i*.

For about 25 different amino acids characteristic colors were obtained on filter paper by spraying with 0.02% Folin reagent (1,2-naphthoquinone-4-sulfonic acid, Na salt) in 5% aq. Na_2CO_3 and drying at room temp. The same colors were also obtained by spraying of paper chromatograms of protein hydrolyzates. The color differentiation was better than with ninhydrin, especially for proline and hydroxyproline. The sensitivity was almost equal to that with ninhydrin.

8338. Novelli, Armando. **Identification of mixtures of sulfonamides by paper chromatography.** *Anales direc. nacl. quím.* (Buenos Aires) 5, No. 9, 7-9(1952).—*C. A.* 47, 5073*c*.

Binary or ternary mixts. of sulfathiazole, sulfaguanidine, sulfamerazine, sulfadiazine, sulfanilamide, sulfapyridine, and sulfamethazine could be sepd. and identified by their R_f values on Whatman No. 1 paper sprayed with a soln. contg. 1.0 g aminobenzaldehyde, 3 ml concd. HCl, and 100 ml H_2O. The solvents used were BuOH, AcOH, and H_2O (50-10-40) and BuOH, concd. NH_4OH, and H_2O (40-10-50). The pure compds. or tablets were prepd. by extn. with sufficient 1% NH_4OH soln. (vol./vol.) to give a concn. of 0.1 g/100 ml. A drop of the supernatant was placed on the paper and allowed to develop for 24-30 hrs at 20 ± 2°C.

8339. Paris, René A. **Paper chromatography of some flavone derivatives.** *Bull. soc. chim. biol.* 34, 767-72(1952).—*C. A.* 47, 4250*b*.

Results were summarized of expts. with 41 flavone derivs., by using BuOH-AcOH mixt., EtOAc, *m*-cresol, and $PhOH-H_2O$ as solvents. Sepns. were readily effected.

8340. Pérez Argilés, V. and Bastero Beguiristain, J. M. **Chromatography in legal medicine.** *Arch. med. exptl.* (Madrid) 15, 129-40(1952).—*C. A.* 47, 5308*b*.

The pigments of hair were sepd. chromatographically after treating the hair with 5% KOH below 60°C. Alkaloids contained in visceral exts. could be sepd. chromatographically, but ultrachromatography was not practical. Blood pigments and degradation products of hemoglobin were successfully detd. by this method.

8341. Ransy, J. **Chromatographic and spectrophotometric determination of vitamins of the B complex.** *J. pharm. Belg.* 7, 224-9(1952).—*C. A.* 46, 9258*i*.

Vitamins B_1 and B_2 were sepd. from B_6 and PP by paper chromatograms developed with H_2O-satd. BuOH. The sepd. groups were eluted from the paper and the solns. read in a spectrophotometer. Formulas for calcn. permitted detns. within ± 5%.

8342. San, Go Lam and Ultée, A. J. Jr. **Paper partition chromatography of sulfonamides.** *Nature* 169, 586(1952).—*C. A.* 46, 11050*c*.

Sulfonamides contg. an unsubstituted amino group were detected by diazotization (30-sec exposure to oxides of N) and coupling. Sulfonamides contg. a carboxyl group were detected by spraying with an indicator.

8343. Sannié, Charles and Lapin, Henri. **Paper chromatography of steroid sapogenins.** *Compt. rend.* 235, 581-2(1952).—*C. A.* 47, 5627*e*.

A developer consisting of a mixt. of gasoline (b.p. 100-125°C), $CHCl_3$, and HOAc 100:4:1 or 100:40:4 could be used to sep. steroid sapogenins. A compd. with an iso side chain at C_{17} traveled faster than the normal isomer, and an A/B cis compd. faster than the trans isomer. Compds. with α-OH seemed to travel faster than the β-isomers. Kammogenin and agavogenin were only separable after acetylation. The compds. were spotted by color tests.

8344. Schill, Göran and Ågren, Allan. **Separation of hyoscyamine and scopolamine.** *Svensk Farm. Tid.* 56, 55-7(1952)(in English).—*C. A.* 46, 6324*b*.

Hyoscyamine-HCl was sol. in $CHCl_3$ whereas scopolamine-HCl was not. This fact was utilized in a chromatographic sepn. of the two alkaloids. A soln. of hyoscyamine and scopolamine in $CHCl_3$ was poured through a column contg. 4 ml *M* HCl and 15 g kieselguhr. The column was eluted with 350 ml $CHCl_3$. The ext. contained hyoscyamine-HCl which was converted into the base by being passed through a second column contg. 4 ml *M* Na_2CO_3 and 15 g kieselguhr, this column was washed with 50 ml $CHCl_3$. Scopolamine was extd. from the first column with 200 ml $CHCl_3$ satd. with NH_4OH. The sepn. may be incomplete if less than 350 ml $CHCl_3$ was used. The same method could be used for the alkaloids in belladonna prepn.

8345. Scholl, A. W.; Bubernak, Joseph, and Galford, Robert R. **Carcinogenic effects of pyrolyzed hydrocarbons from internal-combustion-engine exhaust fumes.** *Proc. W. Va. Acad. Sci.* 23, 79-83(1952).—*C. A.* 47, 291*f*.

A preliminary report on chromatographic sepn. of combustion products of internal-combustion engines. Carcinogenic evaluation in mice was in progress.

8346. Schultz, Otto Erich and Gmelin, Rolf. **Paper chromatography of mustard oil drugs.** *Z. Naturforsch.* 7B, 500-6(1952).—*C. A.* 47, 3520*d*.

Crucifer seeds were ground and extd. with boiling MeOH. The exts. were chromatographed with $BuOH-HOAc-H_2O$ mixts. and *iso*-$BuOH-HOAc-H_2O$. Spots were detected in ultraviolet light, which showed characteristic changes on exposure to NH_3 or spraying with dil. KOH and were due to various pigments, sinapine, and sinapic acid. The glucosides were detected with 1% $Ag(NH_3)_2^+$ or 10% Cu^{++}. Mustard oil glucosides were also chromatographed in the form of thiourea derivs. and detected by $Ag(NH_3)_2^+$.

8347. Schultz, Otto Erich and Gmelin, Rolf. **Isolation of the glycoside of Lepidium sativum in the pure state by column chromatography on cellulose powder.** *Arzneimittel Forsch.* 2, 568-9(1952).—*C. A.* 47, 4048*a*.

A concd. ext. obtained by extn. of defatted seeds with MeOH was made into a paste with cellulose powder, dried, and chromatographed on a cellulose column with $BuOH:AcOH:H_2O$ 40:10:50. Fractions of 100 drops were collected. The glycoside appeared in fractions 21-28. After evapn. to dryness *in vacuo*, the residue was crystd. from a small vol. of H_2O.

8348. SEGAL, H. L. **Gastric analysis. Diagnostic value of intubation and tubeless techniques.** *Clin. Med.* 59, 207-12 (1952).

A quininium exchange indicator compd. produced by replacing the hydrogen ions on a cation exchange resin with quininium ions was fed to the patient and urine samples taken at specific intervals. The quinine present in the urine was extracted with ether and aq. sulfuric acid. Comparison with standards permitted detn. of the amt. of gastric acidity.

8349. SHANKAR, K. AND BARD, R. C. **The effect of metallic ions on the growth and morphology of Clostridium perfringens.** *J. Bact.* 63, 279-90 (1952).—*C. A.* 46, 5131g.

By use of a cationic exchange resin (Permutit H), a metal-deficient complex medium was obtained, which was used to det. the major ion growth requirements of Clostridium perfringens. For optimum growth, Ca^{++}, Mg^{++}, Fe^{++}, Na^{+}, and K^{+} were required, but not Zn^{++}, Co^{++}, or Cu^{++}. None of the latter metallic ions could replace those required for growth.

8350. SHEWAN, J. M.; FLETCHER, L. I.; PARTRIDGE, S. M., AND BRIMLEY, R. C. **Nitrogenous extractives from fresh haddock muscle: fractionation with ion-exchange resins.** *J. Sci. Food Agr.* 3, 394-8(1952).—*C. A.* 47, 4517*d*.

An aq. alc. ext. of fresh haddock muscle was fractionated by displacement chromatography with ion-exchange resins. The presence was demonstrated of Me_3NO, creatine, creatinine, $MeNH_2$, Me_2NH, NH_3, anserine, aspartic acid, glutamic acid, serine, threonine, proline, glycine, alanine, valine, leucine, cystine, phenylalanine, tyrosine, β-alanine, histidine, methylhistidine, lysine, and arginine.

8351. SHIBATA, SHOJI AND TAKIDO, MICHIO. **Evaluation of crude drugs. II. Paper chromatographic studies of rhubarbs. I.** *J. Pharm. Soc. Japan* 72, 1311-4(1952)(in English).—*C. A.* 47, 1335*g*.

Various com. specimens and certain fresh rhizomes and roots of cultivated rhubarbs were compared by paper chromatography. Nearly all specimens examd. contained the following main anthraquinones: chrysophanol, physcion (emodin monomethyl ether), emodin, and rhein, either in free or combined form.

8352. SHU, P. AND THORN, J. A. **Carbon and oxidation-reduction balances and the estimation of fermentation efficiencies of aerobic fermentations.** *Can. J. Botany,* 30, 252-65(1952).—*C. A.* 46, 8809*b*.

An app. and method for prepg. carbon and oxidation-reduction balances of aerobic fermentations were described. The method was successfully applied to citric acid and ustilagic acid fermentations.

8353. SMITH, E. LESTER AND ALLISON, D. **Paper chromatography of radioactive penicillin.** *Analyst* 77, 29-33(1952).—*C. A.* 46, 3222*g*.

Bisynthetic S^{35}-penicillin was chromatographed on buffered paper strips. The distribution of the penicillins along the strips was assessed.

8354. STERNBURG, JAMES AND KEARNS, C. W. **Chromatographic separation of DDT and some of its known and possible degradation products.** *J. Econ. Entomol.* 45, 505-9(1952).—*C. A.* 47, 1322*b*.

Recoveries of 90-100% from the Et_2O ext. of insects were made by chromatographic sepn.: Plug the end of a 12-mm chromatographic tube with cotton, fill it to a depth of 5 or 6 cm with activated alumina (Alcoa, grade E-20, 80-200 or 48-100 mesh); only alumina which does not catalytically dehydrochlorinate DDT should be used. Evap. the Et_2O ext. of the insects, take up the residue in 5 ml petr. ether (b.p. 30°-60°C) and introduce into the alumina column; repeat with 2 more 5-ml portions of petr. ether, then add 60 ml petr. ether. Collect the eluate.

8355. STROUD, S. W. **Determination of 2,4-dichlorophenoxyacetic acid.** *Analyst* 77, 63-7 (1952).—*C. A.* 46, 3460*b*.

A rapid and accurate procedure was described for sepg. and detg. 2,4-dichlorophenoxyacetic acid in a mixt. of chlorinated phenoxyacetic acids. It was based on a sepn. by partition chromatography between ether and strong phosphate buffers on a kieselguhr column and titration of the carboxylic acid groups. Only 10-20 mg of sample was needed.

8356. SVENDSEN, ANDERS BAERHEIM. **The detection of natural cumarin in plants by paper chromatography. IV.** *Pharm. Acta Helv.* 27, 44-8 (1952).—*C.A.* 46, 9255*i*.

By means of microsublimation and paper chromatography the following cumarins were found in the roots of *Pimpinella magna* and *P. saxifraga:* pimpinellin, isopimpinellin, bergapten, isobergapten, umbelliferon, and an unidentified cumarin deriv.

8357. SVENDSEN, ANDERS BAERHEIM. **Investigation of the identity of galenic preparations with the aid of paper chromatography.** *Dansk Tids. Farm.* 26, 125-33 (1952).—*C. A.* 46, 11578*h*.

Survey of the techniques used in the paper chromatography of morphine-contg. preparations.

8358. TANAKA, KUNIYOSHI AND SUGAWA, TOSHIO. **Ergot alkaloids by paper partition chromatography. I. II.** *J. Pharm. Soc. Japan* 72, 616-20, 620-3 (1952).—*C. A.* 46, 9782*b*.

Alkaloids contained in ergots were detd. by use of paper partition chromatography. Development of the chromatogram with BuOH acidified with AcOH gave ergometrine or elymoclavine, agroclavine, and peptide-type alkaloids in different positions which gave characteristic coloration with the Ehrlich reagent; ergometrine and elymoclavine were separately detd. by development with C_5H_5N-BuOH soln. By application of this procedure to total alkaloids extd. from natural ergot, a no. of alkaloids were found to be present. The peptide-type alkaloids contained in ergot were decompd., and the amino- and α-keto acids were examd. by paper partition chromatography.

8359. THIES, H. AND ZAUNER, S. **Regularities of the adsorption of alkaloid salts on aluminum oxide. I. Adsorption isotherms of quinine hydrochloride and morphine hydrochloride.** H. *Arch. Pharm.* **285**, 191-201 (1952).—*C.A.* **46**, 10535*b*.

In general, adsorption by Al_2O_3 of the basic portion of alkaloid salts in soln. did not take place. Al_2O_3 appeared to act indirectly by H and OH ion exchange at the :AlOH groups; this freed the alkaloid bases which were then pptd. since their soly. was much lower than that of their salts. The :AlOH groups can dissoc. as follows: $AlO^- + H^+ \rightleftharpoons :AlOH \rightleftharpoons :Al^+ + OH^-$. In the presence of alkaloid salts, the same type of ion exchange took place except that H^+ ions were removed from the more highly dissocd. alkaloid salts in preference to water; this caused pptn. of the bases as soon as the soln. is satd. If the alkaloid salt solns. were sufficiently concd., the entire Na of the adsorbent was exchanged with H^+ ions, decreasing the OH^- concn. of the soln. so much that the dissocn. $:AlOH \rightleftharpoons :Al^+ + OH^-$ became appreciable and resulted in a measurable exchange of OH^- against the anion of the alkaloid salt.

8360. THIES, H. **Regularities of the adsorption of alkaloid salts on aluminum oxide columns. II. Anion exchange on aluminum oxide.** *Arch. Pharm.* **285**, 224-30(1952).—*C.A.* **47**, 827*d*.

The adsorption by Al_2O_3 of anions from alkaloid HCl solns. depended on the ability of exchangeable AlOH groups to dissoc. and thus on the pH of the soln. The pH of the adsorption system, on the other hand, was regulated by the alkaloids since it depended on their soly. and dissocn. consts.

8361. TULUS, RASIM. **Ion-exchanging substances.** *Kimya ve Sanayi* **26-7**, 349-56(1952).—*C.A.* **46**, 11577*h*.

The practical use and theory of ion exchangers in technical and pharmaceutical chemistry were discussed.

8362. TYLER, V. E. JR. AND SCHWARTING, A. E. **The separation of the ergot alkaloids by paper partition chromatography.** *J. Am. Pharm. Assoc.* **41**, 354-5(1952).—*C.A.* **46**, 9782*a*.

Conventional paper partition chromatography, in which H_2O was the stationary phase, did not sep. the ergotoxine and ergotamine alkaloids since they followed the solvent front of the wash liquid. By substituting an org.-aq. system for the H_2O a partition coeff. favoring the stationary phase was achieved. The use of acidic wash liquids assured the stability of the alkaloids.

8363. VARMA, K. C.; BURT, J. B., AND SCHWARTING, A. E. **Chromatographic analysis of some terpenes.** *J. Am. Pharm. Assoc.* **41**, 318-20(1952). —*C.A.* **46**, 7942*e*.

The columnar techniques of frontal, elution, and displacement analysis were applied to terpenes and terpene mixts. The first appeared to be the better method for the sepn. of terpenes and was most effective when one terpene was in high concn. Petr. ether was very useful in the sepn. of menthol and menthone, but the qual. analysis of the eluate was difficult.

8364. VAVRUCH, IVAN. **A chromatographic study of amino acids in sugar-beet protein.** *Sugar* **47**, No. 5, 35-6(1952).—*C.A.* **46**, 7349*g*.

The amino acids were prepd. from fresh press juice by mixing with an equal vol. of 95% MeOH at 4°C, centrifuging, hydrolysis with trypsin, adsorption on a sulfonated, strongly acid cation-exchange resin, elution with 7 *N* NH_4OH, treatment with activated carbon, and evapn. on a water bath. Portions of 5 microl. of soln. in a small amt. of H_2O were chromatographed in 1 and 2 dimensions with various solvents and solvent mixts., and the chromatograms spotted with ninhydrin and other reagents. The amino acids were identified by controls with known amino acids and mixts. of them.

8365. VÉLON, PIERRE AND MEDYNSKI, GUY. **Determination of hydrocarbons (in cosmetics) by chromatography and selective solubility.** *Industrie parfum.* 7, 198-200(1952).—*C.A.* 47, 5075*h*.

The total hydrocarbons in cosmetics were sepd. from other substances present by an Al_2O_3 column and the liquid hydrocarbons from the solid hydrocarbons by soly. in MeEtCO. It was first necessary to remove the pigment particles since these may obstruct the Al_2O_3 column. The petr. ether soln. was passed through a column (3 cm in diam., 22 cm high) of Al_2O_3, and the effluent was evapd. to dryness.

8366. WAGNER, JOHN G. AND HARRIS, LOYD E. **A phytochemical investigation of the fruit of Maclura pomifera. III. Color tests, paper chromatography, and infrared spectra of lurenol, lupeol, and their derivatives.** *J. Am. Pharm. Assoc.* **41**, 500-504(1952).—*C.A.* **46**, 11585*a*.

The infrared spectra of lurenol, lurenyl acetate, lupeol, and lupeol acetate were detd. Small quantities of these compds. were sepd. and detd. by paper chromatography.

8367. WANKMÜLLER, ARMIN. **Paper chromatography of pharmaceuticals.** *Naturwissenschaften* **39**, 302-3 (1952).—*C.A.* **47**, 7161*b*.

Examples were given of analysis of pharmaceuticals by paper chromatography: Ladogal, Supronal, Amindan. The R_f values detd. were compared with those of alleged constituents.

8368. WICKSTRÖM, ALF AND SALVESEN, BJARNE. **Separation and identification of barbiturates by paper partition chromatography.** *J. Pharm. Pharmacol.* 4, 98-102(1952).—*C.A.* 46, 4742*e*.

Exptl. results were reported for the following barbituric acid derivs.: 5,5-diallyl, 5,5-allylisopropyl, 5,5-ethycyclohexenyl, 5,5-methylcyclohexenyl-1-methyl, 5,5-diethyl, 5,5-ethylphenyl, 5,5-ethyl(methylbutyl), 5,5-ethylphenyl-1-methyl; and for the thiobarbituric acid derivs.: 5,5-allylisopropyl, 5,5-ethylcyclohexenyl. R_f values for 5,5-diallyl, 5,5-allylisopropyl, 5,5-ethylcyclohexenyl, 5,5-methylcyclohexenyl-1-methyl, 5,5-allylisopropyl, and 5,5-ethylcyclohexenyl at 18-20°C for descending chromatograms with the alk. mobile phases of the indicated solvent systems were: toluene 100:H_2O 30: pyridine 50, all about 0.95; toluene 100:10% NH_3 50, all except 5,5-methylcyclohexenyl-1-methyl about 0.0; $CHCl_3$ 100:H_2O 20:pyridine 40, all about 0.92.

8369. WICKSTRÖM, ALF AND SALVESEN, BJARNE. **Separation and identification of sympathomimetic amines by paper chromatography.** *J. Pharm. Pharmacol.* 4, 631-5 (1952).—*C.A.* 46, 10539*d*.

Adrenaline was dissolved in 5% AcOH to make a 0.5% soln. The other free amines were applied in EtOH or Et_2O soln. on the starting line on a 56 × 20 cm sheet of Whatman No. 1 paper; 25-50 γ in 5-10 microliters being used. The org. phases of the following solvent systems were used: BuOH:H_2O:AcOH (95%), 40:50:10; BuOH:toluene:H_2O:AcOH (95%), 100:100:50:50; AcOEt:H_2O:AcOH(95%), 30:30:10; $CHCl_3$:H_2O:AcOH(95%), 100:50:40. Spray the air-dried chromatograms with 0.5 g of bromocresol green in 100 ml of EtOH to indicate the amines as blue spots on a greenish yellow background which will turn yellow in AcOH vapors. The R_f values with the indicated solvents were tabulated.

8370. YAMPOL'SKAYA, M. M. **Determination of potassium arsenite in the presence of tinctures by the use of cation-exchange adsorbents.** *Aptechnoe Delo* 1952, No. 3, 9-11.—*C.A.* 47, 4043*g*.

K_3AsO_3 was detd. in tinctures from a variety of plant sources (quinine bark, eucalyptus, sunflower, etc.) without preliminary destruction of the org. matter. The solns. were adjusted to pH 10-12 with NaOH and passed through a cationite column (20-5 g resin for typical sample), the latter being washed down with 50 ml H_2O until acidity was removed. The filtrate was analyzed conventionally. The resin removed the coloring and extractive substances very satisfactorily, and recovery of better than 99.5% of As was achieved.

8371. ZÂFIR, MÂLIK. **The selective adsorption of cyclic sulfur compounds.** *Folia Pharm.* 2, 128-31(1952)(in French).—*C.A.* 47, 3523*e*.

The substance present in com. C_6H_6 which was responsible for imparting a red color to aq. acid was removed by adsorption on talc. Talc also removed the color from the acidulated water. The substance could be eluted from talc with EtOH.

8372. BAYLY, R. J. AND BOURNE, E. J. **A new method for the paper chromatography of oligosaccharides.** *Nature* 171, 385-7(1953).—*C.A.* 47, 5294*d*.

The R_f values of oligosaccharides were increased (8-fold for disaccharides) by converting them to *N*-benzylglycosylamine derivs. The sugar soln. was spotted only once, dried, and a 2nd superimposed spot made with 10% benzylamine in MeOH. After heating at 85°C for 5 min. the chromatogram was run descendingly by using the upper phase of a 40:10:49:1 or 40:12:20:1 mixt. of BuOH:EtOH:H_2O:concd. NH_4OH. More H_2O in the solvent gives better resolution in some cases. The spray was 0.25% ninhydrin in alc.

8373. BITMAN, JOEL AND SYKES, J. F. **Chromatographic separation of estrone, estradiol, and estriol.** *Science* 117, 356-8 (1953).—*C.A.* 47, 6602*i*.

A condenser-type chromatographic tube (internal diam. 10.8 mm, circulating H_2O 24°C) contg. C_6H_6—NaOH—Celite 535 (25 ml, 3 g, and 2.4 ml 2.3 *N*, resp.) was charged with aliquots of C_6H_6 solns. of cryst. estrone, estradiol, and estriol (2-10 γ). Estrone appeared in the eluate after a forerun of 30 ml of C_6H_6. Complete recovery was obtained in the next 80 ml. Estradiol appeared after a clear zone of 10 ml of eluate and was recovered in the next 90 ml of eluate. Application of N_2 pressure to the column completed the elutions in a few min. Estriol was not eluted from this system.

8374. BÜCHI, J. AND FURRER, F. **The use of new ion-exchange resin adsorbents for the assay and isolation of alkaloids.** *Arzneimittel-Forsch.* 3, 1-10(1953).—*C.A.* 47, 5635*d*.

The detn. of quinine and total alkaloids in cinchona bark and exts. by the use of ion-exchange resins, (Duolite C-10) was described in detail.

8375. CASTEEL, HELEN WARREN AND WENDER, SIMON H. **Identification of flavonoid compounds by filter paper chromatography. Additional R_f values and color tests.** *Anal. Chem.* 25, 508-9 (1953).—*C.A.* 47, 6311*e*.

Paper chromatographic techniques were extended by the detn. of R_f values for a no. of flavonoid compds. not yet reported in the usual solvent systems. Since the colors produced by chromogenic sprays often aided in the tentative classification of an unidentified flavonoid pigment into one of the major subdivisions of flavonoid compds., the colors produced by these sprays were also detd. for the newly studied flavonoids.

8376. FREDEEN, F. J. H.; ARNASON, A. P., AND BERCK, B. **Adsorption of DDT on suspended solids in river water and its role in black-fly control.** *Nature* 171, 700-1(1953).—*C.A.* 47, 7150*c*.

DDT assocd. with suspended solids in river water gave excellent results in the control of black flies. Fast-flowing rivers in which the water was turbid at the time of treatment might be treated similarly, and perhaps in certain clear-water streams and rivers, finely divided inorg. material with DDT-adsorptive properties could be added along with the larvicide and kept in suspension.

8377. FUJITA, AKIJI AND AOYAMA, MASATARO. **Free and esterified vitamin A in fish oils; chromatographic separation and colorimetric determination.** *J. Biochem. (Japan)* 40, 151-6 (1953).—*C.A.* 47, 5470*g*.

A chromatographic method, devised for detg. free and esterified vitamin A separately, was given using an alumina column.

8378. FUJITA, AKIJI AND AOYAMA, MASATARO. **Colorimetric and fluorometric determination of vitamin A in fish-liver oils; chromatographic**

separation of vitamin A and nonvitamin A materials in the unsaponifiable matter. *J. Biochem.* (Japan) 40, 157-68 (1953).—*C.A.* 47, 6601*g*.

The contents of true vitamin A and fluorometrically active non-vitamin A were estd. separately. For the indirect method estn. of the value of fluorometrically-active nonvitamin A, evap. 5 ml of the C_6H_6 est., dissolve the residue in 2 ml of ligroin, pour into an alumina column, develop with 50 ml of an acetone-ligroine mixt. (1:9), det. the positions of sepd. fractions under ultraviolet irradiation (usually 5 zones appear). *Direct method*—Evap. 5 ml of the C_6H_6 ext. of unsapond. substances, dissolve the residue in 2 ml of ligroine, sep. 5 zones on a chromatographic column of alumina, rinse the column content twice with 2 ml of C_6H_6, and det. the estd. vitamin A colorimetrically or by fluorometric titration.

8379. GRANT, ERNEST W. AND HILTY, WYNE W. **The separation of morphine from codeine by means of ion exchange.** *J. Am. Pharm. Assoc.* 42, 150-2(1953).—*C.A.* 47, 5633*a*.

Morphine could be sepd. from codeine by a strongly basic, quaternary amine-type anion exchanger. Because of its phenolic structure morphine exchanged with the resin while codeine was washed through the column and detd. by titration.

8380. GROTE, I. W. AND WOODS, MARIBELLE. **Antacids. IV. Adsorption effects of various aluminum antacids upon simultaneously administered anticholinergic drugs.** *J. Am. Pharm. Assoc.* 42, 319-20 (1953).—*C.A.* 47, 7110*a*.

As measured by the reduction in acute toxicity in mice, $Al(OH)_3$ magmas showed marked adsorption effects with atropine sulfate, homatropine hydrobromide, and belladonna alkaloids as sulfates but not with monatropine methyl bromide.

8381. HAENNI, EDWARD O.; CAROL, JONAS, AND BANES, DANIEL. **Colorimetric determination of α-estradiol in estrogenic mixtures using partition chromatography.** *J. Am. Pharm. Assoc.* 42, 162-7(1953).—*C.A.* 47, 5633*d*.

A method for the detn. of α- and β-estradiols in complex mixts. contg. the estrogenic ketosteroids as well as other estrogenic diols was described; this method utilized a stock iron-Kober reagent dild. with 1*N* HCl, a simple chromatographic partition system consisting of 0.4*N* NaOH as immobile solvent fixed on Celite, and C_6H_6 as the mobile solvent.

8382. HAENNI, EDWARD O.; CAROL, JONAS, AND BANES, DANIEL. **Partition chromatography of some estrogenic diols.** *J. Am. Pharm. Assoc.* 42, 167-72(1953).—*C.A.* 47, 5633*f*.

The effects of alkali concn., flow-rate, temp., and degree of packing were given concerning the operation of a partition chromatographic system (consisting of NaOH soln. fixed in Celite as the immobile phase and C_6H_6 as the mobile phase) for the sepn. of certain estrogenic diols. Temp. effects were very marked. Partition coeffs. as detd. from these columns were reported for α- and β-estradiols, α- and β-dihydroequilins, and β-dihydroequilenin.

8383. HUTCHINS, HASTINGS H. AND CHRISTIAN, JOHN E. **Sulfonamide separations based on ion-exchange chromatography in combination with radioactive techniques.** *J. Am. Pharm. Assoc.* 42, 310-14(1953).—*C.A.* 47, 7163*g*.

A method was described which was suitable for the assay of sulfonamides and their derivs. in pure form as well as in pharmaceutical prepns. It consisted of adsorption on an ion-exchange resin, followed by the chromatographic elution and the measurement by isotope diln. technique of the individual sulfonamides.

8384. JOLLÈS, GEORGES AND FROMAGEOT, CLAUDE. **Isolation of lysing proteins from rabbit spleen.** *Biochim. et Biophys. Acta* **11**, 95-101 (1953).—*C.A.* 47, 8166e.

A fine particle size carboxylic acid cation exchanger was employed in the chromatographic sepn. of lytic proteins from the spleen of rabbits. The protein was obtained from the spleen by exhaustion with water and precipitation by acetone, alkali, and flavianic acid.

8385. KLEE, FLORENCE C. AND KIRCH, ERNST R. **Determination of morphine in opium with the aid of an adsorption column.** *J. Am. Pharm. Assoc.* 42, 146-50(1953).—*C.A.* 47, 5632*i*.

An app. was described in which morphine was extd. from opium with boiling MeOH and immediately sepd. from interfering and colored substances on a Florisil column by elution with the same solvent.

8386. KOHLSTAEDT, K. G.; MARTZ, B. L.; GRIFFITH, R. S., AND HELMER, O. M. **Clinical experience with mixtures of anion- and cation-exchange resins.** *Ann. N.Y. Acad. Sci.* 57, 260-72 (1953). —*C.A.* 48, 3556*e*.

A report on the clinical effect of a resin mixt. in the treatment of congestive heart failure, cirrhosis and ascites, and essential hypertension. The mixt. contained 59% carboxylic resin in the H^+ form, 29% of the same resin as its salt, and 12% of a polyamine anion exchanger.

8387. LEVINE, JOSEPH; SELZER, GEORGE, AND WRIGHT, WILLIAM W. **Chemical determination of mannosidostreptomycin and dihydromannosidostreptomycin.** *Anal. Chem.* 25, 671-3(1953).—*C.A.* 47, 6311*g*.

The mannosido content of streptomycin and dihydrostreptomycin was detd. by converting the mol. to the neutral mannoside and 2 basic products, streptidine and methyl streptobiosaminide dimethyl acetal or methyl dihydrostreptobiosaminide, resp. An ion-exchange resin was used to adsorb the basic products. The methyl mannosido in the effluent liquid was converted to its dinitrophenyl osazone. This was dissolved in aq.-alc. alkali hydroxide giving a purple soln., the intensity of which was measured spectrometrically at 556 mμ.

8388. LEVY, A. L. AND CHUNG, DAVID. **Two-dimensional chromatography of amino acids on buffered papers.** *Anal. Chem.* 25, 396-9(1953).—*C.A.* 47, 6309*h*.

Previous solvent systems for 2-dimensional chromatography of amino acids, e.g. collidine-phenol-0.3% NH_3, had disadvantages such as irregularly shaped spots, lack of reproducibility, incomplete sepn., discoloration of the paper, and unpleasant odor. The solvent system described (4:1:5 BuOH-AcOH-H_2O, 1:1 *m*-cresol-phenol, pH 9.3, borate buffer) overcame these difficulties, allowing completion of the chromatogram in 40 hrs.

8389. LINDBERG, BENGT AND WICKBERG, BÖRJE. **The chemistry of lichens. III. Disaccharides from Umbilicaria pustulata.** *Acta Chem. Scand.* 7, 140-2(1953)(in English).—*C. A.* 47, 5628*f*.

Arabitol, mannitol, umbilicin, α,α-trehalose, and sucrose were isolated from *Umbilicaria pustulata*. The solvent was evapd. *in vacuo*, the residue treated with H_2O, the undissolved material filtered, excess basic $Pb(OAc)_2$ added to the aq. soln., the ppt. sepd., excess Pb pptd. with H_2S, the soln. passed through an Al_2O_3 column, and the eluate evapd. to dryness to give 7, 21, and 0.5 g, resp., from the Me_2CO and the 2 MeOH exts. The carbohydrate fraction from the Me_2CO ext. in 70 cc. 1% EtOH was absorbed on the top of a 23 × 3.3 cm column of equal parts by wt. Carbon and Celite, and the column washed with 1 liter 1% EtOH, 500 cc. 10% EtOH, and 1 liter 50% EtOH. The 1% EtOH eluted a crude mixt. of arabitol and mannitol (2.5 g) and the 10% EtOH crude umbilican (2.8 g), from which 1.8 g pure, umbilican-octaacetate could be obtained by acetylation.

8390. MOERLOOSE, P. DE. **Paper chromatography of quinine alkaloids.** *Mededel. Vlaam. Chem. Ver.* 15, 13-18(1953).—*C. A.* 47, 6604*i*.

The best sepn. of quinine and quinidine took place by a 2-dimensional chromatogram with 5% aq. NH_3 in one direction and 5% aq. pyridine in the other. By eluting with 10% H_2SO_4 and measuring the fluorescence, a detn. could be carried out in concns. of 1-20 γ. The alkaloids were located on a duplicate strip by means of Dragendorf's reagent.

8391. NORTHCOTE, D. H. **Sorption of water vapor by yeast cell wall and other polysaccharides.** *Biochim. et Biophys. Acta* 11, 471-9 (1953).—*C. A.* 47, 12515*c*.

The sorption and desorption isothermals were detd. at 26°C, and in some cases at 45°C, for yeast, rabbit liver, Mytilus edulis and Helix-pomatia glycogens, yeast glucan, yeast mannan, and dextran (Leuconostoc mesenteroides). A monohydrate of the water and the hexose units of the polysaccharides was suggested in which the water was assocd. with one or both of the secondary hydroxyl groups on C atoms 2 and 3 or 2 and 4; a pair of adjacent secondary hydroxyl groups was not essential for hydrate formation.

8392. PAULSON, JACK C. AND DEATHERAGE, FRED E. **The mechanism of protein hydrolysis by ion-exchange resin catalysis.** *J. Biol. Chem.* 205, 909-15 (1953).—*C. A.* 48, 3422a.

In the course of the dil. acid hydrolysis of bovine serum albumin and edestin by ion-exchange catalysis (Dowex 50), differences were observed among the rates of release of the various acidic and neutral amino acids. Substitution or blocking of the amino group greatly increased the resistance of albumin to hydrolysis. Fixation of the protein substrate on the resin's surface, by combination with the basic groups was essential to the activation of the peptide linkages.

8393. PEARSE, H. L. AND NOVELLIE, L. **South African tobaccos. I. Preliminary identification of amino acids and other constituents.** *J. Sci. Food Agr.* 4, 108-12(1953).—*C. A.* 47, 5638*d*.

The free amino acid content of tobacco leaves was detd. by passing the juice through ion-exchange resins, elution, and paper chromatography of the eluate. Other methods of purification of the juice for paper chromatography were unsuccessful. The following free amino acids were found, though not all were present in all of the exts. tested: aspartic acid, asparagine, glutamic acid, glutamine, serine, threonine, alanine, tyrosine, proline, γ-aminobutyric acid, valine, phenylalanine, leucine, tryptophan, β-alanine, histidine, and lysine.

8394. PORTER, R. R. **Partition chromatography of insulin and other proteins.** *Biochem. J.* 53, 320-8(1953).—*C. A.* 47, 4045*f*.

Two-phase mixts. were used; they were prepd. from $(NH_4)_2SO_4$, Cellosolve, and water with kieselguhr as support for the stationary phase in the partition chromatography of ribonuclease. Other similar systems were adapted for partitioning proteins, consisting of liquid 2-phases using a variety of glycol esters, water, and org. or inorg. solvents. In the partitioning of insulin, 3 systems were employed; they consist of water, Butyl Cellosolves, and Na or K phosphate. Insulin, prepd. chromatographically, either from crude or cryst. material, behaved as a single component and the recovery was nearly 100%.

8395. RAO, TARA AND GIRI, K. V. **Circular paper chromatography. III. R_f values of amino acids and peptides.** *J. Indian Inst. Sci.* 35A, 77-92(1953).—*C. A.* 47, 4249*a*.

The optimum solvent used for the chromatography of amino acids was an *n*-butanol, AcOH, H_2O mixt. (40:10:50 vol./vol.). The influence upon R_f values of amino acid concns., temp., distance moved by the solvent, and distance of the initial spot from the center were examd. Only the latter two had any significant effect on R_f values.

8396. RICHTER, JOHN W.; AYER, DONALD E.; BAZEMORE, ALVA W.; BRINK, NORMAN G., AND FOLKERS, KARL. **Pituitary hormones. V. The purification of corticotropin-B by ion-exchange techniques.** *J. Am. Chem. Soc.* 75, 1952-3 (1953). —*C. A.* 48, 5098*h*.

Corticotropin-B was exchanged on columns of weakly acidic carboxylic acid ion exchange resin buffered with Na^+. Inert materials were eluted by washing with aq. pyridine and aq. acetic acid. The active principle was then eluted with dilute HCl after which it was recovered free of organic salts as the hydrochloride. Activity of the hydrochloride was in the range 250 to 300 units/mg. Purification may also be carried out on columns of oxycellulose. Sulfonic acid cation exchangers were not satisfactory.

8397. Scholz, E. and Hagedorn, P. **Investigation of medicinal mixtures with paper electrophoresis. III. Paper chromatography of galenic tinctures.** *Deut. Apoth. Ztg.* 93, 81-2(1953). —*C.A.* 47, 4044*e*.

A Whatman no. 1 paper strip, 4 cm wide and 30 cm long, was wetted with electrolyte soln. The substance to be tested was applied as a band 3 cm wide, the strip was immersed at both ends into the electrolyte soln., and a d.c. of 110 v. was applied. Sulfonamides could be sepd. in 0.1 *N* NaOH and made visible by diazotization with 2-naphthol. Caffeine-quinine or antipyrine-aminopyrine mixts. were analyzed in 0.1 *N* H_2SO_4 and developed with I_2, flavone mixts. (in 0.1 *N* NaOH) were sprayed with $Pb(OAc)_2$ and observed in ultraviolet light.

8398. Swintosky, Joseph V. and Kennon, Lloyd. **The preparation of powdered carboxymethycellulose and linseed acids.** *J. Am. Pharm. Assoc.* 42, 505(1953).—*C.A.* 48, 4775*c*.

The Na salt of carboxymethycellulose was converted to the free acid by means of an Amberlite IR-120 ion-exchange column, and the soln. was spray-dried to form a water-dispersible powder. Powd. linseed acid was prepd. by extg. clean flaxseed with aq. HCl, pptg. the gum with alc., passing a 2% soln. of the pptd. gum through the ion-exchange column, and spray-drying. The linseed acid to be treated with the ion exchange resin was obtained by extraction of flaxseed with aq. HCl and pptn. with EtOH.

8399. Yampol'skaya, M. M. **Determination of some pharmaceutical preparations in the pure state and in medicinal mixtures with the aid of ion-exchange adsorbents.** *Aptechnoe Delo* 2, No. 1, 17-21(1953).—*C.A.* 47, 5631*a*.

Cation-exchange resins could be successfully used for detn. of tecodine, arecoline bromide, trypaflavine, rubrocol, bigumal, phenamine, vitamin B_1, carbocholine, and sergosine. The results agreed within a few tenths of a percent with those obtained by methods prescribed by the U.S.S.R. Pharm. In the general procedure 5 g of the resin, swelled with H_2O, was regenerated by washing with 3% HCl, washed with distd. H_2O, and a soln. of 0.03-0.05 g of the specimen in 10 ml H_2O was passed through the bed at 2-3 drops/sec. After washing down with 30-40 ml H_2O until wash waters were free of acid reaction, the liberated acid was titrated with standard alkali.

V-8. Agricultural Uses—Soils

8400. Prianishnikov, D. **Estimation of the absorbed bases in soils.** *Landw. Vers. Stat.* 79-80, 667; *J. Chem. Soc.* 103, II, 339 (1913). —*C.A.* 7, 3181.

Both $NH_4C_2H_3O_2$ and 3.2% NH_4OH were suitable for detg. the amt. of absorbed K_2O. For detg. the amt. of absorbed NH_3 in soils it was found that by digesting the soil 10 times with 5% KCl and distg. the soln. with MgO, results were obtained which agreed most nearly with the older methods. Expts. with barley showed that the K_2O of zeolites was almost completely unavailable when alone; in contact with nutritive salts or $CaCO_3$, it was easily assimilated.

8401. Hissink, D. J. **The adsorption processes in soils.** *Intern. Mitt. Bodenk.* 12, 81-172 (1922).—*C.A.* 17, 1100.

The exchangeable bases were considered to be on the surface of the particles of clay and of the humus complex in an adsorbed condition. The cations were principally Na and K, the Ca and Mg compds. being little ionized. A method was developed to sep. the bases exchangeable by neutral salts, the acid-sol. bases, and $CaCO_3$. The investigation of a large number of soils indicated that in clay soils there was a very low content of acid sol. Ca and Na. The avs. were 0.27 and 0.25%, resp., while the K and Mg were 1.34 and 0.826%, resp. Humus soils contain the largest amt. of their bases in exchangeable form.

8402. Hissink, D. J. **Base exchange in soils.** *Trans. Faraday Soc.* 20, 551-66 (1925).—*C.A.* 19, 1022.

The action of neutral salts on soils produced an equil. very quickly. Three minutes sufficed to replace all Ca. A method was described for distinguishing between the bases replaced by neutral salts and those removed by strong acids. An unsatd. condition brought about an acid reaction more readily with a humus soil than with clay. The degree of unsatn. in soils was detd. approx. by a cond. titration using $Ba(OH)_2$. A simple titration of a series of samples using increasing quantities of $Ba(OH)_2$ on a certain quantity of soil may also be used.

8403. Kelley, W. P. and Brown, S. M. **Replaceable bases in soils.** *California Agr. Expt. Sta., Tech. Paper* 15, 39pp. (1925).—*C.A.* 19, 3341.

The replaceable bases of several neutral or slightly alk. soils from California were mainly Ca, Mg in smaller quantities, and very small quantities of K and Na. Alkali soils were characterized by a relatively large amt. of replaceable Na and a correspondingly low amt. of replaceable Ca. The acid soils examd. were characterized by a low total content of replaceable bases, and by the presence in replaceable form of Al, Fe or Mn. Dil. HCl displaced the bases, but may attack other constituents. The replaceable bases were considered to be present not in a state of phys. absorption, but as chem. compds., probably as complex aluminosilicates which had been formed through weathering.

8404. Kelley, W. P. and Brown, S. M. **Base exchange in relation to alkali soils.** *Soil Science* 20, 477-95(1925).—*C.A.* 20, 1295.

The more important types of alkali soils found in the U.S.A. were: (1) Soils whose replaceable Ca and Mg have been substituted mainly by Na.

(2) Soils in which the substitution of Na has taken place to a limited extent. (3) Soils low in replaceable Na and high in Ca and Mg. salts. In the practical reclamation of these soils group (1) will require special treatment in large amts., preferably Ca Salts. Group (2) may be benefited by such special treatments but the application need not be so large. Group (3) may be improved by mere flooding and drainage.

8405. PAGE, H. J. AND WILLIAMS, W. **Studies on base exchange in Rothamsted soils.** *Trans. Faraday Soc.* **20**, 573-85 (1925).—*C. A.* **19**, 1022.

The surface soils of the fertilized plots which received no K salts were greatly reduced in exchangeable K while those to which K salts were added showed a significant increase. Farmyard manure produced the largest exchangeable base content in the surface soil of any treatment and was slightly less in the subsoil. The exchangeable K present in the plots treated with K was much less in the surface 18 in. than the excess of K added over that removed in crops during the course of the expt. Liming greatly increased the exchangeable Ca. The pH values also increased in a somewhat similar order.

8406. SAINT, S. J. **The relation between the pH value, the lime requirement and the thiocyanate color of soils.** *Trans. Faraday Soc.* **20**, 594-8 (1925).—*C. A.* **19**, 1022.

The thiocyanate test for CaO requirement or pH values of soils could not be readily made quant. The thiocyanate color, pH value, and $CaCO_3$ requirement obtained in analyses of 33 soils were tabulated and the correlation of the values was relative only. The intensity of color was dependent upon the acidity, texture of the soil, amt. of org. matter and Fe present.

8407. PAGE, H. J. **Nature of soil acidity.** *Trans. 2nd Comm. Intern. Soc. Soil Sci.* **1926A**, 232-44, 1928.—*C. A.* **22**, 1002.

The absorbing complex of the soil was an insol. colloidal acid (or acidoid), assocd. with surface-active basic and H cations. The existence of replaceable Al^{+++} in the complex and the possibility of OH^- adsorption were the debatable points.

8408. KELLEY, W. P. AND BROWN, S. M. **Base unsaturation in soils.** *Proc. Intern. Congr. Soil Sci.* **1**, 491-507 (1927).

The amt. of replaceable base that a soil gained by treatment with an excess of Ca or $Ba(OH)_2$ was a true measure of its content of replaceable H^+. The NH_4Cl method, as applied before and after the treatment of the soil with alkali-earth hydroxide, gave a close approximation to this quantity with the soils studied. The Ca-exchange complex was practically neutral and, therefore, non-hydrolysable. The unsatd. complex, on the other hand, was acid owing to the nature of its ionization. The exchange capacities of heavy clay soils varied between wide extremes.

8409. KERR, H. W. **The identification and composition of the soil aluminosilicate active in base exchange and soil acidity.** *Soil Science* **26**, 385-98(1928).—*C. A.* **23**, 1198.

The base-exchange material of soils was confined largely to the clay fraction and seemed to be so intimately mixed with other colloidal material that it was impossible to sep. it by sp. gr. methods. By employing the contents derived according to the base-exchange equil. theory, it was possible to identify active aluminosilicates from different sources. The equil. const. seemed to be characteristic of each compd. involved in base exchange. The soil from which the active org. matter was completely removed by gentle ignition gave a value for K agreeing very closely with samples of a clay material (bentonite) and differing markedly from the values found for the true zeolites tested.

8410. MERKLE, F. G. **The influence of fertilizer treatments on the content of exchangeable cations in Hagerstown silt loam.** *Soil Science* **26**, 377-83(1928).—*C. A.* **23**, 1206.

Soils repeatedly fertilized with chem. fertilizers or with org. manures underwent significant changes in the quantity and proportion of replaceable cations. Liming tended to saturate the absorption complex with Ca. A part of the K applied in chem. fertilizers was retained in the acidoid complex. NH_4 from soils may be retained and constitute a large percentage of the total adsorbed cations.

8411. MARTIN, J. C. **Effect of crop growth on the replaceable bases in some California soils.** *Soil Science* 27, 123-36(1929).—*C. A.* **23**, 3043.

The quantities of exchangeable bases in clay or silty-clay loam soils were generally much higher than in sandy loam soils. Nine of the 12 soils, which supported 2 barley crops with a 10-year fallow period intervening, showed significant decreases in K. The content of total bases was not significantly altered by these decreases in K, because Ca and Mg, which comprised 90% of the total, remained const.

8412. PARKER, F. W. **The determination of exchangeable hydrogen in soils.** *J. Am. Soc. Agron.* 21, 1030-9(1929).—*C. A.* **24**, 452.

Four methods for detg. the amt. of exchangeable H in soils were studied. The H content of a soil was assumed to be equal to the difference between the exchange capacity of the soil and its content of exchangeable bases. Exchangeable H was detd. by titrating the soil to pH 7.0 with $Ba(OH)_2$, by detg. the amt. of H replaced by leaching the soil with neutral $Ba(C_2H_3O_2)_2$, and by conductometric titration. The difference method, titration to pH 7.0, and the $Ba(C_2H_3O_2)_2$ method gave similar results for exchangeable H when compared on 12 soils. The conductometric titration method was unsatisfactory for the detn. of exchangeable H.

8413. Chapman, H. D. and Kelley, W. P. **The determination of the replaceable bases and the base-exchange capacity of soils.** *Soil Science* **30**, 391-406(1930).—*C.A.* **25**, 551.

Soly. and decompn. processes in soils rendered the detn. of exchangeable bases somewhat inexact. The base-exchange capacity of the soil could be detd. by digesting and leaching the sample with *N* $AcONH_4$ soln. This soln. brought about approx. complete replacement of H ions without the necessity of treating the sample with an excess of alkali. Neutral MeOH was useful for the removal of the occluded electrolyte. The adsorbed NH_4^+ could be accurately detd. by aeration in the presence of Na_2CO_3.

8414. McGeorge, W. T. **Base-exchange property of organic matter in soils.** *Ariz. Agr. Expt. Sta., Tech. Bull.* **30**, 181-213 (1930).—*C.A.* **25**, 161.

The exchange capacity of highly org. soils was approx. a linear function of the % of carbon in the soil. There was no relation between the N or N-C ratio and the exchange capacity of highly org. soils. Base exchange in highly org. soils took place in chemically equiv. proportions. With H_2O_2 as a reagent for destroying org. matter in soils, the loss in exchange capacity was approx. a linear function of the amt. of org. matter destroyed. This loss in exchange capacity was due to a destruction of the org. matter which functioned in base-exchange reactions.

8415. Schollenberger, C. J. and Dreibelbis, F. R. **Analytical methods in base-exchange investigation on soils.** *Soil Science* 3, Book 30, 161-173, (1930).

Ammonium acetate as a base exchange salt, leaching, as a means of extracting exchangeable cations, exchanged hydrogen, Ca, Mg, Alkalies, Al, Mn, exchangeable NH_4^+ were discussed.

8416. Vageler, P. and Woltersdorf, J. **Base exchange and acidity in soils. II. Preliminary experiments on permutites.** *Z. Pflanzenernahr. Dungung u. Bodenk.* **15A**, 329-42, **16A**, 184-204 (1930).—*C.A.* 24, 5407.

The base-exchange phenomena and the treatment of permutite and soil with acid and bases on the bases were discussed. A math. formulation of the laws governing the satn. of a sorption complex and the removal of bases from a complex was given.

8417. Wiegner, G. **Some physiochemical properties of clays. II. Hydrogen clay.** *J. Soc. Chem. Ind.* **50**, 103-12T(1931).—*C.A.* 25, 3218.

H^+ readily entered into a clay, but left with great difficulty. Micelles contg. a preponderance of H^+, whether in the inner or outer swarm, increased the H^+ concn. of the dispersion medium. The dispersion medium, after removal of suspended particles, had a const. H^+ concn. independent of the no. of particles dispersed in it. Analogously the introduction of particles contg. a preponderance of active OH^- increased the alkalinity of the dispersion medium. Ionic exchange expts., together with cataphoretic measurements and quant. measurements of the dispersion effect, showed that the solid micelle consisted of 3 parts, the micron or ultramicron, the inner ionic swarm and the outer, oppositely charged ionic swarm.

8418. Hissink, D. J. **The reclamation of a part of the Zuyder Zee.** *Trans. Sixth Comm. Intern. Soc. Soil Sci.*, **A**, Pt. A: 177-87, (1932).

The original soil was of a dark color, owing to the presence of ferrosulphide (FeS), and very wet, containing an average of 172 g water per 100 g dry matter. In addition to the drying and de-salting processes, the soil had to undergo another change; the original sodium-magnesium clay soil, had to be changed into a calcium clay soil.

8419. Gapon, E. N. **Theory of exchange adsorption in soils. I.** *J. Gen. Chem.* (U.S.S.R.) **3**, 144-52, 153-8, 159-63(1933).—*C.A.* **28**, 4149[6].

For an adsorbent in contact with a liquid or gaseous phase contg. mols. of substances M_1 and M_2, both of which could be adsorbed, the mass action law imposed the following equil. conditions: $F_2C_1/F_1C_2 = K$, where F_1 and F_2 were the areas of the adsorbent surface occupied by M_1 and M_2, and C_1 and C_2 were their resp. concns. From this, $1/\Gamma = (1/\Gamma_0)\ [1 + (1/K)\ (C_1/C_2)]$, where Γ_0 was max. no. of M_1 mols. that could be adsorbed (assumed to be proportional to the sum of F_1 and F_2), and Γ was the no. of adsorbed mols of M_2 (supposedly proportional to F_2). By plotting $1/\Gamma$ against C_1/C_2, a rectilinear adsorption isotherm was obtained from which the value of $1/\Gamma_0$ could be detd.

8420. Kelley, W. P. **The so-called solonetz soils of California and their relation to alkali soils.** *Am. Soil Survey Assoc., Rept. 14th Ann. Meeting, Bull. No.* **15**, 45-52(1934).—*C.A.* **28**, 4515[1].

The concn. of water-sol. salts was low except in the B_2 and C horizons of certain solonetz soils of Calif. Salts of Na predominated in the water-sol. fraction of the 7 profiles examd. Replaceable bases were 2-3 times greater in the B than the A horizons and were chiefly Ca and Mg. The exchangeable Mg increased and the exchangeable Ca decreased with depth. With one exception, the B_1 horizons were neutral or slightly alk. and the B_2 horizons which contained $CaCO_3$, were strongly alk. Fusion analyses showed decrease of SiO_2 and increase of Al_2O_3, Fe_2O_3 and MgO with depth, which was in agreement with the observed clay content and silica-alumina ratios of the profiles.

8421. Kelley, W. P. and Brown, S. M. **Principles governing the reclamation of alkali soils.** *Hilgardia* **8**, 149-77 (1934).—*C.A.* **28**, 6902[3].

Alkali soils contained either an excess of sol. salts or abnormal amts. of replaceable (adsorbed) Na. The clay and humus of normal soils were combined with Ca. With alkali soils, sol. Na salts tended to bring about replacement of Ca by Na and thus produce chem. and phys. conditions that were extremely adverse to plant growth. Hence successful reclamation of alkali soils depended upon the removal of the sol. salts and the replacement of the adsorbed Na by Ca.

8422. Volk, N. J. **The fixation of potash in difficultly available forms in soils.** *Soil Sci.* 37, 267-87(1934).—*C.A.* **28**, 4817^5.

Alternate wetting and drying of soils treated with sol. K salts caused rapid fixation of K in a non-replaceable form. Ten alternate wettings and dryings sufficed to cause max. fixation. When kept continuously moist very little fixation took place. Of the soil separates, the ultra-clay fractions contained the lowest percentages of K, but had by far the greatest K-fixing power. Fixation was dependent upon the nature as well as the quantity of colloids present. K fixation was reduced by leaching soils with *N* HCl and was increased by leaching with Na_2CO_3. The addn. of $Ca(OH)_2$ to soils usually increased K fixation. Synthetic mixts. of alumina gel, silica gel, $Ca(OH)_2$ and sand did not fix K.

8423. Alten, F. and Kurmies, B. **The physical-chemical rules for the cation exchange in mineral soil.** *Ernahr. Pflanze* **31**, 401-7 (1935).—*C.A.* **30**, 1485^7.

8424. Jacob, A.; Hofmann, U.; Loofmann, H., and Maegdefrau, E. **Chemical and x-ray investigations on the mineral sorption substance in soils.** *Beiheft Z. Ver. deut. Chem. No.* **21**, *Angew. Chem.* **48**, 585-6 (1935).—*C.A.* **29**, 8197^9.

The following properties of soils were detd.: ratio of sesquioxides to SiO_2, ratio of Al_2O_3 to SiO_2, behavior on treating with concd. HCl and X-ray patterns. The results indicated that mixed gels were not the media of exchange adsorption in soils. It was concluded that the base exchange in soils was effected by the cryst. minerals kaolinite and montmorillonite and a clay mineral, x, which needed further investigation.

8425. Mattson, Sante and Gustafsson, Yngve. **The chemical characteristics of soil profiles. II. The mutual interaction of podzolic materials.** *Lantbruks-Hogskolans Annaler* **2**, 1-30 (1935).—*C.A.* **29**, 5564^6.

The isoelec. point and the power to bind acid and base varied greatly for materials contained within the podzol profile. For comparison the theoretical capacity of ampholytes to neutralize acid or base was calcd. for varying dissocn. consts. Curves were plotted representing concn. of salt or amts. of base or acid in combination at different H-ion activities. Strong ampholytes appeared no stronger than weak ampholytes because of the mutual neutralization of acidic and basic groups in ampholytes whose K_aK_b product was high, K_a and K_b representing dissocn. consts. for acid and base, resp. The electrochem. properties of ampholytes and amphoteric colloids were not governed alone by pos. or neg. charges from an excess of cations or anions, but were modified by ions or inner salts ("zwitter ions") which existed in max. concn. at the isoelec. point.

8426. Puri, Amar Nath. **Estimating exchangeable calcium and other cations in soils.** *Soil Science* **42**, 47-59 (1936).

The method of estimating exchangeable Ca in calcareous soils consisted in shaking the soil with 0.05 *N* Na_2CO_3 in *N* NaCl. The decrease in the concentration of CO_3 ions was equivalent to exchangeable Ca in the soil. Exchangeable Ca in calcareous soils could also be detd. by shaking a known wt of the soil with a definite mixt. of K or NH_4 oxalate-acetate-carbonate. $CaCO_3$ was insol. and the decrease in the concentration of oxalate ion was equivalent to exchangeable Ca. Soils containing gypsum required a preliminary treatment with excess $BaCO_3$ when the $CaSO_4$ was converted into $BaSO_4$ and $CaCO_3$, and thus rendered insoluble.

8427. Rost, C. O. **Characteristics of some morphological solonetz soils of Minnesota.** *J. Am. Soc. Agron.* **28**, 92-105 (1936).

The exceptional features of the profiles were the very low amount of exchangeable Na and the very high amounts of exchangeable Mg found in the complex of the B horizon. Ordinarily the Ca and Mg accounted for 90% or more of the exchangeable bases and of this the exchangeable Mg comprised 0.5 to 0.75. The average percentage of exchangeable Na in the same horizon was approx. 3.0 and was lower than would be expected if the soils were classified as solonetz. Those for exchangeable Mg, on the other hand, were much higher than would be anticipated.

8428. Kelley, W. P. **Reclamation of alkali soils.** *Calif. Agr. Expt. Sta., Bull.* **617**, 40 pp. (1937).—*C.A.* **32**, 7628^9.

Alkali soils contained either an excess of sol. salts or of adsorbed Na and reclamation depended upon the removal of these excesses. Black alkali soils contained both sol. carbonate and adsorbed Na. When drainage conditions were favorable, these constituents were removed by applying the proper amt. of gypsum, S, $FeSO_4$ or alum, and then leaching. The application of 1000 lb per acre gave as good results as larger amts. The effect of S was dependent on its oxidation and several months were required for max. effects. The application of stable manure and the culture of such alkali-resistant crops as Bermuda grass or Melilotus alba were valuable aids to reclamation.

8429. Mattson, Sante and Gustafsson, Yngve. **The electrochemistry of soil formation. I. The gel and the sol complex.** *Kgl. Lantbruks-Högskol. Ann.* **4**, 1-54(1937).—*C.A.* **32**, 5127^1.

The functions of org. matter, Al, Fe and silicic acid and the interaction of colloidal hydroxides and acids were discussed. The anionic and cationic sol complexes, obtained at different pH values in the exts. from various mixts. of soil and humus, were studied with respect to compn. and isoelec. point. A min. of solvation was found at a pH corresponding to the isoelect. point of the gel complex in the mixt. Above this pH the sol complex was anionic and more acidic than the gel complex, whereas it was cationic and more basic than the latter at a lower pH.

8430. Mattson, Sante and Wiklander, Lambert. **The equi-ionic point and the point of exchange neutrality of soils.** *Kgl. Lantbruks-Högskol. Ann.* **4**, 169-89(1937).—*C.A.* **32**, 4706^7.

The "equi-ionic" point of a soil was defined as that pH of a soln. which was unaffected by the addn. of the soil in its completely unsatd. condition. At this point the abs. capacities of the soil to bind acid and base were equal and the net capacity to bind acid or base was equal to zero. The point of exchange neutrality was defined as that pH of a soil suspension which was unaffected by the addn. of a neutral salt. The ultimate pH was defined as the reaction of the completely unsatd. or electrodialyzed soil.

8431. Albrecht, W. A. and McCalla, T. M. **The colloidal clay fraction of soil as a cultural medium.** *Am. J. Botany* 25, 403-7(1938).—*C.A.* 32, 8656^5.

Water-insol. ions adsorbed on clay were available as nutrients to plants. Electrodialyzed H-clay was treated successively by addns. of Mg, PO_4, K, Ca and NH_4. This prepd. clay of known base-exchange compn. was used in aq. suspensions as nutrient media for Rhizobium and soybeans. The method permitted accurate chem. control in studies of the interrelations between soil and plants. Plant growth was more normal than when culture soln. methods were used.

8432. Lutz, J. F. **The effect of iron on some physiochemical properties of bentonite suspensions.** *Soil Sci. Soc. Am., Proc.* 3, 7-12 (1938).—*C.A.* 33, 5108^9.

Electrodialyzed bentonite suspensions were treated with $FeCl_3$ solns. equiv. to 12.5-250% satn. Proportionally more Fe was adsorbed at lower than at higher concns. Increased adsorption of Fe was assocd. with increased adsorption of Cl, but the relationship was not linear. The increase in anion-exchange capacity of soils high in exchangeable iron may influence fixation of P and other anionic fertilizer materials. Swelling of the dry colloid and hydration of the suspension were more nearly proportional to the Cl/Fe ratio than to the Fe adsorbed.

8433. Mehlich, Adolf. **Use of triethanolamine acetate-barium hydroxide buffer for the determination of some base-exchange properties and lime requirement of soil.** *Soil Sci. Soc. Am., Proc.* 3, 162-6 (1938).—*C.A.* 33, 6504^7.

The buffer capacity of com. triethanolamine contg. about 15% diethanolamine and 2.5% monoethanolamine was greatest at 0.1 *N* concn. between pH 7.5 and 8.3. The extg. soln. was prepd. by dilg. 500 ml of triethanolamine to 9 liter, adjusting to pH 6.0 with HOAc, adding 350 g $Ba(OH)_2 \cdot 8H_2O$, filtering and adjusting to exactly 0.2 *N* Ba by addn. of distd. water. The final soln. should have pH 8.15. The base-exchange capacity and exchangeable H was detd. by shaking 10-25 g of soil with 50 ml of extg. soln., filtering and leaching with 50 ml of extg. soln. Exchangeable H was detd. by titrating the ext. and the exchange capacity was detd. from the amt. of Ba remaining in the soil after leaching with distd. water and replacing the Ba by 0.5 *N* HOAc.

8434. Puri, Amar Nath and Asghar, A. G. **Titration curves and dissociation constants of soil acidoids.** *Soil Sci.* 45, 359-67(1938).—*C.A.* 33, 6498^2.

Increasing amts. of NaOH were added to 5-g portions of de-based soil and equil. was reached in 48 hrs with intermittent shaking. The pH values did not change much after contact of alkali with soil for 4 to 8 hrs. Hydroxides of other univalent ions such as LiOH, KOH and NH_4OH gave titration curves similar to, but not identical with, those obtained with NaOH. The end point was not sharp and must be reached at different pH values when different alkalies were used. With weak acids, neutralization with a strong base took place between 2 definite pH values. The pH for monobasic acids was 4. The inflection in the curve indicated that the soil acid was dibasic.

8435. Fireman, Milton and Bodman, G.B. **The effect of saline irrigation water upon the permeability and base status of soils.** *Soil Sci. Soc. Am. Proc.* 4, 71-7 (1939).—*C.A.* 35, 245^1.

Percolation of Yolo clay with salt-free water decreased its content of exchangeable bases throughout the column. Loss of NH_4 absorptive capacity occurred in the Yolo soil. The percentage decrease of K and Na in the Aiken soil and Na in the Yolo soil was greater than for other cations. Leaching the soils with water contg. 4000 p.p.m. of $CaCl_2$ + NaCl with a Ca:Na ratio of 1:6 increased the percolation rate. The total change in permeability was not identical with changes in sections of the soil column.

8436. Jenny, H. and Ayers, A.D. **The influence of degree of saturation of soil colloids on the nutrient intake by roots.** *Soil Sci.* 48, 443-59 (1939).—*C.A.* 34, 2989^3.

Base exchange was related to the degree of satn. of soil colloids. The exchangeability of adsorbed K decreased with decreasing degree of satn. The nature of complementary ions markedly affected the relationships. For instance, a K, Ca clay released nearly as much K at 40% satn. as at 100%, while a K, Na clay released markedly less K as degree of satn. was decreased. Clay particles having an effective settling diam. of less that 0.2μ were sepd. from Yolo clay loam. These colloids were leached with salt solns. or electrodialyzed with subsequent addn. of hydroxides. The base-exchange capacity varied from 59 to 67 milliequiv. per 100 g. A satd. soln. of CO_2 replaced a smaller percentage of the K present as the degree of satn. was decreased.

8437. Jenny, H. and Overstreet, R. **Cation interchange between plant roots and soil colloids.** *Soil Sci.* 47, 257-72(1939).—*C.A.* 33, 7457^5.

Data given were on the effect of colloidal clay suspensions on the mineral compn. of plant roots. Low-salt barley roots had a pronounced capacity to retain K ions against distd. H_2O. The roots were active in absorbing K from KCl solns. Dil. clay suspensions carrying absorbed Na, NH_4, or H ions pulled out K from normal low-salt roots and the reduction in the K level of the root depended on clay concn., particle size, and nature of the absorbed cation. Ca-bentonities, in the concns. used, did not greatly affect the K status of the roots.

8438. Kelley, W.P. **Effect of dilution on the water-soluble and exchangeable bases of alkali soils and its bearings on the salt tolerance of plants.** *Soil Sci.* 47, 367-75(1939).—*C.A.* 33, 8878^2.

The total amt. of Na removed from an alkali soil by displacement procedure was sometimes slightly smaller than that removed by extn. with a soil-water ratio of 1:5. The difference was not sufficiently great to cause serious errors in so far as practical agriculture was concerned. One of the soils showed 34.6 milliequivs. of Na per 100 g by displacement and 39.1 milliequivs. in an aq. ext. (soil-H$_2$O ratio 1-3.2). H$_2$O-sol. Ca and Mg were less affected by diln. than was Na. Among the common ions of alkali soils, the total amts. of bicarbonate and sulfate were likely to be the most markedly affected by diln., whereas chloride and nitrate were but little affected.

8439. MALQUORI, ALBERTO. **Determination of the base-exchange capacity of soil.** *Ricerca sci.* **10**, 562-3 (1939).—*C.A.* 34, 206^5.

A table was given with a comparison of 6 methods and 2 types of acid soils, and in addn. 3 of the methods applied to a clay-lime soil pH 7.6.

8440. MURPHY, H.F. **The role of kaolinite in phosphate fixation.** *Hilgardia* **12**, 343-82 (1939).—*C.A.* 34, 2999^7.

Kaolinite when ground to colloidal dimensions had a high phosphate-fixing capacity. The fixation was greatest at acid reactions and this indicated that the H$_2$PO$_4$ ion was the most favored phosphate ion for the reaction. An increase in base-exchange capacity accompanied the increase in phosphate fixed. Even a little kaolin in soils, if in a colloidal condition, would bind the phosphate and make it unavailable to plants. Bentonite had a much lower capacity to fix P in an inaccessible form for plant growth than did colloidal kaolinite. The results explained why soils with a kaolinic type of clay had a high capacity to fix phosphate and a low phosphate availability as measured by plant growth.

8441. PAGE, J.B. AND BAVER, L.D. **Ionic size in relation to fixation of cations by colloidal clay.** *Soil Sci. Soc. Am. Proc.* **4**, 150-5(1939). —*C.A.* 35, 246^8.

The fixation of K by drying may be related to the size of the K$^+$ and contraction of the variable lattice of the montmorillonitic clay minerals. Bentonite colloid did not fix K as readily as Miami colloid, and the fixed K was slightly affected by the concn. of the replacing ion. Large cations such as (C$_2$H$_5$)$_2$NH$^+$ prevented the lattice sheets from coming together on drying and prevented fixation of K. Univalent and bivalent cations with ionic sizes close to the size of certain free spaces within the lattice were closely correlated with susceptibility to fixation.

8442. STOUT, P.R. **Alternations in the crystal structure of clay minerals as a result of phosphate fixation.** *Soil Sci. Soc. Am. Proc.* **4**, 177-82 (1939).—*C.A.* 35, 251^4.

Ground kaolinite and halloysite fixed 300-400 millimols. of phosphate per 100 g of air-dry material. Bentonite of about the same base-exchange capacity fixed insignificant amts. of P. Measurement of water losses from the system kaolinite + KH$_2$PO$_4$ accounted for the exchange of PO$_4$ ions for OH of the crystal lattice. The relative abilities of kaolinite and bentonite to fix phosphate were related to the OH$^-$ available for exchange. Kaolinite ground to less than 1 μ diam. was amorphous to X-rays when phosphated. Removal of the phosphate by leaching at pH 9 followed by washing with HCl at pH 3-4 restored the X-ray pattern.

8443. GRAHAM, E.R. **Primary minerals of the silt fraction as contributors to the exchangeable-base level of acid soils.** *Soil Sci.* **49**, 277-82(1940).—*C.A.* 34, 5585^3.

Definite transposition was shown of Ca from the crystal lattice of finely ground anorthite, hornblende and augite to the ionic atm. of colloidal clay. Microcline and biotite were but little affected by the action of H$^+$ of colloidal clay. The H of acid Putnam clay released 3.4% of the total Ca of anorthite in 107 days, as compared to 0.03% of the total Ca by simple hydrolysis in 70 days. During this metathesis reaction, the pH of the colloidal clay changed from 3.3 to 5.7. Any soil void of Ca feldspars would necessarily be unable to maintain a high exchangeable-Ca level. In the absence of such soil-forming minerals Ca must be added in the form of limestone of fertilizers.

8444. HENDRICKS, S.B. AND ALEXANDER, L.T. **Semiquantitative estimation of montmorillonite in clays.** *Soil Sci. Soc. Am., Proc.* **5**, 95-9 (1940).—*C.A.* 35, 8176^4.

Competition ratios of adsorption of Ca^{++} and NH$_4^+$, H$^+$ and C$_5$H$_{10}$NH$_3^+$ (piperidine ion) and H$^+$ and Ce^{+++} were detd. for various montmorillonites and micaceous samples. The H$^+$, Ce^{+++}, distribution was most useful for estn. of montmorillonites, since these took up more Ce^{+++}; micaceous samples took up more H$^+$ from solns. of equivalent concn. of these ions. The relative proportion of each mineral present in mixts. could be estd. from the absorption ratios and the total exchange capacity. The estimate agreed within 10% with the ratio detd. by thermal methods.

8445. MATTSON, SANTE AND WIKLANDER, LAMBERT. **The "amphoteric" double layer and the double ionic exchange in soils.** *Trans. Faraday Soc.* **36**, 306-19 (1940).—*C.A.* 34, 2990^6.

The highly amphoteric soils, such as the brown and red earths of the Unden series of profiles from Sweden, adsorbed and exchanged, simultaneously, large quantities of anions and cations at or near the pH at which equiv. amts. of anions and cations were adsorbed. It was found that this exchange took place according to the mass law as expressed by the Donnan equil.

8446. MATTSON, SANTE AND WIKLANDER, LAMBERT. **The laws of soil colloidal behavior. XXI. A. The Amphoteric points, the pH and the Donnan equilibrium. B. Experimental.** *Soil Sci.* **49**, 109-34, 135-53 (1940).—*C.A.* 34, 4201^5.

The soil pH, the concn. and compn. of the soil soln., and the capacity of the soil to bind base at a given pH were interdependent variables. A study of the influence of humus upon the reactions of laterite soil was made by adding 2.5, 5.0 and 10.0% of humus acidoid, then detg. the pH in H$_2$O and in increasing concns. of Na$_2$SO$_4$ and BaCl$_2$. The pH in H$_2$O was lowered, the exchange alky. in Na$_2$SO$_4$ was reduced. This gave rise to pronounced maxima in exchange alky. in dil. solns. Exchange acidity in $BaCl_2$ was increased and this increase was greater in concd. soln.

8447. Penman, H.L. **Gas and vapor movements in the soil. I. The diffusion of vapors through porous solids.** *J. Agr. Sci.* 30, 437-62 (1940). —*C.A.* 35, 1165^9.

The dependence of the coeff. of diffusion, D, upon the porosity, S, of a granular solid was investigated. For steady state conditions, with CS_2 and acetone vapors, a curve connecting D/D_0 and S could be drawn which was independent of the nature of the solid, its moisture content and, within limits, its texture. For a limited range of values of S ($0.0<S<0.7$) a good approximation was $D/D_0 = 0.66S$.

8448. Penman, H.L. **Gas and vapor movements in the soil. II. The diffusion of carbon dioxide through porous solids.** *J. Agr. Sci.* 30, 570-81 (1940).—*C.A.* 35, 2255^9.

A detailed description of an app. for measuring the rate of diffusion of CO_2 through granular solids was given and its method of operation described. The results obtained on this app. for CO_2 conform to the curve connecting D/D_0 and S previously obtained for CS_2 and acetone (D=coeff. of diffusion and S=porosity). By the application of the equation $D/D_0=0.66\ S$ to a discussion of soil aeration, it was shown that at all porosities the rate of diffusion of CO_2 from soil was sufficient to account for normal respiration without invoking the assistance of meterological changes.

8449. Radu, I.F. **The base-exchange capacity of soils.** *Bodenkunde u. Pflanzenernahr.* 21/22, 574-580(1940).—*C.A.* 37, 2115^4.

Expts. on adsorption of NH_4 from N NH_4OAc (adjusted to various pH values 4-10) showed only slight but regular increases with pH for bentonite, but large increases for brown kaolin. A plot of adsorptive capacity vs. pH of the reagent soln. was a good basis for conclusions as to the nature of the soil colloid, whether predominantly montmorillonitic or kaolinitic.

8450. Scheffer, F. and Schachtschabel, P. **The determination of the sorption capacity of organic materials in soils.** *Bodenkunde u. Pflanzenernahr.* 21/22 , 643-55 (1940).—*C.A.* 37, 6793^9.

Methods of detg. the sorption capacity of soils were compared and the following procedure recommended: To 5 or 10 g soil in a beaker add, resp., 1 or 2 drops of AcOH and 15 or 30 cc. 15% H_2O_2, cover, let stand 1 hr on water bath, evap. to dryness and repeat the process with 15 cc. H_2O_2. Wash the treated soil into a small filter tube with 0.1 N NH_4 acetate and continue until the washings total 250 cc. Wash out the excess NH_4 acetate with 250 cc. 96% EtOH, exchange the sorbed NH_4 for KCl by treating with 250 cc. 0.2 N KCl and det. NH_4 in an aliquot of the filtrate by the method of Parnas. Deduct this value from the similar one for the untreated soil.

8451. Schlenker, Frank S. **Plant growth in culture solution and availability of ions adsorbed on permutite and aniline black.** *Am. J. Botany* 27, 525-9 (1940).—*C.A.* 34, 7989^9.

Various cations were adsorbed on permutite and various anions were adsorbed on Demineralite. Mixts. were prepd. and suspended in water to simulate different nutrient solns. Plant growth in these suspensions was more satisfactory than in similar nutrient solns.

8452. Barbier, Georges and Coic, Yves. **The mechanism of the absorption of inorganic materials by the plant.** *Compt. rend. acad. agr. France* 27, 729-37 (1941).—*C.A.* 40, 4459^7.

Selective ionic absorption among plants was studied by growing peas in sand cultures supplied with a basic fertilizer and various K/Ca ratios. The absorption of ions by certain cellular constituents, ionic exchange, played an important part in selective absorption phenomena as well as phenomena in antagonism.

8453. Bourne, C.L.C. **Some preliminary experiments on phosphate fixation in British Guiana sugar-cane soils.** *Brit. Guiana Dept. Agr., Sugar Bull.*, No. 10, 50-61 (1941).—*C.A.* 36, 1428^4.

With addns. of 500 p.p.m. of P_2O_5 to numerous soils, the percentage fixation of added P_2O_5 ranged from 40 to 90. Fixation of P_2O_5 by acid soils was not affected by progressive increases in addns. of $CaCO_3$ in quantities sufficient to change the normal pH values from 4.07-4.56 to 6.34-7.56.

8454. Bray, R.H. and Dickman, S.R. **Adsorbed phosphates in soils and their relation to crop responses.** *Soil Sci. Soc. Am. Proc.* 6, 312-20 (1941).—*C.A.* 37, 993^9.

Increase of time and concentration influence phosphate adsorption in at least 2 ways: (a) the total amount adsorbed increased, and (b) some of the phosphate became "more tightly adsorbed", i.e., a secondary reaction occurred. Extraction with NH_4F in neutral and acid solutions provided a means of fractionating the soil P into 3 fractions: Fraction 1 corresponded to the replaceable phosphate, and fractions 2 and 3 corresponded to the "more tightly" adsorbed phosphate which slowly changed to fraction 1 as fraction 1 was removed. A 4th fraction or "acid-sol." phosphate was considered to be such forms as rock phosphate, apatite and similar Ca and Mg compounds, as well as Fe, Al or Mn phosphates.

8455. Johnson, A.L. and Norton, F.H. **Fundamental study of clay: Preparation of a purified kaolinite suspension. I.** *J. Am. Ceram. Soc.* 24, 64-9 (1941).—*C.A.* 35, 1952^9.

Org. matter was removed by H_2O_2 and NaOH digestion, followed by an electrodialysis treatment to remove other inorg. salts and to prep. a clay-water suspension. After NaOH was added, viscosity and titration values were given, in curve form, for (*a*) a regular water-washed Florida clay, (*b*) the same clay after electrodialysis and (*c*) after thorough cleaning by the method here given. If the sample contained lignite, a clean clay exhibited *rheopexy* at certain concns. of NaOH.

8456. Johnson, A.L. and Norton, F.H. **Fundamental study of clay. II. Mechanism of deflocculation in the clay-water system.** *J. Am. Ceram. Soc.* 24, 189-203(1941).—*C.A.* 35, 5267^3.

Small traces of sol. salts or adsorbed ions present in com. clays had important influences. If it was assumed that kaolinite developed active areas on the formation of colloidal particles resulting from fracture parallel to the *c*-axis, which areas were then capable of preferential adsorption of the hydroxyl group, the following conditions must be fulfilled in order that max. dispersion of clean slip may result: (*a*) univalent cations must serve as the countercharges and (*b*) the medium must contain a slight excess of hydroxyl ions, that is, it must be alk. When Ca^{++} ions were present with clays, Na silicate would deflocculate the clay better than Na_2CO_3 owing to the greater soly. of $CaCO_3$ over Ca silicate. If Mg^{++} ions, however, were present as sol. salts, Na_2CO_3 should be as effective as Na silicate on the basis of soly. data.

8457. LAATSCH, W. **The fixation of phosphoric acid by clays.** *Bodenkunde u. Pflanzenernahr.* 23, 17-31 (1941).—*C.A.* 36, 4949[6].

NH_4 zeolites and NH_4 clays sorbed PO_4 ions from K phosphate solns. This anion sorption increased with P_2O_5 and H-ion concn. Bicarbonate ions displaced the sorbed PO_4 ions from the colloid surfaces; SO_4^{--} and Cl^- favored the fixation. The fixation of PO_4 ions by Ca montmorillonite followed the same rules as the fixation by NH_4 clays. The pptn. of PO_4 ion as an insol. Ca salt was not observed (probably because the sorption of PO_4 ion by Ca clays was very rapid).

8458. MARSHALL, C.E. AND BERGMAN, W.E. **The electrochemical properties of mineral membranes. I. The estimation of potassium-ion activities.** *J. Am. Chem. Soc.* 63, 1911-6 (1941).—*C.A.* 35, 5772[4].

Data were given for the charge on the following membranes (expressed as an ionic activity) as related to the temp. of drying: Ca-, H- and K bentonite; for the membrane (bentonite) potentials with the following salt solns.: $CaCl_2$ and $MgSO_4$; and for the effect of pH and large anions (acid phthalate, *p*-toluenesulfonic acid and *p*-nitrophenol). The results indicated that K^+ activities could be detd. in the absence of other univalent cations with a precision within 5% at pH values above 4. A high degree of reproducibility was possible with com. Wyoming bentonite from which all particles larger than 200 mu in equiv. spherical diam. had been removed by supercentrifuging.

8459. MATTSON, SANTE AND KOUTLER-ANDERSSON, ELISAVETA. **The acid-base equilibrium in vegetation, straw and humus. I. Acids, acidoids and bases and their decomposition. II. Acids, acidoids and bases in relation to soil type.** *Lantbruks-Hogskolans Ann.* 9, 1-26, 27-37(1941). —*C.A.* 37, 4765[9].

Studies were reported of mature leaves and needles, straw and green plant substance before and after preserving for a year under aerobic and anaerobic conditions and with and without leaching. In the aerobic series the pH increased rapidly on account of the destruction of the org. acids. The higher the content of bases and acids the more pronounced was this increase. If the content of bases was low or there was much leaching, the pH declined later because of the formatio of acidoids. There was a linear relationship between the H-ion activity and the content of acidoids of the electrodialyzed cured straw and its residue after decompn. The pH, acidity, content of bases, acidoids and org. acids, final pH and exchangeable acidity were detd. in a series of brown earth and podzol soils.

8460. NIKIASHKINA, P.I. **The availability of adsorbed potassium.** *Pedology* (U.S.S.R.) 1941, No. 5, 74-80 (German summary).—*C.A.* 39, 4423[5].

Podzol, degraded chernozem, and red soil samples were satd. with K by using a mixt. of KCl and CH_3COOK. The soil was used as a source of K in growing barley in 1:1 sand-soil mixture. The adsorbed K in podzols was less available than in the other soils tested.

8461. RATHJE, WERNER. **The phosphates. II. Neutral and basic phosphates of the alkali earth metals.** *Ber.* 74B, 342-9(1941).—*C.A.* 35, 4922[8].

The insol. phosphates of Ca, Sr, Ba and Mg were prepd. by the method of "acidimetric pptn." Stoichiometrically equiv. solns. of an alk. earth salt and KH_2PO_4 were added to boiling water in 0.5-cc. portions, followed by sufficient NaOH soln. to keep the mixt. neutral to indicators (bromothymol blue, methyl red and phenolphthalein). Time was allowed after each addn. for the reaction to complete itself. The compn. of the salt pptd. was indicated by the relative amts. of KH_2PO_4 and NaOH used; e.g., in the formation of a triphosphate, $9MCl_2 + 6KH_2PO_4 + 12NaOH \rightarrow 3M_3(PO_4)_2 + 6KCl + 12NaCl + 12H_2O$, the PO_4^{---} -NaOH ratio was 1:2; if a hydroxyapatite was formed, $10MCl_2 + 6KH_2PO_4 + 14NaOH \rightarrow 3M_3(PO_4)_2.M(OH)_2 + 6KCl + 14NaCl + 12H_2O$, a 3:7 ratio occurred. By this procedure it was found that Mg and Ba formed the triphosphates $Mg_3(PO_4)_2$ and $Ba_3(PO_4)_2$, and Ca and Sr formed the hydroxyapatites $Ca_3(PO_4)_2.Ca(OH)_2$ and $Sr_3(PO_4)_2.Sr(OH)_2$.

8462. RATHJE, WERNER AND GIESECKE, FRIEDRICH. **The phosphates. III. Hydroxy-fluo-apatite, the mineral in rock phosphate.** *Ber.* 74B, 349-56 (1941).—*C.A.* 35, 4923[2].

The occurrence of OH, F, Cl, Br, I, SO_4 and CO_3 in natural phosphates has been confirmed by a study of the stability of these compds. in the presence of water. The OH group in artificial hydroxyapatite was displaced by F, SO_4 and CO_3 in concns. above the soly. products of the Ca salts. On the other hand, when hydroxyapatite was treated with F^-, SO_4^{--} and CO_3^{--} below the soly products of their Ca salts, the appearance of an alk. reaction indicated the formation of a definite compd. A new form of hydrofluoxyapatite, isomorphous with hydroxyapatite, was prepd., stable in the presence of water.

8463. RATHJE, WERNER. **The phosphates. IV. Neutral and basic phosphates of some heavy metals.** *Ber.* 74B, 357-62(1941).—*C.A.* 35, 4923[4].

The principle of "acidimetric pptn." was used in the prepn. of the tertiary phosphates of certain heavy metals. NaOH was added to the reaction mixt. in such amts. as to provide the proper environment required by the ppt. Cd, Mn, Fe^{++}, Co, Ni and Cu were pptd. as triphosphates, $M_3(PO_4)_2$; Al, La, Ce and Bi as neutral phospates, MPO_4; Zn and Pb as hydroxyapatites, $3M_3(PO_4)_2 \cdot M(OH)_2$. In order to ppt. $FePO_4$ free from $Fe(OH)_3$, H_3PO_4 solns. were used to repress OH^-.

8464. SCHACHTSCHABEL, P. **Inorganic sorption carriers of soils.** *Bodenkunde u. Pflanzenernähr.* **23**, 1-17 (1941).—*C.A.* 36, 4948^7.

Equal parts of $BaCl_2$ and $MgCl_2$ was a more suitable mixt. for the detn. of the inorg. sorption carriers of soils than a soln. of Ca acetate NH_4 acetate. The ion layer of montmorillonite (in equil. with the mixed soln.) consisted of 57% Ba and 43% Mg; with mica the proportion of Ba ions reached 91%. The sorption capacity of kaolins in soils was low; it was the same as that of montmorillonite.

8465. TADOKORO, TETSUTARO; NISHIDA, MASAO; MAKINO, YOSHIO; ITO, KEIZO, AND SASAKI, TAKESHI. **Stimulant for cane-sugar formation in plants. VIII. IX. X.** *J. Agr. Chem. Soc. Japan* **17**, 97-100, 641-3 (1941); **18**, 269-72 (1942).—*C.A.* 45, 4067*i*.

Sugars of the sugar cane increased when urea was used as N fertilizer. With sugar beets, sugars increased, but ascorbic acid decreased when urea, K_2CO_3, and some adsorbent (active carbon or Fuller's earth) were applied. On the soils of Formosa the yield of sugar of sugar cane was high in non-fertilized areas or in areas of little N and much K. Application of urea and adsorbent gave results similar to those with a small amt. of N fertilizer, i.e. the sugar in the cane increased. Thus, the addn. of adsorbent, the restriction of N fertilizer, and the application of K fertilizer had similar good effects on the formation of cane sugar. The action of the stimulant for cane-sugar formation, i.e an unidentified coloring substance found in the culture soln. of bacterium and fungus, and in the soil of citrus-producing areas (lumiflavin also had the same stimulating action), was greater when combined with the application of urea and adsorbent.

8466. BASU, J.K. AND TAGARE, V.D. **Availability of phosphates in calcareous soils of the Bombay-Deccan in relation to sugar-cane yields and quality of juice.** *Proc. 11th Ann. Convention Sugar Tech. Assoc. India* **1942**, **I**, 15-18.—*C.A.* 37, 6072^8.

The soils contained 3-12% $CaCO_3$; 80-100% of added P_2O_5 became unavailable as carbonate-apatite in the unfertilized soil, but gave increased yields if fertilizer was also added.

8467. COLEMAN, RUSSELL. **Utilization of adsorbed phosphate by cotton and oats.** *Soil Sci.* 54, 237-46 (1942).—*C.A.* 37, 999^7.

Ability of oats and cotton to feed on phosphates adsorbed by kaolinitic and montmorillonitic clays was determined in pot experiments with sand and nutrient solution. A known amount of phosphate was adsorbed by the clays against acid and alkaline extracting solutions, and its availability was measured by both crop yields and plant analyses. The plants grew well on relatively small amounts of phosphates held by either of the clays and, in most cases, utilized 30 to 40% of the adsorbed phosphate present. The results indicated that large amounts of P that heretofore had been considered fixed were available to plants.

8468. GOLDEN, L.B.; GAMMON, N., AND THOMAS, R.P. **A comparison of methods of determining the exchangeable cations and the exchange capacity of Maryland soils.** *Soil Sci. Soc. Am. Proc.* 7, 154-61 (1942).—*C.A.* 37, 6073^9.

Ten different soils were studied for displaceable bases and the total exchange capacity. The solns. tested were *N* NH_4-acetate, NH_4-formate, NH_4Cl, Ba acetate, Ba formate, $BaCl_2$, Mn acetate, $MnCl_2$, K acetate, KCl, 0.5 *N* AcOH, 0.05 *N* HCl, 0.2 *N* cupric acetate and boiling NH_4Cl. The Ba salts were absorbed in large quantities by the exchange complex but when absorbed did not displace equiv. amts. of other cations. The K^+ was highly absorbed by the exchange complex. The manganous and cupric acetate solns. gave good and consistent total exchange capacity values for rapid uses. The acetate anion gave the highest and most consistent results for both displaced bases and the total exchange capacity.

8469. GOLLAN, JOSUE JR. AND CODONI, M.R. **The cation-exchange capacity of soil fractions.** *Anales assoc. quim. argentina* **30**, 146-57 (1942).—*C.A.* 37, 1818^8.

Soil was sepd. into 2 fractions, one containing particles greater than 2 μ, the other less. The cation-exchange capacity was practically zero in the 2 μ fraction, but varied within wide limits in the other fraction. Fractions contg. particles greater than 2 μ which had appreciable exchange capacity, contained aggregates and clumps of particles smaller than 2 μ.

8470. HARADA, MITSURU. **Weathering of eruptive rocks. VIII. New color reactions for clay minerals.** *J. Agr. Chem. Soc. Japan* **18**, 707-13 (1942); *Bull. Agr. Chem. Soc. Japan* **18**, 57-8 (1942)(in German).—*C.A.* 45, 8940*a*.

Montmorillonite could be detected by the dark blue color obtained by adding in succession 5 ml of 2% borax soln., 20 mg of *p*-phenylenediamine-HCl and a little HCl, by the blue color obtained by adding 5 ml of 0.5% metol soln., 5 ml of 10% NaOAc + 10 mg MnO_2 per g of sample, or by the blue color obtained with benzidine-HCl and NH_4OH. Halloysite and kaolinite could be identified by the violet color obtained with benzidine-HCl, MnO_2, and citric acid.

8471. HEINZE, E. **A contribution to the chemical investigation of soils, especially the sorption complex.** *Bodenkunde u. Pflanzenernähr.* 26, 331-62 (1942).—*C.A.* 37, 4172^1.

The soil sample was taken so that the bedding was not disturbed while transferring the sample to a membrane filter for treatment with reagent solns. The solns. used were 0.2 *N* NH_4Cl, 0.2 *N* K_2SO_4, and 1 *N* Ca acetate. The content of materials detd. in the 0.5 liter of filtrate, was used for the calcn. of limiting values and content of sol. salts. Substances detd. in a series of soils showed a regularity of relationships.

8472. Kelley, W.P. **Modern clay researches in relation to agriculture.** *J. Geol.* 50, 307-19 (1942).—*C.A.* 37, 709^8.

The montmorillonite, halloysite and kaolin groups of minerals were most important. Base-exchange and phys. properties depended largely on the nature of the cryst. material present.

8473. Rathje, Werner. **The phosphates. VI. The phosphate equilibrium in the soil.** *Bodenkunde u. Pflanzener nähr.* 28, 129-59 (1942).—*C.A.* 37, 4178^9.

Hydroxyapatite, isomorphous mixts. of hydroxyapatite and fluorapatite, mixts. of $AlPO_4$ and and $Al(OH)_3$ and $FePO_4$ and $Fe(OH)_3$ were prepd. by the method of acidimetric pptn. without contamination by secondary phosphates. Satd. solns. of the apatite in pure water, pH 6.7, could be prepd. by shaking 8 hrs at room temp. or at 95°C and contained, resp., 0.6 and 1.9 mg P_2O_5 per liter. The soly. of the hydroxyapatite and the above hydroxyfluorapatite in water and in very dil. solns. of strong acids and bases increased with the H-ion concn. The soly. of hydroxyapatite was about double that of hydroxyfluorapatite contg. 35% fluorapatite and 4 times that of hydroxyapatite with 70% fluorapatite. The P_2O_5 concns. of the soil soln. and those optimal for growth of many plants were of the same order of magnitude as those called for by the soly. equilibria of the hydroxyfluorapatites and the coexisting sesquioxide phosphates.

8474. Schlenker, Frank S. **Availability of adsorbed ions to plants growing in quartz sand substrate.** *Soil Sci.* 54, 247-51 (1942).—*C.A.* 37, 997^1.

Essential fertilizer ions (N, S, P, K, Ca, and Mg) adsorbed on either zeolite or aniline black, and mixed with quartz sand, supported the growth of either soybeans or kidney beans and successive crops of corn and buckwheat. Comparative experiments showed that the use of adsorbed ions produced greater plant growth than equivalent fertilization with soluble salts. In general, crop yields, in terms of either fresh weight or height, paralleled fertilization.

8475. Staǐkov, Ts. **The occurrence of difficultly soluble magnesium salts that affect the exchangeable magnesium.** *Bodenkunde u. Pflanzenernähr.* 28, 105-18 (1942).—*C.A.* 37, 4181^9.

Various horizons of the profiles of several soils were leached with *N* NaCl or NH_4Cl until all exchangeable Mg was removed or with 0.05 *N* HCl until no further Mg was dissolved. The fact that all 3 solvents removed practically the same amt. of Mg from neutral soils indicated that these soils contained no Mg difficultly sol. in H_2O, that affected the exchangeable Mg. From alk. soils these solvents extd. amts. of Mg increasing in the order NaCl, NH_4Cl, HCl.

8476. Yano, Takeshi; Chikamorti, Kinichiro; Mizuno, Shunji, and Sano, Kimio. **Fertilizing experiments to determine the three-element requirements of cane sugar in the Zirin district, Taiwan.** *J. Soc. Trop. Agr. Taihoku Imp. Univ.* 14, 243-53 (1942).—*C.A.* 42, 2382*f*.

The highest yield of cane sugar in the Zirin district, Formosa, was obtained when the required 3 elements N, P, and K, were supplied through fertilizers in the ratio 100:6:16. Of the three, N was the most important, but when used alone, the yield was about half as much.

8477. Bodman, Geoffrey B. and Day, Paul R. **Freezing points of a group of California soils and their extracted clays.** *Soil Sci.* 55, 225-46 (1943).—*C.A.* 37, 4172^6.

A distinct correlation existed between clay content and moisture content at a const. moisture potential. This influence became progressively less as the energy level diminished. Different soil clays displayed widely differing moisture-potential curves. The curves for the clays were between those for the natural soils on the one hand and those for bentonite and kaolinite on the other. The surface properties, extent of surface, and structural configuration were very much the same for colloids from soils of related origin.

8478. Bray, R.H. **Rapid tests for measuring and differentiating between the adsorbed and acid-soluble forms of phosphate in soils.** *Com. Fertilizer* No. 1, 66, 30-6 (1943).—*C.A.* 37, 5813^9.

Adsorbed P was detd. as follows: Place 1 g air-dried soil in a flat-bottomed 15 1/2 × 50 mm glass vial, add 7 ml of a soln. of 0.03 *N* NH_4F in 0.025 *N* HCl, close with cork stopper, shake 1 min. and allow to settle for over 1/2 hr until the supernatant liquid is clear. Add 0.25 ml acid NH_4 molybdate soln. (100 g NH_4 molybdate in 850 ml distd. H_2O added slowly with stirring to a second soln. of 1700 ml concd. HCl in 160 ml H_2O), stir carefully with glass rod without disturbing the soil in the bottom of the tube. Stir with a bright tin rod. Read the colors by looking through the tube at an angle of about 45° at a white paper lying horizontally. Standard phosphate solns. could be used for comparing the colors.

8479. Graham, E.R. and Albrecht, W.A. **Nitrate absorption by plants as an anion-exchange phenomenon.** *Am. J. Botany* 30, 195-8(1943).—*C.A.* 37, 3797^8.

Maize plants on a substrate of low N content grew equally well when extra N was added adsorbed on resin (Amberlite IR-4) and when N was added in water-sol. form. When plants were growing actively and water-sol N was leached from cultures given N in this form, N deficiency resulted. Leaching of cultures contg. adsorbed N produced no effect on growth.

8480. Joffe, J.S. and Kunin, R. **Mechanical separates and their fractions in the soil profile. II. The cation-exchange properties and pedogenic implications.** *Soil Sci. Soc. Am., Proc.* 8, 386-7(1943)(Published 1944).—*C.A.* 39, 372^8.

The low exchange capacity of the same separates in the A and B as compared with that of the C horizon of 2 soil types indicated degradation of the exchange complex. In the clay fractions the higher exchange capacity of the A horizon was due to the organo-mineral gels and to the residual org. matter. There seemed to be no difference in the exchange capacity of the different sized clay fractions. Montalto clay fractions had an exchange capacity similar to that of laterite. There was no difference in the exchange capacity of the clay fractions in the B and C horizons. In the solodized chernozem, bentonite-like minerals probably account for the high exchange capacity.

8481. LAATSCH, W. **Adsorption of phosphoric acid in soil.** *Kolloid-Z.* 102, 60-6 (1943).—*C.A.* 37, 6074⁶.

Ca permutites adsorbed PO_4 ions from alkali phosphate solns., as did also Ca montmorillonites. Humic acid added to Ca clays decreased such adsorption and could release already sorbed phosphate.

8482. MARSHALL, C.E. **Cationic activities, exchangeable bases and uptake by plants.** *Soil Sci. Soc. Am., Proc.* 8, 175-8(1943)-(Published 1944).—*C.A.* 39, 575⁷.

The relationship between the chem. environment of the plant root and the compn. of the plant was reexamd.

8483. PERKINS, ALFRED T. AND KING, H.H. **Phosphate fixation by soil minerals: mica and related groups.** *Soil Sci. Soc. Am., Proc.* 8, 154-8 (1943).—*C.A.* 39, 378².

Major phosphate fixation by this group of minerals seemed to depend on structural or anionic Al (AlO_3^-), while minor amts. of phosphate fixation depended on cationic aluminum or magnesium (Al^{+++} or Mg^{++}) and possibly the hydroxyl radical. It appeared that phosphate fixation was accompanied by the spreading of the space lattice.

8484. RAYCHAUDHURI, S.P.; SULAIMAN, M. AND BHUIYAN, A.B. **Physicochemical and mineralogical studies of black and red soil profiles near Coimbatore.** *Indian J. Agr. Sci.* 13, 264-72 (1943).—*C.A.* 42, 6479*h*.

The base-exchange capacities of both soils and clay fractions decreased after treatment with Na_2S-oxalic acid, and those of the residues from the black soils and clay fractions after Truog's treatment were higher than those of the residues from the red soils and clay fractions. The base-exchange capacities of the black soil were higher than those of the red. The org. C content and the C/N ratio were higher for the black soils than the red, but the total N percentages were about equal.

8485. RICH, C.I. AND OBENSHAIN, S.S. **Effect of certain soil treatments on the cation-exchange properties and organic matter content of Dunmore slit loam.** *Soil Sci. Soc. Am., Proc.* 8, 304-12(1943)(Published 1944).—*C.A.* 39, 375⁵.

Fertilizer and cropping practices which tended to increase crop yields at Blacksburg, Va. also tended to increase soil org. matter and cation-exchange capacity. There was a significant pos. correlation between org. matter content and cation-exchange capacity of the soil. Superphosphate, rock phosphate, muriate of potash and farm manure had little or no effect on soil reaction. $(NH_4)_2SO_4$ caused a reduction of the pH and exchangeable Ca and Mg and an increase in exchangeable H.

8486. SINGH, DALIP AND CHAWLA, DEV. RAJ. **Base exchange studies. II. Variation in the content of exchangeable bases affecting plant growth.** *Indian J. Agr. Sci.* 13, 368-76(1943).—*C.A.* 42, 3513c.

Parts of an original soil sample were exhaustively leached with neutral solns. of the chlorides of Na, K, Ca, and Mg, and these artificially satd. soils were mixed in various proportions with the original; max. displacement of Ca with 90.04, of Na 94.4, Mg 88.24, and K 86.09%. A large proportion of the citric acid-sol. K was constituted by exchangeable K ions that surrounded the clay particles. The percentage of mineral matter taken up by the plants was greatest from the K and least from the Ca soils. In general, the base that was in excess was absorbed the most. Na increased the absorption of K, and Mg increased absorption of K and Na.

8487. ALBAREDA HERRERA, J.M. AND GUTIÉRREZ RÍOS, E. **Equilibrium of exchange cations in profiles of Spanish soils.** *Anales fis. y quim (Madrid)* 40, 365-78(1944).—*C.A.* 44, 258*b*.

The displacement of exchange cations from higher strata to lower in soil samples from five regions in Spain was studied. In the humid regions the sol. salts and the ratios of Na/Ca and (Na + K)/(Ca + Mg) increased with depth; in the arid regions they decreased with depth according to opposite washing effects which descended in the first case and ascended in the second.

8488. CASSIDY, N.G. **Exchangeable sodium and the physical properties of soils.** *Queensland J. Agr. Sci.* 1, No. 1, 140-56 (1944).—*C.A.* 39, 145⁴.

The chem. effect of an irrigation water upon a soil was shown to depend primarily on the (Ca + Mg) / (Na + K) value of the water. Exchangeable Na only affected soil structure adversely when it constituted about 15% of total exchangeable bases. Deterioration was then rapid as Na increased.

8489. HAMPL, JAN. **The influence of silicon dioxide on the accessibility of phosphoric acid in soil.** *Chem. Listy* 38, 125-7(1944).—*C.A.* 44, 5505*f*.

SiO_2 was not directly assimilated by plants. It adsorbed colloids and K salts in soil and thus made a portion of phosphoric acid in soil available to plants.

8490. HOOVER, C. DALE. **The fixation of potash by a kaolinitic and a montmorillonitic soil.** *Soil Sci. Soc. Am., Proc.* 9, 66-7(1944) (Pub. 1945).—*C.A.* 40, 1259⁷.

Quant. data was obtained on the fixation of K from KCl and K_2HPO_4 in 2 soils whose fine clay mineral fractions were predominantly montmorillonite and kaolinite, resp. K was applied at 4 rates and the soils were then stored moist, and sampled after 1-, 3-, 9-, and 24-month periods. Both soils fixed approx. as much K in 1 month as they fixed over longer periods of time, although there was some tendency for slight increases in fixation of K with time by the kaolinitic soil. An important relationship between free Fe and Al in montmorillonitic and kaolinitic clays and an increase in base-exchange capacity resulting from the absorption of P_2O_5 were indicated.

8491. HULL, H.H. AND STEVENS, N.E. **Changes in pH and in base-exchange properties of cranberry soils following the use of alkaline water.** *Soil Sci.* 58, 405-8(1944).—*C.A.* 39, 1714^7.

Irrigation of cranberry peat soils for 2 yrs. in the greenhouse with alk. water increased the pH of Bennett peat 1 unit and the pH of Durphee soil 1.4 units. The amts. of exchangeable Ca and Mg and the base-exchange capacity increased markedly in all samples. The percentage base satn. also showed considerable rise.

8492. MALQUORI, ALBERTO. **Behavior of humus in clay-bearing soils. I. Influence of humus on the swelling of clays.** *Ann. chim. applicata* 34, 99-110 (1944).—*C.A.* 41, 3239*i*.

Measurements of the swelling of clay-bearing soils in H_2O, before and after treatment with H_2O_2, proved that the presence of humus reduced the amt. of swelling. The humates fixed by the cations from the clay represented the org. material most active in interfering with the swelling of the argillaceous colloids present in soil.

8493. MALQUORI, ALBERTO. **The behavior of the organic matter in clay soils. II. Base-exchange capacity of the organic matter and of the humic acid, and its relations to the base-exchange capacity of the clay.** *Ann. chim. applicata* 34, 111-26 (1944).—*C.A.* 42, 6029*g*.

The total base exchange capacity of the soils was detd. In the new method the soil remaining on the filter was washed with H_2O. As soon as the excess KCl was completely removed, the K humate began to dissolve, yielding a brown soln. When the washings became colorless, the soil on the filter was resatd. with NH_4^+ by means of 0.1 *N* NH_4Cl soln., followed by washing with 80% MeOH of pH 7. The NH_4 was then replaced by K through treatment with KCl soln., and the NH_4 was detd. in the filtrate with HCHO. The base-exchange capacity detd. by the H_2O_2 method was around 300 mg equivs. in 100 g of org. matter, that by the new method around 500 mg equiv. in 100 g of humic acid. The base-exchange capacity of clay soils was an additive property only if the mobile humates alone were considered; if that of the humus combined with sesquioxides was used, the result was smaller than that calcd.

8494. MARSHALL, C.E. **Exchangeable bases of two Missouri soils in relation to composition of four pasture species.** *Missouri Agr. Expt. Sta., Research Bull.* No. 385, 60 pp. (1944).—*C.A.* 40, 2566^2.

A base-exchange investigation of the Putnam silt loam and Lindley silt loam showed that apart from differences in exchangeable Ca, Mg, Sr, K, and Na, the Mn reserves were differently distributed in the 2 soils. The Lindley had a large amt. of exchangeable Mn, but relatively large amts. were liberated by acid treatment. Expts. on limited exchange against acid showed that Na treatments produced a well-marked complementary-ion effect whereas K, Mg, and Ca treatments did not. Uptake of Mn by the crops depended largely on the pH of the soil, and on the exchangeable Mn present. Uptake of Na and K was but little affected by addns. of Ca or Mg to the soil, but Na addns. definitely increased the K content of the crops. The total cations per 100 g dry matter calcd. in equivs., were relatively const. under the several treatments.

8495. MATTSON, SANTE. **The pedography of hydrologic soil series. V. The distribution of potassium and phosphorus and the calcium/potassiu ratios in relation to the Donnan equilibrium.** *Lantbruks-Högskol. Ann.* 12, 119-29 (1944-45).—*C.A.* 39, 4422^3.

The Ca/K ratio varied with the satn. of the soil and with the strength of the acidoids. The univalent cations were relatively better adsorbed by an unsatd. than by a satd. soil and at a given pH the univalent cations were relatively better adsorbed by a weak acidoid than by a strong acidoid. A dil. soln. attached to the micelles had the same effect as a concd. external soln.: both favored the adsorption of the univalent ions.

8496. MATTSON, SANTE AND KARLSSON, NILS. **The pedography of hydrologic soil series. VI. The composition and base status of the vegetation in relation to the soil.** *Lantbruks-Högskol. Ann.* 12, 186-230 (1944-45).—*C.A.* 39, 4422^6.

"Excess base," Ca, Mg, K, P, N, pH, acidity, and percentage of base satn. were detd. in 56 species from the Dala brown earth and the Unden and Annerstad podzol series, the latter including several raised bog species. Although the pH was more alk. the brown earth did not contain more base content and the percentage base satn. was about as high as in the peat. The ratios Ca/Mg, Ca/K, and Mg/K in the soils were reflected in the plants. There must be a critical soil pH for each plant species at which the roots lose cations through protolysis and exchange faster than they can be accumulated by the absorption and assimilation of physiologically alk. salts.

8497. MATTSON, SANTE; SANDBERG, GUSTAF, AND TERNING, PER ERIK. **Electrochemistry of soil formation. VI. Atmospheric salts in relation to soil and peat formation and plant composition.** *Lantbruks-Högskol. Ann.* 12, 101-18 (1944-45).—*C.A.* 39, 4421^5.

The ratio of Ca to Mg in a series of soils ranging from Dala brown earth to a raised bog was detd. to find the effect of receiving water directly as rain ("ombrogenic") as contrasted with receiving water from contact with soil minerals. "Semiombrogenic" (excessively leached) soils were the intermediate members. The Ca/Mg ratios were: Dala brown earth, 40 soil samples 8.43, 30 plant species 2.58; Under podzol, 20 soil samples 1.80, 12 plant species 1.71; Annerstad podzol, 1 peat sample 0.87, 13 plant species 1.46; Ramna bog, upper, ombrogenic layer 0 to 260 cm., 27 samples 0.48; lower layer 260 to 360 cm., 10 samples 1.38, 3 plant species 1.34.

8498. MUKHERJEE, S.K. **Contribution of clay, silt, and sand fractions and organic matter of some Indian soils towards their base-ex-**

change capacities. *Indian J. Agr. Sci.* 14, 137-9 (1944).—*C.A.* 42, 2699*i*.

The base-exchange capacities (b.e.c.) of the clay, clay silt, sand, and org. matter of 4 Indian soils were detd. by the $Ba(OAc)_2$-NH_4Cl method. The clay, clay silt, and sand were obtained as in the mech. analysis of soil, but without H_2O_2 pretreatment. The b.e.c. of these fractions, except sand, was detd. both before and after treatment with H_2O_2; from the difference in b.e.c. in the 2 cases and the loss of ignition, the b.e.c. of org. matter was calcd. Clay was found to make the highest contribution to total b.e.c., org. matter was 2nd. The org. matter assocd. with clay had a higher b.e.c. than that assocd. with either silt or soil.

8499. Perkins, Alfred T. and King, H.H. **Phosphate fixation by soil minerals. III. Particle size.** *Soil Sci. Soc. Am., Proc.* 9, 61-5 (1944).—*C.A.* 40, 661^8.

A study was made of the relation of particle size (less than 150 μ) of various minerals to phosphate fixation in the pH range where crops grew. The coarse particles of quartz were inert; the fine particles fixed all the phosphate added. The coarse particles of hematite had low activity; the fine particles fixed about 12 times as much phosphates. With musovite, phlogophite, and biotite the increase in fixation by the fine particles in relation to the coarse particles was 20 times or more.

8500. Ushikoshi, Ikuo. **Studies on the planting of the cane sugar. I. Inoculation with azotobacter.** *J. Soc. Trop. Agr. Taihoku Imp. Univ.* 16, 122-8 (1944).—*C.A.* 42, 2706f.

By inoculating the soil with *Azotobacter vinelandii* and *A. chroococcum* the N fixation in soil and the growth of soil bacteria increased. The crop of the cane-sugar plants increased 4-7% and the yield of refined sugar 10% or more.

8501. Aldrich, D.G.; Parker, E.R., and Chapman, H.D. **Effects of several nitrogenous fertilizers and soil amendments on the physical and chemical properties of an irrigated soil.** *Soil Sci.* 59, 299-312(1945).—*C.A.* 39, 3614^4.

The soils of citrus plots were treated annually with such nitrogenous fertilizers as $Ca(NO_3)_2$, $NaNO_3$, $(NH_4)_2SO_4$, urea, and manure over a 16-year period. Water-stable aggregates were lowest when $(NH_4)_2SO_4$ was added and highest with manure. Addns. of $NaNO_3$ markedly increased both H_2O-sol. and exchangeable Na and decreased aggregation. Repeated addns. of $(NH_4)_2SO_4$ resulted in sufficient accumulation of exchangeable NH_4^+ seriously to impair the phys. properties of soil. Rather small increases in exchangeable Na may result in serious impairment of water penetration and related properties. When gypsum was applied with $NaNO_3$, more favorable structural conditions resulted.

8502. Allaway, W.H. **Availability of replaceable calcium from different types of colloids as affected by degree of Ca saturation.** *Soil Sci.* 59, 207-17(1945).—*C.A.* 39, 2836^2.

Soybean seedlings were used to measure the availability of Ca. The order of availability of the replaceable Ca from the various colloids was peat > kaolinite > illite and Wyoming bentonite > Mississippi bentonite. In every colloid the availability of the replaceable Ca was increased by increases in percentage Ca satn. The 2 bentonites (good examples of the montmorillonite group) showed a difference in the replaceability and the availability to plants of their replaceable Ca.

8503. Chandler, Robert F. Jr.; Peech, Michael, and Chang, C.W. **The release of exchangeable and nonexchangeable potassium from different soils upon cropping.** *J. Am. Soc. Agron.* 37, 709-21(1945).—*C.A.* 40, 154^8.

Upon continuous cropping with clover the exchangeable K content of the test soils decreased very rapidly at first, then more gradually until a certain level was reached, when the K-supplying power of the soil was detd. largely by the rate at which the nonexchangeable K was converted into the exchangeable form. The dry wts and the K content of the plants of the successive crops were closely assocd. with the amt. of exchangeable K in the soil. The K content of the plants decreased upon continuous cropping.

8504. Coutts, J.R.H. **Effect of veld burning on the base-exchange capacity of a soil.** *S. African J. Sci.* 41, 218-24(1945).—*C.A.* 39, 5024^9.

The base-exchange capacity of a soil was scarcely altered by heating the soil to 250°C, but heating to 250-500°C caused about 20% reduction in buffering capacity. The influence upon base-exchange capacity of veld burning under field conditions was very small and probably transitory.

8505. Fujimoto, Charles K. and Sherman, G. Donald. **The effect of drying, heating, and wetting on the level of exchangeable manganese in Hawaiian soils.** *Soil Sci. Soc. Am., Proc.* 10, 107-12 (1945)(Pub. 1946).—*C.A.* 41, 2190^f.

A gradual increase of exchangeable Mn occurred when soils were air dried. Oven-drying and steam-sterilization in a no. of soils increased the exchangeable Mn from a few p.p.m. to approx. 3000 p.p.m. The release of Mn was increased with increasing incubation temps. At lower temps. the length of incubation influenced the release of exchangeable Mn. When soils were moistened to approx. the moisture content of max. field capacity, the level of exchangeable Mn was decreased gradually.

8506. Hoyos, Angel de Castro. **A new method of determining the base-exchange capacity of soils containing carbonates.** *Anales fís. y quím.* (Madrid) 41, 284-90 (1945).—*C.A.* 43, 8081^h.

The sample (5g) was placed in a 100ml flask and 0.5 *N* AcOH added in 50 cc. portions until all carbonates present were decomposed. To the residue after filtn. was added 50 ml *N* $Ba(OAc)_2$ (pH 7), and the mixt. permitted to stand 24 hrs with occasional stirring. It was filtered again and treated with four 50 ml portions of $Ba(OAc)_2$, filtered, and washed with 30 ml 96% alc.; 50 ml NH_4Cl soln. was then added, and the mixt. allowed to stand 10 hrs. It was filtered again, the filtrate this time being collected, and treated again with 300 ml NH_4Cl soln. in 50 ml portions. The total filtrate collected after treatment with the NH_4Cl was evapd. slightly, a few drops of HCl was added, and the Ba contained in the filtrate was detd. and the milliequiv. of Ba adsorbed detd. This corresponded to the base-exchange capacity of the soil analyzed.

8507. Mehlich, Adolf. **Effect of type of soil colloid on cation-adsorption capacity and on exchangeable hydrogen and calcium as measured by different methods.** *Soil Sci.* 60, 289-304 (1945).—*C.A.* 40, 1621^1.

With colloids of hydrous mica and the 2:1 lattice type, the cation-adsorption capacity was virtually the same with all the methods studied. The NH_4OAc method yielded lower values with colloids of the org. and the 1:1 lattice type than those obtained by the other methods. An org. soil at first satd. with Ca contained greater amts. of H after treatment with NH_4OAc. More ammonium ions remained adsorbed from NH_4OH than from NH_4OAc. Adsorption of Ba from $Ba(OAc)_2$ was greater in the presence of $CaCO_3$. With colloids of the 1:1 lattice type and the org. soils the degree of satn. was consistently higher when detd. by the NH_4OAc method. The efficiency of the Ba and NH_4 ions in replacing Ca was about the same for the mineral colloids and it was appreciably less with NH_4 for org. soils.

8508. Ross, Clarence S. and Hendricks, Sterling B. **Minerals of the montmorillonite group: their origin and relation to soils and clays.** *U.S. Geol. Survey, Profess. Paper No.* **205-B**, 23-77(1945).—*C.A.* 40, 6025^3.

Detailed mineralographic studies of over 100 selected specimens of montmorillonite group minerals were summarized and coordinated. Formulas of a special type were used to express the compositions of the various recognized members of the group. Other sections were devoted to reviews of nomenclature, crystal structure, base exchange, thermal analysis, optical properties, electron microscopy, synthesis, and origin and occurrence.

8509. Aderikhin, P.G. **The function of colloids in the adsorption of phosphoric acid by soils.** *Potchóvédénié* 1946, 550-4; *Chimie & industrie* 58, 377 (1947).—*C.A.* 42, 4297*f*.

Positively charged $Fe(OH)_3$ colloids exhibited a high adsorption capacity for P_2O_5 anions. Negatively charged colloids (humus) exhibited the same property, but to a lower degree. Colloidal soils adsorbed notably less P_2O_5 than gels. Adsorption increased with intensity and completeness of coagulation. Humus colloids adsorbed an appreciably lower proportion of P_2O_5 from Ca monophosphates than from Na monophosphates.

8510. Albrecht, W.A. **Plant nutrition and the hydrogen ion. V. Relative effectiveness of coarsely ground and finely pulverized limestone.** *Soil Sci.* 61, 265-71 (1946).—*C.A.* 40, 3554^2.

The use of 10-mesh limestone, 100-mesh or pulverized limestone, $CaSO_4$, and $CaCl_2$ as Ca fertilizers for establishing sweet clover showed that the smaller applications of the 10-mesh limestone were relatively most effective as measured in corn yields. The mechanism of the action of limestone in the soil was discussed.

8511. Ayres, A.S.; Takahashi, M., and Kanehiro, Y. **Conversion of nonexchangeable potassium to exchangeable forms in a Hawaiian soil.** *Soil Sci. Soc. Am., Proc.* **11**, 175-81(1946) Pub. 1947.—*C.A.* **42**, 2376*g*.

A 4.5-yr study was made of the conversion of nonexchangeable K to available forms in Poamoho soil, the conversion being brought about by continuous cropping to Napier grass without the addn. of K. Levels of K in the plants decreased during the first 2.5 yrs of cropping, after which there was little change. The release of K from nonexchangeable sources in the soil was very great, ranging from 3400 to 4200 lb K_2O per acre, depending upon the treatment, for the 4.5 yr period.

8512. Bottini, E. **The adsorption compounds of soils in relation to their reaction and the chemical fertility grade.** *Annuar. ist. sper. chim. agrar. Torino* **16**, 63-87 (1946).—*C.A.* **43**, 5891*f*.

In acid and neutral soils the adsorbed K^+ and NH_4^+ were found in equiv. quantities (1 milliequiv. per 300 g soil); in alk. soils K^+ prevailed over NH_4^+. Also PO_4^{-3} and NO_3^- were found stoichiometrically equiv. (1 milliequiv. per 1000 g soil), but much lower than the cations because of the prevalence of electroneg. colloids. Total adsorbable quantities of ions were: K^+ and NH_4^+ 4-13 and 3-12 milliequivs. %/g soil, resp., (except for alk. soils where the NH_4^+ adsorption prevailed), NO_3^- and PO_4^{-3} 1-4 and 4-12 milliequivs. %/g soil, resp., (PO_4^{-3} was not merely adsorbed but also chemically fixed).

8513. Chaminade, Raymond. **The existance and the conditions of formation of compounds by the adsorption of phosphorus humus complexes.** *Compt. rend.* **223**, 168-70 (1946).—*C.A.* **41**, 242*f*.

A pptd. calcium phosphate in the presence of the calcium-humus complex gave rise to the formation of complexes with humus and with H_3PO_4. Such complexes were easily formed in nonacid soils. The P-humus complex was dispersible, and its stability varied inversely with the P_2O_5 content.

8514. Chaminade, Raymond. **Compounds of phosphate and humus.** *Ann. agron.* **16**, 229-40 (1946).—*C.A.* 41, 5245*f*.

When Ca phosphate was pptd. in the presence of Ca humate, a combination formed which contained humate and P_2O_5. Conditions under which this compd. could be formed occurred frequently in alk. soils. These compds. dispersed in water at pH values at which Ca phosphates were most nearly insol.; thus at pH less than 8.0, more than 5g P_2O_5 per liter was found after centrifuging one of these phosphate-humate solns. X-ray spectrography failed to show the cryst. pattern of $Ca_3(PO_4)_2$.

8515. Chernov, V.A. and Belyaeva, N.L. **The nature of soil acidity.** *Pedology* (U.S.S.R.) 1946, 593-603.—*C.A.* 41, 2828*i*.

Red loams (krasnozem), podzolic soils, humic acid, ascangel, and kaolinite were tested for their capacity of keeping adsorbed Ca in the presence of H or Al. Al was more effective in replacing Ca than H. As the adsorbent became more basic, more Al was sorbed. To demonstrate the exchangeability of Al some podzolized soils were treated with Al salts, the excess removed and the adsorbed Al replaced with KCl. It was pointed out that in acid soil the Ca was replaced by Al.

8516. DAS, S.; MUKHERJEE, S.K.; SEN, ABHISWAR, AND VISWANATH, B. **Indian soils. III. Base-exchange properties.** *Indian J. Agr. Sci.* 16, 234-45 (1946)—*C.A.* 42, 3111*f*.
Detns. of pH, exchangeable-base content, and exchangeable-base capacity were carried out on samples taken at different depths in 43 soil profiles from different parts of India. Exchangeable Ca, Mg, Na, and K in that order were predominant. Mg was high in black and black-cotton types of soils and Na was high in the saline soils. $CaCO_3$ was present in 33 of the profiles. The remainder were acidic and had a lower base-exchange capacity.

8517. GHANI, M.O. AND ISLAM, M.A. **Phosphate fixation in acid soils and its mechanism.** *Soil Sci.* 62, 293-306 (1946).—*C.A.* 41, 1364*c*.
Two soil samples were treated with each of 3 P carriers, and incubated at optimum H_2O content for varied periods. The available P was extd. with HOAc and detd. As the amt. of P added was increased, the available P increased, but not in the same proportion. As the time of contact between the P compd. and the soil increased, the available P tended to decrease for 2 weeks then remained nearly const. At the start of the incubation period 45 and 85% of the added P was fixed. As the contact period increased to 6 weeks, these values rose to 70 to 95%, resp.

8518. HEWITT, ERIC J. **Use of water purified by synthetic resin ion-exchange methods for the study of mineral deficiencies in plants.** *Nature* 158, 623(1946).—*C.A.* 41, 2777*h*.
The use of demineralized water held considerable possibilities for large-scale trace element research.

8519. JENNY, H. **Adsorbed nitrate ions in relation to plant growth.** *J. Colloid Sci.* 1, 33-47(1946).—*C.A.* 40, 3502^6.
Nitrate ions absorbed on the ion-exchange resin Amberlite IR-4 acted as a reservoir of nitrates available for plant growth. At high concns. adsorbed nitrate was superior to $NaNO_3$. The degree of satn. of the Amberlite by nitrate had a marked effect on plant growth, and at low degrees of satn. growth was nil. The addn. of soil to Amberlite contg. adsorbed nitrate released substantial amts. of nitrate. The exchangeability of adsorbed nitrate had a complicated relationship to the degree of satn. Amberlite IR-4 in H_2O contained adsorbed OH^-.

8520. JUNG, E. **The fine structure of humus substances. (A). Rontgenographic investigations on humus substances. (B). The question of the fine structure of humic acids.** *Z. Pflanzenernahr., Dungung u. Bodenk.* 37, 2-16(1946).—*C.A.* 41, 5772*f*.
X-ray investigations on brown coal, peat, soil humus from black earth formations, and the humic acids obtained therefrom showed the "high moor" peat to be amorphous and the other humus substances to contain slight amts. of cryst. carbon in an amorphous org. groundmass. Coking tests were made with the humic acids. It was concluded that the humic acids were not cryst., but rather consisted of crystallites of graphite structure (the proportion of which varied depending on the conditions of formation) in an amorphous-mesomorphous groundmass.

8521. KURTZ, TOUBY; DETURK, ERNEST E., AND BRAY, ROGER H. **Phosphate adsorption by Illinois soils.** *Soil Sci.* 61, 111-24(1946).—*C.A.* 40, 3551^2.
P adsorption by soil was detd. by measuring the P_2O_5 concn. of solns. of known concns. after they had been in contact with the soil. Adsorption curves for 4 soils at different ratios were similar in shape. Adsorption by Muscatine silt loam was not complete after any particular time interval but the rate of reaction did decrease. The amts. of phosphate which could be removed by water in successive extns. decreased and the easily acid-sol. fraction increased. The bulk of the added phosphate was retained in the adsorbed form from which it was displaced by the fluoride ion in a neutral soln.

8522. MARSHALL, C.E. AND AYERS, ALVIN D. **Clay membrane electrodes for determining calcium activities.** *Soil Sci. Soc. Amer.* 11, 172-74 (1946).
With the exception of the differences in sensitivity to monovalent and divalent cations exhibited by the H-bentonite, none of the membranes tested showed a selectivity for any individual cation such as was shown for H^+ by certain glass membranes. If membranes were available which have different permeabilities for the cations concerned, it will be possible to extend the usefulness of the method to mixtures. Complete Ca-H titration curves were obtained for three concentrations of Putnam clay. Bentonite was electro-chemically similar to Putnam clay.

8523. MATTSON, SANTE. **Effects of liming on leached, acid soils.** *Kgl. Lantbruks-Högskol. Ann.* 13, 196-222 (1946) (in English).—*C.A.* 41, 826^h.
A somewhat podzolized loamy moraine on red gneiss had been excessively treated with lime 60 years earlier. It was well drained and subject to annual pptn. of 700 mm (27 in.), and as a consequence all sorts of deficiency symptoms were exhibited. The effect of leaching was tried in the lab. with similar results. The limed soil became more basic with increasing depth; the virgin soil became more acid. The exchangeable Mn had been greatly reduced by the lime. Hay grown on the limed soil contained much less Mn than the grass grown on the uncultivated podzol. The Ca, Mg, and the Ca/Mg, and Ca/K mass ratios of exchangeable ions had become excessive.

8524. MATTSON, SANTE AND LARSSON, KARL GUSTAF. **The laws of soil colloidal behavior. XXIV. Donnan equilibria in soil formation.** *Soil Sci.* 61, 313-30(1946).—*C.A.* 40, 5179^7.
Soils having a low cation-exchange capacity should, other things being equal, contain a higher proportion of exchangeable univalent cations than soils having a high exchange capacity. The more unsatd. a soil, the greater should be the pro-

portion of exchangeable univalent cations. Among the leached soils the proportion of alkali cations should be greatest in the highly unsatd. soils possessing weak acidoid properties, whereas the proportion of alk.-earth cations should be greatest in the slightly leached, satd. soils possessing a high exchange capacity. These conclusions were supported by exptl. work and analytical data from various sources.

8525. MEHLICH, ADOLF. **Soil properties affecting the proportionate amounts of calcium, magnesium, and potassium in plants and in hydrochloric acid extracts.** *Soil Sci.* 62, 393-409 (1946).—*C.A.* 41, 3563*g*.

The influence of the type of colloid and the degree of Ca satn. on the percentage release of Ca by H was studied. In a bentonite colloid-sand mixt., having a cation-adsorption capacity of 4.8 milliequivs., the amts. of Ca released at 28 and 99% Ca satn. were resp., 0.14 and 0.95 milliequivs.

8526. MENCHIKOVSKY, FELIX. **Effect of the nature of exchangeable bases on soil porosity and soil-water properties in mineral soil.** *Soil Sci.* 62, 169-81 (1946).—*C.A.* 40, 7468^3.

The total cations of a gray soil from the northern part of the Jordan Valley ranged from 34 milliequiv. per 100 g dry soil in the 0-25-cm layer to 31 milliequiv. in the 75-100-cm layer. The Na/Ca ratio varied in the same order from 5.6 to 12.9. The corresponding values for the hygroscopicity were 8.61 and 10.64, both figures being expressed in percentage of dry soil. Exchangeable K and Ca showed a decrease with depth in the Jordan Valley gray soil. Values for the former decreased from 0.41 milliequiv. per 100 g dry soil in the 0.25-cm layer to zero in the 75-100-cm layer, while the latter varied from 26.6 to 18.3 milliequiv. per 100 g in the same layers. Exchangeable Na and Mg in the same soil showed an increase with depth. The Na varied from 1.50 to 2.34 milliequiv., while the Mg varied from 5.47 to 10.31 milliequiv. per 100 g dry soil.

8527. MICHAEL, E. AND OSSENBERG, H. **The sorption of calcium compounds in the soil.** *Z. Pflanzenernähr., Düngung u. Bodenk.* 37, 16-39 (1946).—*C.A.* 41, 5659*i*.

Shaking tests were carried out with a Dahlem soil and with the naturally occurring mineral, montmorillonite. Ca compds. were retained in the soil in amts. which varied very widely. The amt. of Ca adsorbed from the chloride and the acetate was insignificant. Only slight amts. were adsorbed from the bicarbonate and the lactate. On the other hand, very much larger amts. were adsorbed from the hydroxide without any corresponding displacement of other bases. Ca^{++} and OH$^-$ were adsorbed in equiv. amts. The greater adsorption of the hydroxide was not a peculiarity of Ca. Other hydroxides, e.g., those of K$^+$ and NH$_4^+$, showed the same behavior toward the soil, although to different degrees. The OH ions were to be regarded as the cause of the higher cation adsorption; their effect extended also to other added cations. Preliminary treatment of the soil to remove carbonates, phosphates, and org. substances did not essentially change the adsorption of Ca.

8528. PETERSON, J.B. **The role of clay minerals in the formation of soil structure.** *Soil Sci.* 61, 247-56(1946).—*C.A.* 40, 3550^7.

Montmorillonite formed gel-like globules which varied in resistance to dispersion in water according to the conditions of the expt. Kaolinite had no apparent effect on the state of aggregation that developed in a puddled Tama soil. Montmorillonite markedly increased the amt. of material resistant to wet-sieving but only when enough of the clay had been added to give it a dominating role in the mixt.

8529. RANEY, W.A. AND HOOVER, C. DALE. **The release of artificially fixed potassium from a kaolinitic and a montmorillonitic soil.** *Soil Sci. Soc. Am., Proc.* 11, 231-7(1946)Pub. 1947. —*C.A.* 42, 2380*f*.

The montmorillonitic soil (Susquehanna) fixed large percentages of the K applied. A greater quantity was fixed when the soil was air-dried after the storage period and prior to leaching than when the soil was leached while still moist. K fixation was insignificant in the kaolinitic soil (Orangeburg) in contrast to the montmorillonitic soil. The kaolinitic soil contained larger quantities of applied K still in the exchangeable form when the soil was air-dried after the period of storage than when the soil was leached while still moist. In those soils contg. artificially fixed K there was a greater quantity of K released to the exchangeable form than in the untreated soils.

8530. RICHES, J.P.R. **Use of synthetic resins in the estimation of trace elements.** *Nature* 158, 96(1946).—*C.A.* 40, 6536^5.

Trace elements could be isolated from plant digests by the use of synthetic resins. A column of bed volume 1 ml packed with Amberlite IR-100 was washed and classified, and taken through successive exchange cycles with *N* HCl and *N* NH$_4$Cl solns. Two ml of a soln. contg. Cu, Cd, Ni, Zn, and Mn salts (each in approx. 4 × 10^{-4} *M* concn.) was introduced to the purified column and the adsorbed cations eluted with HCl. In the presence of *N* NH$_4$Cl the cations were fully retained, but appeared in the first effluent fractions; in the presence of *N*/10 salt solns. the cations were fully retained. *N*/10 HCl displaced only the Cd in the eluate, while *N* HCl liberated Zn, Mn, Cu, Ni, and Cd, thus showing that it should be possible to isolate the cations by varying the nature and concn. of the soln. used in eluting the adsorbed cations. Cations may be sepd. from interfering anions during passage through a column.

8531. RIEHM, H. **Determination of the adsorption capacity of the soil in mass investigations according to H. Riehm and its significance, especially for the evaluation of the lactate value.** *Z. Pflanzenernähr., Düngung u. Bodenk* 37, 61-74(1946).—*C.A.* 41, 6648*f*.

A rapid method was given for the detn. of the T value, which was expressed in milliequivs. per 100 g of soil. Consideration of the T value instead of the type of soil was admissible only if a relation existed between the T value and the phosphoric acid adsorption. Such a relation was established on the basis of data on 210 soils of widely varying origin. For the estn. of the lactate no. it was recommended that instead of the group "sandy soils", all soils having a T value up to 7.5 be grouped together; instead of "middle soils," soils having T values of 7.6-15 be used, and instead of "heavy sandy soils," all soils having T values above 15 be used.

8532. Schroeder, W.T.; Davis, J.F., and Shafer, John, Jr. **Deionized water not a suitable substitute for distilled water in boron studies.** *J. Am. Soc. Agron.* 38, 754 (1946).—*C.A.* 41, 1279*g*.

B-deficiency symptoms appeared 5 weeks after the emergence of Detroit Dark Red beets in minus-B distd.-water nutrient soln. No B-deficiency symptoms appeared in minus-B deionized-water nutrient or either of the complete nutrient solns. used.

8533. Sergeev, E.M. **New developments in methods of determining heat of wetting of soils and soil materials.** *Pedology* (U.S.S.R.) 1946, 289-300.—*C.A.* 41, 825*f*.

The construction of the calorimeter permitted the use of soil samples without disturbing the structure. The factors influencing the heat of wetting of soils were discussed. The temp. of the detn. was of great importance. At 4°C the detn. gave the highest value.

8534. Sieling, Dale H. **Role of kaolin in anion sorption and exchange.** *Soil Sci. Soc. Am., Proc.* 11, 161-70 (1946) (Pub. 1947).—*C.A.* 42, 2378*g*.

Kaolin could be activated for anionic sorption by ball-milling or by heating with alkali. The active constituent of ball-milled and alkali-activated kaolin was believed to be a hydrous alumina such as γ-AlOOH. The Al_2O_3 of ball-milled kaolin sorbed phosphate and arsenate in practically equiv. amts. from the more dil. solns. of these ions; however, from the more concd. solns. the sorption of arsenate far exceeded that of phosphate. The amt. of either anion sorbed was dependent upon the reaction of the equil. soln. and the initial concn. The lower the pH within the range of 3.0 to 7.0, the greater the sorption and the higher the concn. at any fixed pH, the more of the anion was sorbed per unit of Al_2O_3. Freshly pptd. hydrous Al_2O_3 sorbed phosphate and arsenate in greater quantities than an equiv. quantity of Al_2O_3 contained in ball-milled kaolin.

8535. Stanford, G. and Pierre, W.H. **The relation of potassium fixation to ammonium fixation.** *Soil Sci. Soc. Am., Proc.* 11, 155-60(1946)Pub. 1947.—*C.A.* 42, 2380*c*.

The occurrence of K fixation under moist soil conditions was not limited to calcareous soils, but also took place to a measurable extent in certain acid soils when large amts. of K were supplied. The fixation reaction reached equil. within 24 hrs in a calcareous Webster soil. The soil to water ratio influenced appreciably the rate of fixation during the initial steps of the reaction, but after 24 hrs the influence was only slightly apparent. Extn. of the calcareous Webster soils with ammonium acetate or acid extn. destroyed their capacity to fix K.

8536. Tendeloo, H.J.C.; Vervelde, G.J., and Voorspuij, A.J.Z. **Electrochemical behavior of ion-exchange compounds. II. Pontential measurements on plant roots and their bearing on ion uptake by plants.** *Re. trav. chim.* 65, 539-44 (1946) (in English).—*C.A.* 41, 4047*c*.

By assuming that the non-diffusible ion originated from a substance which behaved as a weak acid, the concn. of its anion being therefore not const. but depending on the pH, fairly good agreement was found between the calcd. and exptl. values for the potentials of plant roots. The relation between the ion concns. just inside the wall of the plant root and that of the surrounding soln. could be described by the Donnan equil. K accumulated when the root was immersed in KCl soln. and a 100-fold diln. of the outer soln. resultec in no more than a 5.5-fold diln. inside the cell wall.

8537. Thorne, D.W. **Calcium carbonate and exchangeable sodium in relation to the growth and composition of plants.** *Soil Sci. Soc. Am., Proc.* 11, 397-401(1946)(Pub. 1947).—*C.A.* 42, 3888*f*.

With a Ca-satd. clay mixed with sand the growth of Stone tomato plants was somewhat inversely proportional to $CaCO_3$ concn. in the culture medium. The decreased growth was assocd. with increases in Ca and decreases in K and P concn. in the plants. The growth and compn. of tomato plants were also studied in colloidal clay cultures in which 3 levels of $CaCO_3$ were mixed in combination with 4 different ratios of exchangeable Na to Ca. Growth decreased with increasing degrees of Na satn. and the effects of Na were accentuated by the presence of $CaCO_3$. In the presence of $CaCO_3$ exchangeable Na was less effective in increasing P uptake than in its absence.

8538. Trenel, M. **Nature and importance of the "exchangeable acidity" of soil.** *Z. Pflanzenernähr., Dungung u. Bodenk*, 37, 305-21(1946); *Chimie & industrie* 59, 169(1948).—*C.A.* 42, 7469*f*.

H^+ ions could in no way be held responsible for growth-inhibition phenomena. On the other hand, they rendered possible the absorption of nutritive principles by the roots. A pH below 5 ensured the soly. of toxic Al. This toxicity, which produced important assimilation troubles, was specific. It was not related to the assimilation of P_2O_5 and was not suppressed by the presence of CaO.

8539. Tsyurpa, I.G. **The kinetics of exchange reactions of cations.** *Pedology* (U.S.S.R.) 1946, 309-14.—*C.A.* 41, 826*g*.

Chernozem soil, kaolinite, and askanite (montmorillonite-like) were satd. with Ca and the speed of replacement of it was studied by use of NH_4Cl of different concns. The speed of replacement of cations depended on the structure of adsorbent. The replacement took place faster on colloids contg. kaolinite. The exchange reactions started at the surface and then penetrated into the colloids.

8540. Yasue, Yasunobu. **Insecticidal effect of silica gel.** *Science* (Japan) 16, 40-1(1946).—*C.A.* 45, 10468*a*.

The insecticidal properties of silica gel, SiO_2 (quartz sand), and diatomaceous earth were tested against *Calandra sasakii* and *Tribolium ferrugineum*. Silica gel was the most active; diatomaceous earth and quartz sand were next. They were tested by using fine powder for fasting insects, or by adding 1% to the fodder of the insects.

8541. ALEIXANDRE FERRANDIS, VICENTE. **Base-exchange capacity and curves of loss on ignition of some Spanish clays.** *Anales inst. espan. edafol., ecol. y fisiol. vegetal* 6, 455-74 (1947).—*C.A.* 42, 5595*e*.

The red clay fraction was extd. by sedimentation from a series of 13 soils from Valencia where the mean annual rainfall was 166.9 mm. and the av. temp. 16.1°C, and from Malaga where the mean annual rainfall was 508.5 mm. and the av. temp. 18°C. Base-exchange capacity varied directly with the loss on ignition at 700°C. After ignition the base-exchange capacity was reduced 80 to 90%. The ratios SiO_2/R_2O_3, and SiO_2/Al_2O_3 showed no relation to the base-exchange capacity.

8542. ANTIPOV-KARATAEV, I.N.; KADER, G.M., AND FILIPPOVA, V.N. **Nature of the uptake of ions by clays and soils. III. Uptake of univalent and bivalent cations of chernozem soil and humic acid.** *Kolloid, Zhur.* 9, 315-24 (1947).—*C.A.* 43, 7618*b*.

Soil satd. with cation K_1 was shaken with a soln. of the chlorides of K_1 and K_2 in which the ratio $K_1{:}K_2$ varied between 1:9 and 9:1. If the final concns. of K_1 and K_2 in the soln. were C_1 and C_2, and the amts. in the soil were X_1 and X_2, the $X_1C_2/X_2C_1 = k$, the "equilibrium const.". The uptake was reversible and k was independent of $K_1{:}K_2$ for the pairs $K{:}NH_4$($k = 2.6$), Ca:Mg (3.3), and Ca:Ba (0.77), all on a chernozem, 100 g of which satd. 44-45 milliequiv. $K_1{:}K_2$ for Ca:Mg on a Ca humate from peat, for K:Na and Ca:Pb on chernozem, and also for Ca:Cu on chernozem when the exchange occurred in an alk. soln. The uptake was irreversible for Ca:Hg, Ca:Cu (in H_2O) and Ca:Al (at pH 4.3-7) on chernozem, i.e., Hg, Cu, and Al could not be displaced by Ca.

8543. ARMIGER, W.H.; HILL, W.L.; PINKERTON, CECIL; LAKIN, H.W., AND ROBINSON, W.O. **Composition and fertilizer value of spent phosphate catalyst from the petroleum industry: "Solid phosphoric acid catalysts" and copper, pyrophosphate catalysts.** *J. Am. Soc. Agron.* 39, 318-26(1947).—*C.A.* 41, 4879*e*.

The "solid phosphoric acid catalysts" tested contained in addn. to silica, P_2O_5 24-64, H_2O 6-19, and R_2O_3 0.2-2%. In greenhouse tests with 3 of these spent catalysts, growth response of spring wheat to the catalysts was nearly as good as that to double superphosphate. The Cu pyrophosphate catalysts contained P_2O_5 12-38 and Cu 17-24%. They were essentially Cu pyrophosphate suspended on charcoal. More than 85% of the P and 55-99% of the Cu were sol. in the official soly. test for available phosphates in fertilizers.

8544. ARNON, DANIEL I. AND GROSSENBACHER, EARL A. **Nutrient culture of crops with the use of synthetic ion-exchange materials.** *Soil Sci.* 63, 159-82 (1947).—*C.A.* 41, 5661*f*.

Tomato plants were grown through the fruiting stage and lettuce for a period of 6 weeks in sand culture to which nutrients were supplied as adsorbed ions on Amberlites. Comparisons were made with sand culture and with water-culture nutrient solns. Exts. of sand mixed with Amberlite nutrients showed pH values from 3.30 to 4.28. The Ca and Mg in Amberlites were shown to be insufficiently available for good growth. In some expts. K and nitrate were supplied by daily irrigations of dil. KNO_3 soln., but all other nutrients were furnished by Amberlites. A discussion of contact effects between roots and solid particles was given.

8545. BARBIER, GEORGES AND TROCME, SERGE. **The colloidal properties of humic acids formed under various conditions.** *Compt. rend.* 224, 1582-3(1947).—*C.A.* 41, 6108*g*.

Four humic acids were studied as to dispersion, flocculation, ion exchange, and adsorption on clay. Aq. suspensions of humic acids were prepd. by decalcification, treatment with NH_4OH pptn. with HCl, and dialysis; 4 samples of humus of increasing age were used: liquid manure aged for 3 months, compost aged for 3 yrs, peat, and lignite. Little difference was observed in the capacity of the acids for bases. All were adsorbed on lime clays.

8546. BEAR, FIRMAN E. **Cations for canning crops.** *Food Packer* 28, No. 2, 76,78 (1947).—*C.A.* 41, 7608*i*.

A discussion of the cation exchange system in soils.

8547. CHAMINADE, R.; SEGALEN, P., AND VISTELLE, R. **The effect of humus on the conversion of phosphate ion in a lateritic soil.** *Ann. agron.* 17, 530-5 (1947).—*C.A.* 42, 2701*g*.

Neubauer tests were performed on 100-g samples of a soil taken from near Tananarive in Madagascar to which were added weighted portions of humus extd. from a temp. zone soil by 3% $(NH_4)_2C_2O_4$. The humus was pptd. by HCl and added to the soil as the Ca salt. Added P_2O_5 was not available to the plants unless humus was present.

8548. CHAMINADE, R. AND VISTELLE, R. **The role of humus in soils. The effect of humus on the fixation and mobility of phosphate ion in soils.** *Ann. agron.* 17, 536-44 (1947).—*C.A.* 42, 2701*e*.

Samples and columns of soils with selected addns. of the Ca salt of humus extd. from soil were percolated with solns. of phosphates of various concns. The residual P_2O_5 in the solns. was detd. chemically, and the columns were dissected to det. the depth of penetration. The amt. taken up by the soil increased with successive perfusion to a max. and then declined. The acidity of the perfusing $H_4Ca(PO_4)_2$ solns. eventually decompd. the compds. formed by the initial fixation and thus caused the decline.

8549. COHEN, W.H. AND KNIGHT, B.H. **Adsorption phenomena in soils with special reference to their surface area.** *J. Soc. Chem. Ind.* (London) 66, 357-64 (1947).—*C.A.* 42, 2041*g*.

Malachite green oxalate in 1:10,000 solns. was adsorbed by 0.25 g of over-dried soil. The residual color of the solns. was measured in a photoelec. colorimeter. The time of contact was about one hr, with shaking and standing overnight. Results for 32 soils ranged from an almost pure sand to an almost pure clay. Then 8 soils were sepd. into coarse fractions by sieving (A.S.T.M.) and 8 fine fractions each by sedimentation. The surface area of each fraction of the 8 soils was detd. by air permeability. The adsorption of dye on these fractions was found to depend on the physicochem. nature of the clay minerals present and on the surface area.

8550. DEAN, L.A. AND RUBINS, E.J. **Anion exchange in soils. III. Applicability to problems of soil fertility.** *Soil Sci.* 63, 399-406(1947).—*C.A.* 41, 7604*e*.

In acid soils, phosphate tended to accumulate as an exchangeable anion. The amts. of exchangeable phosphate which acid soils contained were not, however, necessarily a reliable index of the fertility status of these soils, since the anion-exchange capacity, the pH, and the amts. of other forms of P were also contributing factors.

8551. GULVADY, SHARDA; RAO, K. SUBBA, AND RAO, B. SANJIVA. **Hysteresis in sorption. XVI. Sorption of water in some Indian soils and soil fractions.** *Proc. Indian Acad. Sci.* 25A, 229-34 (1947).—*C.A.* 41, 5359*d*.

Sorption-desorption curves on H_2O vapor at 30°C showed negligible sorption for the sand fractions, coarser than 0.02 mm; whereas the silt fraction, 0.02 to 0.002 mm, and the clay fraction, finer than 0.002 mm, showed appreciable sorptions. Treatment with H_2O_2 to remove org. matter reduced the sorptive capacity. Black cotton soil showed a sorption of 18 g per 100 g of activated soil compared with 8 g for the red laterite soil.

8552. HELLERMAN, YA. M. **Some data on the mechanism of mineral nutrition of plants by adsorbed ions.** *Compt. rend. acad. sci. U.R.S.S.* 55, 543-6(1947).—*C.A.* 42, 4244*c*.

In expts. in which plants were grown in nutrient solns. with and without activated carbon, more Ca, P, and Cl were taken up in the presence of the carbon. It was suggested that accumulated org. substances around the roots, root secretions and intermediate products of their decompn. by bacteria, were adsorbed by the carbon; this freed the active adsorbing surface of the roots. The presence of materials in soils capable of adsorbing org. substances probably similarly improved the mineral nutrition of plants.

8553. ICHIKAWA, CHIKABUMI. **Reaction (acidity) and exchangeable lime of soils of mulberry fields.** *Nôgaku (Sci. Agr.)* 1, 35-41(1947).—*C.A.* 44, 3188*h*.

Seventy soil samples from 30 prefectures of Japan were tested. The pH of the soils was 4.6-5.7, av. 5.4; these soils were not extremely acid. Sandy loam averaged pH 5.5 and clay-loam averaged pH 5.4. The org. matter content was low, 0.93-28.82%, av. 8.72%. Hydrolytic acidity (with Ca acetate) was 1.0-15.5, av. 3.1. Exchangeable acidity (Daikubara's method) was 0.9-24.6, av. 5.6. Exchangeable Al_2O_3 plus Fe_2O_3 sol. in *N* KCl was found to be greater in the more acid soils than in the less acid soils (0.006-0.142%, av. 0.029%).

8554. JACOB, K.D.; WARD, F.N.; HILL, W.L., AND PINKERTON, CECIL. **Report on phosphoric acid: neutral ammonium citrate and 2% citric acid solutions as solvents for alpha phosphate.** *J. Assoc. Offic. Agr. Chemists* 30, 529-48(1947).—*C.A.* 41, 7615*a*.

The important phosphate-bearing constituents of "alpha phosphates" were α-$Ca_3(PO_4)_2$, glass, and apatite; crystals of $Ca_3(PO_4)_2$ and apatite were often imbedded in the glass. Hydroxyapatite, a compd. which has low fertilizing value and which was probably formed as an intermediate in the prepn. of alpha phospate, was more than 50% sol. in citric acid but only about 25% sol. in NH_4 citrate. Citric acid soly. was usually, but not always, higher than the citrate soly. In the case of alpha phosphate with less than 0.5% F, the av. difference for 33 samples was 3.4% of the total P.

8555. JOFFE, J.S. AND LEVINE, A.K. **Fixation of potassium in relation to exchange capacity of soils. II. Associative fixation of other cations, particularly ammonium.** *Soil Sci.* 63, 151-8 (1947).—*C.A.* 41, 4264*i*.

The data showed that out of 42.7 mg of Ca added to a sample of bentonite, 43.2 mg was recovered. The amts of Ba added to samples of H-bentonite and Montalto H-colloid were, resp., 1.87 and 1.87 milliequivs., while the amts. recovered were resp., 1.87 and 1.84 milliequivs. The amts of NH_4, fixed by a natural Wyo. bentonite at 47° and 74°C were, resp., 0.18 and 0.46 milliequivs., while the amts of K fixed by the same material at identical temps. were, resp., 0.52 and 0.69 milliequivs.

8556. JOFFE, J.S. AND LEVINE, A.K. **Fixation of potassium in relation to exchange capacity of soils. III. Factors contributing to the fixation process.** *Soil Sci.* 63, 241-7 (1947).—*C.A.* 41, 5661*c*.

Increasing quantities of Ca diminished the quantities of K fixed by H-bentonite. When 1 symmetry unit of K alone was added, 6.4 mg of K were fixed by 2.119 g of H bentonite. When 9 symmetry units of Ca were added to 1 of K, the K fixed was only 2.1 mg. The results showed that K competed successfully with Ca as previously indicated.

8557. JONES, U.S. **Availability of humate potassium.** *Sci. Soc. Am., Proc.* 12, 373-8(1947)—(Pub. 1948).—*C.A.* 43, 2725*a*.

Humic acid, free of mineral contaminants, was prepd. and satd. with a const. amt. of exchangeable K and various amts. of exchangeable Ca and H. At equil., of the total exchangeable K present, 82 to 96% was sol. in carbonated water and 50 to 90% in water. Increasing amts. of K dissolved as the Ca satn. increased from 0 to 80%, but beyond this there was little, if any increase. At equil., H-bentonite held twice as much exchangeable K as did humic acid.

8558. LAMPITT, L.H.; MONEY, R.W.; JUDGE, B.E., AND URIE, A. **Pectin studies. I. Method of**

purification. *J. Soc. Chem. Ind.* **66**, 121-4 (1947).—*C.A.* **41**, 7016*i*.

Purification of pectin was studied by using pptn. by EtOH or Me_2CO, dialysis, ion exchange, and combinations of these methods. The highest pectin content (detd. as Ca pectate) was obtained by dialysis followed by pptn. in 70% EtOH. Ash content was reduced to 2-4% by this method. It was thought that passage through ion-exchange resins, which reduced the ash to 0.25% of the Ca pectate value, cause some splitting off of combined inorg. material.

8559. LEVINE, A.K. AND JOFFE, J.S. **Fixation of potassium in relation to exchange capacity of soils. IV. Evidence of fixation through the exchange complex.** *Soil Sci.* **63**, 329-35(1947).—*C.A.* **41**, 5666*f*.

A simple linear relation existed between the amt. of K entering the exchange complex and that fixed. K must first be in the exchangeable form to be fixed. The similarity of results of the 2 expts. indicated that the phenomenon of fixation was essentially the same for different fixing materials.

8560. LUCAS, E.H. AND HAMNER, C.L. **Inactivation of 2,4-D by adsorption on charcoal.** *Science* **105**, 340 (1947).—*C.A.* **41**, 4268*c*.

Aq. solns. of the Na salt of 2,4-dichlorophenoxyacetic acid in concns. of 1000 to 10,000 p.p.m. were inactivated by 1-10% aq. suspensions of charcoal (Norit A). Oil prepns. of 2,4-dichlorophenoxyacetic acid were less readily inactivated. The discovery was of value in removing small residues of 2,4-dichlorophenoxyacetic acid from equipment which was also used for other agricultural purposes, since even small amts. were injurious to certain plants.

8561. MCAULIFFE, C.D.; HALL, N.S.; DEAN, L.A., AND HENDRICHS, S.B. **Exchange reactions between phosphates and soils: hydroxylic surfaces of soil minerals.** *Soil Sci. Soc. Am., Proc.* **12**, 119-23 (1947).—*C.A.* **43**, 1131*f*.

Kinetics of the exchange between phosphate on the surface of soil minerals with phosphate in soln. was followed by the use of P^{32}. Two reactions were recognizable. The first of these in which the fraction P^{32} solid/P^{32} soln. changed logarithmically with respect to time corresponded to exchange between phosphate in soln. and phosphate on the surface. Phosphate after sorption on the surface underwent a further reaction which remains to be studied. The amt. of rapidly equilibrating surface phosphate paralleled levels of phosphatic fertility measured by anion exchange. Extents of hydroxylic surfaces for kaolinite, halloysite, diaspore, and gibbsite were measured by use of the isotopic-exchange reaction: Surface $OH^- + DOD \rightleftarrows$ Surface $OD^- + HOD$.

8562. MELSTED, S.W. AND BRAY, ROGER H. **Base-exchange equilibrium in soils and other exchange materials.** *Soil Sci.* **63**, 209-25(1947).—*C.A.* **41**, 5665*g*.

The term "symmetry value" was used to express the condition when the no. of milliequivs. of exchangeable cations on a colloid equaled the total milliequivs. of salt in soln. The distribution of ions of the same valence on an exchange surface was affected less by the concn. of the soln. in an equil. system than in a leaching system. The concn. in soln. of ions of different valences had a marked effect on their final distribution on the exchange material in both types of systems. The ratio of the ions in a leaching soln. was a factor in detg. the distribution of those ions on the exchange material. Distribution of the ions on an exchange surface was controlled to a greater degree by the nature of the colloid or exchange material than by any other single factor.

8563. OLSON, R.V. **Iron solubility in soil as affected by pH and free iron oxide content.** *Soil Sci. Soc. Am., Proc.* **12**, 153-7(1947) (Pub. 1948).—*C.A.* **43**, 1133*c*.

Ammonium acetate adjusted to pH 4.8 dissolved Fe from soils that varied from 0.15 p.p.m. in alk. soils to 20 p.p.m. in acid soils. The amt. of Fe dissolved increased rapidly with decreases in soil pH in soils more acid than pH 6.5. This indicated a difference in the amt. or form of Fe in acid soils as compared to neutral or alk. soils. The addn. of Fe_2O_3 to 1 of the soils caused an increased Fe soly. at all pH levels. At pH levels below 4.5, Fe soly. in the soil suspensions did not reach the soly. of Fe in sulfate solns.; this indicated the presence of org. or inorg. Fe compds. which were more sol. than the Fe sulfates.

8564. RUBINS, E.J. AND DEAN, L.A. **Anion exchange in soils. II. Methods of study.** *Soil Sci.* **63**, 389-97(1947).—*C.A.* **41**, 7604*c*.

The methods used for satg. soils with anions and for displacing the adsorbed anions were virtually a counterpart of the common base-exchange methods. Procedures were given for extg. exchangeable anions and for prepg. soils satd. with anions. Analytical methods were outlined for the detn. of phosphates in exts. contg. 0.5 *M* concns. of arsenate, fluoride, citrate, and tartrates in 0.5 *M* phosphate exts.

8565. TOTH, STEPHEN J. **Release of adsorbed potassium, calcium, magnesium, and barium from a soil colloid as influenced by the nature of the acidoid link.** *Soil Sci.* **63**, 141-50 (1947).—*C.A.* **41**, 4264*d*.

The anions adsorbed by samples of Sassafras-loam colloid receiving phosphate, silicate, and humate treatments were, resp., 0.12 milliequiv. per g, 7.00 milliequiv. per g, and 1.12 g per g. The exchange capacity of a cation-satd. colloid receiving a phosphate treatment was Ca, 34.06; Ba, 42.54; Mg, 40.41; and K, 28.32 milliequiv. per 100 g; the percentage increase in the exchange capacity after the treatment was: Ca, 48.3; Ba, 74.8; Mg, 20.9; and K. 20.3%. The amts. of Ca cation released by hydrolysis from a colloid receiving no treatment, phosphate, silicate, and humate treatments were, resp., 16.4, 21.9, 19.8, 16.3%; the corresponding amts. of Mg cation were, in the same order, 26.2, 32.3, 33.6, and 37.6%.

8566. TOTH, STEPHAN J., AND BEAR, FIRMAN E. **Phosphorus-adsorbing capacities of some New Jersey soils.** *Soil Sci.* **64**, 199-211(1947).—*C.A.* **42**, 5146*g*.

The P-adsorbing capacities of the surface horizons of these soils in a standard H state ranged from 0.03 milliequivs. for Norton silt loam.

Liming these H soils to pH 6.5 resulted in marked reduction in P adsorption. The P-adsorbing powers of the H soils of a few profiles were lower than those of the original samples. This was due to loss of Fe and Al by soln. in the 0.05 *N* HCl used to prep. them. Phosphate applications to the max. adsorption value greatly increased the exchange capacities of soils in the field state.

8567. VOLK, GAYLORD M. AND BELL, C.E. **Effect of anion balance on the leaching of ions from sandy soils.** *Soil Sci. Soc. Am. Proc.* 12, 188-90 (1947) (Pub. 1948).—*C.A.* 43, 1509*d*.

The movement of NO_3^- and Cl^- followed a generally similar pattern. The crest of concn. of sol. salts occurred with the passage of approx. 6.6 in. of water. Ca and Mg were similar in their responses to variation in anion concn. and there was only slight difference in their response to the Cl^-, NO_3^- and $SO_4^=$ ions. Na^+ had a concn. crest at the passage of 7.2 in. of water after treatment. Fifty-two % more SO_4 (from sol. carriers) moved from the band placement than from broadcast placement. At pH 6.9, 90% more SO_4 was lost than at pH 6.1. In general, all of the cations responded to all anion crests of concn., but there was a definite differential response in mixts. which might be called a repression of soly. under the equil. set up in the presence of the exchange complex.

8568. WEAVER, ROBERT J. **Reaction of certain plant-growth regulators with ion exchangers.** *Science* 106, 268-70 (1947); *Boton. Gaz.* 109, 72-84 (1947).—*C.A.* 41, 7221*b*; 42, 1012*i*.

The degree of adsorption and elution of 2,4-$Cl_2C_6H_3CH_2COOH$ and its NH_4^+, Cu^{++} and Ca^{++} salts, 2,4,5-$Cl_3C_6H_2CH_2COOH$, and $C_6H_5NHCO_2$-iso-Pr by certain cation and anion exchangers (Amberlite IR-100 H, Zeo-Karb H, Decalso, Zeo-Dur, Amberlite IR-4B and De-Acidite) was studied. Amberlite IR-100 H adsorbed almost equal equiv. amts. of 2,4-$Cl_2C_6H_3CH_2COOH$ and its salts. The amt. of 2,4-$Cl_2C_6H_3CH_2COOH$ adsorbed varied directly with the concn. of the soln. Elution data indicated that much of it adsorbed in soils was not subject to leaching

8569. WHITTAKER, C.W.; COE, D.G.; BARTHOLOMEW, R.P.; VOLK, G.W., AND RADER, L.F., JR. **Influence of placement on response of crops to calcium phosphates.** *J. Am. Soc. Agron.* 39, 859-68(1947)—*C.A.* 42, 706*e*.

Di- and tricalcium phosphates, both found in ammoniated superphosphate, gave greatly reduced yields in the localized placement. Silicocarnotite, the principal phosphatic component of basic slag, was also adversely affected by a localized placement. Mixing with as little as 2.5% of the soil greatly improved crop response to dicalcium phosphate and silicocarnotite and gave some improvement with tricalcium phosphate. Hydroxylapatite and fluorapatite in general gave much lower crop response than the other phosphates, and that response was less affected by varying placement.

8570. WOODRUFF, C.M. **Determination of the exchangeable hydrogen and lime requirement of the soil by means of the glass electrode and a buffered solution.** *Soil Sci. Soc. Am., Proc.* 12, 141-2(1947) (Pub. 1948).—*C.A.* 43, 1131*d*.

A soln. buffered at pH 7 was used of such a character that the pH of the soln. decreased linearly with respect to the quantity of acid that could be added to it. A satisfactory buffered soln. consisted of a mixt. of *p*-nitrophenol and Ca acetate titrated to neutrality with NaOH. If the buffering capacity of such a soln. was large with respect to the buffering capacity of the soil that was added to the soln., and if the depression of the pH of the soln. by the exchangeable H of the soil was restricted to small values, then the depression of the pH of such a soln. approached an abs. measure of the exchangeable H in the soil.

8571. ALEIXANDRE, FERRANDIS, V. AND VICENTE, J. GARCIA. **The variation of the physiochemistry properties of soils with their particle size.** *Anales inst. españ. edafol., ecol. y fisiol. vegetal (Madrid)* 7, 529-604 (1948).—*C.A.* 43, 6347*a*.

The fractions by sedimentation were (1) less than 0.80 μ, (2) between 0.80 and 1.13 μ and (3) between 1.13 and 1.97 μ in diam. The 3 fractions were taken from each of 19 soils from various parts of Spain, and each separately analyzed for SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, and loss on ignition. The proportions of SiO_2 and TiO_2 increased with the particle size. Loss on ignition decreased with increase in particle size. The ratio Fe_2O_3/Al_2O_3 was unchanged in the various fractions of the same soil. In several cases Mg increased with decreasing particle size. When the clays were converted to acid clays, the gel fraction of the samples increased with decreasing particle size.

8572. ALLAWAY, W.H. **Differential thermal analyses of clays treated with organic cations as an aid in the study of soil colloids.** *Soil Sci. Soc. Am., Proc.* 13, 183-8 (1948).—*C.A.* 44, 4179*d*.

When a piperidine-treated clay was subjected to differential thermal analysis, a stepwise combustion of the adsorbed piperidine often resulted. The temps. at which the combustion was most rapid may be related to the compn. of the clay. The method was sufficiently promising to warrant consideration, but the information gained merely supplemented that from other methods.

8573. ANTIPOV-KARATAEV, I.N.; KADER, G.M., AND FILIPPOVA, V.N. **Nature of the uptake of ions by clays and soils. IV. Uptake of bivalent cations by red-brown clay and some soils.** *Kolloid, Zhur.* 10, 73-82(1948).—*C.A.* 43, 7618*e*.

The uptake was reversible and the "equil. const." k was independent of $K_1:K_2$ for Ca:Mg on a red-brown clay, a red soil, and a podzol soil, k being 1.5, 4.1, and 4.1, resp. The Cl^- was 0.015 *N* in all cases. The uptake was reversible on red-brown clay, but k varied with $K_1:K_2$ for Ca:Pb and Ca:Hg, and the reversibility was poor for Ca:Cu in both aq. and alc. solns. The greater the value of k, the greater was the selectivity of a soil. Bentonite clay was less selective than soils contg. kaolin and sericite. The uptake decreased in the series Pb>Ba>Ca>Mg for chernozem and Pb>Ca>Ba>Mg for montmorillonite clay.

8574. Antipov-Karataev, I.N.; Pasvik-Khlopina, M.A.; Merkulova, M.S., and Grebenshchikova, V.I. **Nature of the uptake of ions by clays and soils. V. Uptake of heavy metal ions by clays and soils in dynamic conditions.** *Kolloid. Zhur.* 10, 401-5(1948).—*C.A.* 43, 7618*g*.
Solns. of $HgCl_2$, $PbCl_2$, and $CuCl_2$ were filtd. through a column 5 cm wide of argillaceous soil satd. with 19 mg equiv. Ca per 100 g at a rate of 1 cm/min. For 0.002 *N* $HgCl_2$ and 0.006 *N* $PbCl_2$, the const. *k* was 277 and 100 liters/cm, resp. $CuCl_2$ behaved like $PbCl_2$. Before the breakthrough, the soil bound 1.1, 1.9, and 2.7 mg equiv. Cu^{++} or Pb^{++} from their 0.0005 *N*, 0.001 *N*, and 0.002 *N* solns., resp.

8575. Arle, Fred H.; Leonard, O.A., and Harris, V.C. **Inactivation of 2,4-D on sweet-potato slips with activated carbon.** *Science* 107, 247-8 (1948).—*C.A.* 42, 5154*g*.
Sweet potato slips, the roots of which were moistened and then dusted with activated carbon (Norit A, about 1 lb/1000 sprouts), were protected against injury from the Na salt of 2,4-D, used immediately before planting. Concns. sprayed on the soil were 1000, 2000, 3000, 4000 p.p.m., resp., calcd. as free acid equiv.

8576. Barbier, Georges and Chabannes, Jean. **Relation between adsorption of anions by clays and their flocculation.** *Compt. rend.* 226, 1036-8(1948).—*C.A.* 42, 6480*d*.
The rapid adsorption of sulfate or phosphate by suspensions of various clays increased markedly on addn. of a salt which caused flocculation, such as $CaCl_2$, and reached a max. when flocculation was complete. Clays deprived of exchangeable bases by acid treatment did not adsorb phosphate, except for those contg. free Fe_2O_3, which were activated for phosphate adsorption by acid treatment. Neg. sols and humic acid were not adsorbed by clays unless flocculating agent was present.

8577. Barbier, Georges and Chabannes, Jean. **The mechanism of the slow fixation of phosphate by clay soils.** *Compt. rend.* 226,2175-78 (1948).
The slow fixation of phosphates in the soil differed essentially in the initial rapid adsorption. The reaction took place first at the external surface of the particle and then penetrated slowly into the interior network of the clay crystallites. The first bonds of the clay with the phosphate ions were broken easily by dilute acid, but the final combination was dissociated easily by dilute alkali.

8578. Bear, Firman E., and Prince, Allen B. **Magnesium needs of New Jersey soils.** *New Jersey Agr. Expt. Sta., Bull.* 739, 4-19(1948).—*C.A.* 43, 3956*e*.
Alfalfa adsorbed Mg, Ca, and K in the ratio of 1:5:6, resp., when the soil ratio was 4:43:6. Heavy application of K increased Mg deficiency in the plant. As MgO applications to the soil were increased, increased yields of potatoes and vines resulted based upon the dry wt of the crops. Upon untreated soil, the Mg content of the tubers, leaves, and stems were, resp., 13, 18, and 11 milliequivs. Sol. sulfate and oxide forms were more effective than dolomitic limestone in overcoming Mg deficiencies. Less than 20% of the soils contained optimum Mg.

8579. Chernov, V.A. **The nature of soil acidity. II. The mechanism of the reaction of acid soils with solutions of neutral and hydrolytically basic salts.** *Pedology* (U.S.S.R.) 1948, No. 1, 14-23.—*C.A.* 42, 7470*c*.
The value of soil acidity, detd. by the interaction with different salts, depended not only on the pH of the soln. and the nature of the cation but also on the anion. In the interaction of red loams and podzolized soils with hydrolytically basic salts of CH_3COONa and NaF, the anions of these salts exchanged with the OH ions and for that reason, the hydrolytic acidity of the soils was near or lower than the exchange acidity.

8580. Coleman, N.T. and Mehlich, A. **Some chemical properties of soils as related to their cation exchange-anion exchange ratios.** *Soil Sci. Soc. Am., Proc.* 13, 175-8 (1948) (Pub. 1949).—*C.A.* 44, 3641*g*.
There was a relationship between the equil. pH of Ca-soil-H_3PO_4 system (pH_e) and the ratio of cation-exchange capacity to anion-exchange capacity (C/A) such that pH_e could be used as an index of C/A ratio. Adsorption of phosphate ions was highest for those soils with low C/A ratios. There were at least 2 types of bonding between phosphate ions and clay; the first seemed to be exchange adsorption, the second counter ion exchange. The greatest increases in cation-exchange capacity were observed for those soils with the lowest C/A ratios. Montmorillontic soils gave high C/A ratios and low pH_e values, kaolinitic soils gave intermediate values, and Gibbsitic soils gave low values of C/A ratio and high values for pH_e.

8581. Ensminger, L.E. **The relation between water lost and the phosphate ion adsorbed on phosphating clay minerals and soil colloids.** *Soil Sci. Soc. Am. Proc.* 13, 170-4 (1948) (Pub. 1949).—*C.A.* 44, 3642*i*.
Clay minerals and soil colloids, as well as chemically pure Al_2O_3 and hydrated Al_2O_3, were treated with 40 ml of *M* $(NH_4)_3PO_4$ per 2 g of material at pH 4.25, 5.7, and 7.0 The molar ratio of water-released to PO_4- adsorbed increased material at pH 4.25, 5.7, and 7.0. The molar ratio this indicating a change in the valence of the phosphate ion adsorbed. The ratio for chemically pure hydrated Al_2O_3 increased from 1.53 at pH 4.25 to 3.01 at pH 7.0. This indicated that P was adsorbed as the PO_4 ion at pH 7.0. The ratio for chemically pure Al_2O_3 varied from 0.57 to 1.35, which indicated the valence of the phosphate ion adsorbed varied with pH.

8582. Fujimoto, Charles K. and Sherman, G. Donald. **Behavior of manganese in the soil and the manganese cycle.** *Soil Sci.* 66, 131-45 (1948).—*C.A.* 42, 9026*a*.
The exchangeable Mn of soils decreased progressively with increasing quantities of lime applied. Dolomite had a smaller depressing effect on exchangeable Mn than did $CaCO_3$. Plant absorption of Mn was decreased by the addn. of either

$CaCO_3$ or dolomite to soil. S, when applied to soils, increased the exchangeable Mn and increased the absorption of Mn in plants. Chem. reducing agents such as hydroquinone, $SnCl_2$, HCHO, hydrazine sulfate, and KI increased the exchangeable Mn of soils; hydroquinone was the most effective of the group studied.

8583. GAPON, E.N. AND CHERNIKOVA, T.N. **Chromatographic exchange adsorption of cations by soil minerals.** *Doklady Vsesoyuz. Akad. Sel'sko-Khoz. Nauk im, V. I. Lenina* (U.S.S.R.) No. 7, 26-8(1948).—*C.A.* 43, 3549*h*.

Columns of kaolinite and bentonite in glass tubes were leached with an equimolar soln. of $Co(NO_3)_2$ and $CuSO_4$ and washed with water. On top of the column of kaolinite appeared pale blue-green spots (the Cu zone) and on the bottom pale pink-colored spots (the Co zone). Passing a 1.0 *N* soln. of $(NH_4)_2CO_3$ gave a ring of colloidally pptd. blue $CuCO_3$. By continuous washing with the $(NH_4)_2CO_3$, all of the Cu could be removed as the carbonate.

8584. GHOLSTON, L.E. AND DALE, C. **The release of exchangeable and none-exchangeable potassium from several Mississippi and Alabama soils upon continuous cropping.** *Sci. Soc. Am., Proc.* 13, 116-21(1948) (Pub. 1949).—*C.A.* 44, 2685*i*.

German millet was grown for 545 days, under greenhouse conditions, on representative soil types from 8 Mississippi and 3 Alabama agricultural soil areas. Eight crops were harvested from each soil and 2 soil samples were taken after alternate harvests. Six of the 11 soils showed a considerable lowering of the exchangeable K content by the 1st and 2nd crops, Whereas the other 5 soils, though showing a similar trend, were decreased more gradually by successive crops. After the 2nd harvest, all of the soils exhibited a rather gradual lowering of their exchangeable K content to the point where the K-supplying power of the soils was largely detd. by the rate at which nonexchangeable K was converted to the exchangeable form.

8585. GOR'KOVA, I.M. **The influence of water on the aggregation of dispersed systems of soil and other materials from the ground.** *Pochvovedenie* 1948, 260-7.—*C.A.* 42, 9022*d*.

Water was contained in soils and materials, such as kaolin, bentonite, and clays, at 3 water levels: (1) hygroscopic moisture or water vapor mols. adsorbed by the surface of the solid phase; (2) water of the diffused double layer of ions on the surface of the solid phase; (3) free water. Quant. data were given on the moisture content of the different zonal soils at the 3 levels and on the relation of these conditions of moisture to the aggregation of the materials tested.

8586. HANNA, W.J. AND REED, J. FIELDING. **A comparison of ammonium acetate and buffered barium chloride methods for determining cation-exchange properties of limed soils.** *Soil Sci.* 66, 447-58 (1948).—*C.A.* 43, 3128*f*.

The $BaCl_2$ method and NH_4OAc method for detg. exchange properties of soil were compared on 3 soils limed to different degrees. In all cases the values obtained with the $BaCl_2$ procedure were highest. At 15% satn., the Bladen, Craven, and Hyde soils gave an exchange capacity of 22.1, 9.5, and 38.2 milliequiv. per 100 g of soil with the $BaCl_2$ procedure. The ammonium acetate procedure gave values of 14.1, 4.3, and 17.2 resp. At 60% satn. the values were 22.3, 10.0, and 39.2 for $BaCl_2$ and 14.2, 5.0, and 18.9 for NH_4OAc. At 90% satn. the corresponding values were 22.1, 10.0. and 35.9 for $BaCl_2$and 14.7, 5.5, and 20.0 for NH_4OAc. Appreciable amts. of $CaCO_3$ were dissolved by the NH_4OAc but not by the $BaCl_2$ soln.

8587. HARDY, F. AND HEWITT, C.W. **Phosphate fixation in British Guiana sugarcane soils.** *Trop. Agr. (Trinidad)* 25, 19-22 (1948).—*C.A.* 43, 8591*i*.

A marked capacity to fix added sol. P was demonstrated for surface samples of representative sugar cane soils. The degree of fixation was about 73% of P absorbed or 65% of P added. After 3 months incubation, limed (with gypsum and calcium bicarbonate) and unlimed samples fixed 67 and 78%, resp. of the added P.

8588. HOSKING, J.S. **The cation-exchange of soils and soil colloids. I. Variation with hydrogen-ion concentration.** *J. Council Sci. Ind. Research* 21, 21-37(1948).—*C.A.* 42, 7469*a*.

A rapid method for detg. cation-exchange capacities was described. Samples as small as 0.1 g were leached with NH_4OAc solns., adjusted to pH values from 5 to 10, and the NH_4^+ adsorbed estd. In all the samples cation-exchange capacities increased from a min. value at pH 5 to a max. value at pH 9, then decreased at higher pH values. The rate of increase in cation-exchange capacities per unit pH varied from 0.5 to 3.0 milliequiv. per 100 g, and this variation was independent of the clay mineral type, the soil type and the magnitude of cation-exchange capacities. The term "cation-exchange capacity of the soil" should be used for the value at the pH of the soil, and the term "max. cation-exchange capacity," for the value at pH 9.

8589. HOSKING, J.S. **The cation-exchange of soils and soil colloids. II. The contribution from the sand, silt, and clay fractions and organic matter.** *J. Council Sci. Ind. Research* 21, 38-50 (1948).—*C.A.* 42, 7469*d*.

Cation-exchange reactions were not confined to the clay or colloid fractions of soils. There was a decrease in cation-exchange capacities in passing from the colloid to the silt fraction, but cation-exchange capacities persisted in all but the most highly siliceous sand fractions. Cation-exchange capacities of the silt and sand fractions were related to the presence of high concns. of clay minerals which distributed generally throughout all the fractions of the soil.

8590. KHACHVANKYAN, M.A. **The cationic complex adsorbed by clays in equilibrium with several types of natural waters.** *Gidrokhim. Materialy* 14, 69-75 (1948).—*C.A.* 45, 5470*f*.

The treated clays were subjected to pressure to remove the excess of equil. soln. This was followed by leaching the clay with a 1.0 *N* soln. NH_4Cl. At the same time the moisture of the pressed clay was detd. by drying at 105-110°C. To obtain the true value of the adsorbed cations it was necessary to det. the vol. of the cations in the equil. soln. between the clay particles. It was possible to calc. the complexes of adsorbed cations on the clay which corresponded to the equil. conditions with the cations of the 4 types of water analyzed. These data may be used in detg. the type of soln. in which the clays formed.

8591. LEENHEER, L. DE. **The adsorptive properties of soils and their mineralogical interpretation.** *Bull. soc. belge géol., paléontol. et hydrol.* 57, 299-320 (1948).—*C.A.* 43, 7618*i*.
Some data on Belgian clay soils were reviewed.

8592. MARSHALL, C.E. **Ionization of calcium from soil colloids and its bearing on soil relations.** *Soil Sci.* 65, 57-68(1948).—*C.A.* 42, 5151*a*.
In the montmorillonite and beidellite clays the active fraction varied abruptly for Na and for Ca at different stages of neutralization. Na showed a narrow zone and Ca a broad zone of very low activity. Kaolinite showed a fairly steady rise in active fraction for both cations as the amt. of base increased. These differences in active fraction reflected large differences in differential heat of adsorption of the cation in different regions of the titration curves. Ionizations of all cations, but especially of Ca, was much greater for kaolinite than for the montmorillonite clays.

8593. MARSHALL, C.E. **Electrochemical properties of mineral membranes. VIII. Theory of selective membrane behavior.** *J. Phys. & Colloid Chem.* 52, 1284-95 (1948).—*C.A.* 43, 2069*g*.
The mobility ratio of cations within the membrane, as well as differences in differential heats of adsorption, were considered.

8594. MATTSON, SANTE. **Laws of ionic exchange. III. Donnan equilibria in plant nutrition.** *Kgl. Lantbruks-Hogskol. Ann.* 15, 308-16(1948). —*C.A.* 42, 6033*f*.
Barley plants were grown in kaolin and in 11 g bentonite plus enough quartz sand so that all weighted 300 g. Each was satd. with one of a series of solns. that contained K and Ca ions in the proportions from 90/10 to 10/90% resp., of the exchange capacity. In the 3-weeks-old plants the K/Ca ratio varied from 3.0 to 19.8 in the plants grown in Kaolin and from 4.9 to 55.4 in the plants grown in bentonite. The difference was explained as a valence effect on the Donnan distribution of ions in a system of 2 colloidal phases of different ionic activities. The relatively large amts. of NH_4^+ and Mg^{++} in the nutrient solns. apparently displaced enough K to satisfy the requirements of the plants in the kaolin as readily as in the bentonite.

8595. MCLEAN, E.O. AND MARSHALL, C.E. **Reciprocal effects of calcium and potassium as shown by their cationic activities in montmorillonite.** *Soil Sci. Soc. Am., Proc.* 13, 179-82 (1948) (Pub. 1949).—*C.A.* 44, 3644*i*.
The Ca in the montmorillonite clay was more firmly held than H. Ca in small proportions had relatively little effect, but as the proportion of Ca increased it greatly enhanced the dissocn. of the K clay. K in relatively small amts. could cause a strong depression in the Ca activities, but by the time a 50:50 mixt. was reached the Ca could no longer be measured. These data were detd. on 0.5% K-H and Ca-H bentonite systems.

8596. MEHLICH, A. **Determination of cation- and anion-exchange properties of soils.** *Soil Sci.* 66, 429-46 (1948).—*C.A.* 43, 3127*i*.
Enough air-dry soil to give 0.5 to 2.5 milliequiv. exchange capacity was weighed into special funnels. $BaCl_2$ was buffered at pH 8.1 with triethanolamine added, the soil washed with unbuffered $BaCl_2$, and finally with water. Exchangeable H, Ca, Mg, K, and Na were detd. in the filtrate. The cation-exchange capacity was obtained by replacement of Ba from the soil with $CaCl_2$, at pH 8, pptg. the Ba as the chromate, and finally detg. $BaCrO_4$ colorimetrically. For the detn. of anion-exchange capacity the Ca-satd. soil was treated with H_3PO_4 in an amt. equiv. to the cation-exchange capacity. After 24 hrs of contact, the pH was measured, and the phosphate ion adsorbed was detd. The exchangeable phosphate was detd. by replacement with acidified NH_4F.

8597. MEHLICH, A. AND REED, J. FIELDING. **Effect of cation-exchange properties of soil on the cation content of plants.** *Soil Sci.* 66, 289-306(1948).—*C.A.* 43, 3128*c*.
The principal effects on plants of the exchangeable cations of soils were: (1) an increase in the exchangeable K, for any given level of Mg and Ca, caused an increase in K, and decreased Ca and Mg in the plants; (2) an increase in the exchangeable Mg, for any given level of Mg and Ca, increased Mg, decreased Ca, and had no significant effect on K in the plants; (3) for approx. the same level of exchangeable K, the K content of the plants increased and the Ca, and Mg contents decreased with decreasing cation-exchange capacity; (4) though the sum of the cations in the plant varied somewhat with the harvest or with the crop, it was relatively const. for each crop; and (5) for any given soil treatment, the K content in oats and turnips was about the same order.

8598. MILLER, R.B. **Chemical properties of two New Zealand bentonities.** *New Zealand J. Sci. Technol.* 30B, 198(1948).—*C.A.* 44, 5049*f*.
Two samples of bentonite had base-exchange capacities of 43.7 and 74.0 milliequiv. %, and contained 11.4 and 0 milliequiv. % exchangeable Na, and 15.6 and 0% free $CaCO_3$, resp. One sample also contained 36.6 milliequiv. % exchangeable Ca and after leaching with 18 and 4 milliequiv. % Mg and K, resp., had 80% base satn. By normal base-exchange methods, e.g., leaching with NaCl, the swelling properties (which det. com. value) of both were improved. Thus, lower-grade bentonites having inadequate swelling properties could be improved by this process.

8599. PERKINS, ALFRED T. **Kaolin and treated kaolins and their reactions.** *Soil Sci.* 65, 185-91(1948).—*C.A.* 42, 6975*f*.
Certain properties of kaolin were drastically changed by heating or by mortar grinding. Heating caused a loss of about 13%, of the wt of the clay in the form of H_2O. This treatment also caused an increase in particle size, an increase in phos-

phate fixation, an increase in alky. of the mineral, and development of a somewhat whiter color. Grinding kaolin markedly increased the base-exchange capacity, phosphate-fixing capacity, and alky.; it slightly darkened the color. The chief differences between the effects of heating and grinding were the changes in base-exchange capacity and in phosphate fixation. This was interpreted to mean that base exchange was a function of surface area, whereas phosphate fixation was a function of the OH radicals as well as of surface area.

8600. Petronici, Clara and Buffa, Aldo. **Determination of exchange capacity of soils.** *Ann chim. applicata* 38, 329-31(1948).—*C.A.* 45, 7733*i*.

Various methods for the detn. of ion-exchange capacity of soils were compared experimentally. Gedroiz' method was the best.

8601. Sarishvili, I.F. **Determining the adsorption of acetic acid in soils.** *Pochvovedenie* 1948, 184-9.—*C.A.* 42, 9022*c*.

The red soils (red loam) adsorbed some AcOH when acetate was used in detg. hydrolytic acidity. Soils showing a hydrolytic acidity lower than exchange acidity adsorbed more AcOH. A method of detg. AcOH and type of app. used were described.

8602. Sauerlandt, Walter. **The exchange capacity of manure.** *Z. Pflanzenernahr., Dungung u. Bodenk.* 41, 53-64(1948).—*C.A.* 43, 3132*a*.

The exchange capacity was detd. for manure mixed with various composting materials (straw, potato tops, sawdust, peat, powd. needles, and leaves) in order to follow changes during rotting. In the alk. region, the exchange capacity, representing carboxyl and phenolic groups, showed no great change during rotting, but the exchange capacity in the acid region representing only carboxyl groups decreased.

8603. Scheffer, F. and Schachtschabel, P. **Structure and sorption of soil colloids.** *Beitr. Agrarwiss*, No. 4, 11-20(1948).—*C.A.* 43, 7171*a*.

The base-exchange capacity of soils is called a "sorption-capacity" as the involved processes in the soil were still unknown. The sorption properties of the inorg. components in the soil was given and the methods to det. the partial sorption of the org. matter were described.

8604. Sequeiros Bores, José M.. **Agricultural characteristics of tobacco-growing areas (Cáceres and A'vila) in Spain. II. Base-exchange capacity of the soil.** *Bol. inst. nacl. invest. agron.* (Madrid) No. 19, 205-19(1948).—*C.A.* 46, 3197*g*.

Climatic influence was weak and the underlying rocks had a great influence on the compn. and character of the soils. They were poor in exchangeable bases, particularly K. Detailed analyses were tabulated.

8605. Sharov. V.S. **The rate of diffusion of adsorbed cations in a suspengel of clay.** *Kolloid. Zhur.* 10, 463-5 (1948).—*C.A.* 43, 7777*h*.

Suspengel was solidified suspension. When two cylinders of bentonite, one satd. with Ca and the other with Cu, were kept in direct contact or were sepd. by a thin paper or cellulose sheet, Cu^{++} migrated into the Ca bentonite at a rate of 0.5 cm in 500 hrs at 20°C.

8606. Sokolov, A.V. and Koritskaya, T.D. **The movement of phosphates in the soil.** *Pedology (U.S.S.R.)* 1948, 636-40.—*C.A.* 43, 5141*g*.

Tests were made on the movement and adsorption of P of different sources (mono-, di-, and tri-Ca phosphate, Ca metaphosphate, and K metaphosphate) as affected by temp. and speed of filtration. Plants were grown in a double pot, the inner one receiving N and K salts and the outer one contg. the P salt. The plants were grown in the inner pot which was sepd. from the outer by a collodion membrane. The phosphates moved through the membrane and supplied the plants with P. The temp decrease did not alter much the adsorption of P. With an increased speed of filtration, more P moved through the soil.

8607. Takahashi, Seikô; Hirota, Kôki, and Inoue, Yoshiyuki. **Agricultural chemicals. VI. Adsorption of nicotine by acid clay and the inhibitor.** *J. Agr. Chem. Soc. Japan* 22, 31 (1948).—*C.A.* 46, 9760*i*.

Nicotine was adsorbed from leaf-tobacco ext. (pH 5.6, nicotine 0.205%) by acid clay at a slightly lower rate at pH 5-6 and at similar max. rates at pH lower than 5 and higher than 6. The optimum amt. of acid clay added was 10%, when 58.3% of the nicotine in the ext. was adsorbed. From a dil. soln. of pure nicotine sulfate 10% acid clay could adsorb 97% of the nicotine. Thus, there must be an inhibitor for this adsorption in the leaf-tobacco ext. NH_4 salts, pectin, and resinous material were found to be responsible for this inhibition.

8608. Troug, Emil. **Lime in relation to availability of plant nutrients.** *Soil Sci.* 65, 1-7 (1948).—*C.A.* 42, 5149b.

Conditions with pH between 6.5 and 7.5 were the most favorable for phosphate availability. Below pH 6.5, the influence on availability rapidly became less favorable. At strong acidity, the conditions for both the accumulation of S in org. matter and its subsequent transformation to sulfate for plant use were not very favorable. With increased acidity, the amts. of K, Ca, and Mg that existed in readily available form usually decreased. Liming decreased the availability of such elements as Mn, Fe, B, Cu, and Zn.

8609. Tryon, E.H. **Effect of charcoal on certain physical, chemical, and biological properties of forest soils.** *Ecol. Monographs* 18, 81-115 (1948).—*C.A.* 44, 9603*d*.

Two types of charcoal, hardwood and conifer, in 2 sizes, less than 1 mm and 2 to 5 mm, were mixed with 3 soils, Merrimac sand, Maltby sandy loam, and Berlin clay loam, so that the charcoal comprised 15, 30, and 45% of the total by vol. Addn. of charcoal reduced the rate of evapn. and thus tended to increase the time required to reach the wilting percentage. Total N was increased by hardwood charcoal and decreased by conifer charcoal. Phosphoric acid, K, Ca, and Mg were increased as were pH values.

8610. VLAMIS, J. AND JENNY, H. **Calcium deficiency in serpentine soils as revealed by absorbent technique.** *Science* **107**, 549(1948).—*C.A.* 42, 5597*c*.

Absorbent techniques, involving amberlites as ion carriers, were used to det. whether or not rosette disease was conditioned by Mg excess or Ca deficiency, either abs. or relative. Ca Amberlite added to Conejo soil overcame the disease and produced normal plants. Water-culture expts. showed that the disease was produced as a result of Ca deficiency, in the absence of significant amts. of Co, Cr, and Ni.

8611. WEAVER, ROBERT J. **Contratoxification of plant growth-regulators in soils and on plants.** *Botan. Gaz.* **109**, 276-300(1948).—*C.A.* 42, 3895*c*.

In field plots 2,4,5-trichlorophenoxyacetic acid was least toxic and the Bu ester of 2,4-D most toxic and persistent as measured by the emergence of beans, soybeans, mustard, and Sudan grass and by the wt of tops. Toxicity was decreased by spading or plowing. Admixt. of ion exchangers Zeo-Karb H or Norit A reduced or completely eliminated the toxic effect of 2,4-D. Super Filtrol and attapulgus clays were ineffective, lampblack and bone char partially so as contratoxicants.

8612. WEAVER, ROBERT J. **Uses of activated carbon in contratoxification of plant-growth regulators.** *Botan, Gaz.* **110**, 300-12(1948).—*C.A.* 43, 2355*h*.

With 2,4-D(NH_4salt) applied at 10 lb/acre, 100-500 lb Norit A, each raked in the top 3 in., were required for complete contratoxification. With a cone consisting of a mixt. of Norit A and soil placed above each seed or with a mixt. covering a row of seeds, protection against a broadcast application of 2,4-D was obtained and weeds were controlled. Norit A in soil, retained its absorption capacity for 2,4-D for 12 days. Coating the seeds with Norit A before planting in soil previously treated with 2,4-D protected red kidney bean but not soybean, pea or wheat. When Norit A was applied following spraying with the Bu ester, it gave little protection unless applied within 15 min.

8613. ZUEV, L.A. AND GAPON, E.N. **The adsorption of water vapor by soils.** *Pedology (U.S.S.R.)* **1948**, No. 2, 113-20.—*C.A.* 42, 7470*f*.

A weakly degraded chernozem and a medium podzolized loam were satd. with Ca, Mg, Na, and H. Mixts. of the cationic soils were made up and subjected to adsorption of water vapor under a vacuum of 4.5×10^{-5} mm Hg at 15°C. The adsorption curves for the different cations and their mixts. took on an S-shaped form. At the start, the adsorbed cations had some influence on the adsorption of vapor. In general, the effect of the cations was indirect, inasmuch as they have affected the structure of the soil. The Freundlich equation was applicable only to the initial portion of the curve.

8614. ADERIKHIN, P.G. **The role of exchangeable cations in the adsorption of phosphorus by chernozem.** *Pochvovedenie (Pedology)* **1949**, No. 5, 302-5.—*C.A.* 43, 7621*c*.

One sod-podzolized and 4 chernozem soils were treated with 0.05 *N* HCl to saturate them with H and then were leached with chlorides of Na, K, NH_4, Mg, Ca, and Fe to replace the H. The prepared soils were treated with $CaH_4(PO_4)_2$, 0.004 molar soln., shaken for 5 min., and allowed to stand for 24 hrs shaken again, and filtered. The quantity of P adsorbed was detd. by "difference" analyzing the filtrate. The highest adsorption of P was gained by the soil satd. with Fe, followed by Ca. The soils varied in the adsorptive capacity for P, depending on the exchange capacity.

8615. AIDINYAN, R. KH. **Material exchange and formation of mineral colloids in the first stages of soil formation on massive crystalline substructures.** *Doklady Akad. Nauk S.S.S.R.* 67, 729-31(1949).—*C.A.* 44, 495*e*.

Examn. of moss and lichen growth on rock showed that the ash of the plants was much higher in P and Ca than was the rock structure; the excess may reach 500-1000%. Similar, but less pronounced accumulation was observed with K, Mg, Fe, and Mn, followed in descending order by Al, Na, and Si, on basalts. Such activity of the plants resulted in formation of humus-enriched "melkozem" soil, capable of cation exchange of 10-50 milliequivs. per 100 g, which was 60-80% sats. with Ca. The ion-exchange capacity of the colloids was 70-100 milliequivs. per 100 g.

8616. ALBAREDA HERRERA, J. MA.; ALVIRA, T., AND GUERRA, A. **The brown soils of Spain.** *Anales edafol. y fisiol. vegetal* (Madrid) **8**, 421-501 (1949).—*C.A.* 45, 1279*f*.

The clays showed the typical ratio SiO_2/R_2O_3 = 2. The exchange capacity had no relation to this ratio in the clay. There was a pos. connection between SiO_2/Al_2O_3 and the amt. of Ca contained in the clay. The exchange capacity increased with the content of slime + clay. There was a well-defined parallelism between content of org. matter and content of gels. The presence of org. matter facilitated soln. of the gels in the Tamm reagent. In all cases, including a single podzol, the amt. of SiO_2 in the form of gel was virtually const. in all horizons, and only the Fe and Al sesquioxides showed variations. The brown soils studied had not undergone degradation.

8617. ASGHAR, A.G.; DHAWAN, C.L., AND BHOLA, K.D. **Preliminary studies on the establishment of color standards in relation to soil constants.** *Indian J. Agr. Sci.* **19**, 21-9(1949).—*C.A.* 45, 4859*e*.

The soils were analyzed for clay, sticky point, exchangeable bases, available phosphate, and $CaCO_3$. A correlation analysis was run between soil color and the other analyses. A significant positive correlation was found between black color and both clay and exchangeable Ca. By partial correlation analysis, black color was found to depend on the amount of exchangeable Ca, and to be independent of the clay content. Red color was significantly correlated with sticky point.

8618. ASKLUND, B. **The problem of the differentiation of the apatite iron ores.** *Geol. Fören. i. Stockholm Förh.* **71**, 127-76 (1949)(English summary).—*C.A.* 43, 8317*a*.

These ores had special chem. characteristics: low SiO_2, as shown by the predominance of syenitic rocks, high Na, V, Ti, and P. These characteristics were best explained on the basis that the ores represented the result of sepn. of magma into 2 immiscible liquid phases.

8619. Asklund, B. **Apatite iron ores and geochemistry.** *Geol. Fören. i Stockholm Förh.* **71**, 333-46 (1949).—*C. A.* **43**, 8317*f*.

From the geochem. viewpoint some rather rare types of apatite Fe ores were observed like those of Ikerberg (Sweden) which were combined with increasing percentages of Cr, Co, Ni as compared with ores which were combined with syenites and quartz-porphyries. The whole series of rocks which were related with apatite-Fe ores all over the world belonged to quite especially Na-rich types.

8620. Ayres, A. S. **Release of nonexchangeable potassium in Hawaiian sugar-cane soils.** *Univ. Hawaiian Agr. Expt. Sta. Tech. Bull.* **9**, 50 pp. (1949).—*C. A.* **44**, 10984*e*.

Moist storage of soils produced no changes in levels of exchangeable K. Partial removal of exchangeable K, followed by moist storage, resulted in the release of small amts. of K. Ca soils liberated 2.5 times as much K on moist storage as acid soils. Liming of acid soil did not release K if exchangeable K were not first displaced. Treatment of soil with H_2O_2 did not result in increased recovery of exchangeable K. Levels of exchangeable K diminished with cropping. Release of nonexchangeable K upon electrodialysis was directly related to the release by soils on moist storage. Rates of release of K decreased with time. Extn. of exchangeable K-free soils with hot *N* HCl produced quantities of K which were directly related to the release of nonexchangeable K upon cropping and also upon moist storage.

8621. Barbier, Georges and Chabannes, Jean. **The mechanism of the adsorption of phosphates by various constituents of the clay of soils.** *Ann. agron.* **19**, 343-79(1949)—*C. A.* **43**, 9315*d*.

The sol. fraction of P_2O_5 in fertilizers was taken up by the clay by a slow process of absorption which included 2 successive phases that differed in the speed of fixation and the nature of the bonding force. In the first phase a band between PO_4^{-3} with exchangeable metallic cations, especially Ca, was quickly established. In the second phase the PO_4^{-3} was bound by the nonexchangeable cations that were an integral part of the clay particles and migrate with them to the anode during electrophoresis. The PO_4^{-3} taken up in the first absorption gradually passed into the second. The second form can subsequently be extd. by dil. alkali. If in this extn. $Ca(OH)_2$ was used instead of NaOH some of the PO_4^{-3} bound in the second manner passed into the first.

8622. Barbier, Georges and Durroux, Marcelle. **Equilibria to which the fixation of potassium in the nonexchangeable state gives rise in the soil.** *Compt. rend.* **228**, 1747-9(1949).—*C. A.* **43**, 7172*g*.

Expts. were carried out on a clay soil to det. whether there was an equil. between the exchangeable and nonexchangeable K. Samples were washed with $CaCl_2$ soln., kept moist for varying lengths of time, and then extd. with $AcONH_4$. The fact that the amt. of exchangeable K was greater for longer periods indicated a change from nonexchangeable to exchangeable K. This transformation was found to be favored by alternate desiccation and humectation of the soil, but the same treatment favored the transformation to nonexchangeable K in other soils. Ca-contg. humates suppressed both transformations.

8623. Birch, H. F. **The estimation of adsorbed and acid-soluble phosphates in East African soils.** *Tech. Commun. No.* **46**, 225-30(1949).—*C. A.* **44**, 4182*a*.

Data on 20 soils showed that below pH 5.5 the ratios of adsorbed P_2O_5 to acid-sol. P_2O_5 ranged from 28 to infinity, between pH 5.5 and 6 from 1.8 to 6.8, while above pH 6 no ratio was greater than 2.7 and most of them were approx. 1. With increasing soil acidity the proportion of P_2O_5 in the adsorbed form increased; with increasing alky. the proportion of acid-sol. P_2O_5 increased. At pH 4.9 and below, 100% of the P_2O_5 was in the adsorbed form, at pH 8.5 and above, none of the soil P_2O_5 was in the adsorbed form. Similarly for the acid-sol. fraction, at pH 8.8 and over, 100% of the P_2O_5 was in this form and none at pH 4.9 and under.

8624. Brown, Bahngrell W. **A fluorescence study of Wyoming bentonite.** *Am. Mineral.* **34**, 98-101(1949).—*C. A.* **43**, 8988*a*.

Wyoming swelling-bentonite and Colorado beidellite, when brought into contact with a water soln. of Zn uranyl acetate, fluoresced under short ultraviolet light; other clays did not respond. Data were given correlating this test to the green compressive strength, viscosity, and shear.

8625. Chernov, V. A. **The nature of soil acidity. III. The mechanism of the reaction of acid soils with an alkaline solution.** *Pochvovedenie (Pedology)* **1949**, No. 5, 256-67.—*C. A.* **43**, 7616*h*.

A water and KCl suspension of Krasnozem (red loam) of the Caucasian subtropics was detd. at a series of points on the titration curve of the KCl suspension. The data showed that the mechanism of the reactions involved was as follows: the OH groups combined with the trivalent Al and the K ions were adsorbed by the soil. This reaction took place in the pH range 5.4-7.2. The pH curve of the H_2O suspension was 2.0-2.5 units lower than that of the KCl suspension. From the quantity of alkali that it took to titrate to the break on the titration curve, the base necessary to eliminate the exchange acidity was calcd.

8626. Coleman, N. T.; Jackson, M. L., and Mehlich, A. **Mineral composition of the clay fraction. II. Several Coastal Plain, Piedmont, and mountain soils of North Carolina.** *Soil Sci. Soc. Am., Proc.* **14**, 81-5 (1949)(Pub. 1950)—*C. A.* **45**, 1713*c*.

The mineral constitution of the fine clay, coarse clay, and the fine silt fractions of the *A*, *B*, and *C* horizons of 7 North Carolina soils were detd. The base-exchange capacities of the colloids were largely correlated with the kind of colloidal minerals present.

8627. D'ANS, JEAN AND ULRICH, ERNST. **Conversion of montmorillonite with neutral salt solutions.** *Naturwissenschaften* 36, 344-5(1949).—*C. A.* 44, 5504*h*.

Hydrogen montmorillonite (HMo) was titrated in 1 to 3% KCl soln. (100 ml) with a glass electrode as indicator. The amt. of H ions liberated was proportional to the HMo used; however, the Mo acted as a dibasic acid, the first H was readily neutralized, whereas it took up to several days for the equil. to become established with the second H. From the data an apparent mol. wt. of HMo of 2000 was calcd.; the mol. wt of the simplest formula $Al_2O_3.4SiO_2.H_2O$ was 360.

8628. EVANS, D. D. AND KIRKHAM, DON. **Measurement of the air permeability of soil in situ.** *Soil Sci. Soc. Am., Proc.* 14, 65-73(1949)(Pub. 1950).—*C. A.* 45, 1710*g*.

A method was developed for measuring the air permeability of soil without disturbing the soil. Measurements of the permeability of some Iowa soils under different cropping systems and treatments demonstrated the usefulness of the method.

8629. EVERSON, JOHN N. AND WEAVER, JAMES B. **Effect of carbon black on properties of soils.** *Ind. Eng. Chem.* 41, 1798-1801 (1949).—*C. A.* 43, 9317*i*.

Carbon black incorporation in soil had an important temp. effect. At the surface and 2 in. deep in the soil, addn. of carbon increased max. and min. temp. attained. This temp. effect increased the time available for plant growth and possibly the biol. activity in the soil.

8630. FERRARI, CARLO. **The adsorption of silicic acid by roots.** *Boll. sci. facoltà chim. ind. univ. Bologna* 7, 23-5 (1949).—*C. A.* 43, 9320*f*.

The colored silicomolybdic ion was formed only if silicic acid reacted with molybdic acid; it did not form if the silicates were previously treated with acids and SiO_2 was free. This reaction was used to det. the condition of silicates existing in soils near the root hairs, which in respiratory activity, develop CO_2. Silicic acid formed by the action of HCl or H_2SO_4 on a sol. silicate in the soil existed in a dialyzable form, able to react with NH_4 molybdate.

8631. FRIED, MAURICE AND MACKENZIE, ARNOLD J. **Rock phosphate studies with neutron-irradiated rock phosphate.** *Soil Sci. Soc. Am., Proc.* 14, 226-31(1949)(Pub. 1950).—*C. A.* 45, 3542*a*.

With rock phosphate, the higher the soil pH, the lower the relative amts. of fertilizer to soil P absorbed by plants. With superphosphate, soil pH did not influence this relative uptake. At pH 5.8, plant removal of P from superphosphate equaled or exceeded removal from rock phosphate even when the latter material was applied at 4 times the P_2O_5 rate. The total uptake of P from the rock phosphate was as much as 16.4 times that of Ca.

8632. GORING, C. A. I. AND BARTHOLOMEW, W. V. **Microbial products and soil organic matter. II. The effect of clay on the decomposition and separation of the phosphorus compounds in microorganisms.** *Soil Sci. Soc. Am., Proc.* 14, 152-6 (1949).—*C. A.* 45, 2123*e*.

Mixed microbial tissue was allowed to decomp. in the presence of varying concns. of kaolinite and bentonite. With the analysis used, clay did not prevent almost complete extn. of the org. P present although it did interfere with the normal distribution among the several org. fractions. Bentonite exerted a more marked effect than did kaolinite.

8633. HARRIS, THOMAS H. **The determination of γ-benzene hexachloride in insecticide products.** *J. Assoc. Offic. Agr. Chemists* 32, 684-90 (1949).—*C. A.* 43, 9330*i*.

Silicic acid (50 g) was employed in the chromatography and 5-ml fractions were collected. The slurry of silicic acid with nitromethane and hexane was prepd in a Waring Blendor. A dye, D & C Violet No. 2 (1-hydroxy-4-p-toluinoanthraquinone), was added to the soln. aliquot to be chromatographed and served as a visible marker for the front of the colorless γ-benzene hexachloride band as it moved down the column. The advantages of the method were fewer fractions collected, simplified app., and more rapid analysis, the chromatography time being reduced from about 3 hrs to about 45 min.

8634. KIEFER, C. **Origin of the charge of suspensions of foliated minerals and its relation to the surface lattice structure of minerals.** *Bull. soc. franc. céram.* **1949**, No. 2, 24-30; *Ceram. Abstracts* **1951**, 147.—*C. A.* 46, 6043*g*.

Electrophoretic studies were conducted to det. whether the charge on the kaolinite micelle could be ascribed to adsorption of ions from the surrounding soln. or to dissocn. of ions from the surface of the mol. It was shown that kaolinite acquired its charge by adsorbing ions, while mica (muscovite) became charged by dissocn. of ions from its surface. This was demonstrated by measuring the electrophoretic velocity of the micelles at varying concns. The velocity of mica increased with increasing diln., while that of kaolinite decreased. Na pyrophosphate was used as the deflocculant. The results were confirmed by the observed changes in the cond. and the pH of the suspension.

8635. KREVELEN, D. W. VAN AND HOFTIJZER, P. J. **Drying of granulated materials. I. Drying of a single granule.** *J. Soc. Chem. Ind.* 68, 59-66(1949).—*C. A.* 43, 4906*a*.

To predict the dimensions of app. needed, a theoretical presentation was followed by the derivation of equations for granules with no sol. salts and granules with sol. salts crystg. during drying. Exptl. verification was obtained by using wet marl and nitro-chalk fertilizer contg. 60% NH_4NO_3 and 40% marl.

8636. LANDERGREN, STURE. **Formation of apatite-iron ores.** *Geol. Fören. i. Stockholm Förh.* 71, 293-302 (1949).—*C. A.* 43, 8317*b*.

The problem of apatite-Fe ore genesis was considered as a link of a metamorphic cycle within the upper lithosphere. The enrichment in Fe, V, P, and F took place mainly in the exogenic phase of development, on the geochemistry of the Fe ores of Grangesberg, and on the general geochemistry of the Swedish Fe ores and assocd.

rocks. The element distribution mentioned was significant for sediments especially those in the English oölitic Fe ores which were of typical marine origin. The V:Fe and P:Fe ratios in these ores were nearly identical with those in the Swedish apatite-Fe ores. Also, the geochem. cycle of F^- was typically exogenic and combined with that of P. Enrichment of both elements was normal in sedimentary ores.

8637. MALQUORI, ALBERTO AND FORTUNIO, MARIA. **The surface activity of argillaceous materials. III. Treatment of different types of clay with hydrochloric acid and potassium hydroxide.** *Ann. chim. applicata* 39, 427-46(1949).—*C.A.* 45, 9785*c*.

The clay was treated for 30 min. with boiling HCl (concn. from 0.1 *N* to 10.5 *N*) and boiling KOH (5%) resp., the soln. filtered, and the amt. of dissolved SiO_2, Al_2O_3, and Fe_2O_3 detd. The ratio of dissolved SiO_2 to Al_2O_3 seemed to be a const. for the same type of clay, the abs. value of the dissolved materials being a measure of the amorphous material contained in the clay. The treatment with HCl decreased the anion-exchange capacity of every clay, whereas the treatment with KOH did not affect it.

8638. MANN, C. A.; CEAGLSKE, N. H., AND OLSON, A. C. **Mechanism of dielectric drying.** *Ind. Eng. Chem.* **41**, 1686-94 (1949).—*C.A.* 43, 8752*i*.

A comparison of 4 drying curves, the movement of liquid H_2O in the sand, crit. moisture contents, and relation between const. drying rate and the unsatn. of the air were independent of the method of drying. The rate of dielec. drying increased linearly with voltage, increased with the frequency when the air temp. increased, and might increase or decrease with an increase in air velocity depending upon the air temp. The rate depended on particle size and, perhaps, shape and bulk d., and upon the elec. properties of the liquid satg. the sand.

8639. MARSHALL, C. E. AND BARBER, S. A. **The calcium-potassium relationships of clay minerals as revealed by activity measurements.** *Soil Sci. Soc. Am., Proc.* **14**, 86-8(1949)(Pub. 1950).—*C.A.* 45, 1713*a*.

The Ca-K relationship was studied on Arizona bentonite, Putnam clay (beidellite), illite from Illinois grundite, illite from Maquoketa shale, kaolinite from Langley, S.C. halloysite, and attapulgite. When the ratio of K/Ca activities was plotted against the ratio of K/Ca concns., it was seen that the montmorillonite group clays gave extremely steep curves as compared with kaolinite. The data emphasized the fact that the ionic environment of the plant root was an extremely sensitive function of the type of clay mineral present in the soil.

8640. MILES, EVAN E. **Report on exchangeable potassium in soils.** *J. Assoc. Offic. Agr. Chemists* 32, 370-2 (1949).—*C.A.* 43, 7172*e*.

A collaborative study of exchangeable K in soils indicated that the volumetric potassium cobaltinitrite-ceric sulfate procedure of Mehlich was more accurate than the flame-photometric method.

8641. MOSCHLER, W. W.; OBENSHAIN, S. S.; COCKE, R. P., AND CAMPER, H. M. **The effect of varying amounts of ground limestone on the pH and base exchange properties of Sassafras fine sandy loam.** *Soil Sci. Soc. Am., Proc.* **14**, 123-5(1949)(Pub. 1950).—*C.A.* 45, 1711*b*.

The data were based on samples taken after 23 yrs of liming at different rates. The 10-18 in. layer contained much less org. matter and dil. acid-sol. P than did the 0-8 in. layer. However, the 2 layers compared favorably in pH, exchangeable H, Ca, Mg, and K. In terms of percentage satn., the exchangeable H decreased from a high of 61% to a low of 28% at the extreme rates of application (0 and 3000 lbs per acre, resp.), while exchangeable Ca increased from a low of 24% to a high of 57%.

8642. NAYAR, M. R. AND SHUKLA, K. P. **Base exchange, adsorption, permeability, and related properties of soils.** *J. Sci. Ind. Research* (India) 8B, No. 8, 137-40 (1949).—*C.A.* 44, 5503*g*.

A series of adsorption expts. with Na_2CO_3 of varied concn. on soils showed that Freundlich's adsorption isotherm was applicable. The const. a in the equation $y=aC^{1/n}$, in which y was Na_2CO_3 adsorbed and C the equil. concn., showed that a varied as the square of the base-exchange capacity, B. The value of n varied from 0.8 to 1.1. Data on the base-exchange reaction showed that the Ca exchanged, x, could be expressed in terms of the initial concn., I, and the base-exchange capacity, B, as follows: $x + (P+IB)/(q+I)$ in which p and q were consts. This equation fitted the data more closely than that of Langmuir or of Vageler.

8643. PATHAK, A. N.; MUKERJI, S. K., AND SHRIKHANDE, J. G. **The cation-exchange capacity of the different mechanical fractions of the soil and its organic matter.** *Current Sci.* **18**, 375-6 (1949).—*C.A.* 45, 293*f*.

Samples were taken at depths of 0 to 15, 15 to 30, and 30 to 60 cm from profiles of the station's permanent wheat plots that have been used without manure and with manure. The samples were sepd. into clay, silt, and sand fractions according to the international method. The base-exchange capacity was detd. for each sample and for the primary particles of all samples of both series it was of the order 30 milli-equivs./100 for the clay, 7.5 for the silt, and 2 for the sand. The exchange capacity of the clay alone was 4.48 milliequivs./100 at 0 to 15 cm, 5.77 at 15 to 30, and 9.09 at 30 to 60 for the unmanured series and 3.91, 6.11, and 8.52 for the manured series.

8644. PERKINS, ALFRED T. **Reactions of muscovite, bentonite, and their treated residues.** *Soil Sci.* 67, 41-6 (1949).—*C.A.* 43, 3957*f*.

Grinding altered the chem. and phys. characteristics of muscovite and bentonite. It greatly increased the base-exchange capacity of muscovite and its reaction with acid and base. It activated bentonite so that aggregation or polymerization occurred when the mineral was suspended in water. Base-exchange capacity was decreased by prolonged grinding, which indicated decompn. of the mineral.

8645. PERKINS, ALFRED T. **Reactions of bentonite as influenced by adsorbed cations and grinding.** *Soil Sci. Soc. Am., Proc.* 14, 93-6(1949).—*C.A.* 45, 2374*b*.

Dry grinding bentonite destroyed the montmorillonite complex. The decompn. products reunited to form other minerals including kaolin. The formation of kaolin was favored by satg. the exchange complex with equal amts. of Ca and H. Ca-satd. bentonite did not form kaolin on grinding, and H-satd. bentonite formed only min. amts.

8646. RANEY, W. A. **Field measurement of oxygen diffusion through soil.** *Soil Sci. Soc. Am., Proc.* 14, 61-5 (1949)(Pub. 1950).—*C.A.* 45, 1709*h*.

A chamber for measuring O_2 diffusion in the soil in *situ* was described. There was little difference between the effects of regular plowing and subsurface tillage, but disked and rotary-tilled plots gave higher values for density and lower values for the diffusion rate and partial pressure of O_2 at 4-, 8-, and 12-in. depths. In the rotations, the partial pressure of O_2 was lower under the rotation with the larger quantity of incorporated org. matter, yet the diffusion rate was higher which indicated better aeration even with the lower partial pressure of O_2.

8647. SHAW, W. M. **Determination of exchangeable hydrogen and lime requirement of soils.** *J. Assoc. Offic. Agr. Chemists* 32, 437-52 (1949).—*C.A.* 43, 7171*d*.

When 13 soils were titrated with $Ca(OH)_2$ in 0.5 *M* $(AcO)_2Ca$ and $Ba(OH)_2$ in 0.5 *M* $(AcO)_2Ba$, little difference in values was obtained, whereas $AcONH_4$ gave much lower results. At the Ca-absorption levels equiv. to the indicated base requirement by the $Ba(OH)_2$-$(AcO)_2Ba$ titration, the incubated soils had a pH about 7.1. The proposed "2-point" titration procedure was believed to be more in line with the base-exchange principle, and gave results nearest to those obtained by soil-$CaCO_3$ equil.

8648. SMITH, H. V.; BUEHRER, T. F., AND WICHKSTROM, G. A. **Effect of exchangeable magnesium on the chemical and physical properties of some Arizona soils.** *Soil Sci.* 68, 451-62 (1949).—*C.A.* 44, 4179*f*.

A study of two poor Arizona soils high in Mg showed that the poor structure of these soils was due to their high montmorillonite content of colloidal clay. Mg acted like Ca and not like Na in its effects upon the structural properties of soil; e.g. when capillary rise was measured on Gila fine sandy loam satd. with different amts. and ratios of Mg to Na, the rate of capillary rise decreased as the percentage of Na satn. increased and the percentage of Mg satn. decreased.

8649. THERON, J. J. AND NAUDE, C. J. **The influence of fertilizers and irrigation on the acidity and the exchangeable bases of the soil.** *Union S. Africa, Dept. Agr. Sci. Bull. No.* 276, 21 pp. (1949).—*C.A.* 44, 9606*g*.

This application of about 200 lb per acre of $(NH_4)_2SO_4$ over a 4-year period reduced the pH of the surface soil of a red loam from 5.5 to 5.0. This treatment also reduced the exchangeable Ca and Mg in the surface soil; some of the ions were absorbed in the subsoil. The pH of the subsoil was not affected. The exchangeable K also was not affected either in the surface or subsoil. The annual application of 7 tons of manure raised the pH of the surface soil by about 0.16 units and materially increased the exchangeable Ca, Mg, and K. The use of irrigation water contg. 200 p.p.m. of Ca and Mg bicarbonates raised the pH of the soil and increased the exchangeable Ca and Mg materially.

8650. VLAMIS, J. **Growth of lettuce and barley as influenced by degree of calcium saturation of soil.** *Soil Sci.* 67, 453-66 (1949).—*C.A.* 43, 7622*h*.

Leaching with 5 tons of gypsum per acre alleviated rosette disease and improved the yield markedly. Various cations were added to the soil on cation-exchange Amberlite. Ca-Amberlite relieved the symptoms and increased the yield to the normal high fertile soil level. Mg-Amberlite decreased the yield and increased the rosette disease. Sr-Amberlite effected a very slight improvement. Various cation Amberlites were added to a fertile soil in an attempt to produce the rosette. Only when the Ca satn. was lowered, irrespective of the method, did the rosette appear.

8651. WIKLANDER, LAMBERT. **Adsorption equilibra between ion exchangers of different nature. I. Release of cations from soil by adsorption on exchange resins.** *Kgl. Lantbruks Högskol. Ann.* 16, 670-82(1949).—*C.A.* 44, 778*g*.

The distribution of a univalent ion in equil. with H ion between two acidoids of different properties mixed in different proportions was calcd. on the basis of theory. By an appropriate choice of proportions of the mixt. the ion could be almost completely adsorbed on the stronger ion. The effect of the time of contact, grain size of the resin, and the proportions of the mixts. was studied with a mineral soil satd. with various cations and a sulfonated ion-exchange resin "Wolfatit K". Equal proportions of the resin and the soil effected a practically complete extn. of the releasable ions. The ions studied were K, Cu, Mn, Fe, and Al.

8652. ALBAREDA HERRERA, J. M.; ALEIXANDRE FERRANDIS, V., AND GARCIA VICENTE, J. **Variation of the physicochemical properties of clays with size of particle.** *Anales edafol. y fisiol. vegetal* (Madrid) 9, 279-337 (1950); *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 80-2; 4, 74 (1950).—*C.A.* 45, 4858*i*; 46, 4714*a*.

The active surface and the quantity of water adsorbed increased if the fraction was mostly kaolinite, but the influence of particle size was inconspicuous if it was mainly montmorillonitic. The B.E.T. equation was used to calc. y_m (the no. of mol. layers of water adsorbed). Comparison of y_m and the exchange values of the clays showed that, in general, they varied in the same sense. It was immaterial whether the 0.8- or the 1.13-μ fraction was taken, because their phys. properties and mineral compns. were much alike; in less-developed soils it was advisable to sep. the fractions.

8653. Askinazi, D. L. and Ginzburg, K. E. **The role of clay minerals in the soil on the adsorption of phosphate ions.** *Trudy Pochvennogo Inst. im. V. V. Dokuchaeva, Akad. Nauk S.S.S.R.* 33, 20-48(1950).—*C.A.* 47, 240*e*.

Ignited clay minerals and R_2O_3 changed their capacity to adsorb phosphates. $Fe(OH)_3$, iron-contg. minerals, and $Al(OH)_3$ in some cases reduced the quantity of sorbed P; in other cases, freshly prepd. $Al(OH)_3$, gibbsite, and other Al-contg. minerals increased the adsorption of P. Montmorillonite and muscovite were not affected by the ignition; biotite behaved like the Fe-contg. minerals. Pot tests with the different phosphates corroborate the chem. tests on the capacity to adsorb P and make it immobile.

8654. Baird, Guy B. and Mehlich, A. **The effect of soil-exchangeable cations on Swiss chard and cotton.** *Soil Sci. Soc. Am., Proc.* 15, 201-5(1950)(Pub. 1951).—*C.A.* 46, 209*e*.

The effect of exchangeable Ca, Ba, Sr, Mg, K, Na, NH_4^+, and H ions on the growth and mineral content of Swiss chard and cotton was studied in greenhouse pot cultures. The degree of Ca satn. ranged from 10 to 80%, the remainder in each case being made up by one of the other complementary ions. At the highest level of Ca there were no significant differences in growth of Swiss chard, and only slight differences in the case of cotton, irrespective of the complementary ion. At the lowest level of Ca both plants failed to grow where the complementary ion was Ba, H, or Na. In addn. cotton failed at this Ca level when Sr or K was the complementary ion.

8655. Baouman, Alfred. **The enrichment and thermal treatment of natural phosphates.** *Genie civil* 127, 266-70 285-90(1950).—*C.A.* 44, 11044*d*.

The North African phosphates were described and their drying and flotation reviewed. Thermal treatment of these phosphates, the reactions involved, and the properties of the thermophosphates obtained were discussed. They could be used instead of superphosphates in fertilizers.

8656. Barber, Stanley A. **Studies of cationic activities on clay minerals.** *Pub. No.* 1361, 215 pp. *Microfilm abstracts* 9, No. 3, 3-4 (1950).—*C.A.* 44, 5676*h*.

8657. Barbier, Georges and Maroger, Maurice. **Action of humates on pulverized apatite.** *Compt. rend.* 230, 130-2(1950).—*C.A.* 44, 4619*g*.

Humates dissolved in H_2O permitted calcium phosphates slightly sol. in themselves to maintain a stable suspension, and formed a homogeneous colloidal soln. A neutral colloidal soln. of calcium humates was agitated 1 day with 2.5 g pulverized apatite contg. 1% > 2 μ particles, then centrifuged at 1500 gravity 10 min. The liquid floating on the surface contained 6.7 mg P_2O_5/liter compared with 0.32 for the apatite agitated in pure H_2O. If a neutral soln. of calcium phosphate (6 mg P_2O_5/liter of mixt.) was added to the humates, the phosphates remained entirely dissolved in the intermicellar liquid. Suspensions of known amts. were centrifuged and verified the fact that the apatite settled independently of the humates.

8658. Bárta, R.; Satava, V.; Vachtl, J., and Vašiček, J. **Green clay of Vonšov.** *Chem. Listy* 44, 177-84(1950).—*C.A.* 45, 5843*c*.

The green clay of Vonšov (northwestern Bohemia) was subjected to chem. analysis, microscopic, thermal, x-ray investigations, and examn. under the electron microscope. Sorption capacity and ability to eliminate adsorbed electrolytes were detd. Possibilities of tech. use were suggested.

8659. Beavers, Alvin H. and Marshall, C. E. **The cataphoresis of clay minerals and factors affecting their separation.** *Soil Sci. Soc. Am., Proc.* 15, 142-5 (1950); *Univ. Microfilms, Pub. No.* 1772, 143 pp; *Microfilm Abstracts* 10, No. 3, 236-7 (1950).—*C.A.* 46, 206*f*.

Sepn. of complex mixts. of clay minerals by selective coagulation of individual members was discussed. Favorable conditions for sepn. occurred when 1 constituent of the mixt. had zero zeta potential and was coagulated, while the others had a high zeta potential and formed a stable suspension.

8660. Benson, A. A.; Bassham, J. A.; Calvin, M.; Goodale, T. C.; Haas, V. A., and Stepka, W. **The path of carbon in photosynthesis. V. Paper chromatography and radioautography of the products.** *J. Am. Chem. Soc.* 72, 1710-18 (1950).—*C.A.* 44, 5967*g*.

Paper chromatography was employed to sep. the radioactive products formed during photosynthesis in $C^{14}O_2$. The method was used for the sepn. and identification of carboxylic acids and phosphate esters. The first observed product of CO_2 assimilation during photosynthesis was isolated and shown to be phosphoglyceric acid.

8661. Bergna, H. E. **Electrokinetic behavior of clay minerals.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 3, 75-80, 174 (1950).—*C.A.* 46, 5761*a*.

The electrokinetic behavior of clay minerals, kaolinite, halloysite, illite, and montmorillonite was studied and the electrokinetic potential variation with pH established with a microelectrophoretic cell. An explanation of the different electrokinetic behavior of clays, based on cryst. structure, was suggested.

8662. Bidwell, O. W. and Page, J. B. **The effect of weathering on the clay mineral composition of soils in the Miami catena.** *Soil Sci. Soc. Am., Proc.* 15, 314-18(1950)(Pub. 1951).—*C.A.* 46, 1864*c*.

The illitic type of clay mineral was dominant in the horizons of these soils. This type of clay mineral was present in the parent material and it appeared that a large part of this mineral occurring in the solum may have been inherited from the parent material. Differential thermal and x-ray analyses gave little evidence for change in the nature of the clay minerals of these soils with depth. Cation-exchange detns.

indicated differences in chem. properties with depth.

8663. Black, I. A. and Smith, E. **Routine determination of exchangeable bases in soils by the Lundergardh flame spectrographic method.** *J. Sci. Food Agr.* 1, 201-8(1950).—*C.A.* 45, 495*i*.
A modified procedure was given for detg. exchangeable bases which also gave information on the base satn. of the soil. The modifications include an automatic leeching app. for extg. soils with NH_4OAc.

8664. Bloomfield, C. **Observations on gleying.** *J. Soil Sci.* 1, 205-11(1950).—*C.A.* 46, 7265*e*.
Samples of clays were incubated with sugar solns. under anaerobic conditions in glass bottles. Artificial gleying occurred and the reaction decreased to pH 4-5. When $CaCO_3$ was present, a gum often formed on the top. Only a small amt. of the reduced Fe remained in the clay, the majority being in the soln. On oxidation, Fe^{+++} was not always pptd.; some complex org. compds. were formed.

8665. Bodman, G. B. and Fireman, Milton. **Changes in soil permeability and exchangeable cation status during flow of different irrigation waters.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 1, 397-400; 4, 175-6(1950).—*C.A.* 46, 2728*d*.
The effect of long-continued irrigation of soil-columns with NaCl-free H_2O and with H_2O salinized by the addn. of $CaCl_2$ and NaCl was examd. with respect to changes in permeability and exchangeable cation status of Aiken and Yolo clay loams. Similar patterns of permeability changes were observed regardless of salt concn. and cationic ratios, e.g., (a) high initial, (b) min., and (c) max. permeability. Stages (a), (b), and (c) were attributed to gradual air displacement, increased H_2O satn., and better H_2O conduction. Influences of microörganisms were believed negligible. High-Na H_2O (Ca/Na = 0.17) increased the exchangeable Na in the soil and also very greatly reduced its permeability, but the latter occurred only when irrigation with high-Na H_2O was followed by irrigation with H_2O of much lower content of total sol. salts.

8666. Boischot, P.; Durroux, M., and Sylvestre, G. **The fixation of iron and manganese in calcareous soils.** *Ann. inst. natl. recherche agron.*, Ser. A, *Ann. agron.* 1, 307-15(1950). —*C.A.* 45, 6331*c*.
Fe and Mn were fixed by Ca in soil. Fe was pptd. and difficult to redissolve in soil soln. Mn was adsorbed and easily dissolved in soil soln. Mg caused an increase in Mn fixation. Clay also adsorbed Mn and yielded it to soil solns.

8667. Bower, C. A. **Fixation of ammonium in difficultly exchangeable form under moist conditions by some soils of semiarid regions.** *Soil Sci.* 70, 375-83 (1950).—*C.A.* 45, 4387*d*.
Of the 21 samples studied, 15 fixed appreciable amts. of NH_4. The sums of the amts. of NH_4 and K fixed were practically the same regardless of the KCl/NH_4Cl ratio in the treating soln. Both the NH_4 and K ions caused equal reductions in the cation exchange capacity.

8668. Bower, C. A. **Availability of ammonium fixed in difficultly exchangeable form by soils of semiarid regions.** *Soil Sci. Soc. Am., Proc.* 15, 119-22(1950)(Pub. 1951).—*C.A.* 46, 203*c*.
A comparison was made of difficultly exchangeable NH_4^+ and readily exchangeable NH_4^+ in soil. A max. of only 10% of the NH_4^+ supplied in difficultly exchangeable form was recovered by barley after 17 days of growth when cultures were not artificially inoculated with nitrifying bacteria, while as much as 75% of the readily exchangeable NH_4^+ was recovered.

8669. Brown, Donald A. and Albrecht, Wm A. **Complementary ion effects in soils as measured by cation exchange between electrodialyzed hydrogen clay and soils. Cation exchange between electrodialyzed clay and soils as a measure of the suite of cations most available to plants.** *Soil Sci. Soc. Am., Proc.* 15, 133-8(1950) *Univ. Microfilms, Pub. No.* 1775, 166 pp.; *Microfilm Abstracts* 10, No. 3, 239-40 (1950).—*C.A.* 45, 6330*i*; 46, 202*h*.
Increasing the percentage satn. by Na decreased the fraction of Ca and Mg in the suite of cations exchanged under all levels of $CaCO_3$. The fraction of K was both increased and decreased. The fraction of Na in the cations exchanged increased proportionally to the degree of Na satn. at the 65% Ca level. The effects of Na were greatest at the lowest levels of $CaCO_3$, the effects being modified by addns. of 3.0, 6.0, and 9.0% free $CaCO_3$.

8670. Carè, Enrica. **DDT and bentonite in the control of Calandra granaria.** *Boll. zool. agrar. e bachicolt., univ. studi Milano* 16, 37-46(1950).—*C.A.* 46, 4164*d*.
A satisfactory technique of assocg. bentonite as insectifuge and DDT as insecticide against *C. granaria* was described.

8671. Davidson, Donald T. **Exploratory evaluation of some organic cations as soil-stabilizing agents.** *Iowa Eng. Expt. Sta., Eng. Rept.* No. 4, 531-7(1950-51); *Highway Research Board, Proc.* 29, 531-7(1949).—*C.A.* 45, 8176*g*.
Armac T, Armac 18D, Armac 12D, Rosin Amine-D acetate, Amine 220, and Ammonyx T were tested on Edina sub-soil, a highly plastic fine-grained clay in amt. equiv. to 1 to 75% of the base-exchange capacity. Results by ASTM methods for plastic limit, liquid limit, plasticity index, shrinkage limit, and rate of slaking were good.

8672. De Keyser, W. L. and Rijssen, A. van. **Micaceous and clay minerals. I. Alteration of micaceous minerals.** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam* 1950, I, 99-100; IV, 66.—*C.A.* 46, 1395*f*.
The behavior of micaceous minerals was studied in the presence of a finite vol. of H_2O at 100°C and an infinite vol. of H_2O at 80°C. At 100°C it was found that the rate of exfoliation was different for various minerals, and an equil. condition reached, which was characterized by a grain-

size distribution. The rate of exfoliation and the final grain-size distribution were very sensitive to the presence of other ions or small quantities of other minerals, e.g., feldspars. At 80°C the pH of micaceous minerals showed a marked influence of dissolved CO_2, indicating a rather strong adsorption of the CO_2 on the mineral. The titration curves showed 2 isoelec. points at pH ± 7 and pH ± 3.

8673. EATON, FRANK M. **Significance of carbonates in irrigation waters.** *Soil Sci.* 69, 123-33(1950).—*C. A.* 44, 7467*g*.

The ability of Na to replace adsorbed Ca and Mg in the soils was increased when irrigation water contained sufficient carbonate plus bicarbonate to ppt. most of the Ca and Mg as carbonates. Thus, low Na concn. in irrigation water did not insure against Ca replacement and black alkali formation.

8674. ERIKSSON, ERIK. **The water content-ion activity relationship in bentonite gels and soils.** *Kgl. Lantbruks-Högskol. Ann.* 17, 204-10 (1950)(in English).—*C. A.* 45, 5348*g*.

As long as the water content was below the point of transition from gel to suspension the water content was equal to a const. × (H^+ ion content)$^{-1/2}$ + another const. for bentonite, and approx. valid in a very small range for electrodialyzed ground Mölner humus, a low-moor peat and 5 clayey soils.

8675. EVERSON, JOHN N. AND WEAVER, JAMES B. **Effects of carbon black on the properties of soils. II. Effects on humid soils.** *Soil sci.* 69, 369-76(1950).—*C. A.* 44, 10982*c*.

Carbon black, by darkening soils, increased energy absorption; because of the differences in charges between colloidal clay and carbon, flocculation and an aggregation occurred in some treated soils. Carbon-treated soils were ready for plowing as much as two weeks earlier than untreated soils. Other factors increased by carbon treatment were water-holding capacity, accumulation of salts near soil surfaces, wet and dry flocculation and moisture content.

8676. FUJIWARA, AKIO. **Chemical constitution and availability of iron and aluminum phosphates. I. The constitutions and fertilizer effects of scarcely soluble phosphates.** *Tohoku J. Agr. Research* 1, 129-41, 143-9 (1950).—*C. A.* 45, 7284*e*.

The scarcely sol. phosphates, particularly iron salts, became high in fertilizer effect by the promotion of hydrolysis resulting from high temp., alk. reaction of surface water, and large quantity of water. In winter the degree of hydrolysis was lowered, but Al salts were not reduced and showed an effect superior to iron salts for barley crops. Amorphous ppts. of $FePO_4$, $AlPO_4$, and cryst. $Ca_3P_2O_8$ promoted fertilizer effects in descending order of effectiveness. The method of manufg. fertilizer by dissolving phosphate rock and repptg. after neutralization was important.

8677. GATTA, LUIGI DELLA. **The red soils of Apulia. I. Exchangeable potassium.** *Ann. sper. agrar.* 4, 169-78(1950).—*C. A.* 44, 8034*e*.

The exchangeable K in 92 cretaceous lime soils and 4 eocene soils from Apulia varied from 0.010 to 0.052 (av. 0.029) % or 300-1560 kg/ha. The exchangeable K of 50% of the samples was between 0.0225 and 0.0375%. The Apulian red soil was richer in exchangeable K than that from other provinces and did not need a K top dressing. There was no relation between exchangeable and total K in these soils.

8678. GONZÁLEZ, F. GARCÍA. **Properties of silicates of the montmorillonite group.** *Anales edafol. y fisiol. vegetal* (Madrid) 9, 149-85 (1950).—*C. A.* 45, 3704*e*.

Alk. and alk. earth samples of montmorillonites were heated to const. wt at 100-800°C and rehydrated in a moisture-satd. atm. Montmorillonites contg. cations of large vol. and small electrostatic field had a high rehydration capacity as long as the crystal structure was not destroyed by loss of tightly bound H_2O. The fixation of the layers brought about a condition similar to that of the structure of mica. Both montmorillonite and kaolinite behaved as moderately strong acids and reacted practically neutral at pH 5. On the other hand, clays reacted as very weak acids on account of the presence of gels of Al_2O_3, Fe_2O_3, and SiO_2.

8679. GORING, C. A. I. AND BARTHOLOMEW, W. V. **Microbial products and soil organic matter. III. Adsorption of carbo-hydrate phosphates by clays.** *Soil Sci. Soc. Am., Proc.* 15, 189-94(1950).—*C. A.* 46, 205*i*.

Data were presented to show to what extent some of the carbohydrate phosphates could react with the clay mineral fractions commonly found in soil. The concn. of the adsorbents in suspension was 0.5% and of P 0.025 to 0.075 mg per ml. With coarse bentonite the sequence of decreasing adsorption of the salts of monovalent cations was phytin > phytin derivs. > fructose 1,6-diphosphate > fructose 6-phosphate, orthophosphoric acid > glucose 1-phosphate > glycerophosphoric acid > phosphoglyceric acid. Salts of divalent cations were adsorbed to a greater extent than those of monovalent cations. The carbohydrate phosphates and orthophosphoric acid were fixed to the greatest degree between pH 5 and 6.5. Bentonite adsorbed carbohydrate phosphates to a greater extent than did illite or kaolinite.

8680. GRANDORI, REMO; GRANDORI, L.; DOMENICHINI, G., AND CARÈ, E. **Bentonite as disinfestation agent of stored wheat.** *Boll. zool. agrar. e bachicolt., univ. studi Milano* 16, 51-84(1950). —*C. A.* 46, 4164*c*.

Fine powd. Italian bentonite mixed 0.2-0.5% with wheat was satisfactory to control wheat insects. Bentonite was permitted by the Italian Pharmacopeia.

8681. GRUNER, E. AND VOGEL, R. E. **Swelling properties of bentonites based on adsorption of cations.** *Kolloid-Z.* 116, 89-99(1950).—*C. A.* 44, 6229*h*.

Treating six bentonites with alk. earth (Mg, Ca, Sr, Ba) or alkali (Na, K) hydroxides gave semifluid slips, the consistency of which depended on the concn. of the hydroxide. Two opposing reactions were involved: (1) liquifaction, as a result of OH-ion adsorption, and (2) swelling as a result of the adsorption of H_2O at the Si-O planes of the montmorillonite crystal lattice. The latter depended largely on the cation valence and on the basicity of the hydroxide, i.e., the chemisorption of the bentonite-hydroxide system which took place at the Si-O planes. Hydration of the adsorbed cations resulted in addnl. H_2O at the planes, and thus in increased swelling. Increasing basicity of the hydroxide caused increased chemisorption, blocking of the Si-O planes, and thus reduced swelling.

8682. Gutierrez Rios, E. and Gonzalez, F. Garcia. **Genesis of bentonite from Tidinit (Spanish Morocco).** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam* **1950**, **I**, 92-6; **IV**, 65.—*C.A.* **46**, 1398*i*.

The high pH values (8.28-8.70) of the suspensions in H_2O showed that the process occurred under alk. conditions. Thermal analysis by the method of dehydration curves at 100-800°C showed a steady increase in hydration H_2O. The cation-exchange capacity showed a steady increase from 5.23 to 104.07 milliequivs./100 g of sample. Silicates of bentonites from Spanish Morocco have been formed by action of H_2O on andesites under alk. conditions, with hydration of the original lattice of feldspar which caused rupture of the lattice bonds and permitted formation of a suitable equil. between the silicate compn. and the soln. producing the transformation.

8683. Gutiérrez Ríos, E. and Martin Vivaldi, J. L. **Hydration of layer-lattice silicates with exchangeable cations.** (Inst. edafol. y fisiol. vegetal, Granada, Spain). *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* **2**, 67-71; **4**, 59 (1950).—*C.A.* **46**, 4319d.

8684. Hardon, H. J. **The bases in the clay fraction of Indonesian soils.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* **1**, 310-12(1950).—*C.A.* **46**, 2726*g*.

The lateritic soils contained kaolinite, the marl soils montmorillonite, and the limestone soils metahalloysite. An explanation of this uniform compn. was the rapid weathering under tropical conditions. H_2O adsorption was a function of mineralogical compn. The amt. of adsorbed bases was detd. on the clay fraction of more than 45 samples of Indonesian soils of several soil groups. Ca was mostly in the exchangeable form, but only a small % of Na was exchangeable; Mg and K was intermediate between these two. The bases present in the nonexchangeable form were either a constituent of the clay minerals or were bound to Fe oxides, which amt. to rather high percentages in the clay fractions. Although total Ca was generally higher than Mg, the nonexchangeable Mg showed the highest values of the bases: also there was a high % of nonexchangeable Na in all the soil fractions.

8685. Haseman, J. F.; Brown, Earl H., and Whitt, Carlton D. **Some reactions of phosphate with clays and hydrous oxides of iron and aluminum.** *Soil Sci.* **70**, 257-71(1950).—*C.A.* **45**, 4387*h*.

Phosphate fixation by clay minerals was affected by pH, concn. of the phosphating soln., temp., and the nature of the mineral. The decreasing order in which minerals fixed phosphate generally was: gibbsite, goethite, illite, kaolinite, montmorillonite. Complex Fe and Al phosphates formed upon fixation showed pattern similar to the palmerite pattern.

8686. Hutton, Curtis, E. **Chemical and physical characteristics of a chrono-litho-sequence of loess-derived prairie soils of southwestern Iowa.** *Soil Sci. Soc. Am., Proc.* **15**, 318-24 (1950)(Pub. 1951).—*C.A.* **46**, 1681*g*.

The data indicated clay minerals of a high exchange capacity belonging to the montmorillonite-nontronite and illite groups. The exchange capacity of the clay in the more highly weathered Seymour soil was lower than in comparable horizons of the Monona and Sharpsburg. The data showed that (*a*) cation eluviation, (*b*) formation and movement of clay within the sola, (*c*) differences in parent material, and (*d*) variations in effective time of soil formation were the primary causes of the differences between the profiles studied along this sequence.

8687. Istomina, V. S. **The wedge effect of thin layers of water between the particles of coherent ground.** *Kolloid. Zhur.* **12**, 279-85 (1950).—*C.A.* **44**, 10981*i*.

Soils of a definite moisture content, w_o, were placed in beakers and covered with H_2O. After 1.5-3 months, the moisture content was detd. at different levels, and the depth h was found at which $w = w_o$. From the exptl. relation between h and w_o, the relation between pressure and the thickness a of the H_2O film covering the soil particles was calcd.; $\sigma = h\gamma$ and $a = w\gamma/S(1-n)\Delta$; γ was the d. of the soil, S its specific surface, n its porosity, and Δ was the density of H_2O.

8688. Jenny, H.; Nielsen, T. R.; Coleman, N. T., and Williams, D. E. **The measurement of pH, ion activities, and membrane potentials in colloidal systems.** *Science* **112**, 164-7(1950).—*C.A.* **44**, 9774*e*.

The liquid-junction potential between a KCl bridge and a suspension of highly charged clay or resin particles was not negligible. The transference no. of Cl^- in KCl solns. was lowered by suspended cation exchange particles, the more so the greater the exchange capacity and the less the activity of the KCl. The membrane potential had the effect of lowering the electrometrically detd. pH of suspensions, pastes, and gels.

8689. Khan, D. V. **The absorption of organic substances by soil minerals.** *Pochvovedenie* (Pedology)(U.S.S.R.) **1950**, 673-80.—*C.A.* **45**, 4385*g*.

Humic acid was prepd. by extg. soil with 2% NH_4OH, pptg. with H_2SO_4, dialyzing until free of SO_4, and dissolving with NH_4OH to pH 6.8. This soln. was mixed with montmorillonite and assocd. minerals, kaolinite, orthoclase, and muscovite in the ratio of 1:5. The montmorillonitic group adsorbed 1.2-0.969 g C per 100 g of the mineral; kaolinite 0.20 g; orthoclase 0.25 g; and muscovite 0.44 g. When the minerals were ground to less than 0.2 μ, the kaolinite, orthoclase, and muscovite increased their adsorption capacity, but not the montmorillonite. The minerals were satd. with H, Ca, Fe, and Al and tested for sorptions of humic acid. The Fe- and Al-satd. minerals sorbed most.

8690. KOSHEL'KOV, P. N. **The neutralizing capacity of ground rock phosphate.** *Pochvovedenie* (Pedology)(U.S.S.R.) 1950, 688-97.—*C.A.* 45, 4392*a*.

Ground rock phosphate was not as effective as a neutralizing agent of soil acidity as $CaCO_3$. However, its P availability continued for a long period of years. In using phosphates it is well to keep in mind that it does eliminate sol. Al and partially neutralizes soil acidity.

8691. LOW, PHILIP F. AND BLACK, C. A. **Reactions of phosphate with kaolinite.** *Soil Sci.* 70, 273-90(1950).—*C.A.* 45, 4387*i*.

Phosphate fixation in concd. solns. by kaolinite was in 2 stages: (1) surface replacement of Si tetrahedra by P tetrahedra, (2) phosphate-induced decompn. of the surface phosphate with subsequent pptn. of an Al phosphate compd. Phosphate fixation in dil. solns. differed from phosphate fixation in concd. solns. In dil. solns. phosphate fixation by kaolinite was a chem. reaction which followed the Freundlich adsorption isotherm.

8692. LEENHEER, L. DE; BOODT, M. DE, AND WELVAERT, W. **The determination of the exchange capacity of the mineral fraction and of the organic matter in the Belgian seapolders.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 1, 129-32(1950)(English summary)—*C.A.* 46, 6303*d*.

Schachtschabel's percolation method was used on a rough soil sample and a 2nd test on a sample treated with 100 vol. % H_2O_2. The results were very satisfactory. The difference in exchange capacity of the clay and silt fraction in 2 different sublandscapes of the seapolders was evident, according to their different ages and mineralogical compns., although the granulometric analysis showed no differences.

8693. MAREL, H. W. VAN DER. **The mineralogical composition of the clay (< 2 μ) separate of the Dutch soils and their cationic-exchange capacity.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 92-4(1950).—*C.A.* 46, 4713*h*.

The mineralogical compns. and base-exchange capacities were given for various (< 2 μ) separates of sea, river, and boulder clays, river loams of pre- and postglacial origin, loess, residual clays from soft limestones, and sediments of tertiary and older date.

8694. MAREL, H. W. VAN DER. **The determination of the cationic-exchange capacity of the inorganic soil particles.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 94-7(1950).—*C.A.* 46, 4713*i*.

The < 2 μ separate of the soil was percolated with 0.5 *N* solns. of NaOAc (pH about 8.2)(to remove adsorbed H ions), NH_4Cl (pH about 5.5)(to remove the elec. double layer of amorphous gels), and NaCl, the filtrate-NH_4 detd., and the cation-exchange capacity (C.-E.C.) calcd. The application of this method to various clays of Dutch soils indicated that there was a close relation between the mineralogical compn. of the clay separate free from org. matter of the Dutch sediments and their C.-E.C. in meq./100 g of < 2 μ separate.

8695. McCLELLAND, J. E. **The effect of time, temperature, and particle size on the release of bases from some common soil-forming minerals of different crystal structures.** *Soil Sci. Soc. Am., Proc.* 15, 301-7 (1950)(Pub. 1951).—*C.A.* 46, 1682*f*.

The effect of particle size, degree of Ca and H satn. of the colloid, temp., and time on the rate of release of bases from bentonite-mineral mixts. was investigated. The minerals examd. were olivine, augite, hornblende, albite, labradorite, microcline, anorthoclase, muscovite, phlogopite, and biotite. The rate of release of bases from minerals increased with decreasing particle size, but the extent to which particle size influenced base release varied with different minerals. Increasing the ratio of Ca:H on the colloidal complex decreased the rate of base release. The rate of base release increased with temp., but the effect of increased temp. decreased with time. Fresh minerals released bases at a fast rate and this rate rapidly decreased with time.

8696. McGEORGE, W. T. AND FULLER, W. H. **Relation between the sodium:calcium ratio in the saturation extract and percentage sodium in the exchange complex.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 1, 400-3; 4, 175-6(1950).—*C.A.* 46, 2729*d*.

Studies of the soils in the upper Gila River Valley of Arizona, after irrigation several years with H_2O of high salinity and unfavorable Na:Ca ratio, indicated an increase in percentage exchangeable Na (X) in the soil and a higher Na:Ca ratio (Y) in the satd. ext. Plots indicated a correlation between X and Y, the unit change in Y/unit change in X being greater for the subsoils than for the surface soils.

8697. McILRATH, WAYNE J. **Growth responses of tomato to nutrient ions adsorbed on a pumice substrate.** *Plant Physiol.* 25, 682-701 (1950).—*C.A.* 45, 221*a*.

The pumice substrate on which the various ions were adsorbed consisted of 3900 g of pieces 1 in. or less in diam. The results indicated that sufficient amts. of Mg, K, and P could be adsorbed on pumice to satisfy the plant's requirements for growth to maturity. The quantity of adsorbed Ca was inadequate for normal growth.

8698. MEHLICH, A. **Cation exchange-anion exchange ratios of kaolinitic soil colloids.** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam 1950*, **I**, 133-5; **IV**, 80-1.—*C.A.* 46, 1199*c*.

Digestion of kaolin and kaolinitic soils 4 hrs with 20% HCl to remove most of the Fe and Al oxides resulted in a slight increase in the cation-exchange capacity (C) and a large decrease in the anion-exchange capacity (A). Consequently, the *C/A* ratio was increased and the equil. pH (pH$_e$) decreased. Also, in most cases, the anion-exchange capacity of the treated samples was nearly the same as the cation-exchange capacity before treatment. The *C/A* ratios and pH$_e$ values of the untreated samples showed some relation to the clay mineral compn. Phosphating increased the cation-exchange capacity of the untreated soils and kaolin and had no effect on the HCl-treated soils; the *C/A* ratio was correspondingly increased, but was not as high as on the HCl-treated soils.

8699. MEHLICH, A. AND REED, J. FIELDING. **Hydrogen in soils in its relation to mineral content of plants.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 1, 251-4(1950).—*C.A.* 46, 2218*b*.

Results showing the effect of H ions from HCl on the release of metal cations as related to degree of satn. indicated that (*a*) with the complementary ions remaining const., the release of Ca increased with increasing degree of Ca satn., (*b*) for a given degree of Ca satn., but increasing amts. of Mg or K, the release of Ca decreased, the decrease being greater the lower the degree of Ca satn., (*c*) with decreasing amts. of HCl supplied, for a given degree of Ca satn. and const. Ca-Mg or Ca-K ratios, releases of Mg and K in proportion to Ca increased. Progressively less H ions were adsorbed by soil colloids from addns. with decreasing degree of base satn. A characterization of soils from the standpoint of cation-exchange capacity, exchangeable cations and their release by varying amts. of HCl indicated the reasons for the variations of cations in different or the same plant species.

8700. MENZEL, R. G. AND JACKSON, M. L. **Sorption of copper from acid systems by kaolinite and montmorillonite.** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam 1950*, I, 125-8; IV, 80.—*C.A.* 46, 1199*b*.

Exchange reactions of Cu, K, and H ions were studied. The simple exchange of Cu^{++} ions for K ions sorbed on kaolinite or montmorillonite occurred only in acid dil. Cu solns. The sorption of $CuOH^+$ ion, formed by hydrolysis of Cu^{++} ion according to the equation: $Cu^{++} + H_2O = CuOH^+ + H^+$, was indicated by release of less K than Cu sorbed accompanied by a pH decrease. The H^+ ions released in forming $CuOH^+$ ions were buffered to a limited extent by Al dissolved from the clays.

8701. MERWIN, H. D. AND PEECH, MICHAEL. **Exchangeability of soil potassium in the sand, silt, and clay fractions as influenced by the nature of the complementary exchangeable cation.** *Soil Sci. Soc. Am., Proc.* 15, 125-8 (1950)(Pub. 1951).—*C.A.* 46, 203*a*.

Four soils representing the Dunkirk, Mardin, Honeoye, and Gloucester series were leached with successive portions of 0.5 *N* acetate solns. of different cations. The amt. of K exchanged by the different cations decreased in the following order: Na > H > NH_4 > Mg > Ca > Ba. Three of the soils failed to release K to the 0.5 *N* Ba and Ca acetate solns., but effectively removed the trace of K present as an impurity in these salt solns. In contrast to the continued extn. of K by the NaOAc and the AcOH soln., the NH_4OAc soln. gave a very clear-cut sepn. of the exchangeable K.

8702. MUKHERJEE, S. K. AND GANGULY, A. K. **Base-exchange capacity and crystalline structure of silicate minerals related to soils and clays.** *Indian J. Phys.* 24, 233-56(1950).—*C.A.* 45, 6973*i*.

The chem., phys., and elec. nature of crystals of β-cristobalite, β-tridymite, kaolinite, pyrophyllite, talc, montmorillonite, attapulgite, muscovite, and illite were reviewed with the object of correlating these data with the base exchange capacity. The effect of particle size was considered, and it was shown that for some minerals this could be correlated with base exchange capacity while for others it could not.

8703. OLPHEN, H. VAN. **A tentative method for the determination of the base-exchange capacity of clays.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 97-9; 4, 81(1950).—*C.A.* 46, 4712*h*.

A new tentative method for the detn. of the base-exchange capacity of clays with cetyltrimethyl ammonium bromide was discussed. It was based on the exchange of the cations by strongly adsorbed org. cations. Interfering flocculating electrolytes were NaCl and $FeCl_3$, which should be removed previously by washing on a collodion membrane.

8704. PAAUW, F. VAN DER. **Relation between the lime status and the availability of phosphates in a sandy soil.** *Verslag Landbouwkund. Onderzoek.* No. 56.8, 19 pp.(1950).—*C.A.* 45, 2125*b*.

At the beginning of the expt. different amts. of P_2O_5 and Ca were obtained by application of varying amts. of these in 25 combinations. The expt. was continued for 6 yrs. After a few yrs, the pH varied between 4.2 and 6.3, the P-citrate no. (H_3PO_4 sol. in 1% citric acid), between 12 and 50. In sandy soil, the soly. of H_3PO_4 in H_2O diminished the higher its pH. The P-citrate no., however, was rather independent of the pH. In most cases, the effect of a high P content on the yield was most important at a high pH. Deficiency in P_2O_5 produced in this case markedly decreased yields. The absorption of P_2O_5 contained in the plant material was considerably less at a high pH. In general, optimal yields were obtained with a high P_2O_5 and Ca content. A very low pH had a similar effect on the relation between P_2O_5 content and yield, as has a high pH. The absorption of P_2O_5 proved to be optimal at pH 4.8-5.5; if higher, there was need for more P_2O_5.

8705. PARKERT, C. W.; PERKINS, ALFRED T., AND DRAGSDORF, R. D. **Decomposition of minerals by grinding.** *Trans. Kansas Acad. Sci.* 53, 386-97(1950).—*C.A.* 45, 505*f*.

Kaolinite, montmorillonite, and muscovite decompd. on grinding in a ball mill. Samples ground for various periods of time up to 25 weeks were analyzed with reference to av. particle size, soly., pH, base-exchange capacity, thermal curves, and x-ray diffraction. Indications were that grinding permitted the formation of amorphous material differing from the original material in chem. reactions and structure.

8706. Peng, C. Y.; Chang, S. W., and Hou, K. C. **Nutrient adsorption by soils in relation to soil plasticity.** *Trans. Intern. Congr. Soil Sci. 4th Congr., Amsterdam 1950*, I, 136-7.—*C. A.* 46, 1197*c*.

Plasticity curves were made on samples of a series of soils in which increasing doses of $CaCO_3$ and $Fe(OH)_3$ were incorporated. A yellow-colored lateritic soil (Limonized)(designated as Y_1, Y_2, and Y_3 for its 3 calcified forms), which showed the highest adsorption, and the least reliberation of P_2O_5, increased its reliberation power to as much as 100% when it had been enriched with 2.5% of $CaCO_3(Y_1)$; it then decreased this power to below half of its original with Y_2 and Y_3. Neither of the other soils, including a lateritic soil, a neutral purple-brown soil, and a halloysite, showed the corresponding increase in reliberation power. The effect of various exchangeable cations on the nutrient adsorption power and on the form of plasticity curves was detd. by using an acid purple-brown soil, a red earth, and a halloysite.

8707. Perkins, A. T. and Draggsdorf, R. D. **Decomposition of bentonite as influenced by adsorbed hydrogen and calcium plus grinding.** *Soil Sci. Soc. Am., Proc.* 15, 93-7(1950)(Pub. 1951).—*C. A.* 46, 207b.

Dry grinding of bentonite caused its decompn. so that the Al and Si were more reactive and sol. The decompn. of bentonite and other clay minerals might result in the temporary formation of amorphous silicas, aluminas, or their hydrates, which might recombine into the original clay mineral or other clay minerals of similar structure.

8708. Ramírez Romero, Guillermo. **Exchangeable cations extracted from soils of Valle by tenth normal hydrochloric acid and by ammonium acetate.** *Acta Agron.* 1, No. 1, 51-6(1950). —*C. A.* 46, 2729*i*.

Total exchangeable cations, Ca, Mg, and K were detd. upon 55 soils and subsoils from a point in Valle, 5 km north of Palmira by two methods. The direct detn. of Mg by Titan Yellow gave figures much higher than the difference between the total exchangeable bases and the sum of the exchangeable Ca and K.

8709. Ramsauer, B. **The soil-moisture progress curves.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 35-7; 4, 38-9(1950)(English summary).—*C. A.* 46, 5763*b*.

The H_2O in the soil was defined as the total amt. of H_2O actually present in the soil profile characterized by its type. In the climatically normal yr a characteristic curve of soil moisture had to correspond to each natural soil profile.

8710. Rode, A. A. **Nature of the forces retaining "capillarily suspended" moisture in soil.** *Trudy Pochvennogo Inst. im. V. V. Dokuchaeva* 32, 397-406(1950).—*C. A.* 46, 5763*e*.

The term "capillarily suspended" included unrelated phenomena. In sandy soils as well as in the interphases of subsoil-air and fine-grained subsoil-large-grained subsoil, water was held primarily by capillary forces and was thus correctly called "capillarily suspended." In loamy and clayey soils and subsoils water was held by membrane pressure and should therefore be referred to as "membrane suspended." In all cases, part of the water was held by mol. forces and was, therefore, combined water.

8711. Roy, B. B. and Das, S. C. **Electrochemical properties of hydrogen clays from typical Indian soils.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 3, 81-3(1950).—*C. A.* 46, 5759*i*.

H-clays isolated from regurs (black cotton soils) from different localities of India appeared to be montmorillonitic in nature, and H-clays from lateritic soils of Belgaum and Coimbatore and from acid soils of Jorhat were kaolinitic, according to potentiometric titration curves, electroviscous properties, SiO_2/R_2O_3 and SiO_2/Al_2O_3 ratios, and x-ray, thermal dehydration, and optical studies.

8712. Saito, Nobufusa; Kokubu, Nobuhide, and Kakihana, Hidetake. **Alteration of petalite.** *J. Chem. Soc. Japan*, Pure Chem. Sect., 71, 131-3(1950).—*C. A.* 45, 4610*a*.

A general tendency was that during the alteration SiO_2 and Li_2O contents decreased, while those of Al_2O_3 and water increased. In spite of the decrease of Li_2O other rare alkali metals such as Rb and Cs were found to be considerably concd. in altered petalite. These phenomena were explained by the base-exchange reaction of hydrous aluminosilicates such as hydrocastorite or montmorillonite to which petalite changed by alteration.

8713. Sugden, W. **The influence of the film of water absorbed on mineral grains on the hardening of natural sediments and remarks on similar phenomena.** *Geol. Mag.* 87, 26-40(1950); *Chem. Zentr.* 1950, II, 980.—*C. A.* 46, 11060*b*.

A study of the mechanism of the hardening of sediments showed that the water adsorbed on the mineral grains played an important role in the process. This adsorbed water was also of importance in other geol. processes, such as the migration of oils and gases.

8714. Trifonov, I. and Spasov, A. **The effect of high mechanical pressure upon the binding between the water of constitution and the silicate radical in the kaolin molecule.** *Annuaire univ. Sofia*, II, *Fac. sci.*, Livre 2, 37-43 (1950)(German summary).—*C. A.* 46, 11055*a*.

Samples (10 g) of kaolin, previously dried 1 hr at 120°C, were subjected to 20 tons/cm^2 pressure for 6 hrs at ordinary temp., 150°C, and 200°C, the blanks were also heated to the same temps. without application of pressure. Then, both blanks and samples were heated 1 hr at temps. ranging from 200 to 800°C, and the loss of water of constitution was detd. In general, the results indicated that the rate of dehydration was greatest between 400° and 500°C for both. However, at temps. below 500°C more H_2O was lost by samples than by blanks, the difference showing a max. again between 400° and 500°C.

8715. ULRICH, RUDOLPH. **Some chemical changes accompanying profile formation of the nearly level soils developed from Peorian loess in southwestern Iowa.** *Soil Sci. Soc. Am., Proc.* 15, 324-9(1950)(Pub. 1951).—*C.A.* 46, 1682*c*.

The changes in exchangeable cations and pH within similar morphological horizons indicated that H had taken the place of the other cations in the order: Na > K > Ca > Mg with increasing horizon differentiation. The development of a nearly impermeable subsoil was accompanied by a marked increase in exchangeable Na in all horizons. The base-exchange capacity of the eluvial horizons increased to a max. and then decreased with increasing horizon differentiation, whereas the base-exchange capacity of the lower horizons continued to increase. The percentage of base satn. of the solum horizons tended to decrease with increasing horizon differentiation, indicating that cationic eluviation was an important process.

8716. VASSILIADES, C. **Determination of the total exchange capacity of soils.** *Prakt. Akad. Athenon* 25, 427-37(1950).—*C.A.* 47, 3501*i*.

A quick method for detg. the total exchange capacity of soils was developed. The soil was satd. with Ba which was replaced with Cr. From the decrease in strength of the K_2CrO_4 soln. (used to replace Ba by Cr) detd. iodometrically after changing it to K_2CrO_7 with H_2SO_4, the total exchange capacity of the soil was found.

8717. VERHOEVEN, B. **Soil-moisture studies in view of salt-movement control.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 3, 165-9; 4, 177-9(1950).—*C.A.* 46, 5763*c*.

The possibilities were pointed out to calc. capillary rise in different soil types with varying water tables, of the total evapn., and of the passage of H_2O through soil owing to rain or irrigation.

8718. VERVELDE, G. J. **Ion adsorption by soil minerals as a Donnan equilibrium.** *Proc. Koninkl. Nederland Akad. Wetenschap.* 53, 919-30(1950).—*C.A.* 44, 8579*d*.

Adsorption phenomena in the soil were best described by the laws of the Donnan equil. The measurement of the membrane potential of solid materials could be performed by using a glass-electrode type of app., but the difficulties of transforming soil constituents into suitable electrodes remained. The potentials measured with glass electrodes were essentially membrane potentials. A complication of the exchange laws was caused by the fact that in some soil minerals adsorption was not only a two-dimensional surface phenomenon, but also occurred in the interior of the particles.

8719. VRIES, D. A. DE. **Some remarks on gaseous diffusion in soils.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 41-3; 4, 43(1950).—*C.A.* 46, 2728*i*.

The relation between the diffusion rate through a granular material and the porosity of the material was calcd. for materials built up of elementary particles of different shapes, by using a formula derived from the theory of elec. cond. The theory could be applied likewise to the case where the elementary particles formed aggregates; the diffusion rate in the latter case was, at the same porosity, greater than for the same soil with the elementary particles uniformly distributed.

8720. WALKER, G. F. AND MILNE, A. **Hydration of vermiculite saturated with various cations.** *Trans. 4th Intern. Congr. Soil Sci., Amsterdam* 2, 62-7; 4, 58-9(1950).—*C.A.* 46, 4432*e*.

Exchangeable Mg cations normally present in vermiculite can be replaced by other cations, e.g., Li, Na, Be, Mg, Ca, Sr, Ba, or Al, with concomitant alteration in the organization of the structural H_2O layers. Of the ions which entered the structure, only K and NH_4 were not assocd. with layers of H_2O mols. in the vermiculite lattice. The amt. of structural H_2O present was also sensitive to changes in humidity, although less so than in the montmorillonites.

8721. WANDER, I. W. **Effect of calcium phosphate accumulation in sandy soil on the retention of magnesium and manganese and the resultant effect on the growth and production of grapefruit.** *Proc. Am. Soc. Hort. Sci.* 55, 81-91 (1950).—*C.A.* 44, 9602*i*.

Ca phosphate accumulated in large amts. in the sandy soils of central Florida through the use of superphosphate in mixed fertilizers and the const. adjustment of soil reaction to pH 5.5 to 6.0 with ground limestone. The accumulated Ca phosphate was a factor in the retention of Mg and Mn added as sulfates, but did not affect the retention of K added as sulfate or chloride. In sandy soils of low exchange capacity the adsorptive power of Ca phosphate became of importance in citrus nutrition. Growth and production records indicated that conditions which favored the accumulation of Ca phosphate within a pH range of 5.5 to 6.0 resulted in better nutrition of grapefruit.

8722. WAZER, JOHN R. VAN AND BESMERTNUK, EVELYN. **Action of phosphates on kaolin suspensions.** *J. Phys. & Colloid Chem.* 54, 89-106(1950).—*C.A.* 44, 3685*g*.

A rheological study of the effect of adding small amts. of ortho-, pyro-, tripoly-, trimeta-, and long- and short-chain vitreous phosphates to various purified kaolins was described. The reduction in yield value upon addn. of a polyphosphate anion was only slightly more pronounced in the presence of all Na cations than in the presence of all $(Me)_2N^+$ cations, the pH being kept at 7. The chain phosphates formed a lyotropic series in which the ability to soften a Na-kaolin slurry was in the order of increasing ionic wts, with part of this effect attributed to anionic charge and part to complexing ability of the polyphosphates. The phosphates and other deflocculants caused the yield value to remain low until the solids concn. was nearly equal to the plastic limit where the yield value increased suddenly.

8723. WIKLANDER, LAMBERT. **Fixation of potassium by clays saturated with different cations.** *Soil Sci.* 69, 261-8(1950).—*C.A.* 44, 9601*f*.

The nature of the adsorbed ion on soil colloids markedly affected the amt. of K fixation which may occur. Ions of similar size to K prevented much K fixation. Cations of dissimilar size that occupied fixation positions were easily replaced by the K resulting in greater fixation. Fixation was found to be low when the clay was satd. with H, K, or NH_4, but very high when satd. with Ca and, especially, with Na.

8724. WIKLANDER, LAMBERT. **Kinetics of phosphate exchange in soils.** *Kgl. Lantbruks Högskol. Ann.* 17, 407-24(1950)(in English). —*C.A.* 45, 5346*e*.

Tagged P atoms were used to study the equil. between the various forms of P: (a) in the soil soln., (b) micellar, relatively readily displaceably adsorbed at the soil soln.-soil particle interface, (c) less readily displaceably adsorbed, and (d) pptd. insol. some of which is not available. Neutral salts had the expected effect in displacing the equil. according to their ability to react with P_2O_5 or only to affect the tonicity of the soln. Drying a pedalfer soil increased its ability to retain P, decreased the exchangeable P_2O_5, and increased the proportion fixed.

8725. WINTERINGHAM, F. P. W.; HARRISON, A., AND BRIDGES, R. G. **Analysis of DDT derivatives by reversed-phase paper partition chromatography.** *Nature* 166, 999(1950).—*C.A.* 45, 6788*c*.

The paper for reversed-phase chromatography was prepd. by dipping it in an ether soln. of petrolatum. A mixt. of radio-Br analogs of DDT in benzene was spotted on the paper and run (descending) with EtOH:H_2O:concd. ammonia, 80:15:5. $(C_6H_4Br)_2CHCCl_3$, $(C_6H_4Br)_2C{:}CCl_2$, and $(C_6H_4Br)_2CHCOOH$ showed R_f values of 0.44, 0.35, and 0.75, resp.; they were located and detd. by counting the β-radiation from Br^{82}. A test indicated no isotopic exchange.

8726. WYLLIE, M. R. J. AND PATNODE, H. W. **The development of membranes prepared from artificial cation-exchange materials with particular reference to the determination of sodium-ion activities.** *J. Phys. & Colloid Chem.* 54, 204-27(1950).—*C.A.* 44, 4748*i*.

Similarity was noted for artificially prepd. membranes from cation-exchange materials and natural shales, in which clay minerals served as cation-exchange materials and inert constituents as binding agents. Granular Me-polymethacrylate was mixed and molded with bentonite, illite, Fuller's earth, Zeokarb, and Amberlites IR-1 and IR-100. The first and last gave potentials in NaCl solns. of different concns. that were close to those computed by the Nernst equation. Amberlite IR-100 permitted concns. as high as 4 *N*. Polystyrene as a binding agent could contain 50-70% Amberlite, but the membranes were less satisfactory mechanically than with polymethacrylate with 20-30% Amberlite.

8727. YASUE, YASUNOBU. **Zacher's effect of titanium oxide and zirconium oxide against insects.** *Science* (Japan) 20, 184(1950).—*C.A.* 45, 10467*i*.

The insecticidal effect of the powder of TiO_2 or ZrO_2 was proved against *Tribolium ferrugineum*. The insecticidal activities of the IV group elements were in the following order: $ZrO_2 > TiO_2 > SiO_2$.

8728. ZACHER, FRIEDRICH. **Surface-active powders and contact insecticides.** *Proc. 8th Intern. Congr. Entomol., Stockholm* **1948**, 838-41(1950). —*C.A.* 45, 8710*g*.

In the control of grain weevils with DDT dusts, the addn. of SiO_2, MgO, Al_2O_3, or activated charcoal had no appreciable effect.

8729. ZALMAZON, E. S. AND SHISHOVA, E. S. **Method of separation of the colloid fraction from carbonaceous clay and ooze.** *Izvest. Akad. Nauk S.S.S.R., Geol. Ser.* **1950**, No. 2, 145-9.—*C.A.* 45, 509*g*.

Expts. were made with samples of clays, the purities of which were confirmed by chem. and thermal analyses. Data furnished were: (1) soly. of argillaceous minerals in 0.1 *N* HCl and 0.5 *N* AcOH, (2) soly. of clay in filtrates and wash waters, and (3) soly. of carbonates in the filtrates and wash waters.

8730. ADERIKHIN, P. G. **The influence of soil structure on the adsorption of phosphoric acid.** *Pochvovedenie* (Pedology) **1951**, 201-3.— *C.A.* 45, 7734*b*.

Pulverizing chernozem increased the quantity of P adsorbed. The different-particle size fractions of several soils showed that the finer the fraction the higher the P adsorbed.

8731. AKAMINE, ERNEST K. AND SAKEMOTO, HERBERT I. **Brominated charcoal to prevent fading of Vanda orchid flowers.** *Am. Orchid Soc. Bull.* 20, No. 3, 149-52; *N.Y. State Flower Growers Bull.* No. 72, 1 (1951).—*C.A.* 46, 3703*g*.

Premature fading of Vanda orchids in shipment from Hawaii to the U.S. was probably due to C_2H_4 from one or more faded blooms accelerating the fading of the others. Sealing Br-impregnated activated coconut charcoal (23% Br_2) with the flowers prevented the fading flowers from causing the normal ones to fade; the marketable life of normal flowers was also prolonged. The correct amt. of the Br_2 charcoal to use should be detd.

8732. ALBAREDA HERRERA, JOSE M^A; ALEIXANDRE FERRANDIS, VICENTE, AND SANCHEZ CALVO, M^A. DEL CARMEN. **The Silurian rocks of Spain. II.** *Anales edafol. y fisiol. vegetal (Madrid)* 10, 461-506 (1951).—*C.A.* 46, 4970*e*.

An analytical study of the Spanish Silurian rocks was reported. A detn. of total exchange capacity and principal exchange cations in Silurian clays showed that Ca was present in greatest quantity, followed by Mg, suggesting that the Mg absorbed gradually formed more stable complexes than did the Ca.

8733. AOMINE, SHIGENORI. **The fixation of ammonium(ion) in soils. I. Ammonium fixation of some soils in the southeastern provinces of Japan.** *J. Sci. Soil Manure, Japan,* 22, 83-7 (1951).—*C.A.* 46, 3692*f*.

NH_4^+ was found less in surface soils and more in subsoils. There was a correlation coeff. of + 0.69 ± 0.05 between the fixed and adsorbed NH_4^+. Drying before treatment did not affect soils having a strong affinity for fixed NH_4^+. Drying before treatment did increase the percentage of fixed NH_4^+ in the soils.

8734. Babcock, K. L.; Davis, L. E., and Overstreet, Roy. **Ionic activities in ion-exchange systems.** *Soil Sci.* 72, 253-60(1951).—*C.A.* 47, 240*c*.

The activity of an ion in the adsorbed state in a soil system can be detd. by specifying a value of soln. compn. If the infinitely dil. soln. was chosen as the reference state, the activity of an adsorbed ion was the same as its activity in the soln. phase. Therefore, the activity of the adsorbed ion was not uniquely correlated to other values such as degree of satn. or mole fraction. However, activity ratios were involved in exchange reactions and could be correctly estd. from ion-exchange relations. The "ion-exchange const." was an experimentally detd. useful quantity. It was not, however, the same as the thermodynamically defined equil. const. for the exchange process.

8735. Barbier, G.; Maroger, M., and Gachon, L. **Phosphoric acid and humus.** *Ann. inst. natl. recherche agron., Ser. A, Ann. agron.* 2, 317-33(1951).—*C.A.* 47, 809*h*.

Neutral humates showed no measurable solvent action on finely ground, naturally occurring phosphates (apatites). Humic anions sat. the pos. charges of $Fe(OH)_3$ and reduced its power to adsorb the PO_4 ion. It was not established that complex Fe humic compds. can adsorb PO_4 ions in the presence of exchangeable Ca.

8736. Barker, S. A. and Marshall, C. E. **Ionization of soils and soil colloids. II. Potassium-calcium relationships in montmorillonite-group clays and in attapulgite.** *Soil Sci.* 72, 373-85(1951).—*C.A.* 47, 3505*a*.

Ca-K relationships were examd. in detail for Putnam clay (beidellite, Arizona bentonite, and attapulgite). Ca and K mutually affected each other through the bonding-energy relationships of the ionizing surfaces. The ratio of K activity to Ca activity at 10% exchangeable K was 1.2 for Putnam clay, 2.1 for Wyoming bentonite, and 4.1 for Arizona bentonite. These ratios, however, were affected by other colloid-chem. and phys. factors in addn. to the concn. of the clay.

8737. Barshad, Isaac. **Cation exchange in soils. I. Ammonium fixation and its relation to potassium fixation and to determination of ammonium-exchange capacity.** *Soil Sci.* 72, 361-71(1951).—*C.A.* 47, 3502*d*.

A wide variety of soils had the capacity to fix both NH_4 and K. Much of this fixation resided in the coarser fraction of the soils and was assocd. with vermiculite-like minerals. Leaching with a salt soln. did not effectively remove all the adsorbed NH_4^+. Only distn. with NaOH was found effective. The replacement of an adsorbed ion depended upon its accessibility. Ions in an expanded-type layered lattice were replaceable by any kind of a cation; ions in a contracted-type layered lattice were replaceable only by those cations that caused the lattice to expand when they were adsorbed.

8738. Bonnet, J. A.; Lugo-López, M. A., and Abruña, F. **Cation-exchange capacity of some tropical soils of Puerto Rico.** *J. Agr. Univ. Puerto Rico* 35, 49-56(1951).—*C.A.* 46, 11532*h*.

The total exchange capacity for 81 soils and for 4 cations, Ca, Mg, K, and Na, were detd. The highest value obtained for total exchange capacity was about 64 meq. per 100 g of dry soil for a rendzina and the lowest was 2 meq. for a laterite. There was a wide difference between the min. and max. values of total exchange capacity for various soil groups. The highest value for total exchangeable bases was over 60 meq. for an alluvial soil and the lowest was less than 2 meq. for a lateritic soil; these contained 80 and 32%, resp., of exchangeable Ca.

8739. Brasseur, H.; Dallemagne, M. J., and Melon, J. **The constitution of hydroxylapatite and chlorapatite synthesized in a wet way.** *Bull. soc. roy. sci. Liége* 20, 447-52(1951).—*C.A.* 46, 6043*a*.

Synthetic hydroxylapatite and chlorapatite were shown to differ from natural substances by substitution of $1/2\ H_2O$ for $Ca(OH)_2$ and $CaCl_2$, resp., from thermal analyses and x-ray diffraction data. The synthetic compds. were proposed as precursors in natural formation of apatites. Impure chlorapatite was synthesized by adding $CaCl_2$ to a cold H_3PO_4 and heating the mixt. to boiling.

8740. Brown, D. A. and Albrecht, Wm. A. **Plant nutrition and the hydrogen ion. VII. Cation exchange between hydrogen clay and soils.** *Univ. Missouri Agr. Expt. Sta. Research Bull.* No. 477, 3-24(1951).—*C.A.* 46, 11530*f*.

The permeability of different membranes decreased significantly with increasing drying periods between 1.5 and 6 min. The rate of cation exchange increased with increasing ratios of cation/H^+. The suite of cations exchanged was more significant than the fractions of their totals exchanged from the soil. By adjustment of the cation:H^+ ratio and the time interval for exchange, the suite of cations exchanged became more representative of that which can be exchanged from the soil to the plant roots.

8741. Budnikov, P. P. and Al'perovich, I. A. **Plasticity and swelling of deaerated clay.** *Doklady Akad. Nauk U.S.S.R.* 81, 659-62(1951).—*C.A.* 46, 9274*f*.

Readily fusible montmorillonite clays contg. quartz were deaerated in a vacuum chamber, and the air contents detd. Plasticity was detd. by the sphere method. The process of swelling was divided into two stages, one characterized by connection of adsorbed moisture with exothermic heat effects and contraction of the system, and a 2nd stage characterized by osmotic suction of the liquid phase proceeding without heat and contraction effects. Removal of micro-dispersed air destroyed the surface tension at the macro-bubble-water boundary, increased the mobility of the liquid phase, and promoted osmotic infiltration of moisture during the swelling process.

8742. Ciferri, Raffaele and Marcelli, Emanuel. **Toxic effect of mercury zeolites on tobacco**

seedlings. *Notiz. malattie piante* (Italy) No. 14, 11-16(1951).—*C.A.* 46, 1692*i*.

A Hg zeolite, used at the dose of 0.3% for the disinfection of tobacco seeds, caused some toxic effect on the seedlings. Seedlings were able to free the Hg from the zeolites in a form to give a pos. reaction with diphenylcarbazone. The absorption of the poison did not take place through the roots, as these were rather inhibited in their development.

8743. Crivelli, Emanuele. **The production of fluosilicates and of silica gel in the works of phosphate fertilizers.** *Chimica* (Milan) 6, 426-8(1951).—*C.A.* 46, 5273*h*.

About 2 kg of Na fluosilicate (98%) could be theoretically recovered from the washing waters of the gases produced in the manuf. of 100 kg of fertilizers, but actually this production ordinarily reached 0.5-1 kg because the F compds. were difficult to remove from the spongy masses of hyperphosphates. The production of F silicates and of silica gel was described.

8744. Davidson, Doreen I.; Sowden, F. J., and Atkinson, H. J. **Application of paper chromatography to identification and quantitative estimation of amino acids in soil organic-matter fractions.** *Soil Sci.* 71, 347-52(1951). —*C.A.* 46, 3193*a*.

Both qual. and quant. estns. of specific amino acids were made on org. fractions of two soils. One-dimensional and two-dimensional chromatograms were used. The amino acid content of org. matter was much lower in a dark-brown prairie soil than in two fractions of a podzol soil.

8745. Fischer, C. W., Jr. and Keller, J. R. **Prevention of decay of horticultural products by the use of brominated activated charcoal.** *Proc. Am. Soc. Hort. Sci.* 57, 432-8 (1951) *N. Y. State Flower Growers Bull. No.* 65, 2-3 (1951).—*C.A.* 45, 10462*h*; 8179*c*.

Rot in flower shipments in tight enclosures could be prevented by the use of brominated active charcoal suspended over the flowers. Actual contact with the flowers must be avoided as HBr was apparently formed in such cases and injured the flowers. Promising results were also secured with raspberries, strawberries, and tomatoes.

8746. Funabiki, Shigeo and Goto, Kyo. **Soil colloids of middle and western Japan. VI. Adsorption of calcium and ammonium ions by the soils.** *J. Sci. Soil Manure, Japan* 22, 140-2(1951).—*C.A.* 46, 3693*c*.

NH_4^+ and Ca^{++} were adsorbed in almost equal amts. in the noncolloidal fractions of soils. In the colloidal fraction, more Ca^{++} was adsorbed than NH_4^+. This was attributed to the difference in the "form" of H ion; namely, one was exchangeable with NH_4^+ and the other was not.

8747. Gallaway, Bob M. and Buchanan, J. Spencer. **Lime stabilization of clay soil.** *Bull. Agr. Mech. Coll. Texas* 7, No. 1, 57 pp.(1951); *Texas Eng. Expt. Sta. Bull.* No. 124.—*C.A.* 46, 7265*f*.

The load-bearing capacity of soils used in *road-building* was improved by the reaction of certain clays with lime. The stabilization was chem. in nature. The weaker positively charged metallic elements were replaced by the stronger positively charged Ca cations, which in turn influenced the thickness of the adsorbed moisture films on the exterior of the clay grains. The plasticity of clay soils, which was a rough measure of their stability, was a function of the thickness of the water films. Claylike soils of low base-exchange capacity showed no improvement in plasticity properties, and all those of high base-exchange capacity showed large improvement.

8748. Hadaway, A. B. and Barlow, F. **Sorption of solid insecticides by dried mud.** *Nature* 167, 854(1951).—*C.A.* 45, 8700*e*.

Aldrin, γ-$C_6H_6Cl_6$, dieldrin, and DDT (listed in the order of increasing persistence) were sorbed by the surfaces on which they were sprayed. When the crystals of dieldrin and DDT were no longer visible, the insecticidal activity was lost; with aldrin and γ-$C_6H_6Cl_6$, however, activity persisted. The rate of sorption depended on the particle size of the insecticide, the nature of the surface, and (inversely) on the relative humidity. Sorption on absorbent material, such as the dried mud walls in the houses of African natives, was very high, sorption being complete in 24 hrs at 78°F.

8749. Hauth, W. E. Jr. and Davidson, Donald T. **Clay fraction in engineering soils. II. Particle-size distribution and cation-exchange capacity.** *Iowa Eng. Expt. Sta., Engr. Rept. No.* 10, 458-64 (1951-52).—*C.A.* 46, 9756*a*.

The measurement of particle-size distribution in the colloidal range was based on the measurement of the sp. gr. of the suspension by a soil hydrometer (range of 1.010-0.990). The exchange capacity values varied widely depending on the type and particle size of the clay mineral involved.

8750. Klechkovskiĭ, V. M. and Zherdetskaya, G. N. **Sorption of phosphate ions in soils as studied by isotope displacement.** *Doklady Akad. Nauk S.S.S.R.* 76, 717-20(1951).—*C.A.* 45, 5854*h*.

Letting a 1-g soil specimen stand 20 min. with 5 ml soln. of labeled Na phosphate (P^{32} isotope) at pH 6 and concn. 0.001 mg P_2O_5 per ml, filtration, washing with pure H_2O until the washing gave const. impulse count, and passage of 5-ml portions of 0.01 *N*, then 0.1 *N* Na phosphate free of P^{32} through the soil specimen showed definite displacement of the labeled PO_4 ion by a several-fold factor (in terms of impulse count). Peat-podzol and chernozem soils showed such isotope displacement most rapidly and completely; krasnozem was more retentive (results given graphically). Passage of labeled Na phosphate soln. through chromatographic column with soil specimens showed the max. sorption of 0.6 mg per 1 g of soil for the peat-podzol type and over 2.4 mg/g for krasnozem type, as shown by increased max. concn. in the upper layers of the specimen.

8751. Long, M. I. E.; Owen, O., and Winsor, G. W. **The availability of nitrogen in some bone materials used in horticulture.** *J. Sci. Food Agr.* 2, 125-34(1951).—*C. A.* 45, 5857*a*.

Samples of bone meal were added to soil in quantities equiv. to 300 p.p.m. and after a nine-day incubation period at 23.5°C, the fraction of total N readily converted to NH_3 and nitrate was detd. Significant correlations with these fractions were found with the percentage of total N sol. in water, with bulk ds., pH of their aq. suspensions, and the NH_3 liberated on distn. with magnesia.

8752. Manshard, E. **Relation of pH (H_2O) value and base-exchange capacity *(V)* as a basis for determining the sorption capacity *(T)* for soils.** *Z. Pflanzenernähr. Düngung, Bodenk.* 54, 125-34(1951).—*C. A.* 46, 8302*d*.

On the basis of the analyses of 179 soils a formula $pH(H_2O) = 0.0354\ V + 4.0$ was derived. V together with S detd. in various ways may be used to det. T, sorption capacity, from $T = \frac{S}{V}100$, where $S =$ buffer capacity. Classification of soils on basis of calcd. T were made.

8753. McGeorge, W. T. and Breazeale, E. L. **Absorption of gypsum by semiarid soils.** *Arizona Agr. Expt. Sta. Tech. Bull.* No. **122**, 3-48 (1951).—*C. A.* 46, 11531*i*.

A reasonably close approximation of the gypsum-absorbing capacity of the soil could be detd. by a lab. examn. The exchangeable cations did not combine with the clay minerals with equal firmness. There was an initial gypsum reaction with the active colloid mass after which there was a slower and continuing reaction with the less-active mass. Frequent light applications of gypsum in the irrigation water were more effective than single heavy applications of dry gypsum. The gypsum requirement of a soil could not be calcd. on the basis of exchangeable Na or K.

8754. McIlrath, Wayne J. **Nitrate adsorbed on pumice as a nitrogen source for plant growth.** *Proc. Iowa Acad. Sci.* 58, 179-88(1951).—*C. A.* 46, 5764*e*.

Although the nitrate adsorption of pumice was very low, a major portion of the nitrate became available for plant utilization under the conditions of this expt. The mechanism of the release of nitrate from the substrate was unknown. Growth of plants on the pumice substrate was normal until the available supply of N became the limiting factor.

8755. McLean, E. O.; Barber, S. A., and Marshall, C. E. **Ionization of soils and soil colloids. I. Methods for simultaneous determination of two cationic activities.** *Soil Sci.* 72, 315-25(1951).—*C. A.* 47, 807*e*.

The appropriate mobility ratio for the membrane electrode must be detd. The appropriate equations, techniques, and precautions necessary for detn. of the cationic activities were illustrated. The technique was feasible and membranes made for this purpose were reusable.

8756. Mel'nichenko, L. G. **Some colloidal-chemical processes occurring in the system clay-water.** *Ogneupory* **16**, 81-8(1951).—*C. A.* 45, 8323*d*.

In analyzing the surface phenomena of the system clay-water, it was necessary to consider the processes of hydrolysis of kaolinite. Such hydrolysis, in all probability, occurred gradually under ordinary conditions; it started on the surface of the particles with the formation of intermediate protective compds., and the decompn. of the kaolinite into individual hydroxides began only under more favorable conditions. The elec. charges on the kaolinite particles resulted: (1) direct dissocn. of "clay" acid with the sepn. in soln. of H^+ ions, which were in the cryst. cell of the kaolinite, and the formation of macroanion and (2) dissocn. of secondary intermediate compds. resulting from the hydrolysis of the locations with ruptured bonds. Solvation had a greater effect on relative stabilities of colloidal solns. than did the elec. charges.

8757. Mortland, M. M. and Gieseking, J. E. **Influence of the silicate ion on potassium fixation.** *Soil Sci.* 71, 381-5(1951).—*C. A.* 46, 3195*e*.

When K_2SiO_3 was added to clay minerals, K fixation may occur. Kaolinite fixed insignificant amts. of K, montmorillonite clays intermediate amts., and illitic clays intermediate to high amts. When KOH was added to the same clays, very little fixation occurred. Fixed K was that K which could not be removed with boiling N HNO_3.

8758. Mukherjee, S. K. and Marshall, C. E. **Electrochemical properties of mineral membranes. IX. Membrane characteristics of clay pastes.** *J. Phys. & Colloid Chem.* 55, 61-8(1951).—*C. A.* 45, 2796*f*.

By using inverted glass U tubes contg. clay plugs to connect two electrolyte solns., the "membrane potential" of the plug was detd. as the equil. p.d. between two satd. calomel electrodes, one dipping into each soln. The plugs were made from Wyoming bentonite (montmorillonite) and Putnam clay (beidellite), by using the fine (less than 0.2 micron) fraction of electrodialyzed clays satd. with the desired cation (Na^+, K^+, or Ca^{++}). The plugs gave high cond. and came to equil. quickly, though overnight contact was sometimes necessary. With different concns. of the same chloride in the two solns., the range of activities over which the clay plugs showed selective behavior for cations and obeyed the Nernst equation was detd. as follows: 0.001-0.027 for K^+, 0.00097-0.0175 for Na^+, 0.000033-0.0027 for Ca^{++}. Within these ranges, potential detns. on clay plugs exposed to different solns. were used to calc. the differences in differential heat of adsorption for two cations.

8759. Mukherjee, J. N.; Mitra, R. P., and Bagchi, S. N. **Electrochemical character of H-clays in relation to their mineralogical compositions.** *Indian Soc. Soil Sci. Bull.* No. 6A, 1-18(1951).—*C. A.* 47, 6077*c*.

Potentiometric titration curves and suspension viscosities of Indian kaolinites, bentonites, and soils (and especially graded size fractions thereof) in their mineralogical characterization were given. Viscosities were measured for 2% suspensions in an Ostwald viscometer, and titrations were run in 1/4% suspensions. H-kaolinite, H-kaolins, and H-clays from lateritic soils and acid soils were of dibasic character with inflections in the pH curves at about 8 and about 9 representing capacities of from 5 to 20 meq./100 g at the first inflection and near twice as much at the second. Viscosities were about 0.7 or 0.8 centipoise without appreciable changes from pH 6 to 11. H-montmorillonite, H-bentonites, and H-clays from black cotton soils were essentially of monobasic character, and capacities ranged from about 50 to 100 meq./100 g, the inflections ranging from pH values of 7 to 9.

8760. Mukherjee, S. K.; De, R. M., and Rao, Venugopala. **Cation exchange in homoionic clay salts. I. Influence of hydrogen ion concentration on symmetry values and the lyotrope series.** *Indian Soc. Soil Sci. Bull.* No. 6A, 67-88(1951).—*C.A.* 47, 6077*h*.

Clay fractions, a black cotton soil, an acid soil, and a Kashmir bentonite, were selected for prepn. of homoionic clays. Na-, K-, NH_4-, Ca-, and Ba-clays were made by neutralization to equivalence of the respective H-clays, and Mg- and Al-clays by repeated leachings. Each reciprocal system, M-clay + M'A = M'-clay + MA, was prepd. from both directions, and analyzed by analysis of the supernatant liquid both for the chlorides of each metal and for the acetates of those available. Apparent cation exchanges estd. from symmetry values in systems of purposely controlled low pH tended to become equal, but the actual introduction of exchanging cations into the complex in competition with H followed the lyotrope series with good resolution. The homoionic clays actually prepd. still retained some residual exchangeable H. Actual measured pH values at equil. were always lower in the chloride systems than in the acetate.

8761. Mukherjee, S. K. **Cation exchange in homoionic clay salts. II. Symmetry values and the mineralogical composition of the clays. III. Comparative study of the base-exchange equations and of the exchange isotherms in the light of the exchange measurements.** *Indian Soc. Soil Sci. Bull. No.* 6A, 89-95, 96-114 (1951).—*C.A.* 47, 6078*c*.

For three prepd. clays symmetry values for displacements of the univalent ions and of Al from the kaolinite type were higher than those from the montmorillonites, and displacements of the bivalent ions were lower. Exchange isotherms obtained for various clay salts of the acid clay and black cotton soil clay above were used to approx. the relative merits of the base-exchange equations.

8762. Muñoz, V. Cortes. **Spectrophotometric determination of calcium in tobacco.** *Bol. inst. nacl. invest. agron.* (Madrid) 11, 371-401 (1951).—*C.A.* 46, 10551*b*.

Ext. 1 g of ground tobacco with 25 ml HCl, dild. 1:2, filter, wash, treat with active charcoal, make to a vol. of 200 ml; mix 1 to 10 ml, corresponding to 0.18 to 0.6 mg Ca, with 2 ml satd. $C_2O_4(NH_4)_2$ soln. at 90°C, neutralize with dil. NH_4OH, centrifuge after 90 min., wash the ppt. with a mixt. of H_2O 100, EtOH 100, Et_2O 100 and concd. NH_3 soln. 2 ml, dry, dissolve in exactly 1 ml 5% HCl, add 10 ml $Fe(CNS)_3$ soln., and read the absorption in a spectrophotometer at 540 mμ.

8763. Nagasawa, Sumio and Yoshinobu, Midori. **Lethal effect of so-called inert pulverized dusts on insects. IV. Volclay and Panther Creek bentonites on the adult of the azuki bean weevil Callosobruchus chinensis.** *Botyu Kagaku* 16, 35-40(1951).—*C.A.* 45, 10467*g*.

Volclay (Na-rich, readily absorbing H_2O, and swelling and suspendable in H_2O) and Panther Creek (Ca-rich, absorbing H_2O slightly more than Fuller's earth, not much swelling, and pptg. from H_2O) bentonites were sprinked as fine dusts (through a no. 325-sieve) over *Callosobruchus chinesis* held at 30°C and 52, 73, 91, and 100% relative humidity. Both were found lethal, but showed no significant difference in effect. Males were more resistant than were females. The lethal effect seemed primarily due to abrasion inflicted by the dust particles on the insect body and secondarily to a loss of H_2O from the body.

8764. Noda, Masaya and Saio, Kenji. **The phosphate-fixing capacity by iron and aluminum in soils. I. The influence of humus on phosphate fixation by iron and aluminum.** *J. Sci. Soil Manure Japan* 22, 64-8(1951).—*C.A.* 46, 1686*g*.

The power to prevent phosphate fixation was greater in hydroxy acids than in amino acids. The following order of decreasing power to prevent fixation was established: citrate > tartrate > oxalate > glycerine > alanine > succinate.

8765. Rojas-Cruz, Luis A. **Determination of the total base-exchange capacity of soils with a high content of organic matter.** *Rev. colombiana quím.* 4, No. 1, 18-24(1951).—*C.A.* 46, 2730*a*.

Total base-exchange capacity was detd. for 12 soils by 4 methods as well as the pH, total N, org. C, and exchangeable H. For soils contg. more org. matter than 2%, the sum of the bases displaced by NH_4OAc was added to the H displaced by distn. with $Ba(OAc)_2$. The exchange capacity of the soils appeared to be due in large part to org. exchange materials.

8766. Rojas-Cruz, Luis A. **The exchangeable bases of twelve Colombian soils and their effect upon the fertility.** *Rev. colombiana quím.* 4, No. 1, 25-31(1951).—*C.A.* 46, 2730*c*.

The base-exchange capacity of Colombian soils was high in general and in many exceeded 100 meq. /100 g. The detn. of an exchangeable cation was not enough to det. its availability, the proportion of the total base-exchange capacity of the soil it occupied must be considered. The high rainfall in Colombia was considered a major factor of the low degree of satn. of the soils, and Ca and probably Mg were shown to be deficient.

8767. Samuel, Boyd L. **Chromatographic separation and determination of some organic thiocyanates in insecticide products.** *J. Assoc.*

Offic. Agr. Chemists 34, 764-5(1951).—*C. A.* 45, 10469*h*.

The chromatographic detn. of the γ isomer of benzene hexachloride was found to be satisfactory for sepg. 2-thiocyanoethyl esters of aliphatic acids whose av. C content was 10-18 (as a unit), isobornyl thiocyanoacetate, and 2-butoxyethel 2-thiocyanoethyl ether.

8768. SASAKI, SEIICHI. **Japanese acid earth. I. Chemical properties.** *J. Sci. Soil Manure Japan* 21, 193-7(1951)(English summary).—*C. A.* 46, 1195*g*.

The base-exchange capacity and titratable acidity were very low in the *P* layer, but the 1st was high in the G_1-H_2 layers (paralleling the 10% HCl-sol. SiO_2 contents) and the 2nd was likewise high in the G_1, G_2, and H_1 layers especially in the upper layers (agreeing with the degree of unsatn.). This indicated that the acid earth was formed by weathering of both the inner and outer layers accompanied by the mineralization of clay. From the discrepancy of the base-exchange capacity and titratable acidity, the acidity of the acid earth might not agree with the so-called adsorption capacity.

8769. SCHACHTSCHABEL, PAUL. **Determination of *S*-values (exchangeable cations), *T*-values (sorption capacity), and degree of saturation (of soils).** *Z. Pflanzenernähr. Düngung Bodenk.* 53, 7-20 (1951).—*C. A.* 45, 10453*c*.

Best results were obtained from the sum of the exchangeable cations or by the amt. of NH_4^+ sorbed from NH_4Cl soln. Various methods were compared for detn. of the *T*-values. For calcn. of the degree of satn., a soil of pH 7 (KCl) was considered satd.

8770. SHAW, W. M. AND MACINTIRE, W. H. **Exchangeable hydrogen as determined by various procedures in relation to the soil's capacity for calcite decomposition.** *J. Assoc. Offic. Agr. Chemists* 34, 471-92(1951).—*C. A.* 45, 9785*h*.

The calcium acetate procedure was found to be the one best adapted for routine detn. of the lime requirement necessary to raise the pH value of a soil to near neutrality. Procedure: Shake 10 or 20 g of soil with approx. 100 ml of 0.5 *M* Ca acetate previously adjusted to pH 7, and allow to stand overnight. Filter the suspension through a folded filter into a 250-ml volumetric flask. Transfer the soil to the filter and wash with the acetate soln. to a vol. slightly below the 250-ml mark and then add the acetate soln. to the mark. Transfer the 250-ml ext. to a 400-ml beaker and titrate with 0.1 *N* $Ba(OH)_2$ to pH 8.8 using a pH meter. This titration in ml of 0.1 *N* $Ba(OH)_2$ minus the titration value of 250 ml of the Ca acetate blank, divided by the sample wt and multiplied by 10 gives the exchangeable H in meq. per 100 g of soil.

8771. SMITH, DONALD H. AND CLARK, FRANCIS E. **Anion-exchange chromatography of inositol phosphates from soil.** *Soil Sci.* 72, 353-60 (1951).—*C. A.* 47, 3502*b*.

Phytin and its derivs. were extd. from 4 soils by standard techniques. When these were subjected to chromatographic analysis only 10.5, 6.9, 16.2, and 34.0% of the exts. were inositol hexaphosphate. When soils were incubated with inorg. P for 30 days, some of the P was found in the chromatographically sepd. inositol hexaphosphate.

8772. THEMLITZ, R. **Absorption of iron by nontronite.** *Z. Pflanzenernähr., Düngung, Bodenk.* 54, 249-72(1951).—*C. A.* 46, 9024*h*.

The av. cation adsorption capacity olive-green nontronite was 80 milliequiv. per 100 g clay mineral. The base-satd. complex after sepn. had the compn. CaO 80, MgO 19, K_2O 1%. Mineral acids > 0.1 *N* attacked the nontronite; dil. acids dissolved Fe. H_2O was easily and continuously removed below 300-350°C, while above this temp. H_2O of constitution escaped stepwise at intervals. Loss of water of constitution above 350°C reflected the destruction of the lattice brought about by the action of acids. Nontronite energetically adsorbed Fe^{+3}. Fe-nontronite on hydrolysis yielded H-nontronite and ferric oxide hydrate. The ferric oxide hydrate was adsorbed on the surface of the mineral giving it a more or less rust-brown color. The adsorbed phase on the surface aged less rapidly than did Fe_2O_3 sol adsorbed on quartz.

8773. WIKLANDER, LAMBERT. **Saturation of colloids and soils by means of exchange resins.** *Kgl. Lantbruks-Högskol. Ann.* 18, 154-62(1951). —*C. A.* 46, 3193h.

The resin in granular form was satd. with the ion to be transferred to the colloid or soil and filled into a glass column of which the outlet tube was brought up to the filling level and provided with a stopcock. Thus, the hydrostatic head on the column was small. The fine suspension was passed through the column. In this way about as much K was transferred to a soil as by electrodialysis and more than by leaching with KCl soln. When the resin was contained in a Cellophane tube and stirred about in the suspension considerably less was transferred in the same length of time.

8774. AGARWAL, B. R. AND POLLARD, A. G. **Extraction of potassium from soil by electrodialysis and by ammonium acetate leaching. II. Examination of potassium-hydrogen clays.** *J. Sci. Food Agr.* 3, 152-3 (1952).—*C. A.* 46, 7268*e*.

Suspensions of clays were treated with KOH according to their base-exchange capacity and dried. They were then electrodialyzed with water in a Marsden cell at times up to 2 hrs and also leached with NH_4OAc soln. Electrodialysis for 1 hr removed substantially the same amt. of K as leaching. It was suggested that the K removed by the more prolonged dialysis was derived from nonexchangeable or fixed forms.

8775. AĬDINYAN, R. KH. **Minerals of percolloidal soil fractions.** *Doklady Akad. Nauk S.S.S.R.* 83, 291-4(1952).—*C. A.* 46, 8793*a*.

The secondary minerals formed in the soil owing to soil formation and weathering were usually capable of swelling, etc. in the presence of H_2O. Soil specimens fractionated as to particle size, indicated the presence of several fractions (by d.)

in the particle size range 0.2-2.0 μ, with some 90% composed of lighter minerals. This range covered the presence of montmorillonite, quartz and mica, feldspars, kaolinite, and ferrous minerals. The smaller particles were generally more rounded in shape. The amt. of org. matter adsorbed on such specimens showed a progressive increase with decrease of d. After removal of humus by H_2O_2 the adsorbability declined to some extent.

8776. ALBAREDA HERRERA, JOSE M^A.; ALEIXANDRE FERRANDIS, VICENTE, AND SANCHEZ CALVO, M^A. DEL CARMEN. **Soils of Silurian origin in the Spanish humid zone.** *Anales edafol. y fisiol. vegetal* (Madrid) 11, 455-507 (1952).—*C.A.* 47, 3501*a*.

The analytical data were tabulated of chemicomineral and org. analyses, exchange capacity and cation-exchange studies, and mech. analysis, Mech. erosion predominated over chem. erosion in the formation of the profiles, which was in agreement with the climatic conditions of the area, which did not favor chem. erosion. The distribution of exchange cations along the profile agreed with the humid character of the soil. The predominating clay material was illite, at times accompanied by kaolinite, the formation of which agreed with the pH of the profile.

8777. AOMINE, SHIGENORI AND WADA, KOJI. **The fixation of ammonium [ion] in soils. V. Fixation of ammonium [ion] in homoionic soils.** *J. Sci. Soil Manure, Japan* 23, 1-4(1952).—*C.A.* 47, 2411*a*.

Soils from mica schist, granite, and alluvium were studied. After satn. with Li, Na, K, Mg, Ca, Ba, and H by chloride treatment (for H, by HCl or acetic acid), the soils were caused to adsorb NH_4^+ by treatment with neutral *N* NH_4OAc soln. NH_4^+ remaining in soils after leaching with *N* KCl was considered as fixed, that remaining after washing with methanol, as absorbed. Washing with dil. acid decreased the fixation capacity of soil, but not its absorption capacity. Ba or Ca soil, prepd. from H-soil, had the same fixation and absorption to capacities as had H-soil. H-soil from micaceous soil tended to have a high absorption capacity than had the original soil. Soil satd. with Ca, or Na fixed about the same amount of NH_4 as did the original soil; that satd. with Li, Mg, or Ba fixed less; K soil had no fixing power.

8778. AYRES, A.S. AND HAGIHARA, H.H. **Available phosphorous in Hawaiian soil profiles.** *Hawaiian Planters' Record* 54, 81-99(1952).—*C.A.* 46, 9241*d*.

The supply of the available P was found to be related to the degree of weathering of the soil. Fertilization resulted in the accumulation of considerable reserves of available P in surface layers of many of the soils examd., but this was not generally true of the humic and hydrol humic latosols, as in some of these soils the available P was very low and below the crit. level for the optimum growth of sugar cane. Generally the levels of available P diminished with depth.

8779. BEAR, F.E.; PRINCE, A.L., AND TOTH, S.J. **Effect of increasing fertilizer concentration on exchangeable cation status of soils.** *Soil sci. Soc. Am., Proc.* 16, 327-30(1952).—*C.A.* 47, 5599*d*.

The most significant general effects in a 10-yr expt. of adding 1 ton per acre of a 4-8-8 fertilizer annually, or its equiv. in higher grades up to and including a 12-24-24, were the lowering of pH values, increase in exchangeable H and K, and reduction in exchangeable Ca and Mg. There was little evidence to indicate any bad effects that could not readily be overcome by the use of Mg-contg. liming materials as correctives. No relation was apparent between fertilizer concn. and crop content of Ca, Mg, K, and Na.

8780. BOWER, C.A.; REITEMEIER, R.F., AND FIREMAN, M. **Exchangeable cation analysis of saline and alkali soils.** *Soil Sci.* 73, 251-61 (1952).—*C.A.* 47, 5053*f*.

Because of the difficulties inherent in the detn. of exchangeable cations and cation-exchange capacity of saline and alkali soils, modified procedures were adopted. The following scheme was used: (1) ext. soil with NH_4OAc and det. the cations removed; (2) det. the cations in a satn. ext. of the soil; (3) subtract (2) from (1); (4) det. cation-exchange capacity by measuring the amt. of Na absorbed from excess NaOAc. To overcome the problem of poor permeability, samples were shaken in centrifuge tubes with the extg. liquid and centrifuged clear. The process was repeated as necessary.

8781. CHATTERJEE, B. AND BOSE, J. **The electrochemical properties of humic acid.** *J. Colloid Sci.* 7, 414-27(1952).—*C.A.* 46, 10790*c*.

Results of chem. analysis of humic acid sols extd. from acid soil or from Merck's humic acid were: C 50.2-54.3, H 4.3-5.2, N 1.9-3.3, ash 3.4-8.3%. The titration curves corresponded to H-ion activities of the order of 10^{-4} *N*, which was greater than the activity of the ultrafiltrate from the sols. Humic acid sols contained weakly dissocd. acids, part of which were in true soln. and part consisted of insol. colloidal particles. The base-exchange capacity of the sols depended on the nature of the base used for titration.

8782. CHERNOV, V.A. **The nature of soil acidity.** *Pochvovedenie* 1952, 899-908.—*C.A.* 47, 6590*e*.

New exptl. data were presented on the source of Al that appeared in soln. when the cations of different soils were replaced either by 0.05 *N* HCl, 1.0*N* KCl alone, or intermittently with these extg. agents. Al came from nonsilicate sources and was capable of entering the exchange complex more effectively than the H ion.

8783. CHERNOV, V.A.; BELYAEVE, N.L., AND KISLITSYNA, L.P. **A comparison of the energy of adsorption of hydrogen, aluminum, calcium, and ammonium ions by chernozem and red loams.** *Pochvovedenie* 1952, 528-37.—*C.A.* 47, 1897*d*.

The adsorption of the H, Al, Ca, and NH_4 ions by lateritic soils, chernozem, and askangel was studied by using the chlorides of these salts in various combinations, with and without various concns. of HCl and with $(CH_3COO)_2Ca$. The const. of the adsorption exchange was detd. and this const. (which was the same as the ratio of the energy of adsorption of the H ions to that of the adsorption of Ca ions) was not a const. but a variable value. The ratio of the adsorption energy of any two kinds of cations in soils was not a const. The energy of adsorption of Al^{+3} was many times greater than the energy of adsorption of Ca in lateritic loam and askangel. The energy of adsorption of H ions on the objects used was lower than that of the Ca ions. The energy of adsorption of Al^{+3} was many times greater than the energy of adsorption of H ions.

8784. CORNFIELD, A.H. **Rapid copper acetate method for the determination of the base-exchange capacity of soils.** *J. Sci. Food Agr.* 3, 388-90(1952).—*C.A.* 47, 4535*a*.

The method was applicable to unsatd. and calcareous soils. Place 4 g of air-dried soil (passed through a 2-mm sieve) and 0.5 g of $BaSO_4$ in a test tube marked at 11.6 ml. Add 5 ml of 0.5 *N* AcOH and shake 0.5 min. Add a few drops of AmOAc if foaming is severe; if effervescence occurs add another 5 ml of 0.5 *N* AcOH, or as much as is necessary until effervescence ceases. Add 0.07 *N* AcOH almost to the top of the tube, shake 10 sec., allow to settle, remove most of the supernatant, and repeat the washing with 2 more portions of 0.07 *N* AcOH. Add 0.07 *N* AcOH to mark, and then add 10 ml of 0.1 *M* $Cu(OAc)_2$. Heat at 50 °C for 5 min. in a water bath, stirring occasionally. Cool, remove a 10-ml aliquot of the supernatant, add 10 ml of 20% KI, and titrate with standard 0.5 *N* $Na_2S_2O_3$. The 10 ml of soln. withdrawn for titration was equiv. to 2 g of soil, and the base-exchange capacity of the soil equal to the reduction in Cu ion concn. when expressed in appropriate units.

8785. DEMOLON, ALBERT; BOISCHOT, PIERRE, AND LAJON, JACQUELINE. **The ability of soils to fix the H_2PO_4 ion.** *Compt. rend.* 234, 1820-3 (1952).—*C.A.* 46, 9243*c*.

With a muddy soil of pH 6.5 which contained 14% clay, 8.7% free Fe, 0.9% humus, and 0.14% P_2O_5, it was found that free Fe entered into the fixation of P_2O_5 and that the fixation reached a max. when the P/Fe ratio was less than 3%. Hydroxyquinoline, humic acid, tannin, or H_2S was found to block the fixing power of the Fe. The clay in the soil was found to be related to the Fe which it fixed by adsorption. The substitution of K^+ by Ca^{++} at constant pH resulted in the fixation of P_2O_5, but the addn. of CaO had an opposite effect. The fixing capacity for P_2O_5 was given for 7 soils.

8786. DOLE, MARJORIE WELSH. **The Aspergillus niger method for determining copper in soils.** *Soil Sci.* 73, 135-47(1952).—*C.A.* 47, 3499*d*.

The method was found satisfactory for measuring small amts. of available Cu. Spore color was a better criterion of Cu level than either amt. of sporulation or mycelial wt. Both ionic and adsorbed Cu were readily available to *A. niger*, although the rate of color development was slower for adsorbed Cu. A recommended procedure for routine assays for soil Cu was described.

8787. EGGERT, R.; KARDOS, L.T., AND SMITH, R.D. **Relative absorption of phosphorus by apple trees and fruits from foliar sprays, and from soil applications of fertilizer, using radioactive phosphorus as a tracer.** *Proc. Am. Soc. Hort. Sci.* 60, 75-86(1952).—*C.A.* 47, 5601*c*.

Greenhouse and field expts. showed that water-sol. radioactive P salts applied as sprays to foliage and small branches of apple trees could be adsorbed and translocated to other parts of the trees. In the greenhouse tests with trees 1 yr old, $(NH_4)_2HPO_4$ was absorbed in larger amts. than $NH_4H_2PO_4$, Na_2HPO_4, Na_3PO_4, and $Ca(H_2PO_4)_2$. There was a continuing absorption during the 30 days even though the leaves were never remoistened after the initial spray had dried. As terminal growth developed from the area originally sprayed, increasing amts. of P were found in unsprayed leaves that were removed at intervals of 1 week from near the tip of that growth. When P was applied to the soil there was no uptake by the trees when a penetration of only 2 in. was obtained. When the fertilizer penetrated 4 in. deep, 2.68-3.78% of the P in the tissue was obtained from the fertilizer; when penetration was 8 in. deep, up to 5.77% of P came from the fertilizer.

8788. FOX, R.L.; OLSON, R.A., AND MAZURAK, A.P. **Persistence of ammonium ion and its effect upon physical and chemical properties of soil.** *Agron. J.* 44, 509-13(1952).—*C.A.* 47, 2410*h*.

NH_4^+ applied to an eroded Sharpsburg soil in early November was almost completely recovered in the surface one-half in. on April 1. Appreciable amts. of NH_4^+ remained in the surface one-half in. after 2 addnl. months. The persistence of the NH_4^+ caused a deflocculated condition which resulted in a crusting of the surface soil. Soil samples collected on April 1 showed increased pH in proportion to rate of NH_4^+ application in the previous fall. Samples collected on June 15 showed increased exchangeable H^+ and decreased pH and exchangeable Ca^{++} and Na^+ with increasing rate of NH_4^+ application. The influence of applied NH_4^+ on exchangeable K^+ and Mg^{++} was small. A trend of reduced permeability with increasing rate of NH_4^+ application was noted in disturbed samples collected in the early spring.

8789. HSEUNG, Y. AND JACKSON, M.L. **Mineral composition of the clay fraction. III. Some main soil groups of China.** *Soil Sci. Soc. Am., Proc.* 16, 294-7(1952).—*C.A.* 47, 244*i*.

Samples from China were analyzed by fractionation at 5, 2, 0.2, and 0.08μ, and application of x-ray diffraction and elemental analysis procedures. Montmorinic dioctahedral illite was found in the Desert soils and showed a young stage of soil weathering. The content of the montmorin series was low in most of the soils studied, attributed to drier cool climates than in the regions of the U.S. where it commonly occurred. The weathering mean ranged from 2.5 to 11.0 for the soils of China examd.

8790. JACQUET, J. AND LE NIR, Y. **Rapid method for the determination of so-called assimilable phosphates in soils.** *Compt. rend. acad. agr., France* 38, 139-42 (1952).—*C.A.* 47, 245*f*.

A 0.25, 0.5, and 1% soln. of trichloroacetic acid was used, resp., to ext. P from acid, slightly calcareous, and calcareous soils. Three g of finely ground sample was agitated for 1 min. with 18 ml of the proper concn. of trichloroacetic acid in a test tube fitted with a ground-glass stopper and filtered. To 6 ml of the filtrate, 1 ml of molybdate reagent was added and the mixt. shaken. The mixt. was treated with 2 ml of a 2% soln. of hydroquinone and shaken. The contents were allowed to stand 10 min. and 10 ml of Na_2SO_4 added. A blue complex phosphomolybdate formed immediately and the intensity of the color measured by means of an electrophotometer.

8791. KEIL, K. **The densification and strengthening of binding soils (adhering loose rocks).** *Bautechnik* 29, 42-6 (1952).—*C.A.* 46, 5814*c*.

Binding soils could be stabilized (to make them more suitable for building foundations and stronger as building materials) by chem. or electrolytic treatment based on the phys. change which the soil underwent by elimination of the decisive influence of the water. This was made possible by the limitation of the exchangeability of ions and the capacity of water mols. to be adsorbed at the unsatd. border areas of the clay minerals. The action of this chem. strengthening was always limited to the chem. sphere of influence. The mutual actions between chemicals and soils were discussed.

8792. KELLER, W.D. AND FREDERICKSON, A.F. **Role of plants and colloidal acids in the mechanism of weathering.** *Am. J. Sci.* 250, 594-608(1952). —*C.A.* 47, 803*f*.

The decompn. of minerals by H ions resulted from its penetration into the carbonate and silicate crystal lattices to form high-energy bondings with O. The H ions may arise from the ionic double layer surrounding plant roots, humic or carbonic acids in natural waters, or acidic clays. The breakdown of the rock was effected by the polarization of O atoms by H ions or by ion-exchange processes. The replaced metallic cations were transferred in soln. or by contact exchange by networks of colloidal particles. The growing plants utilized some of the cations as nutrients and hence promoted further weathering.

8793. MAMAEVA, L. YA. **A rapid method for determining adsorbed sodium in solonetzic soils.** *Pocȟvóvedenie* 1952, 574-6.—*C.A.* 47, 1881*h*.

The method was based on: (1) adsorbed Na was replaced by Ca^{++} of gypsum with a definite titer; (2) After contact of the soln. of $CaSO_4$with the soil, the residual Ca^{++} in soln. was detd.; (3) The residual Ca^{++} of the gypsum soln. was detd. by pptg. with 0.1 *N* soln. of a mixt of NaOH and Na_2CO_3; (4) The excess alkali mixt. was detd. by titrating with 0.1 *N* HCl.

8794. MCLEAN, E.O. **The effect of humus on cationic interactions in a beidellite clay.** *Soil Sci. Soc. Am., Proc.* 16, 134-7(1952).—*C.A.* 46, 8305*h*.

Expts. with mixts. of 10 parts of beidellite clay and 1 part of crude humic acid showed that the exchange capacity of the clay-humic acid system was 73% of that of the sum of the component parts. Base satn. in the clay-humus systems, relatively higher than the sum of actual exchange capacities of the component parts, resulted in higher activities of the cations in all cases than in the clay alone. In spite of the higher activities in the clay-humic acid systems the interactions of the cations were very similar to those in the clay alone.

8795. MILLER, E.V. AND COLEMAN, N.T. **Colloidal properties of soils from western equatorial South America.** *Soil Sci. Soc. Am., Proc.* 16, 239-44(1952).—*C.A.* 47, 245*d*.

In the humid tropical regions, kaolin clays were common, but there was also evidence of juvenile soils. Immaturity was indicated by high contents of exchangeable bases, presence of clays with high cation-exchange capacities, evident lack of crystallinity of the clays, and pH values which were relatively low for the existing degree of base satn. Dark colored acidic Andean soils possessed high phosphate-retaining capacities and high exchangeable Al. Their cation/anion exchange-capacity ratios were less than 1.

8796. MITCHELL, LLOYD C. **A new indicator for the detection of the chlorinated pesticides on the paper chromatogram.** *J. Assoc. Offic. Agr. Chemists* 35, 1928(1952).—*C.A.* 47, 5063*f*.

Spray with 0.05 *N* $AgNO_3$ in 95% alc. and air-dry for 1/2 hr. Spray with 37% HCHO soln. and air-dry for 1/2 hr. Spray with *N* KOH in MeOH, air-dry for a few min. to remove excess MeOH, and heat in an oven at 130-3° for 1/2 hr. Spray with a mixt. of concd. HNO_3 and 30% H_2O_2 (1 + 1) and air-dry overnight. Expose to the sun or bright daylight until the spots are fully developed. This indicator was suitable for compds. resistant to alk. dehalogenation such as aldrin and dieldrin, as well as compds. not so resistant.

8797. MOTL, O. **The determination of Atabrin by means of an ion-exchange chromatographic method.** *Českoslov. farm.* 1, 630-2(1952).—*C.A.* 47, 5071*d*.

The basic component was detd. on Amberlite IRA-400.

8798. NIKITIN, A.A. AND RAINEY, JOSEPHINE W. **Reactions between trace-element salts and nitrogen-phosphorus-potassium carriers in fertilizers.** *Agron. J.* 44, 541-6(1952).—*C.A.* 47, 2415*f*.

The weak pptg. action of phosphate on trace elements did not interfere with their availability when used with N-P-K carriers in fertilizers. Superphosphate sorbed much smaller amts. of trace elements than did the nonacid-forming N-P-K (6-8-6) fertilizer. A substantially larger amt. of Cu than Zn and Mn was sorbed by N-P-K. Sorption of trace elements by N-P-K was considerably reduced in the presence of $Fe_2(SO_4)_3$. There was less pptn. of trace elements if NH_3 had been completely reacted with N-P-K before the addn. of the trace elements. With NH_3 present, Cu sorption by N-P-K was diminished above pH 6.0 by formation of the cuprammonium complex. When lime was used to adjust the pH, the sorption of Cu was const. above pH 5.0.

8799. O'COLLA, PROINSIAS. **Analysis of chlorinated organic insecticides by partion chromatography on paper and on cellulose columns.** *J. Sci. Food Agr.* 3, 130-5(1952).—*C.A.* 46, 8802*h*.

γ-Hexachlorocyclohexane in insecticidal prepns. was detd. as follows: A sample contg. approx. 40 mg γ-hexachlorocyclohexane was extd. 3 times with petr. ether satd. with Ac_2O, filtered into a flask contg. a trace either of benzeneazo-2-naphthol or of 1-hydroxy-4-*p*-toluidinoanthraquinone and dild. to 5 ml. The soln. contained all the γ- and ζ-isomers present in the sample and some of the α- and β-isomers. The isomers were sepd. chromatographically. Locating γ-hexachlorocyclohexane was aided by viewing the fluorescent benzeneazo-2-naphthol, which moved with the ζ-isomer, under ultraviolet light.

8800. PRATT, P.F. **Release of potassium from nonexchangeable forms from size fractions of several Iowa soils.** *Soil Sci. Soc. Am., Proc.* **16**, 25-9(1952).—*C.A.* 46, 5237*c*.

The K release from nonexchangeable forms to HNO_3 per unit wt was highest in the 0.2-2-μ fraction for 12 of 13 Iowa soils, was highest in the <0.2-μ fraction for 1 soil, and decreased with increase in particle size in the silt fractions. For each of 6 size fractions the release per unit wt was correlated with release from the whole soil. The clay fractions contributed about 60% and the coarser fractions about 40% of the K release from the whole soil. For 8 soils the lowest total K was in the <0.2-μ fraction and the highest total K was in the 2- to 5-μ fraction. The percentage of the total K sol. in HNO_3 was highest in the < 0.2-μ fraction and decreased with increase in particle size.

8801. PYLE, R.E. AND JONES, P.R. **The effects of wetting agents on the physical properties of clay bodies.** *Am. Ceram. Soc. Bull.* **31**, 233-6 (1952).—*C.A.* 46, 9274*e*.

Florida kaolin 50, feldspar 15, flint 35% was used. The wetting agent was dissolved in a small portion of the water of plasticity which was const. at 28% of the dry wt. In general, drying shrinkage and porosity were decreased by the addn. of a wetting agent, while firing shrinkage, dry strength, and fired strength were increased. The nonionic and cationic agents had but little effect. Each wetting agent had its individual optimum concn.

8802. RAMBERG, HANS. **Chemical bonds and distribution of cations in silicates.** *J. Geol.* **60**, 331-55 (1952).—*C.A.* 46, 11055*c*.

The presence of OH did not affect the Fe-Mg distribution in talc and anthophyllite, but appeared to do so in serpentine and chlorites. The capacity to accept Al in the tetrahedral positions also increased from orthosilicate to tectosilicate. Al preferred to enter Si positions with a max. no. of electroneg. bridging oxygen-neighbors. This resulted in a decrease of the electronegativity of the oxygen with a consequent increase in the Fe-Mg ratio and evidence was presented to support this theoretical conclusion in hornblende, anthophyllite, and biotite.

8803. ROTINI, O.T.; DEL CARRATORE, A.; LOTTI, G., AND CARLONI, L. **The absorbant power of agricultural land for metaphosphoric acid.** *Chimica e industria* (Milan) **34**, 711-14(1952).—*C.A.* 47, 4533*e*.

To det. the velocity of metaphosphate fixation of agricultural soil, 300 cc. 0.1 *N* metaphosphate soln. was added to 150 g earth, and the residual Na metaphosphate detd. after 1 min., 30 min., 1 hr, 5 hrs, and 7 hrs. The results showed that metaphosphate absorption was almost instantaneous and the total absorption after 7 hrs was very little more than that after 1 min. To det. the absorption curve of Na metaphosphate as a function of the initial concn., the residual $NaPO_3$ was detd. in a series of measurements in which 50 g earth was treated for 5 min. with 100 cc. $NaPO_3$ solns. of varying concn. The results of fixation velocity and final metaphosphate concn. measurements showed that the process of absorption presents all the characteristics of colloidal absorption phenomena.

8804. SCHOFIELD, R.K. **Soil colloids.** *Chemistry & Industry* **1952**, 76-8.—*C.A.* 46, 7265*b*.

Colloidal particles of the soil usually had a neg. charge. In a soil, well leached with 0.01 *M* $CaCl_2$, the soln. was considered around a neg. particle. The Ca-ion concn. in the Stern layer and in the Gouy layer against it were controlled by the neg. charge in the solid surface. Diln. of the outer $CaCl_2$ concn. did not greatly affect the inner concn. The inner Ca-ion concn. was controlled by the neg. charge on the solid. An equation for the neg. adsorption in the Gouy layer was obtained which involved only slight approximation. The Smoluchowski equation was inapplicable in some cases because the elec. cond. varied so much within the diffuse double layer. Calcn. of the proportion of the Ca and of the Na ions in both the Gouy and Stern layers was described.

8805. SHAW, W.M. **Report on exchangeable hydrogen in soils. Interrelationship between calcium sorption, exchangeable hydrogen, and pH values of certain soils and subsoils.** *J. Assoc. Offic. Agr. Chemists.* **35**, 597-620(1952). —*C.A.* 47, 2917*b*.

The Ca acetate procedure for the detn. of exchangeable H in soils afforded satisfactory indications of the $CaCO_3$ required to raise the soil to pH 7, and this procedure could be utilized jointly with the pH detn. and one other soil const. (Metal cation content, exchange capacity, or pK value) for the detn. of $CaCO_3$ required to raise the pH to values other than 7. To obtain concordant results with the Ca acetate procedure, the directions concerning the size of sample, duration of contact, and vol. of leaching should be adhered to.

8806. SMITH, DONALD H. **Chromatographic separations of soil organic compounds.** *Iowa State Coll. J. Sci.* **26**, 287-8(1952).—*C.A.* 47, 1881*c*.

The acidic nature of phytin suggested that its presence in soil could be investigated by base-exchange methods. A 1.25 × 24-cm bed of a base anion exchanger in the sulfate form wassatd. to 0.25 of its length with inositol phosphates. The bed was washed at the rate of 32 ml per hr by HCl whose concn. was increased from 0.1 *N* to 1.0 *N*. The effluent for each hr was collected separately. From a mixt. of Na phytate and derivs., 9 org. compds. were collected in quantities sufficient to det. their inositol to P ratios. To a sample of each soil, inositol phosphates were added and a second sample was left untreated. All samples were extd. by a method thought to be specific for phytin. Only 25 to 50% of the extd. org. P was eluted concurrently with known inositol phosphates. To 2 soils, radioactive P, dextrose, and NH_4NO_3 were added. After 30 days' moist incubation at room temp., a mixt. of inositol phosphates was added and the phytin was extd. immediately. The ext. was sepd. chromatographically. Activity was found in part of the eluate known to contain inositol penta- and hexaphosphates.

8807. Smith, Donald H. and Clark, Francis E. **Chromatographic separations of inositol phosphorus compounds.** *Soil Sci. Soc. Am., Proc.* 16, 170-2(1952).—*C.A.* 46, 8574*g*.

A chromatographic method was described for the resolution of inositol phosphates. Na phytate, considered sufficiently pure to use as a standard of comparison, was found to contain some 30% of compds. other than the hexaphosphate. The pentaphosphate constituted the bulk of the admixed material. From a mixt. of Na phytate and derivs., 9 org. P compds. were sepd. in sufficient quantities to permit detn. of their inositol/P ratios.

8808. Smolík, Ladislav. **The influence of the exchangeable bases on the height of the capillary rise of water in soil.** *Sborník Českoslov. Akad. Zemědělské* 25, 473-8(1952).—*C.A.* 47, 4533*g*.

A H soil (pH 4.06) was prepd. by electrodialysis of the sandy loam. By action of hydroxides on this soil Ca soil (pH 7.53), Mg soil (pH 8.44), and Na soil (pH 9.93) were prepd. and used to det. the heights of the capillary rise (soils connected with H_2O by cotton). The highest rise were in the H soil, the lowest in the soils with the highest amt. of the exchangeable Na. The rise of H_2O in soils satd. with $Mg^{2+} + Ca^{2+}$ was between the rise of the H and Na soil.

8809. Williams, D.E. and Jenny, H. **The replacement of nonexchangeable potassium by various acids and salts.** *Soil Sci. Soc. Am., Proc.* 16, 216-21(1952).—*C.A.* 46, 8302*e*.

A large proportion of the K absorbed by plants growing on Ramona loam was obtained from the nonexchangeable form. The soil contained 20,000 p.p.m. of K of which 78 p.p.m. was exchangeable to neutral, normal NH_4OAc. Rye plants grown by the Neubauer technique removed, in addn., 112 p.p.m. of nonexchangeable K from the soil. Water satd. with CO_2 at pH 4.0 leached through the soil for 50 days removed only 39 p.p.m. of nonexchangeable K. Equal vols. of CO_2- satd. water which passed through the soil removed the same amt. of K regardless of the rate of leaching or thickness of the soil column. The final concn. of K in the CO_2-satd. water leachates was 0.1 p.p.m. A correlation was found in extn. and leaching expts. between pH and the amt. of K replaced from the soil.

8810. Evans, Daniel D. **Effect of combined pressure and concentration gradients on gaseous flow through soils.** *Iowa State Coll. J. Sci.* 27, 165-6(1953).—*C.A.* 47, 5592*i*.

Darcy's law was found to be valid down to pressure gradients as low as 0.00018 mm of H_2O per mm of porous medium and probably down to 0. Slip flow and free mol. flow in ordinary moist soil were negligible. Five problems were solved by use of the combined laws of Darcy and Fick and two auxiliary equations: (1) Flow through a tube of porous medium with an absorber at one end which removed one component, in a specific case, could be calcd. with only 13% error by considering diffusion flow only. (2) Flow through a tube of porous medium with a volatile liquid at one end, when CS_2 was the liquid, was calcd. from diffusion only and the error was 43%. (3) The inclusion of a viscosity factor in expt. 2 was negligible. (4) A respiration problem in which O_2 and CO_2 were diffusing in opposite directions showed a slight build up of pressure due to differences in the two rates of diffusion, the change produced a max. error of 6% in the calcd. rates. (5) Studying the importance of mass flow of gas, as during a linear change of barometric pressure with time, showed that normal changes of barometric pressure had little influence on transference of gases in soil.

8811. Flegg, P.B. **The effect of aggregation on diffusion of gases and vapors through soils.** *J. Sci. Food Agr.* 4, 104-8 (1953).—*C.A.* 47, 5591*i*.

The diffusion coeff. of Et_2O and Me_2CO through soils did not vary over the range of aggregate sizes tested. The diffusion coeff. decreased as the moisture present in the soil increased regardless of aggregate size. It was calcd. that the decrease in diffusion coeff. produced by the water in the soil was approx. proportional to the reduction in porosity due to the vol. of water present.

8812. Kamoshita, Yutaka and Iwasa, Yasushi. **Effect of heating soil upon the absorption of dyes by the soils. I.** *J. Sci. Soil Manure, Japan* 23, 141-2(1953).—*C.A.* 47, 5595*a*.

When soils were heated from 300 to 600°C, their absorptive power for methylene blue was changed in accordance with their natures. The power increased in volcanic ash soil, but decreased in acid soil and also kaolinitic soil.

8813. Tamura, T. and Jackson, M.L. **Structural and energy relationships in the formation of iron and aluminum oxides, hydroxide, and silicates.** *Science* 117, 381-3(1953).—*C.A.* 47, 7142*f*.

A particular difference between the Al and Fe series was the absence of cryst. $Fe(OH)_3$, resulting in the formation of lepidocrocite, FeOOH, by oxidation and dehydration of cryst. $Fe(OH)_2$. The formation of Mg and Fe silicates of Al (montmorins) took place only where soil leaching was slow, being replaced by kaolin as leaching progresses, while iron-rich soils decomp. to goethite ($HFeO_2$) and Fe_2O_3.

V-9. Applications to Foods, Wines, and Liquors

8814. LYMAN, J.F.; BROWNE, E.H., AND OTTING, H.E. **Readjustment of salts in milk by base-exchange treatment.** *Ind. Eng. Chem.* 25, 1297-8(1933).—*C.A.* 28, 834⁸.

Passage of raw milk through zeolite removed more Ca and P when the milk had been acidified. Milk of artificially increased acidity (0.3% as lactic) lost 22% each of its Ca and P. After this treatment, rennin failed to produce a curd unless the milk was first boiled. On boiling, the tendency to coagulate was greater when HCl had been used previously to acidify the milk than when citric acid had been used. The Na:K ratio or content need not be disturbed if the zeolite was revived with the proper salt combination. Revival with NaOH was necessary to affect P removal. Previous treatment with HCl lowered the alky. of the ash obtained from zeolite-treated milk, but treatment with lactic or citric acid raised it. Butter fat did not interfere with base-exchange and the milk was not appreciably changed in taste.

8815. CONNOLLY, G.C. **A new purification tool. Activated carbon.** *Mida's Criterion* (Whiskey & Wine Ind.) 41, 53-6 (March)(1936)

The use of activated carbon just previous to the cistern-room was suggested for the purification of alcohol or the treatment of young whiskey in order to eliminate the traces of "slop" or "hog-track" odor and taste. The presence of grain oils and certain fatty matter, possibly coming from the germ of the grain, was largely responsible for these particular impurities. Usually 0.5 to 1.0 lb of "Nuchar Wa" was sufficient for treating 50 gallons of most young whiskies, although as much as 2 to 5 lbs were required for very heavy bodied whiskies. The treated raw liquor was about 103 to 110 proof. After contact of about 1/2 to 1 hr, the mixture was filtered through a completely enclosed filter press. The filter cake was blown with air, removed, and destroyed by burning on the distillery premises.

8816. CONNER, R.T. AND STRAUB, G.J. **Combined determination of riboflavin and thiamin in food products.** *Ind. Eng. Chem., Anal. Ed.*, 13, 385 (1941)

No appreciable adsorption of riboflavin from solns. containing 3-10 micrograms occurred on a column of Decalso. Riboflavin was quantitatively adsorbed on Floridin and Supersorb, but appeared to be completely eluted from the latter only. The necessary remaining details of the analysis were critically discussed.

8817. GENTILINI, LUIGI. **Chromatographic analysis applied to the detection of the most common adulterants of the color of red wines.** *Annuar. staz. sper. viticolt. enol. Conegliano* 10, 59-72(1941).—*C.A.* 40, 3222⁹.

Chromatographic analysis with an adsorbing column of activated MgO and with Et_2CO as a washing liquid permitted the detection of the presence of the following colors added to red wines: hematin, basic and acid fuchsin, scarlet red, and Bordeaux B and R.

8818. DÉRIBÉRÉ, MAURICE. **Bentonite and hygiene.** *Ann. hyg. publ., ind. sociale* 20, 1-8 (1942).—*C.A.* 37, 3863⁸.

The use of bentonite for the clarification of water, wine and AcOH and for cosmetics was discussed.

8819. GENTILINI, LUIGI. **The effect of charcoal on the alcoholic and glycerol fermentation of grape must.** *Ann. tech. agrar.* 14, 94-8(1942).—*C.A.* 38, 4749⁶.

Sterilized must dild. to 12% of sugar was fermented at 31°C by beer yeast in the presence of wood or animal charcoal (0.5 and 2.5%). Addn. of charcoal increased considerably the content of CO_2 and decreased the yield of alc., favoring the formation of glycerol. Addn. of sulfite had an unfavorable effect on the formation of glycerol.

8820. HAMILL, GEO. K. AND SIMONDS, PAUL W. **Detection of grape wine in blackberry wine.** *J. Assoc. Official Agr. Chem.* 25, 220-6 (1942).—*C.A.* 36, 2371¹.

The method consisted essentially in dilg. 10 ml of wine with 50 ml of acidified water (either with or without preliminary reduction with 0.5 g granulated Zn and 4 drops concd. HCl), filtering through a 2:1 mixt. of Grade A activated Al_2O_3 and filtercel, washing with H_2O or dil. CH_2O, and observing under ultraviolet light. The presence of grapes was indicated by yellow colors ranging from pastel tones to russet; blackberries and other berries imparted mauve to purple shades, some contained "off" shades, others approached the clear purples of control tubes adsorbed from water only.

8821. LECOQ, H. **New technique in qualitative and quantitative microchemical analysis-chromatographic reactions.** *Bull. soc. roy. sci. Liége* 11, 679-94(1942).—*C.A.* 38, 3921³.

The absorbent (Al_2O_3,SiO_2, etc.), was contained in a capillary tube which was attached to a large tube. The liquid to be tested was sucked into the capillary tube through a plug of cotton. The mode of operation and the advantages of the method were fully discussed.

8822. MATCHETT, J.R. **Tartrates from still slops.** *Wines and Vines.* 24, 18 (1943).

Tartrate in brandy still-slops was removed in high purity and satisfactory yield through the use of synthetic anion exchangers placed in beds. When still-slop was passed through these exchangers under controlled conditions, the tartrate remained affixed to them while most of the unwanted material passed through. When the exchanger bed had attained a capacity load, a solution of NaCl was passed through it to remove the tartar as sodium tartrate soln. of about 5% concn. The process yielded calcium tartrate of excellent purity, and recovery will amount to 85% or more. Chemical reagent costs at present prices amounted to about 4 cents per pound of tartrate recovered.

8823. ROUSSELOT, ALBERT. **New method for the demineralization of gelatins.** *Compt. rend.* 216, 54-6(1943).—*C.A.* 38, 5428⁹.

The usual procedures for the demineralization of gelatin increased the protein content of the gelatin. By the use of synthetic ion exchangers, it was possible to demineralize gelatins and glues without increasing the protein content. Gelatins contg. 1 g / liter of Al, Mg, Ca, Ba and SO_4 ions were completely dimineralized by passing over a 15-cm column of a resorcinol-HCHO resin, kept at the temp. of boiling acetone. Demineralization proceeded readily for 8, 10 and 15% gelatin solns. but was poor with 1 or 2% solns. The exchange was a true stoichiometric reaction and the power to exchange did not depend on the surface of the exchanger.

8824. TOLBERT, N.E. AND AMERINE, M.A. **Charcoal treatment of brandy.** *Ind. Eng. Chem.* 35, 1078-82 (1943).—*C.A.* 37, 6814^6.

The phys. properties and effectiveness of 27 charcoals in adsorbing the constituents of brandy from pure soln. in 50% alc. of each major constituent of brandy or from com. brandy were tested. The charcoals (0.5 g per 100 ml) removed acidity, furfural and tannin; but the esters, acetaldehyde and higher alcs. were unaffected. Many charcoals also adsorbed Cu, Fe, coloring matter or ext. material from brandy. The charcoals varied markedly in adsorption ability. Fusel oils up to about 25% could be removed by using larger amts. of charcoal (3 or 4 g per 100 ml); but at 94% alc. and 70°C the adsorption of higher alcs. was reduced. Increasing the period of contact did not improve adsorption. Charcoals failed to remove from the brandy an appreciable amt. of the major chem. constituents; but they improved the organoleptic character as to obnoxious odors, tastes and color.

8825. WILLIAMS, G.C. AND FALLIN, E.A. **Activated carbon treatment of raw whisky.** *Ind. Eng. Chem.* 35, 251-4 (1943).—*C.A.* 37, 1559^4.

The chem. changes and taste changes were reported that took place when a distillate from an alc. fermentation process was treated with each of several activated carbons. The effect of one carbon was investigated between 20° to 80°C. At room temp., the change in acids, esters, aldehydes and fusel oil was slight, but not consistently in one direction. However, the treatment at elevated temps. definitely produced an increase in acids and permanganate time, while it indicated decreases in ester, aldehydes and fusel oil.

8826. GARCÍA HERNÁNDEZ, MANUEL. **Differentiation of ethyl alcohol produced by the fermentation of sugar-cane juices from that produced by the fermentation of grains.** *Anales acad. cienc. med., fis. y nat. Habana* 83, 166-7(1944-45).—*C.A.* 46, 679g.

To 5 ml of EtOH add $FeSO_4.7H_2O$ crystals (free of $Fe_2(SO_4)_3$) and 2 ml of 2% KSCN. Development of a red color was attributed to the presence of peroxides, and was considered to indicate that the EtOH was obtained by the fermentation of sugar-cane juices. EtOH from grains did not give the red color.

8827. KOMINEK, E.G. **The use of ion exchangers in brewing-water treatment.** *Brewers Digest* 19, No. 8, 35-7(T104-T106) (1944).—*C.A.* 38, 6043^9.

The effect of various salts in H_2O on the flavor and appearance of beer was discussed. The presence of high concns. of Na_2CO_3 and $NaHCO_3$ in H_2O in certain localities had required blending with distd. water, an expensive procedure. The cation exchanger made possible the removal of such salts and the 2-stage treatment using a cation and an anion exchanger also removed sulfates and chlorides. The mechanics of ion exchangers were explained and the method of regenerating an exhausted exchanger outlined.

8828. KURSANOV, A.L. AND ISAEVA, E. **Adsorption of enzymes by yeast cells.** *Biokhimiya* 9, 273-83(1944).—*C.A.* 39, 3115^6.

In studying the fermentation processes of champagne wine, it was observed that after the introduction of the champagne yeast, the activity of the enzymes found in the original wine decreased during the first several days; some of the enzymes, like β-glucosidase, had completely disappeared. After 3-4 weeks the enzyme activity again increased. The enzymes initially adsorbed by the yeast cells had been liberated when the latter began to disintegrate. The following enzymes were adsorbed from an aq. soln. by yeasts of the strain *Saccharom. steinberg:* sucrose, peroxidase, trypsin, and β-glucosidase.

8829. MATCHETT, J.R.; LEGAULT, R.R.; NIMMO, C.C., AND NOTTER, G.K. **Tartrates from grape wastes.** *Ind. Eng. Chem.* 36, 851-7(1944).—*C.A.* 38, 5637^1.

A substantial part of the approx. 15 million lb of tartaric acid annually required was potentially available in the wastes of the grape processing industry. Lab.-scale expts. indicated the com. feasibility of using synthetic ion-exchange materials for recovery of this and possibly other valuable constituents of the wastes.

8830. NISSEN, B.H. AND LAUFER, STEPHEN. **Filter mass and filter aids. Outline of methods of analysis.** *Brewers Digest* 19, No. 12, 52-3, 56 (160T-1T, 164T)(1944).—*C.A.* 39, 1113^9.

Filter-mass detns. included moisture, ash, total Fe, distribution, sol. material, ether soly., sol. Fe, I_2 test, taste test and microsopic examn. Semiplant practical tests described prepn. of filter pad on a small filter press. Analyses of filter aids, such, as diatomaceous earths, were much the same as those for filter mass. Tests included: color, pH, H_2O soly., taste, speed of filtration and settling time.

8831. SOL'TS, L.M. **A simplified method for refining raw spirit.** *Farmatsiya* 1944, No. 2, 33-5.—*C.A.* 39, 3392^1.

Samples of raw spirit contg. 0.006, 0.01, and 0.02% aldehydes were dild. to 80, 70, 50, 40, and 20 vol.-%, then shaken with 1-5% of a solid adsorbent. Filtration followed at once, or after standing 8 hrs. Adsorption with clay, activated carbon, whiting, and wood ash gave no significant result with raw (88%) spirit and none after diln. to 80 or 70%. In 50% spirit (initial aldehyde content 0.02%) there was some removal of aldehydes: in 40% spirit the completeness of aldehyde removal ranged up to 60%. Activated carbon was most effective as a deodorant, with the added advantage of low spirit loss (3-5% as against 15-25% with clay).

8832. COOLEY, MAXWELL L.; CHRISTIANSEN, JAMES B., AND SCHROEDER, CARL H. **Chromatographic estimation of vitamin A in mixed feeds.** *Ind. Eng. Chem., Anal. Ed.* 17, 689-92 (1945).—*C.A.* 40, 652⁵.

High-purity Na_2CO_3 was used as the adsorbent in the chromatographic procedure. This facilitated the simultaneous sepn. of vitamin A and carotene from most common noncarotene pigments and other substances occurring in livestock feed which interfered with the $SbCl_3$ detn of vitamin A. Neither vitamin A nor carotene was retained appreciably by the adsorbent. A combination of sapon. with the chromatographic procedure may result in a loss of as much as 9% of the original vitamin A, but recoveries were good when sapon. was omitted.

8833. DIETZ, CARL. **Wort filtration with diatomaceous silica filter aids.** *Brewer's J. (Chicago)* 92, No. 5, 22-3, 52 (1945).—*C.A.* 39, 3391⁴.

Chem. changes occurring during wort cooling, theories on the effect of wort cooling, and wort filtration were discussed. Even with comparatively large amts. of coarse filter aids, the flocculent suspended material rapidly provided a compact cake and brilliant wort. Advantages of wort filtration were: (1) a cleaner yeast, (2) increased capacity, (3) increased yield, and (4) greater uniformity of wort at pitching time.

8834. TOMOTA, NORITAKA AND FUJIKI, KAXUYA. **Application of activated carbon in the butanol fermentation of concentrated "unrefined sake."** *J. Soc. Chem. Ind. Japan* 48, 17(1945).—*C.A.* 42, 6053*b*.

The presence of a small amt. of activated carbon promoted BuOH fermentation of corn. The carbon was added 10 hrs after the fermentation was initiated, with the pH held at 5.6 and the incubation at 35°C for 72 hrs.

8835. CARRE. **The use of activated carbons in agricultural industries.** *Bull. assoc. chim.* 63, 108-10 (1946).—*C.A.* 41, 1126*a*.

The phys. and chem. properties of activated carbons were described. In the sugar industry the best results were obtained by prepg. a slurry in sirup, mixing with 2nd carbonation juice, filtering, adding the filter cake to 1st carbonation juice, evapg., sulfuring, and filtering again. Activated carbon could be used to advantage for removing undesirable impurities from alc., wine, cider, perry, vinegar, and vegetable oils.

8836. CLERCK, J. DE AND DUGAUQUIER, CH. **The specific action of certain ions in water on the quality of beer.** *Bull. assoc. anciens etud. brass. univ. Louvain* 42, No. 2, 64-79 (1946).—*C.A.* 41, 4273*g*.

The effect of water with addn. of certain salts on the quality of beer was studied. Sixty exptl. mashes were prepd. with tap water and distd. H_2O to which the following salts were added: NaCl, Na_2SO_4, $NaNO_3$, $CaCl_2$, $CaSO_4$, $Ca(NO_3)_2$, $MgCl_2$, and $MgSO_4$. The effect of the time of addn. was studied by adding the salts before boiling, after boiling, and during moistening of the malt. The Na ion, especially under the form of chloride, produced a very disagreeable taste, while Na_2SO_4 gave a bitter taste to the resulting beer. Nitrates, besides being harmful to the fermentation, were distinctly injurious to the taste of the beer.

8837. CRANSTON, H.A. AND THOMPSON, JOHN B. **Use of an ion-exchange resin in determination of traces of copper. With special reference to powdered and fluid milk.** *Ind. Eng. Chem., Anal. Ed.* 18, 323-6(1946).—*C.A.* 40, 4314⁴.

The Cu was made available by reducing the pH with $HClO_4$. It was then concd. on an ion exchanger in the H-cycle, stripped from the ion exchanger with dil. HCl, and detd. polarographically by means of an additive standard technique.

8838. DUARTE, CORDELIA NOBREGA AND BARBOSA, MARIA DE LOURDES. **The problem of decolorizing beverages.** *Rev. inst., Adolfo Lutz* 6, 122-31 (1946).—*C.A.* 41, 3919*d*.

Liquids wherein sugars were to be detd. should not be decolorized with vegetable carbon, which adsorbs glucose. Lightly colored vinegars, dry wines, fermented cane juice, gin, rum, kirsch, vodka, etc., which contain less than 1% of sugars, could be decolorized with alumina cream. Where the natural coloring was intense, Pb subnitrate gave excellent results. To a quantity of beverage selected in view of the probable sugar content, add 10-20 vol. % of the 50% reagent (avoiding an excess); after a few min. add the calcd. equiv. amt. of a 20% NaOH soln. and filter off the clear soln. This method succeeded well with bitters, apertifs, etc., which were strongly colored with vegetable exts. that resisted carbon and Pb subacetate (exception: dark beers).

8839. HADORN, H. **The removal of acids and salts from fruit juices and concentrates by ion-exchange resins.** *Mitt. Lebensm. Hyg.* 37, 114-23 (1946).—*C.A.* 40, 5503⁸.

All free acid could be removed from fruit juices by passage through an ion-exchange resin, and by combining this passage with another through a cation-exchange resin, all dissociable salts could be taken out. Juice could be passed through 1 vol. of the ion exchange resin at the rate of 10 vols. per hour, but when 6 to 8 vols. have passed through, the resin must be regenerated. All the odor and taste except sweetness due to the sugars disappeared from the juice during the process.

8840. ISHERWOOD, F.A. **Determination and isolation of the organic acids in fruit.** *Biochem. J.* 40, 688-95(1946).—*C.A.* 41, 2505*f*.

Acidified fruit juice adsorbed into silica gel was extd. in the form of a column with 50% (v/v) butanol-$CHCl_3$. The fruit acids were concd. and dissolved in 50% (v/v) *tert*-amyl alc.-$CHCl_3$ for analysis. The acid mixt. was sepd. by means of a partition chromatogram with 0.5 N H_2SO_4 as the non-mobile and the butanol-$CHCl_3$ mixt. as the mobile phase.

8841. NISSEN, B.H.; BLUST, F.A.; EHRENFELD, L.; KAZANJAN, W.; MILLER, M.C.; PINKERTON, K.E., AND SALETAN, L.T. **Filter mass and filter aids.**

Brewers Digest 21, No. 1, 43-5(7T-9T)(1946).—*C.A.* 40, 2083^4.

Samples were sent to 4 collaborators for analysis based on methods reported in 1944. Data were presented on two filter-mass samples for color, % moisture, H_2O-and EtO-sol. material, I_2 test, ash, distribution, microscopic examination, and taste tests. Filter aids were tested similarly and in addn. pH, settling time, speed of filtration, turbidity, and taste were reported. Adjunct to filter mass was tested also. In general the values reported were in good agreement. Variation was shown in results for loss on ignition and speed of filtration. Further study is necessary.

8842. Ribeiro, Manuel Bessa. **Elimination of reducing agents of nonsugar nature from port wine.** *Anais inst. vinho Porto* 1946, No. 7, 51-68.—*C.A.* 42, 3131*i*.

The advantages and disadvantages of the existing methods for the detn. of the reducing sugars in rich wines were discussed. Tests were carried out to solve the problem of the reducing substances, which were not sugars, by elimination with Pb subacetate, Na_2SO_4, and lactic acid. A pH of 3-4 obtained by incorporation of lactic acid into the wine prevented the combination of the Pb subacetate with levulose and glucose.

8843. Roey, G. van. **The filtering mass and its main adjuvant, "asbestos."** *Bull. assoc. anciens étud. brasserie, Univ. Louvain* 42, 1-12 (1946).—*C.A.* 41, 2281*i*.

The prepn. of the filter pads and how to judge good ones were taken up. The pad should be examd. microscopically for structure and fineness of fiber, and a chem. detn. of the amt. of ash should be made. If the insol. ash was 0.25% or more, it showed that the filter contained at least 1% asbestos fibers.

8844. Tanabe, Osamu. **Manufacture of synthetic saké from the waste liquor of ethyl alcohol distillation.** *Shokuryô no Kagaku* (Sci. of Foods) 1, 298-9(1946-47).—*C.A.* 46, 11572*a*.

The waste liquor left behind after distg. EtOH from the fermented liquor from sweet potatoes by the amylo process was filtered and concd. to 1/30 at 40-50°C. To 1 part of this sirupy liquid 1.5 parts of EtOH was added, the ppt. formed was removed by filtration, EtOH was recovered by distn., and then a comparatively palatable liquid (contg.: total acid (as succinic) 6.72, ethersol. acid (as succinic) 6.60, amino acids 0.42, glycerol 13.74, total N 1.22, glucose 8.40%) was obtained. This liquid was treated with a small amt. of active carbon, neutralized partly with Na_2CO_3, dild. suitably, and incorporated with suitable amts. of glucose and EtOH to form synthetic saké.

8845. Gore, Herbert C. **Use of an anion-exchange resin in the preparation of sirups from orange and grapefruit juices.** *Fruit Products J.* 27, 75-6(1947).—*C.A.* 42, 6469*g*.

By use of an anion-exchange resin it was possible to remove 79% of the titratable acids from orange and grapefruit juice with a loss of 19.8% of the ascorbic acid. The process consisted of stirring the fruit juices with about 5% of the resin for 75 min. at room temp., allowing the resin to settle, and decanting the juice. While the sirups produced by filtering and boiling these juices were clear and of good color, the grapefruit sirup possessed a bitter taste.

8846. Jacobs, Morris B. **Oxidative aging of whisky.** *Am. Perfumer* 49, 263-5 (1947).—*C.A.* 41, 3582*h*.

A review describing methods using oxidizing gases and electrolytic treatment.

8847. Jacobs, Morris B. **Catalytic aging of whisky.** *Am. Perfumer* 49, 391,393 (1947).—*C.A.* 41, 4609*g*.

Review of catalytic oxidative methods, and miscellaneous methods such as those using distn. and oxidation sepn. and oxidation extn., and charcoal treatment for the aging of whisky.

8848. Popov, Asen D. **Detection of elderberry pigments and some other foreign natural and synthetic coal-tar dyes in red wine.** *Annuaire univ. Sofia, Faculté sci.* 44, Livre 2, 31-110 (1947-1948).—*C.A.* 43, 8091*f*.

The Fuller's earth used (Tonsil) could be heated to 500°C without visibly diminishing its adsorption efficiency. The coloring matters of wines and elderberry pigments could be sepd. chromatographically in acid, neutral, and alk. soln. in relation to many adsorption media. The coloring matters of the fruit of *Sambucus nigra* and *S. ebulus* possessed the same chromatographic behavior. The pigments of wine and whortleberry were chromatographically identical. There was no difference between the coloring matter of kermes berries and beets. In the coloring matter of beets a supplementary red-violet component was obtained, which under the conditions of chromatography would not be adsorbed by the new method, but went into the filtrate. The method could be used to det. if a wine was colored with elderberry juice.

8849. Robereau-Gayon, J. **The treatment of wines with bentonite.** *Rév. viticult.* 93, 203-7, 237-43 (1947).—*C.A.* 42, 717*h*.

Wines were stabilized against Cu and Fe pptn. by removing colloidal protein by means of bentonite. Unless protein was removed, wine proteins flocculated gradually and carried the Fe and Cu with them. The unnatural flavor conferred by bentonite was removed by addn. of charcoal. The phys. character of bentonite necessary to give satisfactory results was described.

8850. Valaer, Peter. **Chromatographic adsorption of wines.** *J. Assoc. Offic. Agr. Chemists* 30, 225-6(1947).—*C.A.* 41, 6666*d*.

The adsorption mixt. could consist of equal quantities of filter-cel and Al_2O_3 or of 2 parts by wt of Al_2O_3 to 1 part by wt of filter-cel. The simplified procedure consisted in wetting the adsorption tube with water, dilg. 10 ml of the wine to 50 ml, pouring through the adsorption tubes (an 18-20-in. vacuum expedited the operation), passing 25 ml of water through the adsorption tube, continuing suction of air for 10 min., and proceeding as in the original method. It had been found that: (a) all berry wines exhibited a blue fluorescence; (b) apple, peach, raisin, pear, grape, prune, plum, and cherry wines exhibited bright yellow fluorescence; (c) certain wines like elderberry exhibited unusually deep blue colors; (d) the prohibited pokeberry wine, which was sometimes incorporated into wines, exhibited fluorescence that seems characteristic.

8851. KIELHÖFER, E. **The thermal turbidity of 1947 wines.** *Deut. Wein-Ztg.* 84, 293-4(1948) *Chem. Zentr.* 1949, 1012.—*C.A.* 46, 9247*b*.

The 1947 young wines were far more sensitive to heat than other young wines. Almost all of these wines became turbid at 40-45°C; many of them did even upon standing 3-5 days at 25-6°C. The substances responsible for the turbidity could be removed with gelatin or with isinglass, but a 10% SiO_2 sol gave the best results (500-1000 ml per 1000 liter). Partial clarification was obtained by the use of large amts. of wine carbon (600 g per 1000 liter) or of fluid wine yeast (90-100 liter). Filtration through kieselguhr, cellulose mass, etc., had little effect on the turbidity. The most effective method of clarification was warming the wine to 25-6°C for 3-5 days.

8852. LOZA, V.M. AND VECHER, A.S. **Clarifying wine with bentonites.** *Vinodelie i Vinogradarstvo S.S.S.R.* 8, No. 3, 8-11(1948).—*C.A.* 43, 353*e*.

Bentonite suspensions neutralized (to phenolphthalein) by H_2SO_4 retained their clarifying powers without affecting the titratable acidity of the wine; such suspensions were recommended for treating wines of low acidity. Further neutralization gave a denser ppt. However, neutralization was not a requisite for bentonite suspensions in most cases, since at ordinary dosages acidity was not lowered more than 0.2%.

8853. ODA, MAKOTO. **Butanol fermentation with sugar as the raw material. IV. The effect of adding active carbon.** *J. Agr. Chem. Soc. Japan* 22, 67(1948).—*C.A.* 46, 1705*a*.

Beneficial results were obtained by adding com. active carbon to the mash. Treatment of active carbon with acid or alkali was not effective in improving its effect.

8854. RANKOV, G. AND POPOV, A. **A method for detection of the coloring substance from elderberry in red vinegar.** *Annuaire univ. Sofia, Faculte sci.*, Livre 2, 45, 145-53, German summary, 154-6 (1948-49).—*C.A.* 45, 813*i*.

A chromatographic method, with PbO and Al_2O_3 as adsorbants, was developed to detect artificial coloring of vinegar with elderberry juice. The sample of vinegar (100 ml) was dild. by twice evapg. to 15-20 ml and diln. with H_2O to 100 ml; a 30 ml aliquot was then neutralized with $CaCO_3$, filtered, and passed through a glass tube contg. a 1 cm thick layer of PbO over Al_2O_3 (2-4 cm); a blue-violet coloration of the Al_2O_3 layer indicated presence of elderberry juice.

8855. RUBIA PACHECO, J. DE LA AND BLASCO LÓPEZ-RUBIO, F. **Practical method of clarifying and aging wines.** *Ion* 8, 303-4(1948).—*C.A.* 42, 9068*i*.

Finely dispersed O_2 was bubbled through turbid wine of excessive Fe content (40-60 mg Fe/liter.) On storage and filtration a clear wine of aged flavor was obtained. Residual Fe was 1.6-5 mg/liter.

8856. SKŘIVÁNEK, M. **A new procedure for filtering solutions particularly fermented substrates.** *Chemie* (Prague) 4, 227-8(1948).—*C.A.* 46, 2747*a*.

Freshly pptd. $CaHPO_4$ in the substrate formed a sediment which permitted easy and satisfactory filtration. For monosaccharides and their oxidation products add 1-5 ml of 70% H_3PO_4 to a liter of substrate, keep at 50°C for 10 min., neutralize with freshly pptd. $CaCO_3$, and filter with any accepted filtration. For polysaccharides which were hydrolyzed by acids, add 1 g of slacked lime or the milk of lime to a liter of the substrate, keep at 50°C for 10 min., and neutralize with H_3PO_4 dild. 1:1. The method worked well for fruit juices.

8857. SOMMER, HERMANN; MONNIER, ROBERT P.; RIEGEL, BYRON; STANGER, D. WARREN; MOLD, JAMES D.; WIKHOLM, DONALD M., AND KIRALIS, ELIZABETH S. **Paralytic shellfish poison. I. Occurrence and concentration by ion exchange.** *J. Am. Chem. Soc.* 70, 1015-18(1948).—*C.A.* 42, 6878*i*.

The digestive glands of 4360 kg of mussels contg. a min. poison content of 4000 mouse units (M.U.)/100 g mussel were worked up during a 3-year period. The glands were preserved in acid alc., ground and the pH of the defatted brei was adjusted to 4.5. The solid was centrifuged off, the supernatant liquid decolorized with active carbon and concd. Increase in pH and temp. decreased the activity. Further concn. was effected by passing the ext. through Na-Decalso and elution with 20% $BaCl_2$. Concn. of the eluate and extn. with alc. gave a 50-70% yield of the poison with a toxicity of 70-140 M.U./mg constituting an 18-fold concn.

8858. SOMMER, HERMANN; RIEGEL, BYRON; STANGER, D. WARREN; MOLD, JAMES D.; WIKHOLM, DONALD M., AND MCCAUGHEY, MARGARET B. **Paralytic shellfish poison. II. Purification by chromatography.** *J. Am. Chem. Soc.* 70, 1019-21(1948).—*C.A.* 42, 6879*b*.

Since the poison concentrates prepd. by ion exchange on Decalso contained salts of other org. bases and inorg. salts, further purification was carried out by chromatography on Norit A from 1.0 *N* HCl solns. and elution with distd. H_2O. Exts. with activity greater than 1 M.U./γ were obtained. The details were described.

8859. STADTMAN, FLOYD H. **Deterioration of dried fruits. III. Chromatographic separation of carbonyl compounds as 2,4-dinitrophenylhydrazones.** *J. Am. Chem. Soc.* 70, 3583-6(1948).—*C.A.* 43, 1120*i*.

Apricot concentrates, continuously extd. during storage with Et acetate and the extd. material in H_2O treated with 2,4-dinitrophenylhydrazone, gave a mixt. of 2,4-dinitrophenylhydrazones which, chromatographed on $MgSO_4$ and eluted with C_6H_6-petr. ether, C_6H_6, Et acetate, and EtOH, were shown to contain furfural and hydroxymethylfurfural (by spectroscopic examn.), as well as 13 other CO compds.

8860. WAHHAB, A. **Deterioration of dried fruits. II. Identification of furfurals.** *J. Am. Chem. Soc.* 70, 3580-2(1948).—*C.A.* 43, 1120*h*.

The formation of hydroxymethylfurfural during the darkening of dried apricots was established by the prepn. of the Bz deriv., the phenylhydrazone, and the 2,4-dinitrophenylhydrazone. The evidence for the formation of furfural was based on its steam volatility, spectroscopic analysis, partition between ether and H_2O, and the behavior of its 2,4-dinitrophenylhydrazone on a Tswett column.

8861. BÄSSLER, K. **American bentonite and its suitability for the treatment of wine.** *Weinblatt* 43, 448-50(1949); *Chem. Zentr.* 1950, I, 1040.—*C.A.* 46, 8807*h*.

American bentonite was superior for the removal of protein from wine. Its swelling and adsorption capacities were essentially higher than those of German bentonite. A high tannin content acted as a stabilizer for the bentonite. The addn. of gelatin (e.g., to tannin-contg. fruit wines) therefore accelerated pptn. and filtration. Bentonite also removed undesirable tastes.

8862. BOURNE, E.J.; DONNISON, G.H.; PEAT, S., AND WHELAN, W.J. **Fractionation of potato starch by means of aluminum hydroxide.** *J.Chem. Soc.* 1949, 1-5.—*C.A.* 43, 6447*a*.

To a 3% aq. dispersion of starch contg. 3.5 g $Al_2(SO_4)_3 \cdot 18H_2O$/3.5g starch, an excess NH_4OH was added, and the mixt. centrifuged. The acidified supernatant liquid failed to give the starch-iodide test indicating that Al_2O_3 had adsorbed starch completely. When this ppt. was boiled with H_2O, most of the amylose passed into soln., whereas practically none of the amylopectin dissolved. When less $Al(OH)_3$ was used, amylopectin was preferentially adsorbed.

8863. BUHRER, NILTON E. **Detection of caramel in brandy.** *Chemist Analyst* 38, 86 (1949).—*C.A.* 44, 2171*e*.

Evap. 50 ml to nearly 10 ml, filter if necessary, and to a part of the concentrate add 2 ml of $Pb(OAc)_2$ reagent. Shake and then centrifuge for 5 min. If the supernatant liquid is colorless, caramel is absent. If it is colored, either caramel or a dye may be present. Take another 5 ml of the concentrate and treat with HCl + powd. Zn. If, after this treatment, the liquid is yellow, caramel is present.

8864. CARPENTER, D.C. AND SMITH, W.C. **Separation of a crystalline globulin from tomato juice and determination of its isoelectric point.** *Arch. Biochem.* 23, 45-8 (1949).—*C.A.* 43, 9167*i*.

A cryst. globulin, isolated from tomato juice serum, proved to be anionic at pH 4.2. It could be removed by an anion exchange resin without going through tedious dialysis prior to removal of the food accessory by a cation exchange resin.

8865. CUNHA, RAMOS, MÁRIO DA AND TEIXEIRA DE OLIVEIRA, HERNÂNI. **Chromatographic study of the coloring materials of port wine.** *Anais inst. vinho Porto* 1, No. 10, 11-24 (1949).—*C.A.* 45, 7745*g*.

Colored plates of chromatograms obtained from variously treated wines were exhibited. The adsorbents were Al_2O_3 and a local clay.

8866. GARRETT, O.F. **Application of ionic exchangers to the processing of milk products.** *Proc. 12th Intern. Dairy Congr.* 3, 49-56 (1949).—*C.A.* 44, 6982*c*.

A study was made of the effect of anionic and cationic exchangers on milk, whey, and ice cream mix. Evapd. milk was stabilized against sterilization. Dried cream was more sol. and did not oil off on reconstitution when properly treated before drying. The Ca-ratio must be reduced from 1.2 to below 0.75 in the cream for best results.

8867. GEHRKE, C.W. AND ALMY, E.F. **The action of mineral-ion exchange resins on certain milk constituents.** *Science* 110, 556-8 (1949).—*C.A.* 44, 5488*b*.

The removal of Ca, Na, K, and Mg ions from soln. was studied by the cation exchanger, Zeo-Karb-H. The increasing order of removal was from Na to K to Mg to Ca in individual ion solns. In mixts. Ca was more completely removed if the anion present was citrate, than if it was Cl^-. Single, binary, and ternary solns.of HCl, citric acid, and H_3PO_4 were passed through an anion exchanger, De-Acidite.

8868. KIELHÖFER, E. **Experiences in the treatment of wines which tend to develop protein turbidities.** *Weinblatt* 43, 540-2(1949).—*C.A.* 46, 9247*e*.

Expts. with German and American bentonites, fibrous Al_2O_3, Brockmann Al_2O_3, and celite showed that only bentonite effectively prevented the development of turbidity in wine. The use of 2 g bentonite per liter removed 49-59 mg of N per liter. This was several times the amt. of N removed by the other prepns. The use of as much as 3 g/liter of bentonite had no effect on the taste of the wine. However, the mineral content of the wine was increased by 240 mg/liter, probably due to the adsorption of exchangeable Na, Ca, K, and Mg by the wine. The amt. of N pptd. by thermal treatment (25-30°C) was essentially less than that removed by bentonite. Therefore, the thermally treated wine was less stable but the organoleptic properties were probably less affected.

8869. LEGAULT, R.R.; NIMMO, C.C.; HENDEL, C.E., AND NOTTER, G.K. **Tartrates from grape wastes - use of anion exchangers in a chloride-tartrate cycle.** *Ind. Eng. Chem.* 41, 466-71 (1949).—*C.A.* 43, 3969*i*.

Tartaric acid, as calcium tartrate, was recovered effectively by the exchange of tartrate for Cl^- on an anion exchange resin. Recovery data indicated a useful life of 500 cycles for the materials with a recovery of 1800-2000 lb of tartaric acid/ft^3, by purging every 30 cycles and with a makeup of exchange material of about 10% each 50 cycles. Hot NaOH was most effective in reactivating the exchanger, fouled by cloudy still slop.

8870. MATHERS, ALEX P. **Detection of tartaric acid and tartrates in wine.** *J. Assoc. Offic. Agr. Chemists* 32, 417-21(1949).—*C.A.* 43, 7189*a*.

Activated carbon (0.5g) was added to 10 ml wine dild. with 50 ml distd. H_2O, the mixt. warmed on a steam bath for 10 min., and filtered into a centrifuge bottle. Addn. of 5 ml of 5% neutral AcOPb soln. yielded a ppt. which, after centrifuging, washing with 40 ml distd. H_2O and recentrifuging, was dissolved in 5 ml $AcONH_4$ soln. (20% in glacial AcOH). The ppt. which formed on the addn. of a mixt. of 5 ml of 3% AcOPb soln. in glacial AcOH and 25 ml anhyd. EtOH was collected by centrifugation and treated for 20 min. with a mixt. of 4 ml 10% Na bisulfate soln., 10 ml 1% HIO_4, and 10 ml H_2O. After addn. of powd. $NaHSO_3$, 4 ml of *p*-nitrophenylhydrazine reagent was added and the centrifuge tube placed in boiling H_2O for 10 min., the soln. filtered into a separatory funnel, and the aq. layer extd. with 50 ml Et_2O. After washing the Et_2O ext. with 5 ml distd. H_2O, it was passed through an adsorption column packed with glass powder, the column washed with 30 ml Et_2O, and eluted with 20 ml anhyd. EtOH.

8871. Otting, H.E. **Ion-exchange application in milk products.** *Ind. Eng. Chem.* 41, 457-9 (1949).—*C.A.* 43, 3942*g*.

The cation-exchange removal of Ca from milk to produce a soft or non-curding milk was described. The problems were associated with taste, color, appearance, cream-line, bacterial count, etc., and with maintaining a favorable balance of Ca to P. Ion exchange treatment retarded lactose crystallization in ice cream and prevented coagulation of milk proteins in the preparation of evaporated milk.

8872. Sisakyan, N.M. and Bezinger, E.N. **Separation and determination of amino acids in wine by the methods of (partition) distribution chromatography on paper.** *Doklady Akad. Nauk S.S.S.R.* 69, 573-6 (1949).—*C.A.* 45, 7745*b*.

Examn. of Georgian Kakhetin wines by means of partition paper chromatography showed the presence of: glutamic acid, alanine, valine, and proline; very small amts. of aspartic acid, serine, and threonine were detected, and phenylalanine might be possibly present.

8873. Spaeth, Earl C. and Rosenblatt, David H. **Partition chromatography of anthocyanidins.** *Science* 110, 258(1949).—*C.A.* 43, 9359*d*.

In the course of work on the coloring matter in wine and grapes, a method was developed for sepg. malvidin and petunidin by partition chromatography on a column of pptd. metasilicic acid. A mixt. of malvidin and petunidin in 1:3 BuOH-Et_2O was placed on a column prepd. from 2.38 g metasilicic acid, 1.32 ml 10% H_3PO_4, and 1:3 BuOH-Et_2O and washed through with the latter. Malvidin formed a lower and petunidin an upper band.

8874. Asô, Kiyoshi; Shibaski, Kazuo, and Nakayama, Teizo. **The utilization of apples. I. Effects of ion exchanger on juice and cider.** *J. Fermentation Technol.* (Japan) 28, 454-9(1950).—*C.A.* 47, 1306*c*.

By passing 2 cation and anion exchangers alternately for several times the last anion exchanger (1 kg) adsorbed 106 g malic acid from crude malic acid soln., 69.5 g from purified apple juice, 55.5 g from apple wine, and 36.5 g from turbid juice. The turbid apple juice with high viscosity had to be clarified before treating; otherwise the efficiencies of the exchangers greatly decreased. 63.65% malic acid was released from the exchanger. Excess acids and inorg. substances were excluded by this treatment of the juice and wine, and it also served to prevent their deterioration.

8875. Bosticco, A. and Ramello, Luigi. **Treating acid milk by ion exchangers.** *Ann. facoltà. med vet. Torino* 1, 152-7(1950).—*C.A.* 47, 1303*d*.

Milk treated by anion exchangers got a substantial reduction of total acids, some oscillatio of the pH, slight changes of the rH, d., and reductase time, a slight decrease of the fat and P, and no change of protein, lactose and Cl.

8876. Etienne, A.D. and Beyer, G.F. **Determinatio of alcohol in wines and liqueurs.** *J. Assoc. Offic. Agr. Chemists* 33, 1016-20(1950).—*C.A.* 45 2625*f*.

The William's method was modified for wines and liqueurs. The principal modifications were: (1) an improved extg. reagent; (2) an increase in the vol. of extg. reagent and in the vol. of sample; (3) a redesigned app.; and (4) treatment of sample with activated carbon to prevent emulsions. The method was rapid and accurate, ±0.5%.

8877. Golovatyǐ, R.N. **Determination of copper and iron in wines by cationites.** *Vinodelie i Vinogradarstvo S.S.S.R.* 10, No. 5, 27-8 (1950). —*C.A.* 44, 9620*g*.

The prepn. of a sulfo-resorcin cation exchange resin was described. Both Cu and Fe could be quantitatively adsorbed even from satd. solns. of tartaric acid. In the presence of EtOH, tartaric acid, glycerol, or glucose, however, the activity of the resin was reduced. For Fe detns. 300 ml wine was filtered through the resin; for Cu, 2-3 liter was necessary. Fe was eluted from the H-form of the exchanger by a 20-25% KCl soln. Cu was similarly eluted from the K-form of the resin.

8878. Guntz, A.A. **Ion-exchangers, and their possible application in wine technology.** *Chim. anal.* 32, 246-8(1950).—*C.A.* 46, 7280*e*.

Exchange of cations for H ion should make possible the detn. of total anions by a simple measurement of acid content. Suitable anion-exchange reactions ought to make possible the removal of acetates from wines.

8879. Haller, H. S. and Bell, R. W. **Ion exchange as a means of improving the keeping quality of frozen homogenized milk.** *U.S. Dept. Agr. Annual Conference*, Cornell Univ. (June 20-22, 1950).

Removal of about one-fourth of Ca and lesser amts. of other cations with no removal of the citrates, phosphates, or chlorides resulted in definite improvement in physical stability. The most satisfactory treatment involved the use of an org. cation exchanger regenerated to a 99:1, Na:H ratio. This treatment, by removal of as little as 10 to 15% of the Ca and lesser amts. of the other cations, with no removal of the anions, produced a milk of normal flavor with improved physical stability and deferment of an oxidized flavor.

8880. Haller, H. S. and Morin, A. C. **Ion exchange as a means of varying the salt constituents of milk.** *U.S. Dept. Agr. Annual Conference,* Cornell Univ. (June 20-22, 1950).

An org. cation exchanger regenerated to a 99:1, Na:H ratio produced a soft curd milk of normal pH with one treatment. The milk retained all its citrates, phosphates, and chlorides. Treatment with a cation exchanger regenerated to a 93:7, Na:H ratio, followed by treatment with an anion exchanger, removed up to approx. 20% of the citrates, phosphates, and chlorides in addn. to Ca and other cations. Treatment with a strong anion exchanger, followed by treatment with a small amt. of cation exchanger in the H-form removed citrates and chlorides and small amts. of Ca and other cations, but no phosphates.

8881. Hozumi, Tadahiko and Satô, Makoto. **Studies on alcoholic beverages by paper partition chromatography. I. Detection of reducing sugars of saké and wine.** *Nippon Jôzô Kyôkai Zasshi* (J. Soc. Brewing Japan) 45, 322-5(1950).—*C. A.* 46, 1706*a*.

The R_f values of reducing sugars by the ascending method with (1) PhOH satd. with H_2O or a (2) $BuOH$-Me_2CO-H_2O mixt. (4:1:1) were, resp., D-maltose 0.36-0.38, 0.18-0.19; D-glucose 0.41-0.45, 0.31-0.32; D-lactose 0.46-0.47, 0.15-0.16; D-galactose 0.52-0.54, 0.31-0.39; D-mannose 0.51-0.54, 0.38-0.39; D-xylose 0.54-0.55, 0.43-0.45; D-arabinose 0.53-0.57, 0.38-0.42; D-fructose 0.56-0.57, 0.43-0.45; and D-rhamnose 0.67-0.69, 0.57-0.58. The coloring reagent used was $PhNH_2$ acid phthalate. Japanese saké contained D-glucose and D-maltose, while white wine contained D-fructose, D-glucose, and D-maltose.

8882. Ichikawa, Osamu and Hôjô, Susumu. **The paper partition chromatogram in the course of beef putrefaction. I.** *Igaku to Seibutsugaku* (Med. and Biol.) 17, 49-52(1950).—*C. A.* 45, 1266*g*.

Beef was putrefied at room temp. in summer and, at intervals, samples were withdrawn and hydrolyzed. The amino acids and amines thus obtained were examd. by the paper partition chromatography. The beef after putrefaction for 48 hrs still contained all the essential amino acids, and significant changes were not observed in the number of amino acids detected. Unidentifiable spots increased suddenly after 48 hrs, and most of them were suggested to be amines, owing to their colors with ninhydrin and positions on the paper chromatogram.

8883. Itô, Kyôgorô and Kawanishi, Junsaku. **Synthetic ion-exchange resins in the brewing industry.** *Nippon Jôzô Kyôkai Zasshi* (J. Soc. Brewing Japan) 45, 385-91(1950).—*C. A.* 46, 1706*h*.

In purifying raw alc. an ion-exchange resin was used instead of active carbon for treatment after oxidation of impurities. Electrolytes could be removed successfully. Aldehydes and fusel oil could be partly removed. The pH before oxidation and before ion exchange should be controlled. The resin, especially anion-exchange "Dia-ion A" (Nippon Kasei Co. Ltd.), had the disadvantage of being slightly unstable and sol. in EtOH.

8884. Itô, Kyôgorô; Kawanishi, Junsaku; Kasai, Keisaku, and Yamazaki, Takeshi. **General characteristics of commercial active carbon in the recent (Japanese) market.** *Nippon Jôzô Kyôkai Zasshi* (J. Soc. Brewing, Japan) 45, J. 48-52, 59-62(1950).—*C. A.* 46, 7281*i*.

Thirty-six samples were analyzed and examd. as the purifying agent of saké. The intense black active carbon with low d. was generally best.

8885. Kubo, Shoji and Tsutsumi, Chuichi. **Application of cation-exchange resin in the determination of phosphorus in cereal foods.** *Rept. Food Research Inst.* (Japan) 3, 75-85(1950); 5, 163-9(1951).—*C. A.* 47, 7127*a*.

A detailed report of the method.

8886. Kubo, Shoji and Tsutsumi, Chuichi. **Application of cation-exchange resins to the determination of phosphorus in foods.** *Bull. Chem. Soc. Japan* 23, 187-9(1950)(in English).—*C. A.* 46, 4133*i*.

Ash a 5 g sample at 550-600°C. Dissolve in HCl and evap. to dryness. Dissolve in dil. HCl, filter, and pass through a cation exchanger column (100-200 mesh) in Na form. Adjust the eluate to pH 4.63 (methyl red) and titrate with 0.05 *N* alkali to pH 8.98 (phenolphthalein-thymol blue mixt.). Large amts. of Fe interfered.

8887. Loza, V. M. and Vecher, A. S. **Effectiveness of various bentonites in the clarification of wine.** *Vinodelie i Vinogradarstvo S.S.S.R.* 10, No. 7, 35-9(1950).—*C. A.* 45, 4876*c*.

Since it was known that the capacity for intracryst. expansion was an important factor on the effectiveness of the clarification of wines with bentonite, this property of various bentonites was studied. The colorimetric reaction of benzidine with montmorillonite was used as an indication of the amt. of it present. For effective clarification of wines, bentonite must be at least 99% colloid. The Crimean bentonite although having a satisfactory swelling capacity, especially after treatment with alkali, had only 18% colloid and was therefore unsuitable. The cation-exchange values for the various bentonite samples varied from 92 to 100 equiv. per 100 g. The various samples of bentonite were compared in their speed and completeness of wine clarification and these values were correlated with phys. and chem. properties of the sample.

8888. Ongaro, Dante. **Behavior of wine with organic ion exchangers.** *Riv. viticolt. e enol. (Conegliano)* 3, 277-83 (1950).—*C. A.* 44, 11016*d*.

Percolation through a cation exchanger freed wine from both inorg. and org. cations; the resulting liquid was completely deacidified by an anion exchanger. Treating wine with the anion exchanger alone eliminated the free acids and caused some changes of the salt compn.

8889. Ôtaka, Yôichi. **Constituents of saké. I. Identification of amino acids by paper chromatography.** *J. Agr. Chem. Soc. Japan* 24, 366-8(1950-51).—*C. A.* 46, 10528*f*.

Cystine, aspartic acid, glutamic acid, serine, glycine, valine, leucine, phenylalanine, tyrosine, tryptophan, proline, histidine, arginine, and lysine were detected in saké with paper chromatography. Their contents were roughly estd. by comparing chromatograms obtained with samples and pure amino acids. Contents of glutamic acid, glycine, alanine, valine, leucine, and arginine accounted for the majority of amino acids in saké.

8890. Pavlov-Grishin, S. I. **Use of "Oglanlinskovo" bentonite in the clarification of wine.** *Vinadelie i Vinogradarstvo S.S.S.R.* 10, No. 7, 40(1950).—*C.A.* 45, 4876*f*.

Twelve wines were subjected to clarification with "Oglanlinskovo" bentonite. The rate of treatment was 4-30 g of air-dry bentonite per decaliter of wine, applied as a 10% aq. suspension; 3 wines were completely clarified, darkened to a slight turbidity, and the remaining 5 were not clarified at all. The completely clarified wines required 2 hrs treatment with bentonite. The titratable acidity (calcd. as tartaric acid) dropped 0.22% after treatment with 1-10% suspensions of bentonite and the pH dropped 0.05 units.

8891. Procopio, Mario and Spanò, Nello. **Ion exchange in wine treatments.** *Riv. viticolt. e enol.* (Conegliano) 3, 381-6, 412-18(1950).—*C.A.* 45, 3989*i*.

The results of some batch expts. with both cation exchanger and anion exchangers on wine were reported. High doses 5-20% of cation exchanger (H form) changed wine compn. too much, while doses of 1-2.5% were effective in removing Fe and Cu without affecting wine ashes too much (decrease from 0.220-0.236 to 0.103-0.117%) and acids (increase from 5.6-7.5 to 6.7-9.4 per thousand; pH from 3.1 to 2.1). Doses from 1 to 10% free anion exchanger decreased acids from 0.74 to 0.18%, changed the pH from 3.1 to 5.2 and also removed Fe.

8892. Scandura, Camillo and Grasso, Sebastiano G. B. **Acid removal from wines by anion exchangers.** *Riv. viticolt. e enol.* 3, 17-24 (1950).—*C.A.* 44, 4193*e*.

The batch method of acid removal was discussed, as fixed acids were better adsorbed than volatile acids. By the column method total acids were removed; the addn. of fixed org. acids after the treatment was suggested.

8893. Scandura, Camillo and Grasso, Sebastiano G. B. **Acid removal from wines by anion-exchange resins.** *Riv. viticolt. e enol.* 3, 177-80(1950).—*C.A.* 44, 7022*a*.

Some practical expts. with an industrial app. were reported.

8894. Spaeth, Earl C. and Rosenblatt, David H. **Partition chromatography of synthetic anthocyanidin mixtures.** *Anal. Chem.* 22, 1321-6 (1950).—*C.A.* 45, 7744*i*.

Preliminary to a study of the colored substances in wine and grapes, a chromatographic method for the sepn. of mixt. of synthetic malvidin chloride, petunidin chloride and delphinidin chloride was developed with a 10 cm silicic acid column with 10% H_3PO_4 as the immobile aq. phase and a soln. of 2 parts phenol and 1 part toluene as the nonaq. phase. Three sep. colored portions of the eluate were collected, and the anthocyanidins were detd. spectrophotometrically.

8895. Tarantola, Clemente. **Invertase in wines.** *Riv. viticolt. e enol.* 3, 229-32, 247-53(1950).—*C.A.* 44, 9113*i*.

Wines were not to be subjected to ultrafiltration or decolorization with charcoal, or tannin-gelatin treatment, as some losses of invertase may occur by such treatments. Only the addn. of 500 p.p.m. SO_2 or 200 p.p.m. NaF could be used to stop wine fermentation without invertase injury.

8896. Torii, Hideichi and Furuya, Kôzô. **Separation of tea tannin by means of paper chromatography.** *J. Agr. Chem. Soc. Japan* 24, 178-81(1950-51).—*C.A.* 46, 10483*a*.

BuOH satd. with H_2O was the most favorable developing solvent for sepg. tea tannin with paper chromatography. Six spots of the following R_f values were observed after spraying $Fe_2(SO_4)_3$ soln. on the chromatogram: 0.05-6, 0.22-7, 0.33-7, 0.37-41, 0.41-4, 0.67-9; the colors of these spots were: blue, blue, green, blue, green, blue, in this order. Tannin compn. of tea leaves tested with this method was different with varieties of the plant.

8897. Valaer, Peter Jr. **Chromatographic adsorption of wines.** *J. Assoc. Offic. Agr. Chemists* 33, 319-20(1950).—*C.A.* 46, 7280*f*.

Fluorescent colors shown by the Al_2O_3 in ultraviolet light may afford evidence of adulteration of berry wines with grape, peach, apple, and cherry.

8898. West, D. B.; Evans, R. F., and Becker, Kurt. **Chromatographic analysis in the brewing laboratory.** *Proc. Am. Soc. Brewing Chemists* **1950**, 107-17(1951).—*C.A.* 45, 8716*i*.

Columnar, paper, and ion-exchange techniques were discussed. Investigations were discussed of the sepn., concn., and chromatography on columns of Sn, Cu, and Fe sometimes found in beer. Further work was necessary for quant. chromatographic methods to det. these metals. Research possibilities were suggested by reviewing the literature of allied industries.

8899. Becker, Kurt. **Ion-exchange treatment for brewing water.** *Brewers Digest* 26, No. 7, 43-9(1951).—*C.A.* 46, 3709*h*.

Ion-exchange methods in relation to the treatment of natural waters for brewery uses were described. Water was demineralized more economically by means of ion exchange than by distn. Exchange treatment of waters contg. more than 175 p.p.m. of carbonate hardness, $MgSO_4$ and Na_2SO_4 combined, or $MgCl_2$ and NaCl combined was shown to be as feasible as boiling, lime softening, etc. In order properly to approach the problem of water purification for brewery purposes an individual study should be made of the particular type of water to det. proper treatment. It was suggested that waters contg. under 175 p.p.m. of carbonate hardness and without freakish properties otherwise will not generally warrant demineralizing.

8900. Capt, Emile. **Attempts to prevent iron casse by the use of special carbons.** *Stas.*

fédérales essais viticol., arboricol. chim. agr., Lausanne et Pully, Pub. No. **408**, 883-6 (1951).—*C.A.* **46**, 3711*a*.

Owing to changes in appearance and flavor of wine, the treatment of iron casse with decolorizing carbon did not give satisfactory results.

8901. FÁBREGUES Y SOLAR, JOSE MARIA DE AND MESTRES JANÉ, ANTONIO. **Treatment of grape must with ion-exchange resins.** *Bol. inst. nacl. invest. agron.* (Madrid) **11**, 429-43(1951). —*C.A.* **46**, 10527*e*.

Minerals, colloidal materials, and color which were present in concd. grape limited its use as a source of sugar. The removal of these substances with ion-exchange resins was undertaken with 2-liter samples, which were passed through columns of 100 g anion- or 200 g cation-exchange resin, 500-ml fractions were collected. Detns. of total acids, total SO_2, free SO_2, and reducing sugars were tabulated for individual fractions. The density of the must was 1.0628 and its sugar concn. 15.6%. After an addnl. passage through the anion column the must was completely free from acid and free and combined SO_2. Musts freed from anions and having a pH of about 7 were very difficult to ferment.

8902. GENIN, G. **The recovery and purification of lactose by means of ion-exchange resins.** *Lait* **31**, 511-18(1951).—*C.A.* **47**, 228*i*.

The mechanism of the action of ion-exchange resins was reviewed, and 2 methods of recovering lactose from cheddar-cheese whey were discussed.

8903. GRASSO, SEBASTIANO. **New aspects of the decoloration with resins.** *Olearia* **5**, 24-7 (1951).—*C.A.* **45**, 6350*i*.

Data were given on exptl. tests of the decoloration of raw concd. glycerol, wine, and molasses with a synthetic ion-exchange resin. These inconclusive tests showed that Duolite S-30 did not lose much of its decolorizing power on regeneration.

8904. HARRIS, G.; BARTON-WRIGHT, E. C., AND CURTIS, N. S. **Carbohydrate composition of wort and some aspects of the biochemistry of fermentation.** *J. Inst. Brewing* **57**, 264-80 (1951).—*C.A.* **46**, 9775*e*.

The presence of fructose, glucose, sucrose, maltose, maltotriose, and maltotetraose in wort was confirmed by use of paper chromatography. The presence of maltopentaose was suggested. No free pentoses or isomaltose was found. On subjecting the wort to fermentation by a top-fermenting yeast, glucose was completely removed in 13 hrs, fructose was first excreted then assimilated, all sucrose was absorbed within 25 hrs. Maltose was fermented at a slower rate than either hexose or sucrose.

8905. LÜERS, HEINRICH. **Improvement of brewing water by ion exchangers.** *Brauwelt* **1951**, 407-11.—*C.A.* **45**, 10481*c*.

A discussion of ion exchangers and their applications to brewing operations. $CaCl_2$ was suggested as an additive to demineralized water because of the favorable organoleptic properties of Cl^- and the increase in acidity of wort caused by Ca^{++}.

8906. MALYOTH, ELEANORE. **Paper chromatography of honey.** *Naturwissenschaften* **38**, 478(1951). —*C.A.* **46**, 10482*g*.

With BuOH-AcOH-H_2O as solvent, well-sepd. bands of fructose, glucose, sucrose, maltose, melezitose, and dextrins were obtained on one strip. To develop, the strip was sprayed 1st with aniline oxalate; fructose, glucose, and maltose appeared brown. It was then sprayed with $KMnO_4$ soln. contg. 3% H_2SO_4. During drying at 90-100°C the paper lost color and fructose, sucrose, and melezitose appeared gray-black, glucose and maltose remaining brown. This was a typical behavior for ketoses *vs.* aldoses. Amino sugars could be found by spraying with ninhydrin; they appeared as red spots.

8907. PROCOPIO, MARIO AND ZANIN, SECONDO. **Carbons for iron removal (from wines).** *Riv. viticolt. e enol.* (Conegliano) **4**, 351-8(1951). —*C.A.* **46**, 3711*b*.

Fe removal from both artificial solns. and wines was tried with an active HCl-washed charcoal, 2 ion exchangers (Cecation and Cecanion), and a French carbon called PCH 8. Only PCH 8 seemed to give satisfactory results (30-50% removal) although its action was never const., but was influenced by the liquid to be treated. In any case, the efficiency of $Fe(CN)_6^{4-}$ was not reached.

8908. SCANDURA, CAMILLO. **Acid removal from wine by anion exchangers.** *Riv. viticolt. e enol.* (Conegliano) **4**, 323-8(1951).—*C.A.* **46**, 2234*g*.

In order to avoid losses of particularly important substances, it was suggested adding to the wine, after the exchange treatment, a calcd. quantity of H_2SO_4 and repeating the passage through the exhausted column so that the lost substances could be recovered.

8909. STRINGER, J. E. C. **Chromatograph test for the presence of moisture in alcohol.** *Nature* **167**, 1071-2(1951).—*C.A.* **46**, 1921*g*.

Paper-strip ascending chromatography was used for detecting H_2O (0.1-5%) in alc. The alc. was allowed to ascend a calibrated paper strip contg. 2 zones, the lower impregnated with $FeSO_4$ and the upper with $K_3Fe(CN)_6$. The $FeSO_4$ eluted by the H_2O carried to the upper zone to give a blue band of $Fe_4[Fe(CN)_6]_3$, the extent and intensity of which depended on the amt. of H_2O present.

8910. SULSER, H. AND HÖGL, O. **Application of paper chromatography in food chemistry. I. Principles and methodics. II. Differentiation between fruit wine and grape wine. III. Examination of different vinegars.** *Mitt. Gebiete Lebensm. Hyg.* **42**, 376-94, 395-402, 403-408(1951).—*C.A.* **46**, 651*e*.

The presence of tartaric acid, sorbitol, fructose, glucose, and glycerol was shown by using paper chromatograms. The results thus obtained were checked by chem. analysis. Tartaric and citric acids, sorbitol, fructose, glucose, glycerol, and hydroxymethylfurfural were detected in vinegars by paper chromatography.

8911. UNO, HYOJIRO AND KOYAMA, AKIRA. **Identification of aldehyde by paper chromatography.**

J. Fermentation Technol. (Japan) 29, 219-21 (1951).—*C. A.* 47, 1008*c*.

A mixt. of benzenesulfohydroxamic acid and an aldehyde in abs. alc. was added with NaOH to make it basic, and the hydroxamic acid of the aldehyde thereby prepd. was chromatographed on paper with iso-AmOH:AcOH:H_2O = 5:1:1 or with BuOH:-AcOH:H_2O = 5:1:1 to give R_f values. The aliphatic aldehydes C_1-C_5 could be sepd., but C_6 or more as well as normal and iso-compds. could not. Three aromatic aldehydes, vanillin, veratrum aldehyde, and benzaldehyde as well as two furan aldehydes, furfural and methylfurfural, could be sepd.

8912. WEISS, LOUIS C. **Chromatographic properties of oil-soluble coal-tar colors.** *J. Assoc. Offic. Agr. Chemists* 34, 453-9(1951).—*C. A.* 45, 9865*c*.

The behavior was described of 22 oil-sol. colors, 17 certifiable and 5 nonpermitted, on various chromatographic adsorbents with various solvent systems. With the appropriate adsorbents and solvents, many of these colors could be sepd. from each other chromatographically.

8913. YOSHINO, HIROSHI. **Studies on soy sauce by paper partition chromatography. I. Sugars and amino acids in the cooking juice of soybeans.** *Nippon Jôzô Kyôkai Zasshi* (J. Soc. Brewing, Japan) 46, K. 7-13(1951).—*C. A.* 46, 7282*a*.

The descending method with phenol (with 10% of 0.1% aq. NH_3), collidine, or BuOH-AcOH-H_2O (4:1:1) as the solvent and aniline acid phthalate, benzidine reagent, or resorcinol reagent as the coloring reagent showed the existence of glucose and sucrose in the alc. ext. of the defatted soybean meal and the existence of fructose, glucose, sucrose, and stachyose in the aq. ext. obtained by treating the residue from alc. extn. with H_2O at 40-50°C. The juice obtained by cooking defatted soybean meal under 10 lb pressure contained fructose, galactose, glucose, sucrose, manninotriose, and stachyose; the existence of arabinose and mannose was not evident. The amino acids were examd. with ninhydrin, K iodoplatinate, Pauly reagent, or Ehrlich reagent as the coloring reagent.

8914. YOSHINO, HIROSHI. **Studies on soy sauce by paper partition chromatography. II. Sugars in soy sauce.** *Nippon Jôzô Kyôkai Zasshi* 46, K, 44-51(1951).—*C. A.* 46, 7282*c*.

The influences of NaCl, amino acids, EtOH, and org. acids on the detection of sugars were examd. With soy sauce (which contained about 18.5% NaCl) the effect of NaCl was the greatest; in general NaCl decreased R_f values of sugars. Ketose or ketose-contg. oligosaccharide could not be detected in soy sauce. Owing to the presence of NaCl the detection of oligosaccharides was difficult. Soy sauce contained as monosaccharides glucose, galactose, arabinose, and xylose. Two-dimensional chromatography showed the nonexistence of mannose.

8915. ARRARAS, ENRIQUETA G. **Ion-exchange resins in the separation of caffeine from maté.** *Rev. fac. cienc. quím. Univ. nacl. La Plata* 24, 53-61(1952).—*C. A.* 47, 1865*h*.

Powd. maté *(Ilex paraguarensis)* contg. 1.05% caffeine was extd. by boiling 0.1, 0.2, or 0.5% H_2SO_4 or by cold maceration (similar results). On account of the presence of the cations competing with the caffeine on the resin the yields were reduced. Therefore, org. extg. agents were tried and 5 *N* NH_4OH in 60% alc. was satisfactory, and by this method 98% of the caffeine was extd. by repeating the process several times. To save time $CHCl_3$ was used as solvent, after alkalization of the column with ammoniacal alc., obtaining a yield of 92% of the caffeine present in maté.

8916. BARILE, G.; STEIN, A. M., AND PASCUCCI, E. **Chromatographic investigation of the organic synthetic coloring matters in food products.** *Ind. ital. conserve* 27, 152-4(1952).—*C. A.* 47, 5038*d*.

The dye was extd. from 50 g of a fruit conserve and fixed on wool, the wool was discharged, and the soln. of the dye concd. to a few cc. The chromatographic investigation was made with Whatman No. 4 paper with the following solvents: (1) EtOH (80%) 70, BuOH 20, NH_4OH (d. 0.925) 10; (2) EtOH (80%) 70, BuOH 20, 2*N* AcOH 10 cc. The values of R_f with the 2 solvents for 19 most common org. dyes were tabulated.

8917. CAPT, EMILE. **The application of ion exchanger to sour wines.** *Annuaire agr. Suisse* (N.S.) 1, 1113-27(1952); *Stas. féderales essais agr., Mont-Calme et Montagibert, Lausanne et Pully Publ.* No. 412.—*C. A.* 47, 5623*c*.

The ion exchanger was utilized in the treatment of sour wines with unsatisfactory results.

8918. DELINDATI, G. AND PELIZZIARI, A. **Deacidification of tomato juices with ion exchangers. Preliminary note.** *Ind. ital. conserve* 27, 50-4(1952).—*C. A.* 47, 1305*g*.

The method employed in the expts. was described. With the anionic resin Amberlite IRA-4B, the acid content of the juices decreased from 0.42-0.50 to 0.12-0.15%, and with Activit IMAC it decreased from 0.47-0.53 to 0.17-0.21% (calcd. as citric acid).

8919. FAGEN, HAROLD J.; STINE, J. B., AND HUSSONG, R. V. **The identification of reducing sugars in cheddar cheese during the early stages of ripening.** *J. Dairy Sci.* 35, 779-82 (1952).—*C. A.* 47, 228*g*.

A one-dimensional filter-paper chromatographic method was described for studying the fate of sugars in cheddar cheese. Typical sugar patterns for cheddar cheese made from raw and pasteurized milks were presented. Cheddar cheese made from pasteurized milk contained traces of sugar (galactose) for approx. twice as long as cheddar cheese made from raw milk. Results indicated that pasteurization destroyed or inhibited microörganisms capable of utilizing galactose.

8920. GJERTSEN, POUL. **Chromatography and its application in brewing chemistry.** *Brewers Digest* 27, No. 11, 47-52, 57(137T-142T, 147T) (1952).—*C.A.* 47, 7156*d*.

A review of column and paper chromatography and applications to detection or detn. of amino acids, hop resins, and sugars in brewery materials and products.

8921. HARRIS, JOHN P. **Active carbon, its application in brewing.** *Brewers Digest* 27, No. 2, 50-2(21T-2T)(1952).—*C.A.* 46, 6320*a*.

A review of the use of active carbon for the following purposes in breweries: water purification to remove color, odor, Cl_2, and impurities; sterilization and purification of air; deodorizing of CO_2; removal of color or off-odor or off-flavor from the product.

8922. HASHIZUME, TAKESHI; IRIE, YU, AND MITSUI, TETSUO. **Chemical constituents of beer. I. Identification of amino acids of beer by paper partition chromatography.** *Mem. Research Inst. Food Sci., Kyoto Univ.* No. 4, 12-18(1952)(in English).—*C.A.* 47, 2425*h*.

Amino acids in various beers were pptd. as their Hg salts, filtered, and liberated by H_2S. The chromatograms were prepd. with $PhOH$-NH_3 and BuOH-MeOH (both contg. 35% water) as developing solvents. In the beers of 3 main Japanese makers were found glycine, alanine, valine, leucine, aspartic acid, glutamic acid, asparagine, ornithine, lysine, arginine, histidine, proline, possibly α-aminoisobutyric acid, and an unknown amino acid, and in Tuborg beer (German product) serine in addn. to the above 14 amino acids.

8923. HASHIZUME, TAKESHI AND MITSUI, TETSUO. **Chemical constituents of beer. II. Identification of organic acids of beer by paper partition chromatography.** *Mem. Research Inst. Food Sci., Kyoto Univ.* No. 4, 19-24(1952).—*C.A.* 47, 2426*a*.

As detd. by paper chromatography of the hydroxamic derivs., beer contained acetic, lactic, malic (or citric), oxalic, and succinic acids, the last of which in a considerable amt. The fraction of aldehydes and ketones appeared to have close relation to the flavor of beer.

8924. HELM, E. **Induced gushing in beer.** *Brewers Digest* 27, No. 1, 49-50(5T-6T)(1952).—*C.A.* 46, 6320*f*.

Addn. of aq. $NaNO_2$ to lager beer produced a reddish tint and induced gushing of the pasteurized, bottled product. Gushing was induced also by addn. of an aq. suspension of active carbon but not when the carbon was first held 24 hrs under several changes of EtOH and then suspended in air-free distd. water. Use of 1% aq. NaCN instead of the EtOH did not inhibit promotion of gushing by active carbon.

8925. HÖGL, O. **Investigating sweet wines and "Mistellen" with paper chromatographic methods.** *Z. Lebensm.-Untersuch. u. -Forsch.* 95, 177-9(1952).—*C.A.* 46, 11571*e*.

Mistellen was a grape must product which had been "silenced" (inhibition of fermentation) by adding alc. Genuine dessert wine could be distinguished from Mistellen by the presence of glycerol. Because glycerol was difficultly sepd. from sugar by common methods of analysis, a paper chromatographic method was recommended. A 1.1:4.0:1.9 EtOH:BuOH:H_2O mixt. was used as the solvent and the glycerol was detected with $AgNO_3$ reagent in the procedure. A quant. method was based on comparison of result with those from wines contg. a definite amt. of glycerol.

8926. INSKEEP, GORDON C.; TAYLOR, G. G., AND BREITZKE, W. C. **Lactic acid from corn starch.** *Ind. Eng. Chem.* 44, 1955-1966(1952); *Intern. Sugar J.* 55, 131(1953).

American Maize Products Co., which produced lactic acid from corn syrup in its plant at Hammond, Ind., used a relatively high temperature bacterial fermentation with the micro-organism *Lactobacillus delbruckii*. As the acid was formed in the fermenters, it was continuously neutralized by $CaCO_3$ present in the medium to form Ca lactate, which was later converted to lactic acid. Purification was by repeated carbon bleaches. Its market in the food industry was apparently close to being saturated. However, lactic acid derivatives offered potentially an almost unlimited industrial outlet, depending primarily on the cost for which they could be prepared.

8927. JAKOVLIV, G. **Determination of chromatographic characteristics of fruits in sweet foods and drinks.** *Inds. agr. et aliment.* (Paris) 69, 223-5(1952).—*C.A.* 47, 6570*b*.

Warm conserves, preserves, pastes, candy, and bonbons and dil. with an equal vol. of Fe-free tap H_2O (grind foods contg. whole or chopped fruits and eliminate pits and cores) dil. the drinks with an equal wt of sugar sirup, and evap. any alc. present. Weigh a 50-g sample, add 10 ml of H_2SO_4 (20 vol. 66° Bé acid/100 vol.) and 40 ml of tap H_2O, heat to 50°C mix, let settle, and decant the supernatant. Add 25 ml of pure *sec*-BuOH, and mix well but avoid emulsifying strongly. Transfer 5 ml of the ext. of yellow fruit or 3 ml of red or highly colored ext. to a column packed with chromatographic Al_2O_3 (0.5 × 10 cm packing in a 35-cm tube). Allow 2 hrs per ml for absorption (atm. pressure). Typical chromatograms were described for apricots, bananas, black and red currants, cherries (4 kinds), quince, strawberries, raspberries, gooseberries, bilberries, oranges, peaches, apples, red plums, green gages, red and white grapes, and red tomato concentrate.

8928. JAKOVLIV, G. AND COLPÉ, G. **Column chromatography to identify coloring matter added to foodstuffs.** *Ann. fals. et fraudes* 45, 354-68(1952).—*C.A.* 47, 1301*g*.

Foodstuffs were extd. with an equal wt of H_2O. Beverages contg. EtOH were first freed of the latter by evapn. An ext. prepd. with iso-AmOH was given on a column of Al_2O_3 of 0.5 cm diam. at 20-25 cm height. As eluents (24 hrs, 10 ml each) were used: H_2O, 5% NH_3, *N* NaOH, 0.1 *N* HCl, followed by 3 ml *N* NaOH, MeOH, 5% $BaCl_2$, $NaHSO_3$. The chromatograms of a large no. of permitted and prohibited colorants were described.

8929. JAKOVLIV, G.; GX, A. I., AND COLPÉ, G. **Column chromatographic method in the identification of coloring matter added to foods.** *Ann. fals. et fraudes* 45, 435-6(1952).—*C.A.* 47, 4001*e*.

8930. MARSH, G. AND KEAN, C. **Applications of chromatographic methods to organic acids in wines.** *Wines & Vines* 33, 17-20(March 1952).

The presence of tartrates in berry wines made them liable to rectification tax. Because established methods of analysis were unable to cope with very low tartrate concentrations, it was not known whether fruits other than grapes contained the compound in more than trace quantities. A new procedure involving paper chromatography preceded by treatment of the wine with weakly basic and acidic cation and anion exchangers was developed. The org. acids adsorbed from the wine by the anion exchanger was eluted from the column with dil. NH_4OH. This solution was then passed through the hydrogen form of the cation exchanger, converting the NH_4^+ salts to free acid. Chromatographic analysis of the concentrated effuent permitted determination of as little as 50 p.p.m. of tartaric acid.

8931. MARSHALL, C. AND WALKIN, A. **Preparation of full-flavored apple juice with increase resistance to fermentation.** *Food Technol.* 6, 229-234(June 1952).

Ion exchange resins were employed to decrease the tendency of apple juice toward fermentation. A single pass of the juice through a strongly acidic cation exchanger greatly improved resistance to fermentation, although considerable loss of volatile flavor occurred. A full-flavored juice of high fermentation resistance was prepared by removing the volatile flavor before deionization and then reconstituting the juice after treatment.

8932. MILLER, JOHN M. AND ROCKLAND, LOUIS B. **Determination of cysteine and glutathione in citrus juices by filter paper chromatography.** *Arch. Biochem. Biophys.* 40, 416-23(1952).—*C.A.* 47, 1305*e*.

Filter-paper chromatography demonstrated the presence of cysteine and glutathionine in concentrates of the sulfhydryl constituents of orange, grapefruit, lemon, and lime. Heating the fresh juices decreased the amt. of both compds.

8933. NAUMANN, CARL W. **The removal of cations from wort and beer.** *Brauwissenschaften* **1952**, 105-6.—*C.A.* 47, 2932*e*.

By passing dild. wort and beer through a cation exchanger acidic solns. were obtained from which phosphate could be quantitatively pptd. with magnesia reagent. The phosphate in both was found to be the same while the total acids in beer was higher due to org. acids formed during fermentation by yeast. Org. acids in ion-exchanged beer seemed to inhibit the growth of organisms which may include sarcina, bacilli, acetobacteria, and wild yeast. The cation exchanger may be helpful in chem. analysis, study of the metabolism of PO_4^{3-}, phosphoprotein, and phytic acid by yeast, and brewing operations.

8934. PEREIRA, A. **A paper chromatography method for quantitative determination of cystine in wheat gliadin hydrolyzates.** *Cereal Chem.* 29, 478-81(1952).—*C.A.* 47, 1866*g*.

The detn. of cystine-cysteine in hydrolyzates of wheat gliadin by the described method gave a mean of 2.83%, somewhat greater than the literature values of 2.74, 2.6, and 2.4.

8935. RUF, W. **Paper chromatograph for detection of foreign coloring materials in wine.** *Z. Lebensm-Untersuch. u. -Forsch.* 94, 190-4(1952). —*C.A.* 46, 6318*i*.

Chromatographs of the coloring material of blackberry, bilberry, elderberry, beets, vegetable Bordeaux, synthetic Bordeaux, each of these mixed with red wine were compared with red wine. The chromatographs were made from water, alc.-water mixt., and phenol-water mixt. The distinguishing features were illustrated and discussed.

8936. SCHILD, E. AND RIEDL, W. **Chromatographic analysis of the bitter substances of hops.** *Brauwissenschaften* **1952**, 81-7.—*C.A.* 47, 819*d*.

The bitter substances of hops were extd. quantitatively with MeOH in a homogenizer and the ext dild. with 2% H_2SO_4 was extd. then with hexane or petr. ether. Concn. *in vacuo* at 40°C in an atm. of CO_2 or N_2 gave a residue of total hop resins. Chromatography of the latter dissolved in benzene on silica gel gave an eluate from which the α- and β-hop acids were recovered by concn. The soft resins were detd. by difference while resoln. in MeOH and addn. of $Pb(OAc)_2$ gave a quant. value for humulone, lupulone could be detd. by difference. In view of the availability of suitable silica gel, chromatography was suggested for a rapid assay of hops.

8937. SIMONDS, PAUL W. AND PRO, M. J. **Chromatographic detection of grape wines in the presence of other wines.** *J. Assoc. Offic. Agr. Chemists* 35, 796-9(1952).—*C.A.* 47, 2931*b*.

Paper chromatography was employed to isolate a fluorescent material from grape wine for the purpose of detecting grape wine in the presence of other wines. A paper strip was suspended in a mixt. of the wine with water and butanol. After the initial development of the chromatogram, the paper was dried and suspended in a mixt. of satd. aq. K Al sulfate and abs. alc. After development with this solvent, the paper strip was dried and suspended in an atm. of NH_3 for 3 min. and then examd. under ultraviolet light. With grape wine a strong chrome to cadmium yellow fluorescent band was obtained; with peach, cherry, and apple wine, a weak brown-yellow fluorescent band; and with a no. of other wines tested no fluorescent band was obtained.

8938. STEUART, DAN W. **Redox potentials in cider making.** *Chemistry & Industry* **1952**, 830-1.—*C.A.* 47, 2900*a*.

Attempts were made to study changes in cider by detn. of the oxidation-reduction potentials; however, the Indicator Time Test (ITT) was found more convenient. For these tests 5 ml of a 0.005 *M* soln. of 2,6-dichlorobenzenoneindophenol was mixed with 200 ml of cider, and the time required for 50% decolorization of the dye was measured.

This was detd. by sighting through the bottle of the mixt. and a similar bottle of water and comparing with a similar bottle of cider without dye viewed in line with a 50% decolorization standard comprised of 2.5 ml of the dye soln. in 200 ml of phthalate buffer of pH 3.5. For apple juices from the press, ITT ranged from 5 to over 60 (all values in min. for 50% decolorization). Bubbling air through several juices for 1 hr had no effect on ITT in some, but increased the values by as much as 2 times in others.

8939. UNDERWOOD, G. E. AND DEATHERAGE, F. E. **Amino acids of green and roasted coffee, including a new method of protein hydrolysis.** *Food Research*, 17, 425-432(1952).—*C.A.* 46, 11498*d*.

Fourteen amino acids were identified in hydrolyzates of green Santos coffee beans. By use of ion-exchange chromatography, 9 of these amino acids were estd. quantitatively in hydrolyzates prepd. from the green and roasted coffee beans. A new method of protein hydrolysis, with an ion-exchange resin, gave almost complete hydrolysis of casein and of water-sol. coffee proteins. The resin used was Dowex 50, a sulfonated polystyrene resin; the hydrolysis was accomplished by mixing the protein, water, and the H-form of the resin, and then refluxing the mixt.

8940. ZABRODSKIĬ, A. G. AND MOVCHAN, A. A. **Action of adsorbents on alcoholic fermentation.** *Biokhimiya* 17, 513-20(1952).—*C.A.* 47, 3513*i*.

The adsorption and desorption occurring on the surface of solids improved the gas metabolism of the yeast cells in the liquid, and thereby increased the rate and extent of alc. fermentation. The adsorbents tested were wood-spruce shavings, oat husks, dry-mash pellets, peat, glass rods, clay, and activated carbon. An unfiltered soln. of sugar, yeast, and nutrient materials caused 90% sugar fermentation. When 5 g sawdust was added to 400 ml of the mixt. the fermentation increased to 99%. The solid adsorbent assisted in the liberation of CO_2 from the liquid. In the absence of solids, the liquid became supersatd. with CO_2 and the yeast activity was thereby inhibited. The use of adsorbents might find practical application in the fermentation of pure molasses and filtered hydrolyzates from wood. Unfiltered corn wort contained so much suspended material that the addn. of adsorbents did not affect the fermentation.

8941. KEENEY, MARK. **Chromatographic determination of butyric acid and the detection of milk-fat adulteration.** *Ice Cream Trade J.* 49, 30-6, 106-8(1953).—*C.A.* 47, 6567*a*.

The variation in the butyric acid content of fat from mixed herd milk was narrow enough to permit the easy detection of more than 10% adulteration of milk fat with nonmilk fat. When data have been accumulated on the butyric acid content of milk fat from various sources, detection of as little as 5% adulteration should be possible.

8942. SULSER, H. AND HÖGL, O. **Application of paper chromatography in food chemistry. IV. Quantitative paper chromatography with the spectrophotometer.** *Mitt. Lebensm. Hyg.* 44, 79-123(1953).—*C.A.* 47, 7125*d*.

A method particularly suitable for series detns. was developed by prepg. small-size diapositives of the photographs of paper chromatograms and measuring their intensity with a spectrophotometer. From 1.5 to 100 γ of alanine, glycerol, hydroxymethylfurfurol, colamine, and choline could be detd. within 5-10%.

8943. TURK, AMOS AND VAN DOREN, A. **Fruit storage. Saturation of activated carbon used for air purification.** *J. Agr. Food Chem.* 1, 145-51(1953).—*C.A.* 47, 6064*g*.

This study presented qual. and quant. analyses of the sorbates of several carbons and their variations through a fruit-storage season. Infrared spectra illustrated changes in relative prominence of several org. functionalities in the carbon sorbates as the season progresses. Analyses of brominated carbon were given. Based on these results, hypotheses were made concerning functioning of activated carbon in fruit storage.

8944. WILLIAMS, A. F. **Determination of glycerol in fermentation solutions. A rapid chromatographic procedure.** *Nature* 171, 655(1953).—*C.A.* 47, 6597*c*.

The method involved the prepn. of a column of coarse cellulose powder which supported a column of chromatographic Al_2O_3. Sufficient sample was taken to give approx. 0.5 g glycerol and contg. approx. 3 ml H_2O. After addn. of 0.5 g Na_2SO_3, 1 g NaOAc, and 0.1 ml AcOH, the resulting soln. was mixed with 15 g Al_2O_3 and the mixt. transferred to the column. The glycerol was eluted with 250 ml of solvent (acetone contg. 5% vol./vol. H_2O and 0.5% vol./vol. glacial AcOH). A volumetric procedure, involving titration with 0.1 *N* NaOH, was used for the final detn. of the glycerol.

V-10. Applications to Soaps, Fats, and Edible Oils

8945. CIUSA, W. **Susceptibility of olive oil to autoxidation. I.** *Ann. chim. applicata* 30, 141-6(1940).—*C.A.* 34, 7638^2.

The antioxidants naturally present in cod-liver oil and olive oil were removed by adsorption on carbon or activated silica. Curves were given for the O_2 uptake (Barcroft-Warburg technique) of olive oil at 40°, 60°, 70° and 90°C; only that at 90°C indicated the occurrence of an induction period.

8946. LIESEGANG, M. C. **A method for estimating the carbon black-removing power of washing agents.** *Fette u. Seifen* 47, 458-60(1940).—*C.A.* 36, 1402^7.

Increasing amts. of washing agent were stirred with 200 mg of carbon black. Drops of this mixt. were placed on baryta paper and rinsed with H_2O. The amt. of washing agent required so that the paper was no longer darkened was called the "carbon black no." This varied between 2 and 70; 2 signified the greatest carbon black-removing power.

8947. STELLING, OTTO. **The so-called activated bleaching earths.** *Tekn. Samfund. Handl.* 1940, 109-30.—*C. A.* 38, 2797[3].

A com. product equiv. to bleaching earth was obtained by activating a Swedish clay contg. montmorillonite as a basic substance. The activation process could not be considered to be just an exchange of bases by substitution of metal ions with H ions, because the activity was still maintained after the replacement of the H ions by treatment with various salt solns., even if the replaceability of the base was decreased about 75%, as when treated with a $CaCl_2$ soln. The bleaching action attained a max. with the increase of the time for treatment with acid. The higher the concn. of the acid, the more readily was the max. attained. The bleaching action decreased with increased moisture content and grain size.

8948. PALENI, ANDREA. **The action of the active earths and carbons on oils, and its evaluation.** *Chimica e industria* 23, 87-90(1941) (Italy).—*C. A.* 36, 7337[1].

The usual methods of detg. the activity of decolorizing adsorbents by color measurement did not permit the detn. of the "non-oil" substances sepd. from the oil. By shaking the adsorbent (after the adsorption process) in the cold with petr. ether, the adsorbed substances remained on the adsorbent and could then be extd. and detd. The decolorizing value was given by the ratio adsorbed substance/adsorbent.

8949. ROSSI, GUIDO. **The refining of vegetable oils.** *Riv. catasto servizi tec. erariali* 8, 320-8(1941).—*C. A.* 37, 3961[3].

Industrial refining processes, including preparatory operations, neutralization and distn., esterification, decolorization, deodorization and hydrogenation were reviewed, as well as a discussion of properties and yields of refined oils.

8950. SARIN, J. L. AND KUKERAJA, I. S. **Some northern India bleaching earths.** *J. Indian Chem. Soc., Ind. & News Ed.* 4, 184-8(1941).—*C. A.* 36, 4676[4].

Eight clays were tested: (1) the dehydration curve between 100° and 600°C, (2) measuring the rise in temp. upon mixing 5 g of the dried (115°C) clay with 10 ml of turpentine and (3) detg. the % soly. of Al_2O_3 and Fe_2O_3 by heating the clay with 0.5 *N* HCl for 3 hrs. Each sample was dried at 90-5°C, screened through a 200-mesh sieve and dried at 110°C for about 4 hrs, after which the bleaching action was detd. by mixing 4% of the clay with rape oil at 90°C and agitating for 10 min., filtering the mixt. and measuring the color of the oil in a Duboscq colorimeter.

8951. BAILEY, A. E.; FENGE, R. O., AND SMITH, B. A. **Variables affecting the yield of normal oleic acid produced by the catalytic hydrogenation of cottonseed and peanut oils.** *Oil & Soap* 19, 169-76(1942).—*C. A.* 37, 275[9].

The nature of the Ni catalyst as influenced by its method of prepn. may have a large effect on the compn. of the hydrogenated product. One of the Ni catalysts formed excessive amts. of isoöleic acid without being correspondingly selective. In the hydrogenation of cottonseed oil, within a wide range of conditions, the production of total solid acids with a given catalyst was relatively const. Peanut oil was a more suitable raw material than cottonseed oil for the production of normal oleic acid because of its initially greater content of this acid and its lesser content of linoleic acid.

8952. BOEKENOOGEN, H. A. **Adsorption methods in the chemistry and technology of the fatty oils.** *Chem. Weekblad* 39, 289-92(1942).—*C. A.* 39, 1769[4].

The bleaching of oils and especially the sepn. of glycerides from other lipoids and from fatty acids were discussed, as well as the sepn. of the fatty acids from one another.

8953. KAUFMANN, H. P. AND KIRSCH, P. **The increase in the molecular size of unsaturated acids and of their esters as the basis for the drying process and the manufacture of surface-coating materials. III. The fractionation of glycerides.** *Fette u. Seifen* 49, 841-54(1942).—*C. A.* 37, 6481[2].

Sepn. by adsorption method with Al_2O_3 and silica gel were reported for blown and oxidized linseed, rapeseed and China wood oils. In general, Al_2O_3 adsorbed the constituents of high mol. wt while the reverse was true of silica gel. A blown linseed oil with a viscosity of 113 centipoises was sepd. with Al_2O_3 into a filtrate of 62 centipoises and an adsorbed portion of 928 centipoises. With silica gel as the adsorbent, the corresponding viscosities were 154 and 106.

8954. LOEW, GUILLERMO AND GOETZ, ARTURO B. **Comparative tests on active earths and charcoals.** *Rev. farm. (Buenos Aires)* 84, 359-64 (1942).—*C. A.* 37, 1232[5].

Adsorbing earth and active charcoal, both of Argentine and foreign origin, were compared by measuring the decolorizing effect on soy-bean oil. In every test, 100 g of oil was heated with increasing quantities of decolorant, from 0.5 to 3% beginning at 70°C, and increasing to 110°C during 15 minutes. The filtered, refined oil was compared with the original sample and a linear effect was observed. Argentine earth was more efficacious than imported earth, but the domestic charcoal was inferior.

8955. SATÔ, MITSURU. **The energy states of the valency electrons in some metals. I, 12. The mechanism of the catalytic action of zinc in the preparation of unsaturated higher alcohol by hydrogenation of vegetable oil.** *Science Repts. Tôhoku Imp. Univ.* 30, 137-53(1942).—*C. A.* 44, 4220*a*.

Hydrogenation of oil extd. from the seeds of Perilla frutescens was studied. At room temp. and above, the electronic energy was insufficient to dissoc. the adsorbed H_2 and to initiate hydrogenation; at 200°C, despite a decrease of the electronic energy, the addnl. thermal energy caused dissocn. and catalytic reaction. At 320°C the energy supplied by the Zn dropped suddenly to such a value that both adsorption and catalytic action became very weak.

8956. Uyeno, Seiichi and Anzai, Rinnosuke. **The life of nickel cataysts and the recovery of spent catalysts.** *J. Soc. Chem. Ind. Japan* 45, 648-9(1942).—*C. A.* 43, 5210*i*.

The life of Ni catalysts for the hardening of fatty oils depended mostly on the purity and kind of oils to be hardened as well as on the refining process with which they had been previously treated. In general, the catalyst could be reused in several batches only with vegetable oils. Catalysts used in hardening marine-animal oils usually deteriorated more rapidly, since some catalyst poisons usually remained in the refined oil. In general, previous refining greatly increased the no. of batches that could be hardened with one charge of catalyst.

8957. Uyeno, Seiichi. **The carrier of the nickel catalyzer used in the hardening of fatty oil.** *J. Chem. Soc. Japan* 63, 976-7(1942).—*C. A.* 41, 3308*i*.

In the hardening of fatty oil under a pressure higher than 100 atm., diatomaceous earth, Kibushi clay, active white earth, kaolin, talc, yellow ocher, and Kurama clay as carriers showed nearly the same activity. Active white earth had the greatest action. The action of bauxite was inferior to that of diatomaceous earth. When bentonite was used as carrier, the formation of higher alc. was presumed from the smell of the reaction product. The use of bentonite shortened the time required to filter the reaction product.

8958. Cavier, Raymond. **The hemolytic action of alkali soaps and their adsorption by charcoal.** *Compt. rend.* 216, 255-6(1943).—*C. A.* 39, 713^7.

The relation between the hemolytic activity of alkali soaps and their adsorption by animal charcoal was investigated. Fifty ml of soap soln. buffered to pH 9.0 was shaken at 20°C with 0.25 g of purified charcoal. Isotherms of adsorption were established for Na dibromoricinoleate, dibromostearate, linolenate, linoleate, oleate, hydrocarpate, bromolaurate, ricinoleate, laurate and hydroxystearolate. A parallelism was established between the hemolytic activity and the intensity of the adsorption.

8959. Duuren, A. J. van. **Bleaching earths of the Netherlands East Indies.** *Koloniaal Inst. Amsterdam, Mededeel No.* 61, *Afdeel. Handelsmuseum No.* 27, 81 pp.(1943).—*C. A.* 40, 7535^2.

Bleaching earths from different localities in Java were studied. These earths consisted partly of montmorillonite and partly of mica-clay minerals. Activation was carried out by boiling 20 g of material with 50 ml of 10% HCl, followed by heating in an autoclave for 30 min. at 138-140°C. The samples were then cooled, filtered, washed, and dried at 105°C. Decolorization tests on mineral and other oils proved to be unsatisfactory for a correct evaluation of the other earths.

8960. Fischer, Earl K. **Surface-active agents.** *Soap, Sanit. Chemicals* 19, No. 12, 25-9, 53 (1943).—*C. A.* 38, 596^9.

The term, surface-active agent, referred to compds. which were adsorbed at an interface, changing the phys. properties of the system. Chemically these compds. ranged from definite entities to unknown mixts. They were characterized by a relatively large mol. which had 2 mol. components of different affinities. They were usually of low volatility. In aq. soln. they were of 3 types in terms of electrolytic dissocn.: anionic, cationic and nonionic.

8961. Graff, Morris M. and Skau, Evald L. **Colored chromatograms with higher fat acids.** *Ind. Eng. Chem., Anal. Ed.* 15, 340-1(1943).—*C. A.* 37, 3961^1.

A mixt. of MgO impregnated with phenol red and petr. ether was poured into a 60-70-cm glass tube 11 mm in diam. and the solvent allowed to percolate out. Fat acid mixts. dissolved in 50 ml of petr. ether were added to the column and the solvent allowed to percolate through. When the mixt. came in contact with the adsorbent, a yellow band was formed which sepd. into zones. After these were clearly developed, the column was allowed to run dry, forced from the tube and cut into sections defined by the change in color of the adsorbent. The fat acids were removed from the latter by dissolving in HCl and extg. with diethyl ether. It was possible to demonstrate a sepn. of an unsatd. fat acid from a satd. one of the same no. of C atoms, and of two satd. fat acids differing in chain length by 4 C atoms.

8962. Joshel, Lloyd M. **An apparatus for quantitative catalytic hydrogenation.** *Ind. Eng. Chem., Anal. Ed.* 15, 590-1(1943).—*C. A.* 37, 6162^4.

An all-glass app. which filled the entire gap between a strictly microapp. and the standard Adams (Burgess-Parr) machine was described. Flasks of several sizes fitted with a magnetic stirrer and 50-ml and 500-ml burets gave the required flexibility.

8963. Kaufmann, H. P. and Wolf, W. **Adsorption separation in the field of fats. V. The separation of cis-trans isomers.** *Fette u. Seifen* 50, 519-21(1943).—*C. A.* 39, 205^7.

Al_2O_3, silica gel and charcoal were compared as adsorbents in the sepn. of an equimol. mixt. of tributyrin and tristearin. Tributyrin was more strongly adsorbed by Al_2O_3 and by silica gel and could be quantitatively sepd. Al_2O_3 or silica gel adsorbed mono-, di-, and tristearin in that order. A mixt. of 1 g each of the Me esters of fumaric and maleic acids in 35 ml Et_2O was poured through a column of 25 g C; 0.3 g of the maleic acid ester was found in the filtrate. The "percolate" obtained with 35 ml ice-cold Et_2O contained a mixt. of the 2 esters; 0.7 g of the fumaric acid ester was obtained from the $CHCl_3$ eluate. A mixt. of 90% oleic, 10% elaidic acid was found in the eluate of the upper part of a silica gel column through which had been poured a C_6H_6 or petr. ether soln. of a mixt. of equal parts of the 2 acids.

8964. Kufferath, A. **Filtration of oils and fats.** *Fette u. Seifen* 50, 370-2(1943).—*C.A.* 38, 3498^8.

Various filter presses used in the fat and oil industry were described. The use of filter aids was discussed.

8965. Uyeno, Seiichi; Tokunaga, Toshikadzu, and Nishio, Minako. **Separation of fatty acids by means of adsorption by bentonite.** *J. Chem. Soc. Japan* 64, 135-8(1943).—*C.A.* 41, 3308*h*.

8966. Uyeno, Seiichi; Tokunaga, Toshikazu, and Nakamori, Gi-ichi. **Separation of oil by adsorption with bentonite. II. Separation of unsaponifiable constituents.** *J. Chem. Soc. Japan* 64, 312-14(1943).—*C.A.* 41, 3309*f*.

The adsorptive power of bentonite for the satd. unsaponifiable portion of fatty oil was larger than for the unsatd. fraction.

8967. Walker, F. T. and Mills, M. R. **Component glycerides of linseed oil—segregation by chromatography. II. Thiocyanogen value of linolenic acid.** *J. Soc. Chem. Ind.* 62, No. 7, 106-9(1943).—*C.A.* 37, 6913^1.

By subjecting a large amt. (70 g) of linseed oil to chromatographic fractionation it was possible to isolate linoleodilinolenin (8 double linkages), and a mixt. of trilinolenin (9 double linkages) and linoleodilinolenin.

8968. Cummins, A. B.; Weymouth, L. E., and Johnson, L. L. **Filter aid and carbon treatment of prime steam lard.** *Oil & Soap* 21, 215-23 (1944).—*C.A.* 38, 5424^2.

With the use of filter aid alone without carbon, each successively coarser filter-aid grade gave a higher filtration rate with corresponding measurable decrease in degree of clarification. Hyflo or at most Celite 503 were the coarsest grades to be recommended for this use. Selection of the most suitable grade depended on the sp. flow-rate or clarity requirements. With the use of filter aid plus carbon of the type tested, Hyflo Super-Cel was the coarsest grade which would satisfactorily retain this carbon. Celite 512 appeared well-suited for this use.

8969. Harris, John P. **Oil decolorizing.** *Soap* 20, No. 5, 31-2, 70(1944).—*C.A.* 38, 3498^8.

The process of decolorizing various fats and oils by treatment with active carbon was described.

8970. Heinz, H. J. **Adsorbents and their use in the fat industry.** *Fette u. Seifen* 51, 448-54 (1944).—*C.A.* 44, 6657*g*.

8971. Kufferath, A. **New compounds for decolorizing and clearing in the fat industry.** *Fette u. Seifen* 51, 280-2(1944)—*C.A.* 44, 6657*i*.

8972. Paleni, Andrea. **Coloring matters of vegetable oils, and the mechanism of decolorization. IV. Refining the oils.** *Chimica e industria* 26, 138-45(1944)(Italy).—*C.A.* 40, 3281^5.

The preliminary treatment of the oils with H_2SO_4 to remove chlorophyll, neutralization with alkali, decolorization, deodorization, sepn. of solid glycerides, filtration, neutralizing by distilling off the free acid, and esterification were all described.

8973. Daniel, David; Lederer, Edgar, and Velluz, Léon. **Constituents of wool fat. II. Chromatographic study of the unsaponifiable fraction.** *Bull. soc. chim. biol.* 27, 218-25 (1945).—*C.A.* 40, 4897^9

The unsaponifiable fraction was dissolved in petr. ether and passed through a column of Al_2O_3. The first filtrate contained a very small amt. of a mixt. of paraffin hydrocarbons. Successive fractions obtained by adsorption and elution contained: (1) a very small amt. of unidentified unsatd. d-rotatory steroid ketones; (2) cholesta-3, 5-dien-7-one, strongly l-rotatory, about 0.6% of the original lanolin; (3) "isocholesterol" (a mixt. of lanosterol, dihydrolanosterol, γ-lanosterol, and agnosterol), 20-26% of the lanolin; (4) cholesterol, 20-30% of the lanolin; and (5) a mixt. of dextrorotatory substances amounting to 5% of the lanolin.

8974. Hassler, John W. **Influence of pH of the adsorbent on the properties of edible oils and fats.** *Oil & Soap* 22, 60-2(1945).—*C.A.* 39, 1998^9.

The effect of active carbon and active clays was discussed. Bee[illegible] and cottonseed oil were used with the clays and menhaden, peanut and coconut oil with the active carbon. The pH of the adsorbent was detd. on the aq. ext. and that of Fuller's earth ranged from 7 to 10 and that of the carbons from 8 to 11. Peroxide bodies in an oil were adsorbed by active clays and carbons; and this work confirmed previous studies that lowering the pH of an adsorbent resulted in increased removal of peroxide bodies.

8975. Prakash, Brahma and Ram, Atma. **Replacement of glycerol by bentonite, a cheap substitute in R.-M. saponification.** *Proc. Ann. Convention Oil Technol. Assoc. India* 2, 36-8 (1945).—*C.A.* 45, 7805*e*.

Because of the scarcity of glycerol, bentonite was tried as a substitute to aid sapon. in the procedure for detn. of the Reichert-Meissl no. Tests showed that 0.3-0.4 g of 100-mesh or 0.4-0.5 g of 60-mesh bentonite was suitable.

8976. Ramsey, L. L. and Patterson, W. I. **Separation and identification of the volatile saturated fatty acids (C_1 to C_4).** *J. Assoc. Official Agr. Chem.* 28, 644-56(1945).—*C.A.* 40, 811^9.

The volatile acids were sepd. on a chromatographic partition column of silicic acid, satd. with an aq. soln. of a suitable indicator, with $BuOH\text{-}CHCl_3$ as the second solvent. Formic, acetic, and propionic acids were sepd. completely from one another, but butyric and isobutyric acids were obtained together, free from their homologs. Pos. identification of all the acids except isobutyric was based on the microscopic examn. of a characteristic cryst. salt (cerous formation, mercurous acetate, mercurous propionate, mercurous butyrate, photomicrographs of which were reproduced).

8977. Sylvester, N. D.; Ainsworth, A. N., and Hughes, E. B. **Determination of fat in mixtures containing fatty acids and the determination of unsaponifiable matter in oils and fat.** *Analyst* 70, 295-301(1945).—*C.A.* 39, 5099[9].

A soln. contg. fat and fatty acids was passed through a column of Al_2O_3 slurry which was tinted with bromothymol blue. The position of the fatty acid band was clearly defined. $CHCl_3$ or Et_2O was convenient as washing solvent. This absorption method for the removal of fatty acids could be applied to the detn. of unsaponifiable matter in oils and fats after acidification of the sapond. product, but the relatively large quantity of fatty acid to be removed made another procedure more advantageous. After the soap soln. had been extd. with ether to remove unsaponifiable matter, wash the ext. with dil. acid to decomp. any dissolved soap and remove the resulting fatty acids by passing the ether soln. through an adsorption column.

8978. Ziels, N. W. and Schmidt, W. H. **Catalytic effect of metals and light on fats and oils.** *Oil & Soap* 22, 327-30(1945).—*C.A.* 40, 1049[9].

The effects of various metals and alloys present during deodorization of hydrogenated cottonseed oil were tabulated, also the effect of deodorizing temp. on the proöxidant effect of boiler plate steel and 18-8 and 18-3-3 stainless steel. The metals tested were: Al, Ni, Ta, Sn, Cr, Fe, Co, Cu, Mn, Pb, and the alloys Inconel, Rezistal, and monel. All metals tested with the exception of Al and Ni exerted some proöxidative effect on various fats and oils of a consistency and purity suitable for shortenings. The metal effect became more noticeable with increasing temps. As a mechanism, the formation of metallic soap was suggested by the inter-action of the metal and the free fatty acid. Inconel and Rezistal were the best of the alloys tested, with monel the poorest.

8979. Hinners, Herbert F.; McCarthy, Justin J., and Bass, Raymond E. **The evaluation of bleaching earths. The adsorptive capacity of some bleaching earths of various pH for chlorophyll in soybean oil.** *Oil & Soap* 23, 22-5(1946).—*C.A.* 40, 2326[4].

Refined extd. soybean oil was bleached in vacuo for 30 min. at 110°C under controlled conditions with various concns. of com. bleaching earths. The bleached oil was analyzed spectrophotometrically and the Lovibond color detd. and the chlorophyll density calcd. by Beer's law. The Lovibond color was not indicative of the chlorophyll concn. in the oil and could not be used to det. the adsorptive capacity of an earth for this pigment. The removal of chlorophyll from the oil by these earths followed Freundlich's adsorption equation. Although the trend was toward better decolorization at the lower pH values, this efficiency was not a function of pH. The adsorption capacity of a bleaching earth for chlorophyll in soybean oil apparently was proportional to the amt. of H or OH ions capable of being adsorbed by the earth.

8980. Kirchner, J. G.; Prater, Arthur N., and Haagen-Smit, A. J. **Separation of acids by chromatographic adsorption of their p-phenylphenacyl esters.** *Ind. Eng. Chem., Anal. Ed.* 18, 31-2(1946).—*C.A.* 40, 1448[3].

Highly purified *p*-phenylphenacyl esters showed a blue fluorescence in ultraviolet light. The derivs. of the lower fatty acids could be used for a chromatographic sepn. on silicic acid columns. A 1:1 mixt. of benzene-petr. ether (b. 80-90°) was used for both adsorption and development, and pressure was used to develop the chromatograms. The derivs. of higher mol. wt were less strongly absorbed than the lower ones. Each member from acetic to capric could be sepd. from the one preceding or following it, and the isoacids with 4, 5, and 6 C atoms could be similarly sepd.

8981. Langston, R. B. and Rich, A. D. **Nomographs for determining relative bleaching costs of adsorbents.** *Oil & Soap* 23, 182-4(1946).—*C.A.* 40, 4540[4].

Nomographs were given for a rapid method for evaluating the differences between bleaching adsorbents. Two operations were involved: (1) the detn. of cost of adsorbent plus adsorbent handling cost and (2) the detn. of value of oil lost in the press cake. The sum of these 2 items offered a basis for comparing adsorbents and was taken as the bleaching cost. When the adsorbent dosage was greater than that covered by the scale of the nomograph, the adsorbent dosage was divided by 2 and the resulting adsorbent purchase and handling costs were doubled.

8982. Oda, Makoto. **Butanol fermentation with sugar as the raw material. III. Increasing the concentration of the mash.** *J. Agr. Chem. Soc. Japan* 21, 16-17(1946).—*C.A.* 46, 1704*i*.

To avoid the toxicity of BuOH some oils and carbons were tested on their power to absorb BuOH; the most effective was com. carbon, supernorite; among the oils tested, emulsified coconut oil, emulsified soybean oil, emulsified peanut oil were high in BuOH absorption. The concn. of sucrose in the mash was varied from 7 to 10%, but 10% was too high. For the 8% mash with peanut cake 1.2%, intermittent addn. of supernorite was effective.

8983. Puri, Amar Nath; Rai, Balwant, and Ratti, T. R. **Studies in the bleaching properties of clays.** *J. Indian Chem. Soc., Ind. & News Ed.* 9, 22-33(1946).—*C.A.* 41, 4660*d*.

The properties of some typical bleaching earths were studied and attempts were made to find some single characteristic property or const. of earth to distinguish a bleaching from a nonbleaching clay. Thirty typical earths were activated by treatment with HCl. The bleaching action of the activated earths was tested by mixing 0.5-g portions with 10-ml portions of a crude oil, heating the mixt. at 90°C for 10 min. and detg. the bleaching effect with the Duboscq colorimeter.

The oils used in these expts. were crude rape seed, crude cottonseed and cottonseed oil treated with NaOH to neutralize free fatty acids. Five earths showed a comparatively good bleaching action, but no single characteristic was found which detd. their suitability for activation. The earths should be free or almost free of humus, with a base-exchange capacity of 20-30 milliequivs. per 100 g of earth, and a neutralization value of about 20 milliequivs.

8984. WILLIAMS, K. A. **Chromatography in the analysis of fatty oils.** *Analyst* 71, 259-63 (1946).—*C. A.* 40, 4980[1].

The application of chromatography to the analysis of fatty oils was reviewed, and methods described for detg. free fatty acids, carotene, xanthophylls and vitamin A, hydrocarbons, oxidized acids and certain impurities of olive oil.

8985. ARCURI, JOSÉ. **Study of the activity and ability of activation of Argentine bentonite.** *Rev. facultad cienc. quim.* 22, 217-24(1947).—*C. A.* 44, 11049*i*.

Seven samples of 200-mesh bentonite from various Argentine deposits were evaluated for their ability to decolorize raw rapeseed oil (Lovibond 90Y/6.0R). One, 2, 3, 4, and 5% of the bentonites were added to the oil at 105°C, agitated for 5 min., filtered off on a Buchner funnel, and the color of the filtered oil was detd. An English Fullers' earth was used for comparison, 3% of which reduced the color to 40Y/5.2R. Not nearly as good an effect was obtained with any of the Argentine materials. Bentonites were activated by treating them with 0.3, 0.6, 1.2, 3, and 6 *N* HCl under reflux at 100°C for 0.5, 1, 2, 3, 4, and 5 hrs, filtration, washing out the excess acid, drying, and powdering them to 200 mesh. Natural bentonites retained between 13.95 and 18.85% of oil, while activated bentonites retained 38.40 to 54.50% (g per 100 g bentonite).

8986. LIN, I. AND WU, SU-MING. **Decolorization of vegetable oil by acid clay.** *Research Bull. Fukien Acad. No.* 2, C 4-8(1947)(in English).—*C. A.* 42, 2118*i*.

Acid clay from Kien-Yang and from Lien-Cheng removed by adsorption the coloring matter from peanut oil less than from darker teaseed oil, the 1st clay being a better decolorizer than the 2nd. Higher temp. and treatment with 5% HCl improved the decolorization. The acid treatment increased adsorption 5-10% and the decolorizing effect was equiv. to the addn. of 70-100% more clay.

8987. MATHUR, KRISHNA G. **Studies in activated silicates.** I. *J. Indian Chem. Soc., Ind. & News Ed.* 10, 47-52(1947).—*C. A.* 42, 6497*a*.

SiO_2 and silicates of Fe, Al, Cr, Cu, Mg, Mn, Ni, and Co were pptd. by adding metallic salt solns., 1-20% concn., to Na_2SiO_3 soln., washing, drying at 60-70°, grinding, and activating at 100-400°C. For the bleaching of linseed, groundnut, cottonseed, rapeseed, and mineral oils, silicates of Mn, Mg, and Cu showed low activity. The bleaching efficiencies were best for silicates pptd. at low concns., about 2%, by slow pptn., and activation at 350°. For the adsorption of benzoic acid, the silicates outside the concn. range of 5-15% showed a loss in adsorptive capacity.

8988. MAZUMDAR, BHUPENDRA KRISHMA AND GOSWAMI, M. N. **Chromatographic separation of stearic acid and oleic acid.** *Indian Soap J.* 12, 227-33(1947).—*C. A.* 42, 3973*i*.

The purpose of the investigation was to develop a method for sepg. stearic acid from oleic acid which was invariably an impurity in stearic acid. The prepn. of Al_2O_3, MgO, silica gel, and activated carbon adsorbents and their use as column materials were described in detail. The Al_2O_3 and MgO columns gave the best results, with carbon the third choice.

8989. MCINTOSH, R.; JOHNSON, H. S.; HOLLIES, N., AND MCLEOD, L. **Preliminary observations of the dielectric constants of vapors adsorbed on activated silica.** *Can. J. Research* 25B, 566-74(1947).—*C. A.* 42, 1466a.

The dielec. consts. of EtCl, butane, and $(CH_2)_2O$ adsorbed on silica gel were detd. by measuring the change in the capacity of an elec. condenser when such gel contg. the adsorbate was placed between the plates of the condenser. The dielec. const. calcd. for adsorbed butane was close to that calcd. for the bulk liquid, whereas the value calcd. for adsorbed EtCl was significantly lower than the value calcd. for the liquid.

8990. PALENI, V. ANDREA. **Decolorization of vegetable oils by active earths.** V. *Olii minerali, grassi e saponi, colori e vernici* 24, 56-8, 77-8(1947).—*C. A.* 46, 279*g*.

The example of sulfured olive oil bleached with Tonsil Optimum 1939 and with Prolit V46, was used to show that carotenes (λ 435) were adsorbed with up to 3-4% earth, while the adsorption of chlorophyll (λ 660) continued up to 7-8% clay.

8991. PAREKH, N. N. AND VAIDYA, B. K. **Activation of clays and earths.** *J. Indian Chem. Soc., Ind. & News Ed.* 10, 29-39(1947).—*C. A.* 42, 6499*a*.

The acid activation of a moderately plastic china clay from Junagadh state, a low plastic yellow clay from Madras Province, and a Central Indian Fuller's earth were studied. The acid concn. was varied from 0.5 to 6 *N*, residual acidity from 1 to 0.003 *N*, and activation from 100° to 600°C. HCl soln. was only 1/2 to 1/3 as effective as H_2SO_4 soln. Bleaching tests were made with groundnut and sesame oils. Fuller's earth was the most active, while little improvement was shown by the yellow clay through activation.

8992. PRITCHETT, W. C.; TAYLOR, W. G., AND CARROLL, D. M. **Chlorophyll removal during earth bleaching of soybean oil.** *J. Am. Oil Chemists' Soc.* 24, 225-7(1947).—*C. A.* 41, 5735*d*.

Approx. 25% of the chlorophyll in crude soybean oil was removed by refining with alkali. Hydrogenation of the oil to a shortening consistency with ordinary catalyst at moderate temp. reduced the chlorophyll by about 2/3; and complete hardening reduced about 95% of the chlorophyll. Deodorization of hardened soybean oil had little influence on the chlorophyll content.

8993. UKIL, SUDHIR CH. AND GOSWAMI, M. N. **Decolorization and deodorization of mustard oil.** *Indian Soap J.* **12**, 258-65(1947).—*C.A.* 42, 3974*g*.

Allyl isothiocyanate was removed from mustard-seed oil by passing steam at 100°C through the oil for 1.5 hrs. The S compd. was not removed by treatment with silica gel, CuO, or cuprammonium compd. For decolorizing the oil, the best results were obtained by treatment with a mixt. of 9 parts of acid-treated Fuller's earth and 1.5 parts of Carbonit (vegetable carbon) for 45 min. at 75°C. Carbonit could be replaced by rice-husk charcoal, made by heating rice husks slowly up to 800-900° and then holding at that temp. for 1 hr, followed by cooling, boiling with 10% NaOH soln. for 2 hrs, filtering, washing to remove NaOH, and drying in a steam oven.

8994. APPELL, FRANCINE. **Chromatography and its application to the study of fatty oils.** *Chimie & industrie* **60**, 36-40(1948).—*C.A.* 42, 7999*a*.

The application to the sepn. of unsaponifiable, fatty acids, glycerol, and oxidation and polymerization products of oils were discussed.

8995. ATKINSON, D. I. W. **The displacement of liquids from porous solids.** *J. Imp. Coll. Chem. Eng. Soc.* **4**, 78-92(1948).—*C.A.* 44, 4291*f*.

The results were applied to filtration, such as the sepn. of vegetable oils from Fuller's earth, or to petroleum production. Expts. were made with 2-layer beds of glass and steel spheres 1/16 to 1/4 in. in diam. to det. the fraction of liquid vol. that would drain from an initially satd. bed. For C_6H_6, heptane, ether, EtOAc, $CHCl_3$, H_2O, liquid paraffin, and lubricating oil, the percentage of drainage was nearly const., varying from 90.75 to 93.4% as the sphere diam. was increased. The contact angle of each of the above organic liquids with H_2O and steel was found to be zero, except the angle for C_6H_6 which was 13°.

8996. DUTTON, HERBERT. J. AND REINHOLD, CATHERINE L. **Adsorption analysis of lipides. III. Synthetic mixtures of ethyl stearate, oleate, linoleate, and linolenate.** *J. Am. Oil Chemists' Soc.* **25**, 120-4(1948).—*C.A.* 42, 3973*f*.

The adsorption analysis of 6 binary mixts. composed of ethyl stearate oleate, linoleate, and linolenate was studied on alumina columns. This technique resulted in fractionation of all 6 systems, including the oleate-linoleate mixt., the latter not fractionating by distn. methods. Measures of the performance of the columns were obtained by dividing the eluate into 2 portions at the point in the fractionation at which the starting compn. was reached. The efficiency of sepn. of pairs appeared to depend on the difference in degree of unsatn. of the components. Over-all recoveries of esters from the columns ranged from 71.8 to 87.5%.

8997. GRACE, N. H. **Canadian erucic acid oils. I. Refining and bleaching.** *Can. J. Research* **26F**, 349-59(1948).—*C.A.* 43, 2000*e*.

The erucic acid oils of Canada (from rapeseed and from mustard seed varieties screened from western Canadian wheat) were dark and unsuitable for edible oils. Clay bleaching tests in CO_2 atm. were made on these oils with or without treatment by conventional alkali refining. Super-filtrol was better than Neutrol, and much better than unactivated Manitoba bentonite; it was used in the following tests: Results of treating and bleaching were expressed in terms of free fat acid and relative transmission in % at 440 and 660 mμ compared to Stanolax (white mineral oil) as standard. With 4% clay increasing treating time from 20 to 80 min. at 100°C had little effect on transmission of rapeseed oil, either crude or partial alkali treatment treated, but did increase free acids of the crude oil from 0.38 to 0.62%, with no change for the other.

8998. HIRSBRUNNER, HANS RUDOLF. **Scouring mineral oil-lubricated wool.** *Textil-Rundshau* 3, 343-52, 382-91, 423-29(1948).—*C.A.* 43, 2780*b*.

Wool lubricants contg. mineral oils were more difficult to remove than those based on vegetable oils. Soaps emulsified best. The colloidal-chem. effects of scouring agents were compared. Mineral oils contg. nonsatd. compds. showed yellowing in storage and light. Non-scoured or insufficiently scoured wool showed inferior dyeing results after insulation, caused by oil residues. Adsorption of scouring and emulsifying agents also counteracted dye adsorption.

8999. KING, R. R. **A.O.C.S. official bleaching earths.** *J. Am. Oil Chemists' Soc.* 26, 12-13 (1948).—*C.A.* 42, 2119*f*.

Natural bleaching earth should be made from English Earth of the XL000 brand and Activated Bleaching Earth should be made from Special Filtrol brand activated clay.

9000. KIRSANOV, N. V. **Properties of upper-Pliocene montmorillonite clays of Sakami.** *Doklady Akad. Nauk S.S.S.R.* 60, 1037-9(1948). —*C.A.* 43, 977*b*.

These were dense, greasy clays of typical origin from swamps or small lakes. The clay minerals belonged to the Mg type of montmorillonite; Ca was bound only to accessory calcite and gypsum; a little was adsorbed on the montmorillonite. The adsorption and bleaching properties of these clays were interesting from the standpoint of technology, e.g. for mineral-oil raffination, soap industry, as a filling or washing agent in textile and fur industry, for oil boring and prospecting slurries, etc.

9001. LAHUERTA CASAUS, PASCUAL AND SANCHEZ MARCO, GODOFREDO. **The regeneration of catalysts used for hydrogenating fats.** *Rev. acad. cienc. exact. fís.-quím. y nat. Zaragoza, Ser. 2A*, 3, No. 2, 65-72(1948).—*C.A.* 44, 6657*h*.

The patent literature was reviewed and the prepn. of catalysts by the decompn. of Ni formate described. The analysis of catalyst residues for Ni (by the dimethylglyoxime method) and for fatty materials by means of the consts. of the Et esters was outlined, including the question of Ni soaps that were sol. in the fat.

9002. MATHEW, P. K.; NAIR, P. V.; RAMAKRISHNAN, T. A., AND SREEMULANATHAN, H. **Deodorization of shark-liver oil.** *Nature* 162, 494(1948).—*C. A.* 43, 1531*b*.

Shark-liver oil could be deodorized by steam treatment, agitation with fermenting milk or toddy, or by catalytic hydrogenation with Ni catalyst. Hydrogenation with 0.25% Ni catalyst for 20-45 min. at 120°C improved the keeping quality with loss of only 7% of vitamin activity. One % catalyst was insufficient to effect complete deodorization, while 0.4% catalyst or operation at higher temps. caused vitamin destruction.

9003. MIYAKE, ROICHI. **Hydrogenation of fatty oils. I. Finback whale oil under atmospheric pressure.** *J. Pharm. Soc. Japan* 68, 1-4(1948)(English summary).—*C. A.* 44, 352*b*.

When finback whale oil was catalytically hydrogenated with Ni-silica gel till the product gave an I_2 no. 83, only those having 2 or more double bonds were satd., and those with 1 double bond originally existed in the oil, or formed by this partial hydrogenation remained unsatd. The reaction was the same at 180° or 210°C; however, it proceeded 1.44 times faster.

9004. MIYAKE, ROICHI. **Hydrogenation of fatty oils. II. Finback whale oil and soybean oil with H. Akins' catalyst.** *J. Pharm. Soc. Japan* 68, 8-10(1948)(English summary).—*C. A.* 44, 352*c*.

With Akins' Cu-Cr oxide catalyst, unsatd. fatty acids above linoleic acid series in both oils underwent selective partial hydrogenation at 180°C or 210°C under atm. pressure. If the reaction started with an initial pressure of 40 atms. H_2 at 140°C, the same results were obtained, but at 180°C, not only oleic acid series, but also the acid radicals were reduced too.

9005. MIYAKE, ROICHI. **Hydrogenation of fatty oils. III. Quantitative analysis of constituents of the seed oil of Xanthium strumarium by selective hydrogenation method.** *J. Pharm., Soc. Japan* 68, 12-13(1948)(English summary).—*C. A.* 44, 352*d*.

From exhaustive hydrogenation by Cu-Cr oxide catalyst and detn. of I_2 no. of the product, the amt. of satd. acid in the oil could be calcd. The decrease of I_2 no. by this hydrogenation also gave the basis for calcn. of linoleic acid, since linoleic was the only highly unsatd. acid in this oil.

9006. MIYAKE, ROICHI. **Hydrogenation of fatty oils. IV. Adkins' catalyst (A) Relation between the decomposition temperature of copper ammonium chromate and activity of copper-chromium oxide catalyst.** *J. Pharm. Soc. Japan* 68, 14-17(1948)(English summary).—*C. A.* 44, 352*e*.

$CuNH_4CrO_4$ decompd. in the air under atm. pressure at 280°C. An addn. of $BaCrO_4$ or kieselguhr or change in the reaction of the pptg. medium did not alter this decompn. temp. Heating the product up to 280°C was sufficient to produce an active catalyst. Under 7 mm Hg pressure, the decompn. temp. was lowered to 260°C, but the product showed no superior catalytic power.

9007. MIYAKE, ROICHI. **Hydrogenation of fatty oils. V. Adkins' catalyst. (B) Reduction of the catalyst and its catalytic action.** *J. Pharm. Soc. Japan* 68, 18-21(1948)(English summary).—*C. A.* 44, 352*f*.

The reduction of Cu oxide in Adkins' catalyst by H_2 began at 128°C under atm. pressure. The reduction of highly oxidized Cr to Cr_2O_3 began at 140°C, but proceeded slowly. In the presence of the Cu oxide, the reduction was very rapid. In Adkins' catalyst, it was reduced to Cu which actually catalysed the hydrogenation of fatty oil.

9008. MIYAKE, ROICHI. **Hydrogenation of fatty oils. VI. Adkins' catalyst (C) Promoter action of chromium oxide.** *J. Pharm. Soc. Japan* 68, 22-5(1948)(English summary).—*C. A.* 44, 352*g*.

In order to hydrogenate highly unsatd. fatty oil at atm. pressure, Cr oxide, a promoter, was necessary to aid the action of the reduced Cu.

9009. MIYAKE, ROICHI. **Hydrogenation of fatty oils. VII. Adkins' catalyst. (D) Chromium oxide as catalyst for the hydrogenation of carbonyl group.** *J. Pharm. Soc. Japan,* 68, 26-8(1948)(English summary).—*C. A.* 44, 352*g*.

Chromium oxide in Adkins' Cu-Cr oxide catalyst had a catalytic action of its own in the hydrogenation of the carbonyl group.

9010. MIYAKE, ROICHI. **Hydrogenation of fatty oils. VIII. Adkins' catalyst (E) Significance of activation of catalyst by washing with acetic acid.** *J. Pharm. Soc. Japan* 68, 29-31(1948)(English summary).—*C. A.* 44, 352*h*.

The function of washing Cu-Cr oxide with AcOH was to remove H_2O-sol. poison, and H_2O could be substituted for the acid without lowering its catalytic power.

9011. MIYAKE, ROICHI. **Hydrogenation of fatty oils. IX. Catalytic action of copper supported on kieselguhr.** *J. Pharm. Soc. Japan,* 68, 32(1948)(English summary).—*C. A.* 44, 352h.

Cu catalyst supported on kieselguhr also could selectively hydrogenate highly unsatd. acids in the oil to oleic acid series under atm. pressure, similar to Adkins' Cu-Cr oxide catalyst.

9012. MIYAKE, ROICHI. **Hydrogenation of fatty oils. X. Relationships between degree of dispersion of copper and carrier and surface area; and between degree of the dispersion and activity of copper catalyst.** *J. Pharm. Soc. Japan,* 68, 33-7(1948)(English summary).—*C. A.* 44, 352i.

The degree of dispersion and surface area of catalyst on kieselguhr, which went through sintering, held a hyperbolic relationship. The high activity of Cu catalyst after sintering in hydrogenation of finback whale oil occurred at a definite degree of dispersion. A method of prepg. a Cu catalyst on kieselguhr relatively uniform was given. Sintering occurred when copper catalyst was repeatedly subjected to reduction and oxidation.

9013. Miyake, Roichi. **Hydrogenation of fatty oils. XI. Adkins' catalyst (F) Characteristic of the catalyst and significance of addition of barium chromate.** *J. Pharm. Soc. Japan* 68, 38-9(1948)(English summary).—*C. A.* 44, 353*a*.

Adkins' catalyst and Cu-kieselguhr catalyst were similar in many respects, except superior uniformity of dispersion of Cu in the former. The fact that high activity of Adkins' catalyst was confined to the short period of time before sintering must be due to this fact. $BaCrO_4$ did not hamper the reduction of copper oxide, and might act as an increased carrier.

9014. Reinbold, Catherine L. and Dutton, Herbert J. **Adsorption analysis of lipides. II. The fractionation of soybean oil and derived ethyl esters.** *J. Am. Oil Chemists' Soc.* 25, 117-20(1948).—*C. A.* 42, 3973*d*.

A rapid method of fractionating soybean glycerides and their ethyl esters by adsorption analysis on an Al_2O_3 column was described. It compared favorably with other fractionation methods. In the adsorption analysis of crude soybean oil the I_2 nos. of fractions ranged from 104 to 173; but under other conditions of adsorption I_2 nos. as high as 200 were obtained. The I_2 nos. of soybean ethyl esters ranged from 61 to 185. Recoveries from the columns were 82.4% for glycerides and 90.0% for the esters.

9015. Salvi, G. **Selective adsorption. Theory, methods, and applications for the separation of hydrocarbons.** *Riv. combustibili* 2, 79-102(1948).—*C. A.* 43, 2839*i*.

Sepn. of hydrocarbon mixts. and analyses of oils and fats by selective adsorption were reviewed. The advantages of the Hopf chromatograph were pointed out for semi-industrial operation.

9016. Swain, Lyle A. **Chromatographic analysis of the unsaponifiable matter of marine animal oils.** *Can. Chem. Process Inds.* 32, 553-4 (1948).—*C. A.* 42, 7069*g*.

A glass tube 1 cm inside diam. was packed with Al_2O_3(-80 + 150 mesh) and heated to 200°C for several hrs. The unsaponifiable matter from 2.5 g of dogfish-liver oil (about 0.5 g) was dissolved in a small vol. of light petroleum, which was caught in 150-ml portions. Evapn. of the 1st portion left a colorless liquid amounting to less than 3% of unsaponifiable matter. In the column a yellow band of pigment was visible approx. 2/3 down the column. Examn. of the column by ultraviolet showed the greenish yellow fluorescence characteristic of vitamin A in a band immediately above the band visible in daylight. Passage of CH_2Cl_2 through the column immediately moved both the visible band of pigment and the fluorescent band of vitamin A down and out of the column.

9017. Tsuchiya, Tomotaro. **Decolorization of rice oil.** *J. Nippon Oil Technol. Soc.* 1, No. 3, 24-9(1948).—*C. A.* 43, 5611*a*.

Addn. of AcOH (0.1-1.0%) to acid clay decreased yellow and green colors, but the red increased; addn. of H_2SO_4 was effective only when the amt. was not more than 0.1% at 50-80°C. Addn. of H_3PO_4 (0.1-0.5%) gave the product of best color. Treatment with activated Fe powder gave good results, although a large amt. was necessary to decolorize to the extent of refined soybean oil.

9018. Zaǐtsev, Mikola. **A new catalyst for the hydrogenation of fats and its use in industry.** *Ukraïn. Tekh.-Hospodars'k. Inst. (Regensburg), Nauk. Zapiski (Ukrain. Tech. Husbandry Inst., Sci. Repts.)* **1948**, No. 1 (Whole No. 4), 123-32(in German, 132-5; in English, 135-8)—*C. A.* 43, 7607*h*.

To 70 parts of $NiSO_4.7H_2O$ and 18 parts of $CuSO_4.5H_2O$ in 4000 parts of H_2O in a vessel with a protective rubber coating was added 50 parts of Na_2CO_3 in 200 parts of H_2O carrying suspended colloidal silica. The ppt. was filtered and the solid was washed with 2000 parts of water at 40°C. Drying of the solid in an oven at 90-100°C yielded a product contg. 5-8% H_2O. It was suspended in a recently distd. fatty oil and the mixt. was hydrogenated, first at 250°C and finally at 275°C. The catalyst was isolated by filtration. The performance of the catalyst compared favorably with other com. catalysts. Its main advantage was the low over-all consumption of Ni.

9019. Doscher, Todd M. **Characteristics of detergent suspended drilling fluids.** *Oil Gas J.* 48, No. 8, 75-80(1949).—*C. A.* 44, 1249*b*.

The effects of soaps and sulfonates added to bentonite drilling fluids were studied. Concn. of 2 to 3% detergent was economically more feasible, but the com. advantage of the fluids described has yet to be proved. Detergents and other colloids acted by coating the clay particles or aggregates.

9020. Grasso, Sebastiano. **New method for the chemical purification of glycerol.** *Olearia* 3, 885-7(1949).—*C. A.* 44, 4201*e*.

To 100 ml glycerol (concn. 85%) add 3 ml concd. H_2SO_4, heat to 140°C for 40 min., passing a strong current of steam through to carry off acrolein and HCOOH. Add 18 g baryta dissolved in little H_2O, completing the operation at 110°C. Add 1 ml concd. H_2SO_4 to bring the pH of the soln. to 3, filter, pass the soln. through a cation- and an anion-exchange resin (Zeokarb HI and DeAcidite E), and decolorize with active carbon.

9021. Gruntfest, I. J. and Young, E. M. **The chemistry of detergency.** *J. Am. Oil Chemists' Soc.* 26, 236-8(1949).—*C. A.* 43, 5213*a*.

A single fiber was placed in a drop of H_2O suspension of a finely divided carbon and observed microscopically. The carbon particles adhered to the fiber; when a proper amt. of soap was added, the carbon particles did not stick to the fiber. Similar expts. with fabric simulated laundry practice. The amt. of dirt picked up by the fabric and held in such tests was estd. by reflectance measurements. There was a critical concn. of soap above which the cloth was recovered white and below which it was black. This concn. depended on the amt. of dirt. When the critical concn. of soap was plotted against the amt. of dirt, a linear relationship was observed.

9022. JENSEN, WALDEMAR. **Chromatographic analysis of tall oil.** *Finnish Paper Timber J.* 31, 293-4(1949)(in English).—*C. A.* 45, 2205*b*.

The filtrate from the detn. of the petr. ether-insol. matter in a 5-g sample of tall oil was dild. to 250 ml. A 50-ml aliquot was evapd. and the neutral matter detd. in the residue by the previous method. The rest of the soln. was transferred to a flask with a reflux condenser, the petr. ether was distd., the residue esterified with MeOH, dissolved in ether, and washed with NaCl soln. The ether soln. thus obtained was dild. to 200 ml. A 50-ml aliquot of this soln. was evapd. to 5-10 ml and the neutral matter (now including the ester) detd. chromatographically; 300-ml ether was used for elution and the substance obtained dried 30 min. before weighing. The difference between the 2 amts. of neutral matter thus detd. comprised the fatty acids in 1-g sample (as ester).

9023. KAWAI, JUNICHI. **Decolorization of rice oil by hydrogen peroxide.** *J. Nippon Oil Technol Soc.* 2, No. 1. 1,30-2(1949).—*C. A.* 43, 5611*b*.

Treatment of rice oil with 2% of 35% H_2O_2 removed 69% of color; this was a much better performance than that of activated carbon or acid clay.

9024. KING, R. R. AND WHARTON, F. W. **Oxidation effects in adsorption bleaching of vegetable oils.** *J. Am. Oil Chemists' Soc.* 26, 201-7 (1949).—*C. A.* 43, 5207*i*.

Adsorption of color and oxidative decrease in color were favorable reactions which resulted during bleaching operations, while oxidative increase in color and oxidative stabilization against adsorption were unfavorable reactions. Adsorbents were shown to catalyze these oxidative reactions. Under any comparable set of conditions significantly lower colors resulted when bleaching was carried out under vacuum or in an inert atm. Multiple-stage bleaching under atm. conditions showed no advantage because of the adverse oxidative effect but might be advantageous under vacuum conditions. Low-pH earths responded better than high-pH earths to vacuum bleaching with respect to improved color removal and oil stability.

9025. KING, R. R. AND WHARTON, F. W. **Continuous vacuum bleaching of vegetable oils.** *J. Am. Oil Chemists' Soc.* 26, 389-92(1949).—*C. A.* 43, 9489*a*.

The advantages of a com. continuous vacuum bleaching method were: deaeration and dehydration of the oil-adsorbent mixt. in the cold by flashing the slurry into a vacuum to remove H_2O and O_2 prior to bleaching; further dehydration and degasification after heating to bleaching temp. by continuous flashing into a vacuum to remove bound H_2O and gaseous products of decompn.; maintaining a closed system to avoid atm. contact from the time the cold refined oil entered to the time the cooled bleached oil left the system.

9026. OTERO-AENLLE, E.; CADORNIGA, CARRO R., AND POMARES, BOIX S. **Some properties of alkali salts of fatty acids. I. Wetting capacity and capillary activity.** *Anales real soc. españ. fís. y quím.* 45B, 1337-60(1949).—*C. A.* 45, 4467*b*.

The wetting capacities of Na and K salts of capronic, caprylic, butyric, stearic, palmitic, and oleic acids were studied in 0.1% solns. The values obtained were compared with surface tension measurements. It was detd. that the capillary activity was not the only factor affecting wetting capacity. The effects of cation, addn. of NaOH, electrolytes, and alc. on wetting activity and surface tension were studied. There was no correlation between wetting capacity and surface tension.

9027. SATO, MITSURU AND MARUYAMA, KENJI. **Energy state of the valence electrons in some metals. I, 17. Catalytic action of Zn in the hydrogenation of the oil extracted from the seed of Perilla frutescens.** *Science Repts. Research Insts. Tohoku Univ. Ser. A,* 1, No. 1, 51-2 (1949).—*C. A.* 44, 9786*c*.

Zn was particularly active as a catalyst in this reaction in the range 200-320°C. Its decrease in activity at 320°C was not as sharp as the increase in activity at 200°C and further investigation at the higher temp. was suggested.

9028. STOUT, LAWRENCE E.; CHAMBERLAIN, DONALD F., AND MCKELVEY, JAMES M. **Factors influencing vegetable-oil bleaching by adsorption.** *J. Am. Oil Chemists' Soc.* 26, 120-6(1949).—*C. A.* 43, 3635*c*.

On the basis of adsorbent activity the acid-activated clays were generally 1.5 to 2 times more effective as bleaching agents than the natural earths. The activity of an adsorbent in bleaching a vegetable oil was at a max. at some particular temp. The acid-activated clays tested had a temp. of max. activity in the range of 100-106°C. The natural earths had max. activity at 118° to 132°. The 3 materials tested that were high in silica had a max. activity at 180° to 250°C, which was high for use in the edible-oil industry.

9029. TSUCHIYA, TOMOTARO. **Effect of added acids on the decolorization of oil by acid clay.** *J. Nippon Oil Technol. Soc.* 2, Nos. 2/3, 1-9 (1949).—*C. A.* 43, 8709*b*.

With crude soybean, rapeseed, and Showyou oil decolorization by acid clay was increased more effectively by addn. of oxalic acid than by addn. of H_2SO_4, AcOH, or H_3PO_4. When AcOH and acid clay were used, green and yellow colors were decreased, but red was increased. H_2SO_4 (0.1%

of oil) was effective at 50°C; at 80°C the green and yellow colors decreased while the red increased. Addn. of H_3PO_4 was effective without exception when the amt. was 0.1-1.0% of the oil.

9030. Ueno, Seiichi; Yoshizaki, Tokuzo, and Ito, Shigeru. **Hardening of fatty oil with use of multiple-component catalysis. I. Catalytic activity of unreduced catalyst consisting mainly of nickel and copper.** *J. Chem. Soc. Japan,* Ind. Chem. Sect., 52, 194-6(1949).—*C.A.* 45, 4063*i*.

A Ni-Cu-kieselguhr (1:1:7) catalyst was prepd. by mixing kieselguhr with $NiCO_3$ and $CuCO_3$ which were pptd. from a $NiSO_4$-$CuSO_4$ soln. The ppt. was washed, filtered, and dried at 100°-105°C. This catalyst was used without being subjected to reduction in H_2. Expts. were done at 180°-200°C with soybean oil in an autoclave under varying H_2 pressures, amts. of catalyst, durations, and water contents. Hardening occurred at low pressures. Above 200°C hardening occurred even at 1 atm. pressure within 2 hrs with 1% catalyst; addn. of free fatty acid showed small effect. H_2O added to oils worked as a neg. catalyst in some cases, but accelerated the reaction in others. Addn. of Na, K, Mg, Ca, Al, Pb, Cr, and Mn salts to the catalyst showed neg. results.

9031. Weil, Herbert. **Industrial oil and fat chromatography.** *Paint Technol.* 14, 391-9, 439-53(1949).—*C.A.* 44, 1267*h*.

9032. Williams, K. A. **The analysis of mixtures of fatty oils with hydrocarbons.** *J. Assoc. Offic. Agr. Chemists* 32, 668-72(1949).—*C.A.* 43, 9489*c*.

The method, especially suitable for the detn. of small percentages of mineral oil in admixt. with fatty oils, consisted of 3 steps: (a) sapon. of oil, (b) sepn. of unsaponifiable matter, and (c) chromatography of the latter on a column of Al_2O_3 with light petroleum (b.p. 40°-60°C) or petroleum benzine (b.p. 30°-75°C) as the solvent. The technique of Newburger could be employed in the chromatography step; an alternative technique (somewhat similar) was described in detail. The hydrocarbons passed through the column and could be quantitatively recovered from the percolate, while the rest of the unsaponifiable matter remained adsorbed.

9033. Williams, K. A. **Chromatographic analysis of fatty oils.** *Discussions Faraday Soc.* 1949, No. 7, 264-7.—*C.A.* 45, 1788*h*.

Advances of the last few years in the application of chromatography to the analysis of fatty oils were briefly reviewed. In particular, reference was made to the sepn. of fatty acids from triglycerides and hydrocarbons from the unsaponifiable matter of natural oils. The sepn. of the constituent mols. of natural oils was described.

9034. Wustefeld, H. **Adsorption and absorption of surface films, especially phosphate coatings, and their plasticity.** *Arch. Metallkunde* 3, 223-4(1949).—*C.A.* 44, 403*g*.

The mechanism of adhesion of soap and complex solns. was discussed.

9035. Zimov'ev, A. A. **Kinetics of reactions proceeding with absorption or evolution of gas. I. Kinetics of the hydrogenation of fats.** *Zhur. Priklad. Khim.* 22, 1253-62(1949). —*C.A.* 44, 3778*d*.

Rates of hydrogenation of vegetable oils consisting mainly of oleic acid triglycerides, in a stream of H_2 [reduced from $(HCOO)_2Ni$ with H_2, in the oil, at not over 260°-5°C], were followed either by detns. of the I_2 no. i, expressing the amt. of double bonds, or of the vol. h. (ml S.T.P.) absorbed. For a 1st-order reaction, $-di/dt = ki$, and $dh/dt = k(h_o - h)$, where h_o corresponded to the amt. of H_2 absorbed at complete satn. The activity of a given Ni catalyst, expressed by k, increased during the reaction but, on repeated use, it tended to become const. At that stage, k was approx. proportional to the amt. of catalyst, in % of the amt. of the oil.

9036. Alexander, A. E. and Gray, V. R. **Aluminum soaps, their nature and gelling properties.** *Proc. Roy. Soc.* (London) A200, 162-8(1950).—*C.A.* 45, 10622*d*.

The chem. nature of Al soaps could be studied by the reaction between Al alkoxides and fatty acids in org. solvents. The product of aq. metathesis between an alkali metal soap and an Al salt appeared to be an adsorption complex of the fatty acid upon hydrated alumina; combination occurred during drying. A polymeric formula for Al soaps was suggested, based upon sixfold coördination Al-O octahedra. When these octahedra joined through an apex, a di-soap resulted, when through an edge, a mono-soap; a combination of these resulted in intermediate values. Some preliminary infrared measurements of Al mono- and di-soaps were consistent with these conclusions.

9037. Fairbairn, D. and Harpur, R. P. **Chromatographic separation of the saturated C_2-C_8 fatty acids from a single small sample.** *Nature* 166, 789-90(1950).—*C.A.* 45, 4061*i*.

Sepn. of mixts. of C_2-C_8 fatty acids was accomplished by adsorption on prepd. silica columns. Silica was obtained by acidifying com. Na_2SiO_3 soln. to pH 8.5 (thymol blue) at 22°C. After aging the ppt. was washed and dried at 110°C for 48 hrs. Two silica columns were prepd., each contg. 0.2 g of silica. In one column (*A*) the silica was impregnated with 1 ml of 0.2% Alphamine Red R indicator, 0.8 ml of 0.1 *N* NaOH, and 1 ml H_2O. In the other column (*B*) the silica was treated with 0.5 ml of 0.2% bromocresol green indicator, 2.1 ml BuOH (199:1), and packed in 14-mm glass tubes. The 2 columns were joined vertically with column A above. The following procedure was used: The fatty acid mixt. in $CHCl_3$-BuOH (99:1 by vol.) soln. was washed into the A column and the chromatogram developed with addns. of $CHCl_3$-BuOH (199:1). Octanoic and hexanoic acids passed rapidly through the *A* column and were fractionated in the *B* column below, eluted, and titrated separately. When the butyric acid band was about to leave column *A*, the columns were sepd. and each fraction obtained by elution with appropriate solvents.

9038. JENSEN, WALDEMAR. **Chromatographic analysis of tall oil. III. Location of acidic matter in column.** *Paper and Timber* (Finland) 32, 142-4(1950)(in English).—*C.A.* 45, 5404*g*.

In the analysis for neutral matter in tall oil by chromatography, the fatty acids were retained on the upper part of the column of Al_2O_3 and the resin acids on the lower. The lowest 10% of the column contained only 1% of the total acids, from which the amt. of adsorbent was concluded to be adequate. Attempts to sep. resin from fatty acids by chromatography were unsuccessful.

9039. KAHLER, F. H. **Purifying crude glycerol by ion exchange.** *Chem. Eng.* 57, No. 7, 109 (1950).—*C.A.* 44, 9170*c*.

Ion exchange could eliminate distn., but not evapn., in the purification of crude glycerol solns. The new method gave a uniform product, stable to light, and the purified solution could be concd. without loss.

9040. KAUFMANN, H. P. **Refining of edible oils.** *Olearia* 4, 101-7(1950).—*C.A.* 44, 7073*g*.

The methods of refining crude vegetable oils, which did not lead to losses of their valuable components, were reviewed, and a plant-scale expt. with colza-seed oil was cited. Chromatography and mol. distn. were critically examd. as possible methods for the tech. sepn. of the valuable accessory substances in vegetable oils.

9041. KAUFMANN, H. P. **Adsorption separations in the fat field. VI. Paper chromatography.** *Fette u. Seifen* 52, 331-42(1950).—*C.A.* 44, 10351*e*.

Paper chromatography was applied to the identification of colors in fats and to the sepn. and identification of fatty acids or mixts. of fatty acids and glycerides. Carotene was detd. by capillarizing a 1-g sample in 100 ml petr. ether or C_6H_{14}, developing with iso-PrOH, and testing for B-carotene by the Carr-Price reaction. Under the same conditions, Ceresin Orange yielded a redish orange zone, dimethylaminoazobenzene an intense reddish violet, Annato (bixin) green, and Ceresin Red red.

9042. KAUFMANN, H. P. AND BUDWIG, J. **The foam test in paper chromatography.** *Fette u. Seifen* 52, 555-6(1950).—*C.A.* 45, 2236*d*.

The foam test for the detection of fatty acids and soaps was adapted to paper chromatography. A soln. of 0.2 mg fatty acid (in petr. ether) or 0.2 mg soap (in water) was placed on a Schleicher and Schüll No. 598G filter paper previously impregnated with Cu acetate soln. and dried. A reagent consisting of equal parts of 30% H_2O_2 and 30% NH_4OH was then added drop by drop. The O_2 liberated caused the ammonia soap to foam. As little as 10 γ oleic acid could be detected.

9043. KOBASHI, TOKUO AND NOBORI, HIROSO. **Studies on the manufacture of higher fatty alcohols by catalytic reduction of fatty oils.** *J. Chem. Soc. Japan,* Ind. Chem. Sect. 53, 363-5 (1950).—*C.A.* 46, 11714*h*.

The activity of the catalyst consisting of cupric zinc oxides and diatomaceous earth was enormously promoted by immersing it in dil. solns. of dichromates or $KMnO_4$ soln. The reduction of fatty acids of coconut oil could advantageously be carried out in the presence of the catalyst giving a product of hydroxyl value 205.6.

9044. LÖW, IRMENTRAUT AND ARGOUD, SIMONE. **Chromatography of carotene from palm oil.** *Oléagineux* 5, 629-33(1950).—*C.A.* 45, 4467*g*.

Concd. carotene exts. of palm oil were prepd. by distn. and by sapon. procedures. When the exts. were dissolved in petr. ether and passed through a column of MgO, 3 carotene isomers (α, β, and γ) and lycopene were found, β-carotene predominating. During the course of treatment, stereoisomers were formed, particularly di-*cis*-β-carotene, which is often misnamed pseudo-α-carotene. Isomerization was reversible, the trans form being the more stable.

9045. MOKRUSHIN, S. G. **Experimental studies of laminar systems. XIX. Ultrathin films as stabilizers of foam.** *Kolloid. Zhur.* 12, 448-51(1950).—*C.A.* 45, 1840*i*.

Colloidal solns. of $Fe(OH)_3$, $Cr(OH)_3$, and $Al(OH)_3$, and thin films of these hydroxides, produced by passing NH_3 over the surface of salt solns., increased the time of collapse of 0.1% gelatin foams. Sols. of CuS, PbS, and ZnS also increased the time, if used in minute amts., but thin films of these sulfides lowered it.

9046. MUKHERJEE, S. **The mechanism of autoxidation of fats. I. Kinetics of catalytic oxidation of oleic and linoleic acids. II. Oxidation of methyl oleate and methyl linoleate.** *J. Indian Chem. Soc.* 27, 230-7, 238-44(1950).—*C.A.* 45, 2233*i*.

Kinetic studies were made of the hematin-catalyzed oxidation of oleic and linoleic acids, and the uncatalyzed oxidation of their methyl esters. O_2 absorption, peroxide formation, and double-bond content were measured. The initial stage of the reaction in each case was cyclic peroxide formation at the double bond, only one bond being attacked in linoleic acid. Subsequently more O_2 was used up than could be accounted for in this way, probably by the formation of hydroperoxide, the energy liberated in peroxide formation being able to remove H from active methylene groups. A chromatographic method for linoleic acid purification was described.

9047. PARDUN, H. AND KUCHINKA, R. **The influence of catalysts on the fatty acid formation during paraffin oxidation.** *Erdol u. Kohle* 3, 109-19(1950).—*C.A.* 44, 6109*g*.

Metal stearates were prepd. and a "Fischer-Tropsch-Gatsch" was oxidized at 120°C to an acid no. 50 with catalyst concns. from 0.05 to 2%. Ca, Th, Mn, Co, and Ni increased the speed of oxidation in proportion to the catalyst concn. The stearates of Na, Ce, Pb, and Fe accelerated the reaction at low, but retarded it at higher concns. Ti, Zr, and Sn gave no definite relation between speed of oxidation and catalyst concn. This was explained on the basis that it was not possible to reproduce the soly. of the accelerator in the substrate.

9048. SATAKE, KAZUO AND SEKI, TOKUICHIRO. **Paper chromatography of hydrazides of fatty acids.** *Kagaku no Ryôiki* (J. Japan. Chem.) 4, 557-61 (1950).—*C.A.* 45, 4604*f*.

Among the solvents examd. mixts. of iso-AmOH, lutidine, and water (10:1.5:1 vol), and especially of iso-AmOH, collidine, and water (10:2:1)(the R_f values given below are for this solvent-mixt.) were found suitable. The one-dimensional ascending method was found preferable to the descending method. It was necessary to heat at 100°-130°C to prep. fatty acid hydrazides, but it was only necessary to mix an excess of $NH_2NH_2.H_2O$ with the Et ester of fatty acids at room temp. to produce fatty acid hydrazides detectable by paper chromatography. The hydrazides on paper were detected by spraying BuOH soln. satd. with 10% ammoniacal $AgNO_3$. The R_f values at 10° were for each hydrazide: formic acid hydrazide 0.11, acetic 0.18, propionic 0.37, *n*-butyric 0.54, isobutyric 0.58, *n*-valeric 0.70, isovaleric 0.70, and *n*-caproic 0.77. The min. amt. detectable was 10 γ in the case of acetic acid hydrazide.

9049. UENO, SEIICHI AND ITO, SHIGERU. **Practical hardening of fatty oil by unreduced catalyst. III.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 53, 252-4(1950).—*C.A.* 46, 11714*i*.

To get reference data for small industries, the hardening of soybean oil was carried out in the presence of the catalysts consisting of the metal salts or hydroxides (Ni-Cu-Ca, Ni-Cu-Mn, Ni-Cu-Zn, Ni-Cu) at atm. pressure.

9050. UENO, SEIICHI; SAKURAI, HIROSHI, AND KAWANAKA, TATSUICHI. **Hardening of rice oil with nonreduced nickel-copper-diatomaceous earth catalyst.** *J. Chem. Soc. Japan.*, Ind. Chem. Sect., 53, 43-4(1950).—*C.A.* 46, 8395*d*.

Rice oil was autoclaved at 180°C for 1 hr in the presence of Ni-Cu-diatomaceous earth catalyst: Ni and Cu were pptd. by adding Na_2CO_3 to the soln. of $NiSO_4$ and $CuSO_4$, and the resulting ppt. washed and dried at 110°C. Diatomaceous earth was ignited and mixed with the ppt. The catalyst was useful for the hardening of rice oil from which wax had been eliminated.

9051. UENO, SEIICHI; SHIGENO, YOSHIHIRO, AND ISHIWATARI, YOSHIRO. **Practical hardening of fatty oil by the unreduced catalyst.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 53, 218-19(1950). —*C.A.* 46, 9869*f*.

Catalyst copptd. by Na_2CO_3 from the soln. contg. $NiSO_4$, $CuSO_4$, and $Co(NO_3)_2$, and having the, resp., proportions, Cu:Ni:Co of 7:3:2, was active. Preliminary reduction in the hydrogen stream at 350°C improved the activity of the catalyst.

9052. YAMAKITA, ITSURO AND FUJII, YUJIRO. **The decolorization of rice oil.** *Bull. Inst. Chem. Research, Kyoto Univ.* 20, 64(1950).—*C.A.* 45, 5949*d*.

Pretreating crude rice oil with a dil. soln. of acid or salt promoted the decolorizing effect of activated acid clay. The color of the oil of higher acid value caused by contact with iron was also easily decolorized by the same treating.

9053. ANSELMI, SCHIPIONE AND CESARI, ADRIANA. **Sesame oil in margarine and in similar fats, additions of coloring matters.** *Ann. chim.* (Rome) 41, 573-86(1951); *Rend. ist. super sanitá* (Rome) 14, 624-38(1951).—*C.A.* 46, 6852*h*.

The colored material in sesame oil was extd. with EtOH, decolorized with activated carbon, and evapd. to dryness over a water bath. The oily residue gave a characteristic red color with a furfural-HCl mixt. Rancid samples gave a slightly less intense color than fresh samples but never neg. Reaction of sesame oil with $SnCl_2$ was generally reliable but was not specific. The furfural test with one sample of refined peanut oil gave initially an orange then a rose color on standing; one sample of soybean oil gave a rose color but the color decreased on standing; and one hydrogenated peanut oil and one hydrogenated coconut oil gave a transitory rosy color.

9054. BORBOLLA Y ALCALÁ, JOSE M^A. R. DE LA; CASTRO RAMOS, ROSALINO DE, AND VÁZQUEZ LADRÓN, RICARDA. **Studies of Spanish decolorizing earths. I. Preliminary tests of activation and decolorization.** *Ion* 11, 135-41(1951).—*C.A.* 46, 1273*i*.

Earths from Lebrija were studied to det. the usefulness of native earths for refining olive oil. The influence of concn. of HCl and time of attack on the activation of the earths was detd. The most suitable period of contact between oil and earth was 15 min. and satisfactory results were obtained by using 1% earth. The apparent d. of the earth, the cond. of its aq. ext., the dehydration curve, and the capacity for activation were correlated. The difference between the pH of an earth detd. with H_2O and that detd. with a soln. of KCl was a measure of potential activity.

9055. HERB, S.F.; WITNAUER, LEE P., AND RIEMENSCHNEIDER, R.W. **Isolation of eicosapentaenoic and docosapentaenoic acids from natural sources as their methyl esters by adsorption and distillation techniques.** *J. Am. Oil Chemists' Soc.* 28, 505-7(1951).—*C.A.* 46, 1271*d*.

Me eicosapentaenoate (arachidonate) and docosapentaenoate were isolated by adsorption and distn. techniques from the highly unsatd. esters of beef adrenal lipides. Specific extinction coefficients detd. under alkali isomerization in 11% NaOH-glycerol at 180°C for 45 min. and in 21% KOH-glycerol at 180°C for 15 min. were graphically presented.

9056. HOLMAN, RALPH T. **Displacement analysis of lipides. VII. Carrier separation of unsaturated fatty acids.** *J. Am. Chem. Soc.* 73, 5289-92(1951).—*C.A.* 46, 9326*e*.

The positions of a series of single unsatd. fatty acids in a carrier-displacement chromatogram were detd. by use of Me esters of even-satd. acids in 1 series, and Me esters of odd-satd. in another with "Darco G 60" as adsorbent and EtOH as solvent. Increasing the no. of isolated double bonds decreased the adsorption. The change satd. → unsatd. → acetylenic acid decreased adsorption. Differences in adsorbability of cis and trans isomers were slight. One isolated double bond in the mol. decreased adsorption roughly equiv. to 2 fewer C atoms. Sepns. of stearic and linoleic acids, and of linoleic acid and its conjugated isomer by carrier displacement were demonstrated.

9057. Inoue, Yoshiyuki and Noda, Manjiro. **Separation and identification of fatty acids. X. Simplified methods of the preparation of hydroxamic acid solutions for paper partition chromatography.** *J. Agr. Chem. Soc. Japan.* **24**, 291-5 (1951).—*C.A.* **46**, 6408*a*.

Since only the solns. of cryst. hydroxamic acids were necessary for chromatographic sepn., 4 simplified methods for prepg. such solns. were devised. Paper chromatography with hydroxamic acid solns. was applied to butter, coconut oil, and K salts of free fatty acids extd. from fruits of *Ginkgo biloba*. These substances contained, resp., butyric, caproic, and caprylic acids; caproic and caprylic acids; and formic, propionic, butyric, caprylic, ginkgolic, and some di- or tribasic acids.

9058. Inoue, Yoshiyuki and Noda, Manjiro. **Separation and identification of fatty acids. XI. Paper partition chromatography of aliphatic carboxylic acids by means of hydroxamic acid method.** *J. Agr. Chem. Soc. Japan* **24**, 295-8 (1951).—*C.A.* **46**, 6408*b*.

The method for satd. fatty acids was made applicable for unsatd., hydroxy, and polybasic acids. The solvents used were BuOH, AcOEt, and butyrone. R_f values with BuOH and color for hydroxamic acids derived from various acids were reported.

9059. Inoue, Yoshiyuki and Noda, Manjiro. **Separation and identification of fatty acids. XII. Application of paper chromatography to the analysis of fats.** *J. Agr. Chem. Soc. Japan* **25**, 161-5(1951).—*C.A.* **46**, 6408*c*.

A new method for the detection of fats consisted of the oxidative decompn. of the glyceride mixt. by $KMnO_4$ in Me_2CO soln., esterification of the acidic oxidation products, prepn. of their hydroxamic acid derivs., and paper chromatographic sepn. of these acids. Paper chromatograms of hydroxamic acid derivs. thus prepd. from linseed, rape, soybean, olive, and herring oils, Japan wax, and beef tallow were shown (descending method at 30°C with BuOH-H_2O or AcOEt-H_2O as solvents).

9060. Kaufmann, H.P. and Budwig, J. **Paper chromatography in the fat field. IV. Radiometry of oleic acid.** *Fette u. Seifen* **53**, 69-73(1951). —*C.A.* **45**, 9893*e*.

Oleic acid could be detd. by placing microdrops of a soln. contg. 24-72γ oleic acid per drop on a sheet of Schleicher and Schüll No. 2040b filter paper, exposing the paper to NH_3 fumes in a closed vessel for 30 min., adding several drops of a reagent consisting of a 2.5% aq. $Cu(OAc)_2$ soln. contg. 1% of a $Co^{60}Cl_2$ soln. having a radiation of 1 mc. per ml, washing the paper with H_2O, drying, cutting out the spots contg. the Co oleate, and measuring the radiation with a Geiger-Müller counter.

9061. Kaufmann, H.P. and Budwig, J. **Paper chromatography in the fat field. V. Radiometric determination of the iodine number.** *Fette u. Seifen* **53**, 253-9 (1951).—*C.A.* **45**, 7801*i*.

The Hanus method for the detn. of the I_2 no. was adapted to paper chromatography. The reagent was I^{139} Br in MeOH satd. with NaBr. Samples of the order of 20γ were used. The sample (in heptane) was deposited on the paper, the solvent allowed to evap., reagent added until there was no further fading of the color, the paper washed, and the radiation measured.

9062. Kaufmann, H.P.; Budwig, J., and Duddek, E. **Paper chromatography in the fat field. VI. Application to soaps.** *Fette u. Seifen* **53**, 285-8(1951).—*C.A.* **45**, 9893*e*.

Soaps were best hydrolyzed with HCl vapors after applying them to the paper. The inorg. salts were then removed with H_2O. Information was given for sepg. the fat acids.

9063. Kaufmann, H.P. and Budwig, J. **Fats. CXXIX. Paper chromatography in the field of fats. 7. Identification and separation of fatty acids.** *Fette u. Seifen* **53**, 390-9(1951). —*C.A.* **46**, 6851*b*.

The paper chromatography of propionic, butyric, valeric, caproic, enanthic, caprylic, octenoic, pelargonic, decanoic, undecylenic, stearic, oleic, elaidic, linoleic, and erucic acids were investigated. Basic dyes, particularly Rhodamine B and Nile Blue, gave characteristic reactions with these acids, particularly under ultraviolet light. Metallic soaps were investigated by using $Cu(OAc)_2$, $Co(OAc)_2$, $MnSO_4.(NH_4)_2SO_4$, $FeSO_4(NH_4)_2SO_4$, $Ni(HCO_2)_2$, $Cr_2(OAc)_6$, $AgNO_3$, $Hg(OAc)_2$, $Tl_2(SO_4)_3$, LiOAc, $MgSO_4$, $CaCl_2$, $ZnSO_4$, $Al(OAc)_3$, basic Bi acetate, and basic Pb acetate and treating the resulting spots with eriochromecyanine, Na alizarinsulfonate, $K_4Fe(CN)_6$, brucine, Rhodamine B, and dimethylglyoxime.

9064. Kaufmann, H.P.; Szakall, A., and Budwig, J. **Fats. CXXX. 8. Lipide replacement in the human skin and its measurement by paper chromatography.** *Fette u. Seifen* **53**, 406-8(1951)—*C.A.* **46**, 6851*b*.

The lipides present in the epidermis after defatting consisted mainly of fatty acids, particularly oleic acid. An ext. of the skin (not defatted) contained glycerides.

9065. Morel, Charles. **Fuller's earth.** *Soap, Perfumery & Cosmetics* **24**, 889-92(1951).—*C.A.* **45**, 10436*g*.

The types and application of Fuller's earth in soap, cosmetics, and allied industries were reviewed; its composition and properties and its use in oil bleaching were included.

9066. Mukherjee, S. and Roy, Jagadish Chandra. **Bleaching of vegetable oils by clays.** *Indian Soap J.* **16**, 281-7(1951).—*C.A.* **45**, 10619*h*.

Four clays were investigated: Gangetic, silt, kaolin, Bihar bentonite, and Kashmir bentonite. HCl and H_2SO_4 were used as activating agents. Higher temp. of drying following acid treatment, and baking at high temp. prior to acid treatment lowered the bleaching power. H_2SO_4 was as good, and in some cases even better, than HCl for activation. In was more difficult to bleach mowrah oil than peanut oil. The former could not be bleached much above 50% with the most active bentonite samples. The effect of residual acidity of the activated clays on their bleaching power was found to be very remarkable; even small changes in acidity gave wide variations in activity.

9067. Nanavati, D.D. **Catalyst in Vanaspati production.** *Proc. Symposium Indian Oils Fats Natl. Chem. Lab. India, Poona* **1951**, 169-74.—*C.A.* 47, 6676*f*.
The degree of hydrogenation and characteristics of texture and grains in Vanaspati depended upon the quality of the Ni catalyst used. Expts.were described to produce the best catalyst. The reduction was done in oil with 40 lb Ni formate, 4 lb Hyflo, and 160 lb of peanut oil in a cylindrical jacketed vessel 2 ft in diam. and 5 ft high. The final temp. was 475°F for 1 hr. Total time required to complete the batch was 8 hrs. Total H_2 used was 3000 ft^3. The Ni obtained was jet black in color and granular in texture.

9068. Nijkamp, H.J. **Chromatographic determination of the volatile fatty acids C_4 to C_{10}.** *Anal. Chim. Acta* 5, 325-31(1951).—*C.A.* 46, 850*h*.
A semimicro method was described and the prepn. of a suitable silica gel absorbent also discussed.

9069. Ohashi, Ken and Nobori, Hiroso. **The treatment of discarded nickel catalyst.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 287-9(1951).—*C.A.* 47, 2910*b*.
Three different methods of regenerating discarded nickel catalysts from oil hardening were compared. The catalyst was: (A) washed with caustic soda and then with water, roasted, and reduced in H_2, (B) Washed with CHCl:CCl_2 or C_6H_6 and continue as in A; (C), from the prepn. of sorbit, washed with hot water, dried, and reduced as above. Catalysts A and C were as active as the fresh ones. Catalyst (B) was a little less active, but it could be used for the prepn. of semihardened oil.

9070. Pereira, A. and Serra, J.A. **Quantitative microdetermination of amino acids after paper chromatography.** *Science* 113, 387-8 (1951).—*C.A.* 45, 5750*c*.
A paper chromatographic techique for the qual. and quant. analysis of certain amino acids was described.

9071. Ray, Leonard N. Jr. and Hutchinson, A. Witt. **Electrophoretic mobilities of carbon in dilute soap solutions.** *J. Phys. & Colloid Chem.* 55, 1334-40(1951).—*C.A.* 46, 2427*h*.
Suspensions of 0.2 g carbon (largely 2-10 μ diam.) in 100 ml of soap soln. (from a crude oleic acid) were studied at 16-30°C in a vertical microelectrophoresis cell. The carbon particles always moved toward the anode. The mobility (μ/sec. v. cm) increased rapidly from 1.65 in distd. water to 4.2 in 0.02% soap soln., rose more gradually to a max. of 5.5 at 0.50%, and decreased slightly to 5.1 at 1.00%. The ability of these solns. to suspend carbon (detd. by photoelec. turbidimeter) varied with soap concn. in nearly exactly the same way.

9072. Schuette, H.A. and Dal Nogare, Stephen. **An oxidation-adsorption method for the analysis of methyl ester fractions.** *J. Am. Oil Chemists' Soc.* 28, 229-31(1951).—*C.A.* 45, 6402*g*.
The method was based on conversion of the unsatd. components of the fractions obtained in analytical distn. of fatty oil Me esters to short-chain fragments by $KMnO_4$ oxidation according to Hilditch and Lea and their subsequent adsorption on Al_2O_3 tinted with bromothymol blue. Tests showed (*a*) that the removal of these fragments was practically quant., provided acids lower than lauric were not present in appreiable amts., (*b*) that duplicate samples agreed within 1% of the satd. ester content, and (*c*) that reproducibility of results was about 0.6%.

9073. Sen, Nirmal Kumar and Chakravarti, Jiban Kumar. **Sterols of jute-seed oil (Corchorus capsularis). 1.** *J. Indian Chem. Soc.* 28, 727-31(1951).—*C.A.* 47, 889*e*.
Chromatography with concd. soln. of the sterols in petr. ether through Brochmann alumina (10 cm × 1.5 cm) gave in the filtrate a sterol fraction which on recrystn. m.p. 116°C, $[\alpha]_D^{30} = -57.9°$ ($CHCl_3$) and having a pos. Liebermann-Burchard. A major fraction of the sterol obtained by the elution of the column gave a fraction m.p. 125-7°C, $[\alpha]_D^{30} = -69.5°$ (in $CHCl_3$), pptd. with digitonin, and showed a pos. Liebermann-Burchard. Tests on a recrystd. and further purified portion of this fraction indicated presence of one double bond.

9074. Sen Gupta, Manick Lal and Basu, U.P. **Indian clays: adsorptive and bleaching properties.** *J. Proc. Inst. Chemists* (India) 23, 80-9(1951).—*C.A.* 46, 5803*h*.
Bleaching earths, important to the vegetable-oil industry of India, were largely imported. Native clays (mainly kaolin and bentonite) had little adsorptive power though activation by boiling 200-mesh clay for 1/2 hr with 20% H_2SO_4, filtering, washing out the sulfate, and drying at 110°C offered promise. Indian clays (activated as well as untreated), a Fuller's earth, and a Canadian bentonite were studied. Higher base-exchange and adsorptive power, and a rather high soly. (mainly Al_2O_3) in 0.5 *N* HCl were also characteristic of bentonites. In general, an adsorptive clay had a high SiO_2/Al_2O_3 ratio, a high adsorptive power for methylene blue, a high acid-sol. fraction, and a dehydration curve that approached linearity. Activation with H_2SO_4 had little effect on methylene blue adsorption, but might increase considerably the ability of a clay to decolorize vegetable oil.

9075. Stromquist, D.M. and Reents, A.C. **C. p. glycerol by ion exchange.** *Ind. Eng. Chem.* 43, 1065-70 (1951).—*C.A.* 45, 7803*d*.
Soap lye crude glycerol, sapond. crude glycerol and glycerol sweet waters were deionized by passage through ion exchangers. The concd. glycerol produced by ion exchange followed by evapn. was equal to and in most cases superior to that produced by distn. and contained less color, ash, and fatty acids and esters, and was more stable toward sunlight.

9076. TAKAYASU, KÔICHI. **Oil refining by colloidal clay.** *Eiyô to Shokuryô* (J. Japan Soc. Food Nutrition) 3, 133-7 (1951).—*C.A.* 46, 11714*f*.

A yellow colloidal clay (loss on ignition 12.05, SiO_2 40.21, $Al_2O_3$41.15, $Fe_2O_3$1.95(lowest), CaO 2.20, MgO 1.35%) produced in the Tochigi Prefecture was the most suitable among 4 clays tested. It was efficient for rapeseed oil and naphtha of low acid no., but not for herring oil of high acid no. (146). The most suitable method of activating the clay was: add 3 parts of 40% H_2SO_4 to 1 part of the clay, heat at 105°C for 2 hrs while stirring, filter, wash with water, dry at 110°C and pulverize. This activated silica gel product had: loss on ignition 5.25, SiO_2 92.45, Al_2O_3 2.35, and Fe_2O_3 0.12%. A sufficient amt. of H_2SO_4 or NaOH could be adsorbed on the gel to give convenient products in powd. form.

9077. TSUTSUMI, SHIGERU; YOSHIJIMA, TADASHI; NAGAO, SHIRO; KAYAMORI, HAJIME, AND KAWAMURA, TARO. **Catalytic hydrogenation in the presence of water. III. Effects of promotors on nickel oxide catalyst. IV. Hydrogenation of polar compounds.** *J. Chem. Soc. Japan*, Ind. Chem. Sect. 54, 25-7,27-8(1951).—*C.A.* 47, 956*g*.

The effect of a promoter for the nickel oxide catalyst was studied in the hydrogenation of oils of high acid value. Active carbon was the best; silica gel and acidic clay come next. Even a small amt. of water was harmful to the catalytic action. The hydrogenation of the oils of high acid value took place more easily than did that of neutral ones. The effect of water was studied for the catalytic action of Raney Ni and NiO in the hydrogenation of nitrobenzene, acetone, benzaldehyde, Et cinnamate, benzyl nitrile and crotonaldehyde.

9078. VENKATASUBRAHAMANIAN, T.A. AND DE, S.S. **Ion-exchange resins for removing the free fatty acidity of oils.** *Science and Culture* 17, 180-1 (1951).—*C.A.* 46, 4251*i*.

Oils deacidified with acid-adsorbing resin had better keeping qualities (judged by the induction period in an O_2 atm.) than those deacidified by other methods.

9079. WANG, SU, MING AND BANG, HAAKON. **Chromatographic analysis of Kennewick, Washington peppermint oil.** *J. Am.Pharm. Assoc.* 40, 113-15(1951).—*C.A.* 45, 4000*h*.

The unpleasant odor of Kennewick peppermint oil could be removed by chromatographic adsorption using activated alumina, $MgCO_3$, or Norit. The best eluents were petr. ether and Et_2O. The use of the adsorption column indicated that the various constituents of the oil could be sepd. and also suggested a method of obtaining menthol from peppermint oil.

9080. YAMAKITA, ITSURÔ. **Rice oil. I. Decolorization of dewaxed rice oil.** *Bull. Inst. Chem. Research, Kyoto Univ.* 24, 24-31(1951).—*C.A.* 46, 3775*e*.

Some physicochem. studies were made on the purification of rice oil whose color was difficult to remove. Activated acid clay up to 12% at 20-100°C had some decolorizing action for the highly acid (acid no. 30-96.6) rice oils tested. Pretreatment of the oil with solns. of HCl, $ZnCl_2$, HCOOH, Na_2SO_4, $MgCl_2$ improved decolorizing by the clay; solns. of $CaCl_2$, $BaCl_2$, and $CuCl_2$ were ineffective; $FeCl_3$, $FeSO_4$, phenolic reducing agents (hydroquinone, resorcinol) were detrimental.

9081. YAMAKITA, ITSURÔ AND AIDA, HIROSHI. **Chromatography of fatty acids. (Preliminary report).** *Bull. Inst. Chem. Research, Kyoto Univ.* 27, 72-3(1951).—*C.A.* 46, 3905*d*.

A new method with I_2 as an indicator and alumina as an adsorbent was employed for chromatographic sepn. of stearic and oleic acids. I_2(1 mg) was dissolved in 10 ml petr. ether and adsorbed on Al_2O_3 activated at 500°C. A mixt. of the two acids in petr. ether-benzene-EtOH was added to the top of the column at the rate of 35 min. per ml to produce two yellow lines. From the m.p. and I_2 value, the first layer was found to contain pure stearic acid, the third layer pure oleic acid, and the second layer a mixt. of these.

9082. YOSHIJIMA, TADASHI AND TSUTSUMI, SHIGERU. **Alloy catalysts for hydrogenation. III. Simultaneous hydrogenation and hydrolysis of fatty oils.** *J. Chem. Soc. Japan.* Ind. Chem. Sect. 54, 554-5(1951).—*C.A.* 47, 6679*f*.

Ni-Al alloy and dil. NaOH together could be utilized for the simultaneous hydrogenation and hydrolysis of fatty oils. Fatty oil of a high acid value, such as rice-bran oil, could easily be hydrogenated and hydrolyzed in 3 hrs at 180°C and at a H_2 pressure of 20 atm. in the presence of Ni-Al (1:1) alloy. With decreasing acid values, the necessary amt. of NaOH increased.

9083. ZAGER, S.E. AND DOODY, T.C. **Glycerol removal from aqueous solutions by anion exchange.** *Ind. Eng. Chem.* 43, 1070-3 (1951).—*C.A.* 45, 7803*b*.

Columns of Amberlite IR-400 and Permutit S were treated with $Na_2B_4O_7$ soln. and dil. aq. solns. of glycerol (1 to 10%) percolated through the resins. From 93 to 98% of the glycerol was removed; the Amberlite IR-400 seemed to have a slightly higher capacity than the Permutit S. The greater the concn., the greater the amt. of glycerol removed; the resins removed more glycerol when in previous contact with $Na_2B_4O_7$ than when in contact with H_3BO_3. The pH had little effect on the reaction.

9084. ANON. **Bleaching earths and adsorptive bleaching of oils and fats.** *Seifen-Öle-Fette-Wachse* 78, 23-6(1952).—*C.A.* 47, 6675*a*.

The use of Fuller's earth and active carbon for bleaching fats and oils was used.

9085. BAILEY, A.E. **Nickel catalysts in hydrogenation of fats and oils.** *Ind. Eng. Chem.* 44, 990-4(1952).—*C.A.* 46, 10644*g*.

The amt. of Ni used as a catalyst for oil and fat hydrogenation was relatively small—in the U.S. it was estd. as 500,000-1,000,000 lb. annually. Each lb of Ni accounted for the hydrogenation of 2500 to 5000 lb of oil, and as a catalyst, Ni has no present substitute. A review was presented of the history and technology of hydrogenation and catalyst manufg. and utilization.

9086. Belekar, G.K.; Kane, J.G., and Shahani, H.S. **Utilization of by-products and waste products of the fatty-oil industry. I. Recovery of nickel from spent nickel catalyst.** *J. Sci. Ind. Research* (India) **11B**, 28-30(1952). —*C.A.* **46**, 6852*b*.

Five spent catalyst samples were digested with 10-50% H_2SO_4 and with various H_2SO_4-HNO_3 mixts. of 15-70% and 20-70% proportions. Higher Ni recoveries (93.2 to 98.3%) in the combined mother liquor and washings occurred from mixed acid treatment.

9087. Benfield, D.A. and Young, R.S. **Separation of sub-sieve powders from olive oil.** *Chemist Analyst* **41**, 94-5 (1952).—*C.A.* **47**, 2571*h*.

Diatomaceous earth in a Büchner funnel was efficient for the removal of particles less than 2 μ in diam. from oil that had been used for classification of powders by sedimentation.

9088. Busby, G.W. and Grosvenor, D.E. **The purification of glycerol by ion exchange.** *J. Am. Oil Chemists' Soc.* **29**, 318-20(1952).—*C.A.* **46**, 9869*e*.

Operation of the Lever Bros. Co., Los Angeles, Calif., plant with a purification capacity of 26,500 lb of crude glycerol per day was described. The ion-exchange purified glycerol analysis was: glycerol 99.30, residue 0.0070, ash 0.0006, MaCl 0.0005, and fatty acids and esters 4.90%.

9089. Castro y Ramos, Rosalino de and Vega, Manuel Nosti. **Spanish decolorizing earths. II. Earths from Lebrija and El Cuervo.** *Anales real soc. españ. fíz-y quím.* **48B**, 247-54(1952). —*C.A.* **46**, 8395*h*.

Samples of earth with small natural decolorizing power became excellent decolorants of olive oil when treated with a leach of H_2SO_4, followed by treatment with HCl: Slowly add 100 g pulverized earth with stirring to 15 ml concd. H_2SO_4 (66° Bé.) in 250 ml distd. water and heat the mixt. with stirring 2 hrs at 130°C on a paraffin bath. Dilute, cool, and wash the mixt. until the pH is 6.5. Add sufficient concd. HCl dropwise or NaCl soln. (4 g/25 ml H_2O) to remove the alk. earth metal content (detd. by previous analysis), stir about 10 min., then wash to pH 6.5. Samples of earth treated as above, obtained at Lebrija and El Cuervo showed a decolorant power equal to the earth from Gador and almost as great as that of German Tonsil earth.

9090. Inoue, Yoshiyuki; Noda, Manjirô, and Hamuro, Yasumasa. **Separation and identification of fatty acids. XIII. Investigation of the constitution of unsaturated fatty acids by paper chromatography.** *J. Agr. Chem. Soc. Japan* **25**, 491-5 (1952).—*C.A.* **46**, 6408*e*.

When an unsatd. fatty acid was subjected to ozonolysis, the products of ozonolysis treated with alk. AgO suspension to oxidize the CO of the aldehydes and semialdehydes to COOH, the salts of mono- and dicarboxylic acids thus obtained were esterified and then coverted to their hydroxamic acid derivs. Paper chromatography could be applied to sep. and identify the derivs. This method of investigating the chem. structure of unsatd. acids was tried on oleic, erucic, linoleic, and linolenic acids with success.

9091. Inoue, Yoshiyuki and Noda, Manjirô. **Separation and identification of fatty acids. XIV. Paper chromatography of fatty acids using the filter paper impregnated with silicic acid.** *J. Agr. Chem. Soc. Japan* **25**, 496-9(1952). —*C.A.* **46**, 6408*f*.

Filter paper was immersed in Na silicate soln. (d. 1.36) for 20 min. and then the treated filter paper was immersed in 6 *N* HCl; silica gel could be fixed on filter paper. This was washed with water and air dried for a day or two; it was pressed and preserved in a desiccator. These were used to sep. the higher fatty acids inseparable on ordinary filter paper. BuOH-C_6H_6(1:1) was suitable as the solvent. Satd. fatty acids themselves were chromatographed with MeOH as the fixing liquid phase and naphtha, b. 70-90°C, as the migrating liquid phase on ordinary or silica-impregnated filter paper, but with inferior result to the paper chromatography of hydroxamic acids.

9092. Kaufmann, H.P. and Budwig, J. **Paper chromatography in the field of fats. X. Fluorescent dyes as indicators in the paper chromatographic analysis of fat acids and fats.** *Fette u. Seifen* **54**, 7-10(1952).—*C.A.* **46**, 7793*d*.

In sepg. and identifying linoleic, oleic, elaidic, erucic, stearic, caproic, caprylic, heptanoic, pelargonic, decanoic, octenoic, and undecylenic acids, the following florescent indicators were of value: quinine, Acridine Orange, Rhodamine B, Fluorol G, chlorophyll, anthracene, anthranol, and various combinations.

9093. Kaufmann, H.P.; Budwig, J., and Schmidt, C.W. **Paper chromatography in the field of fats. XI. Identification and separation of conjugated unsaturated fat acids.** *Fete u. Seifen* **54**, 10-12 (1952).—*C.A.* **46**, 7793*g*.

The paper chromatography of 9,11-linoleic acid, 9,12-linoleic acid, β-eleostearic acid, and β-licanic acid was investigated by using reactions with inorg. salts and dyeing with org. dyes on No. 214 filter paper (Macherey, Nagel & Co.) or No. 2043b (Schleicher and Schüll). The following colors were obtained with metallic soaps of these acids (metal, color, and the above acids, resp.): Cu, light bluish green, satd. green, pale green, yellowish green; Fe, yellowish brown, reddish brown, yellow, pale yellow; Ni, very pale green, pale green turning yellow, pale pink, with green border, pale green; Pb, white, white turning yellow, white, white; Cr, grayish green, grayish green turning grayish violet, grayish green, grayish green; Mn, pale pink, pale pink turning brown, white, white; Co, pink slowly turning pale brown, pink turning dirty green, pink, pink.

9094. Kaufmann, H.P. and Budwig, J. **Paper chromatography in the field of fats. XIV. Examination of polymerized oils.** *Fette u. Seifen* **54**, 340-56(1952).—*C.A.* **47**, 885*i*.

Paper chromatography was applied to polymerized and nonpolymerized fish oils. The former can be identified by treating the developed spots with Rhodamine B-Nile Blue sulfate, $Ca(OAc)_2$, or Rhodamine B alone and examg. in ultraviolet light. The thermal polymerization of fish oils resulted in a decrease of highly unsatd. fat acids. The vitamin A content of the oils was lost during polymerization.

9095. KINOMURA, SHIGERU. **Decolorization of rice-bran oil with Filtrol.** *Yushi Kagaku Kyôkaishi* (J. Oil Chemists' Soc., Japan) 1, 81-4(1952).—*C.A.* 46, 9871*a*.

The efficiency of decolorization was detd. of 4 rice bran oils with Filtrol LX-466, Filtrol Special, and Filtrol Super (U.S.A.) and Active White Clay N of Japan. Oil of low acidity was decolorized best with Filtrol LX-466, while oil with high acid values was most suitably decolorized with the Active White Clay N.

9096. MONTES, ADOLFO L. **Application of chromatography in a study of essential oils.** *Anales asoc. quim. argentina* 40, 273-81 (1952).—*C.A.* 47, 5631*i*.

Chromatographic adsorption was applied to the analysis of essential oils with columns of silicic acid and bentonite. The results were given of the sepn. of binary and tertiary mixts. of 2,4-dinitrophenylhydrazones of 12 aldehydes and ketones of essential oils. For a column 2.5 × 25 cm, sample quantities of 0.1-0.2 g in 1% soln. could be used. When the quantity of one component was very small with reference to the other, a taller column was recommended; this permitted the use of a larger quantity of sample.

9097. PHATAK, S.S.; NAHADEVAN, A.P., AND PATWARDHAN, V.N. **Identification of isoöleic acids present in hydrogenated fats by paper chromatography.** *Current Sci.* (India) 21, 162-3(1952).—*C.A.* 47, 2509*f*.

Et esters of the fatty acids from hydrogenated fat were oxidized in $(CH_3)_2CO$ soln. and the dibasic acids sepd. from the mónobasic acids by distn. in vacuum. The dibasic acids were applied as a dil. aq. ammonia soln. to filter paper and chromatogrammed with a BuOH-water solvent.

9098. RAMASWAMI, S. **Recovery of nickel from spent nickel catalysts in vanaspati (butter substitute) plants.** *Indian Soap J.* 18, 20-4(1952).—*C.A.* 47, 2517*a*.

A discussion was given under the following headings: recovery of the assocd. oil, conversion of Ni into NiS, conversion of NiS to NiO, and conversion of NiO into active Ni for use in hydrogenation.

9099. SEN, NIRMAL KUMAR AND CHAKRAVARTI, JIBAN KUMAR. **Utilization of jute seeds with particular reference to the seed fat.** *Indian Soap J.* 18, 164-70(1952).—*C.A.* 47, 4107*b*.

Jute-seed extn. with petr. ether (b. 40-60°) yields 15% oil, while successive expressions in a hydraulic press yield 10%. The oil was satisfactorily refined by treatment with MgO. The product was bright and of a light yellow color and had a characteristic odor. Bleaching with Fuller's earth or animal charcoal was not very successful. Besides some coloring matter and phosphatides, the jute-seed oils were found to contain a mixt. of sterols and higher hydrocarbons.

9100. CATRAVAS, GEORGES N. **Isomerization produced during catalytic hydrogenation of drying oils.** *Compt. rend.* 236, 716-18(1953).—*C.A.* 47, 5696*g*.

The migration of ethylenic bonds during the partial hydrogenation of linseed oil was studied. In operating under amt. pressure and 175-180°C, and by using pure Ni(0.2% based on the wt of oil) supported on diatomaceous earth as catalyst, a max. of 3.8% isomerization was attained in 20 min. Addn. of $NiSO_4$ (corresponding to 1% S) to the catalyst before its reduction gave a max. of 9.8% in 30 min.

9101. DAVISON, B.K. AND WIGGINS, L.F. **The refining of sugar-cane wax.** *Intern. Sugar J.* 55, 10-12(1953).—*C.A.* 47, 3015*a*.

Crude wax (400 parts) was melted with 40 parts bentonite and 10 parts active charcoal. The required alc. (4000-7000 parts) was added and the mixt. refluxed 1 hr. The wax soln. and suspended bentonite and charcoal were decanted from the resin and filtered at 70°C. The hard wax crystallized from the cooled filtrate and soft fatty material was obtained by evapg. the solvent.

9102. SCHLENK, HERMAN AND HOLMAN, RALPH T. **Methanolysis of triglycerides by an anion-exchange resin.** *J. Am. Oil Chemists' Soc.* 30, 103-4(1953).—*C.A.* 47, 4631*h*.

Interesterification by anion-exchange resin was reported. When Amberlite IRA-400-OH-AG resin 20 g was added to a soln. of cottonseed oil 55 g, ether 250 ml, and EtOH 250 mil, 2 liquid layers formed, which became homogeneous as the reaction proceeded. Such reaction with cottonseed, corn, cod liver, and coconut oils gave 61-73% interesterification at 48-72 hrs reaction time.

9103. TYUTYUNNIKOV, B.N. AND FRAĬER, B. **Studies in the field of hydrogenation of fats.** *Masloboĭno Zhirovaya Prom.* 18, No. 1, 7-10 (1953).—*C.A.* 47, 5699*d*.

A test for evaluation of the activity of a hydrogenation catalyst was proposed. The activity of a catalyst was recorded as the av. vol. of H_2 uptake per hr by a standard fat when it was hydrogenated under standard conditions to the same degree as was conventional in practice.

V-11. Applications to Mining and Metallurgy

9104. NARDIN, ERNEST WILLOUGHBY. **The chlorination of gold ores at Mount Morgan, Queensland.** *Eng. and Mining J.* 71, 85-6 (1901).

The ore, crushed dry to pass a 400-mesh screen, was leached with an aq. soln. of Cl_2 and the soln. subsequently pptd. by passing the Au-liquor through charcoal. The installation described treated 100,000 tons of low-grade ore annually.

9105. WARK, IAN W. AND SUTHERLAND, KEITH L. **Principles of flotation. IX. Influence of the anion on air-mineral contact in presence of collectors of xanthate type and its consequent influence on differential flotation.** *Am. Inst. Mining Met. Engrs., Tech. Pub. No.* 1130, 23 pp. (1939).—*C.A.* 34, 2749⁵.

The influence of certain anions, viz., carbonate, chloride, nitrate, formate, acetate, propionate, tartrate, phosphate, silicate and ferricyanide, on flotation by K Et xanthate was studied. Except for carbonate, phosphate, silicate and ferricyanide, all were added as Cu salts replacing the usual $CuSO_4$ addns. Differential flotation was often based upon the more-ready formation of islands of noncontact with some minerals than others, and on the differentiation that persisted as the islands expanded into alk. regions.

9106. HELBIG, W.A. **Physical removal of impurities from plating solutions.** *Proc. Am. Electroplaters' Soc.* 1941, 68-76.—*C.A.* 36, 1549^1.

For calcg. solids capacity of a filter, an approx. rule was one lb/ft^2 of either filter aid or activated carbon will give a 0.5-in. cake. If a filter aid precoat was necessary, a 0.06-in. cake was usually satisfactory. The usual dosage for periodic activated carbon treatment was 3 to 10 lb/100 gal. The suspension should be agitated 30-45 min. before filtration. Activated carbon must be added in an auxiliary tank and should not come into contact with the plating tank. For continuous filtration with activated carbon, 0.5 lb/100 gal was used. Since brighteners and wetting agents were partially removed by activated carbon, their concn. must initally be higher than normal, so that the normal concn. was obtained after the adsorption equal was reached.

9107. HÜTTIG, GUSTAV F.; BITTNER, CHRISTIAN; FEHSER, ROLF; HANNAWALD, HUGO; HEINZ, WILHELM; HENNIG, WALTER; HERRMANN, ERICH; HNEVKOVSKY, OTTO, AND PECHER, JOSEF. **The reactions of solids. CXXIV. The course of the sintering processes in copper powder.** *Z. anorg. allgem. Chem.* 247, 221-48 (1941).—*C.A.* 36, 6060^4.

Very pure, finely divided Cu powder was heated in H_2 under const. conditions for 2 hrs at 100°, 200°, 300°, 400°, 500°, 700°, and 800°C. After cooling, the photomicrograph, x-ray diagram, pycnometric d., vol.(shaken down), soly. in dil. HNO_3, e.m.f., reactivity toward $AgNO_3$ soln., MeOH adsorption isotherms, and catalytic action on the decompn. of H_2O_2 were detd. The most important characteristic of the sintering process was the contraction at approx. 400°C. Before the skin contraction occurred, there was a distinct period of expansion; this was shown by an increase in the capillary vol.

9108. MOORE, GEORGE E. **Reduction of magnesium oxide by tungsten in vacuum.** *J. Chem. Phys.* 9, 427-31(1941).—*C.A.* 35, 3917^5.

The rate *in vacuo* of the reaction $2MgO + W \rightarrow 2Mg + WO_2$ was calcd. The calcns. were found to be in substantial agreement with expt. The calcns. covered the range 1000-1900°K; the min. reaction temp. was about 1135°K.

9109. PERRUCHE, LUCIEN. **Flotation of nonmetallic minerals and various substances.** *La Nature* 1941, 411-15.—*C.A.* 37, 2965^2.

The flotation process was used for: coal, phosphates, chromates, fluorspar, limestone, S, baryta, kaolin, bituminous earths, talc; sepn. or pptn. of individual constituents of mixts., C, Al and cryolite in Al smelting in the elec. furnace, NH_4Cl and alkali nitrates in fertilizer production, NaF, SiO_2 and Na_2CO_3 in the working up of fluorspar and NH_4Cl and $NaHCO_3$ in the production of soda by the Solvay process, and for the purification of sugarcane juice, drinking water, etc.

9110. PHILIPPOT, E. **Arresting power of active carbon for arsine.** *Rev. Universelle Mines* 17, 212-23(1941).—*C.A.* 37, 5159^8.

Air-contg. 1 g/m^3 of AsH_3 was passed at a rate of 1500 liters/hr through boxes contg. active carbon, and a filter, and the times before breakthrough of AsH_3 was observed were measured. Ordinary active carbon was effective for 5-10 min., but anhyd. active carbon was about 5 times as effective. The provision of a silica gel container for preventing access of H_2O to the active carbon was recommended in the case of masks worn by workers in atm. likely to contain AsH_3.

9111. PHILLIPS, ARTHUR AND SKINNER, E.N. **Solubility of oxygen in high-purity copper.** *Trans. Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Paper No.* 1280, 8 pp. (1941).—*C.A.* 35, 3205^8.

Solid soly. of O_2 in high-purity Cu was found to increase from 0.0018% at 550°C to 0.0070% at 1040°C. Failure of the soln. to behave ideally suggested a possible change in the mechanism of adsorption at high temp.

9112. SOKOLOV, I.A. **Use of charcoal for the production of high-quality pig iron.** *Stal* 1941, No. 5, 3-6.—*C.A.* 38, 44^5.

Because FeO was more nearly completely reduced at 800-1200°C by charcoal than by coke and because the soly. of FeO in Fe increased with the temp., the amt. of FeO dissolved in a charcoal blast furnace was smaller. This in turn resulted in decreased quantities of SiO_2, MnO and Al_2O_3 in the pig-Fe, since they were pptd. by FeO. This explained why charcoal pig-Fe with the same analysis (except for nonmetallic inclusions) as coke pig-Fe was superior in quality.

9113. CANGUILHEM CONTRUCCI, H. **Flotation of minerals, especially nonmetallic ones, and its relation to the chemical industry.** *Anales I° congr. panamer. ing. minas y geol., Santiago, Chile* 4, 1796-1801(1942).—*C.A.* 45, 9773^g.

Different applications of the flotation process in the chem. industry was discussed.

9114. FLOE, CARL F. AND CHIPMAN, JOHN. **Effect of impurities on the solubility of sulfur dioxide in molten copper.** *Trans. Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub. No.* 1435, 9 pp (1942).—*C.A.* 36, 1576^5.

The effects of C, O and S on the soly. of SO_2 in molten Cu at 1100°, 1200° and 1300°C were studied. The results indicated that for pure Cu and for Cu contg. an excess of either O or S, the reaction of soln. might be expressed by either of the simple equations: $6Cu(\lambda) + SO_2(g) = Cu_2S$ (in Cu) + $2Cu_2O$ (in Cu) or $SO_2(g) = S$ (in Cu) + 2O (in Cu). The equil. const. for this reaction was detd. at 1100°, 1200° and 1300°C.

9115. GLAZUNOV, A.; JENICEK, L., AND VONDRACEK, V. **The influence of sugars on the cathode precipitate.** *Chem. Listy* 36, 318-23 (1942).—*C.A.* 44, 1345*b*.

The presence of glucose or sucrose in a $ZnSO_4$ electrolyte favored the formation of a glossy surface. Similarly, the deposition of black amorphous metal required lower c. ds. with increasing amt. of sugars in the soln. With the same concn. of sugar, the deposition of a glossy surface required higher c.d. at higher temps.

9116. MILLER, E.K. **Air conditioning for blast furnaces.** *Heating & Ventilating*, 39, 48-51 (January), 1942.

The air conditioning unit to dry the blast at a blast furnace of the Jones & Laughlin Steel Corp. resulted in a 16% increase in pig iron production and a 4% reduction in coke consumption. The saving in electric energy offset air conditioning operating cost. Air was conditioned by drawing it through chilled water (38.5°F) sprays and eliminating excess moisture.

9117. SUTHERLAND, KEITH L. **Principles of flotation. X. Influence of cations on air-mineral contact in presence of collectors of the xanthate type.** *Am. Inst. Mining Met. Engrs., Tech. Pub. No.* 1494, 8 pp. (1942).—*C.A.* 37, 1355[5].

The effects of cyanide and alkali upon adsorption of K Et xanthate at activated mineral surfaces were investigated. $ZnSO_4$ had only a small effect on adsorption in the presence of cyanide and a considerable depressant action on chalcopyrite in the absence of cyanide. For $CuSO_4$, the relative insoly. of Cu Am xanthate compared with Cu Et xanthate induced greater island formation (second region of nonadsorption). The formation of the second region of noncontact was more marked with Ag salts, which was in accordance with the greater insoly. of Ag Et xanthate compared with Cu Et xanthate. The order of response of various minerals to xanthate differed according to the cation present.

9118. WEFRING, C. **Wood charcoal as a protection for steel against oxidation (during heat-treatment).** *Tids. Kjemi, Bergvesen Met.* 2, No. 2, 11-14 (1942).—*C.A.* 38, 6257[4].

Heat-treatment of a steel with 0.89% C packed in wood charcoal showed considerable decarburization of the surface. Analysis of the gaseous products from the charcoal showed high H-values and considerable water. Drying at 1000°C or grinding the charcoal to extreme fineness did little good.

9119. WOLOCHOW, DAVID. **Dry blast for blast furnaces.** *Metal Progress* 42, 546, 552, 554, 556 (1942).

Published results indicated that removal of moisture from the furnace blast was a practical and economical means of increasing production and general efficiency. Despite the failure of early dry-blast plants erected early in the century, improved design and lower cost of erection of present-day systems warrent their application today.

9120. CANGUILHEM CONTRUCCI, H. **Some results obtained in the flotation of nonmetallic minerals.** *Rev. ing. quím., Univ. Concepción (Chile)* 2, No. 2, 78-28 (1943).—*C.A.* 39, 1968[3].

Preliminary tests on flotation of limestone and of apatite were described.

9121. ERLENMEYER, H.; KAM, HAZIM, AND THEILHEIMER, W. **Flotation experiments with 8-hydroxyquinoline as collector. V. Flotation experiments on oxide compounds in the presence of metal salts.** *Helv. Chem. Acta* 26, 1129-31 (1943).—*C.A.* 38, 1152[2].

Flotation expts. were performed with ferric oxide, ferric oxide hydrate, chromic oxide, chromic oxide hydrate, hematite and chromite. The added salts included compds. of Cu, Mg, Zn, Fe, Ni, Mn, Ca, Co, Cr and Hg.

9122. JONES, G.W. AND KENNEDY, R.E. **A simple device for detecting small concentrations of organic halide gases in the atmosphere.** *U.S. Bur. Mines, Rept. Investigations* 3697, 10 pp. (1943).—*C.A.* 37, 4599[2].

A simple tester was described for detecting low concns. of halide gases in the atm. Based on the principle of the halide lamp, halide-contg. gases were adsorbed and concd. by adsorbent charcoal; thus, the sensitivity of the test was greatly increased. The tester was so constructed that tests could be made by aspirating the atm. through it, by suspending it in the atm., or by swinging it in the atm. to be tested. Expts. on 25 different halide gases showed that concn. of < 1 p.p.m. could be detected.

9123. MORRISON, W.S. **Synthetic cation and anion exchange resins as new research tools in the field of electrodeposition and related arts.** *Monthly Rev. Am. Electroplaters' Soc.* 30, 702-18 (1943).—*C.A.* 37, 6195[5].

Suggested uses in electroplating were: (1) recovery of Ag from spent Ag plating solns. and rinse water; (2) control of the pH of plating solns.; (3) removal of harmful contaminants in waste water as a means of over-coming sewage-disposal problems; (4) removal of Na_2CO_3 (from CN^- type plating solns.); (5) purification of water used to replace that lost by evapn. By passing a portion of a Ni plating soln. through an anionic resin exchanger, the pH of the soln. could be raised in a few min. from 4 to 6.

9124. BEVER, MICHAEL B. AND FLOE, CARL F. **Solubility of hydrogen in molten copper-tin alloys.** *Trans. Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub. No.* 1703, 11 pp. (1944).—*C.A.* 38, 2916[5].

The soly. of H_2 in different liquid Cu-Sn alloys was a regular function of compn. It decreased rapidly with addns. of Sn up to approx. 40% by wt or 25 atomic % and quite slowly with further addns. The intersection of these lines at about 25 atomic % of Sn was interpreted as an indication that Cu_3Sn existed in the liquid state. The soly. of H_2 in pure Cu and in Cu-Sn alloys measured at 1200°C was proportional to the square root of the pressure.

9125. ERLENMEYER, H. AND THEILHEIMER, W. **Flotation experiments with 8-hydroxyquinoline as collector. VII. Fractional flotation as a method for classification of solid substances.** *Helv. Chim. Acta.* 27, 1315-19 (1944).—*C.A.* 39, 2471[8].

The expts. were conducted with hydrated $Fe(OH)_3$, obtained by pptn. from $FeCl_3$ with NH_4OH, 8-hydroxyquinoline as collector, with and without addn. of $Co(NO_3)_2$. The floated part was always lighter in color and of smaller grain size than the residue. No direct relationship between grain size and yield was observed. Expts. were also conducted with Fe_2O_3 prepd. by ignition of $Fe(OH)_3$, by heating $FeSO_4$, in an elec. furnace at 600°C, and by heating FeC_2O_4 at 200°C. When the concn. of the collector was sufficiently great (20 mg of collector to 2 g of sample) there was no marked difference in yield with the different prepns.

9126. Sekine, Hideo. **Mechanism of enamel adherence to steel. I.** *J. Japan. Ceram. Assoc.* 52, 263-7(1944).—*C.A.* 45, 7329*f*.

At higher temps. the viscosity and surface tension of enamel glaze decreased, and it covered the surface of steel. At this stage an oxidized layer formed along the crystal boundaries of the steel surface and bound the glaze and the steel; this layer formed below the γ-to-α transition temp. of the steel. Co oxide acted as the absorbent of heat rays.

9127. Theilheimer, W. and Erlenmeyer, H. **Flotation experiments with 8-hydroxyquinoline as collector. VI.** *Helv. Chim. Acta.* 27, 1313-15 (1944).—*C.A.* 39, 2471[6].

The distribution of hydrate Fe_2O_3 between the foam and sediment with 8-hydroxyquinoline as collector was strongly influenced by addn. of metallic salts. By the addn. of Ni^{+2}, the yield of poorly floating hydrated Fe oxide prepns. was increased from 26.8 to 92%, but the addn. of Cu^{+2} reduced this to 11.2% and with a good floating Fe oxide prepn. yielding 93.4%, this was depressed to 23.0%. Expts. showed that the effect of Cu^{+2} varied with the conditions. In the presence of 0.1 *N* HCl, addn. of $CuSO_4$ depressed the yield of floated material from 26.8% to 11.2%, but when the collector was dissolved in 95% alc. the yield was raised from 9.6% to 45.8% by addn. of $CuSO_4$.

9128. Theilheimer, W. and Erlenmeyer, H. **Flotation experiments with fluorspar.** *Helv. Chim. Acta* 27, 1319-21(1944).—*C.A.* 39, 2470[9].

In flotation expts. with fluorspar with 8-hydroxyquinoline as collector, the yield was greatly affected by conditions. Fluorspar was particularly sensitive to CO_2. A freshly ground sample of fluorspar with 10 mg of collector and 1 ml of 2 *N* NH_3 gave a yield of 90.7%, but after standing a few weeks (both fluorspar and solns.) the same prepn. gave a yield of only 59%. If fresh NH_3 soln. was used, the aged fluorspar gave a yield of 82.5%. Addn. of $Ba(OH)_2$ to bind the CO_2 also raised the yield of 75%.

9129. Theilheimer, W. and Erlenmeyer, H. **Flotation experiments with pegmatite.** *Helv. Chim. Acta* 27, 1428-9(1944).—*C.A.* 39, 2471[2].

In order to use pegmatite as a ceramic raw material, its dark Fe-bearing constituent (mica) must be removed. The purity of the product could be detd. by alk. fusion in which material of the desired purity yielded a white melt, whereas the Fe-bearing constituent produced a bluish green melt. Tests were conducted with various collectors to det. their suitability for purification of pegmatite.

9130. Vernon, W.H.J.; Wormwell, F., and Nurse, T.J. **Surface film on chromium-nickel (18/8) stainless steel.** *J. Iron and Steel Inst.* (London), Advance copy, October (1944)12 pp.—*C.A.* 39, 5234[2].

Surface films removed from polished Cr-Ni (18/8) austenitic steel were analyzed. The Cr content of the film was greater than that of the under-lying steel, and increased with the degree of polish. The thickness of the film as measured by the total oxides present (Cr_2O_3, Fe_2O_3, NiO) increased also with the degree of polish. Surfaces from which the film had been removed were less passive than when polished.

9131. Wada, Masayoshi. **Flotation method. I. Determination of wetness of solid by the plank-slanting method.** *Bull. Research Ins. Mineral Dressing Metall.* 3, 30-45(1944).—*C.A.* 45, 4*e*.

To det. wetness of solid with H_2O the following wet-isothermal equation was derived: $F' = \gamma \cos \theta - \gamma_0 \cos \theta_0 = BRT \log [(c/a) + 1]$, where F' = wet boundary pressure of a boundary-active solid of c concn.; γ_0 = surface tension of pure H_2O; θ_0 = angle of contact between the solid and H_2O; R = gas const.; T = abs. temp.; a and B = arbitrary consts. From $BRT/(a + c)$ ($-A'$, wet activity) differentiated from the above with respect to c, and $(B/a)RT$, the same when c was zero, a and B could be evaluated, and $B/a = k$ was defined as wet activity coeff.

9132. Dietzel, A. **Theory of the adherence of enamel to iron.** *Keramik* 78, 5/8, 19-20; 9/12, 34-36(1945); *Ceram. Abstracts* 1950, 138.—*C.A.* 45, 7329*c*.

When the enamel was fired for the proper time, there was no oxide layer, and there must be another reason for the adherence. Tests showed that the Fe_3O_4 which was dissolved in the enamel reacted with metallic Fe and formed FeO, not the reverse. A 3rd theory on adherence dealt with the roughness of the Fe surface as an indispensable condition. The oxides CoO and NiO were reduced to Co and Ni by the Fe. These Co and Ni deposits formed local galvanic couples and the resulting corrosion caused the roughness.

9133. Gay, R. **Diffusion method of studying precipitation phenomena. Mineralogical applications.** *Bull. soc. franc. mineral.* 68, 60-152 (1945).—*C.A.* 43, 7296*h*.

A layer of gelatin on a glass surface was prepd. If one edge of the gelatin was immersed in a soln. of a salt, the salt diffused into the gelatin and the concn. of the salt increased from one edge of the gelatin to the other. Two such gelatin layers were prepd. with salts that reacted to form a ppt. The two layers were placed together so that the axis of the concn. gradient of one salt was perpendicular to the axis of the concn. gradient of the other salt. The points of contact of the two gelatin surfaces embraced a wide range of concn. differences, and the effect of these differences on the diffusion of ions from one gelatin layer to the other was shown by the progress of a pptn. front. The nature of the pptn. process was discussed with reference to certain concretions, e.g., cone-in-cone, met with in petrography.

9134. Herzog, Eugène. **Formation of calcium carbonate and silica deposits during corrosion of iron in soft water.** *Métaux, corrosion, usure* 20, No. 5, 57-60(1945).—*C.A.* 45, 5599*e*.

Results were given of tests made to examine the conditions in which $CaCO_3$ and SiO_2 deposits formed on mild steel immersed in soft H_2O. Particular attention was paid to the influence of the surface condition of the sample and of the rate of H_2O circulation.

9135. SUSSMAN, SIDNEY; NACHOD, FREDERICK C., AND WOOD, W. **Metal recovery by anion exchange.** *Ind. Eng. Chem.* 37, 618-24(1945).—*C.A.* 39, 3502[9].

Cation exchange-materials had been employed in the recovery of metals, but the use of anion exchangers to recover metals in the form of anionic complexes from dil. solns. was new. Cr recovery was studied most entensively. The chromate removal by the chloride and sulfate salts of the anion exchanger was about the same, i.e., 3.09 and 3.05 milliequiv. per g of exchanger resin. Recovery of the Cr with alk. regenerants, such as NH_4OH, averaged 80-90%. The concn. increase over the dil. feed solns. thus obtained ranged from 10- to 25-fold. Since the anion-exchange resins contained but little inorg. ash, recovery of the higher-priced precious metals by ashing of the resin was economically feasible.

9136. THOMPSON, J.G. **Determinations of hydrogen in iron and steel by vacuum extraction at 800°C.** *Trans. Am. Inst. Mining Met. Engrs.* 162, 369-74 (1945).—*C.A.* 40, 7064[3].

Specimens of plain carbon and low-alloy steels retained approx. 0.00035% H after annealing in H_2 at 1100°C. Remelted electrolytic Fe retained about 0.0005%, and 14-18% Cr steels quenched from 1100°C in H_2 retained more than 0.0007% H.

9137. VOSBURGH, F.J. **Carbon and graphite for mechanical and electrical parts.** *Metals & Alloys* 22, 721-6(1945).—*C.A.* 40, 3[2].

Mech. and phys. properties and uses of carbon, graphite, impervious carbon, impervious graphite, porous carbon, and porous graphite in cylinders, slabs, tubes and brick forms were summarized.

9138. BERGER, P. **Defects in plating solutions and their remedies.** *J. Electrodepositors' Tech. Soc.* 21, 195-209 (1946).—*C.A.* 41, 1563*b*.

Defects of electrodeposits resulting from impurities in the plating soln., from incorrect soln. compn., or from improper cleaning before or after plating were described and remedies were discussed. Methods of purification of the common plating solns were given.

9139. GLAUCH, E.S. **Use of graphite in iron powder compacts.** *Proc. Ann. Spring Meeting, Metal Powders Assoc.* 2, 2-7, discussion. 7-12 (1946).—*C.A.* 45, 4185*e*.

The compacts were made of electrolytic Fe powder with 0.85% by wt of various grades of graphite added. A pressure of 50 tons/in² was used. Sintering took place at 1100°C for 1 hr in dissocd. NH_3. Reduction of the Fe powder in H_2 before mixing and pressing improved the resulting tensile strength and hardness. Residual oxide films tend to decarburize the compact throughout and thus reduce the amt. of the effective graphite. The improvement is not the same for all grades of graphite. Sintering in a graphite tube instead of an open boat improved the mech. properties which were still higher if the powder was freshly reduced. The use of closed-end tubes inside the furnace muffle did not usually result in carburization. For the test conditions described a 1% graphite addn. yields a total C content of 0.9% with 0.75% in form of combined C and 0.15% as graphite.

9140. KARUNAKARAN, C. AND NARASINGARAO, M. **Concentration of graphites by froth flotation.** *Current Sci.* 15, 285-6 (1946).—*C.A.* 41, 2213*g*.

Unoxidized graphite ore contg. as little as 14% C was appreciably enriched even with an unconditioned, coarse pulp in a single stage froth flotation. The ore was ground to pass 50 mesh, 30 g was pulped with 150 ml water, treated with 0.2 ml pine oil, and aerated for 12 min. on a sintered glass funnel. Both froth and gang were sepd., dried, weighed, and analyzed. In every case the froth was enriched in C by more than 15%, but the total graphite recovery was low, in most cases being of the order of 20%.

9141. KURTZ, JACK. **Sintered high-density tungsten and tungsten alloys.** *Proc. Ann. Spring Meeting Metal Powder Assoc.* 2, 40-9, discussion, 49-52(1946).—*C.A.* 45, 4619*d*.

Densities up to 99 1/2% of theoretical were obtained in W alloys contg. 10% Cu-Ni or 10% Co-Ag. Such high densities were more difficult to achieve when the alloy contents were lower which was very desirable for some applications. In this case, purity and particle-size distribution must be carefully controlled. The alloying addns. were mixed in by means of a ball mill. This was done preferably wet with either CCl_4 or alc. for a period of 10 hrs. A small amt. of paraffin may be added to the mixt. to facilitate pressing at 15-20 tons per in.² Sintering for the 10% alloy contg. compn. took place between 1350 and 1400°C and for the 99.5% W material between 1500 and 1650°C.

9142. MOKRUSHIN, S.G. **Experimental investigations of laminar systems. XVI. Formation of uni-and multimicellar films of colloidal ferric and aluminum hydroxides.** *J. Gen. Chem.* (U.S.S.R.) 16, 11-16 (1946)(English summary).—*C.A.* 40, 6935*g*.

Colloidal solns. of hydroxides of Fe, Cr, and Al on long standing formed an invisible film on the surface. Observations on multi-laminar films deposited in the usual manner indicated that for $Fe(OH)_3$ the thickness of the unimicellar film was about 40 A., whereas the size of the micelle as detd. by ultrafiltration was 20mμ.

9143. SCHOUTEN, C. **Synthetic replacements as an aid to ore-genetic studies.** *Econ. Geol.* 41, 659-67(1946).—*C.A.* 42, 8718*e*.

Pyrite in ore bodies exhibited a great variety of forms but in each single deposit the forms were characteristic. The occurrence of metallic sulfides pseudomorphous after FeS_2 but with preservation of internal structures indicated that synthetic replacement might give a clue to the natural process. If natural ore structures were considered due to metasomatism, it was possible to produce similar structure synthetically, using host material from the same locality.

9144. Tomashov, N.D. **Anodic oxidation of aluminum alloys and the possibilities of its application in machine building.** *Vestnik Inzhenerov i Tekh.* 1946, No. 2, 59-65.—*C.A.* 40, 6005^4.

Anodically oxidized Al had properties which made it desirable in the construction of internal-combustion motors. Films 50-500 μ thick were required. The films were porous to an extent variable within certain limits. They could also be filled with pigments to color the surface, with Ag salt to photosensitize it, or with oil or colloidal graphite to impart antifriction properties to the surface. The oxidized film adhered very strongly to the Al base.

9145. Volkova, Z.V. **The bubble mineralization process in flotation.** *Compt. rend. acad. sci. U.R.S.S.* 51, 449-52 (1946).—*C.A.* 40, 7105^4.

A theory of froth flotation was developed which permitted calcn. of the min. quantity of air used in flotation, the coeff. of air utilization, and the coeff. of sepn. of minerals of different flotabilities such as quartz and barite.

9146. Volkova, Z.V. **Flotability of solids.** *J. Phys. Chem. (U.S.S.R.)* 20, 1213-24 (1946) (in Russian).—*C.A.* 41, 2614*f*.

The effects of contact angle, of the size of bubbles and mineral grains, of the induction time of a bubble, and of the ratio (R) of mineral to gang on the result of flotation were calcd. Flotation resulted in sepn. if the grains were 20-400 μ. Smaller grains adhered to bubbles even if wetted, and bigger grains did not adhere whatever the contact angle. The probability of adhesion between a given grain and a given bubble could be calcd. if the surface properties of the grain, the induction time, the size distribution of the powder, and the ratio R were known.

9147. Webber, H.M. and Hotchkiss, A.G. **Furnace atmospheres for sintering.** *Proc. Ann. Spring Meeting Metal Powder Assoc.* 2, 13-38 discussion, 38-9(1946).—*C.A.* 45, 4184*f*.

At high temps. H_2 was reducing in contact with Fe with relatively high amts. of moisture, while at low temps. less moisture was permissible to maintain the reducing condition. For alloy steels and many nonferrous metals H_2 had to be purified. Removal of O_2 was accomplished by passing the H_2 over Cu at 1100-1200°F, or through a Pd catalyst purifier at room temp. Drying was done in activated Al_2O_3 driers up to 1000 ft^3/hr. For greater flow rates refrigeration prior to drying was frequently employed. Compacts made from Cu and especially Ni alloys were sintered in a S-free atm. Coke oven gas usually contains S. In this case the amt. was passed through a water-spray and then through an Fe oxide plus wood shavings tower. The former removed SO_2, the latter H_2S. If the atm. was to be strictly nondecarburizing, CO_2 was removed by absorption in a monoethanolamine soln.

9148. Bloodgood, Don E. and Losson, Felix J. Jr. **Removal of toxic substances from metal-plating wastes by ion exchange.** *Proc. 3rd Ind. Waste Conf., Purdue Univ. Eng. Bull., Extension Ser. No.* 64, 196-208 (1947).—*C.A.* 43, 4797*a*.

Plating wastes contg. 315-335 p.p.m. total hardness, 360-376 p.p.m. alky., 27.7-53.1 p.p.m. CrO_4, 17.3-51 p.p.m. KCN, and pH 7.5-7.95 were passed through a lab. 2-stage ion-exchange unit with cation- and anion-removing resins in series. KCN was reduced to 0 to 5 p.p.m. and CrO_4 almost completely removed. The cation resin was regenerated with 4% NaOH.

9149. Bochmann, Gerhard and Fiddecke, Liselotte. **Influence of adsorbed liquid layers upon crack resistance.** *Metallforschung* 2, 239-43(1947).—*C.A.* 42, 5391*i*.

The influence of adsorbed liquids upon the magnitude of crack resistance of various metals was investigated. In the cracking process the dispersion as well as the cold deformation was influenced by the surface activity of the surrounding medium. This was previously only known for brittle nonmetallic materials. If in cracking, dispersion was of greater significance than the cold deformation occurring simultaneously, crack resistance decreased with increasing surface activity of the surrounding medium. This applied to the investigated metals, Sb and cast Fe.

9150. Brenner, Abner and Riddell, Grace. **Deposition of nickel and cobalt by chemical reduction.** *J. Research Natl. Bur. Standards* 39, 385-95(1947) (Research Paper 1835).—*C.A.* 42, 1857*g*.

Data were presented on the deposition of Ni, Co, and Ni-Co alloys from hot hypophosphite solns. without the use of electric current. The alk, Ni soln. (pH 8-10) contained $NiCl_2.6H_2O$ 30, $NaH_2PO_2.H_2O$ 10, NH_4Cl 50, and sodium citrate 100 g per liter. A typical acid Ni soln. (pH 4-6) contained $NiCl_2.6H_2O$ 30, NaH_2PO_2 10, $NaC_2H_3O_3$ 50 g per liter. Deposition could be obtained on noncatalytic surfaces by changing the compn. of the bath, making contact with a more electronegative metal, or depositing a thin layer of a catalytic metal on the surface of the noncatalytic surface.

9151. Eigeles, M.A. **Effect of variable hydrogen-ion concentration on flotation.** *Gornyi Zhur.* 121, No. 6, 31-5(1947).—*C.A.* 43, 1227*i*.

The effect of alkali and acid on the distribution of the collector (Na oleate) between the soln. and minerals was studied to elucidate the effect of pH on flotation. The effect of H^+ and OH^- on flotation of minerals was due to the adsorption of these ions on the surfaces of the minerals. As the concn. of H^+ increased, they were adsorbed on the mineral surface where their action was two-fold: the amt. of collector adsorbed on the mineral surface was reduced and a strong hydration envelope formed around the surface. The combined effect prevented the mineral particle from adhering to an air bubble. A decrease in the concn. of H^+ in the pulp reduced their no. on the mineral particle, thereby weakening the hydration envelope and also increasing the quantity of collector on the mineral surface.

9152. Eigeles, M.A. **The influence of the size of mineral particles on their depression and activation in the flotation process.** *Doklady Akad. Nauk S.S.S.R.* 57, 919-22 (1947).—*C.A.* 45, 7489*d*.

The effectiveness of the flotation process in the presence of a collector (oleic acid) and a depressor-activator (Na silicate) was studied. The concn. of the oleic acid was so chosen that the av. extn. of the exptl. material (fluorite) was 71.5%. The addn. of 100 g/ton of Na silicate increased the flotation of the fluorite to 95.8%. In general, the higher concns. of Na silicate withdrew the larger particles from the flotation and thus had a depressing action, while the smaller particles were still further activated. For particles of mesh size -14 + 20, concns. of 5-10 and 200-400 g/ton of Na silicate had an activating action, while concns. of 20-100 and 500-1000 g/ton had a depressing action.

9153. HERGT, H.F.A.; ROGERS, J., AND SUTHERLAND, K.L. **Principles of flotation—flotation of cassiterite and associated minerals.** *Am. Inst. Mining Met. Engrs., Mining Technol.* 11, No. 1, *Tech. Pub. No.* 2081, 18 pp. (1947).—*C.A.* 41, 1579*d*.

The use of sulfated and sulfonated paraffin chain compds. for the flotation of cassiterite was studied. With Na cetyl sulfate as collector the conditions recommended for the selective flotation of cassiterite from ore contg. more than 0.2% Sn and Fe sulfides and quartz were: grind in an alk. circuit (pH more than 10); reduce the sulfide content to less than 1.0% by flotation with xanthate; condition the pulp at 25°C for 10 min. with Na cetyl sulfate in the pH range 3.0-5.0 before flotation in this range; leaching with 1% HCl is effective for deactivating quartz prior to cleaner floats, for which no further addns. of collector are made. Sepn. of cassiterite from muscovite and wolframite appeared feasible at pH values below 2. Flotation tests indicated a good sepn. from mica but no sepn. from wolframite.

9154. LEIDHEISER, HENRY, JR. AND GWATHMEY, ALLAN T. **The influence of crystal face on the electrochemical properties of a single crystal of copper.** *Trans. Electrochem. Soc.* 91, 12 pp. (1947)(Prepring).—*C.A.* 41, 2339*b*.

The importance of crystal face in several electrolytic processes in a $CuSO_4$-H_2SO_4 soln. was investigated with the aid of electrolytically polished single crystals of Cu. The processes studied consisted of simple chem. etching, electroetching, electrodeposition, action of an a.c., action of an a.c. superimposed on a d.c., and electrolytic replacement. It was found that all of these processes were influenced greatly by the crystal face exposed at the surface.

9155. LYUTIN, L.V. **Stabilization of mineral suspensions.** *Trudy Vsesoyuz, Nauch.-Issledovatel. Inst. Mineral. Syr'ya, Ministerstvo Geol. S.S.S.R.* No. 178, 151 pp.(1947)(English summary).—*C.A.* 46, 5932*d*.

Sedimentometric and viscometric methods of evaluation of the adhesion intensity of particles were discussed. The effect was discussed of proteins, sulfite liquor, tannins, high-polymer carbohydrates, cetrarinic acid, soaps, and inorg. colloids on suspensions of graphite, kaolin, corundum, and $BaSO_4$.

9156. MOKRUSHIN, S.G. AND SHEINA, Z.G. **Experimental study of laminar systems. XV. Thin films of metal sulfides as emulsifiers.** *Kolloid. Zhur.* 9, 285-8 (1947).—*C.A.* 47, 943*i*.

Films of CuS and PbS, produced by passing H_2S over $Cu^{++}$and Pb^{++}solns., were ground to a powder, x g of which were mixed with 8 ml C_6H_6 and then with 2 ml H_2O. When x varied between 0.02 and 0.1, the most stable emulsions (water-in-oil) formed at $x = 0.08$; the particle diam., d, of the emulsions was smaller, the greater was x, 0.008 cm at $x = 0.08$. When, by mixing 8 ml C_6H_6 with 2 ml 0.25 *N* NaOH and PbS, oil-in-water emulsions were prepd., their stability also was max. at $x =$ 0.08 g and $d = 0.008$ cm.

9157. MOKRUSHIN, S.G. **Experimental study of laminar systems. XVII. Thixotropy of suspensions of crushed films of metal sulfides and hydroxides.** *Kolloid Zhur.* 9, 185-9(1947).—*C.A.* 47, 944*a*.

CuS films, produced at the boundary of 0.5 *M* $CuSO_4$ soln. and H_2S gas, were ground until 72% of the particles were 10-25 μ in size; 25% suspension of this powder was thixotropic. PbS suspensions, prepd. analogously, were thixotropic at 15% concn. $Fe(OH)_3$ and $Cr(OH)_3$ powders, prepd. by passing NH_3 over solns. of $FeCl_3$ and $Cr_2(SO_4)_3$, resp., and grinding to 5-15 μ and 2-6 μ, resp., gave thixotropic suspensions at 36% and 30%, resp.

9158. PETUKHOVA, V.P. **Recovery of silver with the aid of cationite.** *Zavodskaya Lab.* 13, 767-8(1947).—*C.A.* 43, 3306*b*.

The ammoniacal soln. of AgCl was poured over a column of ash-free org. cationite previously purified with HNO_3 and then with 5% NH_4OH. After adsorption, the column was washed with H_2O until removal of Cl^- ions was complete; then, the Ag was eluted with 10% HNO_3. The recovery was 98.5%.

9159. P'YANKOV, V. AND DRUZHININ, F. **Velocity of the reaction between hydrogen sulfide and some metal oxides.** *J. Applied Chem. (U.S.S.R.)* 20, 693-6 (1947)(in Russian).—*C.A.* 42, 1483*d*.

The rate of absorption of H_2S (20% in air) by 0.05-0.15-g samples (grain size 1.5-2 mm) of MnO_2, PbO_2, and yellow HgO was detd. statically at 20°C. The amts. absorbed (moles H_2S per mole oxide) after 1, 5, 25, 50 min. were: MnO_2 1.06, 1.2, 1.45, 1.51; PbO_2 0.64, 0.90, 1.12, 1.29; HgO 0.52, 0.61, 0.72, 0.76. In dynamic absorption, in a stream of air, contg. 0.35-4.0 mg H_2S per liter, flowing at the rate of 500 ml/cm² of sorbent section, the protective effect of layers 10, 20, 30, and 40 mm deep, lasted: MnO_2, 10, 32, 76, and 135 min.; PbO_2, 24, 76, 120, and 184 min., resp.

9160. ROGERS, J. AND SUTHERLAND, K.L. **Principles of flotation—activation of minerals and adsorption of collectors.** *Am. Inst. Mining Met. Engrs., Mining Technol.* 11, No. 1, *Tech. Pub. No.* 2082, 17 pp. (1947).—*C.A.* 41, 1579*f*.

The response of minerals to activator and collector was detd. by captive-bubble tests and confirmed by flotation tests in glass-stoppered cylinders. Five principles were available for detg. the value of a reagent as an activator or depressant: All minerals adsorbed H^+ and (or) OH^- so that the pH value of the soln. largely detd. the adsorptive properties of the mineral. Depressants were chosen from compds. of which the active ion had the same polarity as the collector. Activators were chosen from compds. of which the active ion had the opposite polarity to the collector.

9161. SAPIRO, S.I. **Surface phenomena in metallurgical processes.** *Stal* 7, 395-9(1947).—*C.A.* 43, 2553*f*.

Knowledge of the surface phenomena taking place at the interface melt-gas, melt-solid, melt-melt was important for understanding the processes in a metallurgical furnace. The surface phenomena were classified into: (1) inception of new phases; (2) growth of new phases; (3) adsorption and wetting; (4) dispersion and soln., e.g., dispersion of air in metal within a converter, and (5) sundry contact processes, e.g., $2CO \rightarrow CO_2 + C$ in the presence of Fe_2O_3.

9162. TOLEDO PIZA, FERNANDO ALVARES DE. **Direct reduction of iron ore with charcoal.** *Third Congr. an assoc. brasil. metais, Bol. assoc. brasil. metais* 3, 490-5 (1947) *(Inst. pesquisas tecnol. Div. met., Separata No.* 180*)*.—*C.A.* 42, 2899*g*.

Tests indicated that, when pig Fe was expensive and scrap was scarce, direct reduction of pure iron ores with wood charcoal may be economical, and pilot-plant study for Brazil was recommended. Ceramic or high-temp. alloy pots were practical. Two hrs at 1000°C was insufficient and 12 hrs sufficient to completely reduce 16-kg charges.

9163. WINKELMANN. **Requirements for foundry graphite powder.** *Werkstatt u. Betrieb* 80, 117 (1947).—*C.A.* 42, 2901*f*.

To obtain smooth castings of exact dimensions and without surface defects the graphite powder used for dusting the pattern should be very high in C, and as low as possible in ash and S or pyrite; the cryst. form was preferred to the amorphous, as it is more refractory. The crude graphite was heated in an elec. furnace to 2500-3000°C, and artificially further graphitized by addns. of coke, charcoal, anthracite, or bituminous coal. These addns. were to bind the oxygen of the graphite and to burn almost completely all impurities without attacking the graphite C.

9164. ZAPADANSKIĬ, M.B. **The use of dyes as flotation reagents.** *T͡svetnye Met.* 20, No. 2, 28-31(1947).—*C.A.* 42, 4005*e*.

Acid (anionic), basic (cationic), and mordant dyes were tested as collectors. The acid dyes (predominantly acid azo dyes and primulin) were poor collectors except for metanil yellow. A 1% aq. coln. of metanil yellow was acidified with HCl (0.5 parts of acid to 1 part of dye coln.). As the total quantity of dye soln. was increased from 90 to 510 g per ton, the recovery of 170-mesh fluorite rose from 76 to 85%. With 540 g per ton of collector added in aliquots of 180 g per ton, the total recovery increased to 90-92%. Of the basic dyes methyl violet, crystal violet, and malachite green in the form of free bases acted as collectors. The quartz floated in these tests was of various results. The recovery was 90-95%. To sep. quartz from fluorite, very pure kerosene or white spirit should be used. Carnotite, too, was floated by these reagents. Alizarin, alizarin yellow, and alizarin blue were not suitable for floating quartz or fluorite.

9165. BARGONE, A. AND RINALDI, F. **Mechanism of decarbonization in the treatment of steel.** *Tec. ital.* 3, 319-26(1948).—*C.A.* 43, 3759*g*.

The physicochem. conditions of the decarburization process in liquid steel in elec. and Martin furnaces were investigated. Present hypotheses were examd. to establish the slowest rate-detg. step of the process, the overall equation for which was given as: $FeO + C \rightarrow Fe + CO - \Delta H$. In homogeneous phase, formation of liquid Fe and of gaseous CO took place with rates of the same order of magnitude, depending on general variables such as furnace conditions, or dross.

9166. DASTUR, MINU N. AND CHIPMAN, JOHN. **Elimination of the thermal-diffusion error in studies of gas-metal equilibrium.** *Discussions Faraday Soc.* 1948, No. 4, 100-8.—*C.A.* 43, 4932*i*.

Errors could be minimized by adequate preheating of the incoming gases. Expts. were described at 1535-1563°C, with preheating at low, intermediate, and high levels, i.e., 800°, 1200°, and 1563°C. The primary feed gas was H_2, the admixed gases A, He, and Hg vapor. In the absence of sufficient preheating, addn. of a heavy inert gas tended to diminish the errors.

9167. ERISTAVI, D.I. **Adsorption of nickel and cobalt from aqueous solutions by manganese dioxide and manganese ore of Chiatur.** *Kolloid. Zhur.* 10, 322-8 (1948).—*C.A.* 43, 7774*i*.

MnO_2 adsorbed approx. equal amts. of Co and Ni from solns. of their chlorides and nitrates; at the highest concn. used (1.7 *M*) approx. 6 milliatoms of Ni or Co were adsorbed by 1 g MnO_2 independently of the method of prepn. of MnO_2 (6 methods were used). The adsorption was cationic (i.e., the anion was not adsorbed) and reversible. Various MnO_2 and $MnCO_3$ ores adsorbed more Ni than Co. This may explain the greater percentage of NiO (0.04-0.09%) than of CoO (less than 0.003%) in the ores.

9168. FORNANDER, S. **Behavior of oxygen in liquid steel during the refining period in the basic open-hearth furnace.** *Discussions Faraday Soc.* 1948, No. 4, 296-307.—*C.A.* 43, 4989*a*.

A ladle made from graphite or mild steel was provided with a wooden cover, secured by a thin Fe wire. It could be dipped through the slag layer, and after the wire melted and released the cover, fill itself without contamination with the melt. Reliable detns. of O were carried out this way. The C content of the bath had the greatest influence on the O-content during the refining period. At high C, concn. products [C] × [O] were scattered, but approached equil. values at lower C levels. Mn contents from 0.15 to 2.3% had no influence on O content of bath or on rate of C decrease.

9169. GAUDIN, A.M.; BRUYN, P.L. DE; BLOECHER, W., AND CHANG, C.S. **Radioactive tracers in flotation.** *Mining and Met.* 29, 432-5(1948).—*C.A.* 42, 7210*i*.

Because carbon was an essential ingredient in all collecting and frothing agents, C^{14} could be used as a tracer. Tracer technique may be used to measure surface area of mineral particles and to throw more light on the dynamic properties of the mineral-agent bond formed after addn. of a suitable collector. It may be possible to explain the preferential attachment of collector ions to a particular mineral surface in the presence of other minerals.

9170. GERLACH, WALTER; RENNENKAMPFF, JAKOBA, VON AND BRILL, ALEXANDER. **Magnetic and electrical studies of sintered carbonyl nickel specimens.** *Z. Metallkunde* 39, 130-9(1948).—*C.A.* 42, 7214*d*.

From Ni carbonyl powder (contg. C, 0.05; Fe, 0.04; S, 0.0003%; and Ni balance) small specimens were made by sintering without pressure at 400-1000°C in air, H_2 and vacuum. Sintering in air produced oxidation of powder particles below 1000°C. At 1000°C when d. was highest, equiv. mech., magnetic, and elec. properties were obtained when tested at -300 to +350°C regardless of amt. of sintering; slow cooling in air after sintering caused oxidation only when d. was below max.

9171. GLEMBOTSKIĬ, V.A. **Chemistry of flotation processes.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* 1948, 385-90.—*C.A.* 42, 6171*i*.

Depression of the flotation of a mineral could be attained by reducing the concn. of the ions of the mineral in soln. through introduction of a common ion. Pure quartz was not floatable with any anionic collector (oleic acid, Na oleate, peat resins, high-mol. xanthates, etc.). Smithsonite, $ZnCO_3$, which was nonfloatable owing to its high soly., could be rendered floatable by the process of "two-stage activation" consisting in successive treatment with $BaCl_2$ and Na_2SO_4 and resulting in the formation of an insol. film of $BaSO_4$.

9172. GOODEVE, CHARLES AND JACK, K.H. **Kinetics of nitrogen evolution from an iron-nitrogen interstitial alloy.** *Discussions Faraday Soc.* 1948, No. 4, 82-91.—*C.A.* 43, 4933*d*.

The rate of N_2 evolution from ϵ-Fe nitride at 350 to 500°C was given by a 2nd order equation with respect to interstitial N-concn. and was assocd. with an activation energy of 42,100±1400 cal/g mol. The velocity of diffusion of N atoms to the surface was at least 10^4 times as rapid as the rate-detg. process. The rate-detg. stage of the reaction was considered the combination of N atom pairs at the solid surface.

9173. KATO, ETSUZO. **Removal of pyrite from Amakusa china stone by flotation. I. II.** *Bull. Govt. Research Inst. Ceramics* (Kyoto) 2, No. 1, 5-7; No. 2, 50-53 (1948).—*C.A.* 46, 6349*i*.

Flotation in an alk. medium of china stone from Amakusa Island was studied. Mixts. of K ethyl xanthate with white camphor oil gave good results, while the addn. of NaOH, Na silicate, or Na pyrophosphate to get high pH values (8-10) yielded poor results. No definite relation was found between the degree of removal of pyrite (42-57%) and the particle size of the raw china stone.

9174. KLASSEN, V.I. **Effect of gases liberated from a solution of the flotation of minerals.** *Zhur. Fiz. Khim. (J. Phys. Chem.)* 22, 991-8 (1948).—*C.A.* 43, 3*g*.

Fluorite was flotated when (a) the air bubbles were introduced from outside, (b) the air bubbles were produced by satg. the liquid with air at 0.5-0.75 atm. and releasing the pressure, and (c) both these methods were used simultaneously.

9175. KLASSEN, V.I. **Effect of gas adsorption on the flotability of minerals.** *Gornyl Zhur.* 122, No. 9, 32-4 (1948).—*C.A.* 43, 3325*c*.

The effect of phys. adsorption of a gas (H_2, air, CO_2) on the floatability of fluorite and arsenopyrite was studied by passing the purified gas through a partition and then through the mineral (-100 + 200 mesh) at a rate of 160-8 bubbles/min. The mineral powder raised to the surface was collected and weighed. In the flotation of fluorite (200 g NaOH/ton and varying amts. of oleic acid), air was more active than H_2. The adsorption of gases by the mineral particles was subsequent to the attachment of the collector to the particles. In the absence of a collector, the hydration envelope on the mineral particle was complete and the bound H_2O, devoid of its capacity to dissolve gas, hampered the penetration of the gas to the mineral surface.

9176. KOEBEL, NORBERT K. **Sintering atmospheres used in powder metallurgy.** *Proc. Ann. Spring Meeting, Metal Powder Assoc.* 4, 6-14, discussion, 14-18(1948).—*C.A.* 45, 4185*b*.

In sintering, a reducing atm. was usually required; vacuum sintering was used in special cases where the conventional reducing atms. react with the work. Pure dry H_2 had great reducing power, but was expensive. An atm. produced by heating anhyd. NH_3 to 1700°F over a catalyst may contain up to 0.5% undissocd. NH_3; thus, its application was restricted to nonferrous and low-alloy ferrous materials. The most widely used sintering atm. was produced by exothermal cracking of city or natural gas; this atm. was used chiefly for low-C steel and bronze. The high CO_2 content and the presence of H_2 in conjunction with H_2O was strongly decarburizing. CO_2 could be removed by passing the gas over incandescent charcoal, or by scrubbing the gas with ethanolamine.

9177. KROLL, J. AND SCHELECHTEN, A.W. **Reactions of carbon and metal oxides in vacuum.** *J. Electrochem. Soc.* 93, 247-58(1948).—*C.A.* 42, 5365*e*.

The reduction of several metal oxides by carbon in a vacuum was studied. None of the refractory oxides studied was stable in contact with carbon in a vacuum above 1380°C. Oxides of multivalent metals reacted at 700°C or less. As a method for producing pure metals, best results were obtained with Cr, V, Cb, and Ta. A Cr metal analyzing 97% Cr and a V metal analyzing 93% V were obtained. The vacuum reduction method would be practical only for the production of the more expensive and rarer metals.

9178. Miller, H.C. **Sintering of brass compacts.** *Proc. Ann. Spring Meeting Metal Powder Assoc.* **4**, 70-4, discussion, 74-9(1948).—*C.A.* 45, 4618*h*.

Sintering expts. were carried out with pre-alloyed brass powder pressed at 30 tons per in². Various mixts. of H_2 and N_2 were used as atm. for sintering at 850 °C for 30 min. Flow rates of approx. 2 ft³/hr for each 100-g sample were maintained. Very poor strength resulted from sintering in plain N_2 with gradual improvement as the H_2 content was increased. Loss of Zn increased with greater H_2 content in the atm. Dezincification could be controlled by letting the Zn vapor pressure build up in the atm. The appearance of sintered brass was not impaired by considerable amts. of H_2O. Dezincification was avoided by sintering in closed containers which contained small amts. of zinc stearate not in contact with the work.

9179. Pamart, Charles. **Carbonization conditions for Lorraine coals. Relation between conditioning of the charge and cohesion of the coke.** *Compt. rend. congr. ind. gaz Paris* (Assoc. tech. ind. gaz France) **65**, 156-70(1948).—*C.A.* **46**, 10580*f*.

A min. "porosity" of the charge was important. Rather than attain this by compression of the charge, proper size distribution of the pulverized coal and of low moisture content was important, both of which contributed to low porosity. A series of tests in an 80-mm test oven, 30-kg charge, 600 °C, 60-20-20 mixt. of Lorraine, Saar, and semicoke, showed that the resultant coke increased in Micum tumbler test from 9.4 to 24.4% of 0-10 fraction for moisture content of mixt. from 1.38 to 5.57%.

9180. Peretti, E.A. **New method for studying the mechanism of roasting reactions.** *Discussions Faraday Soc.* **1948**, No. 4, 174-9.—*C.A.* **43**, 4988*g*.

The roasting reaction was followed in the case of CuS, by prepg. cylindrical briquets from -100 mesh C.P. CuS (2.86 cm diam., 2.86 cm long) under 3500 lb/in² pressure, placing them in a muffle furnace at 430-965 °C, and following the reaction by cutting the cylinders transversely and measuring the diams. of the visible phase boundaries. Visual and x-ray examns. showed $CuS \rightarrow Cu_2S \rightarrow Cu_2O \rightarrow CuO$.

9181. Plaksin, I.N. and Bessonov, S.V. **Effect of adsorption and chemical action of oxygen on the flotation properties of gold, silver, and copper.** *Doklady Akad. Nauk S.S.S.R.* **60**, 637-9 (1948).—*C.A.* 43, 7875*f*.

A study was made of the effect of O_2 on the interaction between metal and collector. The contact-angle method was used for detg. the floatability of a given metal surface. For Au the influence of oxide film formation was not observed. For Ag all stages of the oxidation could be observed, whereas for Cu the first stage of oxidation proceeded so rapidly that only the effect of oxide film formation could be observed. Times required to establish contact of metal with collector were studied.

9182. Plaksin, I.N. and Bessonov, S.V. **Role of oxygen and other gases in the flotation phenomena.** *Izvest. Akad. Nauk U.S.S.R., Otdel. Tekh. Nauk* **1948**, 1773-88.—*C.A.* 45, 8417*c*.

The contact angle was measured by projecting the image of a drop resting on a mineral surface, and measuring the angle directly. The metal surfaces were electrolytic Au and Ag which were formed into cylindrical tablets of 8 mm diam. and 0.5 mm thick. The minerals, pyrite, galena, and arsenopyrite were also studied. For exposure of the mineral surface, the method of polishing (under a layer of dist. water) was adopted. O_2 (from the air or dissolved in water) was adsorbed on metal surfaces in the following steps: (1) phys. adsorption of gas, (2) activation of adsorption, and (3) fixation of O_2 on the surface with formation of O_2 film (chemisorption), and then (4) considerable oxidation of the surface with formation of an oxide film. Other gases used in the expts. were N_2 and CO_2.

9183. Plaksin, I.N.; Khazhinskaya, G.N., and Brovkina, T.F. **The problem of the floatability of zinc blende.** *Izvest. Akad. Nauk U.S.S.R., Otdel. Tekh. Nauk* **1948**, 681-90.—*C.A.* 45, 7932*c*.

There was an increase in floatability of zinc blende not activated by $CuSO_4$ when air or O_2 was blown through the pulps for a short time. Floatability of zinc blende was increased by small amts. of $CuSO_4$ (1 kg/ton) but decreased by increasing concns. of $CuSO_4$ to 5 kg/ton. The particle size had a very important influence on the stability of the activating film. Increasing the concn. of lime in the pulp to 0.112% decreased the recovery of zinc blende by 30% during flotation of the slime fraction. By oxidizing the surfaces of the zinc blende particles, their activity toward the collecting reagent was enhanced.

9184. Preller, G.S. **Surface areas of materials.** *S. African Mining Eng. J.* 59, 111-13 (1948).—*C.A.* 42, 4029*d*.

The importance of surface area and condition, particularly in processes of chem. reactions, was discussed at length and the structural properties of some natural minerals were described explaining the reasons for more or less readiness to react with liquids.

9185. Seiberlich, J. **Absorption studies with waste pickle liquor.** *Steel* **122**, No. 2, 90-8 (1948); *Univ. New Hampshire, Eng. Expt. Sta., Eng. Pub. No.* 6.—*C.A.* 42, 8143*e*.

Wood charcoal, animal charcoal, petroleum coke, peat, activated carbon, activated silica, coal dust, and colloidal $Fe(OH)_2$ were used to study the absorption of $FeSO_4$ from com. steel pickle liquors contg. an excess of H_2SO_4. Activated carbon gave best results in neutral and acid solns.; 90% of the soln. was absorbed by the equiv. of carbon. Activated silica and colloidal $Fe(OH)_2$ absorbed approx. 50%. A large part of H_2SO_4 remained in soln. $FeSO_4$ was removed from the activated material by extractions with hot water. Methods for activating the materials were described.

9186. Sutherland, K.L. **Physical chemistry of flotation. XI. Kinetics of the flotation process.** *J. Phys. & Colloid Chem.* 52, 394-425 (1948).—*C.A.* 42, 2836*h*.

A math. analysis was given of the adhesion of mineral to bubble. The "collision area" of a bubble of radius R was proportional to $R\gamma$, where γ was the radius of the mineral particle. Calcd. induction periods were probably about as accurate as the exptl. values. When there was a distribution of mineral particle sizes, the rate of flotation was the sum of a no. of exponential functions of time. When there was a distribution of bubble sizes, the av. rate of flotation was equal to the rate of flotation with suitably defined mean size of bubble. An exptl. method of detg. the bubble-size distribution was described.

9187. Weingraber, H. v. **Standardization of surfaces.** *Die Technik* 3, 417-23(1948).—*C.A.* 45, 8430*g*.

It was necessary to consider alterations in the material caused by machining or other working, the requirements which the material must fulfil, appropriate tests, and means of ensuring reproducibility. The surface structure varied according to pretreatment and state of the raw material, e.g., cast, rolled, or wrought, bonderized, pressed, drawn, or coated protectively. Twenty examples of classes based on static or dynamic strain were described and appropriate mech., optical, and elec. tests suggested.

9188. Aleĭnikov, N.A. **Formation and properties of flotation disperse systems.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 22, 812-22 (1949).—*C.A.* 45, 8850*b*.

The mineralized froth formed by dispersion of air in coarse aq. suspensions of coal were classified on the basis of 2 types: (1) film structure and (2) aggregate structure. The aggregate froths were easily formed in the presence of emulsions of air and hydrocarbons or as a result of disruption of the fine structure of film froth or as a result of processes of flocculation. The phys. condition of the air bubble in the dispersed medium should be considered as the condition of the system, including bubbles, adsorption layers, and their surrounding solvated films. The following relations detg. the depth of the film and the size of the gas bubble were proposed: $h = (a - 1)r$; $\Delta P = 2\sigma/3(a - 1)r$, where h was thickness of film, r radius of froth cell, a max. vol. of froth formed, P pressure of gas inside the froth cell, and σ surface tension of the medium.

9189. Andrade, E.N. da C. and Randall, R.F.Y. **The Rehbinder effect.** *Nature* 164, 1127 (1949). —*C.A.* 44, 3324*f*.

Work on single Cd crystals indicated that the diminution of mech. strength of metals by surface-active liquids was due to a disintegrating action on the metal oxide film.

9190. Burstall, F.H.; Davies, G.R., and Wells, R.A. **Inorganic chromatography on cellulose. III The use of columns of cellulose for the separation of metals.** *Discussions Faraday Soc.* 1949, No. 7, 179-83.—*C.A.* 45, 60*d*.

Ni, Co, Cu, Fe, Hg, Bi, Cd, as chlorides, could be sepd. by elution with appropriate org. solvents on a column of cellulose prepd. from paper pulp. The solvents contained Me Pr CO, acetone, water, HCl, Me acetate, Na phosphate, Et ether, and HNO_3. The sepns. depended on the selectivity of the solvent, the partition of the salts between the org. solvent and the water in the cellulose and the adsorbability of the metal ions.

9191. Church, T.G. **Formation of radioactive surface films on minerals.** *Natl. Research Council Can., Rept.* CRC-407, 8 pp.; *Nuclear Sci. Abstracts.* 3, 83(1949).—*C.A.* 44, 2417*h*.

It was found that specific minerals in an ore could assume a surface radioactivity by undergoing reactions with radioactive ions in soln. It was essential that the mineral have a suitably tarnished or coated surface, for, in general, no exchange occurred on a fresh surface. It was suggested that the radioactivity so induced could be used in conjunction with a mech. device to separate and concentrate valuable minerals or to control plant processes.

9192. Cooke, Strathmore R.B. **The flotation of quartz with calcium as activator.** *Tech. Pub. No.* 2607-B (1949). —*C.A.* 43, 6953*i*.

The activation and flotation of quartz with Ca^{++} could be explained on the basis of exchange of H^+ on the quartz and Ca^{++} in soln. At high Na^+ concns., Na depressed Ca-activated quartz by removing the Ca. At high Ca^{++} concns., hydroxyl ions could replace collector ions and depress the quartz. Fine quartz particles adsorbed Ca ions under conditions which prohibited large particles from doing the same.

9193. Doughty, F.T.C. **Flotability of minerals.** *Mining Mag.* 81, 268-71 (1949).—*C.A.* 44, 878*h*.

Minerals were divided, according to their flotability, into 4 classes: (1) those easily floatable; (2) those floatable, with probable recoveries of the order of 80%; (3) those difficult to float (certain gang minerals make satisfactory results impossible); (4) those not yet floated on a com. basis, though many of them could be floated in the lab. Metallic minerals and industrial minerals were considered separately.

9194. Faddis, S.C. **Effect of nitrogen in improving physical properties of low-carbon steel.** *Open Hearth Steel Proc. Conf., Am. Inst. Mining Met. Engrs.* 32, 260-3(1949).—*C.A.* 46, 4451*c*.

N_2 could be used advantageously in low-C rimmed, semikilled, and capped steels to obtain greater hardness and higher-tensile strength. The hardness of steels contg. 0.007 and 0.1% of N_2 was compared.

9195. Fast, J.D. **Influence of oxygen, nitrogen, and carbon on the impact strength of iron and steel.** *Intern. Gieterij-Congr., Amsterdam* 1949; *Metalen, Congresboek* 1949, 171-83.—*C.A.* 45, 95*h*.

Mild steel was melted in a glass vessel in vacuum to expel CO and N_2 and remelted in the presence of O_2 and N_2. The impact strength of the resulting alloys was measured. N_2 up to 0.030% had no effect at 20°C; O_2, even in large amts., had no effect on mild steel or pure Fe if more than 0.002% C was present. By the ignition of thin-walled cylinders of metal, O_2 was detd. below 0.01% with a precision of 0.0005%. The intergranular cleavage strength was reduced by oxide, but not by carbide, along the crystal boundaries to make the metal brittle. O_2 and N_2 adversely influenced the mech. properties with increasing temp. by shifting the transition range; O_2 and carbon did not cause a min. in the curve of pure Fe, but O_2 + N_2 or C + N_2 did.

9196. Fuks, G.I.; Klychnikov, V.M., and Tsyganova, E.V. **Adhesion of microscopic particles to solid surfaces in liquids.** *Doklady Akad. Nauk S.S.S.R.* **65**, 307-10 (1949).—*C.A.* **44**, 9772*h*.

With suspensions of 0.8-15-μ particles of quartz, glass, graphite, clay, resin, and surfaces of quartz, glass, metal, or paraffin, plots of the fraction θ of particles still adhering to the surface after the action of a force F gave distribution curves with a max. If adhesion was characterized by the min. F/G, and by nos. of adhesions on a vertical (γ_1) and on a horizontal surface (γ_2), it was noted that in H_2O the ratio γ_1/γ_2 increased with the concn. of electrolyte. The values of γ varied with the medium, the nature and size of the particles and of the solid surface, and the length of the time of contact between the particles and the surface. The adhesion no. γ_1 of quartz was an exponential function of the concn. c of electrolyte, $\gamma_1 = k_1 + k_2 \log c$; the coeff. k_2 was approx. const. (8.75-10.0) for chlorides of Li, Na, K, Rb, Mg, Ca, and Ba, whereas k_1 increased with decreasing hydration of equiv. ions.

9197. Gaudin, A.M. and Bruyn, P.L. de. **Radioactive tracers in mineral engineering problems and particularly in flotation.** *Trans. Can. Inst. Mining Met. Engrs.* 52, *(in Can. Mining Met. Bull. No.* 447*)*, 331-7 (1949).—*C.A.* 43, 8321*i*.

Flotation expts. were made relating to the absorption of dodecylamine on quartz. The amine acetate abstracted by quartz amounted to 0.008 mg per g of quartz. Since it was found that the surface of the quartz was such that about 0.21 mg of agent would be required to form a complete monoionic film, the coating in the expt. was only 3.8% complete.

9198. Glembotskiĭ, V.A. **Chemosorptive activity of the mineral in connection with its flotation properties.** *Izvest. Akad. Nauk U.S.S.R., Otdel. Tekh. Nauk* **1949**, 1701-9.—*C.A.* 45, 9311*g*.

In expts. on flotation of galena with K Et xanthate as collector, only part of the mineral surface was covered with a layer of collector. This film was unimol. and the finer the mineral particles, the higher the chemosorptive activity.

9199. Gyorki, József, and Preisich, Miklós. **Removal of sulfur from coal gases.** *Magyar Kém. Lapja* 4, 147-50(1949).—*C.A.* 45, 844*i*.

For the treatment of gases from Hungarian brown coals rich in S, the dry iron hydroxide absorbing method was proposed. The yield of this method was independent of Fe content or eventual alkalinity of the mass. Parallel expts. at the plant of Pét with desulfurizing app. with active carbon or iron hydroxide showed that the first method had lower costs and was available for the production of S at more reasonable prices.

9200. Hussey, S.J. **Application of ion-exchange resins in the cyanidation of a gold and silver ore.** *U.S. Bur. Mines Rept. Invest. No.* 4374, 33 pp (1949).—*C.A.* 43, 3753*e*.

The ore was not amenable to treatment by usual cyanidation techniques, but was amenable to cyanidation followed by countercurrent adsorption of values from the leach pulp by the anion exchange resin Amberlite. Optimum leach extn. from the ore was 78.4% of the Au and 51.5% of the Ag. An over-all recovery of 74.8% of the Au and 40.7% of the Ag in all ore was effected by countercurrent adsorption and regeneration. Over-all efficiency of adsorption by the resin was 95.4% of the Au and 79.0% of the Ag in the pregnant solns. of the leach pulps. Total recovery in the eluting solns. was 98.7% of the Au and 99.5% of the Ag adsorbed by the resin. NaOH was the best eluting and regenerating agent tested.

9201. Kauko, Yrjo. **The action of water and of calcium hydroxide solution on slag.** *Ing. Vetenskaps Akad., Handl. No.* **201**, 11 pp. (1949).—*C.A.* 44, 23*g*.

A glass electrode was used and results checked against standard buffers at values above pH 10. Oxidation-reduction potentials were also measured. Curves were given in which log OH was plotted against concn. of $Ca(OH)_2$ and against adsorbed OH^-. A reversible adsorption of OH^- on the slag took place which had a zero value at about pH 2.5.

9202. Kemsley, D.S. **Deformation of single crystals of tin in solutions of oleic acid.** *Nature* 163, 404 (1949).—*C.A.* 43, 6028*i*.

Alteration of the surface condition caused no change in crit. shear stress. Various paraffin oils, e.g., hexadecane and kerosene with different viscosities, had no effect on the changes. The elongation of the crystal had no effect on the elec. resistance in air or in the oleic acid soln.

9203. Klassen, V. I. and Ratobyl'skaya, L. D. **Estimation of the flotation activity of mineral surfaces.** *Doklady Akad. Nauk S.S.S.R.* 67, 487-9(1949).—*C.A.* 44, 2821*a*.

Contact angle and hysteresis of wetting were the chief properties considered. For the exptl. work an air bubble of a detd. size was placed on a horizontal surface consisting of a mineral powder fixed to a strip of glass. The slide with adherent bubble was placed under water and tilted until the bubble was displaced. From such an expt. the force required to displace the bubble was calcd. Results were given for expts. conducted with a natural Ca-contg. silicate as the mineral.

9204. Lukashin, V. I. **Conversion of the sulfur contained in the charge into calcium sulfide in metallurgical smelting.** *Izvest. Akad. Nauk, Otdel. Tekh. Nauk* **1949**, 131-5.—*C.A.* 44, 2424*h*.

After preliminary flushing with N_2, 3 hrs heating of the 15-20 g sample of CaO in a 5-6 liter/hr stream of N_2 passed over boiling S, and cooling to room temp. under 18-20 liter/hr. N_2, the product from a sample of CaO (from pure $CaCO_3$, ignited at 1100°C), heated at 400°C, analyzed (CaS, $CaSO_4$, CaO, insol., MgO, "S") 1.01, 0.66, 95.96, 0, 0, 2.26%, and from a sample of CaO (marble, ignited at 1100°), heated at 900°, 58.40, 36.45, 3.11, 0.52, 0.25, 1.13%. At 900°, almost all (96.64%) of the S bound is in the form of CaS + $CaSO_4$, only 3.36% of it in the form of "S". At 400°, only 14.2% of the S bound is in the form of CaS + $CaSO_4$, 85.8% of it in the form of "S". In the reaction between S vapor and pure $CaSO_4$, the product was, at 400° (3 hrs) CaOS, $CaSO_4$ 99.90% (i.e. unchanged), at 600° (3 hrs) 1.60, 98.32%, at 700° (2 hrs) 7.32, 92.48%, and at 900° (6 hrs) 97.73, 2.12%.

9205. Machu, W. **Surface chemistry and kinetics of corrosion processes.** *Arch. Metallkunde* 3, 1-7(1949); *Fortschr. Gebiete Phosphatier* 3, 1-21(1950).—*C.A.* 45, 4196*b*.

Accelerated corrosion tests were run on parkerized, bonderized, and plain steel panels in solns. of Na_2SO_4, NaCl, and Na_2CrO_4. The value of the rate const. for the formation of corrosion products was a numerically exact value for the strength and speed of attack on the metal. The reaction rates at a local anode area were dependent upon the ratio of bare unprotected metal to the nonreactive surface area. The effect of time on corrosion was detd. by the instability of the corrosion layer and the ease with which cathode polarization took place.

9206. Machu, W. **Kinetics in coating methods, especially by the phosphate process.** *Arch. Metallkunde* 3, 203-8(1949).—*C.A.* 44, 958*f*.

The time factor in the coating reaction was proportional to the amt. of exposed anode surface. In accelerated treatments with oxidizing, reducing, or org. addns., the actual rate of deposition deviated from the calcd. value because of interference by the addn. agents. There was probably a cathode reaction superimposed on the anode process.

9207. McLeod, J. M. **The relationship between carbon deposition and reducibility.** *J. West Scot. Iron Steel Inst.* 57, 242-53(1949-50).—*C.A.* 46, 3476*h*.

The carbon deposition range for some Fe ores and sinters were investigated under conditions as similar as possible to those in the blast furnace. Variation in the amount of carbon deposited with different CO/CO_2 ratios was detd. Deposition of carbon was found to be a max. with easily reduced ores and sinters. Carbon deposition was measured in a CO atm. by change in vol. of the specimen and reducibility by the CO_2 produced after correction for that produced by carbon deposition. Samples + 1/4 to -1/2 in. in size and weighing 10 g were used. Carbon deposition started at 450°C, reached a max. at 500°C, and then fell off; at 650°C it was negligible. The significance of the results in terms of blast-furnace operation was outlined.

9208. Neumann, B. and Klemm, H. **The structural formation of iron oxide-silicate bloomery furnace slag and the process for separating the metallic iron out of the slag.** *Arch. Metallkunde* 3, 7-11(1949).—*C.A.* 45, 4186*c*.

The Fe reduction process was carried out in a pit-type furnace. The furnace was brought to heat with an air blast blowing through the bed of charcoal. Alternate layers of charcoal and ore and charcoal mixt. were introduced. The large excess of charcoal goes off as CO_2. This prevented the reduced Fe from oxidizing. Because of the short reduction time, small quantities of FeO remained unreduced in the slag. The reduction of the Fe ore took place at about 1200°C. At this temp. the melting point of the Fe (1528°) was not reached, so it sepd. from the fluid in a pasty state with some slag particles included.

9209. Okamura, Toshihiko; Masuda, Yoshimichi, and Kikuta, Sadao. **Experimental study of the kinetics of sintering of metal powder at constant temperature. I.** *Science Repts. Research Insts. Tohoku Univ.* Ser. A, I, 357-63 (1949).—*C.A.* 45, 4618*f*.

The breaking strength and shrinkage of Cu powder sintered at 500, 550, 660, and 720°C and of Fe powder sintered at 700, 750, 800, 880, and 910°C were measured. With Cu the shape of the breaking strength curve changed abruptly in the neighborhood of 700°C, but the shrinkage curves exhibited no such change. Microscopic examn. indicated that the period in which the breaking strength curve rose steeply coincided with the closing of the open pores in the specimens. The vol. of the pores w varied with time t at const. temp. as follows: $w = At^n$, where A and n were consts. The activation energies for sintering were 56,000 cal/mole for Cu and 65,000 cal/mole for Fe.

9210. Pask, Joseph A. **Adherence of glass to metal.** *Better Enameling* 20, 6-7, 31(1949).—*C.A.* 45, 5382*d*.

Practices involved in making vacuum-tight glass-to-metal seals for the electronics industry were described. An oxide layer was presumed to account for adherence in glass-to-metal seals. A new theory combining the oxide and mech. theories was proposed in which oxide formation was necessary for wetting of metal by glass, but surface roughness caused by oxidation and(or) chem. etching by CoO during firing gave the actual adherence.

9211. Plaksin, I. N. and Dubrovskaya, E. M. **Effect of gases on the flotation of phosphorite ores.** *Doklady Akad. Nauk S.S.S.R.* 68, 361-3 (1949).—*C.A.* 44, 3856*g*.

A lab.-type flotation machine was modified by a cover to prevent entrance of air and devices at the side to supply air from below into the cell. The phosphorite ores were ground to a screen size of 100-270 mesh, deslimed, and dried previous to the flotation. The reagents used were Na_2CO_3, Na silicate, and tallow soap. Practical flotation in N_2 was not feasible. O_2 gave the most noticeable increase in the recovery of P_2O_5. Air and N_2 lowered the recovery of P_2O_5 in the concentrate. O_2 increased the hydrophobicity of the mineral surface and also caused an increase in the thickness of the sorption layer of the collector.

9212. Plaksin, I. N. and Dubrovskaya, E. M. **Effect of the sorption action of gases on the floatability of phosphorites.** *Izvest. Akad. Nauk U.S.S.R., Otdel. Tekh. Nauk* **1949**, 1030-7. —*C.A.* **45**, 8417*g*.

The angle of contact between the mineral surface and the flotation medium was measured. The polished section of phosphorite immediately after exposure of the surface was dipped into collector consisting of a 20% soln. of carboxylic acids in kerosene. After the given time of contact, the polished section was carefully removed from soln., rinsed with distd. water, dried in air for 3 min., and arranged for measurement of contact angle. It was concluded that air, without the influence of collector, promoted the hydrophobization of the surface of the phosphorite mineral. When the phosphorite surface sorbed collector without the influence of air, a 3-hr period of contact with the collector was required for development of the max. contact angle (60°). However, after preliminary action of air on the mineral surface for 2 hrs and subsequent contact of mineral with collector for 1 hr the contact angle increased to 68°.

9213. Plaksin, I. N.; Khazhinskaya, G. N., and Brovkina, T. F. **Influence of the natural composition and structure of zinc blendes on their floatability.** *Izvest. Akad. Nauk U.S.S.R., Otel. Tekh. Nauk* **1949**, 1361-4.—*C.A.* **45**, 7932*f*.

Flotation tests were made with zinc blende from 5 different deposits. The minerals to be tested were ground to -100 mesh (40-50%, -200 mesh). On the basis of the expts. made it was concluded that O_2 activated zinc blende, interacting with the Fe sulfide in it. Graphs were used to show (1) mineral recovery *vs.* length of time of oxygenation of a zinc blende to which $CuSO_4$ was added and (2) mineral recovery *vs.* length of time of oxygenation without addn. of $CuSO_4$. The results of analyses of the zinc blendes for Zn, Cu, Fe, Pb, and insol. residue + silica were given.

9214. Plaksin, I. N. and Kurenkov, I. I. **Intensification of flotation granulation.** *Gornyĭ Zhur.* **123**, No. 4, 34-5(1949).—*C.A.* **44**, 87*f*.

Flotation granulation consisted of combining gravity concn. with flotation. Such condition was obtained when ore was tabled while air was supplied to the treated material. Some of the principles involved in tabling were discussed.

9215. Plaksin, I. N. and Okolovich, A. M. **Depression of pyrite and arsenopyrite in flotation in an alkaline medium.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* **1949**, 907-22. —*C.A.* **45**, 9431*i*.

All expts. were made with ore of two sizes: -100 mesh and -200 mesh. In cases where the effect of the alkali appeared to be chiefly a result of sorption, lime showed considerably greater influence than did NaOH. However, when the depression was a consequence of formation of a deposit on the mineral particles, large differences were not observed. Limed films showed less stability than films formed by the action of NaOH. The high activity of lime appeared to be a result of activity of the Ca^{++} which was involved in formation of films on the mineral surface. Addn. of $CuSO_4$ to the pulp caused an increase in flotation capacity of arsenopyrite in lime medium.

9216. Rebinder, P. A. and Likhtman, V. I. **Influence of the experimental conditions on the effect of adsorption in facilitating the deformation of metal single crystals.** *Doklady Akad. Nauk S.S.S.R.* 69, 219-22(1949).—*C.A.* **45**, 6449*i*.

Adsorption of surface-active substance in microcracks prevented their collapsing and thus facilitated plastic flow. Consequently, this effect could not be expected to be observed either at low rates of deformation, where spontaneous recovery predominated over development of microcracks, or at too high rates where adsorption lagged behind the production of microcracks. The effect of BuOH and $C_7H_{15}OH$ vapor on the stress-strain curve of single crystals of Sn, Pb, Zn, and Al, as compared with the same curves *in vacuo* (10^{-5}mm Hg), was observed with an unetched surface. In observations of the creep, effects of surface-active substances showed themselves in a wide range of loads, and were not contingent on an optimum rate of deformation.

9217. Thon, N.; Kelemen D., and Yang, Ling. **Porosity of electrodeposited metals. A.E.S. Research Project No. 6. IV. Measurement of very low porosities by the low pressure-constant overpressure method.** *Plating* 36, 362-6(1949).—*C.A.* 43, 6923*f*.

Sound wrought Ni foils 2.5 μ thick were found to be incomparably less porous than electrolytic foils of comparable thickness. Ni deposits with preferred orientation of (110) crystal faces parallel to the base metal surface were much more porous than those with (100) faces parallel.

9218. Tittel, Oszkár. **Bentonite as a secondary material in foundries.** *Bányász. Kohász. Lapok* **82**, 490-5(1949).—*C.A.* **45**, 2833*h*.

For the evaluation of Hungarian bentonites as secondary materials in foundries, the amt. of water required to obtain solidification in 24 hrs was detd. Bentonites of first quality took up 15-times their own vol., water absorption in the 2nd group was 10-times, in the 3rd group 7-times as much as the vol. of the sample. Thixotropy and film formation on drying were 2 characteristic properties suitable for application in foundries.

9219. Vajna, Sandor. **Separation of sulfur from Hungarian coals.** *Magyar Kém. Lapja* 4, 25-6(1949).—*C.A.* **45**, 1322*f*.

Hungarian coals had a mean S content of 3-4%, half of which was transformed into H_2S at gas production. Sepn. of S by active carbon was plausible only with gases where previously a proper purifying procedure was made, whereas the $Fe(OH)_3$ mass could be used for gas purification without previous steps.

9220. WARK, I. W. **Methods of separation based on surface properties.** *Roy. Australian Chem. Inst. J. & Proc.* 16, 387-404(1949).—*C.A.* 44, 10384*g*.

The general principles of sepg. phys. mixts. by selective flotation were outlined. The use of zanthates as collectors, the nature of the adsorbed xanthate film, and the use of differential depressants for sepg. minerals of like contact angle properties were particularly discussed. Phys. mixts. could also be sepd. by means of detergents, which like flotation reagents depended on competitive adsorption, and by electrostatic methods.

9221. WU, PAO-ZUNG AND MORRIS, T. M. **The effect of silicate and hydroxyl ions on the abstraction of potassium ethyl xanthate by galena.** *Bull. Univ. Missouri School of Mines and Met., Tech. Ser. No.* 74, 15 pp.(1949).—*C.A.* 44, 3857*i*.

Chem. and flotation tests showed that OH^- and SiO_3^{2-} reduced galena recovery in flotation when KEtX was used as a collector, as these ions retarded the reaction of the xanthate ions and the Pb^{++} at the galena surface.

9222. AKSEL'ROD, R. S. AND TARASOVA, L. S. **Determination of oxygen in steel.** *Zavodskaya Lab.* 16, 1494-5(1950).—*C.A.* 45, 10131*f*.

The molten metal was sampled with a Fe sampling vessel contg. an Al wire spiral (0.3-0.5% of sample wt). The Al_2O_3 formed was detd. and after subtraction of the Al_2O_3 present naturally in the steel, the amt. of O present in the original sample was calcd.

9223. ANDRADE, E. N. DA C.; RANDALL, R. F. Y., AND MAKIN, M. J. **The Rebinder effect.** *Proc. Phys. Soc.* (London) 63B, 990-5(1950).—*C.A.* 45, 4511*i*.

The immersion of wires of certain metals in nonpolar paraffin contg. a little oleic acid increased the rate of flow of the metal under a given stress and increased the elec. resistivity. The mech. effect could be obtained with single crystals of Cd if the surface was contaminated by a thin oxide layer, which was known to increase the crit. shear stress, but not if the surface was clean. The effect was attributed to the disruption of the hardening surface layer by the active agent and not to penetration into the metal.

9224. BELYAEV, A. F. AND KOMKOVA, L. D. **Effect of pressure on the burning velocity of thermites.** *Zhur. Fiz. Khim.* 24, 1302-11(1950).—*C.A.* 45, 3696*h*.

The effect of pressure on the burning rate of solids was used as a criterion for deciding whether the gas phase partakes or not in some rate-detg. step. The systems studied were (1) $Cr_2O_3 + 2Al$, (2) $Fe_2O_3 + 2Al$, (3) $Cr_2O_3 + 3\ Mg$, (4) $1.5\ MnO_2 + 2\ Al$. Pressed cylinders (800 atm.) of the reactants were burned in a bomb under a N_2 pressure up to 150 atm. The linear reaction rate was registered photographically. Runs in an atm. of A showed that formation of nitrides did not affect the rate. The observed rates were of the order of a few cm/sec. The effect of pressure was to regulate the adsorption of the metal vapor rather than to regulate the vaporization of the metal.

9225. BLOODGOOD, D. E. AND STRICKLAND, A. **Chromium removal by ion exchange.** *Water & Sewage Works* 97, 28-32(1950).—*C.A.* 44, 2678*f*.

No satisfactory method was developed for regenerating the resins by direct replacement reactions, for both the chromate and Cr^{+++} appeared to form stable, complex compounds with the resins. A new method of elution, not yet fully tested, suggested the reduction of the chromate adsorbed on the anion exchanger to the cationic Cr^{+++} by means of H_2O_2.

9226. CHVORINOV, NIKOLAJ. **Controlling the shape of graphite in cast iron.** *Hutnické Listy,* Suppl. No. 2, 50-6(1950).—*C.A.* 45, 996*e*.

The factors influencing the graphitization process were studied. The dissolved O_2 and S contents had a decisive influence both in the case of standard types of cast iron and also in the case of nodular cast iron.

9227. COOK, MELVIN A. AND NIXON, JOHN C. **Theory of water-repellent films on solids formed by adsorption from aqueous solutions of heteropolar compounds.** *J. Phys. & Colloid Chem.* 54, 445-59(1950).—*C.A.* 44, 6229*a*.

The most important use of water-repellent films was in flotation. The films were formed by adsorption of collectors which were anionic, cationic, and nonelectrolytic compds. in the order of industrial importance. Zeta potentials and contact bubble data were in accord with the neutral-mol. theory involving the adsorption of mols.

9228. COSTA, R. L. **Regeneration of chromic acid solutions by cation exchange.** *Ind. Eng. Chem.* 42, 308-311(1950).—*C.A.* 44, 3377*a*.

Chromic acid anodic baths, Cu stripping baths, and other chromic acid solutions that were rendered useless by the accumulation of dissolved metals, such as Al, Cu, and Fe were regenerated in passing through a bed of cation exchange resin. The soln. was made suitable for reuse, and the problem of disposing of the waste was minimized.

9229. CRABTREE, E. H. JR.; WINTERS, V. W., AND CHAPMAN, T. G. **Developments in the application of activated carbon to cyanidation, including the desorption of gold and silver from carbons.** *Am. Inst. Mining Met. Engrs., Tech. Pub. No.* 2744-B, *Mining Eng.* 187, No. 2, 217-22(1950).—*C.A.* 44, 2423*c*.

The carbon-cyanidation process was used in a stagnant ore pulp in a 25 ton per day pilot plant. Minus 150-mesh activated carbon, with lime and cyanide, were pulped with Au-bearing tailings residues at a consistency of 75% solids and allowed to stand 15 to 20 hrs. The carbon was then recovered from the dild. pulp by flotation. About 75% of the Au was recovered in the carbon flotation concentrate. Another method which used coarse activated carbon in revolving screen containers partially immersed in a series of 3 agitators recovered 92.7% of the

Au in a coarse concentrate assaying 41.86 oz of Au per ton of carbon. This concentrate was then treated by a desorption method in which 98.4% of the Au was extd.

9230. DUNHAM, K. C. AND TAYLOR, J. T. **The use of diamond-impregnated tools for rock-slicing.** *Mineralog. Mag.* 29, 191-9(1950).—*C. A.* 45, 6880*c*.

Diamond powder was mixed with powd. metal and sintered without fusion of the metal to bond diamonds with metal for use in grinding laths. Diamond-impregnated cut-off disks must rotate at a min. peripheral speed of 6000 feet per min., and a heavy cutting machine was needed.

9231. EĬGELES, M. A. **Kinetics of mineralization of air bubbles in selective flotation and the effect of flotation reagents on it.** *Trudy Soveshchaniya Teorii Flotatsion. Obogashcheniya, Moscow 1948, Rol Gazov i Reagentov v Protsessakh Flotatsii* **1950**, 63-84 (discussion, 84-5).—*C. A.* 47, 6319*g*.

The adhesion of down-falling mineral particles to rising air bubbles was affected by many factors. In a flotation cell the time during which a particle might become attached to a bubble was very short. The max. time of contact, $\tau = 1.6\ R/u$, where R was the radius of the bubble and u the relative rate of motion of particle and bubble, i.e., the sum of the velocities of bubble and particle. This was calcd. to be 0.004-0.008 sec. The flotation properties of a mineral in a one-mineral system depends only on the interaction of the mineral with its own ions, water, and gas. In a many mineral system ions derived from other minerals, however, insol., come into play.

9232. GANDRUD, B. W. **Kerosene flotation: a process for cleaning and dewatering fine sizes of coal.** *Rev. ind. minerale* 31, 230-54 (1950).—*C. A.* 45, 4020*c*.

The process with citation of U.S. Bureau of Mines report was fully described.

9233. GAUDIN, A. M. AND BLOECHER, F. W. **Adsorption of dodecylamine on quartz.** *Trans. Am. Inst. Mining Met. Engrs.* **187**, *Tech. Pub. No.* **2813-B** (in Mining Eng.) **187**, 499-505 (1950).—*C. A.* 44, 5651*d*.

By using radioactive dodecylamine acetate, an isotherm for the adsorption of dodecylamine from soln. on to the surface of quartz was detd. for a pH range of 6 to 7 at 20° to 25°C. At low concns. the amt. adsorbed per g of quartz varied directly as the sq. root of the soln. concn. Pure quartz, with a sp. surface of 4430 cm^2 per g, was floated almost completely (95% recovered), at a pH near 7. This was achieved with 0.1 lb dodecylamine hydrochloride, and 0.08 lb terpineol per ton of quartz. About 60% of the collector was on the mineral surface and 40% in the liquor.

9234. GLEMBOTSKIĬ, V. A. **Mechanism and velocity of collecting in relation to the intensification of the flotation process.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* **1950**, 253-8. —*C. A.* **45**, 9433*d*.

At the beginning of flotation it was possible to increase the speed, in spite of the continuing increase of mineral particles from the pulps tending to reduce the speed. The effect of increasing the speed of flotation without introduction of addnl. collector was explained as proceeding from chemo-sorption. Consideration of velocity-time curves by comparing them with recovery-time curves permitted one to evaluate directly the velocity of the collecting reaction and the distribution of mineral particles according to their chemo-sorption activity.

9235. GYORKI, JÓZSEF. **Enrichment of Hungarian Liassic coals by flotation.** *Bányász. Kohász. Lapok* 5, 83, 504-10(1950).—*C. A.* 45, 8736*g*.

Expts. were conducted in 1922 with Liassic coal from Királd contg. 37.18% ash. The coal was comminuted to a max. grain size of 1 mm, and flotation was accomplished with 1 ml naphthalene oil/kg. The enriched product contained 30.7% ash, and the gang 38.04% ash. Good results were accomplished by similar treatment of coal from Pécs. The optimum amt. of oil was 0.15-0.17%, based on the amt. of dry mud.

9236. HAJTÓ, NÁNDOR. **The production of nodular graphite structures in cast iron by use of alloying materials.** *Bányász. Kohász. Lapok* **5**, 268-79(1950).—*C. A.* 45, 996*f*.

Nodular graphite structures were produced in cast iron by means of Mg-Al and Mg-Al-Si alloys. In some of the experiments Ca was used instead of Mg. Interesting results were obtained by adding approx. 0.7% Ca (as Ca-Si alloy) to the liquid iron and adding 1% Mg (as Mg-Al-Si alloy) after the Ca was dissolved in the iron.

9237. HEDVALL, J. ARVID; GERNANDT, H. O., AND AKESSON, Y. **New uses for Swedish minerals other than ores. Transforming flotation apatite to phosphate fertilizer.** *Trans. Chalmers Univ. Technol., Gothenburg* No. **100**, 3-22 (1950)(in English).—*C. A.* **45**, 4007*d*.

Apatite flotation concentrates, when heated alone up to 1,000°C, showed little change in citrate soly. The addn. of kaolin, pholerite, CaO, CaO with SiO_2, and SiO_2 alone caused only slight increases in the citric acid soly. With 30% SiO_2 added and the mixt. heated at 1400°C for 60 min., in an atm. contg. 33% water vapor, the citric acid soly. was only 40.5% of the total P_2O_5. With 35% serpentine, 40% of the F was vaporized and 97.5% of the P_2O_5 was solubilized in 15 min. at 1520°C. Data and curves were presented which showed that serpentine was more effective than two other Mg silicates at lower concns. in the mix.

9238. HEUBERGER, J. **Powder metallurgy studies. I. Sintered properties of pressed bodies of copper and graphite powder.** *Trans. Chalmers Univ. Technol., Gothenburg, No.* **98**, 3-10(1950). —*C. A.* 45, 91*c*.

Test bodies were prepd. from mixts. of natural graphite 10% and electrolytic Cu powder 90%. The hardness and bulk d. were investigated in the range 500-750°C at 25° intervals. At lower temps. there first occurred a swelling of the pressed body (decrease in bulk d.), which was least prominent in the bodies prepd. at low pressure and most prominent in those prepd. at high pressures. In the range 550°-675°C a marked contraction occurred (increase of bulk d.), which was traceable to the actual sintering of the connected Cu skeleton. The practical sintering temp. of a Cu powder could be lowered by repeated oxidation and reduction at decreasing temps. down to 350°.

9239. HILL, R. A. W.; SUTTON, L. E.; TEMPLE, R. B., AND WHITE, A. **Slow self-propagating reactions in solids.** *Research* (London) 3, 569-76(1950).—*C.A.* 45, 3697*c*.

The self-propagation of slow reactions in mixts. of the following oxidizing and reducing agents was studied by recording the temp. changes as the reaction front passed a point: $Fe-BaO_2$, $Fe-K_2Cr_2O_7$, $S-BaO_2$, $Fe-KMnO_4$, $Mo-BaO_2$, and $Mo-KMnO_4$. Propagation of the reactions occurred only by thermal conduction. Diffusion of hot gaseous products through the interstices might in some cases convey heat over and above that conducted by the solid.

9240. HOPKINS, D. W. AND ADLINGTON, A. G. **Factors affecting the reduction of zinc oxide by carbon. A study of the reduction of zinc metaferrite by carbon.** *Bull. Inst. Mining Met. No.* 530, 117-28(1950).—*C.A.* 45, 2833*f*.

Zn metaferrite, $ZnO.Fe_2O_3$, was heated in a retort with carbon at from 600° to 1050°C for periods of 2 and 4 hrs. Above 560°C Zn metaferrite dissocd. into ZnO and Fe_3O_4. In a charge which was small enough to be at virtually the same temp. throughout, no reduction of ZnO took place until this Fe_3O_4 had been completely reduced to Fe, but on a larger scale overlapping of reactions may occur, and Zn vapor may be reoxidized. The effect of temp. was pronounced above about 920°C.

9241. MERRILL, REYNOLD C. AND GETTY, RAYMOND. **Suspending action of alkaline electrolytes on ilmenite black.** *J. Phys. & Colloid Chem.* 54, 489-97(1950).—*C.A.* 44, 6229*f*.

The suspending action on ilmenite black measured after sedimentation for 3 hrs of solns. (10^{-7} to 10^{-1} M) of NaOH, Na_2CO_3, Na_3PO_4, $Na_4P_2O_7$, Na_3HSiO_4, Na_2SiO_3, $Na_2O\cdot 2\cdot 9SiO_2$, and $Na_2O\cdot 3.3SiO_2$ showed max. efficiencies at low concns. Na dodecyl-benzenesulfonate exhibited max. efficiency at a higher concn. Mixts. of org. and inorg. detergents showed 2 regions of max. efficiency, probably due to each constituent. Nonionic detergents were less effective as suspending agents. The best suspending agents consist of a weakly adsorbed ion and a strongly adsorbed ion, giving the particles a high electrostatic charge or ζ-potential.

9242. MILLAN DEL VAL, FRANCISCO. **Blast-furnace hearth lined with rammed carbon.** *Inst. hierro acero* 3, 210-22, 282-7(1950).—*C.A.* 45, 4183*f*.

In 1943 a carbon-lined blast furnace was started in Spain which successfully produced some 600,000 tons of pig iron. There are now 5 such blast furnaces in operation. The first ones were built with German materials. The blast furnaces so lined were cheaper in materials, and required much less labor.

9243. MINCSEV, MÁRIA RALCSEVA. **Gas-purifying material based on iron oxide produced from roasted pyrite.** *Magyar Kém. Folyóirat* 56, 164-7(1950).—*C.A.* 46, 1228*a*.

Expts. were conducted for the utilization of roast pyrite waste and HCl, obtained as byproducts of H_2SO_4 manuf. Av. compn. of roast pyrite waste was Fe_2O_3 83.5, S 3.74, Zn 4.15, As 0.03, Cu 0.54, and SiO_2 7.56%; 10-40% of the total iron content being present in the form of Fe(II), this latter fact was considerably detrimental to the phys. properties and H_2S-absorption capacity of the gas-purifying material. Roasted pyrite was dissolved in HCl (sp. gr. 1.16) at 70°C, the $FeCl_2$ oxidized with gaseous Cl, then milk of lime or dolomite added to ppt. $Fe(OH)_3$. The ppt. obtained with dolomite showed significantly lower H_2S-absorbing capacity than that produced by milk of lime.

9244. MOORE, GEORGE E.; ALLISON, H. W., AND MORRISON, JAMES. **The reduction of strontium oxide by tungsten in vacuum.** *J. Chem. Phys.* 18, 1579-86(1950).—*C.A.* 45, 6022*f*.

Between 1150-1550°K, SrO was reduced by W in vacuum. The rate of the reaction $3/2\ SrO(s) + 1/2\ W(s) \rightleftharpoons 1/2\ SrWO_3(s) + Sr(g)$ to the right was expressed by the equation $\log M = -[(1.810 \times 10^4)/T] + 8.460$, where M was the rate of evapn. of Sr metal in grams per cm^2 per hr and T was °K. This rate was believed to correspond to the equil. pressure of Sr metal in the above reaction. This equil. pressure was given by $\log P = 2.286 + 0.5 \log T - [(1.810 \times 10^4)/T]$, with P in atms.

9245. PASK, JOSEPH A. **Glass-to-metal seals.** *Product Eng.* 21, No. 1, 129-34(1950).—*C.A.* 44, 8704*c*.

Wettability of the metal by the molten glass at sealing temps. was discussed and sealing procedures were described.

9246. PHILLIPS, D. J. AND THOMPSON, N. **Surface effects in creep of cadmium crystals.** *Proc. Phys. Soc.* (London) 63B, 839-47(1950).—*C.A.* 45, 4515*c*.

A recording rate-of-strain meter was used to investigate the changes in creep rate when the chem. environment of a stressed Cd crystal was altered. Expts. were made with aq. solns. of a no. of inorg. salts of Cd. The observations were explained in terms of variations in the thickness of a surface film of Cd hydroxide, the presence of such a film having the effect of reducing the creep rate by an amt. depending on its thickness. Measurements were also made on the effect of very thin films, formed by immersion in distd. water; these were estd. to be about 10^{-6} to 10^{-7}cm thick. When the films were removed with dil. H_2SO_4 a sudden small-strain increment was observed, the magnitude of which depended on the film thickness.

9247. PHILLIPS, G. C. AND RICHARDSON, J. E. **Preparation of carbon targets.** *Rev. Sci. Instruments* 21, 885-6(1950).—*C.A.* 45, 962*i*.

A thin, pure, uniform carbon target was made by cracking benzene vapor on 3-mil Ag foils at

1500°F in the absence of air. These targets have a carbon deposit of about $25\gamma/cm^2$. Isotopically enriched C^{13} targets were prepd. from enriched MeI on a 1/32-in thick Ni disk heated by means of an induction furnace. The disk was outgassed while hot, MeI vapors were admitted and the disk heated to a red-orange. I_2 deposited on cooler parts of the enclosure but none on the sample.

9248. Plaksin, I. N. **Effect of gases on minerals.** *Gornyĭ Zhur.* 124, No. 2, 32-7(1950).—*C.A.* 44, 5285*h*.

The effect of O_2, N_2, CO_2, and H_2O satd. with O_2 on Au, Ag, Cu, and sulfidic minerals was studied on the floatability of the minerals. The effect of the gases was inferred from the contact angle of H_2O and a given surface following exposure to a gas. O_2 caused Au and Ag to turn hydrophobic and the sulfides to become first hydrophobic and then hydrophilic. In order of increased resistance to oxidation the sulfides were: sphalerite, pyrite, and chalcopyrite.

9249. Plaksin, I. N. **The action of gases and reagents on minerals in flotation processes.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* **1950**, 1827-43.—*C.A.* 46, 69*i*.

Flotation expts. were made to det. the difference in the effect of O_2 on metals and on sulfides. The natural hydrophobicity of minerals was explained by the sorption of O_2 after which the hydrophobicity of the mineral surface decreased. The hydrophobicity of the mineral surface during the action of the collector reached a max., which depended on the chem. activity of the metal. Interaction of the reagent with the mineral was detd. by the compn. as well as by the structure of the cryst. lattice of the latter.

9250. Plaksin, I. N. **Role of gases and chemical interaction with reagents in flotation processes.** *Trudy Soveshchaniya Teorii Flotatsion. Obogashcheniya, Moscow 1948, Rol Gazov i Reagentov v Protsessakh Flotatsii* **1950**, 32-56 (discussion 56-62).—*C.A.* 47, 6319*b*.

While the contact angle was not an abs. measure of floatability, it could be stated that as the contact angle increased, the floatability improved and conversely. The effect of O_2, N_2, and CO_2 on the contact angle was studied on metals (Au, Ag, and Cu), sulfidic minerals (sphalerite, pyrite, and chalcopyrite), and phosphatic minerals. The contact angle made by a drop of H_2O placed on a surface after treating the latter with one of the gases at 20°C was measured over a period of time at 15 min. intervals. O_2 induced hydrophobization, i.e., increase of the contact angle of Au and Ag surfaces. The results for Cu were inconclusive. The hydrophobic properties of phosphate were enhanced in increasing order by CO_2, N_2, and O_2. Expts. with freshly exposed (cleaved) surfaces of minerals showed that they acquired hydrophobic properties as consequence of absorbing O_2.

9251. Plaksin, I. N.; Khazhinskaya, G. N., and Brovkina, T. F. **Effect of the granulometric characteristic on the floatability of zinc blende in relation with self-activation.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* **1950**, 407-11.—*C.A.* 45, 9433*b*.

Zn blende ground to -100, -200, -250, and -325 mesh was studied. The expts. were made by using 40 g of ore in a flotation machine equipped with a mech. stirrer. Flotation took place in an alk. medium, with a charge of 1 kg/ton of lime, 200 g/ton of ethyl xanthagenate as collector, 170 g/ton of pine oil as frother. In one series of expts. an activator (1 kg/ton of $CuSO_4$) was used, in the other series no activator was added. In another expt. a mineral mixt. of the following compn. was floated: ZnS 12.5 and SiO_2 87.5%. Increasing the amt. of collector and lime did not promote the selectivity of sepn. sufficiently. Treatment of the pulp with O_2 gave better results.

9252. Plaksin, I. N. and Kurenkov, I. I. **Enrichment of useful minerals by flotation granulation.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Tekh. Nauk* **1950**, 1189-97.—*C.A.* 46, 71*a*.

The basic app. consisted of a concn. table. There were arrangements for feeding air, together with jets of water, into the table. The table was so constructed that gas could be fed from the sides of its working surface. It was possible to obtain the ore concentrates in both deslimed and non-deslimed form. It was found that preliminary treatment of the ore pulps with O_2 or air considerably increased the grade of concentrates and the recovery of the useful minerals.

9253. Rebinder, P. A. **The importance of flocculation and frothing in flotation concentration processes.** *Trudy Soveshchaniya Teorii Flotatsion. Obogashcheniya, Moscow 1948, Rol Gazov i Reagentov v Protsessakh Flotatsii* **1950**, 13-31.—*C.A.* 47, 6317*g*.

The basic step in flotation was the adhesion of particles to air bubbles. In frothless flotation flocculation was the basis of concn. In froth flotation the adhering particles stablized and reinforced the air bubbles. Flocculation was distinct from coagulation induced by electrolytes. Coagulation by electrolytes, involved a reduction in the thickness of the hydrated double layer. To flotation pulps were usually added org. surface-active substances. The main purpose of these was to render at least part of the surface of the particles hydrophobic. The effect of K, Et, Bu, and Am xanthate, Na oleate, and heptoic acid on monodispersed systems of PbS and malachite was studied. All of these caused flocculation, the degree of which increased with the length of the hydrocarbon chain and with the decrease of the diam. of the particles.

9254. Romwalter, Alfréd and Fekete, László. **Wetting of coal powder.** *Bányász. Kohász. Lapok* 5, (83), 615-17(1950).—*C.A.* 45, 8738*e*.

Expts. proved that the effect of pure water and that of aq. electrolyte solns. were equally unsatisfactory, owing probably to an O-film coating the particles of coal. When coal powder was previously mixed effectively with 33% water, the thick pulp was suitable for wetting coal dust. When such coal-dust pulp dried, the film produced was hydrophilic. For the effective removal of coal dust from coal mines the use of exhaustors was proposed. The cost of this operation could be covered by the fuel value of the coal dust recovered.

9255. Simard, G. L.; Chupak, J., and Salley, D. J. **Radiotracer studies on the interaction of dithiophosphate with galena.** *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 2815-B, Mining Eng.* 187, 369-73(1950).—*C.A.* 44, 3857*b*.

Measurements were made of the rate of uptake, the isotherms, the desorption, and the exchange of dithiophosphate on both ground mineral and single crystals. No single mechanism could account for the observed over-all interaction. The process was complex because of the heterogeneous nature of the galena surface. The interaction was not one of phys. adsorption, but appeared to have characteristics of both chemisorption and surface chem. reaction.

9256. Smith, G. C. and Dewhirst, D. W. **Internal oxidation of dilute copper alloys.** *Trans. Australian Inst. Metals* 3, 71-4(1950); *Australasian Engr.* Nov. 7, **1950**, 61-5.—*C.A.* 46, 7974*e*.

Alloys of Cu contg. Al 0.6, Be 0.2, and Si 0.6% in the form of 1.2-mm strip were heated to 950°C in air for 30 min. followed by the use of N_2 for 90 min. Metallographic examn. revealed internal oxidation with the formation of a subsurface layer of Cu contg. particles of the oxide of the minor constituent. Factors detg. the thickness of the rim and the size, shape, and distribution of the particles were discussed.

9257. Sun, Shiou-Chuan and Zimmerman, R. E. **The mechanism of coarse coal and mineral froth flotations.** *Trans. Am. Inst. Mining Met. Engrs.* 187, *Tech. Pub. No.* 2843-F *Mining Eng.* 187, 616-22(1950).—*C.A.* 44, 5651*g*.

The max. size of bituminous and anthracite coal particles which could be efficiently floated in a lab. Fagergren flotation machine was found to be 3 × 6 and 14 × 20 mesh, resp. The optimum rate of aeration for the flotation of coarse particles in the machine was approx. 450 ml of air per in.^{2} per min.

9258. Thon, N.; Yang, Ling, and Kelemen, Denis. **Porosity of electrodeposited metals. A.E.S. research project no. 6. VI. Effect of surface structure of the basis metal on the permeability and corrodibility of deposits.** *Plating* 37, 280-4(1950).—*C.A.* 44, 4349.

Thin foils deposited on mech. polished surfaces were more permeable and corroded initially at a faster rate than those deposited on cryst. surfaces.

9259. Zadra, J. B. **A process for the recovery of gold from activated carbon by leaching and electrolysis.** *U.S. Bur. Mines, Rept. Invest. No.* 4672, 47 pp.(1950).—*C.A.* 44, 4837*c*.

The Au-laden charcoal was leached with a soln. contg. 30 g Na_2S and 40 g NaOH per liter. Two liters of soln. was required per lb of charcoal. In lab. tests, 97% of the Au in a charcoal, assaying 300 oz of Au per ton, was extd. in 4 hrs. The tests also showed that the leached charcoal could be reused 11 times without reactivating; the adsorptive efficiency for 11 cycles was 97.1%, but decreased thereafter to 82% at the end of the 20th cycle. Charred excelsior and Type 430 stainless-steel wool were studied to det. their efficiency as Au-collecting media. Each had advantages and disadvantages.

9260. Zapffe, C. A. and Landgraf, F. K. **Hydrogenizing effect of steam on ferrous alloys at elevated temperatures.** *Am. Soc. Testing Materials, Symposium on Corrosion of Materials at Elevated Temps., Spec. Tech. Pub.* No. **108**, 50-7, discussion 58(1950).—*C.A.* 45, 8429*e*.

The effect of steam in heat treatment of types 410, 440-C, 414, and 430 stainless steels was investigated. The damage caused by hydrogenization was indicated by a decrease in bendability before fracture. All of the stainless steels tested were susceptible to embrittlement, in some cases after only one min. of exposure to steam. Recovery was accomplished by aging steam-embrittled samples in hot glycerol or by room-temp. aging.

9261. Alexander, Ben H. **Diffusion phenomena occurring during sintering.** *J. Metals* **191**, 95(1951).—*C.A.* 46, 3928*a*.

The compacts of two dissimilar metals were made by winding wires of the two metals on a spool at the same time. Although a perfectly uniform bond or neck was formed between two wires of the same metal, this was not true when the adjacent wires were dissimilar. The bond formed by the preferential movement of one kind of atom, with the result that the bond or neck was asymmetric, i.e., it was wider on one side than the other.

9262. Boshin, Ro. **Chemical polishing of steel wire and lubrication in wire drawing.** *Kinzoku* (Metals) 21, 342-5(1951).—*C.A.* 46, 7971*a*.

A description was given of the pickling or chem. polishing before drawing and some lubricants for wire drawing, such as lime, soap, phosphate coatings, Cu plating, alkalies, talc plus soap powder (or talc plus pigment), graphite, or powd. Cu. The adhesive power of the lubricants and the life of dies depended on pickling of steel wire. Although soap was more expensive than lime, it could be made more economical than the lime by means of special device. Dipping of the chemically polished wire in a $CuSO_4$ soln. gave sufficient Cu deposition for the drawing, but removal of the Cu after drawing was very difficult. Coating the wire by chem. means was insufficient for drawing to higher degrees. Solid dispersions of graphite in higher fatty acids could be used for the drawing with 90% reduction.

9263. BURSTALL, F. H.; KEMBER, N. F., AND WELLS, R. A. **Inorganic chromatography on cellulose: some applications to the analysis of nickel-plating baths.** *J. Electrodepositors' Tech. Soc.* 27, Advance copy No. 11, 12 pp. (1951).—*C. A.* 45, 5571*b*.
Co, Fe, Zn, Cu, Mn, and Cd impurities were sepd. together from a Ni-plating soln. by extn. in a cellulose column with an acetone-HCl-H_2O solvent. Colorimetric methods for estn. of each impurity without further sepn. were described.

9264. CHESTERS, J. H.; ELLIOTT, G. D., AND MACKENZIE, J. **The evolution of the all-carbon blast furnace.** *J. Iron Steel Inst.* (London) 167, 273-82(1951).—*C. A.* 45, 4183*g*.
In spite of burden handicaps No. 6 made 12% and No. 1 4% more iron than in the first year of the previous campaigns. There was no evidence of scab or scaffold trouble in the stack. The main factors leading to scaffold formation were sticking of the burden to the fireclay inwall, carbon deposition forcing the working face nearer to the center of the furnace, alkali attack forming *kalsilite* or *kaliophilite* with the fireclay.

9265. CHRETIEN, ANDRÉ AND FREUNDLICH, WILLIAM. **The formation of a titaniferous slag by selectively reductive fusion of ilmenite.** *Compt. rend.* 233, 413-15(1951).—*C. A.* 46, 864*h*.
Fusion of ilmenite with charcoal and Na_2CO_3 gave 2 liquid layers: a slag contg. 74% TiO_2 and 1.5% Fe and a melt contg. Fe and 0.5% TiO_2. The ratio Na_2O/TiO_2 should be 0.24 to ensure sufficient fluidity of the slag. The amt. of carbon added together with that from the flux and crucible must be limited to that required to reduce the Fe oxides and carburize the Fe. The temp. must be high enough for fusion and fluidity, but not too high or reduction of the TiO_2 will occur.

9266. CLAY, J. E. AND RABONE, PH. **Flotation of pyrite from cyanide residue in acid mine water.** *J. Chem., Met. & Mining Soc. S. Africa* 52, No. 5, 97-104, discussion 105-8(1951). —*C. A.* 47, 2099*f*.
Owing to a shortage of H_2SO_4 which was used in the production of pyrite in S. African ores, expts. were made to produce it by flotation on a cyanide residue from gold mines contg. about 2% FeS_2 as pyrite with a trace of pyrrhotite and no marcasite. A recovery of 90% of the pyrite was obtained. The results were promising economically, especially as some Au was recovered along with the pyrite.

9267. COHEUR, PIERRE. **Bessemer steel low in nitrogen and phosphorus.** *Metal Progress* 60, No. 4, 78-80(1951).—*C. A.* 45, 10162*h*.
The Belgian com. practice of blowing basic Bessemer steel with O_2-enriched air (30% O_2), with or without carbonates, was described. N_2 contents of 0.007 to 0.012% and P as low as 0.05% were accomplished regularly and the steel was suitable for deep-drawing applications. The use of O_2 and steam gave about 0.002% N and 0.035% P.

9268. CONRAD, F.; CREMER, E., AND KRAUS, TH. **The adhesion of magnesite powder on solid surfaces. I.** *Radex Rundschau* 1951, 227-33.—*C. A.* 46, 4320*g*.
In the adhesion of a powder on an inclined plane, an additional adhesive force was introduced besides the frictional force. Adhesive force was detd. by measuring the inclination of the plane required to start the powder moving. The relation between mass of the powder, angle of inclination, adhesive force, friction factor, etc., was mathematically explained.

9269. CRANDELL, MELVIN G. **Surface protection via phosphate coatings.** *Can. Chem. Processing* 35, 994-6, 998-9(1951).—*C. A.* 46, 2817*b*.
Bondertie produced a phosphate coating on Fe, steel, Zn, Cd, Al, and their alloys. Application to the various metals was outlined. Parco compd. provided an effective rust prevention by changing the surfaces of Fe or steel to a water-insol. phosphate coating.

9270. CRAWFORD, A. **Preparation of ultra-clean coal in Germany.** *Trans. Inst. Mining Engrs.* 111, 204-18(1951-52).—*C. A.* 46, 5816*i*.
The first process employed dense-medium washing followed by fine grinding and froth flotation to remove impurities. In the 2nd process jig washing and froth flotation of the finely ground clean coal was followed by a chem. extn. process with HF and HCl for the removal of impurities. A 3rd projected process used a similar preliminary treatment of jigging (2 stages) and froth flotation, but required a 2.5% soln. of NaOH as an extn. agent. This was applied at a pressure of 120 atm. at 250°C.

9271. DAVIES, R. L. **Quantitative chromatographic separation and estimation of cadmium in copper alloys using paper strips.** *Nature* 168, 834(1951).—*C. A.* 46, 2954*h*.
A soln. of the nitrates contg. Cd at 10^{-4} to 10^{-3} g per ml was chromatographed with MeEtCO + 30% by vol. of concd. HCl. The sepd. Cd was eluted with hot 1% HCl and detd. polarographically against an internal standard.

9272. DHINGRA, D. R.; GUPTA, M. G., AND BHATTACHARYA, M. C. **Anodization and multicoloring of pure aluminum.** *J. Proc. Inst. Chemists* (India) 23, 118-34(1951).—*C. A.* 46, 6569*c*.
Sheets of Al (>98% purity) were anodized in 15% H_2SO_4 at 25-30°C, with 12 amp./ft^2 c.d. (12-15 v.) for 50 min. Lower or higher acid concns. gave less desirable coatings. Single-color dyeing was done by dipping in a soln. of acidic dye (1 g/liter, pH 2.6-4.4) and raising the temp. from 50 to 80°C in 5-10 min. Good shades were obtained with Alimax dyes: Yellow N, Orange GR, Red A, Green G, Green BN, Blue BN, and Blue BG. Inorg. solns. such as chromates were not satisfactory. Multicoloring was done by successively dyeing in darker shades, masking the previous

portions with cellulose nitrate or asphalt. Time of immersion was about 1 min.

9273. DIENES, G. J. **The volume diffusion of metals.** *J. Applied Phys.* 22, 848-9(1951).—*C.A.* 46, 2869*g*.

New diffusion data were collected and analyzed. The large neg. value of entropy of activation called for by Zener's alternative theory is pointed out.

9274. EDWARDS, G. R. AND EWERS, W. E. **Adsorption of sodium cetyl sulfate on cassiterite (flotation of cassiterite).** *Australian J. Sci. Research* A4, 627-43(1951).—*C.A.* 46, 4973*i*.

Pure SnO_2, of surface area 10 m^2/g (N_2 adsorption), was prepd. by burning Et_4Sn, atomized in a stream of air, in H_2. For flotation tests the SnO_2 was crystd. from molten borax. Natural SnO_2 (less pure) was used in comparative flotation tests. Adsorption of Na hexadecyl sulfate (Na cetyl sulfate) was detd. by titration of the supernatant soln. after shaking for 18 hrs. The cassiterite surface appeared to be amphoteric in nature with units of the type: $Sn(OH)_2$. Above pH 5, Na rather than hexadecyl sulfate ion was adsorbed by the surface. Titration of cassiterite with 0.01 *N* NaOH indicated one dissociable H^+ per 44 $A.^2$ of surface. Cations from Na_2SO_4, KCl, and $CaCl_2$ also displaced H^+ from the surface. Below pH 5 hexadecyl sulfate ion was absorbed, displacing OH^-; one hexadecyl sulfate ion occupied each 23 $A.^2$ of surface. Complete flotation occurred when as little as 3% of the surface was covered by adsorbed sulfate.

9275. ENGEL, A. L. **Simple treatment methods for oxide gold and silver ores.** *U. S. Bur. Mines, Rept. Invest.* No. 4758, 14 pp.(1951).—*C.A.* 45, 2379*d*.

In 5 samples of marginal ores it was possible to use activated charcoal for simultaneous extn. of dissolved Au and Ag during leaching in cyanide soln. This treatment was applicable to cyanidation of minus 48-mesh material where leaching by agitation could be used. It was of advantage in treating ores that were clayey or otherwise difficult to settle. The charcoal was produced from fruit pits and sized between 10 and 30 mesh.

9276. FERGUSON, IAN. **Flotation in Brunswick Green paints.** *Paint Technol.* 16, 379-91(1951).—*C.A.* 46, 1775*b*.

Since small differences in flotation of various paints were considerably magnified when thicker films were used, the testing procedure adopted was to allow a definite vol. of paint to fall on a level panel and to dry in a draft-free atm. The mottling, thus obtained, bore a direct relationship to the flooding obtained by brushing films of normal thickness. Degree of flooding increased as the ratio of green pigment increased. The extender which reduced flooding most was activated $CaCO_3$. Unbodied linseed-oil paints were noticeably free from flooding. Influence of driers and grinding times were studied and found to be minor. It was noted that thixotropic paints did not have floating tendencies.

9277. GERICKE, SIEGFRIED AND KURMIES, BRUNO. **Significance and sources of the element fluorine in basic Bessemer slags.** *Stahl u. Eisen* 71, 454-7(1951).—*C.A.* 45, 7934*a*.

Comparisons between F-content and P_2O_5 soly. of basic slag showed no definite connection up to 0.020% F. At higher F-contents the P_2O_5 soly. decreased markedly. The av. F-content of basic slag was 0.008%. Since the F-content rarely exceeded 0.020%, the low amt. of F had little effect on the behavior of P_2O_5 in 2% citric acid soln. A F-content of over 0.030% results in a decrease in P_2O_5 soly. With increasing SiO_2 contents, the soly. of P_2O_5 in 2% citric acid soln. generally increased. Higher SiO_2 and lower F-contents insured high soly. of P_2O_5. Tests on the presence of F in the blast furnace and converter showed clearly that the entire amt. of F in the blast furnace passed over into the slag, and that the pig iron was free of F.

9278. GHOSE, T. K. **Demineralizing of Indian coals and graphites by phase exchange method.** *Science and Culture* 17, 47-9(1951).—*C.A.* 47, 2456*b*.

A new approach to the problem was tried by utilizing different interfacial forces of different solid surfaces (both cryst. and amorphous) in the presence of 2 or more immiscible liquids in such a way that slurry phases were developed. If in this condition mech. (shearing) forces were applied externally, the surface affinity of such solid particles towards their respective liquid phases increased, i.e., those solid particles having greater affinity for water migrated into the latter phase, those having greater affinity for oil remain in the oil phase. Carbon particles remained concd. in the oil phase; impurities like clay, carbonates, oxides, sulfides, and silicates migrated towards the water phase in their free form.

9279. GOLDACRE, R. J. **The flotation of King Island scheelite in hard mine water.** *Australian J. Appl. Sci.* 2, 89-107(1951).—*C.A.* 47, 1905*c*.

Various groups of flotation reagents, were tested in hard mine water (Ca 10, Mg 20, and Na 100 mg/liter) in an attempt to find agents for selectively sepg. scheelite from the main impurity, garnet (chiefly andradite) in the King Island ore. With fatty acids, flotation increased with chain length to pelargonic acid (C_9), then decreased. Fatty amines were useful collectors, especially laurylamine (C_{12}), but lacked selectivity at high pH values (above pH 6). "Ninol 400" gave good sepn. but near pH 2. The alkyl sulfates and sulfonates were not collectors for scheelite above pH 6, unless activated. Pb^{++} ion was especially active and gave excellent flotation with sodium laurylsulfate. Selective conditions under which andradite did not float were found only at low pH values, and were therefore not operable in the presence of the impurity calcite.

9280. GRÜNDER, WERNER AND BUNJI, BELA. **Investigation of the flotation of arsenic-rich lead-zinc ores.** *Z. Erzbergbau u. Metallhüttenw.* 4, 341-4(1951).—*C.A.* 46, 71*b*.

Expts. showed that it was possible to obtain a Pb concentrate contg. 80% Pb and less than 0.3% As. Details of the flotation methods were given.

9281. GUTIÉRREZ GUTIÉRREZ, L. AND FOZ GAZULLA, OCTAVIO R. **Elimination of iron from sands for glass manufacture by flotation. I. Characteristics of four Spanish glass sands.** *Anales real soc. españ. fís. y quím.* 47B, 687-98(1951).—*C.A.* 46, 10564*i*.

Small amts. of Fe had some desirable, although mostly detrimental, effects on the properties of glass, particularly on optical characteristics. Certain characteristics of the sands were summarized according to their end use: grain size, type, and amt. of impurities. The sands of Gijón, Avilés, Liria, and Espirda (Spain) were given mech., chem., and mineralogical analyses, and it was necessary to purify them to make a quality glass.

9282. GUTIÉRREZ GUTIÉRREZ, L. AND FOZ GAZULLA, OCTAVIO R. **Sands for glass. Removal of iron by flotation II. Purification experiments on Spanish sands.** *Anales real soc. españ. fís. y quim.* (Madrid) 47B, 777-94(1951).—*C.A.* 46, 4187*b*.

Spanish sands contained too much Fe. Removal of this Fe by treatment with HCl was unsatisfactory. The sands from Gijon and Aviles responded well to double flotation with oleic acid and α-naphthalamine hydrate. The sands so treated were satisfactory for high-quality-glass production. The sands from Liria and Espirdo responded best to flotation first with oleic acid and then "fuel oil."

9283. HINDMARCH, E. AND WATERS, P. L. **Froth flotation of coal.** *Trans. Inst. Mining Engrs.* (London) 111, 221-34(1951).—*C.A.* 46, 5816g.

Milling down to correct size grading was necessary to liberate inter-banded dirt. Expts. were carried out on a coal analyzing moisture 0.6, volatile matter 22.9, fixed C 67.3, ash 9.2, and S 0.6%. Float and sink tests indicated that appreciable yields of coal (greater than 50%) giving less than 1% ash were obtained for all sizes below 20 mesh. Crushing down to minus 100 mesh did not greatly increase the liberation of coal from dirt.

9284. HOFFMANN, KURT. **Physical-chemical questions in thermal zinc recovery and their significance for practice. Reply to comments by H. Grothe.** *Z. Erzbergbau u. Metallhüttenw.* 4, 344-9(1951).—*C.A.* 46, 389*a*.

The reduction of ZnO resulted from action of solid carbon, which was especially effective at the beginning of the process, as well as by CO, which became the principal reducing agent with rising temp. The effective completion of the reaction required a considerable flow of excess quantities of CO through the muffle. By briquetting the charge, advantageous application of the coke with slow evolution of reducing gas and improved operating conditions for Zn recovery in the muffle were obtained.

9285. HORSLEY, R. M. AND SMITH, H. G. **Principles of coal flotation.** *Fuel* 30, 54-63(1951). —*C.A.* 45, 3577*f*.

The more air-avid coals could be floated by the addn. of a frothing agent alone. Several typical frothers (cresols, alcs., etc.) were shown to have no appreciable effect on the air-solid contact. The air-avidity of all coals, except lignite, was greatly increased by the use of an oily collector which increased the natural contact angle and decreased the induction period. Oxidizing agents greatly reduced the contact angle at a coal surface. $KMnO_4$ was most effective, small quantities considerably reducing the floatability of a coal. In industrial practice, oxidation and weathering will tend to reduce, and contamination from lubricants, to increase, the natural floatability of the coal.

9286. IRMANN, R. **Sintered aluminum with high resistance to heat.** *Rev. aluminum* 28, 267-75, 311-16(1951).—*C.A.* 46, 2462*a*.

Under special temp. and compression conditions it was possible to sinter Al powder in spite of the Al_2O_3 film formed naturally on the Al grains. The plasticity of the isolated Al particles enabled one to obtain an intimate contact because the plastic deformation ruptured the oxide film and permitted the sintering to be accomplished after a preliminary compression following which the desired shape was obtained by extrusion or die-forging.

9287. KLASSEN, V. I. AND ERENBURG, R. Z. **Floatability of mineral grains of different sizes in relation to the density of the flotation suspension.** *Doklady Akad. Nauk U.S.S.R.* 79, 855-7(1951).—*C.A.* 46, 4884*h*.

Flotation of natural S was effected with the ordinary lab. flotation machine. It was observed that the floatability of coarse grains improved with diln. of the suspension. Fine grains floated better in more dense suspensions. It was suggested that the effect of the d. of the suspension was of a phys. nature. In the case of the decrease in floatability of coarse particles with increasing d. of suspension, a demineralization of the air bubbles occurred. Coarse particles were more easily sepd. from bubble surfaces than were fine particles. On the other hand, the finer particles were floated more easily from a dense pulp because of the increased probability of contact with the bubble and because of improvement of conditions for overcoming the energetic barrier layer of H_2O between bubble and particle.

9288. KÖSTER, WERNER AND RAFFELSIEPER, JOSEF. **Diffusion during sintering of a nickel-copper alloy.** *Z. Metallkunde* 42, 387-91(1951).—*C.A.* 46, 2467*d*.

The diffusion process during sintering of compressed Ni-Cu powders was followed magnetically. Sintering isotherms between 800 and 1200°C were obtained. The kinetics above and below the m.p. of Cu were about the same. At 1200°C a period of 25 hrs was necessary to produce homogeneity. The activation energy for homogenization was 28.5 kcal/mole and agreed well for the activation energy for the diffusion of Ni into Cu.

9289. KOVAL'SKAYA, T. S. **Investigation of the floatability of small-size fractions of long-**

flame coal. *Ugol* 26, No. 5, 30-1(1951).—*C.A.* 45, 8229*e*.

Flotation was tested on a no. of samples of Lisichansk coal. The final fractions of this coal were contaminated with clayey substances which on softening coated the coal particles and hampered their flotation. Using $CaCl_2$ as a depressor improved the concentrate. Starting with the 6-0 mm fraction, screening out the 1-0 mm fraction, then grinding the oversize to 1-0 mm and floating it improved the concentrate considerably. Under these conditions the concentrate amounted to 70.18% of head and contained 7.89% of ash (the ash content of the head was 19.82%). The tailings amounted to 15.20% with an ash content of 70.72%.

9290. Lownie, H. W. Jr. **Need stronger foundry coke.** *Foundry* 79, No. 7, 72-6(1951).—*C.A.* 46, 239*a*.

Over 100 heats were made in a 10-in. exptl. cupola with a foundry coke manufd. in 1942. On replacing this coke with a coke produced from similar coals and with almost the same coking time, the tapping temp. dropped to 1499°C from 1516°C before the change, and the C in the Fe to 3.40% from 3.60. The old coke contained 7.2% by wt ash and 91.0% fixed C, and the new 9.9% ash and 88.8% fixed C. In the operation of a 54-in. cupola the melting operation was more dependable and satisfactory when using a 28-hr coke than when using a 16-hr coke.

9291. Mindler, A. B.; Gilwood, M. E., and Saunders, G. H. **Metal recovery by cation exchange.** *Ind. Eng. Chem.* 43, 1079-81(1951).—*C.A.* 45, 7490*f*.

Permutit Q in the H-form was used to remove Sn from Na_2SnO_3 solns. The Na_2SnO_3 was passed upflow through the resin in a column jacketed at 77°C and the effluent carrying the H_2SnO_3 floc handled by settling or sludge filtering. The clarified H_2O could then be neutralized and reused for rinsing tinned sheet metal. Zn was removed from relatively strong H_2SO_4 solns. by the Permutit Q; at concn. to 1.0% H_2SO_4 the Zn removal was approx. 95% from solns. contg. 500 p.p.m.

9292. Nedin, V. V. and Morgun, A. P. **Addition of petroleum soap to hard water for better wetting of dispersed dust.** *Gornyĭ Zhur.* **1951**, No. 1, 34-5.—*C.A.* 45, 5952*b*.

The dust of drills in mines was laid by means of water to which petroleum soap was added as wetting agent. For greater effectiveness hard water must be softened. On softening with lime-soda, a gelatinous mass of alk. earth soap formed in the water and clogged the lines and drill passages. Softening the water by passing it through a base-exchange material removed this difficulty.

9293. Piatti, Luigi. **Effect of wetting agents on corrosion. II. The influence of nonionic wetting agents.** *Werkstoffe u. Korrosion* 2, 441-4(1951).—*C.A.* 46, 4456*d*.

Surface-active agents in concn. of 0.4% were used. Nonionic agents caused less loss of wt by corrosion than did ionic agents. The greater the surface-activity of the agent (in the range studied) the more favorable was its effect on corrosion.

9294. Pryor, M. J. and Cohen, M. **Role of dissolved oxygen during the inhibition of the corrosion of iron by sodium phosphate solutions.** *Nature* 167, 157(1951).—*C.A.* 45, 5598*c*.

In phosphate solns. that were satd. with air, passivity of Fe was reached at a pH of 7.25. When all O_2 was removed from the phosphate solns., corrosion was not inhibited. The corrosion product in the absence of O_2 was a colorless tabular cryst. deposit.

9295. Rozhanskii, V. N.; Amfiteatrova, T. A., and Rebinder, P.A. **The change of the crystal structure of a metal in deformation in surface-active media.** *Doklady Akad. Nauk S.S.S.R.* 76, 697-8(1951).—*C.A.* 45, 7403*d*.

The rate of increase of the elongation of an electrolytic Cu wire of 0.05 mm diam. was greater in a surface-active soln. of 0.5% oleic acid or 0.5% cetyl alc. in nonpolar kerosene than in the pure kerosene. The plot of the log of the ratio of the rates in the active and in the inactive medium, as a function of the elongation, passed through a max. at an elongation of about 0.55%. The relative increase of the no. of grains per unit vol. was distinctly faster in the active medium.

9296. Savage, W. H. D.; Brink, P. A. M.; Merwe, J. M. van der, and Malherbe, P. le R. **The float and sink analysis of coal with special reference to the effect of variations in the moisture content of the coal.** *J. Chem. Met. & Mining Soc. S. Africa* 52, 1-11(1951).—*C.A.* 46, 3729*c*.

When coal was analyzed by flotation, and the sink material washed and refloated in the same liquid, addnl. float material was recovered. When samples of coal (smaller than 16-mesh, BSS) of different moisture contents were floated, the coals contg. the least moisture yielded the greatest wt of floats. The dried coal gave the total yield in the first sepn. Since removal of H_2O lowered the apparent sp. gr. of coal, coal recovered by rewashing should not be added to the floats. Drying of refloated coals may be due to evapn. of H_2O when the org. flotation medium was removed or to dehydration of the coal by the liquid. Coals should have the same moisture content before flotation; the most practical method was to sat. the coal with H_2O before flotation.

9297. Shklovskiĭ, I. S. **Corrosion of metals in dry and moist hydrogen sulfide.** *Trudy Inst. Fiz. Khim., Akad. Nauk S.S.S.R.* 2, *Issledovaniya po Korrozii Metal.*, No. 1, 241-56(1951).—*C.A.* 47, 5859*h*.

After an exposure of 180 days to dry H_2S at room temp., Mg, Pb, and 18-8 steel did not change in wt; Al, Fe Avial (Al with Mg 0.45-0.9, Fe 0.6, Cu 0.6, Si 0.5-1.2, Mn 0.35), Zn, brass (Cu 68, P 0.1, Fe 0.1, Sn 0.1, Pb 0.03, Zn rest), Ag, Ni, Cu, in increasing order, gained wt, up to 0.4 mg/cm^2; Ni, Fe, and Pb changed color; Zn showed only interference colors, but 18-8 became covered with black spots. The rate of corrosion of brass and Pb increased slowly with time; that of Cu approached zero rate. Fe formed FeS and the film blistered, resulting in wt-losses of 50 $mg/cm^2/60$ days; Mg corroded linearly with time, with wt-loss as high as 15 mg/cm^2 in 2 days, the products being MgS, MgO, and $Mg(OH)_2$.

9298. SHKLOVSKIĬ, I. S. **Corrosion of metals in mixtures of air with hydrogen sulfide and in solution of hydrogen sulfide.** *Trudy Inst. Fiz. Khim., Akad. Nauk S.S.S.R.* 2, *Issledovaniya po Korrozii Metal.* No. 1, 257-75(1951).—*C.A.* 47, 5860*b*.

Tests were conducted at room temp. for up to 60 days. In air with 5% H_2S and 80-90% humidity, Zn, Al, Fe, Pb, and Avial changed little in appearance and corrosion was negligible; Ag, Sn, and 18-8 steel changed in appearance considerably, but the corrosion film was protective and the corrosion was only 0.2-0.6 mg/cm^2 in 60 days; on brass and Ni, the corrosion films adhered poorly, and corrosion was approx. 3 mg/cm^2 in 60 days; attack on Cu was strong, linear with time, and accompanied by intergranular corrosion, and the products were basic sulfates with Cu_2S; attack on Mg accelerated with time and was very rapid.

9299. SODA, NORIMUNE AND MIYAGAWA, YUKIO. **A relation between the thickness of molecular films and the transition temperatures of friction.** *Ôyô Butsuri* (J. Applied Phys.) 20, 159-60(1951).—*C.A.* 46, 5922*c*.

The mech. transition temps. T were measured of built-up films of Ba stearate on steel with various nos. n of layers. T increased as n increased until T reached the max. temp. 200°C at $n = 9$. At least 10 layers were necessary for the boundary lubrication. This may be because the apparent 10 layers corresponded to the effective monolayer owing to roughness of the substrate surface. T in the case of Cu reached its max. at 100°C with $n = 5$.

9300. SUSUKIDA, HIROSHI AND SANO, KOKICHI. **Effects of some catalysts on reduction velocity of solid iron oxide by carbon.** *Tetsu-to-Hagane* 37, 456-61(1951).—*C.A.* 47, 956*e*.

When a mixt. of Fe_2O_3 and carbon was heated, the following reaction took place: (1) $C + CO_2 \rightleftarrows 2\ CO$; (2) $Fe_2O_3 + 3\ CO \rightleftarrows 2\ Fe + 3\ CO_2$; (3) $Fe_2O_3 + 3\ C \rightleftarrows 2\ Fe + 3CO\ (CO_2)$. The velocities of evolution of the gases for various modes of mixing of catalysts with Fe_2O_3 and carbon at const. temp. were detd.: (*a*) $BaCO_3$ affected favorably reaction (1), and CaO accelerated reaction (2) or (3). (*b*) MgO, TiO_2, Al_2O_3, and SiO_2 were neg. catalysts for the reduction of Fe_2O_3 by carbon.

9301. WADSWORTH, MILTON E.; CONRADY, ROBERT G., AND COOK, MELVIN A. **Contact angle and surface coverage for potassium ethyl xanthate on galena according to free-acid-collector theory.** *J. Phys. & Colloid Chem.* 55, 1219-30 (1951).—*C.A.* 46, 803*e*.

The contact angle ϕ correlated on the basis of the free-acid-collector theory gave a linear relation with the abs. surface coverage θ by the equation $\theta = a\phi + b$, if single-site adsorption was assumed. The consts. a and b were detd. from the exptl. ϕ-pH data. The method of evaluation of the linear relation yielded pertinent information concerning mineral surfaces.

9302. WARREN, DONALD AND LIBSCH, J. F. **Role of gases in the production of high-density powder compacts.** *J. Metals* 3, *Trans.* 774-81 (1951).—*C.A.* 45, 8422*c*.

The influence of various pressing and sintering conditions upon the permeability, d., and percentage of pores connected to the surface of Fe-Co powder compacts were studied. These data led to a study of the effect of evolved gases on the sintering process and to a successful minimization of the influence of such gases.

9303. WILLIAMS, DAVID AND NAKHLA, F. M. **Chromographic contact-print method of examining metallic minerals and its applications.** *Bull. Inst. Mining Met.* No. 533, 257-95(1951).—*C.A.* 45, 6956*g*.

An attacking agent to free metallic ions from a mineral and a specific reagent that combined with the released ions to form a colored compd. indicative of a particular element was used. It was developed to det. the constituent elements of opaque metallic minerals in polished sections and in discrete grains. Gelatin-coated Ag-free paper (Eastman No. 867, or glossy bromide paper soaked 15 min. in $Na_2S_2O_3$ soln. to remove the Ag, washed 1 hr in running cold H_2O, and dried) was used. A piece of gelatin-coated paper was impregnated with an appropriate attacking reagent. On pressing the gelatinized side of the paper against the polished surface of the specimen a thin veneer of the susceptible minerals was attacked and the liberated ions became trapped in the gelatin film. After the paper was removed, it was developed in a reagent that was specific for the element in question.

9304. WILLIAMS, W. LEE. **Behavior of titanium at temperatures to 900°F.** *Iron Age* 167, No. 24, 81-4(1951).—*C.A.* 45, 6554*i*.

Tensile tests of commercially pure Ti showed a leveling off of strength properties in the range of 500-800°F. C and N content had little influence on this. Cold rolling gave higher yield and tensile strength up to 900°F in short time tests. Up to 600 or 700°F stress-rupture curves were very flat. Specimens of Ti were exposed for 45 days to steam from a satd. steam line averaging 550 lb per $in.^2$ gage and 480°F temp. Weight loss was only 0.018 g compared with 0.094 g for Type 403 steel under the same conditions.

9305. ZANDER, J. M. AND LINHART, O. C. **Effect of ferrous and sodium sulfate on the rate of nickel deposition.** *Better Enameling* 22, No. 5, 6-7(1951).—*C.A.* 47, 6276*c*.

A marked retardation of Ni deposition was found when either $FeSO_4$ or Na_2SO_4 was added to an immersion Ni-plating bath. $FeSO_4$ was an end-product contaminant formed by the displacement of Fe for Ni. Na_2SO_4 contamination resulted from adjustment of the pH with caustic.

9306. Zvyagin, B. M.; Rozenbaum, R. B.; Todes, O. M., and Yurovskiĭ, A. Z. **The theory of rock crushing. II. Division of the particles of the products of crushing into two fractions and the calculation of the average composition of these fractions.** *Izvest. Akad. Nauk S.S.S.R., Otdel. tekh. Nauk* **1951**, 1218-29.—*C.A.* 47, 80*e*.

A method was given for detg. the relative no. of floating and depositing particles by distributing them into 2 fractions. Also, a method for detg. the av. compn. of the floating and depositing fractions was provided.

9307. Allan, J. C. **Table flotation for the removal of sulfides from tin-wolfram concentrates in Portugal.** *Bull. Inst. Mining Met.* No. 553, 81-90(1952).—*C.A.* 47, 2654*f*.

By suitable treatment 60% of wt of mixed sulfides was eliminated. The resulting concentrate, carrying 45% WO_3 and 4% Sn, was dried and passed over the magnetic separators. The Sn concentrates contained Sn 72.8, CaO 1.34, Fe 0.77, WO_3 0.41, S 0.23, As 0.13, Pb 0.06, Zn 0.10, and Cu 0.05%. The W concentrates assayed WO_3 73.17, SnO_2 0.04, As 0.18, S 0.48, Zn 0.07, Bi 0.02, Cu 0.02, FeO 20.75, and MnO 4.2%.

9308. Barraclough, K. C. and Sykes, C. **The importance of hydrogen in steel manufacture.** *Inst. hierro y acero* 5, 282-97(1952).—*C.A.* 46, 7019*h*.

The water in raw materials in the charges must be controlled as well as that on equipment used. Up to 1 ml of H_2 per 100 g of steel could be tolerated. Above this, the effect was more pronounced in ordinary and low alloy steels than in high alloy steels, such as stainless steel.

9309. Barwell, F. T. **Effect of surface structure, composition, and texture on friction under boundary conditions.** *Proc. Roy. Soc.* (London) **A212**, 508-12(1952).—*C.A.* 46, 8447*d*.

The coeff. of friction of surfaces lubricated under boundary conditions may be profoundly affected by such factors as the degree of working of the substrate material, the nature of the oxide film, and the degree of roughness of the surface. Expts. were described wherein the frictional behavior of surfaces of stainless steel specimens prepared in various ways was compared. The worked surface layers increased the value of the coeff. of friction, but the effect of surface texture was of predominant importance. The effect of different oxide films was best illustrated by reference to pure Al.

9310. Beeghly, H. F. **Behavior of nitrogen and some of its compounds in steel.** *Anal. Chem.* 24, 1095-1100(1952).—*C.A.* 46, 11070*e*.

A modification of the rapid micro-Kjeldahl procedure for detg. the N-content of the acid-insol. compds. was presented. A simple, economical method for prepg. ammonia-free water with ion-exchange resins was proved and its use was described. Illustrative examples of the behavior of N_2 during thermal treatment of steels contg. Al, Si, and V were given.

9311. Brasunas, Anton deS. **Subsurface porosity developed in sound metal during high-temperature corrosion.** *Metal Progress* 62, No. 6, 88-90(1952).—*C.A.* 47, 1027*a*.

Subsurface voids, resulting from diffusion phenomena and subsequent Cr depletion, in Inconel (Ni 75, Cr 15, Fe 7%) and similar alloys were produced by leaching with molten fluorides above 1300°F, high-temp. vacuum treatment at 2500°F, and high-temp. oxidation in air at 2280°F.

9312. Calvet, J. and Potemkine, V. **Oxidation during smelting of aluminum-magnesium alloys and the protective role of beryllium at very low concentrations.** *Recherche aéronaut.* No. 29, 21-8(1952).—*C.A.* 47, 2667*i*.

Addn. of Be prevented oxidation during smelting operations of Al-Mg alloys and was advantageous, especially when the concn. of Mg was higher than 5%. Alloys made of very pure metals were more sensitive to oxidation than those made of ordinary metals. With refined Al the concn. of Mg in the bath had to be kept under 9.5% to avoid rapid alteration. This concn. could be increased to 11.5% in the case of 99.5% pure Al. Only 0.007% Be was necessary to completely protect a bath contg. 12% Mg during 2 hrs at 750°C; the amt. of Ca necessary to achieve the same result was prohibitive.

9313. Charmandarian, M. O. and Andronikova, N. N. **Corrosion and formation of a negative ferric hydroxide sol.** *Bull. soc. chim. France* **1952**, 99-101.—*C.A.* 46, 6069*h*.

The corrosion of Fe, in the presence of gum arabic, in water and in NaCl and Na_2SO_4 solns., was accompanied by the formation of a negative sol. The corrosion was considerably accelerated by light and the presence of salts, but was usually inhibited by the gum arabic. These results were attributed to the diffusion rate of O_2, the stability of the Fe compds., the nature of the adsorbed films, and the peptizing and coagulating action of the media.

9314. Comeaux, Roy V. **The role of oxygen in corrosion and cathodic production.** *Corrosion* 8, 305-10(1952).—*C.A.* 46, 9498*c*.

In the case of buried steel above pH 4.5 the reduced substance was O_2. The 2 electrons furnished by the corrosion of an Fe atom reduced 1/2 O_2 to OH ion. Corrosion ceased if access of O_2 to all points of the surface was eliminated. Complete cathodic protection was achieved when electrons were supplied at the steel surface at the same rate as O_2 diffused to the surface. Current drainage of 1 ma./ft^2 was equiv. to 6.24 $\times 10^{15}$ electrons/ft^2/sec; this amt. reduced 1.56 $\times 10^{15} O_2$, or the amt. of O_2 in 318 monolayers of water. The influence of the thickness of the diffusion layer on the c.d. requirements for complete cathodic protection could be developed from a simple form of Fick's law of diffusion.

9315. Cook, Melvin A. and Talbot, Eugene L. **Surface hydrolysis in sodium lauryl sulfate solutions and its effect on surface tension and on adsorption at the solid-aqueous solution interface.** *J. Phys. Chem.* 56, 412-16 (1952).—*C.A.* 46, 7769*a*.

Hydrolytic adsorption at the free surface of aq. Na lauryl sulfate solns. was shown by pH measurements correlated with foam extn. of the soap, and by means of surface tension *vs.* pH curves at const. concn. and ionic strength. Values of an apparent *surface hydrolysis const.* of 10^{-7} to 10^{-8} were obtained from the latter procedure, although the hydrolytic adsorption may perhaps be due merely to a fatty acid impurity in Na lauryl sulfate.

9316. CREMER, E. AND CONRAD, F. **The adhesion of magnesite powders on solid surfaces. II.** *Radex Rundschau* 1952, 3-6.—*C.A.* 46, 6899*d*.

The adhesive force of a mixt. of an adhesive and a nonadhesive powder corresponded approx. to the percentage of the adhesive component. The adhesive force of a mixt. of two adhesive powders could be calcd. from the av. grain diam., or the latter could be calcd. from the adhesive force. The adhesive force of raw magnesite was lowered to about 1/5 of its value when dried. It increased slowly with rising temp. without, however, approximating the value of undried magnesite.

9317. CROFT, R. C. **Separation of the anhydrous chlorides of iron and aluminum by formation of graphite complexes.** *J. Appl. Chem.* (London) 2, 557-62(1952).—*C.A.* 47, 444*g*.

The possibility of sepg. $FeCl_3$ and $AlCl_3$ by heating with graphite was studied. Graphite occluded $AlCl_3$ and also $AlCl_3 + FeCl_3$ when both were present. The stability of both these new complexes were studied and also of the mixed $FeCl_3$ and $AlCl_3$. A sepn. of the 2 chlorides by heating with quantities of graphite in suitable proportion to the $FeCl_3$ present was feasible and possibly of some value in the industrial chlorination of ferruginous Al ores.

9318. EMEL'YANOV, D. S. **Role of kerosine in intensification of coal flotation and in improving the quality of the concentrate.** *Ugol* 27, No. 4, 37-40(1952).—*C.A.* 47, 289*b*.

Kerosine alone was effective as collector for hard-to-float coal, but its effectiveness was enhanced when used in conjuction with a reagent of the medium-light oil. Kerosine was preferably added 1-2 min. after the start. Such addn. of kerosine reduced the flotation time, increased the recovery, and reduced the ash content of the concentrate. Kerosine was equally effective when used in conjunction with some frother. Thus, 350, 700, 1000, and 1400 g kerosine/ton gave a recovery of 52.46, 61.48, 83.71, and 87.65% of combustible matter in 10 min.

9319. ESIN, O. A. AND OKUNEV, A. I. **Kinetics of the interaction of metal and slag from the point of view of the ionic theory.** *Izvest. Akad. Nauk S.S.S.R., Otdel, Tekh. Nauk* 1952, 1472-82.—*C.A.* 47, 4811*i*.

The ionic theory assumed exchanges of ions, with neutralization of the excess elec. charges at the boundary through passage of ions in the reverse direction. This scheme was illustrated by a quant. interpretation of data on the desulfurization of pig iron. Passage of S^{--} ions from the metal into the slag produced a neg. charge on the slag side; this was counteracted by a passage of O^{--} ions from the slag into the metal. The rate of the forward reaction should increase not only with increasing S content in the metal, but also with the O^{--} ion concn. in the slag, i.e. with its basicity. This was borne out by the data.

9320. FADGEN, T. J. **Metal recovery by ion exchange.** *Sewage and Ind. Wastes* 24, 1101-7 (1952).—*C.A.* 46, 11525*g*.

Experience with ion-exchange resins for removing Cu, Cr, and Ni from dil. plating rinse waters was given. The practicability and economics of the process were discussed.

9321. FINN, WILLY. **Tin-tungsten ore flotation at the Schwarzwasser/Altenberg Mines.** *Z. Erzbergbau u. Metallhüttenw.* 5, 266-70(1952).—*C.A.* 47, 6320*c*.

With an av. crude ore content at Altenberg of 0.64% Sn, 77% of the Sn was recovered in concentrates contg. an av. of 12% Sn. The tailings contained about 0.15% Sn. At Zinnwald, with an av. crude ore content of 0.43% Sn, 82% of the Sn was recovered in concentrates contg. an av. of 11% Sn. The tailings contained about 0.08% Sn. Part of the water essential for the flotation was obtained from the return water from the concentrator and thickener.

9322. FLEMING, MARSTON G. **Effects of alkalinity on the flotation of lead minerals.** *Trans. Am. Inst. Mining Met. Engrs.* 193, *Tech. Pub.* No. 3424-B (in *Mining Eng.* 4, 1231-6)(1952).—*C.A.* 47, 1550*h*.

The mechanism of alkali depression was investigated in each of the 3 systems: cerussite-aq. carbonate-xanthate, cerussite-xanthate, and galena-xanthate. The action of carbonate-free alk. solns. in preventing the flotation of cerussite may be independent of the collector and may be due entirely to decompn. of the mineral surface. This type of alkali depression may operate in any case where the basic product does not yield simple metal ions.

9323. GINDIN, L. G. AND PUTILOVA, I. N. **Immunizers of metals towards corrosion.** *Doklady Akad. Nauk S.S.S.R.* 86, 973-5(1952).—*C.A.* 47, 5860*f*.

A small amt. of anthraquinone delayed by some 100 days the sulfidation of Cu in a soln. of S in C_6H_6 which otherwise took place within a few tenths of a sec. A similar action was shown by $PhNH_2$, $N(CH_2CH_2OH)_3$, quinoline, $PhCH_2OH$, pyrogallol, 1-$C_{10}H_7NH_2$, o-$C_6H_4(CO)_2O$, o-$C_6H_4(CO_2)NH$, etc.; "the immunity period" increased, in this order, from 50 min. to 18 days. Oxidized unsatd. hydrocarbons, e.g. air-oxidized cracking-gasoline, also had an immunizing effect, evidently owing to the presence of peroxides. They lost this ability after distn., and Bz_2O_2 (and tetrahydronaphthalene peroxide) in amts. of the order of 0.1%, prevented the formation of Cu sulfide for more than 100 days.

9324. GROUNDS, ARTHUR AND WANDLESS, A. M. **The mineral matter in coal and its relation to coal-preparation problems. A special study of ash and clinker in industry.** *J. Inst. Fuel* 25, 170-7(1952).—*C.A.* 46, 8346*g*.

Seams now being mined are dirtier than those worked before the war, and mechanization has led to the hoisting of more dirt with the coal. The influence of the mode of distribution of the mineral matter in the raw coal on the ease or difficulty of cleaning operations was discussed, and reference was made to the difficulty in prepg. coals contg. higher than av. proportions of pyritic S. The methods available for coal cleaning were outlined, and their relative merits and demerits considered.

9325. Gründer, Werner and Bunji, Bela. **Flotation of kaolin-rich lead-zinc ores.** *Z. Erzbergbau u. Metallhüttenw.* 5, 182-5(1952).—*C.A.* 46, 7007*h*.

Increasing kaolin content caused an increased Pb content in the waste and therefore reduced yield of Pb. Finer grinding to less than 0.15 mm was essential, as well as an improvement in the dressing process for high kaolin content (10-20%) which prevented the floating of the sulfide particles in the highly viscous slurry. A rake classifier was required for purification and levigation of the particles of less than 20-25 mm coming from the Symons conical granulator. Pb yield increased by 6-7% and the Pb content in the final concentrate increased from about 68 to 76%.

9326. Hagihara, Hitoshi. **Surface oxidation of galena in relation to its flotation as revealed by electron diffraction.** *J. Phys. Chem.* 56, 610-15(1952).—*C.A.* 46, 7943*d*.

The initial oxidation of galena surfaces was studied in air, in an enclosed atm. in galena powder, in a vacuum furnace, in water, and during dry and wet grinding. In all cases $PbSO_4$ was found as the lowest oxidation product. The next higher oxidation product in air was the basic sulfate Pb_2SO_5. Cryst. carbonate, hydroxide, or the lower sulfur oxides, PbS_mO_n, (with n/m less than 4), were not observed.

9327. Hague, H. G. **Cleaning small coal by froth flotation.** *G.E.C. Journal* 19, No. 2, 117-21(1952).—*C.A.* 46, 6807*i*.

App. suitable for cleaning down to a very fine coal below 30 mesh in size was described. Cresol, mixed in 1-3 lb per ton of water, was used to produce the bubbles. Tests of performance were given and cost discussed.

9328. Harris, J. H. **A standard laboratory procedure for the evaluation of East African graphite ores, with special reference to crucible-grade flake graphite.** *Bull. Inst. Mining Met.* No. 552, 43-53(1952).—*C.A.* 47, 1870*g*.

Details were given of a method of extn. of graphite by crushing, sieving, and flotation. The flotation concentrate was filtered, dried, and weighed, and reported as total commercially recoverable graphite. The dried concentrate was sieved, and the wt of -60-mesh graphite recorded as the percentage of graphite fines in the original sample.

9329. Hoar, T. P. and Farthing, T. W. **Solid films on electropolishing anodes.** *Nature* 169, 324-5(1952).—*C.A.* 46, 8990*h*.

Evidence for the presence of a solid film on the surface during electropolishing was obtained on Cu and brass anodes in H_3PO_4. Hg drops were allowed to fall on a horizontal sheet anode during electropolishing. The drops either (a) did not wet the surface but slowly rolled over it and off the specimen after being in contact with it for several min.; (b) became immobilized on the surface, which was then wetted by the Hg over a small area that did not spread while the anodic current flowed, but which began to spread within a sec. or so after the current was switched off; or (c) if very small, sometimes became immobilized on the surface but gave no visible wetting or amalgamation.

9330. Horsley, R. M. **Oily collectors in coal flotation.** *Trans. Inst. Mining Engrs.* (London) 111, 886-94(1952).—*C.A.* 47, 4579*a*.

The more air-avid coals were floated by means of a frothing agent alone, but the addn. of an oily collector greatly enhanced the air-avidity of all coals, with the exception of lignite. A hydrocarbon oil readily displaced H_2O from the surface of coal, forming a surface film that resulted in an increased contact angle and a decreased induction period. Consequently, air bubbles more easily attached themselves to the surface, and improved flotation results.

9331. Horsley, R. M.; El-Sinbawy, H., and Smith, H. G. **Xanthates in coal flotation.** *Fuel* 31, 302-11(1952).—*C.A.* 46, 7730*g*.

Contact-angle expts. demonstrated that pure alkali xanthates were not collectors for coal but that the com. products or pure xanthates in the presence of oxidizing agents had a collecting action. Oxidation resulted in the formation of dixanthogen, which was a powerful collector for coals of all ranks except lignites.

9332. Houtermans, F. G.; Vincent, D., and Wagner, G. **The inclusion of sulfur in the electrodeposition of copper from copper sulfate solution and the measurement of the ionic radius in the formation of unimolecular surface layers.** *Z. Elektrochem.* 56, 944-6 (1952).—*C.A.* 47, 6276*a*.

With S^{35} as a tracer, the inclusion of SO_4^{2-} in the anode and cathode during electrolysis of a 1:1 $CuSO_4$-H_2SO_4 soln., 0.1 *N* in SO_4^{2-}, with a c.d. of 5 ma./cm^2, was detd. by measuring the activity of the Cu electrodes. Both electrodes showed a surface layer of SO_4^{2-}, which could not be washed off with H_2O, but could be dissolved with dil. HCl after oxidation of the Cu surface. This did not change the wt appreciably, but removed the activity completely from the anode and almost completely from the cathode. When 10 mg/cm^2 of Cu was sepd., the deposited Cu contained S $6\text{-}8.10^{-8}$ g/g of Cu. In sepns. of 500 mg/cm^2 of Cu, there was S 7.10^{-5} g/g of Cu. This was probably due to catalysis of the SO_4^{2-} inclusion by the Cu_2O which appeared after 5 hrs of electrolysis, rather than to preferential adsorption of S^{35}.

9333. Hukki, R. T.; Palomäki, Antti, and Orivuori, Erkki. **Electrophoretic investigation of the activation of sphalerite by copper sulfate in flotation.** *Suomen Kemistilehti* 25B, No. 9, 42-9(1952)(in English).—*C.A.* 47, 4262*d*.

Sphalerite was, electrophoretically speaking, a neg. mineral. The ζ-potential of sphalerite particles became more neg. with increasing pH. Floatability of activated sphalerite by xanthates was comparable to that of true Cu sulfide minerals. In activation of sphalerite by $CuSO_4$: $ZnS + Cu^{++} \rightarrow CuS + Zn^{++}$, a pos. ion (presumably Cu^{++}) was adsorbed by pure sphalerite, the extent of adsorption being a function of the pH of the soln. Max. adsorption at the concn. of 25 mg of $CuSO_4$ per liter, took place between pH 7 and 8.

9334. IRMANN, R. **Sintered aluminum with high strength at elevated temperatures.** *Metallurgia* 46, 125-33(1952).—*C.A.* 47, 84*h*.

Sintered compacts prepd. from pure Al powder were much stronger at room temps. than pure Al itself; they were also superior at elevated temps. to the usual Al alloys. Methods of prepg. Al powder and its properties were described. Tensile strength of Al-powder compacts, as extruded, was 32-6 kg per mm^2; for *Anticorodal* (Al-Si-Mg), as heat treated, it was 32-42; for *Avional* (Al-Cu-Mg), as heat-treated, it was 40-8.

9335. KIKUTA, SADAO AND MASUDA, YOSHIMICHI. **Adhesion of small particles of some metals and glass at high temperatures.** *Ôyô Butsuri* (J. Applied Phys.) 21, 114-18(1952).—*C.A.* 46, 10711*c*.

Micrographical measurements in connection with powder metallurgy were reported of the rate *R* of neck formation by adhesion between 2 small spherical solid droplets of glass at 650-80°C and of Ag at 850-910°C. *R* was intensively affected by the geometrical configuration. A possible explanation of the result was the surface diffusion in the earlier stage and the vol. diffusion in the later period. The shrinkage in the distance between centers of the 2 particles was measured and showed a certain geometrical relation with the change in form of the neck.

9336. KIRCHBERG, H. AND SCHUBERT, H. **Separation of pyrites and arsenopyrite by flotation in alkaline medium.** *Bergakad., Freiberg Forsch. A., Bergbau* 3, No. 7, 54-61, discussion, 61 (1952).—*C.A.* 47, 455*h*.

Arsenopyrite, a by-product of Pb and Zn mining, could be concd. by flotation in an alk. medium (pH = 8) contg. amyl xanthate in a concn. of 40 g/1000 kg. The concentrate contained 45% S and less than 1% As. An As concentrate did not appear to be economical to prep. from the available raw material.

9337. LAST, GEORGE A. AND COOK, MELVIN A. **Collector-depressant equilibrium in flotation. I. Inorganic depressants for metal sulfides.** *J. Phys. Chem.* 56, 637-42(1952).—*C.A.* 46, 7008*f*.

The "bubble pick-up" method was employed to obtain comprehensive equil. data for the system potassium amylxanthate—sodium sulfite—galena at 25°C. A free acid collector-free acid depressant single-site mechanism was developed based on the Cooke hydrolytic adsorption theory. It was found to give a complete and self-consistent correlation of the exptl. results of this study. The adsorption potentials for the depressant and the collector, resp., were independent each of the other.

9338. LAST, GEORGE A. AND COOK, MELVIN A. **Collector-depressant equilibrium in flotation. II. Depressant action of tannic acid and quebracho.** *J. Phys. Chem.* 56, 642-8(1952).—*C.A.* 46, 7008*g*.

An exptl. investigation of the systems galena-amylxanthate-tannic acid and galena-amylxanthate-quebracho was carried out. These depressants were regarded as having two surface-active groups capable of adsorbing on a galena surface, namely, the carboxyl and phenolic groups. Not all of the phenolic groups were active as depressants, but only the undissocd. trihydroxyphenyl radical. Tannins in the colloidal form were ineffective as depressants for galena.

9339. LEWIS, A. G. L. **Cupola coke: with particular reference to high-ash coke.** *Foundry Trade J.* 93, 89-93(1952).—*C.A.* 47, 3545*a*.

The effect of high-ash coke and variations in coke quality on the production of iron castings from cupola melts were detailed. C pick-up was the indication of efficiency for cupola melting generally, and as the ash in coke increased, the percentage of C pick-up fell. Other conditions remaining const., as the ash in foundry coke increased, metal temp. decreased. The problem of using high-ash coke can be met (1) by optimum cupola design and operation, (2) by the use of a suitable low-ash C substitute to offset the high ash, such as pitch coke, (3) by the use of the coal-fired air or reverberatory furnace instead of the cupola.

9340. LIVINGOOD, MARVIN D. **Flotation of copper silicate by selected alkyl-substituted polyhydroxy nitroso phenols.** *Univ. Microfilms* (Ann Arbor, Mich.), *Pub.* No. 4027, 164 pp. (microfilm $2.05, paper enlargements $16.40); *Dissertation Abstracts* 12, 659(1952).—*C.A.* 47, 1549*i*.

9341. LOISON, R. **Underground gasification in different countries. VI. French tests of underground gasification at Djerada, Morocco.** *Am. mines Belg.* 51, No. 1, 9-27(1952).—*C.A.* 47, 2455*f*.

The gasification was made with an air current not enriched with O_2 on a coal contg. 89.0% C, ashes 5.4%, and humidity 2%; the upper heating value of the coal is 7925 cal/kg. The tests (described in detail) gave a gas of 350 cal on the av., 500-600 cal for long periods. The thermal efficiency was low (50-60% at the most, 20% in unfavorable periods).

9342. MAURER, JOSEPH. **The influence of adsorption of gas on the surface transformation of a martensitic structure during the tempering of steel.** *Compt. rend.* 234, 1773-5(1952).—*C.A.* 46, 7960*h*.

The hardness of the surface of a piece of steel contg. 0.8% C dropped from initial value of about 595 in all gases at 200°C to values of about 380, 330, 320, 280, and 240 for vacuum, Ne, H, A, or CO_2 atms., resp. Similarly, Brinnell-hardness values dropped from 242 for heating in vacuum or treating with H_2 or A at 200°C down to values of about 170, 150, and 130 for values of heat treating at 500°C in vacuum, in H_2 and A, resp. The results were interpreted as indicating the influence of adsorbed gas on the stability of the surface structure during the transformation of martensite to pearlite.

9343. Merwe, J. W. van der. **Pressure gasification of Uereeniging coal.** *S. African Mining Eng. J.* 63I, 831-3(1952).—*C.A.* 47, 2455*g*.
The carbon in the coal was gasified by the pressure of O_2 and steam resulting in the formation of CO and CO_2, H_2, H_2O as steam, and CH_4. The by-products of the gasification were (per ton of coal): tar and oil 2.2 gallons, gas naphtha 2 gallons, ammonia 18 lb, tar acids 11 lb, CO_2 13,000 ft^3, and sulfuretted H 12 lb. The importance of the process, especially for South African coal mine conditions, was discussed.

9344. Nurse, T. J. and Wormwell, F. **The isolation and examination of films from metal surfaces: an improved technique.** *J. Appl. Chem.* (London) 2, 550-4(1952).—*C.A.* 47, 1018*g*.
A means of strengthening films stripped from metals was sought. The object, such as oxide-covered steel, was immersed in 0.25-1% soln. of Formvar in a mixt. of 2 parts by vol. of acetone and 1 part by vol. of trichloroethylene for 1-2 min., removed, and allowed to drain for 5 min. The film was then stripped in an anhyd. deaerated soln. of I_2 in alc. and washed in anhyd. deaerated methanol. Applications of the technique were cited for oxide films on heated mild steel, the films produced on Fe or steel by industrial treatment, oxide films on polished stainless steel, and the oxide films on Cu, brass, Zn, Ti, Al, Al-Cu, and Al-Si alloys.

9345. Ostrof, Bernard and Thum, Ernest E. **Ion exchange: a new technique for metallurgists.** *Metal Progress* 62, No. 1, 67-74(1952).—*C.A.* 46, 7827*g*.
Uses were described of synthetic resins for ion exchange in H_2O purification, Cr plating, recovery of Cu and Zn from wastes, sepn. of rare earths, and purification of Zr.

9346. Paulson, C. F. **Profitable chromate wastes.** *Metal Finishing* 50, No. 5, 48-50, 56 (1952).—*C.A.* 46, 6577*b*.
The system recommended was a cation exchanger to remove metallic cations from the strong chromic acid soln. and an anion exchanger to recover the chromate from the dil. rinse solns.

9347. Paulson, C.F. **Metal recovery by ion exchange.** *Plating* 39, 1330-4(1952).—*C.A.* 47, 4226*f*.
Processes for recovery of Zn, Sn, Cu, Ni, Au, Ag, and Cr were described. A flow sheet and cost analysis were given for a system for recovering Cu, Ni, and Cr. Ion-exchange recovery was shown to nearly pay for itself as compared to expensive waste-disposal methods.

9348. Philippoff, W. **Some dynamic phenomena in flotation.** *Trans. Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 3265-B (in *Mining Eng.* 4, 386-90)(1952).—*C.A.* 46, 4443*d*.
A possible mechanism for the attachment of a conditioned mineral particle to a rising bubble was developed. The time during which the phenomenon occurred was detd. by the time of impact. During this time the film of liquid between the particle and the bubble must recede, creating the particle-air interface. This velocity of film-recedence was both calcd. and measured and found to be dependent on the dynamic receding contact angle, which was much smaller than the equil. contact angle, measured in the bubble machine. This mechanism, as distinct from the static equil., accounted for the more difficult flotation of fines and slimes. Expts. were made by using particles within the range of sizes used in flotation, but large enough to give easily measurable contact times.

9349. Piatti, Luigi. **Effect of wetting agents on corrosion. III. The influence of the constitution of cation-active wetting agents.** *Werkstoffe u. Korrosion* 3, 186-8(1952).—*C.A.* 46, 7978*g*.
Two cation-active wetting agents, both derived from the same mono-acetylated diamine, were examd. under exactly equal conditions. The hydrochloride gave a practically total protection of the steel while the corresponding methyl ammonium sulfomethylate permitted an attack essentially greater than that by water without the addn. of the wetting agent.

9350. Popel, S.I.; Esin, O.A., and Nikitin, Yu. P. **Effect of carbon on the interfacial tension of iron in contact with slag.** *Doklady Akad. Nauk S.S.S.R.* 83, 253-5(1952).—*C.A.* 46, 8581*f*.
Detns. of the interfacial tension σ between Fe with up to 5% C and a synthetic slag of the compn. CaO 39, SiO_2 36, Al_2O_3 26%, were made at 1400°-1500°C by the method of the sitting drop on a corundum support in a graphite crucible. The interfacial tension decreased uniformly with increasing C content of the iron, i.e. C was surface-active also at the boundary with the slag. The values were close to the surface tension against air; this was due to the absence of chem. interaction between the iron and the slag.

9351. Powers, Robert A. and Hackerman, Norman. **Nickel plating by chemical reduction. I. Effect of the basis metal.** *J. Phys. Chem.* 56, 187-8 (1952).—*C.A.* 46, 7485*f*.
Plating was attempted on evapd. films of Ni, Fe, Au, Cu, and Pt. On only the 1st three, did plating occur. Electron-transmission patterns after stripping the plate from the basis metal gave only the diffraction rings of the basis metal. This indicated that surface geometry, catalytic effects of the surface, and similarity to the Ni lattice were not factors.

9352. Sarjant, R.J. **Fuel and metal.** *Foundry Trade J.* 92, 619-28(1952).—*C.A.* 46, 8343*i*.
The properties of coke as affected by the coal from which it was made and by the carbonizing conditions and the influence of the properties on performance of the fuel in the cupola and blast furnace were considered. Studies on coke reactivity showed that in the cupola, and possibly in the blast furnace, rates of melting and temps. of

the metal were influenced materially by the reactivity. Increased velocity of blast produced the equiv. of a fall in reactivity for a particular temp.

9353. SUBRAMANYAM, G.V. AND NARAYANAN, P.I.A. **Flotation of sulfur from sulfur-bearing clays from Near Masulipatam, Madras.** *J. Sci. Ind. Research* (India) 11B, 423-6(1952).—*C.A.* 47, 4562*d*.

Elemental S of biochem. origin present in a clay deposit was concd. by flotation. At a pulp pH of 4.2, stage addns. of cresylic acid and light Diesel oil produced a concentrate contg. 52% S, being 81% of the S in the feed. Na_2CO_3 and Na metasilicate were used to control pH and deflocculate slimes. The material tested contained about 22% free S.

9354. THEWS, E.R. **The deoxidation, desulfurizing and outgassing of remelted alloys by lithium.** *Metall* 6, 431-3 (1952).—*C.A.*46, 11076*h*.

Although Li was very effective it could be used only where cheaper means were not available. Deoxidation could be accomplished by a no. of metals and compds. such as Al, Mg, Mn, P-Cu. Mg and Mn were also good desulfurizers and P-Cu is good for outgassing. However, for Ni-rich alloys such as Ni bronzes, new Ag-and Pb-contg. bearing metals, Li was required to give sufficiently dense and homogeneous alloys. To avoid the harmful effect of excess Li, not enough was added completely to deoxidize, desulfurize, and outgas the metals, but it was used rather as an adjunct in very small quantities.

9355. TÖDT, FRITZ. **The limits of the electrochemical investigation of corrosion processes and oxygen contents.** *Werkstoffe u. Korrosion* 3, 205-9 (1952).—*C.A.* 46, 7978*d*.

Very small amts. of O_2 or of oxide films on Fe were detd. from the current generated in galvanic cells, in which the current-generating process at the cathode occurred exclusively by an O_2 depolarization. By switching off the current after some time, an equally increasing growth of the current output occurred, which permitted almost unlimited sensitivity in the detn. of very small amts. of oxide films.

9356. VEĬLER, S. YA. **The negative lubricating action of some liquid media in deep drawing of metals.** *Doklady Akad. Nauk S.S.S.R.* 83, 709-12(1952).—*C.A.* 46, 8836*f*.

The relation between *P*, the tangential stress and the chain length of the org. compd. was nearly linear. Solid lubricants, with a pos. lubricating action, lost their effectiveness on softening. With steel, a 5% soap soln. (pos. lubricant) decreased *P* from 650 to 500 kg; under the same conditions, CCl_4 increased *P* from 650 to 1050 kg. The degree of deformation with CCl_4 was 1-2% higher, and with the soap soln. 1-1.5% lower, than under dry conditions. Surface hardening of steel was increased somewhat in CCl_4 and decreased with soap.

9357. WILLIAMS, J. **Trapping of gases in cold-compacted powders.** *J. Iron Steel Inst.* (London) 172, 19-24(1952).—*C.A.* 46, 11063*b*.

With ThO_2 powder, the exptl. method used for Fe did not distinguish the effect of mechanically entrapped gas from that of adsorbed gas because of the large amts. adsorbed. ThO_2 compacts on standing adsorbed further quantities of gas. This was explained on the assumption that an increase of the adsorbing surface occurred by reason of relaxation of the interparticle forces, the slight sepn. of these particles allowing entry of gas to these fresh surfaces.

9358. WROBEL, S.A. **Study in flotation frothing—surface tension: air-solution.** *Bull. Inst. Mining Met.* No. 549, 505-17 (1952).—*C.A.* 46, 11061*c*.

Surface tension was detd. by measuring the pull on a vertical mica plate dipping into the soln.; the app. was described in detail. Variations of surface tension with time were shown only by solns. of some frothers—notably pine oil and 1,1,3-triethoxybutane.

9359. YUDENICH, G.I. AND BOGDANOVA, Z.S. **Flotation of ferrous metal ores.** *Gornyĭ Zhur.* 126, No. 10, 29-33(1952).—*C.A.* 47, 1015*c*.

The original ore was crushed to 3 mm and subjected to wet magnetic sepn. yielding middlings and tailings. The middlings were ground to 0.1 mm and subjected to a 2nd magnetic sepn. yielding a magnetite concentrate and tailings. The latter contained Fe 15-22%, mostly as hematite. Flotation expts. were carried out on these tailings. Collectors in order of their effectiveness were: igepon, Na oleate, merzolate C-4, oxidized kerosine, and fatty acids (paraffin oxidation condensate).

9360. ZADRA, J.B.; ENGEL, A.L., AND HEINEN, H.J. **Process for recovering gold and silver from activated carbon by leaching and electrolysis.** *U.S. Bur. Mines, Rept. Invest.* No. 4843, 32 pp. (1952).—*C.A.* 46, 3923*h*.

Activated carbon was sometimes used in treating Au ores contg. very little sol. Ag. When the carbon was loaded with a suitable amt. of Au, the Ag load was negligible. In the process described, the loaded carbon was leached with a boiling soln. contg. 1.0% NaOH and 0.1% NaCN. The soln. was circulated through a bed of loaded carbon and then to a circular electrolytic cell which included a stainless steel screen anode and a pervious cathode contg. stainless steel wool. Lab. expts. confirmed by pilot-plant operations, showed that 2 liters of soln. per lb of carbon could be used in continuous leaching and electrolysis, regardless of the precious metals load on the carbon.

9361. ANON. **Ion-exchange processes in the plating and allied industries. I. An assessment of their position in the plating and anodizing process.** *Electroplating* 6, 3-9 (1953).—*C.A.* 47, 4225*i*.

Many of the plating defects are caused by suspended matter, often originating as hardness in the make-up or rinse water. Ppts. of $CaSO_4$, $PbSO_4$, $CaCO_3$, etc., in the baths for plating Ni, Cu, Ag, etc., were common sources of trouble. Ion-exchange processes gave waters which had distd.-water quality at lower cost, and justified use (even in rinsing) by virtue of the savings realized in fewer rejects.

9362. ANON. **Ion-exchange processes in the plating and allied industries. II. Ion exchange in recovery processes.** *Electroplating* 6, 121-30 (1953).—*C.A.* 47, 6275*g*.

In the case of CrO_3 contg. anodizing baths for Al, it was possible to justify the complete initial and operating cost amortization within a few years in CrO_3 savings by removing the accumulated Al ions. In the case of Cr-plating baths, after proper diln. of small portions, contaminating metal ions of Fe, Ni, Cu, or Cr(III) could be removed to acceptable levels, thereby keeping such baths operating indefinitely, requiring only make-up. The CrO_3 in the drag-out and rinse water was recoverable. Although reactivation of H_2SO_4 or HCl pickle baths was not feasible, the recovery of H_3PO_4 pickle baths was justified.

9363. BAILEY, R. AND WHELAN, P.F. **The influence of pulp temperature on the froth flotation of four British fine coals.** *J. Inst. Fuel* 25, 304-7(1953).—*C.A.* 47, 5094*h*.

The influence of pulp temp. was studied over the range 5-70°C and was found to be important in the froth flotation of fine coals from Penallta, St. John's, Gresford, and Bedlington E pits, with 2:1 creosote/cresylic acid mixts. as frother. Best results, in terms of wt yield, high-tailings ash, and rapidity of frothing and filtration were obtained at 25-30°C, but even at 20°C good performance was usually possible. Over 30°C there was no improvement.

9364. EMEL'YANOV, D.S. **Lowering the sulfur content of coal flotation concentrates.** *Ugol* 28, No. 4, 36-9(1953).—*C.A.* 47, 7189*e*.

The S in coal-flotation concentrates was decreased by sep. flotation of size fractions and proper selection of kind and quantity of reagent. Removal of the highly dispersable material, e.g., 0.05-0.0 mm, gave a concentrate which contained less ash (6.10-7.93%) and S (1.62-2.86%) than was obtained without removing this fraction (ash 6.82-11.40 and S 2.10-3.08%). With solar oil the S content increased as the amt. of oil increased from 500 to 1000g/ton, but with kerosine the reverse was true.

9365. EVANS, L.F. **The flotation of topaz using sodium hexadecyl sulfate as collector.** *Australian J. Appl. Sci.* 4, 165-73(1953).—*C.A.* 47, 7171*a*.

Sodium hexadecyl sulfate was a poor collector for freshly crushed topaz, but flotation was improved after the mineral had reacted with water, and further improved by pretreating the mineral with ferric or Pb chloride solns. ($10^{-3}M$). The collector was pptd. almost quantitatively by Ca salts, and hence had to be added in excess if Ca was present; Mg salts did not interfere similarly since the pptn. of Mg hexadecyl sulfate was very slow. No method was found for sepg. topaz from cassiterite by flotation, the flotation properties of the two being identical.

9366. GAUDIN, A.M. AND CHARLES, W.D. **Adsorption of calcium and sodium on pyrite.** *Trans. Am. Inst. Mining Met. Engrs.* 196, *Tech. Pub.* No. 3491-B (in *Mining Eng.* 5, No. 2, 195-200)(1953).—*C.A.* 47, 3772*h*.

To measure the difference in adsorption of Ca and Na, radionuclides of Ca and Na were used to evaluate the effect of dissolved O_2, the concn. of Ca or Na, the H-ion concn., and anions present. O_2 in soln. increased the adsorptive power of pyrite for Ca and Na, being greater for Ca. The adsorption d. of Ca increased with increase in Ca concn. and with pH. Na adsorption d. increased with pH and decreased with increasing concns. of Ca and cyanide ions. Ca adsorption decreased slightly in the presence of Na and (or) cyanide ions. In a soln. contg. K ethyl xanthate more Ca and (or) more Na was adsorbed than in the absence of the collector.

9367. GAUDIN, A.M. AND COLE, R.E. **Double-bond reactivity of oleic acid during flotation.** *Trans. Am. Inst. Mining Met. Engr.* 196, *Tech. Note* 144-B (in *Mining Eng.* 5, No. 4, 418) (1953).—*C.A.* 47, 5732*c*.

In the case of fluorite and C-18 fatty acids having 1 or 2 nonconjugated double bonds, there was practically no change of the fatty acid mol. or ion during the flotation operation. The extraordinary utility of these reagents was related to some property of the compds. other than the oxidizability of their double bonds.

9368. GRÜNDER, W. AND DULOVIC, M. **Cerrusite flotation.** *Z. Erzbergbau u. Metallhüttenw.* 6, 99-3(1953).—*C.A.* 47, 4809*f*.

The conditions essential for the flotation sepn. of oxidic Pb ores were discussed, including the influence of the type of sulfidizing agents used such as xanthates, Na_2S and H_2S, the grain size, time of treatment.

9369. HALL, C.L. AND WHELAN, P.F. **Laboratory tests on the concentration of witherite from the Northern Pennines by froth flotation.** *Trans. Inst. Mining Met.* 62, Pt. 6 (in *Bull.* No. 556, 271-83(1953).—*C.A.* 47, 4809*g*.

After grinding to 75% minus 200-mesh B.S. the coal and metallic sulfides could be removed together in a frothing process with $CuSO_4$ as modifier a xanthate collector, and pine oil as frother with simultaneous loss of only about 2.5% of the witherite input. By using under 10 lb of com. oleic acid as collector and about 1 lb of Na silicate as SiO_2 depressant per ton input, the crude 75% $BaCO_3$ ore ground to 75% minus 200-mesh could be made in batch tests to yield a concentrate assaying 90% $BaCO_3$, 90% of the input witherite being recovered in the concentrate, while 70% of the gang was discarded in tailings.

9370. SUN, SHIOU-CHUAN. **Frothing characteristics of cresylic acids in flotation.** *Bull. Inst. Mining Met.* No. 557, 301-20(1953).—*C.A.* 47, 5732*e*.

Cresylic acid is a complex mixt. of alkyl phenols. The frothability of the chem. constituents of cresylic acid was chiefly governed by the balance between their polar and nonpolar groups and consequently by their solubilities. The frothability of different grades of the acid was detd. by chem. compn. The frothability of cresylic acid and its principal components was generally independent of pH values ranging from 3.4 to 7, then increased gradually from pH 7.5 to 10, fell sharply at pH 11, and finally increased again at and beyond pH 11.5.

9371. TRUSHLEVICH, I.V. **Fixing the flotation time of coal slimes more accurately based on the study of the kinetics of flotability of petrographic varieties of coal.** *Ugol* 28, No.2 11-13(1953).—*C.A.* 47, 6631*d*.

Samples of concentrate were examd. with a binocular equipped with an integrator. The yield of lustrous, dull, lustrous-dull agglomerate, dull-gang agglomerate, and gang varieties were plotted on distinctly marked separate curves by variously shaded circles. The diam. of the circle indicated the size. The time needed to obtain a high-grade coking concentrate, fraction suitable for recleaning, fraction suitable for power-house fuel, and fraction suitable for boiler fuel were detd.

9372. WALKER, CHARLES A. AND ZABBAN, WALTER. **Disposal of plating-room wastes. V. Treatment of cyanide waste solutions by ion exchange.** *Plating* 40, 165-8(1953).—*C.A.* 47, 4226*b*.

Ion-exchange principles were discussed. The lab. ion-exchange app. was described.

9373. WULLHORST, B. **Activated carbon in electroplating.** *Metalloberfläche* B7, No. 2, 25-9 (1953).—*C.A.* 47, 4225*e*.

9374. GABRIELSON, GUNNAR. **The determination of boric acid in nickel plating and acid zinc plating baths by means of cation exchangers.** *Plating* 41, 47-54 (1954).—*C.A.* 48, 4368*g*.

Strongly acidic cation exchange resins in the H-form (Amberlite IR-120) were employed to remove Ni, Zn and other interfering ions in the detn. of H_3BO_3 in Ni and acid Zn plating baths. The soln. to be detd. was passed through an exchange column, which adsorbed the Ni^{++} and Zn^{++} liberating equivalents of H^+. The column was then rinsed with distd. water and effluent and rinse waters titrated with NaOH against bromthymol blue. At endpoint, mannitol was added, and the titration continued again to the color endpoint. The max. relative error was reported at less than 0.5%.

V-12. Miscellaneous Applications (Carbon Black, Leather, Lubrication, Paints)

9375. HOEVEN, C. VAN DER. **Displacement of adsorption. A contribution to the practical application of the adsorption theory.** *Chem. Weekblad.* 19, 555-7 (1922).—*C.A.* 17, 1179.

It was not sufficient simply to extract leather with water in order to det. H_2SO_4. Part of it was retained by adsorption. Extraction with 8% Na_2HPO_4 soln. which displaced the adsorbed SO_4^{--} made it possible to wash out the H_2SO_4 contained in the leather.

9376. HOUGHTON, A.S. **Thermal effect of vapors on rubber.** *Proc. Phys. Soc.* 35, 39-44 (1922).—*C.A.* 18, 341.

When rubber was immersed in the vapor of ether, of benzene, pyridine, water, ammonia, toluene, chloroform, oil of lavender, and oil of geraniol, a heating effect was obtained. The effect was maximal within a fews secs, and disappeared within a few min.

9377. HARDY, W. **Free and bound fluid in gels.** *Kolloid-Z.* 46, 268-77 (1928).—*C.A.* 23, 1553.

The range of cohesion at the surface of steel, copper, glass or quartz was large and was the sum of the attractions of the individual mols. The effect of orientation increased cohesion range. Frozen joints of a lubricant between metal surfaces were broken to show the range of influence of metal in preventing crystn. in the adsorbed material.

9378. JOHNSON, C.R. **Carbon black. I. A study of its volatile constituents.** *Ind. Eng. Chem.* 20, 904-8(1928).—*C.A.* 22, 4273.

Complete analyses were made of 5 types of carbon blacks, before and after evacuation, and of the gases removed. The volatile matter in a carbon black had no determinant effect of the properties imparted to rubber, but above certain limits it reduced the reënforcing power of the carbon black and retarded the rate of vulcanization. The gases extracted from the carbon blacks contained CO, CO_2, H_2, N_2, CH_4, C_2H_6, illuminants and O_2. CO and CO_2 may have been reaction products of the O_2 originally present.

9379. WIEGAND, W.B. AND BOGGS, C.R. **Carbon black in rubber insulating compounds.** *Ind. Eng. Chem.* 22, 823(1930).—*C.A.* 24, 4958.

Carbon black had no deleterious effect on the insulating properties of rubber compds., and actually improved them in many cases. Expts. were carried out on 3 compds. in which whiting was replaced by carbon black in various amts. With a 40% rubber compd., the use of 3 1/4% carbon by vol. had the following effects: resistivity increased 68%; breakdown voltage increased 40%; dielec. const. increased 10% (d.c.); dielec. const. at 1000 cycles increased 14%; dielec. const. at 440,000 cycles increased 9%; power factor at 1000 cycles decreased 24%; power factor at 440,000 cycles decreased 19%. With a 30% compd. and with a 35% compd. contg.22% reclaimed rubber, similar improvements were observed, but of less magnitude.

9380. KAUFMANN, CHARLES. **Acetylene carbon black.** *Can. Chem. Met.* 17, 93-5 (1933).—*C.A.* 27, 3782.

Three methods of manufg. carbon black from C_2H_2 were outlined and the phys. and chem. properties listed. The black produced by the thermal process of splitting C_2H_2 into the elements possessed a marked wetability as compared to other carbon blacks. Thermic C_2H_2 blacks were used increasingly in connection with pyrolusite (MnO_2) and graphite for depolarizing purposes.

9381. DROGIN, I. **An outline of carbon black.** *India Rubber J.* 90, 259-74(1935).—*C.A.* 29, 8249^2.

The manuf. of carbon black was described including the methods of production, the characteristics of the factory for producing carbon black, the importance of the lava tip, examn. and analysis of carbon-black deposit, factors which influence the recovery and quality of carbon black, and the application of carbon black to various industries.

9382. ESCH, WERNER. **Active and inactive carbon blacks in the past, present and future.** *Rev. gen. Caoutchouc* 14, no. 135, 3-18 (1937).—*C.A.* 32, 1412[5].

9383. WIEGAND, W.B. **pH properties of colloidal carbon.** *Ind. Eng. Chem.* 29, 953-6 (1937).—*C.A.* 31, 6832[1].

If one part of colloidal carbon be boiled for 15 min. or more with 3 to 10 parts of distd. H_2O, and cooled, the supernatant liquid decanted, and the sludge placed in contact with the glass electrodes of a pH electrometer, a reading was obtained characteristic of the material, e.g., high-grade impingement blacks 2.6 to 4.1; lampblacks 3.1 to 4.2; rubber-grade impingement blacks 3.6 to 5.7, non-impingement carbon 8.2 to 9.3. The pH remained unchanged, within exptl. error, after repeated extn. by distd. H_2O.

9384. DROGIN, I. **A survey of methods for evaluating carbon blacks.** *Rubber Tech. Conf. London, Preprint No.* 18, 12 pp. (May, 1938).—*C.A.* 33, 2290[4].

The evolution of methods for testing channel-process carbon blacks used in rubber manuf. was described from a historical point of view. The numerous phys. and chem. characteristics of carbon blacks were tabulated, with information on the range of the exptl. values of each property and the influence of each of these properties, so far as known, on the properties imparted by the blacks to rubber.

9385. THEIS, EDWIN R.; GANZ, JEROME, AND JACOBY, THOMAS F. **Chrome liquors. X. The effect of dichromate concentration during reduction upon the chemical characteristics of the chrome liquor. XI. The effect of excess sugar during reduction upon the basicity.** *J. Am. Leather Chem. Assoc.* 34, 461-3, 705-9 (1939).—*C.A.* 33, 9705[8]; 34, 2201[8].

In liquors prepd. by adding H_2SO_4 to sugar-dichromate solns. contg. variable sugar, and boiling under reflux, the observed basicity was always lower than that calcd. from the dichromate-acid ratio, owing to formation of org. acids. The basicity decreased with increasing excess of sugar. At 1 and 2.5% Cr_2O_3 reduction was incomplete. At and above 5% Cr_2O_3 reduction was complete, basicities were const., and percentages of all org. acids increased with dichromate concn.

9386. THEIS, EDWIN R. AND GANZ, JEROME. **Chrome liquors. XII. Comparison of the chemical characteristics of basic chromium sulfate liquors made with and without reflux.** *J. Am. Leather Chem. Assoc.* 34, 709-11 (1939).—*C.A.* 34, 2201[9].

The lowering of the basicity caused by org. acids formed from incomplete oxidation of sugar was almost as great when reduction was done in an open vessel (simulating com. practice) as when done under reflux. Prolonged boiling raised the basicity slightly by partial expulsion of volatile acids.

9387. WORNUM, W.E. **Physical aspects of resin and oil systems.** *Varnish Making, Oil & Colour Chem. Assn.* **1939**, 61-75.—*C.A.* 34, 6466[5].

A maleic resin ester and Congo copal resin were heated at several temps. between 200° and 275°C for varying periods and with different proportions of linseed oil. The dispersion of common varnish resins in hot oils was not simply due to soln. At 200° to 225°C adsorption of oil was probably only intermicellar, i.e., flocculates only were dispersed, the micelles remaining intact; bright mixings were not obtained. At 250°C intramicellar adsorption ensued; the brightness of the mixings and tolerances for white spirit increased.

9388. BEECK, OTTO; GIVENS, J.W., AND SMITH, A.E. **On the mechanism of boundary lubrication. I. The action of long-chain polar compounds.** *Proc. Roy. Soc. London* A177, 90-102 (1940).

Lubricants showing little or no surface orientation had a const. coeff. of friction of about 0.1 over the available velocity range from 0 to 1 cm sec. With oils which showed high surface orientation imparted by addn. of long-chain polar compds., a sudden decrease of the coeff. of the friction was observed at various velocities of the sliding surfaces, depending upon the compd. used. The regions of sudden decrease of the coeff. of friction corresponded to a change from metallic contact to extremely high electrical resistance. Long-chain polar compds. acted primarily by inducing the 'wedging effect' and not by giving a direct protection to the surface.

9389. BEECK, OTTO; GIVENS, J.W., AND WILLIAMS, E.C. **On the mechanism of boundary lubrication. II. Wear prevention by addition agents.** *Proc. Roy. Soc. London* A177, 103-18(1940).

Wear preventing agents were effective through their chemical polishing action, by which the load became distributed over a larger surface and local pressures and temps. decreased. Especially effective were compounds containing P or other elements or group V of the periodic system. These were found to form a metal phosphide or homolog on the surface which were able to alloy with the metal surface, lowering its melting point markedly, and by this action aiding greatly in maintaining a polish.

9390. GEHMAN, S.D. AND FIELD, J.E. **X-ray structure of rubber-carbon black mixtures.** *Ind. Eng. Chem.* 32, 1401-7 (1940).—*C.A.* 34, 8332[9].

The effects of carbon blacks of different av. particle sizes on the X-ray structure of stretched vulcanized rubber were investigated. For a given carbon black, the elongation at which a pattern appeared decreased as the proportion of carbon black increased. For a given proportion of different blacks, the elongation at which a pattern appeared varied directly with the av. particle size of the black. The exptl. results indicated the existence of a region of increased stress in the vicinity of the carbon black particles.

9391. HAUSER, E.A. AND LEGGETT, M.B. **Color reactions between clays and amines.** *J. Am. Chem. Soc.* 62, 1811-14(1940).—*C.A.* 34, 6480^7.

Discoloration of white rubber in tires was due to color reactions between clay fillers and antioxidants belonging to the class of amines. To study the reaction further, the color effects produced by a great variety of amino compds. on Wyoming bentonite were examd. The color was specific to the amine of the aniline type and could be produced with all reactive types of clay; benzidines gave blue, anilines green, and toluidines, pink or yellow colors; the intensity of the color depended on the type of clay. The color reaction was not regarded as a simple base exchange reaction.

9392. PARKINSON, D. **Carbon black in compounding rubber.** *Trans. Inst. Rubber Ind.* 16, 87-104 (1940).—*C.A.* 35, 655^2.

The centrifugal method of measuring particle size was applied to carbon blacks. The procedure was to disperse the black (first washed with NH_4OH) in a dil. soln. of NH_4 oleate and tannic acid, and then to sediment in a Hearson centrifuge. In this last operation, agglomerates larger than 0.2 μ were first thrown out, the unsedimented part was dild. to the required concn., and centrifuged for periods of 0.5-24 hrs. The main bulk of the black was composed of particles 25-35 $m\mu$ in diam. Particles smaller than 20 $m\mu$ may have been present.

9393. ANON. **Adsorbers guard telephone equipment.** *Heating, Piping Air Conditioning,* 13, 557(1941).

Loss in transmission and amplification efficiency had been traced to the tarnishing of the Ag contactors of the automatic selectors. This staining was a film deposit caused by minute quantities of certain gases, particularly SO_2, entrained in the air coming in contact with the metal. Adsorbers removed the gaseous impurities from the ventilating air.

9394. DAWSON, T.R. AND MESSENGER, T.H. **A comparison of gas blacks.** *J. Rubber Research* 10, 15-19 (1941).—*C.A.* 35, 5286^5.

Three gas blacks and an acetylene black were compared with respect to grit, coloring power, d., flow in oil, sedimentation in dil. alc., ash, acetone ext., petr.-ether ext. and the phys. properties (rate of vulcanization, extensibility, rigidity, resiliency and hardness) imparted to vulcanizates.

9395. GEHMAN, S.D.; WOODFORD, D.E., AND STAMBAUGH, R.B. **Dynamic properties of rubber. Dependence on pigment loading.** *Ind. Eng. Chem.* 33, 1032-8 (1941).—*C.A.* 35, 8358^4.

A method for measuring the dynamic properties of rubber was described. The dynamic properties of vulcanizates contg. Superspectra black, channel carbon black, Thermatomic black, ZnO, clay and blanc fixe were measured. The dynamic properties of vulcanized rubber depended on the pigment which it contained.

9396. HALL, O.D. **Carbon black.** *Gas.* 17, no. 4, 12-15 (1941).—*C.A.* 35, 3798^2.

The larger part of the carbon black production was by the channel process, in which a natural gas-burner flame impinged on a plate or channel, leaving a deposit of carbon black (about 1.45 lb per 1000 ft^3 gas). One plant burned sour fractionator-vapors, consisting largely of butane and propane, using the channel process, with channels 8 in. wide and 140 ft long. Another plant produced carbon black by the controlled combustion of natural gas in a special furnace.

9397. KANAGY, JOSEPH R. **Evolution of carbon dioxide and water from vegetable-tanned leather at elevated temperatures.** *J. Am. Leather Chem. Assoc.* 36, 609-23 (1941); *J. Research Natl. Bur. Standards* 27, 257-67 (1941) (Research Paper No. 1418).—*C.A.* 36, 1801^9.

Evolved CO_2 and H_2O were absorbed and weighed. H_2O evolved at 60°C did not increase materially after the first day and was considered absorbed H_2O. Evolution of CO_2 at 60°C was slight but measurable. Rate of evolution at any temp. declined slightly with time. H_2O evolved in O_2 (after deducting absorbed H_2O) was about 1.5 times that evolved in air, and 6 times that evolved in inert gas. Evolution of H_2O and CO_2 from vegetable-tanned leather appeared to be due principally to oxidation of the tanning material.

9398. SIMIZU, MAKOTO. **The adsorption of chrome liquors by hide powder.** *Bull. Tokyo Univ. Eng.* 10, 2(1941).—*C.A.* 38, 2235^4.

Hide powder and basic Cr salt solns. were used to det. the influence of time, basicity and concn. on the max. amt. of Cr adsorbed.

9399. TABOR, D. **Desorption or "surface melting" of lubricant films.** *Nature* 147, 609-10(1941).—*C.A.* 35, 6098^4.

Solid films of satd. hydrocarbons or of normal alcs. gave continuous sliding; the transition to stick-slip occurred at the m.p. In the normal satd. acids from pelargonic to stearic, the transition occurred about 75°C above the m.p. The transition was due to the desorption or deorientation of the adsorbed film or to a change of state from closely packed to less-closly packed.

9400. UEBERREITER, KURT. **Active fillers in micro-and macromolecular liquids.** *Angew. Chem.* 54, 508-12(1941).—*C.A.* 36, 4628^4.

An explanation of the effect of carbon black filler on rubber was offered. A "wetting temp.," the range in which the cohesive power of the liquid mols. became equal to the elastic binding power of the active surface, was assumed. It was always higher than the congealing temp. and since rubber-like high polymers congeal far below the temp. at which they are used, carbon black was effective in them only at room temp.

9401. WIEGAND, W.B. **Further electron microscope studies on colloidal carbon, and the role of surface in rubber reinforcement.** *India Rubber World* 105, No. 3, 270-2; *Can. Chem. Process Inds.* 25, 579-81 (1941).—*C.A.* 36, 2443^3.

Nine different com. colloidal carbons were examd. physically and chemically, with particular attention to particle size and shape, color, oil absorption, general colloidal properties, and the properties which they imparted to raw and vulcanized rubber.

9402. AKAMATSU, HIDEO. **Adsorption at the solid-liquid interface. IV. Relation of adsorption, oiliness, and flocculation of powders.** *Bull, Chem. Soc. Japan* 17, 333-8(1942).—*C.A.* 41, 4350*c*.

Adsorption was a necessary condition to reduce friction. For a certain homologous series of lubricants the longer the mol. chain the better was the oiliness. Among the polar radicals, the carboxyl radicals were most readily adsorbed by the glass surface. The oiliness of toluene or xylene soln. contg. a small quantity of fatty acid was explained by the assumption that the fatty acid was selectively adsorbed by the friction surface. If a powder was hydrophilic, it was not likely to flocculate in the polar liquid and the sedimentation vol. was small.

9403. CHESHIRE, A., AND HOLMES, N.L. **The influence of bound water on the equilibrium in leather-water systems.** *J. Intern. Soc. Leather Trades' Chem.* 26, 237-55(1942).—*C.A.* 37, 5615^4.

Equil. in vegetable-tanned leather-H_2O systems was studied over the range 2-28% sol. matter in the liquid phase. Defatted, shaved leather was allowed to stand 2 days with various amts. of H_2O. The leather was then pressed at about 10 tons/cm^2. Hide substance and H_2O were detd. in the pressed leather, and total solids in the expressed soln.

9404. DENFELD. **The oil-adsorption capacity of various working metal surfaces with and without special graphite.** *Deut. Motor-Z.* 19, 102-4 (1942).—*C.A.* 37, 5229^6.

The spreading and adherence of oil drops which were sprayed or run on gliding disks of steel or brass were tested. Untreated oil and oil treated with "Zafit", which was a slipping agent consisting of colloidal graphite in a suspending medium, were used. The wetting and the adherence of oil on metal surfaces were considerably improved.

9405. DÉRIBÉRÉ, MAURICE. **Bentonites.** *Papeterie* 64, 258-62 (1942).—*C.A.* 38, 2204^8.

European bentonites were used for the fixation of pigments and loading materials, in printing paste, in water purification and in miscellaneous ways.

9406. DROGIN, I. **Carbon blacks in natural and synthetic rubbers. III.** *India Rubber World* 107, 272-7(1942).—*C.A.* 37, 1896^9.

Lampblack had the same effects as semireënforcing furnace black in the rubbers; acetylene black gave results intermediate between those with furnace black and channel black. The color (nigrometer), sp surface area, oil absorption, volatility, diphenylguanidine adsorption, pH value, hygroscopicity, max. vol. loading in smoked sheet and extrusion in rubber of representative channel black, 2 furnace blacks, lamp-black and acetylene black were tabulated.

9407. KAMBARA, SHU. **Activation of fillers for rubber mixtures. II. Treatment of calcium carbonate with cation soap.** *J. Soc. Chem. Ind. Japan* 45, 967-70(1942).—*C.A.* 43, 1599*e*.

$CaCO_3$ was treated with an alc. 1-dodecylpyridinium bromide, the solvent was removed by evapn., and its effect on the activity of $CaCO_3$ as a filler for rubber was studied. When $CaCO_3$ after such treatment was used as a filler, vulcanized rubber of much higher tensile strength but with a slightly less elongation was obtained than when ordinary $CaCO_3$ was used, and vulcanization was accelerated. The most suitable proportion of cation soap was found to be 0.26% in wt of $CaCO_3$, which corresponded to the proportion required to cover $CaCO_3$ particles with a single mol. layer of the soap.

9408. LUPPO-CRAMER. **Adsorption processes in photographic emulsions.** *Chem.-Ztg.* 66, 265-7 (1942).—*C.A.* 38, 687^9.

A review of grain-and nucleus-isolation reactions of abnormal adsorption processes, was given especially in the Sterry effect and photographic reduction processes.

9409. MIZUNO, KENJIRO. **Evaluation of the particle size of Japanese carbon blacks for rubber compounding.** *J. Soc. Chem. Ind. Japan* 45, 692-5 (1942).—*C.A.* 43, 1599*i*.

The particle size of Japanese carbon blacks was evaluated by x-ray investigation. The tensile strength, elongation, and elec. cond. of rubber compds. contg. various kinds of blacks were measured, and the relation between these properties and the size of the particles was discussed.

9410. PIETSCH, E. **Effect of stationary strata on the lubrication between sliding and rolling surfaces.** *Kraftstoff* 18, 75-9 (1942).—*C.A.* 37, 4950^9

Stationary strata in moving, lubricated members were points of increased wear. Examples of this were the dead points on pistons and dead centers on roll bodies. The corrosion on such points was not traceable to direct contact between metals, but resulted from changes in mol. phys. processes in the boundary layer of the lubricant.

9411. RUYSSEN, R.G. **The determination of the surface tension of liquids by using the principle of Wilhelmy.** *Meded. Kon. Vlaamsche Acad. Wetensch., Letteren schoone Kunsten België, Klasse Wetensch.* 4, No. 1, 1-17 (1942).—*C.A.* 38, 3177^2.

A Pt plate (thickness 0.005-0.05 cm) was tared and dipped into the liquid to be investigated; then, the wt required to bring the plate back to its original position was detd. Measurements on H_2O, C_6H_6, EtOH and CCl_4 gave good agreement with known values. The values were affected by increasing the thickness of the Pt plate and also its form.

9412. SAMUELSON, OLOF. **Fractionation of sulfite waste liquor.** *Svensk Papperstidn.* 45, 516-18 (1942).—*C.A.* 37, 2573^3.

Sulfite waste liquor was fractionated by means of an exchange of anions. It was possible to sep. the nonelectrolytic components from the acids by selective adsorption of anions. The sepn. of the isolated acids from each other was also possible. The adhesive properties of the waste liquor depended upon the nonelectrolytic components, whereas the lignosulfonic acids did not have any adhesive effect.

9413. VEITH, H. **The absorption of water by rubber in its relation to some general problems of**

swelling. *Kolloid-Z.* 98, 52-62 (1942).—*C.A.* 36, 6372^9.

The absorption of water by tech. rubber mixts. contg. relatively high proportions of fillers (whiting, carbon black, talc and clay) as a function of time could be represented by the equation: $n = Kt^{0.5}$, where n was the quantity of water absorbed per unit vol. and K was a const.

9414. WINTERKORN, HANS F. **Applications of modern clay researches in construction engineering.** *J. Geol.* 50, 291-306(1942).—*C.A.* 37, 737^8.

In highway engineering, the soils considered were within the zones of daily and seasonal moisture and temperature changes. Therefore, their properties must be known as functions of these variables. Base exchange was employed in construction to alter undesirable soil properties (Treasure Island, San Francisco). The ease with which a road-bed was stabilized by means of bitumen of portland cement depended upon the SiO_2-R_2O_3 ratio and on the type and amount of exchangeable ions of the clay fraction.

9415. ANON. **1. Proposed method for measuring the absorption of water by sole leather. 2. Proposed impact method for measuring resistance of coated light leathers to cold cracking. 3. Proposed method for measuring resistance of leathers to deterioration at high temperatures.** *J. Am. Leather Chem. Assoc.* 38, 2, 48-9, 176-8 (1943).—*C.A.* 37, 5887^1.

9416. CHESHIRE, A. **Tanning as a polar adsorption.** *J. Intern. Soc. Leather Trades' Chem.* 27, 123-38, 145-82(1943).—*C.A.* 38, 1901^4.

The adsorption theory of tanning was reviewed. Over a wide pH range the increase in degree of tannage with decreasing pH was const. At any tannin concn. the degree of tannage decreased with increasing temp. Desorption of tannin varied inversely as the surface tension of the H_2O. This was also true in H_2O-acetone or H_2O-alc. mixts. For any leather-solvent system, the product of the equil. concn. of sol. matter and the surface tension was const. Salts, e.g., $MgSO_4$, which raised the surface tension of H_2O also increased fixation of tannin. Tanning was regarded as a polar adsorption of tannin mols., carrying a layer of bound H_2O, upon the surface of collagen, which also carried a layer of bound H_2O.

9417. COTTRELL, J.A. **Some fundamental properties of solid surfaces.** *Paint Tech.* 8, 153-4, 161 (1943).—*C.A.* 38, 4455^5.

Surface phenomena dealing with the spreading of liquids on solid surfaces, of importance in the technology of paints and varnishes, was discussed.

9418. DALLA, VALLE, J.M. **A course of instruction in micromeritics.** *J. Chem. Education* 20, 557-61(1943).—*C.A.* 38, 1160^3.

In many respects fine particles showed the properties of fluids in that they flowed and could be distd. in a current of air; however, in many other respects they had little resemblance to the fluid state.

9419. FURUKAWA, TONOSUKE. **Some experiments on natural inorganic fillers comprising chiefly calcium carbonate. I. Testing of natural fillers by the Meigen reaction and by fineness.** *J. Soc. Rubber Ind. Japan* 16, 123-35 (1943).—*C.A.* 43, 8187*i*.

Compns. of various types of natural and synthetic $CaCO_3$ were tested by the Meigen reaction, and the effects of compn. and fineness on the properties of vulcanized rubber were studied.

9420. HIRANO, S. **The effect of the adsorbed gas on the breakdown of liquid insulation.** *J. Inst. Elec. Engrs. Japan* 63, 463-5(1943).—*C.A.* 42, 1092*g*.

The change of dielec. strength of liquid insulation with a change of atm. pressure depended on the adsorbed gas on the electrode and was independent of the gas dissolved in the oil. The larger the quantity of adsorbed gas, the lower the dielec. strength. The breakdown strength of the adsorbed gas on the pos. electrode was larger than that of the adsorbed gas on the neg. electrode. The breakdown of liquid insulation was attributed to ionization by collision.

9421. JOHANSSON, C.H. AND PERSSON, G. **The diffusion of atmospheric moisture through small openings.** *Iva* 1943, 160-5.—*C.A.* 38, 5127^7.

Relatively large amts. of moisture could enter a container in which dry air was almost hermetically sealed. Diffusion was believed to occur by displacement of a layer of moisture sorbed on the solid surface.

9422. KENDALL, C.E. **Water absorption of varnish and paint films.** *J. Oil & Colour Chem. Assoc.* 26, No. 273, 35-47(1943).—*C.A.* 38, 6113^7.

Conditions were standardized as follows: temp. 20°C, humidity 65%, drying time 7 days, immersion in distd. H_2O at 20°C for 24 hrs. Panels were removed from the H_2O, shaken and blotted to remove surface moisture and cleaned of adhering fibers-all in 10 sec. By studying the evaporation rate of H_2O from the film, it was possible to estimate the moisture in the film before evapn. began by extrapolating the logarithmic curve wt vs. time to zero time. For accurate work corrections should be made for H_2O-sol.matter (about 0.30% in a 100% phenolicwood oil varnish) and moisture present in the film before immersion. The use of glass, Cu, Al and tin plate panels were considered. The last two surfaces gave the smaller absorptions, and their use was recommended.

9423. MAESER, MIETH. **Air permeability of light leather.** *J. Am. Leather Chem. Assoc.* 38, 3-19(1943).

The time required for a unit vol. of air to pass the leather diaphragm was increased by the elimination of doming. Decreasing the doming of the sample by use of a star foot caused the air flow to remain more nearly proportional to the pressure. If some method could be found to hold a diaphragm flat, without reducing the permeability of the leather, or if the leather was thick enough and stiff enough so that doming was practically eliminated, a diaphragm would follow Poiseuille's law.

9424. OKUNO, TOSHIRO; IMADA, FUMIO, AND YOSIDA, KAORU. **Studies on carbon. XI. Some experimental studies on carbon mixture in air-**

dry cells. *Technol. Repts. Kyushu Imp. Univ.* 18, 201-7(1943).—*C.A.* 43, 5572g.

The active carbon (from Quercus and Pinus) alone or mixed with NH_4Cl was molded into a cylinder to incase a CS_2 impregnated graphite anode. It was tested with a Zn cathode in a dry cell for the adsorption of O_2, H_2O, and ionic NH_4Cl and the drop and recovery of e.m.f. after discharge with 5-10 v.

9425. PARKINSON, D. **Effect of diameter and surface area of carbon black particles on certain properties of rubber compounds.** *Trans. Inst. Rubber Ind.* 19, 131-55(1943).—*C.A.* 38, 2844[7].

The fineness of particle size was the controlling factor in the reenforcing properties of carbon blacks. Carbon blacks fell into 4 classes: (1) furnace blacks and impingement blacks (rubber grades); (2) thermal blacks (coarse and fine); (3) lampblack and acetylene black, and (4) impingement blacks (color grades). Carbon black was present in vulcanized rubber in 4 different states: (1) compact clusters of particles; (2) networks of strings or chains in which individual particles were in direct contact; (3) dispersed particles whereby each particle was sepd. from its neighboring particles, but not bonded firmly to the rubber; and (4) dispersed particles which were linked to the macromols. of rubber.

9426. SCHOFIELD, M. **Carbon black and lampblack.** *Paint Manuf.* 13, 233-5 (1943).—*C.A.* 38, 653[2].

The development of methods of production were reviewed together with the relative positions of the 2 forms as pigments. Both pigments absorb far more oil in grinding than do mineral and bone black, yet this was offset by the greater hiding power of these pigments and of carbon black in particular.

9427. SPEEDY, ALAN. **The surface area of colloidal carbons. V. The role of surface area in rubber reenforcement.** *Rubber Age (London)* 24, 182,184(1943).—*C.A.* 38, 5107[5].

Proof resilience, tensile strength, stress modulus, hardness, rebound resilience and plasticity were shown as functions of the loading of a standard rubber mixt. with different types of carbon black.

9428. SPEEDY, ALAN. **The surface area of colloidal carbons. VI. The role of surface area in rubber reenforcement.** *Rubber Age (London)* 24, 206, (1943).—*C.A.* 38, 5107[5].

Tabulated data on loading capacity and elec. resistivity were presented.

9429. SPEEDY, ALAN. **The surface area of colloidal carbons. VII. The role of surface area in rubber reenforcement.** *Rubber Age (London)* 24, 232, 234 (1943).—*C.A.* 38, 5107[6].

The relations of the surface chemistry of different types of carbon black to the phys. properties imparted to rubber were discussed. In general, chem. compn. did not give a clue to the properties imparted to rubber. The relations between colloidal properties and surface area were discussed.

9430. SWEITZER, C.W. AND BRAENDLE, H.A. **The pH, surface and structure of colloidal carbons.** *India Rubber World* 107, 468, 476 (1943).—*C.A.* 37, 1897[3].

Unpublished expts., involving electron-microscopic examn. of rubber-P-33 cements, showed that, in conformity with its surface inertness (low bound-rubber, hardness, modulus and adsorption of rubber), P-33 C black dispersed easily and completely. Assocd. with the lack of C-C bonding was a deficiency of C-rubber bonding, which was confirmed by the low reenforcing power of this type of black.

9431. TURNER, L.B.; HAWORTH, J.P.; SMITH, W.C., AND ZAPP, R.L. **Carbon black in butyl rubber.** *Ind. Eng. Chem.* 35, 958-63(1943).—*C.A.* 37, 6934[2].

Data on the effects of different types of carbon black on the phys. properties (tensile strength, modulus, extensibility, hardness, resistance to tearing, permanent set, resilience, heat build-up, and artificial aging) of butyl-rubber vulcanizates were recorded graphically and discussed. Carbon blacks which reenforced natural rubber did not reenforce the tensile strength of butyl rubber, whereas with respect to other phys. properties, carbon blacks were the same as for natural rubber.

9432. DROGIN, I.; GROTE, H.W., AND DILLINGHAM, F.W. **Behavior of blacks in rubbers. Effect of Banbury mixing.** *Ind. Eng. Chem.* 36, 124-8 (1944).—*C.A.* 38, 1393[1].

The effects of 13 types of carbon blacks (including channel-process blacks and furnace-process blacks made by combustion and by thermal decompn.) in smoked sheet rubber, Buna-S, Buna-N, Butyl rubber, Neoprene-GN and Thiokol-FA were studied. The differences between the phys. and chem. properties of the individual blacks and between their reenforcing powers were shown in their effects in Banbury mixing. Blacks with relatively large specific surface areas, high proportions of volatile components and high pH values caused relatively great power consumption and generated relatively high heat.

9433. FREWING, J.J. **The heat of adsorption of long-chain compounds and their effect on boundary lubrication.** *Proc. Roy. Soc. (London)* A182, 270-86 (1944).—*C.A.* 38, 4175[9].

The frictional behavior between mild steel surfaces lubricated with solns. in white oil of long-chain compds. consisting of halides, acids, α-substituted acids, esters, cyanide, thiocyanate and a nitro deriv. was investigated under high loads at low speeds. Each soln. built up and was in equil. with an adsorbed and oriented film of the polar compd. on the surface. An equation was deduced relating the concn. and the transition temp. with the heat of adsorption. Long-chain polar compds. were adsorbed by the interaction of their dipoles with the atoms in the metal surface.

9434. SCHWARZ, H.F. **Compounding GR-S with channel black and mineral rubber.** *Ind. Eng. Chem.* 36, 51-4 (1944).—*C.A.* 38, 1141[6].

So-called "mineral rubber" (hard asphalt) had certain advantages in GR-S (Buna-S) in addn. to its functions as a softening agent, dispersing agent, filler and extender as in crude and reclaimed rubber. The base mixt. was composed of GR-S 100, S 2, mercaptobenzothiazole 1.5, stearic acid 2 and ZnO 5, to which were added 0 to 130 parts of channel black (EPC) and 0 to 115 parts of mineral rubber (m.p. 300-20°F). The effects of different proportions of GR-S, mineral rubber and carbon black on various phys. properties were shown graphically by method of trilinear compounding.

9435. SERGEANT, S.V. **Reconditioning of transformer oil with activated alumina.** *Proc. Tech. Sect., Paper Makers' Assoc. Gt. Brit. & Ireland* 25, 260-3(1944).—*C.A.* 40, 447^8.

Lab. trials confirmed the efficacy of activated Al_2O_3 in removing acidity from oil, a temp. approaching 100°C was advisable; 10% Al_2O_3 for 30 min. was satisfactory. Because of cost, the catalyst must be reactivated below 700°C.

9436. SPEEDY, ALAN. **The surface area of colloidal carbons. VIII. The role of surface area in rubber reenforcement.** *Rubber Age (London)* 24, 260-1(1944).—*C.A.* 38, 5107^7.

Tinting strength, color and absorption characteristics were discussed, and the general trends of these properties, existing anomalies and suggested hypotheses reviewed.

9437. SPEEDY, ALAN. **The surface area of colloidal carbons. IX.** *Rubber Age (London)* 24, 286, 288 (1944).—*C.A.* 38, 5107^7.

Absorption vs. surface area, loading capacity, the effect of surface on reenforcement, modulus, hardness and rebound resilience were discussed.

9438. SPEEDY, ALAN. **The surface area of colloidal carbons. X.** *Rubber Age (London)* 25, 14, 16, (1944).—*C.A.* 38, 5107^8.

The relation between surface area and rubber properties and the roles of surface and structure were discussed and summarized. A table classified colloidal carbons with respect to their behavior in rubber, their tinctorial properties and their colloidal properties.

9439. SWEITZER, C.W. AND GOODRICH, W.C. **The carbon spectrum for the rubber compounder.** *Rubber Age* (N. Y.) 55, 469-78(1944).—*C.A.* 38, 6602^9.

It was possible to predict the behavior of a carbon black in *Hevea* rubber or in GR-S by the evaluation of 3 properties. The pH value, as measured with a carbon black slurry, was an index of the rate of vulcanization. Specific surface area, was an index of reënforcement, tensile strength, energy and rebound resilience. Structure, as measured by oil absorption and correlated with known surface-area values, was an index of anomalies in modulus, hardness, behavior on extrusion, etc.

9440. BOWDEN, F.P.; GREGORY, J.N., AND TABOR, D. **Lubrication of metal surfaces by fatty acids.** *Nature* 156, 97-101 (1945).—*C.A.* 39, 5074^5.

Metals which were reactive enough to form soaps, e.g., Zn, Cd, Cu, and Mn, were efficiently lubricated by 1% lauric acid in paraffin oil; materials which were unreactive, e.g., Pt, Ni, Cr, and glass, were poorly lubricated. The temp. at which the transition from smooth to stick-slip motion occurred was much higher for the active metals.

9441. COMMISSION OF TESTING METHODS FOR PAINTS. **Water absorption and extraction by water (of paint and varnish coatings).** *Verfkroniek* 17/18, 129-30(1945).—*C.A.* 40, 1323^5.

Smooth, stainless-steel plates, e.g., V2A steel, with a coating of at least 30-40μ, were immersed in a trough of water-resistant material filled with distd. H_2O maintained between 15° and 25°C. The plates resting on specially provided ridges were in vertical position at intervals of at least 1 cm. The H_2O extended 1 cm above their upper edges. All air bubbles were removed and the H_2O renewed every day. After 1, 4, 7, 10, and 14 days the plates were taken out, dried well with strong filter paper or a clean, lint-free towel, and weighed. The apparent water absorption was the increase in wt of the plates, and expressed in mg per dm.^{2}. For the detn. of the extn. of the coatings by H_2O the plates treated as above are dried to const. wt (after the wiping with paper or towel), in an atm. having the same temp. and moisture as that in which they were kept before immersion.

9442. DUMAS, J. **Analysis of activated carbons which are used as depolarizers in batteries.** *Ann. chim. anal.* 27, 11 (1945).—*C.A.* 40, 3062^5.

The activity was detd. by the method of Freundlich. A carbon was said to be impermeable when a piece of it placed in a beaker of water did not fall to the bottom even when agitated violently. Very small quantities of Fe or Zn salts were detrimental. A good specimen should render water very slightly basic to phenolpthalein.

9443. FISK, NEIL R. **Chromatography.** *Paint Tech.* 10, 85-9(1945).—*C.A.* 39, 3990^2.

The principles, app., technique, and scope of the method were described. The method was applied successfully to the sepn. of fatty acid mixts., cellulose acetate fractions, terpenes, etc.

9444. FURUKAWA, TONOSUKE. **Studies on activation of inorganic fillers.** *Bull. Rubber Research Inst. Japan No.* 1, 11-12(1945).—*C.A.* 44, 5628*h*.

Surface treatment of clay, iron oxide, bentonite, diatomaceous earth, Japanese acid clay, and active clay was studied with 10 surface-active materials.

9445. GALLIE, JOHN F. **Carbon black; its relation to the natural-gas industry.** *Gas* 21, No. 9, 19-20(1945).—*C.A.* 39, 5433^9.

The channel process and the thermal decompn. and combustion-furnace processes were described. The Philblack process utilized preheated degraded oil and natural gas in conjunction to produce a high modulus furnace-type black. Recovery of the carbon content was said to run as high as 60%, as against 25-50% for furnace-type plants using only natural gas and 3 to 5% for contact black plants. However, each type of black had its specific uses.

9446. GORDON, M. **Decolorization in perfumery.** *Chimie & industrie* 53, 314-18(1945).—*C.A.* 40, 3228^9.

A study was made of the decolorization of concretes, absolutes, and resinoids by various methods: fractionation, entrainment with glycol, entrainment with phthalate, extn. with alc., decolorization with bone char, with activated charcoal, and with decolorizing earth. The activated charcoal method seemed to be the most effective. The ethyl phthalate method may in certain cases be used, particularly when it is sought to incorporate the solvent into the com. product. The use of decolorizing earths alone did not appear to be of any interest; in presence of activated charcoal they seemed to have some decolorizing power.

9447. HEDIN, RUNE. **Chemical processes in the hardening of portland cement.** *Svenska Forskningsinst. Cement Betong vid Kgl., Tek. Högskol. Stockholm Handl.* No. 3, 5-150(1945).—*C.A.* 40, 6775^8.

The chem. reactions that take place when a mixt. of portland cement and water hardens under normal conditions were studied.

9448. LEACHY, A.B. **Use of Dicalite filler materials.** *Paper Mill News* 68, No. 18, 16, 18, 22 (1945).—*C.A.* 39, 5482^6.

The use, effects, and advantages were discussed of the different grades of Dicalite, a diatomaceous earth consisting of practically pure amorphous SiO_2.

9449. MILLS, M.R. **The application of chromatography to the problems of oil and varnish chemistry.** *Paint Tech.* 10, 107-12(1945).—*C.A.* 39, 5091^3.

Chromatographic methods were utilized to fractionate fatty acid mixts., to separate mono, di, and triglycerides, to sep. the glycerides of linseed oil and to study oil, oxidation products.

9450. PARKINSON, D. **Carbon blacks in GR-S rubber mixtures.** *Trans. Inst. Rubber Ind.* 21, 7-30(1945).—*C.A.* 39, 5539^9.

To 4 base GR-S mixts., contg. different proportions of S, mercaptobenzothiazole, diphenylguanidine, ZnO, softening agent, and stearic acid, were added a medium thermal black, lampblack, fine thermal black, 2 semi-reënforcing blacks, 2 high-modulus furnace blacks, acetylene black, fine furnace black, easy-processing channel black, and medium-processing channel black. The numerous mixts. were vulcanized to different states, and were then tested for tensile strength, modulus, extensibility, recovery, hardness, rebound resilience, tear resistance, and abrasion resistance. The results were presented in detail graphically and were discussed at length.

9451. ADAMS, ROBERT S. **The use of ion-exchange resins in the study of chrome (tanning) liquors.** *J. Am. Leather Chem. Assoc.* 41, 552-73 (1946).—*C.A.* 41, 2924*c*.

Amberlite IR-100 and IR-4 (analytical grades) were used as cation and anion exchanger, resp. The amts. of Cr, acid, and various anions removed were detd. by analysis of the effluents. Anionic Cr was always present in Cr sulfate solns. Results obtained with Amberlite IR-4 (analytical grade) confirmed the presence of anionic Cr. The sum of the percentages of Cr removed from different portions of the same soln. by Amberlite IR-100 and by Amberlite IR-4 (analytical grades) was less than 100 for some solns.

9452. BENSON, G.; GLUCH, J., AND KAUFMANN, C. **Electric-conductivity measurements of carbon blacks.** *Trans. Electrochem. Soc.* 90, 441-7 (1946).—*C.A.* 44, 2815*h*.

The elec. conductivities of carbon blacks, particularly those with highly developed chain structure (e.g., acetylene black), when compressed to a standard apparent d., were more in accordance with their performances in dry cells than the values obtained by measurement under standard pressure.

9453. FISCHER, EARL K. AND GANS, DAVID M. **Dispersions of finely divided solids in liquid media.** *Colloid Chemistry* 6, 286-327(1946).—*C.A.* 40, 2374^7.

Pigments, paints, and printing inks were examples of the solids and liquids and modifying agents dispersed by many types of app. A discussion was given of the liquid phase, the comminuted phase, mech. dispersion, the solid-liquid interface, rheological properties, sedimentation equilibria, contact-angle relations, heat of immersion, adsorbed water, surface-active agents.

9454. GALLIE, JOHN F. **Carbon black in its relation to the natural gas industry.** *Mines Mag. (Colo. School of Mines)* 36, *No.* 1, 19-25(1946).—*C.A.* 40, 3249^9.

9455. GALLIE, JOHN F. **Carbon black manufacture.** *Petroleum Processing* 1, 197-206(1946).—*C.A.* 42, 9122*f*.

Channel, thermal, and various furnace methods of production were described and analyzed with respect to both quantity and quality of yields. Although paraffins were the best raw material, methods were devised to use olefins, diolefins, acetylene, and anthracene. The economics of carbon black manuf. was also discussed.

9456. GUSTAVSON, K.H. **Investigation of complex formation in chromium salts by means of organolites (a preliminary summary).** *J. Intern. Soc. Leather Trades Chem.* 30, 264-79(1946).—*C.A.* 41, 877*d*.

The uncharged complex in 26% acid Cr chloride (72% of the total Cr) had the approx. compn. $[Cr_2Cl(OH)_5]$. Pelt fixed cationic complexes of low mol. wt as the residual liquor contained practically all Cr in the uncharged state. Effect of aging was studied by boiling under reflux for 2 min. a soln. of 66% acid Cr sulfate (sucrose reduced, said to be free from org. anions) contg. 1 g equiv. Cr per liter, and passing 1 ml through the organolite columns after aging for 0 to 6 weeks. While the reaction of Cr with the organolite was primarily ionic, secondary covalent linkages with phenolic groups might be formed.

9457. KITTELBERGER, W. AND ELM, A.C. **Water-immersion testing of metal-protective paints. Role of osmosis in water absorption and blistering.** *Ind. Eng. Chem.* 38, 695-9(1946).—*C.A.* 40, 5575^9.

A paint system consisting of one coat of Zn chromate primer and one coat low-gloss, alkyd hull paint (Navy specifications 52-P-18 and 52-P-25) was applied to Fe, Al, Zn. and glass surfaces and immersed from 24 hrs to 840 hrs in distd. water, NaCl, and sucrose solns. of osmotic pressure from 6 to 30 atm. Results indicated that regardless of metal surface covered, water absorption and blistering increased with time, but decreased markedly with increasing osmotic pressure.

9458. KUNZ, CHARLES J. AND IVES, CHARLES E. **Use of desiccants with undeveloped photographic film.** *J. Soc. Motion Picture Engrs.* 46, 475-510(1946).—*C.A.* 40, 6351^8.

Excessive moisture can be removed from motion-picture film in a roll within a period of several days by a desiccant packed with the film, more rapidly by ample exposure to large quantities of desiccant at normal or reduced pressure, with the aid of refrigeration, or directly by pumping down to the desired vapor pressure. Data were given on the rate of moisture uptake by $CaCl_2$, silica gel, activated alumina, tea, rice, cotton, charcoal, and Drierite.

9459. LERCH, WILLIAM. **The influence of gypsum on the hydration and properties of portland cement pastes.** *Am. Soc. Testing Materials* 46, Preprint A4, 41 pp. (1946).—*C.A.* 40, 4861^7.

Twelve com. clinkers of different compns. were ground to a specific surface of 1900 cm^2/g, with various quantities of gypsum. Five of these clinkers were ground to various degrees of fineness with SO_3 const. at 1.8%. Rate of hydration of neat cement pastes was measured with a conduction calorimeter. Fineness and the alkali and $3CaO.Al_2O_3$ content influenced the gypsum required to secure max. strength and min. contraction on drying.

9460. PETTYJOHN, E.S. **Germany made acetylene and carbon black by cracking natural gas in electric arc.** *Natl. Petroleum News.* 38, No. 32, R596-604 (1946).—*C.A.* 42, 9098*c*.

Complete details were given of the process developed by the Germans for manufg. CH:CH and carbon black by the thermal cracking of natural gas in an elec. arc of d.c. at 7000 v. The cracking took place at high temps. and normal pressures, with rapid quenching to retard polymerization of the low-mol wt hydrocarbons. Mean gas temp. for conversion was 1600°C. After cooling by water spray, the gas passed through a trap and cyclone separators to remove carbon black and was then water-washed, scrubbed with absorption oil, desulfurized, and purified.

9461. PICCINELLI, GIOVANNI. **Italian bentonite and its use in the paint and varnish industry.** *Pitture e vernici* 2, 363 (1946).—*C.A.* 41, 4317*f*.

Italian bentonite could be activated, obtaining neutral products with const. pH value. The gels of this bentonite (5-6%) gave H_2O-oil emulsions, which maintained in suspension even the heaviest pigments, increased the stability and plasticity, did not give premature hardening, had a good covering power, and showed a certain antiseptic action against terrestrial and marine microorganisms.

9462. RIETZ, R.C. AND ANDERSON, L.O. **Use of paperboard as a sorptive material in protective packaging.** *Paper Trade J.* 122, No. 11, 47-50 (1946).—*C.A.* 40, 2626^4.

The most effective packaging method for metal parts that corrode easily used a desiccant to maintain a low relative humidity within the package and an impervious moisture-vapor barrier to enclose the desiccant and the item. A less-exacting packaging method used a corrosion-preventive compd. on the item, and the whole was enclosed within a water-barrier. This was called a "conforming pack", because the package shape conformed roughly to the shape of the item. When a paperboard container housed the preservative-treated part and the water-barrier enclosed the container, the pack was called "nonconforming". Lab. exposure tests showed that the nonconforming pack was consistently superior to the conforming pack regardless of whether the water-barrier had a low or a high transmission rate.

9463. ROEY, G. VAN. **The determination of the adsorbent capacity of the filtering mass.** *Bull. assoc. anciens étud. brasserie, Univ. Louvain* 42, 13-20 (1946).—*C.A.* 41, 2282*d*.

Factors concerned in the filtration of solns. of tannin, peptone, and dextrins through filter pads contg. asbestos were discussed. The type of fiber and its compn. were as important as pore size in removing colloidal material from solns.

9464. SHELTON, J. REID AND WINN, HUGH. **Oxidation of GR-S vulcanizates.** *Ind. Eng. Chem.* 38, 71-6 (1946).—*C.A.* 40, 2345^1.

The effects of the state of cure, temp., and surface area of a vulcanizate (GR-S 100, S 2, Santocure 1.2, fat acid 1.5, Bardol 5, ZnO 5, and channel carbon black 50) on its rate of absorption of O_2 were detd. by measuring this rate of absorption volumetrically at practically const. pressure and correlating the results with the corresponding changes in phys. properties. Chem. reactions, and not diffusion, were the factors controlling the rate of absorption of O_2.

9465. STALEY, FABIAN R. **Carbon-black industry strains to meet requirements for rubber.** *Oil Gas J.* 44, *No.* 44, 86-90(Mar. 9, 1946).—*C.A.* 40, 4195^4.

The use of synthetic rubber tripled the demand for carbon black of which about one-half was made (1946) by the furnace process in comparison with 7% in 1938. Several processes of manuf. were briefly described.

9466. THOMAS, ALBERT. **Experiments on the incorporation of carbon black in latex before coagulation.** *Rev. gén. caoutchouc* 23, 232-3 (1946).—*C.A.* 41, 611*f*.

S, carbon black, etc., were mixed into a homogeneous paste with water, this paste was mixed into latex before coagulation, the mixt. was then coagulated by acid (which also facilitates and completes the blending of paste and latex), most of the serum was squeezed from the coagulum on rolls, the sheets were allowed to drain for 2 days, they were then creped, and finally were used for molding and vulcanizing the products desired.

9467. WHITWELL, JOHN C. AND TONER, RICHARD K. **Correlation of equilibrium moisture data.** *Textile Research J.* 16, 255-67(1946).—*C.A.* 40, 4892^1.

The extrapolations and corrections for all textile data were studied. The data and the const. regain lines were extended statistically to a common point of intersection characteristic of any one fiber in any one process of sorption or desorption. Regions of moisture regains were found which gave conclusive evidence of pure adsorption uncomplicated by swelling.

9468. BARRER, R.M. **Solubility of gases in elastomers.** *Trans. Faraday Soc.* **43**, 3-11(1947). —*C.A.* **41**, 5333*g*.

An extension of the statistics of liquid-elastomers mixts. gave explicitly the sorption isotherm of gases in elastomers above their crit. temps. This isotherm was used to compare the exptl. and theoretical soly. consts. of several permanent gases in various elastomers, with good agreement. Isotherms of a no. of vapors in rubbers were also calcd. For the benzene-rubber system the actual data were successfully reproduced by the isotherm derived from Miller's equation which assumed random mixing. Other mixts. which did not deviate greatly from this isotherm were $CHCl_3$-rubber, heptane-rubber, and toluene-rubber.

9469. BELLAMY, L.J.; LAWRIE, J.H., AND PRESS, E.W.S. **Chromatographic analysis of rubber compounding ingredients and their indentification in vulcanizates. I. General principles and methods.** *Trans. Inst. Rubber Ind.* **22**, 308-13 (1947); *Rubber Chem. and Technol.* **21**, 192-219, 734(1948).—*C.A.* **41**, 6549*d*; **42**, 9224*b*.

Accelerators, antioxidants, and other components of the acetone ext. of a vulcanizate could be sepd. and identified. Activated alumina was used as absorbent, benzene for introducing the material into the column, and benzene, EtOH-benzene (1:99), EtOH-benzene (5:95), and anhyd. EtOH for subsequent development. Reverse chromatograms also were found to be effective for rapid sepn. and avoidance of packed columns. In sepg. accelerators and antioxidants, the possible interference of paraffin wax, mineral oil, pinetar, and fat acids were studied.

9470. BELLAMY, L.J.; LAWRIE, J.H., AND PRESS, E.W.S. **Chromatographic analysis of rubber compounding ingredients and their identification in vulcanizates. IV. Identification of antioxidants.** *Trans. Inst. Rubber Ind.* **23**, 15-20 (1947).—*C.A.* **42**, 400*a*.

It was possible to sep. paraffin wax, fat acid, accelerators, and antioxidants, not only from each other, but also from naturally occurring color and degradation products. Subsequent identification of the main fractions was then simple, e.g., tests such as the Co oleate reaction for accelerators and spot reactions for antioxidants could be applied without interference from other components.

9471. BLOOMFIELD, G.F. **Chromatographic analysis of accelerators.** *Trans. Inst. Rubber Ind.* **23**, 172(1947); *Rubber Chem. and Technol.* **21**, 735 (1948).—*C.A.* **42**, 4788*a*, 9225*f*.

The mercaptobenzothiazole in an eluate from an alumina column did not prove that benzothiazoyl disulfide was converted into mercaptobenzothiazole. Many grades of alumina converted benzothiazoyl disulfide to mercaptobenzothiazole. A less active column, e.g., sucrose or silica gel, might not give this effect, and would offer better evidence whether or not benzothiazoyl disulfide was converted to mercaptobenzothiazole.

9472. BOWLES, R.F. **Further observations of wetting and dispersion.** *Official Digest Federation Paint & Varnish Production Clubs No.* 274, 634-8(1947).—*C.A.* **42**, 2155*h*.

Recent work and theories on the subject were discussed. Chemistry and physics of materials were of less importance than their geometry, which might prove to be the most important consideration with wetting agents.

9473. BRISTOW, J.R. **Kinetic boundary friction.** *Proc. Roy. Soc. (London)* **A189**, 88-102(1947).—*C.A.* **42**, 1477*b*.

Expts. on sliding friction and relaxation oscillation were described. Curves of coeff. of friction against velocity were given for: (1) a series of ethyl esters of satd. fatty acids for hard steel on hard steel and phosphor bronze on hard steel at room temp.; (2) a mineral oil contg. addns. of oleic acid, with sliding surfaces of steel on steel, and brass on hard steel at room temp.; (3) ethyl palmitate lubricating the sliding of tin on hard steel, and (4) a mineral oil as lubricant for steel sliding on hard steel at various temps. The esters used were ethyl formate, ethyl acetate, ethyl propionate, ethyl valerate, ethyl enanthate, ethyl caprylate, ethyl pelargonate, ethyl laurate, and ethyl palmitate. At high speeds, the friction fell continuously with increasing mol. wt for hard steel sliding on hard steel, and for phosphor bronze on hard steel no max. was shown even at very low speeds.

9474. BRODSCHI, J. **Chromatography of rosin oil.** *Congr. tech. intern. ind. peintures inds. assoc.* 1, 212 17(1947)(in French).—*C.A.* **45**, 4944*g*.

Rosin oil, dissolved in petr. ether, was chromatographed on alumina to isolate the constituent responsible for darkening of the oil on storage. The colored portion was strongly adsorbed; it was eluted by C_6H_6. It was phenolic and had O-content of about 10%, hydroxyl no. 220, and av mol. wt 243. The decolorized portion (mainly hydrocarbons) did not darken on subsequent storage. It absorbed O_2 more rapidly than the original oil.

9475. BROOKE, MAXEY. **pH of nonaqueous colloidal carbon sludges.** *Ind. Eng. Chem.* **39**, 846 (1947). —*C.A.* **41**, 5360*h*.

The pH of a series of com. carbon black sludges in H_2O, MeOH, EtOH, and iso-PrOH were reported.

9476. CARPENTER, A.S. **Absorption of oxygen by rubbers.** *Ind. Eng. Chem.* **39**, 187-94(1947).—*C.A.* **41**, 3651*b*.

The value of the manometric method was studied as a tool in fundamental work and in comparing the resistance to oxidation of technical types of rubber, and to study the phys. chemistry of the reaction between rubber and O_2. The results were in accord with a free-radical chain reaction mechanism.

9477. COLIN-RUSS, A. **A theory of desorption in extraction systems of porous complexes.** *J.*

Intern. Soc. Leather Trades' Chemists. 31, 369-78 (1947).—*C.A.* 42, 1101*g*.

9478. Cotton, P. **The spreading of fatty acids on vaporized metallic films.** *Compt. rend.* 224, 1005-7(1947)—*C.A.* 43, 4923*h*.

Drops of oleic and pelargonic acids were found to spread on a Ag surface vaporized on a glass or quartz carrier, provided the metal film thickness was less than 1 mμ for oleic and 2 mμ for pelargonic acid.

9479. Dawson, T.R.; Porritt, B.D., and Scott, J.R. **Comparison of different types of carbon black.** *J. Rubber Research* 16, 199-203(1947).—*C.A.* 41, 7801*b*.

The bulk vol., tinting strength, gloss, and color (alone and with ZnO) of 11 com. carbon blacks were given. It was possible to distinguish so-called gas blacks from other types by a comparison of these properties. The comparative effects obtained with 5 gas blacks, acetylene black, lamp black, thermal blacks, and 2 mineral blacks were studied by detg. the rates of vulcanization, tensile strengths, breaking elongations, hardnesses, permanent sets, and resistances to abrasion at 20°C and resistances to tearing at 20° and 100°C of mixts. of the tire-tread type.

9480. Dogadkin, B.A. and Uzina, R. **Structure and properties of loaded rubber mixtures. I. Mixtures of natural and synthetic latex with bentonite clays.** *Kolloid. Zhur.* 9, 97-108 (1947).—*C.A.* 47, 1963*h*.

Latex concd. in a centrifuge was mixed with clay (x parts for 100 parts rubber) and dried to a film on glass. The breaking stress P for stretching in 1 or 2 dimensions was min. (e.g., 18 and 44 kg wt/cm^2, resp.) when x = 5 to 15%; then P increased with x to e.g., 40 and 195, resp., at x = 40%; at higher x (50 and 60%) P decreased again. The rate of diffusion of H_2O vapor through the films was max. at x = 20%, which max. was 4 times as great as the diffusion at 5% or 40%.

9481. Doi, Iwao. **Studies on the prevention on the effect of carbon black in accelerating the deterioration of rubber caused by oxidation. I. Aging tests of rubber compounded with carbon black.** *J. Soc. Rubber Ind. Japan* 20, 121-3 (1947).—*C.A.* 45, 6417*c*.

Though carbon was a superior reinforcing ingredient in rubber, it accelerated the deterioration of rubber. To study methods to eliminate this effect, various kinds of com. carbon black were mixed in a base mixt. (rubber 50, S 1.5, stearic acid 2, mercaptobenzothiazole 0.5, ZnO) in the proportion of 30, 50, and 70% carbon to rubber. The test-pieces contg. carbon black deteriorated much faster than the blank test-pieces which contained ZnO only.

9482. Doi, Iwao. **Studies on the prevention on the effect of carbon black in accelerating the deterioration of rubber caused by oxidation. II. Control on oxidation by heat-treatment of carbon black.** *J. Soc. Rubber Ind. Japan* 20, 123-5 (1947).—*C.A.* 45, 6417*d*.

When a mixt. of carbon and S in the proportion of 10 to 1 was heated at about 500°C, a considerable quantity of S unextractable by acetone was formed in the black. The carbon black thus treated was highly effective against oxidation of vulcanized rubber, compared with vulcanizates which contained untreated carbon.

9483. Elm, A.C. **Paints as moisture barriers.** *Official Digest Federation Paint & Varnish Production Clubs.* No. 267, 197-228 (1947).—*C.A.* 41, 7133*d*.

Regardless of the nature of the immersion bath, H_2O absorption increased with immersion time. While the films immersed in the salt solns. approached satn. more or less rapidly, the films immersed in the distd. H_2O continued to absorb H_2O, and the curve gave no indication that the satn. point would ever be reached. H_2O absorption, swelling, and blistering decreased sharply as the osmotic pressure of the bath increased. The affinity of a paint coating for H_2O could not always be predicted from the H_2O soly. of the contained pigments. The osmotic pressure gradient responsible for H_2O absorption was largely the result of the formation of hydrophilic org. compds.

9484. Everetts, John Jr. **Sorbents regulate humidity by soaking up the moisture in air.** *Power* 91, No. 11, 74-7 (1947).—*C.A.* 42, 799*c*.

Damage due to moisture in the way of corrosion, mold, mildew, etc., and the need of controlled moisture content, were discussed. Dehumidification could be accomplished by refrigeration or the use of sorbents. Sorbents, both liquid and solid, were listed and their various properties outlined.

9485. Gregory, J.N. and Spink, J.A. **Lubricating properties of molecular layers of stearic acid and calcium stearate on metal surfaces.** *Nature* 159, 403(1947).—*C.A.* 41, 4693*g*.

From 1 to 21 mol. layers of Ca stearate and stearic acid were deposited on Pt, Cu, and stainless steel, from 0.0001 M $CaCO_3$, at pH 6. These layers contained 60% soap and 40% acid. The coeff. of friction k was detd. at various temps. on these surfaces. On Cu, there was permanent increase in k at and above the softening point of Cu stearate. On stainless steel there was an increase in k at and above the softening point of Ca stearate; there were no changes at the m.p. of stearic acid or of ferric stearate. On Pt, there was a temporary increase in k at the temp. at which β,α phase changes occurred, followed by a permanent increase at and above the m.p. of the acid.

9486. Gustavson, K.H. **The problem of equilibrium in chrome fixation by collagen.** *J. Intern. Soc. Leather Trades Chem.* 31, 181-6(1947).—*C.A.* 41, 5331*c*.

The hydrolytic theory of Cr tannage required that the same limiting fixation should be reached, from a given system at all temps. The amt. of Cr fixed after 4 weeks' tannage increased with temp. (4° to 40°C), and that the acidity of the Cr compd. fixed (ratio of total sulfate to total Cr in washed leather) decreased with increasing temp. With base- and acid-exchange resins it was shown that the cationic Cr content of a 65% acid Cr sulfate liquor decreased from 97 to 71% when the temp. was increased from 20° to 40°C. Uncharged Cr increased from 3 to 22% and anionic Cr increased from 0 to 7%. No change in ionic constitution resulted upon cooling from 20° to 4°C.

9487. GUSTAVSON, K.H. **Experimental arguments against the concept of chrome tanning as an adsorption process.** *J. Phys. & Colloid Chem.* **51**, 1181-8 (1947).—*C.A.* 42, 397*b*.

The adsorption concept could not explain the effect of neutral salts nor the tanning action of certain mixed organosulfatochromium complexes in the isoelec. zone of collagen or on its alk. side. Pre-treatment of skin with lyotropic agents or heat denaturation of skin increased its affinity for Cr but did not affect acid fixation. The main reaction in tanning was an attachment of cationic acidochromium complexes to the charged acidic groups of collagen with simultaneous coordination of the complexes to the basic groups of adjacent protein chains. The chelated Cr complexes behaved as bridges between adjacent protein chains resulting in stabilization of structure.

9488. HILL, J.A. **The chemistry and application of detergents.** *J. Soc. Dyers Colourists* **63**, 319-22 (1947).—*C.A.* 42, 3921*i*.

Synthetic anion-active-, cation-active, and non-electrolytic detergents were considered. In general, increase in the wetting power was dependent upon a decrease in surface tension, but in certain processes where penetration into small capillaries was required, a decrease in surface tension might be undesirable. Na alkyl sulfates had a temp. of max. effectiveness, as the mol. wts increased. In general, cation-active compds. had greater bactericidal power than anion-active and non-electrolytic compds.

9489. KANAGY, JOSEPH R. **Adsorption of water vapor by untanned hide and various leathers at 100°F.** *J. Research Natl. Bur. Standards* **38**, 119-28 (1947)(Research Paper No. 1763); *J. Am. Leather Chem. Assoc.* 42, 98-117 (1947).—*C.A.* **41**, 3311*i*.

Adsorption and desorption curves were detd. at relative humidities of 0-96%. Materials studied were com. hide powder (collagen), vegetable-tanned sole leather, the same degreased and washed to remove glucose, salts, etc., Cr-tanned hydraulic packing leather, Cr-vegetable-retanned upper leather, degreased, vegetable-tanned calf, and vegetable-tanned belting, all ground to less than 4 mm. Samples were first brought to equil. at 0% relative humidity over $MgClO_4$, in which condition they contained 0.12-0.94% H_2O (further loss at 100°C). Equil. (adsorption) was reached in 1 day at 11% relative humidity and in 6 days at 54% relative humidity. Adsorption curves were all of the sigmoid type previously found by other workers. The B.E.T. equation was found to apply at relative humidities up to about 33%.

9490. LANDLER, IVAN. **Chromatographic fractionation of some synthetic elastomers.** *Compt. rend.* **225**, 629-31 (1947).—*C.A.* 42, 2128*h*.

Three elastomers (GR-S, Perbunan, and Vistanex) were fractionated by filtration of their solns. in a poor solvent, viz., toluene contg. just too little MeOH to ppt. the elastomer, through a tube contg. 3 layers of an adsorbent mixt. of 75% gas black (80 m^2/g) and 25% active granulated carbon black. The column was washed with the same solvents. The 3 layers were sepd. and washed with true solvents (toluene, CCl_4, and C_6H_6); any of the absorbent mixt. carried into the soln. was centrifuged.

9491. LESSER, MILTON A. **Dishwashing detergents.** *Soap Sanit. Chemicals* **23**, No. 6, 43-6, 195 (1947).—*C.A.* 41, 4937*c*.

9492. MELIKZADE, M.M. AND IVANOVA, T.M. **Determination of quality of carbon black.** *Azerbaĭdzhanskoe Neftyanoe Khoz* **26**, No. 10, 11-12(1947)—*C.A.* 43, 3993*h*.

Methods were suggested for detn. of grit, ash, and moisture in carbon black. For detg. grit an app. was devised which eliminated variable results due to differences in stiffness of brush, hand pressure, etc. Ash was detd. on 8-10 g samples since those previously used (2 g) gave results within exptl. error. For detn. of moisture the temp. was raised from 105-10° to 125-30°C and the time of drying shortened from 2 hrs to 15 min.

9493. MULLINS, L. **Effect of stretching on the properties of rubber.** *J. Rubber Research* **16**, 275-89(1947).—*C.A.* 42, 2463*i*.

An extensive investigation was made of the effects of stretching under different conditions on the tensile stress-strain, stress relaxation, swelling, elec. cond., and elec. power factor of vulcanizates loaded with different types of reënforcing or stiffening fillers, including carbon black, whiting, colloidal clay, amorphous silica, and Mg carbonate.

9494. ODA, RYOHEI; FUZITA, TOSHIRO, AND KIDA, WASAKU. **Fillers for adhesives of urea resins. I. Effect of surface grooves on the adhesion strength. II. Effects of fillers.** *Chem. High Polymers* (Japan) 4, 31-2, 33-4 (1947).—*C.A.* **45**, 2712*h*.

Grooves were cut on a beech block in different directions. Adhesion strength was lowest when the grooves were cut parallel to the tensile direction. Various fillers, such as Bakelite carbon, ebonite, cement, active carbon, lignin, diatomaceous earth, and Al_2O_3 were added to adhesive paste. The decreases of adhesion strength were least when 10% Bakelite carbon powder was added. Cement and active charcoal were undesirable.

9495. PATTERSON, J.B. **Silicone resins in finishes.** *Org. Finishing* **8**, No. 4, 32-7(1947).—*C.A.* 43, 1214*a*.

With some silicones, the use of curing catalyst was detrimental to flexibility and heat aging. With others, catalysts were desirable for obtaining practical curing rates, gloss, hardness, mar-resistance, and freedom from thermoplasticity. These catalysts had no effect on discoloration other than the tinting effect of the metallic salt. The high curing temp. required for silicone resins did not eliminate the use of colors such as lithol and toludine reds. Those which discolored in alkyds at 300°F could be held at 400°F in silicone enamels for several hrs with no appreciable color change. TiO_2 enamels could be held at 500°F for as long as 100 hrs with no discoloration.

9496. PRESS, E.W.S. **Chromatographic analysis of accelerators.** *Trans. Inst. Rubber Ind.* **23**, 172(1947).—*C.A.* 42, 4788*c*.

Although complicating the analytical application of the chromatographic method, the evidence of Bloomfield did not invalidate the conversion of benzothiazoyl disulfide to mercaptobenzothiazole during vulcanization. The green color reaction with Co oleate was obtained in the acetone ext. before passage through alumina, and when a C_6H_6 soln. was poured onto the column, a clear zone was formed at the top before decompn. could occur on elution with EtOH.

9497. SIEMS, NORMAN E. **Paper-mill applications of activated silica sols.** *Paper Mill News* 70, No. 51, 80-1(1947).—*C.A.* 42, 1055*a*.

Applications of activated silica sols included raw water coagulation, stock conditioning, fiber and filler retention, white water treatment, and general mill water treatment.

9498. SODA, NORIMUNE. **The two kinds of boundary friction.** *Rept. Inst. Sci. Tech.* (Tokyo Univ.) 1, 50-9(1947).—*C.A.* 45, 3587*c*.

In ordinary friction observed at lower pressure there existed oriented or unoriented films of uni- or multimol. layers, whereas in the 2nd kind of friction whose coeff. was higher than the ordinary one, the absorbed mols. lost their properties as films. The second kind of boundary friction was found at higher pressure exerted perpendicularly at the boundary surface. In ordinary friction, the boundary surface was scarcely injured, while in the 2nd kind it wore out.

9499. TATSUNO, TSUNEO. **Bagasse as water-absorbing material.** *Rept. Taiwan Sugar Expt. Sta. (Formosa) No.* 1, 111-16(1947).—*C.A.* 42, 1031*i*.

Dried and powd. bagasse absorbed 20% of its weight of moisture from an atm. satd. at 25-30°C and retained 3-5 times its wt. of liquid water. A mixt. of 50g of the air-dry powder and 200 ml of a 20% brine of $MgCl_2$, when dried, absorbed 155% of its wt. of water from air of 100 relative humidity in 18 days. Pure $CaCl_2$ or $MgCl_2$ did not absorb as much under the same conditions.

9500. WATSON, JOHN H.L. **Observations of crystal structure and particle shape in electron micrographs of several carbon blacks.** *Trans. Electrochem. Soc.* 92, 13 pp.(1947)(Preprint).—*C.A.* 41, 6453*d*.

Electron micrographs were shown of the so-called amorphous carbon blacks. The effect of variable particle shape on mean particle diam. and specific surface calcns. was pointed out. All the exptl. evidence, including electron and x-ray diffraction data, suggested that the crystal particles were small graphitic units, and that the graphitic nature of the carbon black was a surface rather than a vol. phenomenon.

9501. WHITWELL, JOHN C. AND TONER, RICHARD K. **Predicting equilibrium moisture relations with particular reference to textile fibers.** *Textile Research J.* 17, 99-108(1947).—*C.A.* 41, 2904*d*.

Methods used in extrapolating exptl. equil. moisture regain data were discussed. Procedures were outlined by which an entire family of equil. curves could be predicted with a min. of exptl. data.

9502. WHITWELL, JOHN C. AND WILLMER, DAVID B. **Calculation of equilibrium moisture relations (with particular reference to low temperature conditions).** *Textile Research J.* 17, 664-9 (1947).—*C.A.* 42, 1429*e*.

Equil. moisture data for some textiles were extended to lower temp. regions than covered by expt. For any single isotherm (moisture-regain vs. relative-humidity) there were potentially two limiting lines if the temp. was below freezing, whereas there was only one point at freezing and only one line for any temp. above freezing.

9503. BASIAK, JAN AND NIEWIADOMSKI, TADEUSZ. **Carbon black.** *Przemysl Chem.* 4, 304-7(1948). —*C.A.* 42, 9123*a*.

The methods of producing carbon black in the U.S. and Europe were reviewed and the properties and uses of the principal com. grades given.

9504. BOWES, J. H. AND MORSE, G. O. **The use of salts in the finishing of sole-leather bends. III. The effect of magnesium sulfate, cane sugar, and glucose on the drying of leather and on the water content of leather at different relative humidities.** *J. Soc. Leather Trades' Chemists* 32, 343-54(1948).—*C.A.* 43, 427*h*.

Leather samples, immersed in satd. $MgSO_4$, 50% glucose, 50% sucrose, and satd. $MgSO_4$ plus glucose or sucrose, lost H_2O more slowly than leather immersed in H_2O, during the initial stages of drying at 20°C and 40 to 70% relative humidity. The H_2O content of leather at equil. with air of various relative humidities was affected as follows: 40% relative humidity, no effect; 70-75% relative humidity, increased slightly by $MgSO_4$ but not by sugars; 85-100% relative humidity, increased markedly by $MgSO_4$ and by the sugars. The increase in the presence of $MgSO_4$ plus glucose or sucrose was greater than with either alone.

9505. BRAENDLE, H. A.; STEFFEN, H. C., AND SHEPPARD, J. R. **Carbon pH and structure in rubber compounding.** *India Rubber World* 119, 57-62(1948).—*C.A.* 43, 892*d*.

The effects of new type of carbon blacks in rubber and GR-S depended not only on their fineness, as with previous standard types of carbon black, but also on 2 factors which have hitherto been relatively unimportant: high pH and sp. structure.

9506. BREMMER, G. M. AND COLPITTS, J. H. **Attempt to produce carbon black by fine grinding.** *Trans. Inst. Rubber Ind.* 24, 35-51 (1948).—*C.A.* 43, 1169*h*.

The ultimate particle size was little influenced by dry or wet grinding, aids such as stearic acid, naphthalene, S, and BzH, the gaseous atm. (N_2, CO_2, and C_2H_2), or the pressure (vacuum to 100 p.s.i. of CO_2). The particle size depended primarily on the raw materials, as shown by tests with anthracite coke, pitch coke, active charcoal, wood charcoal, coal, retort carbon, paraffin coke, sugar charcoal, and coke-oven cokes. In general, a particle size was reached by ball-mill grinding which remained unchanged by further prolonged grinding.

Ground coke was characterized by an extremely large surface area relative to the dispersable size. These observations were reconcilable if it was assumed that grinding produced extremely small particles, part of which grouped together and formed non-dispersable clusters.

9507. CATTON, N. L. AND THOMPSON, D. C. **Effect of carbon blacks on swelling of Neoprene GR-M-10 vulcanizates.** *Ind. Eng. Chem.* **40**, 1523-6(1948).—*C.A.* 42, 8515*f*.

The degree of swelling of Neoprene-C black vulcanizates in a petroleum oil depended on both the percentage of carbon black and the type. With increase in percentage vol. of carbon black, the swelling decreased relatively rapidly up to about 20% by vol., then decreased in simple proportion to the increase in loading. Above this crit. range, carbon black functions merely as a diluent. The greater the surface area of the black, the greater was this initial disproportionate decrease in swelling with increase in loading. The swelling was, in general, inversely proportional to the log of the surface area of the carbon black. The state of cure also affected the swelling, i.e., the longer the cure, the less was the swelling.

9508. CLARK, GEORGE L.; ECKER, ALFRED C. JR., AND BURTON, ROBERT L. **Commercial and experimental carbon blacks.** *Ind. Eng. Chem.* **41**, 201-8(1948).—*C.A.* 43, 1949*g*.

A crit. and quant. x-ray diffraction study was made of 66 carbon black samples. The measurements involved were primarily two interplanar spacings. No 2 carbon blacks gave even approx. the same x-ray pattern. A direct relationship was established between the ratio of the 2 cryst. dimensions which measured flatness of shape, and ease of processing of channel carbons and structural characteristics. Details were given for various carbon blacks and graphitic acids. One series of exptl. carbon blacks was subjected to correlative phys. electron-microscope, and x-ray tests. The electron-microscope particle was of the order of 25 primary crystallites measured from x-ray data.

9509. COHAN, LEONARD H. AND SMITH, ROBERT E. **The effect of pigments on the hardness of natural and synthetic rubbers.** *Rubber Age* (N.Y.) 63, 465-8(1948).—*C.A.* 42, 7083*i*.

If an elastomer contg. a pigment or filter was assumed to be a uniform elastic matrix contg. inelastic particles, its modulus could be calcd. At equiv. states of cure, hardness appeared to depend primarily on the percentage loading and on the particle shape and not to be influenced by particle size, cryst. structure, chem. nature of the particle surface, or chem. compn. of the pigment.

9510. COHAN, LEONARD H. AND SPIELMAN, RUSSELL. **Inorganic pigments in natural and synthetic rubber.** *Ind. Eng. Chem.* 40, 2204-10(1948).—*C.A.* 43, 1593*c*.

The behaviors in elastomers of $CaCO_3$ pigments was governed by the av. diam. of the particles, i.e., by the surface area of the pigments, in a manner similar to that already reported to be true of carbon blacks. When different inorg. pigments were compared, factors other than surface area, e.g., particle shape, cryst. structure, and nature of the surface, must be taken into account. A special study of the effect of different proportions of pptd. $CaCO_3$ showed that, with increase in loading, the resistance to tearing, stiffness, and hardness of natural rubber, GR-S, Hycar, Neoprene, and Butyl increased. The tensile strength of GR-S and Hycar increased considerably, that of natural rubber and Neoprene slightly, and that of Butyl decreased.

9511. CRANOR, D. F.; SNYDER, J. W., AND COBBE, A. G. **The vulcanizing characteristics of reënforcing furnace carbon.** *India Rubber World* **117**, 749-51, 797(1948).—*C.A.* 42, 4788*e*.

A major difference between furnace carbon blacks and channel blacks in rubber was their differing effects on the rate of vulcanization. With equal percentages of mercaptobenzothiazole, the mixt. contg. Statex-K vulcanized in about 0.5 the time required for that contg. EPC channel black. A reduction in mercaptobenzothiazole to compensate for this impaired the phys. properties. If the T-50 test and true coeff. of vulcanization were reliable criteria of the phys. state of cure, then modulus was not an index of the comparative states of cure of vulcanizates contg. carbon blacks with different degrees of reticulate chain structure (symmetry of particle aggregates).

9512. DANNENBERG, E. M. **Carbon black-loaded GR-S stocks. Relationship between reënforcement and swelling properties.** *Ind. Eng. Chem.* **40**, 2199-2202(1948).—*C.A.* 43, 2014*a*.

An exptl. study was carried out to ascertain the effects of various types of carbon black on the swelling of the elastomer component in unvulcanized and vulcanized GR-S mixts. The swelling of the elastomer component was not influenced significantly by the type of black. The fact that equil. swelling measurements did not indicate any strong interaction of a primary-valence type, did not exclude the possibility of weaker attractive forces or an undetectably small amt. of primary-valence cross-linking. Elastomer-C black systems should be regarded as simple phys. mixts.

9513. DOGADKIN, B.; PECHKOVSKAYA, K., AND DASHEVSKIĬ, M. **Structure and properties of filled rubber mixtures. III. Mixtures of sodium-butadiene rubber with channel black.** *Kolloid. Zhur.* **10**, 357-68(1948).—*C.A.* 43, 8188*c*.

The elec. resistivity *R* of mixts. of butadiene rubber with carbon black (av. particle size 35 mμ) was decreased 10-fold by good mixing. When the wt ratio (r) of carbon black to rubber increased from 0.2 to 0.4, *R* decreased from 1.8×10^8 ohm-cm to 1.8×10^5, while further increase of r to 0.6 lowered *R* to 1.5×10^6 only. Ohm's law was valid in all mixts. Presumable at $r > 0.2$, carbon black particles did not touch each other; between $r = 0.2$ and 0.4 they formed chains, and above $r = 0.4$ they gradually filled the space between the chains. Stearic acid (5%

of the carbon) slightly increased *R* and slightly decreased the swelling ability of the mixt.

9514. DOORENTZ, R. AND ETTEL, O. **Lignite filter ash as a binding material.** *Bauplan u. Bautech.* 2, 293-7(1948).—*C.A.* 45, 7768*i*.
The suitability of lignite filter ash as a binding material varied greatly depending on the origin of the coal and the type of combustion to which it was subjected. Setting proceeded probably with the formation of gypsum, silicic acid, or Ca carbonate. Steam-setting gave good results. The fine-grained fraction was the decisive factor in the process of setting, since the coarse grains contained carbon particles surrounded by a clinker film. Ash from low-temp. coke showed the best binding properties.

9515. DROGIN, I. **The effects of carbon blacks on the viscosity of rubber.** *Proc. Rubber Tech. Conf. London* **1948**, 17 pp.(Preprint).—*C.A.* 43, 7251*c*.
The effects of 24 carbon blacks and 4 inorg. fillers (barytes, pptd. $CaCO_3$, clay, and ZnO) on the viscosity of natural rubber were studied when mixed in a lab. Banbury machine (960 g rubber and 24 g carbon black and equal vols. of fillers, starting temp. 85°F). During the initial stages, the viscosity depended chiefly on the properties of the pigment, particularly on the size, surface, shape, structure, and the adsorptive capacity. The greater the surface area, oil absorption, and the diphenylguanidine adsorption, and the lower the nigrometer index, the higher was the viscosity after very short mixing times. The greatest change in viscosity occurred in the first 4 min., and the decrease was greater with a relatively fine pigment than with a coarse one. Viscosity measurements also indicated the extent of wetting and progress of dispersion of each pigment.

9516. DUFFY, GEORGE J. **New carbon black for the ink industry.** *Am. Ink Maker* 26, No. 11, 23-6 (1948).—*C.A.* 43, 1196*f*.
The use of liquid hydrocarbons as a raw material for furnace blacks resulted in the deposition of a very small amt. of partially polymerized, firmly bonded hydrocarbon on the surface of the blacks. This coating improved wetting and dispersing properties and corrected tendencies to settle out in light-bodied oils. The structure of these blacks enabled them to produce much better and bluer top tones, resulting in copy that was sharper, blacker, and cleaner.

9517. GENERAL TIRE & RUBBER CO. **GR-S black 1 and GR-S black 2.** *India Rubber World* **118**, 660-2(1948).—*C.A.* 42, 9230*g*.
GR-S black 1 and GR-S black 2 were masterbatches of GR-S and carbon black prepd. from GR-S latex and contg. 50 and 46 parts, resp., EPC black per 100 parts of solid GR-S. GR-S black 1 and GR-S black 2 had the advantages over mixts. of GR-S and EPC black prepd. by milling in that subsequent time of mixing was shorter, power consumption was less, operations were cleaner, optimum uniform dispersion of carbon black was assured, and storage and handling were simpler.

9518. GOBHIL, R. K.; GUPTA, A. C., AND ATHAWALE, D. Y. **High-temperature graphite lubricant-oil dag.** *Proc. Ann. Convention Oil Technol. Assoc. India* 3, 10-16(1948).—*C.A.* 45, 8751*f*.
The graphite should be ground and levigated so that it passed through a 300-I.M.M. sieve. Use of vegetable oil in place of mineral oil had no adverse effect for a product required for glass molds. Al soap of peanut oil (1.5%) was suitable as the emulsifying agent.

9519. GONGWER, L. F. **Clays for rubber.** *India Rubber World* **118**, 793-5(1948).—*C.A.* 42, 9226*h*.
The properties which clays impart to vulcanized rubber and Gr-S were shown by tabulated data of the results of tests of representative vulcanizates contg. so called hard and soft clays. The lower grit content of a clay showed the better the performance of the vulcanizate. Particle-size distribution was a contributing factor in the performance of the vulcanizate. In synthetic elastomers in particular, clays were outstanding in the reenforcement which they imparted in comparison with other nonblack fillers.

9520. GREGORY, J. N. AND NEWING, MARJORIE J. **Lubrication of metal surfaces by silicone films. Synthesis and analysis of chlorosilanes.** *Australian J. Sci. Research, Ser. A*, 1, 85-97(1948).—*C.A.* 43, 7219*d*.
Silicone films were prepd. on polished metal surfaces from mono- and di-ethyl- and mono- and di-isoamylchlorosilanes. Monocetylchlorosilane was unsatisfactory. The films could not be obtained by direct adsorption. The metal surface must first have adsorbed water. Cu, mild steel, Ag, and Pt were examd. The silicone layers reduced the coeff. of friction to values characteristic of good boundary lubrication even up to 200°C. The addn. of paraffin destroyed the wear resistance of the film on Ag but increased it on Pt. The films on Cu and mild steel were not affected. The hydrocarbon part of the mol. was turned outwards from the metal surface and was water-repellent.

9521. GWATHMEY, ALLAN T.; LEIDHEISER, HENRY JR., AND SMITH, PEDRO G. **Influence of crystal plane and surrounding atmosphere on some types of friction and wear between metals.** *Natl. Advisory Comm. Aeronaut., Tech. Note* No. **1461** 37 pp.(1948).—*C.A.* 42, 8041*c*.
The effect of crystal plane on dry static friction was detd. between 2 single crystals of Cu. The pull required to sep. a spherical crystal resting on a flat face was measured at room temp. after previously heating the crystals in H_2 to 500°C to remove any oxide present on the surfaces. The coeff. of friction between the (100) faces was greater than 100, and that between (111) faces was approx. 25. The atms. used were H_2, and N_2 contg. 0.2% O_2.

9522. HALL, R. H. AND MITTON, R. G. **The water absorption of vegetable-tanned sole leathers.** *J. Soc. Leather Trades' Chemists* 32, 331-43 (1948).—*C.A.* 43, 427*f*.
Water absorption was measured both by the conventional method (increase in wt of blotted specimen after 15 min. or 24 hr immersion) and

by change in apparent wt of a specimen suspended in H_2O from a balance arm. The latter gave results differing considerably from the former, owing to change in vol. of the leather on wetting, but permitted measurements at very short immersion periods. Absorption took place in 2 stages —a very rapid initial absorption, probably due to filling of capillaries, followed by a much slower absorption due to diffusion into the fibers and soln. of entrapped air.

9523. HIESTER, NEVIN; MCCARTHY, JOSEPH L., AND BENSON, H. K. **Separation of lignosulfonic acids from sulfite waste liquor by batch dialysis.** *Paper Trade J.* 126, No. 16, 58-61 (1948).—*C.A.* 42, 3953*e*.

Direct batch dialysis of sulfite waste liquor was carried out by a procedure which could be used to obtain purified Ca lignosulfonates in quantities sufficient to permit the substances to be lab. tested for various utilization applications. Other salts or lignosulfonate acids could be obtained by cation-exchange procedures by using appropriate resins. Analyses were given of products dialyzed for 213 to 335 hrs.

9524. JUNGBLUT, C. **The role of sulfur in machining lubricants.** *Rev. inst. franc petrole* 3, 307-12(1948).—*C.A.* 43, 3999*g*.

The incorporation of elemental S into fuel oils permitted these to be used as machining lubricants in the steel industry. Simple soln. of S in the oil was ineffective. On heating a mixture of S and oil to 250°C H_2S was evolved. Thus treated oils showed improved performance. The S in the oil formed a sulfide film on the metal surface to be machined, as shown by increased S in the metal. This layer facilitated oil wetting of the surface. The active S-content of an oil was detd. by finding the amt. of S deposited per unit time at standard temp. on a Cu powder prepd. by reduction of a $CuSO_4$ soln by Al.

9525. KAHN, J. M. **Application of a flocculation-type unit in paper-mill white-water treatment.** *Paper Trade J.* 127, No. 24, 57-9 (1948); *Tech. Assoc. Papers* 31, 136-8(1948).—*C.A.* 43, 1185*d*.

Provision was made for recirculation of previously treated white water and slurry so that coagulation of the suspended solids took place in the presence of previously formed floc. White water from a mill manufg. liner board and contg. 3 lb suspended solids, after treatment with alum and activated silica, had its 5-day B.O.D. reduced 59% and a reduction in suspended solid of 94%.

9526. KAJISAKI, CHIYOTOSHI; MIZUHARA, YUZO; HORI, KAZUHIKO, AND TANAKA, YASUO. **Effects of carbon on the coloring of porcelain. I. Preliminary tests.** *Bull. Govt. Research Inst. Ceramics* (Kyoto) 2, No. 1, 16-20(1948).—*C.A.* 46, 6351*i*.

Test pieces made of various clays, quartz, silica gel, diatomaceous earths, etc., were fired in an atm. of coal gas at 300°, 600°, and 900°C. The deposition of carbon was detd. by wt increase or by oxidizing carbon to CO_2 with H_2SO_4 + $K_2Cr_2O_7$. Deposition of carbon was observed not only on clays, but also on quartz, feldspar, diatomaceous earths, or silica gel. The contents of Fe or TiO_2 had no apparent relation to the amt. deposited. Test pieces of clay heated at 400°C in coal gas after preliminary heating at 300, 600, or 900°C in air showed more deposition than test pieces not preheated.

9527. KAJISAKI, CHIYOTOSHI; HORI, KAZUHIKO, AND TANAKA, JUN'ICHI. **Effects of carbon on the coloring of porcelain. II. Action of carbon monoxide on ferric oxide and titanium dioxide.** *Bull. Govt. Research Inst. Ceramics* (Kyoto) 2, No. 2, 39-42(1948).—*C.A.* 46, 6352*a*.

Pure Fe_2O_3 and TiO_2 and their mixts. were heated in CO at 900-950°C for 1 hr, and the amt. of carbon deposited was detd. TiO_2 had only slight decompn. activity on CO compared with Fe_2O_3, which showed its highest activity at 450-550°C.

9528. KAJISAKI, CHIYOTOSHI; HORI, KAZUHIKO, AND TANAKA, JUN'ICHI. **Effects of carbon on the coloring of porcelain. III. Behavior of carbon before and after the sintering of bodies.** *Bull. Govt. Research Inst. Ceramics* (Kyoto) 2, No. 2, 43-46(1948).—*C.A.* 46, 6352*b*.

Tests pieces made of porcelain bodies, i.e., mixts. of china stone and feldspar, were heated at 1250°C in mixts. of N_2 and coal gas. The deposition of carbon depended largely on the compn. and flowing speed of the gas. The limiting porosity was found to be about 5%, and each body had its own limiting temp. where this limiting porosity was attained. If decarbonizing reactions occurred at this temp., the body bubbled, and if not, it sintered and became colored. To avoid coloring by carbon, therefore, the decarbonizing reaction should be completed before reaching the limiting temp.

9529. KANAGY, JOSEPH R. AND CHARLES, ARBELIA M. **Effect of temperature and time on the weight loss of leather.** *J. Am. Leather Chemist's Assoc.* 43, 274-93(1948).—*C.A.* 42, 8507*e*.

Samples of standard hide powder and of 9 different types of com. leathers were heated at various temps. in a Brabender moisture tester. At 80°C equil. was attained in 4-6 hrs for all leathers except sole leather. At 100°C and above the wt-loss increased slowly with time of heating. For the leather samples the wt-losses detd. by heating to equil. at 80°C were generally only slightly lower than those detd. by extrapolating the straight-line portions of the 100°C-curves to zero time. These results indicated that the equil. at 80°C represented the liberation of nearly all of the adsorbed water from the leather.

9530. LOUTH, GEORGE D. **Determination of free carbon in compounded rubber and synthetic elastomers.** *Anal. Chem.* 20, 717-19(1948).—*C.A.* 42, 8512*a*.

Add 10 ml 1,1- 2,2-tetrachloroethane to 0.1-0.15 g sample, heat until the latter is well softened, add 15 ml boiling HNO_3 (d. 1.42), simmer until the sample is completely decompd. and the carbon black thoroughly dispersed. Cool to 20°C, add 25 ml Et_2O (agitation), allow to stand until 2 layers form, decant the top layer through a Gooch crucible, repeat until the top layer is colorless, after the final decantation, wash down repeatedly with 5 ml acetone and Et_2O, wash with Et_2O, dry the Gooch crucible 30 min. at 250-300°C, cool, weigh. Heat at 900°C, cool, weigh, and calc. loss in wt as free carbon black.

9531. Madigan, J. C. and Adams, J. W. **Latex-incorporated carbon black for synthetic rubber.** *Chem. Eng. Progress* 44, 815-20(1948).—*C. A.* 43, 894*c*.

The process for the incorporation of carbon black in GR-S latex at the synthetic rubber plant was discussed. Expanded use of this type of product was forseen, and the research efforts now being expended on the problem promise continued improvement in quality and reduction in cost.

9532. Morris, Ross E. and Hollister, Joseph W. **Carbon-black dispersion in rubber. Effect of fatty acids.** *Ind. Eng. Chem.* 40, 2325-33 (1948).—*C. A.* 43, 1599*f*.

Adsorption isotherms of stearic acid and other long chain aliphatic acids on various types of carbon blacks were detd. In most cases heptane was the solvent, but in some cases benzene and cyclohexane were used. Considerably more acid was adsorbed by channel blacks from heptane and cyclohexane than from benzene solns. The adsorption isotherms for the acids on channel black on a molal basis came close to coincidence. In general, the finer the black, the greater the adsorption of stearic acid, but the amt. of adsorption was influenced also by the surface condition of the blacks. Stearic acid had little, if any, effect on the dispersion of these types of carbon black and butyl rubber.

9533. Paetsch, Hildegard. **Examination of carbon black in the rubber industry.** *Kautschuk u. Gummi* 1, 241-4, 277-80(1948).—*C. A.* 43, 6454*g*.

A review with special reference to methods of analysis, and data on German and other carbon blacks was presented.

9534. Parkinson, D. and Blanchard, A. F. **Factors influencing the configuration of carbon particles.** *Trans. Inst. Rubber Ind.* 23, 259-79 (1948).—*C. A.* 42, 8008*g*.

Rubber-carbon black mixts. contg., resp., no addnl. ingredient, urea, thiourea, and benzidine were heated 20 and 60 min. at 158°C; corresponding unheated mixts. were prepd. All 12 mixts. were converted to a tire-tread type of mixt., vulcanized, and tested for phys. properties. The vulcanizates prepd. from the unheated mixt. contg. urea, thiourea, and benzidine, from the mixts. contg. the 3 agents heated 20 min., and from all mixts. heated 60 min. had many times the elec. resistance of the vulcanizate prepd. from the unheated mixt. contg. no agent. All 3 agents also increased the resilience and hardness.

9535. Ramsauer, Rembert. **Physical problems of frictional resistance. II. Energy considerations in frictional resistance.** *Kolloid-Z.* 111, 145-55(1948).—*C. A.* 43, 6879*e*.

In the case of metallic faces in vacuo the surface atoms approached within crystal distances, so that for a tangential strain appreciable forces must be overcome. The reduction in friction caused by a lubricant was due to the reduction in shear strength of the surfaces. Ordering was promoted by adsorption on the surfaces. Beyond this adsorbed film and depending on the strength of the intermol. forces, other ordered layers were produced having a quasicryst. condition with favored glide planes parallel to the surface.

9536. Sengoku, Tadashi; Iki, Sataro, and Nishizawa, Shingo. **Studies on carbon black. II. Property of various kinds of carbon blacks.** *J. Soc. Rubber Ind. Japan* 21, 26-31 (1948).—*C. A.* 42, 9228*b*.

Sixteen samples of carbon black obtained by 7 different manufg. methods were compounded in different proportions in rubber. The reinforcing effect was detd. The I_2 adsorption values of the carbon blacks also were detd. to find the relation between I_2 absorption and reinforcing effect. No definite relation was found.

9537. Sengoku, Tadashi and Nishizawa, Shingo. **Studies on carbon black. III.** *J. Soc. Rubber Ind. Japan* 21, 56-60(1948).—*C. A.* 42, 9228*b*.

The vulcanizates contg. the 16 kinds of carbon black were tested for abrasion, heat resistance, aging, and resistance to oil.

9538. Serfass, Earl J.; Theis, Edwin R.; Thorstensen, Thomas C., and Agarwal, Raj. K. **Chrome liquors. XIII. An investigation of anion penetration through the use of ion-exchange resins and diffusion measurements.** *J. Am. Leather Chemists' Assoc.* 43, 132-65(1948). —*C. A.* 42, 7075*e*.

Na salts of org. acids were added in various amts. to 33% basic Cr sulfate solns. prepd. by SO_2 reduction of $Na_2Cr_2O_7$. The solns. were dild. to 1% Cr_2O_3 and aged at 70°F. Samples were taken at various time intervals for examn. by cationic exchange resin and diffusion techniques. Sample aliquots were shaken 1/2 hr with Ionac C-200 resin. The resin was washed free of unadsorbed Cr with water, and Cr and sulfate were detd. in the combined wash and filtrate. Cationic Cr was stripped from the resin with 6 *N* H_2SO_4, and Cr and org. anion present in the cationic complex were detd. in the acid soln.

9539. Skoczynski, Wladyslaw and Szostak, Tadeusz. **Production of carbon black in Poland.** *Przemysl Chem.* 4, 307-9(1948).—*C. A.* 42, 9122*i*.

The properties and uses of the various grades of carbon black were reviewed and the methods used by 2 Polish producing plants were described in detail.

9540. Smith, W. R. and Schaeffer, W. D. **The nature and activity of carbon-black surfaces.** *Proc. 2nd Rubber Technol. Conf.* (London) **1948**, 403-13; *Rubber Chem. & Technol.* 23, 625-34(1950).—*C. A.* 44, 3332*d*; 45, 2650*f*.

The electron-microscope and adsorption-isotherm techniques for evaluating the particle size and surface area of carbon blacks showed that reinforcement could not be interpreted by these methods alone. The activity of the surface also must be taken into account and heats of adsorption offered a means of doing so. The differential heats of adsorption for N_2 and for a series of C_4 hydrocarbons on a group of carbon blacks of differing reinforcing power in rubber were measured. Surface activity decreased with increase in surface coverage. The magnitudes of the initial heats paralleled the reinforcing properties of the carbon blacks. The surface activity and reinforcing power of an MPC type of carbon black was greatly reduced by subjection to high temps. Aldehyde and carboxyl radicals in high concn. and hydroxyl radicals in almost as high concn. were observed.

9541. SODA, NORIMUNE AND MIYAGAWA, YUKIO. **The mechanical transition temperatures. (Fundamental studies on the combination of bearing metals.)** *Rept. Inst. Sci. and Technol. Univ. Tokyo* **2**, 23-30(1948).—*C.A.* **45**, 6373*d*.

Sliding friction was measured for the pairs of Cu-Cu, Ni-Ni, Cu-Ni, and soft iron-soft iron lubricated with normal aliphatic acids of C_4-C_{16}. The mech. transition temps. where stick-slip changes to smooth sliding were different for each pair of metals. Those for soft iron pair were the highest and fairly coincident with the transition temps. observed by electron diffraction, where mols. adsorbed on the metallic surface lost their orientation only by thermal agitation.

9542. SODA, NORIMUNE AND MIYAGAWA, YUKIO. **Thermal limitation in thin-film lubrication of oils.** *Rept. Inst. Sci. and Technol. Univ. Tokyo* **2**, 49-57(1948).—*C.A.* **45**, 6373*e*.

Three kinds of transition temps. were found for sliding friction of metallic surfaces lubricated with thin films of normal aliphatic acids of C_4-C_{16}. At the lowest one T_n smooth sliding changes to stick-slip, which was due to the disappearance of orientation of adsorbed mols. The second one T_o, where stick-slip changed to smooth sliding, was concluded to be due to the oxidation of the lubricant oil and the formation of an orientated film of the oxidation product. At the highest one T_d smooth sliding changed again to stick-slip, increasing the amplitude with temp. and at last it changed to irregular and fluctuating friction characteristic of dry metallic friction.

9543. STUART, A. H. **The adhesion of paint films—some fundamental principles.** *Paint Manuf.* **18**, 347-9(1948).—*C.A.* **43**, 869*b*.

Some of the basic principles which made for good adhesion were stressed. A few lab. tests were reported.

9544. TAYLOR, THOMAS G. **Effect of carbon black and black ion oxide on air content and durability of concrete.** *J. Am. Concrete Inst.* **19**, 613-24(1948).—*C.A.* **42**, 6076*d*.

Carbon black and black iron oxide added to concrete mixts. as coloring agents were tested for effects on air content of concrete, resistance to freezing and thawing, and surface scaling. A general reduction of air content of concrete was found. Effects on strength were variable.

9545. TRILLAT, J. J. **Molecular adsorption and the state of the lubricated surface.** *Bull assoc. franc. techniciens petrole No.* **69**, 17-44(1948).—*C.A.* **43**, 1953*b*.

The adsorption of lubricating films showed the influence by the mol. structure of the oil (especially when modified by additives such as oleic or stearic acids) and the phys. and chem. properties of the metal surface.

9546. ALLEN, E. M.; GAGE, F. W., AND WOLF, RALPH E. **Compounding of natural rubber with a new fine-particle silica.** *Rubber Age (N.Y.)* **65**, 297-303(1949).—*C.A.* **43**, 7251*a*.

Hi-Sil, a hydrated form of silica, had an av. particle size of 0.025 and d. of 1.95. Tests in various proportions in natural rubber mixts. contg. different accelerators showed that it imparted to vulcanizates high tensile strengths, good resistance to abrasion, and high resistance to tearing. In general, it imparted better quality than did any other com. filler other than carbon black. Because of its high adsorptive capacity, higher proportions of accelerator and stearic acid than normally used with ordinary fillers were needed in many cases.

9547. AMBORSKI, LEONARD E. AND GOLDFINGER, GEORGE. **Mechanism of reinforcement. III. Viscosity of carbon black suspensions in GR-S solutions.** *Rev. trav. chim.* **68**, 733-44(1949) (in English); *Rubber Chem. & Technol.* **23**, 803-11(1950).—*C.A.* **44**, 4277*i*; **45**, 8800*a*.

The technique for measuring the viscosities of suspensions of different concns. of carbon blacks in xylene solns. of different concns. of GR-S was described. It was possible to det. the thickness and rigidity of the GR-S layer and the shift in concn. of GR-S with respect to solvent. However, carbon black spheres surrounded by GR-S were not rigid nor was the GR-S soln. continuous, but by measuring viscosity at various rates of shear and extrapolating to zero shear, both these difficulties were minimized. The thickness of the adsorbed layer of GR-S on the carbon black particle was of the order of 150-200 A., in agreement with electron microscopic examn.

9548. BADDELEY, A. R. W.; NISSAN, A. H., AND GARNER, F. H. **Detergency of carbon black in hydrocarbons solution. I.** *J. Inst. Petroleum* **35**, 141-70(1949).—*C.A.* **43**, 5933*d*.

With increasing concns. of Ca naphthenate a more uniform rate of settling was obtained. The adsorption of Ca naphthenate on the carbon black (Micronex) was detd. by measuring the concn. of Ca naphthenate in the clear soln. from which the black had settled out; force-area curves obtained on the Langmuir trough were used to det. the concn. The degree of dispersion measured in this way and the adsorption of Ca naphthenate on the carbon black approached a max. at about 0.188% Ca naphthenate in toluene. With the series of suspensions of Micronex ranging from 0.1 to 1 g in 25 ml of soln., the max. adsorption was reached in all cases at about the same figure, 0.094 to 0.188% concn. of Ca naphthenate in toluene.

9549. BARNETT, C. E. AND JONES, H. C. **Role of adsorption in reinforcement of GR-S.** *Ind. Eng. Chem.* **41**, 1518-22(1949).—*C.A.* 43, 8188*h*.
Non-carbon pigments affected the reinforcing properties of GR-S in a manner which was related to the surface activity of the pigment. Extended studies of GR-S with basic $ZnCO_3$ calcined over a range of temps. showed that tensile strength reached a max. at 350°C calcination for the $ZnCO_3$ and thereafter declined at higher temps. Adsorption studies of toluene-GR-S-pigment cements were made by aging and centrifugation, followed by analysis of the sepd. pigment. The effects of Ca silicate, ZnO, $ZnCO_3$, $Al(OH)_3$, Al_2O_3, MgO, and various carbon blacks on tensile strength, % elongation, modulus, % permanent set, Shore hardness, soln. viscosity, etc., of the GR-S polymers recovered from the cements were summarized.

9550. BIKERMAN, J. J. **Effect of surface roughness on rolling friction.** *J. Applied Phys.* **20**, 971-5(1949).
The minimum tilt at which bearing balls rolled down an inclined plate of stainless steel was greater for rough than for smooth surfaces. The balls used were between 0.159 and 0.635 cm in radius. Capillary attraction presumably did not interfere as superficial drying of the system had no effect. Surface roughness, which was the cause of Coulomb's sliding friction, seemed to cause also rolling friction at low pressures.

9551. COTTON, P. **Spreading of oils over the surfaces of gold and silver films.** *Research (London), Suppl., Surface Chemistry* **1949**, 233-8(in French)(English summary).—*C.A.* 43, 8799*a*.
Au and Ag films were deposited by evapn. and cathodic sputtering on polished surfaces of glass, quartz, or mica. Spreading of a nonpolar paraffin oil and 2 fatty acids (C_9 and C_{18}) on these metal films was studied in dry and in moist air, in a closed chamber. The nonpolar oil in dry air showed no appreciable variation of spreading speed with film thickness; in air satd. with water vapor, spreading took place as in dry air on films having a thickness of more than about 15 A., whereas no spreading was observed on films of less than 10 A. thickness. The polar oils failed to spread in dry air on thick metal films; whereas below a crit. film thickness, slow spreading took place. The different properties of thinner films were attributed to the characteristic "hedgehog" structure of the microcryst. metal films.

9552. DANNENBERG, E. M. AND STOKES, C. A. **Characteristics of reinforcing furnace blacks. Processing shrinkage.** *Ind. Eng. Chem.* **41**, 812-17(1949).—*C.A.* 43, 4887*a*.
An extrusion shrinkage test was described by means of which processing characteristics of rubber mixts. contg. carbon black was studied. The effects of furnace blacks on the processing of rubber and GR-S were studied with special reference to shrinkage and scorching or initial rate of vulcanization. The manuf. of a furnace carbon black which did not tend to make rubber mixts. abnormally scorchy was practicable, and results were given obtained with such a carbon black in rubber mixts. accelerated by mercaptobenzothiazole. The ability of carbon blacks to reduce shrinkage in processing was discussed.

9553. DERYAGIN, B. V. AND ZAKHAVAEVA, N. N. **The stability of thin lubricant films deposited on solid surfaces.** *Kolloid. Zhur.* **11**, 230-1(1949). —*C.A.* 44, 828*f*.
Lubricant was deposited on solid surfaces and then blown off so that only a thin wedge remained; its thickness was detd. interferometrically. The wedge of turbine oil contg. Al oleate, Al stearate, or $BuOCH{:}CH_2$ polymer was more stable on steel than on glass or Cr coating. This explained why lubrication of Cr surfaces was difficult.

9554. DOSCHER, TODD M. **Characteristics of detergent-suspended clays.** *J. Phys. & Colloid Chem.* **53**, 1362-71(1949).—*C.A.* 44, 6607*e*.
Addn. of some nonionic detergents (polyethylene oxide derivs. of an alkylphenol, sorbitol oleate, and tall oil), petroleum oil, and $CaCl_2$ to clay suspensions produced stable dispersions which possessed relatively low visocosities, gel strengths, and fluid losses. The effective nonionic detergent differed from other nonionic detergents in the interaction of polar ends and relatively high polarity of nonpolar ends. Addn. of alcs. which were adsorbed preferentially led to breakdown of the suspensions. The detergent-suspended clays were used in the drilling of oil wells.

9555. DROGIN, ISAAC; BISHOP, HESTER R., AND WISEMAN, PAUL. **High-temperature mixing of fully reenforcing carbon blacks in synthetic and natural rubbers. II.** *India Rubber World* **121**, 57-66(1949).—*C.A.* 44, 362*g*.
The effects of mixing S and carbon blacks in GR-S and natural rubber at 375°F were compared with the effects at conventional temps. Mixing of GR-S X-478 (made at 41°F) at high temps. (around 375°F) involved lower power consumption and resulted in higher viscosity, little increase in shrinkage with furnace blacks and no difference with channel black, less tendency to scorch with furnace black, more tendency with channel black, more bound polymer and gel with channel black and slightly less with furnace black, higher stress modulus, and little change in hardness and tensile strength.

9556. GODFREY, DOUGLAS AND NELSON, ERVA C. **Oxidation characteristics of molybdenum disulfide and effect of such oxidation on its role as a solid-film lubricant.** *Natl. Advisory Comm. Aeronaut., Tech. Note No.* **1882**, 28 pp. (1949). —*C.A.* 43, 6816*g*.
Expts. were conducted with an app. that caused a spherical rider to slide in a spiral path on a rotating disk at velocities between 50 and 8,000 ft per min. and a load of 269 g (126,000 p.s.i., initial Hertz surface stress). A coating of MoS_2 serving as a high-temp. solid-film lubricant maintained low coeff.-of-friction values during its oxidation to MoO_3 as long as an effective subfilm of MoS_2 remained. Films of

MoO_3 alone produced very high friction. MoS_2 began to oxidize slowly in air at 750°F, the rate increasing steadily and becoming high at 1050°F. In vacuum MoS_2 maintained its original structure at 1000°F.

9557. GUSTAVSON, K. H. **Helpful hints in analysis of chromium compounds by means of ion exchangers.** *J. Am. Leather Chemists' Assoc.* 44, 388-92(1949).—*C.A.* 43, 7863*a*.

Some of the apparently insignificant details associated with the chromatographic study of the various complexes formed in Cr salts were of real importance. The effect on accuracy of the degree of fineness of the exchanger, variations in cation content, rate of filtering, size of large complexes, interaction with the phenolic groups of the molecules, the presence of "zwitter ions," etc., were described.

9558. GUSTAVSON, K. H. **Study of the formation of complexes in concentrated solutions of basic chlorides and sulfates (of chromium) by means of ion exchange and by spectrophotometric methods, and their action on collagen.** *Union intern. socs. chimistes inds. cuir, Congr. intern.* 1, 21-45(1949).—*C.A.* 45, 3632c.

9559. HEINLEN, W. H. JR. **An acceleration study using reënforcing furnace blacks in natural rubber treads.** *Rubber Age (N.Y.)* 65, 431-4 (1949).—*C.A.* 43, 7251*h*.

Expts. showed that the tendency of rubber mixts. contg. reënforcing furnace black to scorch could be minimized by using aliphatic thiazoyl disulfides for acceleration and N-nitrosodiphenylamine as retarding agent, without detriment to the phys. properties of the resulting vulcanizates.

9560. JAMAIS, J. **Bloating of clays at high temperatures.** *Bull. soc. franc. céram.* 1949, No. 5, 32-36.—*C.A.* 46, 5804*d*.

Bloating was caused not only by entrapped air, but by gas emitted from (1) carbonaceous material, (2) carbonate and sulfate salts, (3) Fe oxide being reduced to a lower state, and (4) decompn. of certain accessory clay minerals, such as mica.

9561. MARCELIN, A. **Boundary films. The solid/solid boundary and the lubricating films.** *Research (London), Suppl., Surface Chemistry* 1949, 223-31(in French)(English summary).—*C.A.* 43, 8799*d*.

A thick layer ensured perfect hydrodynamic lubrication. This layer became progressively thinner under increasing load or decreasing speed until it reached a min. crit. thickness of about 1μ. The min. liquid film, corresponding to the 2nd stage, was remarkable for its stability when the relative speed of the metal surfaces became extremely small or even zero; the film could resist pressures up to 100 kg/cm^2 without being crushed. When the crit. load was passed, the min. liquid film suddenly collapsed. Then lubrication was provided by means of stratofilms formed by the superposition of one or more double layers of mols. In this stage, wear and tear of metallic surfaces took place.

9562. MILL, C. C. AND BANKS, W. H. **Interpretation of oil absorption of pigments.** *J. Oil & Colour Chemists Assoc.* 32, 599-609(1949).—*C.A.* 45, 365*f*.

Various theories of the absorption of oil by a pigment were presented and analyzed. Oil absorption was essentially a measurement of the oil required to fill the interstices of the particles of a surface-coating. There were several voidage concepts: a partial filling of the spaces created by spherical particles in a plane surface by the formation of liquid menisci, or by the complete filling of the total space. Other concepts were the complete filling of voids created by particles lying immediately above another, thereby giving a max. void, or the filling of voids created by particles that took the shape of a rhomboid thereby giving a min. void.

9563. MULLER, OSCAR P.; JORDAN, J. W., AND BRANCATO, J. J. **Bentonite flatting and gelling agents.** *Official Digest Federation Paint & Varnish Production Clubs No.* 294, 451-62(1949).—*C.A.* 43, 8704*e*.

Long-chain amine bentonites contg. 8, 18, and 34 C atoms (prepd. by the base-exchange reaction $Na^+bentonite^- + amine^+Cl^- \rightarrow$ amine bentonite + NaCl) displayed the following swelling properties: C-8, a low swelling type, giving uniformly dispersed particles suitable for flatting purposes; C-18, a high swelling type, providing max. gelling efficiency in mixts. of polar and nonpolar solvents; and C-34, a high swelling type with distinct properties of thickening coating compns. in which petroleum solvents were the sole thinner. C-18 could be used for the prepn. of solvent-type cleaning fluids and paint removers.

9564. NAGAI, YUSABURO AND HASEGAWA, HIROSHI. **Studies on the oiliness of lubricating oils. I. Frictional coefficients of lubricant oils at various temperatures.** *Rept. Inst. Sci. and Technol. Univ. Tokyo* 3, 15-18(1949).—*C.A.* 45, 6374*c*.

Degeneration of oils at the frictional surface was either due to the oxide films and O_2 adsorbed at the frictional surface, or due to the O_2 contained in the oils.

9565. NAGAI, YUSABURO AND HASEGAWA, HIROSHI. **Studies on the oiliness of lubricating oils. II. The influence of purification upon frictional coefficients of degenerated lubricant oils.** *Rept. Inst. Sci. and Technol. Univ. Tokyo* 3, 54-6(1949).—*C.A.* 45, 6374*d*.

In the case of oils contg. comparatively large quantities of polar substances the frictional coeff. decreased by repeated measurements and converged to a stationary value. With oils contg. extremely small quantities of polar substances the frictional coeff. decreased successively without limit. With purified oils it increased at first slightly and soon came to a stationary value.

9566. ODA, RYOHEI AND SHIMIZU, HIROSHI. **Cation-exchange resin from natural rubber. VI. Drying conditions and decrease of exchange capacity. VII. Summary of manufacturing conditions and characteristics of the resin.**

Chem. High Polymers (Japan) 6, 29-30(1949).—*C.A.* 46, 1184*h*.

H_2SO_4 produced during the thermal drying of the resins, was attributed to the decompn. of SO_3H groups in the resins. The sum of the free H_2SO_4 and the cation-exchange capacity of the heated resin was nearly const.

9567. Parkinson, D. **Reënforcing furnace blacks.** *Trans. Inst. Rubber Ind.* 24, 267-73(1949).—*C.A.* 43, 7251*i*.

Developments in the manuf. of various types of carbon black were reviewed and their comparative properties discussed. Unpublished work indicated the possibility that the crystallite size of carbon black played a part in its reënforcing properties and that a strongly reënforcing carbon black was characterized by a combination of small particles and small crystalite within the particles.

9568. Perchet, R. **Use of activated alumina as an adsorbent.** *Génie civil* 126, 208-9(1949).—*C.A.* 43, 9296*d*.

Advantages and applications were discussed, particularly its use in reclaiming transformer oils.

9569. Roga, B. and Szuba, J. **Physicochemical properties of gas blacks.** *Przemysl Chem.* 5(28), 357-64(1949).—*C.A.* 45, 10556*a*.

The properties of a no. of Polish gas blacks were investigated and an attempt was made to correlate the data with tests carried out on a no. of prepd. rubber samples contg. gas black. Physicochem. data such as adsorptive capacity, heat of wetting, ignition point, and activity could be used in production control as well as in carrying out a rough selection of gas blacks for use in rubber mixts.

9570. Roux, D. G. **The purification of black wattle tannin and its effect on combustion analyses.** *J. Soc. Leather Trades' Chemists* 33, 393-407(1949).—*C.A.* 44, 2781*c*.

Combustion analyses were made on wattle tannin, extd. from fresh bark with MeOH, and freed as far as possible from nontannins and oxidized materials by one or a combination of the following methods: sorption of tannin on hide powder, washing, and partial stripping with 50% aq. MeCO. A second and third stripping gave darker products. Pptn. with $Pb(OAc)_2$, centrifuging, suspending the ppt. in H_2O and treating with H_2SO_4 or $(COOH)_2$ to ppt. Pb and leave a tannin soln. (pH 3).

9571. Schneider, C. G. **Polymeric phosphate in tanning.** *Am. Leather Chemists' Assoc.* 44, 596-604(1949).—*C.A.* 43, 9509*i*.

Hide powder was treated with polymeric Na metaphosphate (Calgon) in H_2SO_4 at pH 3.7 and 2.25. The latter gave a fixation of Calgon almost equiv. to the acid-combining power of the protein.

9572. Siesholtz, Herbert W. and Cohan, Leonard H. **Calcium carbonate extender pigments.** *Ind. Eng. Chem.* 41, 390-95(1949).—*C.A.* 43, 6836*b*.

The effects of particle size of $CaCO_3$ extenders on the phys. properties of paints were studied. The low-n $CaCO_3$ pigments used in the expts. ranged in particle size from 0.05 to 3.9μ. Five pigments in 3 paint formulations were studied and compared with an unextended TiO_2 enamel. The gloss, lightness, and hiding power of the paint films increased with reduced particle size of the extender pigment. Despite the lower opacity in oil, the hiding power of the ultrafines was doubtless enhanced by their improved dispersive action. Decreasing particle size of the $CaCO_3$ extender resulted in a regular increase in the consistency and yielded values of the fluid paints. Graphs of the rheological properties and a math. discussion were presented.

9573. Stokes, C. A. and Dannenberg, E. M. **Carbon blacks—comparison of a fully reinforcing furnace black and easy processing channel black.** *Ind. Eng. Chem.* 41, 381-9(1949).—*C.A.* 43, 6855*a*.

Rubber compounding tests with a com. fully reinforcing furnace black and an easy processing channel black showed a greater tendency of the furnace black stocks to cause scorching. This was thought to be related to a difference in surface constitution, as evidenced by the distinctly greater elec. cond. of the furnace black. Other phys. properties of the rubber compds. were practically identical. Tire treads made with each type of carbon black had similar road-wear performance. These data were significant because of the inherent manufg. difficulties in producing channel black.

9574. Sveda, Michael. **New silica for floor wax. II.** *Soap Sanit. Chemicals* 25, No. 8, 115-17(1949).—*C.A.* 43, 7724*e*.

"Ludox" colloidal silica contained 30% SiO_2 in aq. soln. Light scattering technique was used in detg. its av. mol. wt of 2 million. In combination with shellac, manila gum, and waxes with small particle size, it gave high skid-resistance and also increased gloss and decreased tackiness in water waxes. Freeze resistance was obtained by use of ethylamine. An electromicrographic technique was developed for studying the surface of wax films.

9575. Sweitzer, C. W.; Goodrich, W. C., and Burgess, K. A. **The carbon black gel complex in cold-rubber reenforcement.** *Rubber Age* (N.Y.) 65, 651-62(1949).—*C.A.* 43, 9515*d*.

The carbon black gel complex was the C_6H_6-insol. rubber formed in unvulcanized rubber-carbon black mixts. Many factors detd. the % gel formed. The temp. of mixing had the greatest effect; particle size, structure factors and a specific surface activity of the carbon black influenced the rate of formation of the gel. This activity could be estd. by the behavior of the carbon black toward O_2. Carbon blacks which were highly active in gel development must be mixed at relatively low temps. to avoid scorching; carbon blacks which had only normal activity attained an adequate gel level for full reinforcement with normal high-speed mixing.

9576. Tabor, D. and Tingle, E. D. **Surface attack of metals by fatty acids and the formation of lubricating layers.** *Research (London)*, *Suppl., Surface Chemistry* **1949**, 217-22 (in English and French).—*C.A.* 43, 8799*h*.

Fatty acids were no more effective as boundary lubricants on Ag or Pt than paraffins or alcs. of corresponding chain length. On reactive metals, friction and surface damage remained low up to the softening point of the metallic soap formed at the surface. Lateral adhesion between the lubricant mols. was assumed to be of primary importance in providing lubrication. Phys. adsorption of the mol. at the metal surface was only of secondary importance. Friction expts. on surfaces from which the oxide film had been removed indicated that this reaction did not occur directly with the metal, even in this case of electroneg. metals. Adequate soap formation required the presence of water during the formation of oxide film.

9577. TAYLOR, C. L. **British-made carbon black with special reference to the manufacture of "Seval."** *Petroleum Times* 53, 10-11(1949).—*C.A.* 43, 2407*b*.

The manuf. of Seval, a medium carbon black, by cracking hydro-carbon fuel in checker-brick-type furnaces was described.

9578. TUCK, D. H. **The dyeing of leather.** *J. Soc. Dyers Colourists* 65, 386-9(1949).—*C.A.* 43, 8184*i*.

Basic dyes were employed mainly for dyeing vegetable-tanned leather, all the loose tannin being first fixed with tartar emetic, K Ti oxalate, etc., and for dyeing mordanted chrome leather. Basic dyes yielded very full, rich, powerful surface dyeing, with dyeings fast to perspiration. Disadvantages include lack of penetration and accentuation of grain defects. Acid dyes were applicable to all types of leather. The pH was lowered, generally with HCO_2H to obtain fixation; conversely, by raising the pH with NH_4OH the acid dyes could be made to penetrate. Oil and CH_2O leathers might require application of a chrome alum mordant prior to dyeing with acid dyes.

9579. VULPESCU, GH. **The industrial utilization of glass-wool filters in carbon black factories.** *Rev. Teh. AGIR* 3, 208-11(1949).—*C.A.* 44, 11066*c*.

Glass-wool filters were used at the carbon-black plant near the natural-gas fields of Copsa-Mica. The glass wool effectively retained the fine solid matter which otherwise would cause trouble in the distributing pipes. The initial cost of the glass wool, which is manufd. in Rumania, was low and the flow rates used were similar to those used with elec. filtering devices.

9580. WATSON, JOHN H. L. **The morphology of carbon-black particles in shadowcast specimens.** *J. Applied Phys.* 20, 747-54(1949).—*C.A.* 43, 9418*f*.

A reticulate chain structure was favored for carbon black. The discovery of "hollow" particles in carbon black dispersions of P-33 and Thermax was reported along with possible explanations for the observed image intensities which gave rise to the interpretation of hollowness. Striated surfaces strongly suggestive of a laminar structure and serrated edges were detected. Rough areas arranged both in lines and at random were observed over the surfaces of some particles.

9581. ZHURBENKO, M. P.; RYKBERG, K. V., AND GERASEV, S. V. **High-dispersion clays as leather fillers.** *Legkaya Prom.* 9, No. 4, 15-16(1949).—*C.A.* 47, 1961*g*.

Clays capable of forming highly dispersed suspensions in water could be used as fillers for sole and insole leathers. The clay was bonded more firmly with the leather fibers than were glucose and salts. Filling with clay raised considerably the coeff. of tanning.

9582. AMBORSKI, LEONARD E.; BLACK, CARL E. III, AND GOLDFINGER, GEORGE. **Mechanism of reënforcement. IV. Adsorption of GR-S by carbon black.** *Rubber Chem. & Technol.* 23, 417-24 (1950).—*C.A.* 44, 7575*i*.

A comparison of the ratios of the extinction coeffs. for the original GR-S and for the remaining fractions after certain fractions were specifically removed by carbon black indicated no preferential adsorption by carbon black of any of the units considered. The exptl. error was 5%. However, a change in concn. of 5% of polystyrene would not result in large differences in the tensile strength and modulus of GR-S treated with carbon black. The selectivity must, therefore, be based on mol. wt. The concn. of styrene was measured in relation to the 1,2- to 1,4-addn. units of polybutadiene. The ratios of 1,2- to 1,4-units in GR-S alone and in GR-S treated with a furnace black and channel black, resp., also were detd. There was no selective adsorption in any case.

9583. AMON, FRED H. **Carbon black manufacture in Great Britain.** *Trans. Inst. Rubber Ind.* 26, 177-91(1950).—*C.A.* 45, 1325*g*.

The development of the furnace process was described, and the increased utilization of liquid hydro-carbons in place of gaseous hydrocarbons was pointed out. Analytical tests, lab. compounding tests, and road tests of tires were described, with tabulated data, to show the comparative results obtained with furnace oil black (HAF type) and with channel carbon black.

9584. BOETTCHER, A. **Aerosil, a highly active light-colored filler.** *Kautschuk u. Gummi* 3, 357-60(1950).—*C.A.* 45, 1369*f*.

Aerosil was a colorless silicic acid with d. 2.2, n value 1.55, and particle size 15-25 mμ. Representative data on natural-rubber vulcanizates showed that better quality could be obtained with Aerosil than with CK-3 type of carbon black. Aerosil was of particular interest in the manuf. of transparent rubber products of high quality.

9585. BOSTWICK, R. AND CAREY, R. H. **Filled polyethylene compounds.** *Ind. Eng. Chem.* 42, 848-9(1950).—*C.A.* 44, 6673*h*.

The utility of inorg. fillers as stiffening agents in polyethylene was studied. The fillers included $BaSO_4$, 2 grades of ground $CaCO_3$, pptd. $CaCO_3$, carbon black, clay, $MgCO_3$, and 3 grades of silica. The fillers did not influence materially the characteristics of polyethylene during process and injection molding. In general, the smaller the particle size of the filler, the greater was its stiffening effect. All the fillers reduced mold shrinkage, tensile strength, resistance to tearing, and elongation at rupture, lowered the brittle temp., and increased the initial modulus, dielec. const., power const., and water absorption.

9586. Cabot, Louis W.; Edminster, J. W., and Stokes, C. A. **The manufacture of furnace carbon black from liquid hydrocarbons at Ellesmere Port.** *J. Inst. Petroleum* 36, 707-26(1950).—*C.A.* 45, 2650*g*.

The process used at Ellesmere Port began with the formation of the carbon black from an oil as the result of partial combustion accompanied by thermal decompn. and the building up of fully dehydrogenated fragments into carbon particles. The heat necessary for cracking the hydrocarbon to black was supplied by the combustion of a fraction of the hydrocarbon entering the refractory-lined steel carbon black furnace. After cooling the carbon black aerosol further to 450-500°F by water injection, it was passed through a Lodge-Cottrell precipitator. The carbon black was removed from the electrodes by wrapping; the precipitator was followed by 3 cyclone separators —the combined action of the precipitator and cyclones removed 90-95% of the carbon black. The balance of the carbon black was removed by water scrubbing and a final wet Lodge-Cottrell precipitator.

9587. Crennell, J. T. **Electrochemical behavior of paint film on steel in sea water.** *J. Soc. Chem. Ind. (London)* 69, *Suppl. No.* 1, S36-8 (1950).—*C.A.* 45, 5943*i*.

Submerged painted surfaces were normally cathodic to a bare surface. Metals were not capable of evolving H_2 from sea water so reduction of dissolved O_2 occurred. The cathodic current was stimulated by the presence of O_2. If O_2 was more available in 1 part than another, that part tended to be cathodic. Corrosion occurred at areas of poor aeration which were anodic. On this theory paint surfaces should be anodic, but were actually cathodic.

9588. Dannenberg, E. M.; Jordan, M. E., and Stokes, C. A. **Effect of mechanical aggregation on the dispersion characteristics of carbon black.** *India Rubber World* 122, 663-71 (1950).—*C.A.* 44, 10367*a*.

The topics discussed were: the influence of mech. aggregation of HAF black on the dispersibility in water, influence of the dry d. of channel-grade ink black on the rheological properties of news ink, influence of the bulk d. of MPC channel black on the properties of natural rubber and low-temp. GR-S tread mixts., the effect of bulk d. of HAF black on the properties of natural rubber and low-temp. GR-S tread mixts., the dispersion of oil-type furnace black in Butyl of different viscosities, and the dispersibility of SRF black in butadiene-acrylonitrile copolymer, and of carbon blacks in polyethylene.

9589. Finlayson, C. Malcolm and McCarthy, P. R. **Bentone greases.** *Inst. Spokesman* 14, No. 2, 13-23(1950).—*C.A.* 44, 7053*b*.

Montmorillonite, after removal of nonclay impurities, was treated with an alkyl ammonium salt contg. 16-18 C atoms to produce bentones which when dispersed in mineral oils formed lubricating greases. In comparison with conventional soap-thickened greases, they showed no transitions with temp., had less tendency to sep. oil, had comparable wear properties, but were inferior in rust-prevention. Although bentone greases absorbed large quantities of water, they were resistant to its washing action.

9590. Foreman, G.; Thompson, G. W. H., and Tolliday, J.D. **The use of ion-exchange resins in the study of chrome (tanning) liquors.** *J. Am. Leather Chem. Assoc.* 45, 378-87(1950). —*C.A.* 44, 11144*i*.

Ionac C200 resin adsorbed HCOOH under static conditions used to investigate the compn. of Cr liquors contg. Na formate. The resin did not adsorb HCOOH when used in the percolation method because of the short time of contact necessary. It was suggested that ion-exchange resins be used in the Na-form for the investigation of Cr liquors contg. Na salts.

9591. Gale, E. S. and Staneslow, B. J. **Rheology of carbon-paper inks.** *Am. Ink Maker* 28, No. 12, 34-41, 67(1950).—*C.A.* 46, 5335*d*.

Carbon paper inks were mixts. of pigments (carbon black, Prussian blue, etc.), dyes, waxes, and mineral oil. The present study of the rheology of carbon-paper inks in the molten condition had, as its aim, the substitution of vegetable waxes, such as carnauba, on which the good flow properties of these inks have in the past depended. A carbon black, which was thought to have a H rather than a C oxide complex adsorbed on it, did not disperse more readily in petroleum oils (contrary to previous suggestions), and a carbon black which normally flowed was found after H_2 treatment to have zero flow value. The charged-particle and wetting concepts of dispersion were adversely criticized; it was found that wetting caused a gas pressure build-up in the mill and a lack of flow value.

9592. Gustavson, K. H. **Investigation of complex formation in solutions of basic chromium compounds by means of ionic exchangers, spectrophotometric methods, and interaction with collagen.** *J. Soc. Leather Trades' Chemists* 34, 259-78(1950).—*C.A.* 44, 11148*f*.

Ion-exchange expts. indicated that in both dil. and concd. (0.4 and 8.0 equiv./liter) solns. of $Cr(OH)SO_4$ and dil. solns. of $2\ Cr(OH)SO_4.Na_2SO_4$, 92-100% of the Cr was present as a cationic complex with 2 Cr atoms binding 1 sulfate group. In concd. solns. of $2\ Cr(OH)SO_4.Na_2SO_4$ only 36% of the Cr complexes were cationic and 59% were uncharged. In the initial stages of tanning (2-4 hrs), concd. solns. of $2\ Cr(OH)SO_4.Na_2SO_4$ fixed 50-100% more Cr than dil. solns., but after 24 hrs the fixations were the same. This difference in initial Cr fixation was due to the greater takeup of uncharged complexes, which gradually converted to cationic complexes.

9593. HARRIS, B. L. AND WOLOCK, IRVIN. **Porosity of paint films.** *Official Digest, Federation Paint & Varnish Production Clubs* No. **308**, 645-8(1950).—*C. A.* **46**, 10635*h*.

The structure and characteristics of paint films were elucidated by a no. of permeability studies. Krypton adsorption of peeled dried linseed-oil films indicated no appreciable quantity of fine pores large enough to allow phys. transmission of water vapor. Extn. with acetone increased the porosity only 20%, indicating no penetration of the film.

9594. KAJISAKI, CHIYOTOSHI; HORI, KAZUHIKO, AND SHIBATA, TAMOTSU. **Effects of carbon on the coloring of porcelain. IV.** *Bull. Govt. Research Inst. Ceramics* (Kyoto) 3, No. 2/3, 74-79(1950).—*C. A.* **46**, 6352*b*.

The discoloring and bubbling of porcelain caused by the decarbonizing action of CO_2 and H_2O on carbon which deposited in the body and glaze before the sintering were studied. H_2O was more effective for removing deposited carbon, but it often produced large bubbles in the glaze. Even after the glaze was melted, CO_2 and H_2O dissolved in it and reacted with carbon. To prevent the discoloring and bubbling, the partial pressure of hydrocarbon which causes the deposition of carbon should be at a min.

9595. KAJISAKI, CHIYOTOSHI; HORI, KAZUHIKO, AND SHIBATA, TAMOTSU. **Effects of carbon on the coloring of porcelain. V. Differences in oxidizing rate of deposited carbon by glaze raw materials.** *Bull. Govt. Research Inst. Ceramics (Kyoto)* 4, No. 1, 8-10(1950).—*C. A.* **46**, 6352*e*.

Discoloration by carbon was greatest in lime glazes and least in talc glazes. Powders of kaolin, quartzite, feldspar, china stone, dolomite, and talc were heated to 1000°C in air, and then coal gas was passed over them at 1150° and 1250°C. After the deposition of carbon, the samples were again heated to 900°C, and CO_2-free air was passed over them to oxidize the carbon. The CO_2 formed by oxidation was detd. The samples showed carbon deposition at 1150°C to be greatest with lime, then dolomite, and least with talc.

9596. KAJISAKI, CHIYOTOSHI; HORI, KAZUHIKO, AND SHIBATA, TAMOTSU. **Effects of carbon on the coloring of porcelain. VI. Relation between oxidizing ratio of carbon deposited on glazes and fired porosity.** *Bull. Govt. Research Inst. Ceramics (Kyoto)* 4, No. 1, 10-13(1950).—*C. A.* **46**, 6352*f*.

The oxidizing ratio, i.e., the ratio of the amt. of carbon oxidized by passing air over the specimen to the total amt. of carbon deposited, was greatest with talc, then dolomite, and least with lime. The total carbon was detd. by wet oxidation of powd. samples. Lime glaze was most likely to be colored by carbon. In lime glazes the oxidizing ratio was proportional to the porosity.

9597. KAJISAKI, CHIYOTOSHI; HORI, KAZUHIKO, AND SHIBATA, TAMOTSU. **Effects of carbon on the coloring of porcelain. VII. Yellowish discoloration by carbon and sulfur compound.** *Bull. Govt. Research Inst. Ceramics (Kyoto)* 4, No. 1, 13-16(1950).—*C. A.* **46**, 6352*g*.

Bodies discolored by carbon contained more carbon and S than those not discolored. Whether or not S was necessary for discoloration was not detd. For yellow coloration, dispersion of colloidal carbon was necessary, and this occurred when the glaze was melting. CH_4 caused discoloration, but if H_2S was present CO caused discoloration even in the absence of CH_4.

9598. KANAGY, JOSEPH R. **Influence of temperature on the adsorption of water vapor by collagen and leather.** *J. Am. Leather Chemists Assoc.* **45**, 12-41(1950).—*C. A.* **44**, 3734*a*.

Moisture-relative humidity isotherms were detd. at 28, 50, and 70°C for prepd. collagen, com. hide powder, and several vegetable- or Cr-tanned leathers. Similar detns. were made for chestnut and quebracho tannins at 28°C. Collagen adsorbed more H_2O at all humidities than did com. hide powder. Adsorptions calcd. for vegetable tanned leather from the data on hide substance and tannin alone were less than observed values below 75% relative humidity, but higher above this point. Free energies, heats of adsorption, entropies, and surface areas were calcd. The surface area of Cr leather did not change on heating over the whole range, but that of the other leathers decreased markedly.

9599. KOLTHOFF, I. M. AND GUTMACHER, R. G. **Determination of free carbon in cured rubber stocks.** *Anal. Chem.* 22, 1002-3(1950).—*C. A.* **44**, 10365*c*.

The method was based on the fact that rubber contg. ethylenic double bonds was oxidatively cleaved by *tert*-Bu-hydroperoxide in the presence of OsO_4. The procedure was to soften the cut rubber sample in gently boiling p-$C_6H_4Cl_2$, add *tert*-Bu-hydroperoxide and a catalytic amt. of OsO_4, filter through a Gooch crucible, wash with C_6H_6,HNO_3, and water, dry the residue at 350°C, cool, weigh, burn off the carbon black at low red heat, cool, and weigh again. The loss in wt equaled the carbon black originally present.

9600. KOLTHOFF, I. M. AND KAHN, ALLAN. **Sorption of GR-S-type rubber by carbon black. I. Sorption from benzene solution by Graphon.** *J. Phys. & Colloid Chem.* 54, 251-6(1950).—*C. A.* 44, 7084*i*.

The effects of temp. between 30° and 50°C, time of shaking up to 120 hrs, degree of conversion between 38 and 90%, and proportion of black (about 2-12%) were examd. and the results summarized. The first two factors were insignificant as far as the total amt. adsorbed was concerned. The intrinsic viscosity, however, decreased with increased time of shaking. This may be explained by a gradual replacement of the more rapidly sorbed small mols. by larger ones.

9601. LEE, HAMPTON. **Notes on the base-exchange-resin method for salt estimations.** *J. Soc.*

Leather Trades' Chemists 34, 150-51(1950).—*C.A.* 44, 9714*e*.

Correct ratio of resin to liquor sample, washing of the resin after passage of the sample, proper diln. of the sample before percolation and preconditioning of a new resin were all important factors.

9602. Maschka, A. and Mendl, A. **Investigation by means of ultraviolet spectroscopy of the catalytic bodying of linseed oil (comparison with the uncatalyzed process).** *J. Polymer Sci.* 5, 429-42(1950)(in German).—*C.A.* 45, 4944*e*.

The bodying of linseed oil at 285°C in CO_2 with and without Ni on asbestos as catalyst was studied by detg. I_2 no., viscosity, d., n_D^{20}, acid no., and absorption spectra at 2200-3000 Å. throughout the process. The results were consistent with the intermediate formation of compds. with conjugated double bonds, followed by their disappearance.

9603. McFarlane, J. S. and Tabor, D. **Adhesion of solids and the effect of surface films.** *Proc. Roy. Soc.* **A202**, 224-43(1950).—*C.A.* 45, 6007*d*.

The adhesion was negligibly small with clean hard surfaces in dry air. In moist air, appreciable adhesion might be observed, owing to the surface tension of a thin film of adsorbed water. With very soft metals (Pb or In), marked adhesion was observed in air, if the surfaces were freed of grosser contaminants. If the surfaces were covered with oxide films of appreciable thickness, the amt. of metallic interaction was diminished with a corresponding reduction in the adhesion. Lubricant films had a similar effect. Those materials that were most effective in reducing the adhesion, were also most effective, as boundary lubricants, in reducing the friction.

9604. Meakins, R. J.; Mulley, Joan W., and Churchward, Vivienne R. **Tropic-proofing of electrical materials 1943-6. III. Some experiments on the application of organosilicon compounds to glass and ceramic.** *Australian J. Applied Sci.* 1, 113-19, 1950.—*C.A.* 45, 287*a*.

The elec. insulation resistance of glass and steatite exposed to moist conditions, which normally suffered severe surface leakage due to adsorbed water, were greatly improved by treatment with methyl and ethyl chlorosilane. Preliminary cleaning with chromic acid was not necessary for effective treatment. With other organosilicon reagents, viz. methyl- and ethylsilicon amines and organosilicon varnishes, oils and greases, improved insulation resistances were obtained, but cleaning with chromic acid was necessary, the uncleaned samples having resistances little better than those of the controls.

9605. Meakins, R. J. **Tropic-proofing of electrical materials 1943-6. IV. Treatment of glass and ceramic with quaternary ammonium compounds.** *Australian J. Appl. Sci.* 1, 120-7 (1950).—*C.A.* 45, 287*b*.

Treatment of glass and steatite ceramic with aq. solns. of certain quaternary ammonium compds. improved the elec. insulation resistance (measured at 98-100% relative humidity) by a factor of nearly 1000; a mechanism of adsorption was proposed to explain these results. The durability of the adsorbed amine films depended on the method of prepg. the samples for treatment, vigorous preliminary cleaning with chromic acid giving the best results. Treatment with benzene solns. of laurylamine, cetylamine, cetylpyridinium bromide improved the resistances of glass and steatite if previously cleaned in chromic acid, but not if merely polished with a cloth.

9606. Merriman, P. **Net volume osmosis of various liquids with rubber membranes.** *India-Rubber J.* **119**, No. 9, 7-8, 10(1950).—*C.A.* 45, 21*g*.

When two liquids interdiffused through a rubber membrane, any net osmotic shift was thought to occur away from the liquid having the greater swelling power. By use of membranes of latex-impregnated sintered glass, this trend was verified for the case in which the more-swelling liquid had the lower mol. wt, even when this liquid was relatively the more polar (e.g. chlorinated hydrocarbons); but when the less-swelling liquid had the lower mol. wt, there were instances of osmosis towards the more-swelling liquid, even though this might sometimes be a less-polar chlorinated hydrocarbon.

9607. Moakes, R. C. W. and Pyne, J. A. **Examination of German and Belgian "White Carbons."** *J. Rubber Research* 19, 4-7(1950).—*C.A.* 44, 4278*d*.

Samples of "white carbon" (amorphous silica) of German origin (Aerosil-K3C) and of Belgian origin (silica white) were compared with MPC black as reinforcing agents in natural rubber. The first gave relatively hard vulcanizates, with high extensibility and low modulus. Vulcanization was slow and tensile strength low when normal percentages of accelerator (Vulkacit-Az) were used; with 3 times the normal percentage of Vulkacit-Az, the rate of vulcanization was normal, and the resulting tensile strength approached that obtainable with Vulkacit-Az, whereas the resistance to abrasion was considerably lower.

9608. Modak, K. V. **Carbon blacks.** *Rubber India* 2, No. 9, 9-17(1950).—*C.A.* 45, 4079*c*.

The nomenclature of carbon blacks with respect to the various types, and the mech. and phys. properties imparted by them to vulcanized rubber were described.

9609. Motoyoshi, Masanobu. **Sizing. I. Effect of acid clay on sizing. II. Change of paper size in contact with drying metal plates and wet web. III. Some characteristic sizing effects of bentonite filler. IV. Effect of bentonite filler on sizing. V. Effects of fillers and mechanism.** *J. Soc. Textile Cellulose Ind.* (Japan) 6, 132-4, 319-21, 388-90, 449-51, 522-5(1950).—*C.A.* 46, 6832*h*.

Acid clay added to rosin used for sizing bleached sulfite pulp prevented paper from decreasing in size resistance on drying. The changes in size of handmade paper sized with rosin and dried on various metal plates was prevented by adding bentonite to the rosin. The shrinkage of rosin-sized paper in direct sunlight and its breaking in hot H_2O were also prevented. Dehydrated (by heating up to 800°C) bentonite decreased the effect of rosin sizing. As compared with acid clay, bentonite was highly hydrophilic and dispersed in H_2O as a colloid and formed a film around single fibers of paper.

9610. PISARENKO, A. P. AND REBINDER, P. A. **The vulcanization of synthetic rubbers.** *Doklady Akad. Nauk S.S.S.R.* 73, 129-32(1950).—*C.A.* 44, 10368*a*.

The role of the bridge S in vulcanization was secondary. The main effect of the bound S was its addn. to double bonds and formation of polar groups; the high cohesive forces of vulcanized rubbers were due to attraction between such polar groups. This point of view was corroborated by the decrease, with rising temp., of the mech. strength of vulcanized rubbers, illustrated by curves for diacrylo nitrile, Na-butadiene, and polychloroprene rubber. Vulcanization effects were observed under conditions where bridge formation by bound S was still out of the question.

9611. PROBER, P. V. **The absorptivity of paper and its influence on wallpaper quality.** *Bumazh. Prom.* 25, No. 4, 41-4(1950).—*C.A.* 46, 736*d*.

The requirements of paper for wallpaper manuf. in the USSR was discussed and also the relation between wallpaper quality and the absorptivity of the paper, a comparison of various methods of detg. the H_2O-absorptivity of paper, a rapid and simple method of detg. absorptivity, and the results of testing a no. of papers.

9612. REICH, GEORGE. **Graphite as a black pigment.** *Paint Varnish Production* 30, No. 2, 11, 14, No. 3, 11, 17-19(1950).—*C.A.* 44, 5115*h*.

Classification, properties, and uses in paints were reviewed.

9613. RUDKIN, A. W. **The role of the hydroxyl group in the gluing of wood.** *Australian J. Applied Sci.* 1, 270-83(1950).—*C.A.* 45, 3191*e*.

From glue shear strength tests and from the nature of failure of these joints it appeared that: (1) Methylation of up to 15% of the available wood OH groups did not affect the adhesion of casein glue to wood. (2) Acetylation appreciably reduced the strength of adhesion of urea-formaldehyde resin to the wood, suggesting that chem. bonding was a factor in the adhesion of this type of resin to wood.

9614. SCHNEIDER, C. G. **The effect of metaphosphate on tannin absorption in chrome-vegetable tanning.** *J. Am. Leather Chem. Assoc.* 45, 670-81(1950).—*C.A.* 45, 4073*h*.

Cr-tanned hide powder was treated at room temp. in solns. contg. various concns. of polymeric Na metaphosphate (Calgon). The washed powders were retanned in analytical-strength vegetable-tannin soln. (50% quebracho, 25% hemlock, 25% oak, on tannin basis), and the percentage of sol. solids removed from soln. was detd. Analysis of the treated powders before retannage showed that Cr-bound sulfate was replaced with an approx. equiv. amt. of Calgon. Pretreatment with orthophosphates did not decrease the affinity for tannin. The vegetable tannins may combine with Cr leather partly by displacing aquo groups from the Cr complex.

9615. SHUTTLEWORTH, S. G. **A low-temperature conductometric elucidation of chromium sulfate complex ions.** *J. Soc. Leather Trades' Chemists* 34, 186-96(1950).—*C.A.* 44, 9712*h*.

Titrations were made at 5°C instead of 25°C. The slopes of different parts of the titration curves could then be used to calc. complex bound sulfate. Titration of a freshly boiled 10% soln. of 1/3% basic chrome alum showed 80-90% of the titratable sulfate to be in the complex. If the complexes were mainly dimers, 60-80% were uncharged and the remainder was cationic. Titrations of freshly boiled chrome alum solns. contg. 1, 10, and 150 g/liter gave values of 60, 78, and 83% complex bound sulfate, resp. It was suggested that the 6-membered ring formed by sulfate with 2 olated Cr atoms was more stable than the 4-membered ring formed by a single Cr atom with sulfate.

9616. SHUTTLEWORTH, S. G. **The theory of chrome tanning.** *J. Soc. Leather Trades' Chemists* 34, 410-37(1950).—*C.A.* 45, 4073*d*.

Because carboxyl groups were known to form stable coördination complexes with Cr under conditions similar to tannage, it was assumed that Cr fixation by collagen was due in part to coördination of the protein carboxyl groups to Cr. Inactivation of the carboxyl groups by methylation resulted in greatly reduced Cr fixation and no increase in thermal stability. Cr fixation increased with increase in pH because of the increased no. of carboxyl ions available for coördination with the Cr. A high concn. of neutral salts during tanning caused aggregation of the Cr complexes and these larger particles diffused less readily into the protein network resulting in decreased Cr fixation.

9617. SODA, NORIMUNE AND MIYAKAWA, YUKIO. **Friction of uni- and multimolecular layers.** *Rept. Inst. Sci. and Technol. Univ. Tokyo* 4, 176-89(1950).—*C.A.* 45, 7408*i*.

The kinetic frictions of uni- and multimol. layers of stearic acid and Ba stearate deposited by the Langmuir-Blodgett technique (Y-deposition) were measured for various loads, temps., curvatures of sliders, and combinations of rubbing materials. The friction decreased with the increase of the no. of layers, but the min. no. of layers sufficient for the satn. of lubricating action and the limiting value of the friction largely depended on the curvature of the slider and the kinds of rubbing materials. It was computed that the layer worn by friction was not repaired by the supply from the surrounding layers.

9618. SPERBERG, L. R.; POPP, G. E., AND BAIRD, C. C. **Electrical resistivity of various carbon blacks in natural, GR-S, cold, and Butyl**

rubbers. *Rubber Age* 67, 561-4(1950).—*C.A.* 44, 10367*e*.

The degree of milling of rubber-carbon black mixts. had a major influence on the elec. resistivity of the mixts. when the blacks were of intermediate or large particle size. This influence was insignificant with carbon blacks of relatively fine particle size. The type of rubber governed the elec. resistivity for a given proportion of carbon black; the degree of dispersion was governed by the viscosity (thermoplasticity) of the rubber at the temp. of mixing. Flexing did not notably lower the cond. of a vulcanizate contg. carbon black by rupturing the carbon black chains.

9619. TAKAHASHI, HIROSHI. **Studies on boundary lubrication.** *Rept. Inst. Sci. and Technol. Univ. Tokyo* 4, 29-33(1950).—*C.A.* 45, 6374*b*.

Friction of mineral and vegetable oils was measured by a pendulum-type oiliness tester. In non-polar mineral oils the friction increased with the repetition of measurements, perhaps owing to wear of the surface film. In polar vegetable oils the friction decreased with the no. of measurements, perhaps owing to the fact that the adsorbed film was more and more completed.

9620. THIAGARAJAN, V. AND SRIKANTAN, B. S. **Lubricating properties of vegetable oils. IV. Measurement of oiliness of raw neutral oils through adsorption.** *J. Indian Chem. Soc. Ind. & News Ed.* 13, 219-26(1950).—*C.A.* 46, 1240*e*.

Oiliness, as measured by the interfacial tension of drop numbers, was shown to be increased with the ability of the oil to adsorb on the metal surface. Tests on each oil through packed columns of Cu and Ni balls indicated mohua oil to be the best lubricant. Unsatn. was an indication of lubricating property, but more than one unsatd. group interfered.

9621. TINGLE, E. D. **Importance of surface oxide films in the friction and lubrication of metals. I. Dry friction of surfaces freshly exposed to air.** *Trans. Faraday Soc.* 46, 93-7 (1950).—*C.A.* 44, 6613*h*.

A smooth shallow track on the metal surface was made by a cutting tool of WC. The slider used in the detn. of friction passed over this track immediately behind the cutting tool so that the interval between exposure of the metal and measurement of friction was very short. With unlubricated surfaces the oxide film generally produced a marked reduction in friction even though the period of exposure to the atm. of a freshly cut surface was only a few sec. With subsequent growth of the film there was further reduction but the effect was less marked. The thin layer of oxide immediately adjacent to the surface played a more significant part in reducing the friction than the thicker layers of oxide above it.

9622. TINGLE, E. D. **Importance of surface oxide films in the friction and lubrication of metals. II. Formation of lubricating films on metal surfaces.** *Trans. Fraday Soc.* 46, 97-102(1950)—*C.A.* 44, 6614*a*.

A diamond-edged cutting tool made a smooth shallow track on the lower Cu surface under a pool of the lubricant soln. The combined action of water and O_2 on the surface of a reactive metal was often able to produce a penetrable film which reacted with a fatty acid to give an effective lubricating layer. Long-chain fatty acids might lubricate metals which form a thick permeable layer of oxide capable of reacting with fatty acids to form a soap; or they might lubricate metals whose oxides, although probably capable of reaction with fatty acid, were formed on the surface as compact skins; or they lubricate metals which form no oxide film or only a very thin film.

9623. TJEBBES, E. J. AND ULDEN, J. V. VAN. **Use of bentonite in the flow-casting process.** *Ingenieur* (Holland) 62, Mk, 104-5(1950).—*C.A.* 45, 4477*a*.

Some types of latex gave bad results in flow-casting. Great improvements were obtained by addn. of bentonite. To prevent coagulation by Ca ions, Vulcastab L.W. was added. Often no more bentonite than 1% could be used. Either the thickness of the layer may be increased or the time of settling reduced, compared with the mixtures without bentonite.

9624. VEǏLER, S. YA; SHREǏNER, L. A., AND REBINDER, P. A. **Investigation of the lubricating action on a model of deep drawing.** *Doklady Akad. Nauk S.S.S.R.* 73, 511-13(1950). —*C.A.* 45, 921*h*.

A band of metal folded in a U-shape was drawn out with the aid of a vertical die, between 2 horizontal cylindrical matrixes, and the normal compressive stress exerted between the matrixes and the die was recorded by an indicator connected with the spring dynamometer housing the matrixes. The lubricant detd. the max. possible reduction, e.g., for steel in CCl_4, in mineral oil, and in oxidized paraffin; it was 49, 57, and 65%, resp. The increased ability of the metal to be drawn out in the presence of lubricants was due not only to reduced friction, but also to the greater ease of surface flow in the presence of surface-active substances.

9625. VERRALL, A. F. AND MOOK, P. V. **Adsorption of sap stain and mold-control chemicals by wood.** *Ind. Eng. Chem.* 42, 1350-5(1950).—*C.A.* 44, 8586*b*.

Lab. and field tests with aq. solns. of a mercurial fungicide used in the continuous dipping of green lumber showed a loss in concn. of the soln. owing to adsorption of the mercurial on the wood. Addn. of borax decreased the rate of loss. Solns. based on the chlorophenates did not lose strength with use. The most feasible means of maintaining adequate strength of soln. was to keep a const. level of soln. in the dipping vat by frequent replenishment with a soln. of normal concn.

9626. WAARDEN, M. VAN DER. **Stabilization of carbon black disperions in hydrocarbons.** *J. Colloid Sci.* 5, 317-25(1950).—*C.A.* 44, 10451*c*.

Carbon black was rubbed in a mortar with 20 parts of white petrolatum, and the jelly-like dispersion was added to hydrocarbon oil to form a 0.1% dispersion. The degree of flocculation was rather marked unless the oil contained alkylated aromatic hydrocarbons. The stabilizing effect of these aromatics increased with length and no. of the alkyl chains over the range investigated (up to 16 C atoms long and 2 in no.).

9627. WOLF, RALPH F. AND GAGE, F. W. **Compounding of Neoprene with fine-particle silica.** *Rubber Age* 67, 317-22(1950).—*C.A.* 44, 7577*b*.

Hi-Sil was a particularly valuable pigment in Neoprene, as was shown by comparative tests of Neoprene-GNA vulcanizates contg. 10, 20, 30, and 40% by vol. of Hi-Sil, Ca silicate (Silene-EF), and EPC black, resp. The measurements showed that, in general, Hi-Sil could be used successfully in Neoprene formulations when properties approaching those of Neoprene-EPC black vulcanizates were required of light-colored Neoprene vulcanizates. It was also an excellent and economical substitute for ZnO used as a pigment.

9628. WOLOCK, IRVIN AND HARRIS, B. L. **Porosity of paint films. Adsorption studies of unsupported linseed-oil films.** *Ind. Eng. Chem.* 42, 1347-9(1950).—*C.A.* 44, 9159*e*.

Surface areas of the order of 1000 cm^2 were measured by Kr adsorption at -204.5°C and applied to the study of unsupported oil films. The av. roughness factor of 1.14 for these films indicated that there was no appreciable quantity of fine pores large enough to allow phys. transmission of water vapor.

9629. YAVOROVSKAYA, S. F. **Evaluation of some building and technical materials as to permeability and adsorption of mercury vapor.** *Gigiena i Sanit.* 1950, No. 11, 22-8.—*C.A.* 45, 4017*f*.

The behavior in respect to Hg vapor was detd. largely by porosity size and shape, with some effect of fibers within the structure. Satn. with tars, oils, and bitumens significantly reduced permeability and adsorption of Hg. The detn. was done in Petri dishes contg. Hg covered with sheets of the test materials, with detection being done on the outer side of the covering by means of Prilezhaev test papers at 18-22°C. Expts. on sorption were run for 3 months.

9630. ANDRESEN, ANDRASCH. **The accelerator-adsorption of rubber fillers, especially light intensifying fillers.** *Gummi u. Asbest* 4, 76-81(1951).—*C.A.* 46, 8407*e*.

The adsorption of mercaptobenzothiazole (MBT) and diphenylguanidine (DPG) was detd. Carbon black (2 g) was shaken with 100 ml DPG in MeOH for 5 times 30 min., the mixt. centrifuged, filtered, and 10 ml filtrate titrated with MeOH-HCl soln. of the same normality to give the DPG no. as g DPG adsorbed by 10 kg carbon black. A 0.01 *N* soln. of accelerator was found to be the optimum for adsorption measurements, giving a sharp color change. The DPG and MBT nos. were detd. for various fillers of the SiO_2 type, Teg type, and of different carbon blacks.

9631. ANON. **Carbon black.** *Chem. Eng.* 58, No. 7, 176-9(1951).—*C.A.* 45, 8233*b*.

The plant operated by Phillips Chem. Co. at Borger, Tex., for the production of furnace-type carbon black from petroleum oils was described.

9632. BOWDEN, F. P. **Influence of surface films on the friction adhesion and surface damage of solids.** *Ann. N.Y. Acad. Sci.* 53, 805-23 (1951).—*C.A.* 46, 2876*b*.

The effect of films on surfaces cleaned *in vacuo* by heat was reviewed. Introduction of O_2, H_2O, or caproic acid vapor reduced friction. Caproic acid plus O_2 gave a lower coeff. of friction than did the acid alone. Cl compds. lowered the friction but by heating the metal to 300-400°C, Cl_2 was driven off and the friction increased. Although H_2S did not reduce the friction as much as Cl, the FeS films were stable up to over 800°C. If the oxide film was harder than the underlying metal, it would not protect the surface from adhesion. Air or O_2 reduced friction on diamonds.

9633. BOWDEN, F. P. AND YOUNG, J. E. **Friction of diamond, graphite, and carbon and the influence of surface films.** *Proc. Roy. Soc.* (London) A208, 444-55(1951).—*C.A.* 46, 6889*f*.

The removal of surface films by vacuum outgassing caused a large increase in the friction. The admission of a small amount of O_2, water vapor, or other contaminant reduced the friction. Both phys. adsorption and chem. adsorption were important. With clean graphite surfaces there was strong adhesion at the interface, so that slip and shearing occurred beneath the surface. Carbon and graphite had a neg. temp. coeff. of friction. The low friction normally observed with diamond was due to the presence of adsorbed O_2 and other gases. The friction of clean diamond on diamond was high, and the shear strength at the interface was comparable with the shear strength of diamond. The pressure of water vapor necessary in these expts. to give a low friction on clean graphite was much less than that found necessary to reduce the wear.

9634. BOWMAN, A. AND HUGHES, W. **Wetting and dispersion with particular reference to titanium oxide.** *J. Oil & Colour Chemists' Assoc.* 34, 412-45(1951).—*C.A.* 47, 1404*e*.

The factors affecting the stability of aq. dispersions were particle size, surface elec. potential, and electrolyte concn. TiO_2 aq. dispersions showed that once peptization had occurred, increase of the electrolyte concn. subsequently effected reflocculation. The elec. potential of the adsorbed layer was investigated by the method of the streaming potential. The major stabilizing factor in nonaq. dispersions was the adsorbed dipole potential rather than the adsorbed ionic potential. A description of the dispersion of TiO_2 in the following was included: C_6H_6, xylene, CCl_4, $CHCl_3$, white spirit, MeOH, EtOH, PrOH, iso-PrOH, *sec*-BuOH, BuOH, AmOH, MeOAc, EtOAc, BuOAc, acetonitrile, Ac_2O, HCO_2H, $PhNO_2$, acetone, and Et glycol.

9635. BROPHY, J. E. AND ZISMAN, W. A. **Surface chemical phenomena in lubrication.** *Ann. N.Y. Acad. Sci.* 53, 836-61(1951).—*C.A.* 46, 3250*c*.

Phys. adsorption on metals, chem. reaction at the solid-liquid interface, colloidal behavior of polar mols. in nonaq. liquids, and the activity of the liquid lubricant phase as a source for surface-active materials were reviewed. Measurement of the friction and wear-reducing properties of certain ester oils showed no significant difference from mineral oils.

9636. Bucchi, Renato. **Reactions of gypsum in setting portland cement.** *Chimica e industria* (Milan) **33**, 685-94 (1951).—*C.A.* **46**, 3726*h*.

$CaSO_4$ was introduced as natural gypsum, as anhydrite, or as $CaSO_4.0.5H_2O$. The specific surface factors were detd.; color effects were discussed. The first reaction of $CaSO_4$ and the clinker minerals was the formation of $3CaO.Al_2O_3.CaSO_4.12H_2O$, mixed with $3CaO.Al_2O_3.Ca(OH)_2.13H_2O$ or $3CaO.Al_2O_3.3CaSO_4.nH_2O$. Extensive expts. were made on the progress of the reaction between $CaSO_4$ and the aluminates for different specific surfaces, for a const. temp. of 21°C and a H_2O:cement ratio of 0.3. All the Al_2O_3-contg. crystal phases of the clinkers (including $4CaO.Al_2O_3.Fe_2O_3$) reacted with $CaSO_4$. Hydrolysis and soln. of the Al_2O_3-contg. phases was the slowest, and regulates the total reactions.

9637. Carr, W. **Wetting agents in the paint industry.** *Official Digest Federation Paint and Varnish Production Clubs* No. **319**, 510-16 (1951).—*C.A.* **46**, 7783*f*.

In nonaq. systems the degree of wetting of the pigment by the medium controlled the apparent dispersion of the pigment together with the flow and storage properties of the system. Products which reduced the grinding time and produced good wetting reduced the tendency to structure formation(thixotropy). In a specific example, a triethanolamine soap was added in small amts. to a pigment-oil mixt. which exhibited a marked degree of "false body." The over-all viscosity of the mixt. was greatly reduced.

9638. Clayton, D. and Jenkins, C. H. M. **Physical changes in rubbing surfaces on scuffing.** *Phys. of Lubrication, Brit. J. Applied Phys.*, Suppl. **1**, 69-78(1951).—*C.A.* **45**, 4915*e*.

Cast iron surfaces rubbing against steel developed a thin layer of a "white constituent" when scuffing occurred or was approached. This appeared to contain cementite and a quenched high-C ferritic phase developed from austenite resulting from the high temp. developed by rubbing. In wear tests the scuffing load for castor oil for a ball running on 3 piston-ring segments was about 500 kg compared with 250 kg for plain mineral oil. There was no difference when the free fatty acid (1.6%) was carefully neutralized and the soap removed; thus the glyceride was the effective lubricant.

9639. Cohan, Leonard H. and Watson, John H. L. **Shape factor and other fundamental properties of carbon black.** *Rubber Age (N.Y.)* **68**, 687-98(1951).—*C.A.* **45**, 6009*c*.

Carbon black particles were formed in the flame and consisted of ellipsoidal units firmly attached to one another. Shape factors detd. electron-microscopically were compared with factors derived from modulus and hardness values. There was a rough correlation between the shape factor as measured by, and as calcd. from, modulus and hardness for semireinforcing and channel blacks. Surface areas were calcd. from the ellipsoidal unit-size distribution derived from electron micrographs. Agreement with B.E.T. and I_2 adsorption areas were only within 25-50% for most of the blacks tested. For channel blacks the relatively high area values detd. by adsorption were explained by assuming that a surface roughness factor was involved.

9640. Dannenberg, E. M. and Seltzer, K. P. **Aqueous dispersion of carbon blacks.** *Ind. Eng. Chem.* **43**, 1389-96(1951).—*C.A.* **45**, 8797*a*.

The controlling factors in the wetting of carbon black with water contg. dispersing agents were the bulk d. of the carbon black and the proportion of extractable hydrocarbons on the surface of the black. Fluffy blacks of low bulk d. are difficult to wet. The percentage of dispersing agent depended on (1) the degree of mech. aggregation of the dry carbon black; (2) surface area of the carbon black; (3) percentage of inorg. contaminants, and (4) surface oxidation or the proportion of chemisorbed O. Large surface area and high inorg. solids content reduced the effectiveness of the dispersing agent. The agglomerates produced in the dry state in making pelleted carbon black are not completely dispersed in water and are still present in the final carbon black masterbatch.

9641. Duke, June; Taft, W. K., and Kolthoff, I. M. **Formation of bound rubber of GR-S type of polymers with carbon blacks.** *Ind. Eng. Chem.* **43**, 2885-92(1951).—*C.A.* **46**, 3314*f*.

The carbon blacks were milled into the elastomers at several temps. The higher the loading of carbon black, the higher the percentage of copolymer-carbon black complex, but at the high range of loading it decreased per unit of carbon black. The temp. of mixing had a marked effect; at lower loadings, the higher the temp., the higher the proportion of copolymer-carbon black complex, but with increase in loading the effect became less, and with 100-125% by wt of carbon black, the temp. had no influence. Fractionation of the sol. phase showed that with increase of carbon black loading copolymer of progressively lower mol. wt combined with the carbon black.

9642. Dupont, G.; Dulou, R., and Leon, V. **New method for catalytic dehydrogenation of abietic or resin esters.** *Bull. soc. chim. France* **1951**, 239-41.—*C.A.* **45**, 8784*i*.

Ni on Ni chromite and Ni on diatomaceous earth, in an autoclave, in the presence of a H-acceptor did not effect dehydrogenation of abietic acid or rosin esters at 300°C. Raney Ni was totally inactive even at 350°C. Me abietate was dehydrogenated by Ni formate to the extent of 40-45% of theory, and by a mixt. of Ni formate and active carbon a H-yield of 94% and 70-75% crystd. Me dehydroabietate was attained. Neither this catalyst nor divided Ni could be used for the dehydrogenation of abietic acid because it caused decarboxylation. The dehydrogenation by Pd-carbon was slow but very regular, while Ni formate + carbon was very rapid and stopped quickly. Eight times more Ni than Pd was required.

9643. Garner, F. H. and Baddeley, A. R. W. **Detergency of carbon-black suspensions. III. In toluene.** *J. Inst. Petroleum* 37, 426-9(1951).—*C.A.* 46, 282*b*.

The rates of carbon-black suspensions in toluene were compared after the addn. of stearic, oleic, and linoleic acids, and Ca oleate and linoleate. The acids had practically no effect on the rate of setting, and were not significantly adsorbed on the carbon. The Ca soaps were adsorbed, and the effect on the rates of settling was dependent on the amt. adsorbed; the order found, in increasing effectiveness, was Ca naphthenate, oleate, and linoleate.

9644. Gwathmey, Allan T. **Fundamentals of lubrication with the aid of large metal crystals.** *Ann. N.Y. Acad. Sci.* 53, 987-94(1951).—*C.A.* 46, 3250*g*.

By use of single crystals of Cu it was found that the chem. properties, friction, and wear depended on the crystal face exposed at the surface. A polycryst. Cu sphere was lubricated with mineral oil and pressed against a Pb-plated Cu rotor. In an atm. of air and with a thrust of 400 g, 200 min. was required to wear through the Pb film, while 1 min. was required to wear through this film in H_2. In a similar test with a dry Cu sphere pressing against a rotating Cu-plated steel shaft, in H_2, 5 sec. was required to expose the steel, while in an atm. consisting of 500 parts of N_2 and 1 part of O_2, 6000 sec. was required to expose the steel.

9645. Herrent, P.; Ludé, A., and Jnoff, G. **Filtration of viscose.** *Svensk Papperstidn.* 54, 153-68(1951)(in English).—*C.A.* 45, 9858*f*.

Filtering data were given for the effect of reproducibility, aging of the alkali cellulose, cellulose and soda concn., addn. of TiO_2, Dicalite, and alkali cellulose to the viscose, concn. of hemicellulose to the steeping liquor for pulp in slurry and in sheets, thickness of filter, type of filter material and support, ripening of viscose, presence of Fe salts, and preliminary swelling and nonswelling filter material. Comparable filtrations were also made with mineral oil which had the same viscosity as viscose and in which were suspended TiO_2 and Dicalite.

9646. Hillis, W. E. **The chromatographic examination of tannin extracts.** *J. Soc. Leather Trades' Chemists* 35, 211-18(1951).—*C.A.* 45, 10635*c*.

Com. extracts of cube gambier, Indian cutch, quebracho, wattle, myrobalan, "Myrtan," and solns. extd. from mallet and Dundas mahogany barks were compared by paper partition chromatography with resolving solvent mixts. of BuOH:AcOH:water; *m*-cresol:AcOH:water; and phenol:2 *N* AcOH and HCl. Examn. of the chromatograms under ultraviolet light or by spraying with Tollen's reagent showed all samples to be complex mixts. No sugars were revealed by phthalic acid-aniline spraying and no carbonyl compds. were detected with 2,4-dinitrophenylhydrazine.

9647. Honn, F. J.; Bezman, I. I., and Daubert, B. F. **Autoxidation of drying oils adsorbed on porous solids.** *J. Am. Oil Chemists' Soc.* 28, 129-33(1951).—*C.A.* 45, 4943*h*.

The rate of O_2 uptake of purified soybean oil was detd. as a function of the dispersion of the oil on the surface of highly porous silica gel. The most rapid consumption of O_2 took place at well-defined oil-to-solid ratios characteristic of the specific surface areas of the adsorbents. At the crit. concns. the oil constituted a closely packed uni-mol. layer.

9648. Kato, Jotaro and Nagano, Yoshiaki. **Japan wax. Decoloration of Japan wax. The structure of glycerides of dibasic acids in Japan wax.** *Kogaku Iho, Kyushu Univ. (Technol. Rept., Kyushu Univ.)* 24, 34-8, 38-43(1951).—*C.A.* 47, 1409*h*.

In comparative study on the various methods of decolorizing crude Japan wax by adsorption, passing 5-25% C_6H_6 soln. chromatographically through the activated carbon was best. The structure was discussed with relation to the character of chromatographic fractions of Japan wax.

9649. Khoroshaya, E. S. and Avilov, A. A. **Rapid colorimetric determination of the pH of carbon black latex mixtures.** *Legkaya Prom.* 11, No. 3, 41-2(1951).—*C.A.* 45, 9294*c*.

A carbon black latex mixt. 5 was dild. with water 25 ml and the pH detd. with a pencil colorimeter, the pencil and colorimetric scale No. 4 being used. If a crimson coloration was obtained which corresponded to the extreme right value of pH, the detn. was repeated with pencil scale No. 5. The av. deviation from values obtained with a potentiometer and glass electrode was 0.2 pH.

9650. Kiddoo, Gordon. **Carbon black.** *Chem. Eng.* 58, 104-8(1951).—*C.A.* 45, 4911*h*.

A general trend from the channel process to the furnace process was evident, along with a shift from natural gas to petroleum oils as raw materials.

9651. Kinsman, R. G. and Bowles, R. F. **The flocculation of pigment suspensions.** *J. Oil & Colour Chemists' Assoc.* 34, 592-610(1951).—*C.A.* 46, 8871*i*.

Microscopic measurements, the rate of flow, and the change in cond. and dielec. const. under shear on suspensions of anatase TiO_2, rutile TiO_2, blanc fixe, and various carbon blacks in linseed lithovarnish were described. Systems in which flocculation could be detected microscopically also showed its presence by the other methods. Flocculation was observed both as chain and cluster formation.

9652. Kolthoff, I. M.; Gutmacher, R. G., and Kahn, Allan. **Sorption of GR-S type rubber by carbon black. II. Effect of variables on the sorption by Graphon.** *J. Phys. & Colloid Chem.* 55, 1240-6(1951).—*C.A.* 46, 5878*g*.

Gel-free rubber, in contrast to microgel, could be completely sorbed from benzene soln. by Graphon black. The effect was studied of solvent, mol. wt, and degree of unsatn. of the rubber. Copolymers of butadiene and styrene covering the whole range of compn. were prepd. by the GR-S recipe at 50°C, going to 60% conversion. From the pure diene polymer down to 95% styrene there was little change in the amt. adsorbed. A marked decrease occurred with pure polystyrene. Within a range of mol. wts from 2.3 × 10^5 to 3.2 × 10^4 there was no appreciable variation in the behavior of C_6H_6 solns.

9653. Kremen, S. S. and Lollar, R. M. **A study of the moisture relationships and thermal properties of skin and leather.** *J. Am. Leather Chemists' Assoc.* 46, 34-56(1951).—*C.A.* 45, 8281*e*.

The removal of H_2O from hide powder, depickled calfskin, and Cr-tanned calfskin was studied by a solvent distn. method with various hydrocarbons b. 50-204°C. The shrinkage temps. $[T_s]$ of the heated samples were detd. on an electronic force-shrinkage meter. Cr tannage produced no significant change in the H_2O-binding power or in the dry T_s (detd. in paraffin oil) of collagen.

9654. Kuz'minskiĭ, A. S.; Shanin, L. L., and Lezhnev, N. N. **Diffusions of oxygen and oxidation of rubber in the presence of phenyl-2-naphthylamine.** *Doklady Akad. Nauk S.S.S.R.* 79, 467-70(1951); *Rubber Chem. & Technol.* 25, 230-33(1952).—*C.A.* 46, 285*h*, 11742*i*.

Under const. O_2 pressure p_o, the rate of oxidation (measured by the rate of consumption of the antioxidant phenyl-2-naphthylamine) of films of Na butadiene rubber 30-40μ thick was const. With varying p_o (10-760 mm), the rate w of the inhibited oxidation increased approx. proportionally to the square root of the concn. c of dissolved O_2, $w = k_1c^{1/2}$. In a film 1 cm thick, with both sides exposed to oxidation, stationary distribution of O_2 over the thickness was established, at 120°C in 14 hrs, and in a film 0.1 cm thick in 10-15 min. Practically, on account of the actual dependence of the rate on $c^{1/2}$ (rather than on c), stationary distribution was attained somewhat later.

9655. McGavack, John and Bevilacqua, E. M. **Absorption of oxygen by ammonia-preserved rubber latex.** *Ind. Eng. Chem.* 43, 475-9(1951).—*C.A.* 45, 3634*h*.

Exptl. data on the absorption of O_2 by *Hevea* latex were reported and discussed. Absorption resulting from bacterial invasion could be quantitatively titrated as carboxyl, whereas only a very small proportion of O_2 could be identified in carboxyl form when sterile latex is oxidized. The most rapid absorption of O_2 occurs at a pH value at which most com. latex was imported.

9656. Mills, H. **Pigment surface.** *J. Oil & Colour Chemists' Assoc.* 34, 497-518(1951).—*C.A.* 46, 8872*g*.

The effect of particle structure, as detd. by length of calcination time, on the behavior of lithopone pigments and the relation between oil absorption and paint consistency were discussed. As calcination time increased from 20 to 60 min. particle size increased and surface area, sedimentation vol. in linseed oil, oil absorption, absorption of oleic acid from soln., and thixotropy decreased. These results were explained by the healing of cracks between unit particles initially sintered together and the further sintering of particles as calcining proceeds.

9657. Moore, A. C. **The adsorption of lubricant films: a study of radioactive tracers.** *Phys. of Lubrication, Brit. J. Applied Phys.*, Suppl. 1, 54-7(1951).—*C.A.* 45, 4915*g*.

Exptl. data were reported on the chem. reaction between radioactive metal (Pt, Au, Zn, Cd, and Cu) surfaces and adsorbed monolayers of stearic acid, ethyl stearate, and octadecyl alcohol. If no reaction occurred, lubrication was only found below the bulk m.p. of the lubricant. Reaction, when it did occur, did not cease with the formation of a monolayer of soap on the metal surface, but, if sufficient materials were present, thick films of soap were built up.

9658. Mullins, L. and Whorlow, R. W. **Effect of fillers on plasticity of unvulcanized rubber.** *Trans. Inst. Rubber Ind.* 27, 55-74(1951); *Rubber Chem. & Technol.* 24, 232-49.—*C.A.* 46, 3312*b*.

Rubber contg. a filler softened when masticated and stiffened on subsequent standing. This thixotropic behavior was explained by the disentanglement and orientation of the long-chain rubber mols. caused by shearing. On standing, the structure again formed as the mols. returned to a random orientation because of const. thermal motion. Further, the proportionate stiffening by carbon black was much greater when detd. at low rates of shear than at high rates. The capacity of a filler to form the structure could be altered by the addn. of small proportions of surface-active substances.

9659. Otto, Gerhard. **The sensitivity of lime of anionic leather dyes.** *Das Leder* 2, 210-13 (1951).—*C.A.* 46, 5876*e*.

To test the effect of lime in hard water on dyeing, a dispersion of $CaCO_3$, (74 g of CaO per liter) was prepd. One ml of the dispersion and 10 ml of dye soln. (contg. 6.6 × 10^{-5} *M* pure dyes) were mixed and left overnight. Acid dyes were absorbed only slightly or not at all, but many substantive dyes were completely pptd. In general, a dye reacted with $CaCO_3$ if it contained (1) a nucleus with 2 attached amino groups but without a sulfo group, (2) an aromatic nucleus with 2 OH groups, or (3) a naphthol nucleus with an amino group.

9660. Parkinson, D. **The reinforcement of rubber by carbon black.** *Brit. J. Applied Phys.* 2, 273-80(1951).—*C.A.* 46, 1281*i*.

9661. Pasch, B. Richard and Kluge, Karl Heinz. **The causes of floating of paint pigments.** *Farbe u. Lack* 57, 243-4(1951).—*C.A.* 45, 7799*f*.

Various ZnO whites (NT, GM2, WS, GS, RS) and a lithopone (RS), 25%, black Fe oxide, 2.3%, Signal blue, 0.6%, and yellow Fe oxide, 0.1%, were ground in a vehicle made by heating Alkydal TO and linseed oil standoil 30 min. at 260°C, reducing with mineral spirits, and adding a Pb-Mn Soligen drier. Panels dipped in these rust-protection paints showed medium to considerable floating of unwetted ZnO, and streak formation, increasing with decreasing quality of the pigments. Chrome yellow-milori blue caused only a blue floating effect. Turkey red oil and Silicone oil AL eliminated the floating.

9662. Rabinowicz, E. **An investigation of surface damage with radioactive metals.** *Phys. of Lubrication, Brit. J. Applied Phys.*, Suppl. 1, 82-5(1951).—*C.A.* 45, 4915*i*.

Exptl. autoradiographical data reported showed that when a radioactive metal hemisphere slid over a nonradioactive metal surface, metal transfer took place in the form of discrete fragments and that well-lubricated surfaces gave less transfer than clear surfaces by factors of 400 or more. On heating well-lubricated surfaces, both the coeff. of friction and the amt. of metal transfer increased markedly at the m.p. of the surface film. The metal transfer, however, in contrast to the friction, was sensitive also to temp. change below the surface film's m.p.

9663. Rehner, John Jr. **Thermodynamics and mechanics of filler reinforcement.** *J. Polymer Sci.* 7, 519-36(1951).—*C.A.* 46, 1281*i*.

The reinforcement energy was regarded as a neg. measure of reinforcement, and its component terms (elastic and surface energies) were estd. With very active fillers, e.g., carbon blacks in natural rubber, the surface energy term was dominant. The elastic energy term may become dominant with inert fillers.

9664. Riedel, C. Martin. **Chemicals stop Coffer Dam leaks.** *Civil Eng.* 21, No. 4, 23-4(1951). —*C.A.* 45, 10540*d*.

The silicic gel produced by injection of water glass and $CaCl_2$ soln. cemented the soil into a soft sandstone impervious to water even under considerable hydrostatic head and with a bearing strength up to 50 tons/ft^2.

9665. Savage, Robert H. **Physically and chemically adsorbed films in the lubrication of graphite sliding contacts.** *Ann. N.Y. Acad. Sci.* 53, 862-9(1951).—*C.A.* 46, 2876*a*.

The friction of clean graphite in a vacuum was high. The chief requirement for lubrication was a "separating mol." which was physically adsorbed on a C atom. O_2 increased the attraction for H_2O on graphite so that the H_2O mol. could be used more efficiently.

9666. Schmidt, Ernst. **Effect of colloidal noncarbon pigments on elastomer properties.** *Ind. Eng. Chem.* 43, 679-83(1951).—*C.A.* 45, 6410*h*.

Colloidal SnO_2, SiO_2, ferric ferro-cyanide, polystyrene, and casein in GR-S were studied. These were added as colloidal solns. to GR-S latex, and the mixts. were dried. All increased the strain modulus and tensile strength to different degrees. Colloidal SnO_2 gave the highest tensile strength and modulus values, and these exceeded the values obtained with an equal vol. loading of EPC black. The best results with colloidal pigments should be obtained with stable colloidal solns. of substances which carry elec. charges of the same sign as those of the latex and which contain small amts. of electrolyte.

9667. Smith, W. R. **The behavior of carbon black in rubber and plastics.** *India Rubber World* 125, 325-6(1951).—*C.A.* 46, 4262*i*.

9668. Staudacher, Hans. **The prevention of sediment in paints.** *Deut. Farben-Z.* 5, 381-3 (1951).—*C.A.* 46, 1775*e*.

The sedimentation of certain paints was studied by placing them in test tubes filled 14 cm high, and testing the consistency of the sediment from time to time with a needle ending in a disk-shaped head. A paint made from 67 parts limed rosin soln. (70 parts in 50 parts of mineral spirits) and 33 parts Fe_2O_3-$BaSO_4$ showed slight sedimentation. This was inhibited by wetting the pigment with 10 parts BuOH before adding the limed rosin; the further addn. of 2 parts Aco-Netzmittel 457 to the BuOH made the sedimentation worse. Colloidal silica (Aerosil) ground in mineral spirits (10/70) stabilized a paint made from mineral spirits and Fe_2O_3-$BaSO_4$ pigment if BuOH was used to wet the pigments, but not when mineral spirits were used instead. Polar additives in the right proportion will inhibit sedimentation, and were best used to wet the pigments and inerts before adding vehicles.

9669. Stearns, R. S. and Johnson, B. L. **Interaction between carbon black and polymer in cured elastomers.** *Ind. Eng. Chem.* 43, 146-54 (1951).—*C.A.* 45, 4079*c*.

The thermodynamic changes assocd. with the extension and retraction of unloaded and loaded vulcanizates were described. The thermodynamic changes assocd. with deformation showed that phys. adsorption of the van der Waal type at the interface of polymer and pigment was inadequate to account for the exptl. observations. On the other hand, if chem. bonding took place at the interface of polymer and pigment, it was possible to derive a relation between the entropy of deformation and the extent of the bonding. It was then proved experimentally by a calorimetric method that the surface of a carbon black contained sites which reacted with Br_2 with liberation of the same amt. of heat as do olefins of low mol. wt.

9670. Stokes, C. A. **Fuel aspects of carbon black manufacture.** *J. Inst. Fuel* 24, 90(1951). —*C.A.* 45, 4429*f*.

The mechanism of the formation of carbon black was reviewed; this involved the cracking and polymerization and (or) condensation of hydrocarbons or of org. compds. contg. a large proportion of H and C, the reaction being carried out in the vapor phase; the growth of the particle must occur on a gas-suspended nucleus. With the increasing cost of natural gas, the U.S. was changing over to liquid hydrocarbons as the raw material. The best raw material was of a highly aromatic nature, especially when modern high-structure carbon blacks are to be produced.

9671. Thirion, P. and Chasset, R. **Application of the measurement of the dielectric constant and loss angle to the study of the structure of vulcanizates loaded with carbon blacks.** *Trans. Inst. Rubber Ind.* 27, 364-81(1951).—*C.A.* 46, 3316*f*.

The dielec. loss angles as a function of temp. of vulcanizates contg. carbon blacks made possible differentiation of the Debye type of absorption in the rubber matrix from a supplementary absorption which was influenced only slightly by the temp. and frequency and which was characteristic of carbon blacks possessing definite structures. The exptl. results indicated no differences, either in the chem. or phys. state, between the matrix occupying the space between the particles of carbon black in a loaded vulcanizate and the vulcanizate of the corresponding unloaded base mixt. Dielec. absorption should be of value as a nondestructive test to reveal the colloidal structure of rubber mixts. contg. carbon black.

9672. Voyutskiĭ, S. S.; Zaĭonchkovskiĭ, A. D.; Kargin, V. A., and Rubina, S. I. **Structures in lampblack suspensions.** *Doklady Akad. Nauk S.S.S.R.* 76, 419-22(1951).—*C.A.* 45, 6009*h*.

Suspensions of 5% lampblack in a mineral oil with no observable elec. cond., placed in a rotating viscometer, showed in the direction perpendicular to that of the flow, an elec. cond. λ decreasing with increasing velocity gradient g, and falling, at about $g = 1$ sec^{-1}, to a very low value, but still readily observable. When measured 1 min. after cessation of the flow, λ was in all cases several times as high as when measured during the flow; this, of course, indicated restoration of the structure at rest. An analogous behavior, during the flow and after its cessation, was observed in the direction parallel to the flow. Consequently, the lampblack particles must have a shape close to spherical, since for rod-shaped particles λ ought to increase with increasing g.

9673. Voyutskiĭ, S. S.; Zaĭonchkovskiĭ, A. D.; Kargin, V. A., and Rubina, S. I. **Structure in soot suspensions. I. Effect of the rate of flow, time, temperature, and soot concentration on the structure of soot suspensions.** *Kolloid. Zhur.* 13, 333-8(1951).—*C.A.* 46, 2376*a*.

A carbon suspension in mineral oil was confined between a resting internal cylinder and a rotating external cylinder. The elec. cond. k of the suspension was detd. either between these cylinders (i.e. across the direction of flow, k_1) or between 2 points on the internal cylinder, i.e. along the flow (k_2). Both k_1 and k_2 decreased when the rate of shear (τ) increased; this showed that the particles were nearly equal in size in all directions. At the highest used τ (5-7 sec^{-1}), k_1 and k_2 became independent of τ without declining to zero; this showed that either the structure was not destroyed at τ as high as 7 sec.$^{-1}$ or k is > 0 also in the absence of a structure. The relation between k and τ was identical, whether τ was increasing or decreasing. The cond. method of studying suspensions had the advantage of being nondestructive.

9674. Wolf, Ralph F. and Gage, F. W. **Compounding of Butyl rubber with fine-particle silica.** *India Rubber World* 123, 565-9(1951).—*C.A.* 45, 6415*d*.

Hi-Sil (hydrated silica) was the first filler which was found to give Butyl vulcanizates which had better phys. properties than those contg. semireinforcing furnace blacks and which, at the same time, could be processed satisfactorily. Graphs and tables showed representative results with different proportions of Hi-Sil, various accelerators, different temps. of cure, and different types of Butyl rubber.

9675. Wolf, Ralph F.; Hall, Geo. E. Jr., and Bachmann, John H. **Color reactions between silica pigments and certain accelerators and antioxidants.** *Rubber Age* (N.Y.). 69, 55-6, 104(1951).—*C.A.* 45, 6384*i*.

The discovery that clays gave color reactions with many amines had an analogy in the behavior of Hi-Sil (com. hydrated silica) and Silene-EF (Ca silicate) with certain accelerators and antioxidants. These color reactions were important because, in formulating white rubber mixts. contg. either silicate, accelerators and antioxidants which gave such color reactions must be avoided. The color reactions obtained with various important accelerators and antioxidants were described. These colors may result from reactions between the accelerator or antioxidant and O_2 adsorbed.

9676. Bowden, F. P. and Tabor, D. **The influence of surface films on the friction and deformation of surfaces.** *Symposium on Properties of Metallic Surfaces* (Inst. Metals, London) **1952**, 197-212.—*C.A.* 47, 2570*h*.

In the absence of all contaminating films, gross seizure occurred and sliding was impossible. The smallest quantities of gases or vapors greatly reduced the interaction. This decrease was partly due to chemisorbed films and partly to van der Waals adsorption. Similar, though less marked, effects were observed with nonmetals. The physically adsorbed films were only one or two mol. layers in thickness, and the heavier adsorption often observed with water was due to the presence of hygroscopic impurities on the surfaces. The friction and surface damage of inert metals immersed in an electrolyte may be greatly affected by small changes in the interfacial potential. The oxide film normally present on most metal surfaces can also provide considerable protection.

9677. Bowden, F. P.; Young, J. E., and Rowe, G. **Friction of diamond, graphite, and carbon: the influence of adsorbed films.** *Proc. Roy. Soc.* (London) A212, 485-8(1952).—*C.A.* 46, 8462*g*.

The mechanism of friction for nonmetallic solids was generally similar to that proposed for metals.

9678. Braendle, H. A. **The role of heat in the carbon black reinforcement of rubber. II. Carbon black dispersion and heat in factory processing for optimum reinforcement.** *Rubber Age* (N.Y.) 72, 205-10(1952); *Can. Chem. Processing* 37, No. 1 76-7(1953).—*C.A.* 47, 903*h*. 7247*b*.

Exptl. evidence showed that uniform particle dispersion of carbon black in rubber did not give the best mech. properties, e.g., resistance to abrasion, to a vulcanizate, and that hot mixing was extremely effective in obtaining the best ultimate quality, i.e., toughness, wear, and resilience.

9679. British Standards Inst. **Black (carbon) pigments for paints.** *Brit. Standards* **284, 285, 286**: 1952, 15 pp., 2s.—*C.A.* 46, 9319*e*.

Standards were given for carbon black, bone black, and lamp (vegetable) black. These specified residue on sieve, oil-absorption value, color, tone and staining power, loss in wt. at 100-105°C, ash, ether ext., and matter sol. in water.

9680. Buzágh, A. **Relation between adhesion and stability of disperse systems.** *Kolloid-Z.* 125, 14-21(1952).—*C.A.* 46, 6462*h*.

The adhesion of homodisperse quartz suspensions was measured by the parting angle (adhesion no.) method, dependent on particle size. The sp. adhesion of electrically charged quartz particles went through a min.-max. curve as the particle size increased. With isoelec. quartz, only a max. with a steeply descending branch was obtained. The coagulating effect of $BaCl_2$ on homodisperse quartz suspensions varied with the colloid particle size, and went through a min. value, below which the particles exhibited Brownian movement.

9681. Chodkiewicz, S. A. **Purification of potassium nitrate process liquors: comparison between the filtration, froth flotation, and sedimentation of insolubles.** *J. Appl. Chem.* (London) 2, 639-41(1952).—*C.A.* 47, 4562*c*.

The removal of impurities from KNO_3 process liquor after reaction of $NaNO_3$ and KCl was investigated. Filtration through a sand filter and a filter press did not prove feasible because impurities plugged the filter. Froth flotation and sedimentation proved satisfactory, although the former method did not remove grit and the latter left impurities that floated. In flotation a good sepn. was achieved after treating liquor with K oleate and Turkey red oil.

9682. Collyer, Harry J. **Additional aspects of British carbon black technology.** *Rubber Age & Synthetics* 33, 121-4(1952).—*C.A.* 46, 11742*g*.

Raw materials, the processes for making different types of carbon black, and their behavior in rubber were described.

9683. Compagnon, Patrice and Liponski, Maurice. **The preparation of a natural rubber-carbon black master batch.** *Rev. gén. caoutchouc* 29, 272-5(1952).—*C.A.* 46, 6422*h*.

The prepn. of natural rubber-carbon black master batches directly from latex were extended to channel blacks. The carbon black dispersions were prepd. both by a purely mech. process and with the aid of a dispersing agent such as Darvan. No difficulties were encountered in the incorporation of the carbon blacks in the latex, in coagulation, or in the drying process. In general, the prepn. of master batches from latex offered several advantages: preservation of a large proportion of the natural accelerators in the latex, less loss of carbon black, saving of time in mixing, and more rapid vulcanization.

9684. Dannenberg, E. M. **Carbon black dispersion and reinforcement.** *Ind. Eng. Chem.* 44, 813-18(1952).—*C.A.* 46, 10671*b*.

The degree of dispersion of carbon black in natural rubber, GR-S, Butyl, nitrile rubber, and Neoprene was controlled by the speed of the Banbury mixer and the time. Elec. resistivity detns. and electron-microscope studies indicated large differences in the degree of dispersion. Losses by abrasion and other phys. properties showed that, in some cases, poor dispersion resulted in relatively poor reinforcement. When the reinforcement was very poor, large unwetted aggregates of carbon black were visible before vulcanization. Virtually complete reinforcement was attained at a min. point of mixing, although, judged by elec. resistivity, the degree of dispersion would be regarded as poor.

9685. Dogadkin, B. A.; Pechkovskaya, K., and Mil'man, Ts. **Structure and properties of loaded rubber mixtures. X. Alteration of the carbon structures by heat treatment.** *Kolloid Zhur.* 14, 346-56(1952).—*C.A.* 47, 1964*c*.

The vulcanized mixts. contained 6 parts carbon black per 10 parts rubber. From 20° to 100°C, the elec. resistivity $\rho = \rho_0 \exp(\alpha t)$ (t is temp.); α is detd. by the black rather than by the rubber. The above equation was invalid when ρ was detd. on samples extended to double length. The tensile strength of rubbers filled with channel black decreased on heating (up to 80°C) less than in the presence of other blacks. Short heating at 100°C or long (>10 hr) heating at 60°C caused partial destruction of the structures.

9686. Drucker, C. **Gas friction and adsorption.** *Acta. Chem. Scand.* 6, 671-77(1952)(in German). —*C.A.* 47, 1989*f*.

The coeff. of friction for N_2, H_2, and their mixts., both dry and moist, was shown to be larger when the gas flowed through a capillary tube than when it flowed through a fritted-glass plate. A qual. interpretation was given on the basis that the layer of gas adsorbed at the walls increased the friction at the boundary of this layer above that in the inner part of the gas mass.

9687. Esposito Vitolo, A. and Fornari, A. **Characterization of inks from the standpoint of criminology. II. Chromatographic analysis.** *Minerva medicolegale e arch. antropol. criminale* 72, 59-62(1952).—*C.A.* 47, 5844*h*.

Chromatographic characteristics were given for 30 ink samples, the colors tabulated being referred to "Code universel des couleurs" by Seguy; the results of examn. in ultraviolet light in zones of the absorption column were also listed.

9688. Falk, Hans L. and Steiner, Paul E. **The identification of aromatic polycyclic hydrocarbons in carbon blacks.** *Cancer Research* 12, 30-9(1952).—*C.A.* 46, 8831*h*.

Benzene exts. of some carbon blacks contained the strong carcinogen 3,4-benzopyrene, the weak carcinogen 1,2-benzopyrene, and pyrene, fluoranthene, 1,12-benzoperylene, anthanthrene, and coronene. Furnace blacks, with an av. particle diam. of 80 mμ or more, possessed all 7 of these aromatic hydrocarbons; blacks with particle size below 50 had few or none. These hydrocarbons were not detected in any channel blacks, which had particle diam. of 10-30 mμ, and were made by a different process. Soot itself appears to be carcinogenic on skin but possibly not on respiratory tract epithelium.

9689. Feng, I-Ming. **Lubricating properties of molybdenum disulfide.** *Lubrication Eng.* 8, 285(1952).—*C.A.* 47, 1451*h*.

The lubricating ability of MoS_2 was related to its crystal structure. It was shown by electron microscopy to have a laminar structure similar to graphite. Coeffs. of sliding friction of MoS_2 in thin films and in compressed pellets were detd. to be about 0.20. X-ray results for thin rubbed films showed oriented laminas, the orientation increasing with rubbing pressure.

9690. Ford, F.P. and Gessler, A.M. **Some properties of Butyl rubber-carbon black systems.** *Ind. Eng. Chem.* 44, 819-24 (1952).—*C.A.* 46, 10666*h*.

Butyl rubber mixts. contg. different types of carbon black were studied before and after vulcanization. With the raw mixts., the processing of the mixts. when the carbon black was dispersed to different degrees was studied. The degree of dispersion was detd. by photometry of dil. suspensions, by plastometry, and by electron microscopy, and the effects of the degree of dispersion were judged by extrusion and calendering. The effects of aging, temp., pressure, and mech. dispersion were evaluated.

9691. Ford, F.P. and Mottlau, A.Y. **The dispersion of SRF carbon black in Butyl rubber.** *Rubber Age* (N.Y.) 70, 457-63(1952).—*C.A.* 46, 3790*e*.

Large differences in the degree of agglomeration of carbon black were found, and these micrographs and light-transmission measurements of dil. solns. of the elastomer mixts. in heptane showed good correlation. The differences in degree of dispersion were reflected in the phys. properties of the unvulcanized mixts., and, consequently, in processing behavior, as evidenced by differences in viscosity (measured by the parallel-plate plastometer).

9692. Godfrey, Douglas and Bisson, Edmond E. **Bonding of molybdenum disulfide to various materials to form a solid lubricating film. I. The bonding mechanism.** *Natl. Advisory Committee Aeronaut.*, **Tech. Note** No. 2628, 16 pp. (1952).—*C.A.* 46, 5303*a*.

Air drying and heating of a mixt. of MoS_2 powder and some liquid vehicles caused the decompn. and polymerization of the vehicles. The resin product bound the particles of MoS_2 together and to the surface to be lubricated. MoS_2 was bonded to steel, Al, brass, stainless steel, and glass by the use of vehicles such as asphalt-base varnish, silicones, glycerol, ethylene glycol, polyglycol ether, and corn sirup but not by the use of a light petr. oil vehicle. The reduction of Fe_2O_3, formed by preheating steel in air, to Fe_3O_4 by corn sirup improved the lubricating properties of the solid film.

9693. Godfrey, Douglas and Bisson, Edmond E. **Bonding of molybdenum disulfide to various materials to form a solid lubricating film. II. Friction and endurance characteristics of films bonded by practical methods.** *Natl. Advisory Committee Aeronaut.*, Tech. Note, No. **2802**, 16 pp.(1952).—*C.A.* 47, 2469*e*.

MoS_2 could be bonded to metal with resin-forming liquid vehicles. For bonding thinned asphalt-base varnish, silicon varnish and glycerol were recommended; they gave just as satisfactory results as corn sirup. Application by brushing was followed by air drying, infrared drying, and oven curing. Bonding did not depend on any special surface finish. Friction and endurance tests showed excellent lubricating qualities of films 0.0002-0.0005 in. thick. At low sliding speeds asphalt-varnish bonded films were somewhat inferior.

9694. Gustavson, K.H. **Physicochemical studies of extremely basic chromic chlorides.** *J. Am. Leather Chemists' Assoc.* 47, 151-65 (1952).—*C.A.* 46, 10801*c*.

A soln. of strongly basic (31% acid) Cr chloride of formula $Cr_2(OH)_4Cl_2.2NaCl$ was prepd. by boiling hydrous Cr_2O_3 with HCl, adding NaOH, and again boiling. Analysis by means of 5 different sulfonic acid-type cation exchangers showed 30% of the total Cr to exist as cationic complexes forming salts of 67% av. acidity, corresponding to $Cr_2(OH)_2Cl_4$. The remainder of the Cr consisted of uncharged complexes of 15-18% acidity, corresponding to $[Cr_2(OH)_5Cl]$. Operation of the exchangers in the Na- or H-cycles gave identical results with the aged, boiled solns., but with freshly prepd., unheated solns. the Na-cycle gave higher values for noncationic Cr. All the Cr migrated as complexes of different mobility. The presence of uncharged, nonmigrating complexes, in addn. to cationic complexes of greater mobility, was shown by paper electrophoresis.

9695. Gwathmey, A.T.; Leidheiser, H. Jr., and Smith, G.P. **Friction and cohesion between single crystals of copper.** *Proc. Roy. Soc.* (London) A212, 464-7(1952).—*C.A.* 46, 8447*h*.

Friction and adhesion expts. were made between 2 large crystals of Cu of controlled orientation from the surface of which all oxide had been removed. One crystal was in the form of a sphere and the other was a sphere with 2 flat surfaces cut parallel to particular planes. The coeff. of dry static friction between two (100) faces was greater than 100 and between (111) faces was approx. 25. The greater value for the (100) faces was attributed to the greater digging-in and the increased area of contact produced by slip as displacement occurred.

9696. Hill, L.M. **Kubelka water absorption and free water determinations on vegetable-tanned sole leathers.** *J. Soc Leather Trades' Chemists* 36, 365-75(1952).—*C.A.* 47, 900*i*.

Free water and water absorption were detd. on 7 2-in. squares cut from a 7-in. × 7-in. square taken from the shoulder-belly corner of each of 22 sole leather bends of satisfactory quality. Analysis of variance showed that variability between bends was much greater than variability between squares from the same bend. The squares farthest removed from the shoulder-belly corner gave slightly lower values than others.

9697. Hirst, W.; Kerridge, M., and Lancaster, J.K. **Variation with load of the coefficient of friction and metallic transfer under con-**

ditions of boundary lubrication. *Proc. Roy. Soc.* (London) **A212**, 516-19(1952).—*C.A.* **46**, 8839*h*.

Data were reported for Cu surfaces, lubricated with 1 and 5 monolayers of stearic acid.

9698. HOUWINK, R. **The reinforcement of rubbers.** *Rev. gén. caoutchouc* **29**, 346-53 (1952).—*C.A.* **46**, 7808*c*.

Dispersion of a filler in a polymer and adhesion between the filler and polymer was easy if heat of wetting was evolved. When a sufficient proportion of solvent was added, the polymer mols. glide through the layers of solvent mols., which thereby act as a plasticizing agent. The adsorptive or reactive power of the surface of most filler particles was not evenly distributed over the surface because of chem. constitution and stereo conditions on the surface. Although some evidence indicated the formation of chem. bonds between polymer and filler, the major part of the reinforcing effect was attributable to van der Waal's forces, the energy spectrum of which depended on the chem. and stereo conditions of the filler surface.

9699. KILCHER, H. **Paper chromatography and tannins.** *J. Soc. Leather Trades' Chemists*, **36**, 331-5(1952).—*C.A.* **47**, 3017*f*.

Solns. (5% aq.) of various tannin exts. were examd. by the Rutter disc technique with 40 and 80% AcOH as the mobile phase. Under ultraviolet light each tannin gave characteristic zones of well-defined R_f values and colors. A grouping of tannins according to their fluorescence colors was proposed. Quebracho, oak wood, wattle bark, and tizera gave predominantly green fluorescence, while chestnut, oak bark, valonea, sumac, myrabolans, and Chinese and Aleppo galls gave mainly violet.

9700. KIRBY, K.S.; KNOWLES, E., AND WHITE, T. **Tannins. III. Fractionation of mimosa extract.** *J. Soc. Leather Trades' Chemists* **36**, 45-59 (1952).—*C.A.* **46**, 9877*b*.

Mimosa (wattle) tannin ext. and the fractions obtained by solvent extn. and by countercurrent distribution in immiscible solvents were examd. by 2-way chromatography. The papers, sprayed with ammoniacal $AgNO_3$ and bis-diazotized benzidene, showed the presence of 27 different polyphenolic substances. Examn. under ultraviolet light before and after exposure to NH_3 vapor showed the presence of 10 fluorescent substances most of which were in addn. to those shown by spraying. No one fraction contained less than 2 nor more than 11 substances.

9701. KIRCHHOF, F. **Technical carbon blacks and their use in the rubber industry. I. II. III.** *Gummi u. Asbest* **5**, 218-21, 306-8, 347-8, 350 (1952).—*C.A.* **46**, 11750*d*.

The history of carbon blacks, raw materials used in their manuf. and the characteristics of different types of carbon blacks were described, with diagrams of equipment. Phys. testing methods for detg. some of the properties of carbon blacks and the current classification of different types of carbon blacks were given. The properties imparted to various rubber products and to some plastics by different types of carbon black were described.

9702. KLING, W. AND LANGE, H. **Electrophoretic behavior of pigment particles in detergent solutions.** *Kolloid-Z.* **127**, 19-27 (1952).—*C.A.* **46**, 8932*c*.

Electrophoretic data showed that the neg. ζ-potentials of lampblack, Fe_2O_3, and powd. lignite in H_2O were raised considerably by anion-active detergents (Na dodecyl sulfate, K laurate, Na alkylbenzenesulfonate). In 0.02 N Na_2CO_3, which raised the mobilities in the absence of detergents, further increase in mobility was produced by K laurate only above 0.01 M in the case of Fe_2O_3. Nonionic detergents (polyethylene oxide products) lowered mobilities, especially in the presence of salt, and eventually to discharge the particles. Dodecylpyridinium chloride also caused discharge at concns. of $6 \times 10^{-5} M$ (for lampblack) and $6 \times 10^{-4} M$ (for Fe_2O_3). In detergent solns. added salts had very little effect on the mobility of Fe_2O_3.

9703. KOLTHOFF, I.M. AND GUTMACHER, R.G. **Sorption of GR-S type of polymer on carbon black. III. Sorption by commercial blacks.** *J. Phys. Chem.* **56**, 740-5(1952); *Rubber Chem. & Technol.* **26**, 102-14 (1953).—*C.A.* **46**, 9880*f*; **47**, 6169*b*.

A study of the sorption capacities toward GR-S of 5 com. types of carbon black was made to det. the influence of (1) nature of the carbon black; (2) solvent effect; (3) previous recent history of the carbon black; (4) degree of unsatn. of GR-S; (5) mol. wt of GR-S; and (6) shaking time. For the sorption capacities of the carbon black in decreasing order were Spheron-6, Vulcan-1, Philblack-O, Sterling-105, and Philblack-A. For sorption of GR-S by Vulcan-1, sorption increased with decreasing solvent power.

9704. KUZ'MINSKIĬ, A.S.; LYUBCHANSKAYA, L.I.; KHITROVA, N.G., AND BASS, S.I. **Effect of carbon black on the development of oxidation processes in crude and vulcanized rubbers.** *Doklady Akad. Nauk S.S.S.R.* **82**, 131-3 (1952).—*C.A.* **47**, 4641*g*.

Carbon black had an inhibiting action on oxidation of Na-butadiene rubber because of the decompn of both stable peroxides of rubber and peroxide radicals on its surface. This inhibiting action of carbon black was more pronounced during free (autocatalytic) than during inhibited oxidation. A portion of the inhibitor was sorbed and held firmly on the surface; this eliminated the influence of the inhibitor on the oxidation process.

9705. MANOV, G.G. AND BIZZELL, OSCAR M. **Radioisotopes in paint technology.** *Paint Technol.* **17**, 241-51(1952).—*C.A.* **46**, 10636*i*.

Possible uses of radioisotopes in the protective coatings industries included methods for detg. film continuity and uniformity, film thickness, wear resistance, optimum mixing times, adsorption, diffusion through films, cleanliness of metals, permanency of plasticizers, mechanism of corrosion, and mechanism of drier action. Pile-produced isotopes showed promise as activators in luminous paints.

9706. McKinney, John E. and Roth, Frank L. **Carbon black differentiation by electrical resistance of vulcanizates.** *Ind. Eng. Chem.* 44, 159-63(1952).—*C.A.* 46, 4835*c*.

The resistivity of vulcanizates contg. carbon blacks was affected considerably by flexing, but by avoiding flexing after vulcanization and before testing, the variation coeff. of the resistivity of identical vulcanizates prepd. on different days was approx. 10%. The resistivity decreased with increase in the time of vulcanization rapidly during the undercured stage and slowly during the overcured range. For states of cure where strain tests could be made, the resistivity decreased with the time of vulcanization in accordance with the equation: $(R - R_0)(t - t_0) = 1/b$, which is of the same form as that relating strain and time of vulcanization. Elec. resistivity could be used as a criterion for differentiating between different types of carbon blacks and for detecting differences between different lots of the same type.

9707. Parker, C.A. **Chromatography of rubber accelerators and antioxidants on silica gel.** *Nature* 170, 539-40(1952).—*C.A.* 47, 2528*e*.

Celite allowed chromatographic adsorption of some compds. from acetone exts. of vulcanized rubbers without the destruction of labile compds., as occurred when Al_2O_3 columns were used. Portions of the ext. corresponding to 0.2-0.4 g of rubber were chromatographed on a column 1 cm in diam. The positions of the zones were found by streaking the extruded columns with appropriate reagents. As little as 0.05 mg of most compds. could be detected.

9708. Parker, C.A. and Berriman, Joyce M. **Chromatographic analysis of vulcanized rubbers. Some rapid methods for the detection of certain accelerators and antioxidants.** *Trans. Inst. Rubber Ind.* 28, 279-96 (1952).—*C.A.* 47, 3602*e*.

The chromatographic behavior of 32 com. accelerators and antioxidants on silica gel-Celite adsorbent was studied. The compds. were extd. from the rubber mixts. by hot acetone, the exts. were freed completely of acetone, and solns. for chromatographing were prepd. from the residues by soln. in methylene chloride or CCl_4. Adsorption series were established with 4 binary solvent mixts., and, based on the results, some simple and rapid methods were developed for the identification of the different compds. Different streak reagents were used on the extruded chromatographic column, and with many of the compds. studied, the reagents, in conjunction with the positions of developed zones gave almost unambiguous identification.

9709. Paulson, C.F. **Profits from wastes.** *Industry and Power* 62, 83-84 (1952).

The use of a strongly acidic cation exchanger to purify chromic acid anodizing solns. and a strongly basic anion exchanger to recover chromate from dil. rinse solns. was considered. A process was described which was claimed to be operating on a commercial scale. The advantages over previously employed methods of treating chromate solns. were outlined. Some cost figures and a flow diagram of a chromate recovery system were included.

9710. Pechkovskaya, K.; Mil'man, Ts., and Dogadkin, B. **Structure and properties of loaded rubber mixtures. IX. Alteration of the carbon structures by repeated deformations.** *Kolloid. Zhur.* 14, 250-9(1952).—*C.A.* 46, 9879*i*.

In vulcanized rubber contg. carbon black, the elec. c.d. $i = V^n/pl$, where l was the distance between the electrodes and V the voltage. The resistivity p was an inverse measure of the extent of structure formation by carbon black, and n was greater the more numerous the rubber interstices between the black particles. When rapid extensions and contractions were repeated, p became an almost definite function of the length of the specimen, decreasing when the length increased. After 360,000 extensions and contractions carried out within 12 hrs, p increased 5- to 50-fold, depending on the type of rubber.

9711. Phender, Max. **A simple method for testing lubricants by boundary friction.** *Erdöl u. Kohle* 5, 342-8 (1952).—*C.A.* 46, 8839*f*.

Small test pieces of soft lead were compressed between two parallel planes to which the lubricant was applied. Two forces opposed the force of compression, a force resisting deformation and a radial force resisting the sliding motion on the two planes. The load was applied at a const. rate up to a P max. = 2000 kg. Values for mean surface pressure at P = 2000 kg., mean friction, and lubricating values were given for various soaps, NaOH, mineral oils, rapeseed oil, and tallow.

9712. Popp, G.E. and Harbison, Lynn. **Ozone and sunlight effect on aging of carbon black vulcanizates.** *Ind. Eng. Chem.* 44, 837-40 (1952). —*C.A.* 46, 10668*e*.

Natural rubber-carbon black vulcanizates and GR-S (low-temp. polymer)- carbon black vulcanizates contg. and not contg. an antioxidant were exposed to sunlight and to atm. O_3, resp. Germicidal lamps in a special cabinet were utilized for the O_3 tests; the sunlight tests were in the spring in Ohio. Two series of specimens were exposed: (1) elongated 100% and (2) bent 180°. Deterioration by sunlight or O_3 did not differ with the type, particle size, structure, and phys. properties of carbon black.

9713. Ratner, S.B. **The law of static friction.** *Doklady Akad. Nauk S.S.S.R.* 83, 443-6 (1952).—*C.A.* 46, 8462*d*.

Exptl. detns. of the friction coeff. μ defined by $F = \mu N$ (where F = friction force, N = force applied in pressing one solid against the other), for different resins on steel, and Al alloy, and on plexiglas, showed a linear increase of μ as a function of $1/N$. The data could be represented by $\mu = a + (b/N)$.

9714. Ratner, S.B. and Sokol'skaya, V.D. **Effect of fillers on the coefficient of static friction of resins.** *Doklady Akad. Nauk S.S.S.R.* 86, 121-4(1952).—*C.A.* 47, 1971*c*.

The dependence of the friction coeff. μ on the stress N, of the form $\mu = \mu_\infty + (A/N)$, was verified for resins contg. 10, 45, and 60% carbon black, on Plexiglas, steel, and an Al alloy. The const. A increased with decreasing amt. of filler but was independent of the nature of the support. This meant that the adhesion of the resin to the solid surface was detd. essentially by the hardness of the softer component, i.e. of the resin, and that was detd. by the amt. of filler. The value of μ_∞ was independent of the amt. of filler, but did vary with the nature of the support. Graphite had the same effect as other fillers, but some lowering of μ_∞ was found with sufficiently large amts. of graphite.

9715. RESEN, F. LAWRENCE. **New carbon-black plant completes shakedown run.** *Oil and Gas J.* 50, No. 41, 114, 116(1952).—*C.A.* 46, 4206*b*.

The new carbon-black plant of the Continental Oil Black Co., located at Lake Charles, La., was currently producing high-abrasion carbon-black.

9716. ROUX, D.G. **The fractionation and paper chromatography of black wattle extract.** *J. Soc. Leather Trades' Chemists* 36, 274-84 (1952). —*C.A.* 47, 3017*h*.

Black wattle ext. was fractionated to yield gums, sugars, and polyphenolic tannins, by the following method: A 10% aq. soln. was treated with an equal vol. of EtOH to ppt. gums. These remained stationary both on one- and 2-dimensional chromatograms, with water a minor proportion of the developing agent. One-dimensional chromatograms of the sugars showed the presence of sucrose, glucose, and fructose. One-dimensional paper chromatography of polyphenolic tannins showed small amts. of 3 fluorescent materials, one of which was identified as fisetin.

9717. SCHULZ, E.F. **An improved water extraction test for polyvinyl chloride elastomers.** *ASTM Bull.* No. 183, 75-8(1952).—*C.A.* 46, 9885*b*.

Because of the low water soly. of the plasticizers in vinyl sheeting, large amts. of fresh water must be used in the extn. test. Adding activated carbon to the water prevented satn., and permitted a test with a limited amt. of extractant. The percentage water extn. decreased with increasing specimen thickness, but increased with test temp. and plasticizers concn.

9718. SHEEHAN, G.M.; KRAUS, GERARD, AND CONCIATORI, A.B. **Carbon-black flocculation in rubber-to-metal cements.** *Ind. Eng. Chem.* 44, 580-2 (1952). —*C.A.* 46, 5353*c*.

Vulcanizable GR-S mixts. contg. different loadings of carbon black were used. Milling the individual ingredients and xylene in a ball mill gave strong bonds between rubber and brass and between rubber and steel covered with chlorinated rubber, chlorinated polyisoprene, and butadiene-methacrylic acid copolymer, resp., were obtained. Rupture was entirely in the rubber or at the rubber cement interface. For a given loading, acidic carbon blacks gave the strongest bonds. Under all the conditions studied, adhesion was ascribed either to covalent bonds or to H-bonds.

9719. STUDEBAKER, MERTON L. **The relationship between the modulus of reinforced rubber compounds and the physical properties of various carbon blacks.** *India Rubber World* 127, 215-19, 225(1952).—*C.A.* 47, 1419*h*.

The more strongly hydrophobic a carbon black was the greater was the force of attraction between a given area of carbon black surface and the rubber in which it was dispersed. The carbon to-rubber forces per unit surface were greatest on carbon blacks contg. the highest percentage of H and lowest percentage of O. Probably both phys. and chem. forces play active parts in the reinforcement of rubber by carbon black.

9720. SWAMINATHAN, V.S. **Large carbon-black plant now operating in Britain.** *Petroleum Refiner* 31, No. 1, 124-5(1952).—*C.A.* 46, 2782*e*.

The Philblack Ltd. carbon-black plant near Bristol was in operation. This plant will produce 30 million lb per yr of medium-abrasion furnace (A) black 20 and high-abrasion furnace (O) type from 70,000 tons a yr of a special petroleum fraction obtained in the U.S.

9721. SWEITZER, C.W. **The role of heat in the carbon-black reinforcement of rubber. I. The carbon gel complex in reinforcement.** *Rubber Age* (N.Y.) 72, 55-63 (1952); *Can. Chem. Processing* 36, No. 12, 94-9 (1952).—*C.A.* 47, 903*d*, 5712*e*.

Results were given of expts. on the carbon gel of *Hevea* rubber contg. different types of carbon black, i.e., the effect of surface area on the proportion of carbon gel; the effect of temp. on the proportion of carbon gel in *Hevea* rubber and in GR-S; the effect of the mol. wt and unsatn. of polyisobutylene on carbon gel formation; and a photographic proof of the presence of carbon gel in *Hevea* rubber-carbon black mixts. Fineness, i.e., total surface area of the carbon black was the dominant factor in the development of carbon gel. Structure, pH, and other properties of carbon black played differing but minor roles. The higher the mol. wt and unsatn. of the polymer, the higher the carbon gel content.

9722. SWEITZER, C.W. AND LYON, FRANCIS. **Oxidation of unvulcanized cold rubber. Influence of adsorption by carbon black.** *Ind. Eng. Chem.* 44, 125-31 (1952).—*C.A.* 46, 3312*g*.

Efforts were made to overcome reversibility by removal of solvent. Evapn. to dryness was necessary; then adsorption increased sharply and the temp. coeff. became pos. Under conditions where scission predominated, carbon black depressed the scission reaction. Under conditions where cross-linking dominated, carbon black depressed the aggregative process. The role played by carbon black was its capacity to remove intermediate oxidation products which caused scission and gelation. These results came sufficiently close to paralleling those obtained with mixts. prepd. on a mill to suggest the use of this method to predict the behavior of carbon black in elastomer mixts.

9723. SWEITZER, C.W.; VENUTO, L.J., AND ESTELOW, R.K. **Properties and uses of colloidal carbon.** *Paint, Oil, Chem. Rev.* 115, No. 8, 22-4, 26, 28, 30, 32, 55, 58-60, 62,64 (1952).—*C.A.* 46, 6361*h*.

Colloidal carbon included all carbon pigments in the range from approx. 13 mμ to 150 mμ. Raw materials, manufg. processes, and conditions existing during manuf. affected particle size, shape, porosity, pH, chem. activity, etc. The type of process had the greatest influence. Electron micrographs show that all forms had a reticulate chain structure. Tremendous surface area, as much as 12 acres per lb, accounted largely for their effectiveness in reinforcing rubber. pH, porosity, and adsorptivity may have beneficial or harmful effects on vulcanization and end properties. Adsorptive ability was affected by structure, porosity, O-contg. volatile matter, unsatn., and alkali salts from cooling water.

9724. TABOR, D. **Boundary and extreme-pressure lubrication. Mechanism of boundary lubrication.** *Proc. Roy. Soc.* (London) **A212**, 498-505 (1952).—*C.A.* 46, 8839*i*.

The most effective lubrication was provided by a solid boundary film that possessed a close-packed strongly oriented structure. Fatty acids were generally more effective than hydrocarbons or alcs., since they could react with the surface to form metallic soaps of relatively high m. ps. This chem. attack generally occurred via the metal oxide film on the surface. The soap formation and the difference between a physically adsorbed and a chemically formed layer were investigated by radioactive methods. At the m.p. of the lubricant film a marked increase in pick-up and friction occurred. At still higher temps. a second deterioration in lubricating properties occurred, corresponding to the desorption of the lubricant film.

9725. TOLSTOI, D.M. **Molecular theory of the slip of liquids on solid surfaces.** *Doklady Akad. Nauk S.S.S.R.* **85**, 1089-92(1952).—*C.A.* 47, 1450*c*.

The velocity of slip V_s in a unimol. layer of liquid adjacent to a solid was treated by applying Frenkel's theory of liquids. The effect of slip in the absence of wetting could be considerable, but for Hg it should be observable only in capillaries of diam. of the order of 1-10μ.

9726. VODRA, VICTOR H. **Ultra-fine precipitated calcium carbonate as a "white carbon black."** *Rubber Age* (N.Y.) 71, 507-14 (1952).—*C.A.* 46, 10670*c*.

The subjects discussed were definitions of reinforcement, differences in the phys. and phys.-chem. character of com. grades of $CaCO_3$ and carbon blacks, differences among various types of $CaCO_3$, the effects of particle size of $CaCO_3$ on the quality of vulcanized rubber, dispersion and processing, and the special features of ultra-fine pptd. $CaCO_3$. The effects of the particle size of $CaCO_3$ on the tensile strength, resistance to tearing, and flexing life of vulcanized natural rubber and GR-S were shown.

9727. WILLIAMS, C.G. **Mechanism of action of extreme-pressure lubricants.** *Proc. Roy. Soc.* (London) **A212**, 512-15(1952).—*C.A.* 46, 8840*b*.

Under progressively increasing load the oil film between sliding metals eventually became discontinuous and metallic contact began to occur. The loading practicable without serious surface damage could be increased many fold by using a lubricant contg. an additive capable of reacting chemically with the sliding surfaces to provide emergency protection. The reaction was accelerated by the sharply rising temp. assocd. with incipient seizure, and the protective product was formed in just those places where temps. and pressures rose to values which were extreme relative to those typical of hydrodynamic lubrication.

9728. WILLIAMS, IRA. **Some effects of solid fillers in rubbers.** *India Rubber World* **126**, 359-63 (1952).—*C.A.* 46, 8886*i*.

An organized type of rubber, e.g., natural rubber, was characterized when vulcanized by high-tensile strength and an x-ray diffraction pattern on stretching. This favorable position of the rubber mols. for bonding and efficient vulcanization must either be originally and naturally existent or be effected by a strong external force. Neoprene and Butyl rubber also were organized; butadiene-styrene copolymers were the unorganized type. Organized rubber could be partially disorganized before vulcanization by swelling with an oil, whereas after vulcanization the same oil had no such effect. Pigments contributed to the reinforcement of rubber in 3 ways: (1) mechanically, (2) firm adsorption of the rubber by the filler, and (3) most important, an organizing effect which resulted in more efficient cross-bonding of the rubber mols. during vulcanization.

9729. WILSON, R. **Influence of oxide films on metallic friction.** *Proc. Roy. Soc.* (London) **A212**, 450-2(1952).—*C.A.* 46, 8462*f*.

The mechanism of metallic friction, in air, was investigated for loads ranging from 0.003 to 10,000 g on Pt, Au, Ag, Cu, Sn, Pb, Zn, Cd, Mg, Al, and Cr. With most metals the natural oxide layer was sufficient to prevent metallic contact at very small loads. The degree of protection depended on surface, roughness, the thickness of the oxide film, the relative hardness of the oxide and the metal substrate, etc.

9730. YOUNG, LUTHER O. **Characteristics of flatting agents.** *Paint Varnish Production* **42**, No. 6, 17-20, 44(1952).—*C.A.* 46, 9861*f*.

The synthetic silicas were the best of the commonly used flatting agents. The synthetic silicas were competitive with other types of flatting agents when flatting efficiency was considered. For flat lacquers of spraying viscosity, silicas of 6-14 μ particle size gave the highest flatting efficiency. Synthetic silica flatting agents of this particle-size range required no milling, only dispersing into the desired vehicle. Because of comparatively low loading necessary to get flat films, coatings flatted with synthetic silica had superior flexibility and washability.

9731. ZUEV, YU. S. **Role of carbon black in the action of light on rubber.** *Doklady Akad. Nauk S.S.S.R.* **82**, 935-8 (1952).—*C.A.* 46, 8406*g*.

The rate of elongation of polybutadiene rubber films, kept at 25° ± 0.1° under const. tensile stress increased by simultaneous illumination, more strongly when the rubber contained carbon black. With polyisobutylene rubber, without carbon black, the rate of deformation was the same in the presence or absence of light, but with carbon black illumination increased the rate considerably. The effect of carbon black was not specific: 1% of the dye Sudan black in Butyl rubber and 2% in polybutadiene rubber were even more effective than carbon black. The effectiveness of small amts. (0.2% carbon black and of the black dye), indicated that their action was linked with absorption of light and not with a sepn. of chains by the filler.

9732. AMERONGEN, G.J. VAN. **Influence of carbon black on the oxidation of natural rubber.** *Ind. Eng. Chem.* 45, 377-9 (1953).—*C.A.* 47, 5710*f*.

The study included carbon blacks of different particle sizes, and involved 4 sets of measurements: rate of oxidation, direct and indirect detn. of the soly. of O_2 in rubber, and adsorptive power of carbon black for iodine. Rubber-carbon black mixts. were studied in both the raw and vulcanized states. The greater the sp. surface area, the greater the absorption of I_2 and the soly. of O_2. The normal absorptive power was the same for free carbon black and for the same carbon black in rubber. The higher the temp., the smaller the differences in O_2 soly. The rate of chem. absorption of O_2 was higher at the early stage of oxidation than later, and the greater the surface area of the carbon black, the higher was this rate.

9733. BANIGAN, THOMAS F. JR. **Differential migration of rubber by reversed-phase partition chromatography.** *Science* 117, 249-50 (1953).—*C.A.* 47, 7247*a*.

Rubber was reproducibly chromatographed by using cyclohexanone or mixts. of butyldiethyleneglycol acetate with cyclohexanone or xylene, and filter paper, e.g., Whatman No. 1, treated with a 5 vol. % soln. of methyltrichlorosilane in benzene. The partitioned rubber was stained by a 0.25% soln. of oil blue NA(Calco) in aq. EtOH (1:1). Chromatograms showed increased soln. mobility caused by progressive breakdown of deresinated guayule on mill rolls and by the presence of 1% Cl_3CCOOH in guayule and in *Hevea* rubber.

9734. POLLEY, M.H.; SCHAEFFER, W.D., AND SMITH, W.R. **Development of stepwise isotherms on carbon black surfaces.** *J. Phys. Chem.* 57, 469-71 (1953).—*C.A.* 47, 7285*b*.

The adsorption of A, N_2 and O_2 by carbon black at -195°C was measured after various heat-treatments. The carbon black was partially graphitized by heating at 1000, 1500, 2000, and 2700°C. The structure was altered by these heat-treatments, as shown by x-ray diffraction. Electron-microscopic studies indicated a transition from approx. spherical particles to irregular polyhedra for the graphitized samples. The original carbon samples exhibited the usual sigmoid-type isotherms, whereas with increasing degree of graphitization as many as 3 steps appeared in the adsorption isotherms at relative pressures of 0.35, 0.63, and 0.86.

9735. RAGG, M. **Effect of surface properties and surface reactions on the growth formation on ship bottoms.** *Farbe u. Lack* 59, 17-20(1953).—*C.A.* 47, 3001*f*.

The absence of growth on the thalli of seaweed or algae was interpreted as the result of the low adsorbing power of surfaces with low surface energy, e.g. hydrophilic surfaces in water. Water-insol. hydrophilic coatings would inhibit the deposition of "primary" slime on ship bottoms, particularly in conjunction with poisons. Another surface property of structural materials was their neg., acidoid charge in water which leads to a strong adsorption of metallic ions and creates the laminary zone rich in poison ions which would otherwise be rapidly depleted, but also helps the attachment of the protein surfaces of balanide larvae, etc.

9736. SCHYTIL, F. AND VOLPERS, R. **The reinforcing action of rubber fillers.** *Kolloid-Z.* 130, 110-15(1953).—*C.A.* 47, 6689*i*.

The effect of particle size on the reinforcing action of Al_2O_3 was measured by prepg. optimum vulcanizates from the mixt.: rubber 100, S 3, Vulkacit-D and -DM 1, ZnO 5, wool fat 4, heavy MgO 2, and Al_2O_3 90 parts. The bulk d. of the Al_2O_3 varied from 120 to 200 g per liter. The finer particle sizes resulted in higher tensile strength, elongation, and tear strength, and lower modulus, hardness, and rebound. Stress-elongation curves, obtained in the range 253-353°K, indicated that the vulcanizates with fine Al_2O_3 had lower internal energy owing to the higher neg. entropy term of the finer particles.

9737. SHELTON, J. REID AND COX, W.L. **Effect of oxygen concentration on aging of rubber vulcanizates. I. Effect of partial pressure of oxygen on rate of absorption.** *Ind. Eng. Chem.* 45, 392-6 (1953).—*C.A.* 47, 6169*e*.

The effects of the partial pressure of O_2 on the rate of absorption of O_2 by inhibited and uninhibited natural rubber-carbon black and GR-S-carbon black vulcanizates were studied. The expts. were limited to the const.-rate stage. The rate of O_2 absorption, K_2, in the const.-rate stage was a function of the sq. root of the partial pressure of O_2 for amine-inhibited natural rubber and GR-S vulcanizates. A general equation of the form: $K_2 = b(P + a)^{0.5}$, where P = pressure of O_2 was in good accord with the exptl. data. Initiation by direct attack of O_2 on the hydrocarbon was an important factor in the mechanism of oxidation of amine-inhibited vulcanizates in the const.-rate stage.

9738. SHELTON, J. REID AND COX, W.L. **Effect of oxygen concentration on aging of rubber vulcanizates. II. Effect of partial pressure of oxygen on changes of physical properties accompanying oxidation.** *Ind. Eng. Chem.* 45, 397-401 (1953).—*C.A.* 47, 6169*i*.

The higher the concn. of O_2, the higher was the rate of increase of O_2 absorption, and the higher was the net rate of deterioration of phys. properties. Chain scission was promoted by a high concn. of O_2, whereas cross-linking took place to a relatively great extent at low concns. of O_2. R-radicals were more effective than RO_2-radicals in reacting with double bonds to form cross-links. Heat aging in the absence of O resulted in notable stiffening, particularly for the GR-S vulcanizate. Since lowering of tensile strength was a direct indication of deterioration of natural-rubber vulcanizates, the aging of the latter in air at room temp. was better than would be predicted by tests in O_2 at elevated temps. On the contrary, with GR-S vulcanizates, oxidative hardening was the most serious effect of aging.

V-13. Catalytic Processes on Carbon Adsorbents

9739. Rhead, T.F.E. and Wheeler, R.V. **The rate of reduction of carbon dioxide by carbon.** *J. Chem. Soc.* **101**, 831-45(1912).

The gases were recirculated by means of an automatic Sprengel pump for periods from 4.5 to 40 min. The temp. of the "purified carbon" was varied from 750° to 1100°C. The values of the rate const., k, and the %CO_2 reduced in a given time were detd. by the conditions of expt. as regards rate of circulation of the gases and the length of the column of carbon. The results were of value in regard to the mode of combustion of carbon by O_2. In the series of expts. in which a mixt. containing 20% CO_2 and 80% N_2 was employed, the mean values of k were: 900°C, 0.00060 (t = 1 min.); 950°C, 0.00374; 1000°C, 0.01764; 1050°C, 0.05760; 1100°C, 0.10570.

9740. Rhead, T.F.E. and Wheeler, R.V. **The combustion of carbon.** *J. Chem. Soc.* **101**, 846-56 (1912).

Some CO was produced during the oxidation of a purified wood charcoal at low temps. under conditions which did not admit of the reduction of CO_2 by carbon. CO_2 was undoubtedly produced at low temps. in quantity which could not be altogether accounted for by the supposition that CO was first formed and then oxidized to CO_2. When carbon was burned at low temps., therefore, CO_2 and CO were produced simultaneously.

9741. Gwosdz, J. **Theory of water-gas formation.** *Z. angew. Chem.* **31**, *I*, 137-40 (1918); *J. Soc. Chem. Ind.* 37, 538A.—*C.A.* **13**, 1009.

Superheated steam was passed over various forms of heated carbon and the compn. of the issuing gases detd. The temps. varied from 855° down to 560°C, and the speed of the current of steam was also varied. Natural forms of carbon contg. ash in appreciable quantities behaved in a markedly different manner than purified carbon almost free from ash. With gas coke (8.5% ash) and wood charcoal (1.4% ash) a considerable proportion of CO_2 was always formed (up to 29%). On the other hand lamp carbon (0.1% ash) at temps. down to 600°C gave mixts. closely resembling com. water-gas.

9742. Gwosdz, J. **The principles of water-gas production. Decomposition of steam by red-hot charcoal.** *Verhandl. ver. Bef. Gewerbfleisses* **1918**, 33-45, 55-70; *J. Soc. Chem. Ind.* **38**, 125-6A(1919).—*C.A.* **13**, 2753.

CO was produced as primary product even at a relatively low temp., using charcoal contg. a min. ash content. Further, at the surface of the charcoal, CO_2 was produced by the interaction of CO and steam, the extent of this reaction being largely conditioned by the ash content of the charcoal. The quantity of steam decompd. in unit time varied with the surface area of the charcoal.

9743. Hodsman, H.J. and Cobb, J.W. **Oxygen in gas production.** *Gas J.* **150**, 640-7(1920); *Gas World* 72, 510-17(1920).—*C.A.* 14, 2408.

By using a mixt.of O_2 and steam the coke could be converted into gas with a small expenditure of heat, while the sensible heat of the water gas could be used for carbonizing the coal, thus attaining the max. thermal efficiency. Carbonization with steam would enable nearly 95% of the heating power of the coal to be saved.

9744. Bourcoud, A.E. **Gasification of powdered coal.** *Chem. Met. Eng.* 24, 600-4 (1921).—*C.A.* **15**, 1798.

The problem was to convert ordinary coal and oils completely into gas without leaving unconsumed carbon, and to regulate the time and temp. necessary to complete the reaction. Complete reduction could not be obtained unless the last traces of the first products of combustion reacted with the last traces of carbon in suspension at a temp. well above equil., in general 1100-1150°C. Preheated primary air, from 400 to 560°C must be added. In those examples representing the best results, a temp. of 1700-1800°C was reached in the combustion chamber.

9745. Kohn, S. **Theory of the water-gas process.** *Ind. Eng. Chem.* **14**, 69-72(1922).—*C.A.* **16**, 634.

Ten possible and the 3 probable combinations of reactions which could be used to explain the water-gas process were discussed. Conclusions were drawn from the compn. of the resulting gases to the actual procedure of the reactions.

9746. Sinnatt, F.S. and Slater, L. **Producer gas from pulverized fuel.** *Fuel* 1, 2-3(1922).—*C.A.* **16**, 2980.

By heating bituminous coal powder for a short time to 420-500°C its coking qualities were destroyed although the loss in volatile matter was comparatively small. The fineness of the coal was unaltered by the treatment, and it was then used in the gasification chamber without larger aggregates being produced. The same coal powder cohered badly if an attempt was made to gasify it without previous destruction of its coking properties.

9747. Haslam, R.T.; Hitchcock, F.L., and Rudow, E.W. **Water-gas reactions.** *Ind. Eng. Chem.* **15**, 115-21 (1923).—*C.A.* 17, 868.

The formation of water gas was studied from 650° to 1200°C by varying the steam pressure in the generator and using 2 kinds of carbon. The essential reactions were: (1) $C + H_2O = CO + H_2$; (2) $C + 2H_2O = CO_2 + 2\ H_2$; (3) $C + CO_2 = 2CO$. These reactions took place at the surface and were monomol. The rate of formation of CO_2 below 900°C was $CO_2 = 0.5\ [H_2O - (H_2O)^2]$ and above 900°C $CO_2 = 0.47\ [H_2O - (H_2O)^{1.85}]$.

9748. Lewis, W.K. **Chemistry of combustion in coal-fired furnaces.** *Ind. Eng. Chem.* **15**, 502-3(1923).—*C.A.* 17, 2041.

The percentages of O_2, CO_2 and CO in gases drawn from different levels of the fuel bed of a coke-fired furnace showed (1) that CO_2 was the initial product of interaction of O_2 with carbon and that CO was formed only by reduction of CO_2; (2) the limiting factor in rate of CO_2 formation was the speed of diffusion of O_2 through the inert gases around the carbon particle rather than rate of chemical combination, while the CO concn. depended upon the rate of chem. reaction.

9749. Haslam, R.T. **Producer gas-apparent equilibrium between its constituents and influence of depth of fuel bed.** *Ind. Eng. Chem.* **16**, 782-4(1924).—*C.A.* **18**, 3704.

The constituents of producer gas came to an apparent equil. value dependent on the thickness of the fuel bed alone and independent of gas velocity (rate of firing), ratio of steam to coal, or temp. in the exit gases. A hypothesis explaining this was given, based on the reaction $H_2O + CO = CO_2 + H_2$ being catalyzed by hot surfaces which the gases could reach only by diffusion.

9750. Newell, H.E. and Sinnatt, F.S. **The carbonization of coal in the form of fine particles. I. The production of cenospheres.** *Fuel in Science & Practice* **3**, 424-34 (1924).—*C.A.* **19**, 883.

Coal (60-90 mesh) was dropped through N_2 or coal gas at a definite temp. with recovery of the residue. At 600°C the particles became spherical and swollen, with a lustrous black pitchy appearance and minute vesicles on the surface. The term cenosphere was proposed. These were reticulated and hollow with a ribwork of a brownish black substance and thin films, termed windows. The latter were transparent, varying in color from colorless to brown and in size and thickness according to the carbonizing temp. and 1 expt. varied in no. from 24 to 104 per cenosphere.

9751. Pexton, S. and Cobb, J.W. **Gasification of coke in steam with special reference to rates of gasification and the composition of the gas.** *Gas J.* **167**, 161-9; *Gas World* **80**, 675-8(1924).—*C.A.* **19**, 3368.

A steady stream of N_2 satd. with steam at a known temp. was passed through a column of coke (3 in. in length and 1 in. in diam.) maintained at a desired temp. The steam was passed at different rates and the compn. of the gas produced and the amts. of steam decompd. were detd. The production of high-grade water gas was unlikely under conditions which favored NH_3 preservation. The remaining series of expts. was conducted at 1000°C. The rates of gasification of the carbon of the 900°C coke, the 1270°C coke, and the works-oven coke at 1000°C for a rate of steam such that the time of contact was 2 seconds were as 10:7:5.

9752. Bone, W.A. **Combustion of carbonic oxide.** *Gas J.* **174**, 725-31; *Gas World* **85**, 4-6, 34-8 (1926).—*C.A.* **21**, 2799.

A brief historical survey of the subject was given, followed by a description of recent investigations.

9753. Marson, C.B. and Cobb, J.W. **Influence of ash constituents in carbonization and gasification of coal. II.** *Gas J.* **175**, 882-91 (1926).—*C.A.* **21**, 2548.

Special cokes were made by adding 5% of SiO_2, Al_2O_3, CaO and Fe_2O_3 and equiv. quantities of $CaCO_3$ and Na carbonate to sep. portions of a coal contg. less than 1% of ash. The addns. of SiO_2, Al_2O_3 and fireclay gave similar results to the "pure" coke, but the CaO, Fe_2O_3 and Na carbonate showed a marked increase in reactivity. At 10 liters/hr the steam decompd. was 61% for the "pure" coke, 82, 91, 98% for the CaO, Fe_2O_3 and Na carbonate cokes, resp., while the corresponding percentages of CO_2 in the water-gas made were 9.2, 5.4, 2.6 and 0.4.

9754. Newell, H.E. and Sinnatt, F.S. **The combustion of particles of coal in air. II. The study of cenospheres.** *Fuel in Science & Practice* **5**, 335-9(1926).—*C.A.* **20**, 3342.

When particles of vitrain or clarain from coking coals were heated in an inert atm., cenospheres were formed. Microscopical examn. showed that these were hollow spheres built up by a lattice, the spaces of which were filled with films. Formation of cenospheres was dependent largely upon temp., 600-650°C being most favorable; at higher temps. their size in relation to coal particles was greater and their structure was more fragile.

9755. Agde, G. and Schmitt, H. **Researches on the reduction capacity of coke.** *Z. angew. Chem.* **40**, 1003-8, 1027-32(1927).—*C.A.* **21**, 4052.

Expts. were carried out by heating various cokes such as a model coke made from nearly ash-free soot and pitch, pitch and graphite, pitch coke, and some com. cokes in a tube through which dry CO_2 was passed. Data were taken on the rate of flow of gas, analysis of effluent gases, temp. of tube, size and condition of coke particles, and duration of run. Temps. varied from 600° to 1000°C.

9756. Bone, W.A. and Forshaw, A. **Catalytic combustion. V. The union of carbon monoxide and other gases with oxygen in contact with a fireclay surface at 500°.** *Proc. Roy. Soc.* (London) **114A**, 169-80(1927).—*C.A.* **21**, 1745.

The rate of catalytic combustion of moist H_2 far exceeded that of moist CO. With a moist mixt. of CO and O_2 in combining proportions, the rate of combination was always directly proportional to the pressure of the dry mixt., provided that the CO_2 was quickly removed from the system. When the CO and O_2 were present in other than their combining proportions, their rate of combination was proportional to the partial pressure of the CO. The catalyzing power of the fireclay surface could be temporarily stimulated by previous exposure to the combustible gas and could be removed by exposing the surface to O_2 at the reaction temp.

9757. Brender À. Brandis, G.A. and LeNobel, J.W. **The reactivity of coke.** *Het Gas* **47**, 37-47(1927).—*C.A.* **21**, 2376.

Dry CO_2 was passed through 3-cm columns of six different cokes (2-4 mm particles), charcoal, and retort graphite at 900°C using 35 cm pressure and analyzing the gas. Results in % CO were: 44.2, 17.2, 14.7, 13.0, 28.9, 6.4, 79.6 and 5.7. CO_2 percentages formed at 450°C in air at 25 cc. per min. were, with the same app. 12.7, 11.2, 9.4, 10.1, 12.1, 6.5, 20.8 and 4.7. The usual rapid increase in CO_2 content of the gas, the actual cause of temp. rise, was approx. 20° lower and was a better measure of reactivity.

9758. Haslam, R.T.; Mackie, R.F., and Reed, F.H. **Reactions in the fuel bed of a gas producer. II. Effect of depth of fuel bed and rate of**

firing. *Ind. Eng. Chem.* 19, 119-24(1927).—*C.A.* 21, 813.

At const. steam rate, the cold gas efficiency, the gas heating value, and the % steam decompn. were all increased by increasing either the firing rate or the depth of fuel. The thickness of the oxidation zone and of the primary reduction zone were independent of the firing rate or the total depth of fuel, the improved results above-mentioned being due to increased temp. of the primary reduction zone.

9759. HASLAM, R.T.; WARD, J.T., AND MACKIE, R.F. **Reactions in the fuel bed of a gas producer. III. Effect of the steam-coal ratio.** *Ind. Eng. Chem.* 19, 141-4(1927).—*C.A.* 21, 813.

At a firing rate of 40 lb coal/ft^2/hr, the optimum steam ratio was 0.7-0.8 lb/lb coal, this optimum value increasing with increased rate of firing, and vice versa. The thickness of the oxidation and of the primary reduction zones were independent of the steam ratio, but the temp. of the primary reduction zone decreased with an increasing ratio.

9760. SINNATT, F.S. **The carbonization and combustion of particles of coal: the structure of cenospheres.** *Trans. Inst. Min. Eng.* 73, 147-68 (1927).—*C.A.* 22, 310.

When particles of coking coal of a critical size were exposed to a certain temp. in an inert atm., hollow spheres (cenospheres) were formed. In certain circumstances the cenospheres might be 8 times the vol. of the original coal particles. Cenospheres consisted of 2 major structures—a lattice with the spaces covered by transparent "windows." If cenospheres were exposed to air at a certain temp., the windows were the first portion to undergo oxidation, leaving the lattice as a residue.

9761. SINNATT, F.S.; MCCULLOCH, A., AND NEWALL, H.E. **The study of cenospheres. V. The carbonization of particles of coal.** *J. Soc. Chem. Ind.* 46, 331-5T(1927).—*C.A.* 21, 3729.

Expts. were described of coking particles of coal in coal gas, H_2, steam, coal gas at a reduced pressure, and coal mixed with different per cents of electrode carbon, briquetted and then pulverized. In mixts. made with coal and increasing amts. of electrode carbon the cenospheres became reduced in size and modified in structure.

9762. JONES, J.H.; KING, J.G., AND SINNATT, F.S. **Reactivity of coke.** *Iron Steel Inst.* May, 1928 (advance copy), 20 pp.—*C.A.* 22, 3036.

The reactivity values were measured by the vol. of CO produced when a definite vol. of CO_2 was passed at a constant rate over a definite vol. of sized coke at a const. temp. The previous heat treatment of the coke appeared to have an effect upon the reactivity value. Cokes from various localities differed quite markedly, although carbonization was carried out in similar ways. Reactivity values were characteristic for any one coke and could be arrived at by using CH_4, CO or O_2, as well as by using CO_2.

9763. SINNATT, F.S. **The formation and structure of cenospheres.** *J. Soc. Chem. Ind.* 47, 151-5T (1928).—*C.A.* 22, 3516.

A description was given of the vertically placed silica tube (28 1/2"× 1 1/2") and app. used to produce cenospheres by heating powd. (60-90 or 40-50 mesh I.M.M.) coal or pitch at different temps. from 420° to 950°C. Differences in appearance, diameters and coking properties of cenospheres formed at 500°, 550° and 600°C from durain, vitrain and clarain were tabulated. The av. diam. of cenospheres from clarain at 800°C was 0.55 mm.

9764. BONE, W.A.; FINCH, G.I., AND TOWNEND, D.T.A. **The fundamental aspects of combustion.** *Trans. Fuel Conference, World Power Conference, London,* 1928, 2, 143-85(1929).—*C.A.* 23, 4795.

In the combustion of carbon there were 3 steps: "fixation" of O_2 at the carbon surface, the evolution of oxides of C, and the adjustment of mobile equil. in the reversible system $2CO \rightleftharpoons C + CO_2$ in consonance with the temp. Presence of steam was not essential to ignition and explosion of $CO\text{-}O_2$ mixts. When undried CO burned, both direct and indirect oxidations proceeded simultaneously and independently. The presence of H_2 and steam favored the indirect oxidation.

9765. HUBBARD, D.W. AND REES, W.J. **Dissociation of carbon monoxide in contact with refractory materials.** *Trans. Ceram. Soc.* 28, 277-307 (1929).—*C.A.* 23, 5290.

The progress of the reaction $2CO \rightarrow CO_2 + C$ was followed by the decrease in gas pressure and also by the estn. of the CO_2 formed. The following materials promoted the dissocn. of CO: pure kaolin 450°C, 470-495°; pure silica 520-570°; pure alumina 260°, 350°; firebrick 410°, 430°, 500°; kaolin treated with aqua-regia 430°, 480°, 520-545°; silica brick 530-540°; reburned firebrick 380°, 470°; Scotch firebrick 340-450°, 470-500°; calcined clay 300-400°; calcined dolomite 370-770°; pure Fe_2O_3 300-700°C.

9766. BUNTE, K. AND GIESSEN, A. **Influence of coke reactivity on water gas formation.** *Gas u. Wasserfach* 73, 241-7 (1930).—*C.A.* 24, 2862.

The reactivity of various cokes with respect to water vapor decreased in the following order: wet-quenched, low-temp. lignite coke; wood charcoal; dry-quenched, low-temp. lignite coke; semicoke; wet-quenched gas coke; dry-quenched gas coke and oven coke. This was in the same order as detd. for O_2 alone and O_2 in CO_2. Some relationship could be noted between water vapor decompn. and ignition temp. of the coke, but this was obscured by the effect of undecompd. steam passing through the fuel bed on the water gas equil. in the gaseous phase.

9767. JONES, J.H.; KING, J.G., AND SINNATT, F.S. **The reactivity of coke. III. The influence of iron compounds. Dept. Sci. Ind. Research, Fuel Research** *Tech. Paper* No. 25, 42 pp. (1930) —*C.A.* 24, 4377.

Those Fe compds. which were capable of easy reduction to the metal had an accelerating effect upon the reaction between CO_2 and coke. The activating effect produced by metallic Fe was large; that due to FeO was small. "Reactivation" (autoactivation occurring with certain cokes) was due to reduction of the Fe oxides by the coke to the metal during passage of N_2 and occurred only in cokes with the most Fe. Metallurgical cokes contained some unreducible Fe.

9768. Key, Arthur and Cobb, John W. **Determination of the reactivity of a coke to steam and carbon dioxide.** *J. Soc. Chem. Ind.* **49**, 439-44T, 454T(1930).—*C.A.* **25**, 579.

If two columns of a coke (A) were taken, identical in all respects except that one was of unit length and the other of length *n*, the second column presented *n* times the amount of the same kind of surface to the reacting gas, and its total reactivity was *n* times that of the first column. If a column of unit length of another coke (B) decomposed as much gas as the column of length *n* of coke A under the same conditions, the total reactivities of the two columns were equal, and since the percent decompd. by coke B of unit length was its specific reactivity, this must be equal to *n* times that of coke A. If the specific reactivity of coke B was unity, that of A was $1/n$, and this gave a definition of reactivity, as the reciprocal of the length of a standard coke under the same conditions.

9769. Sihvonen, V. **The reaction mechanism of carbon combustion at low pressures.** *Z. Elecktrochem.* **36**, 806-7(1930).—*C.A.* **25**, 2629.

Kinetic measurements on the carbon combustion at low O_2 pressures, in general, indicated a reaction of the first order. The combustion in streaming O_2 between 800° and 1400°C formed a gas mixt. of const. compn. ($CO_2 + 2CO$). Between 1400° and 1500°C the carbon surface suffered a change whereby, according to the observation of Langmuir, CO was vaporized. Here the velocity curves of both combustion products indicated a break. Between 800° and 1200°C CO formation was promoted through autocatalysis. The presence of CO_2 retarded the combustion of CO and carbon. At 1600°C a minute addn. of water vapor accelerated the formation of both combustion products catalytically.

9770. Burke, S.P. and Schumann, T.E.W. **Kinetics of a type of heterogeneous reactions. The mechanism of combustion of pulverized fuel.** *Ind. Eng. Chem.* **23**, 406-13(1931).—*C.A.* **25**, 2542.

A theory of the kinetics of the combustion of pulverized solid fuel was developed mathematically. This theory gave results in accord with exptl. data.

9771. Drakeley, Thomas J. **The reactivity of coke.** *J. Soc. Chem. Ind.* **50**, 319-30T(1931).—*C.A.* **26**, 1754.

A lab. study of the reaction $CO_2 + C \rightleftharpoons 2CO$ through a temp. range of 950° to 1100°C, on small samples of coke prepd. at temps. from 450° to 1100°C was described. The app. consisted of a silica tube (2 cm by 76 cm), electrically heated, through which CO_2 was circulated. The rate of CO formation and also the coke reactivity were expressed by the equation: $d\,(CO)/dt = k_1(CO_2) - k_2(CO)^2$. Reactivity could not be expressed by a single coeff. k_1 but that k_2, the coeff. of the reverse reaction, must also be given. Results indicated that at high temps. these values approached equality.

9772. Fox, David and White, Alfred H. **Effect of sodium carbonate upon gasification of carbon and production of producer gas.** *Ind. Eng. Chem.* **23**, 259-66(1931).—*C.A.* **25**, 1970.

Na_2CO_3 reacted in appreciable measure with carbon above 800°C and the rate became rapid above 900°C. The reactions were: $Na_2CO_3 + 2C = 3CO + 2Na$; $2Na + CO_2 = Na_2O + CO$; $Na_2O + CO_2 = Na_2CO_3$. The net effect was to increase the vapor pressure of C to 10^{15} times its actual value. The use of coke impregnated with Na_2CO_3 in the gas producer gave gases higher in CO than would otherwise be obtained.

9773. King, J.G. and Jones, J.H. **The reactivity of coke.** *J. Inst. Fuel* **5**, 39-55(1931).—*C.A.* **26**, 3361.

The effect of certain inorg. compds. on the reactivity of industrial cokes was studied. CO_2 at the rate of 5 cc. per min. was passed through a column of 10- to 20-mesh (I.M.M.) coke 7.5 cm long for 20 min. at 950°C. The catalytic effect of Fe was nullified by treating the cokes contg. Fe with TiO_2 or SiO_2. At 1000°C a similar effect was produced by sulfiding the Fe with H_2S. Coke contg. much extractable Fe was reactivated after testing to a const. R_3 value, by cooling in N_2 or by heating with H_2. The addn. of MnO_2 and MgO did not increase coke reactivity but addn. of $CaCO_3$ or Na_2CO_3 did.

9774. Neumann, Bernhard; Kröger, Carl, and Fingas, Ernst. **The reaction of water vapor and carbon in the presence of catalysts.** *Z. anorg. allgem. Chem.*, **197**, 321-38(1931).—*C.A.* **25**, 3908.

The quantities of reaction products formed by passing water vapor over hot graphite with and without added catalysts were detd. at 450° to 1000°C at atm. pressure. Graphite contg. 8% of either Fe_2O_3, CuO, U_3O_8, Al_2O_3, Cr_2O_3 or K_2CO_3 was much more reactive than pure graphite at a given temp. The temp. at which reaction first occurred was lowered from 650°C for pure graphite to 600°, 420°, 625°, 632°, 579° and 550°C, resp., for the above-mentioned catalysts.

9775. Neumann, Bernhard; Kröger, Carl, and Fingas, Ernest. **The effect of various forms of carbon on water-gas formation.** *Gas u. Wasserfach* **74**, 565-72(1931).—*C.A.* **25**, 4687.

Expts. were carried out with wood charcoal, acetylene soot, active charcoal and a very pure electrode graphite alone and with the addn. of Fe_2O_3. A series of expts. were made with each by starting at a temp. 50-100°C above that at which the reaction was initiated. Fe_2O_3 facilitated water-vapor decompn. on graphite, the reaction starting 70°C lower than with pure graphite. C_2H_2 soot and wood charcoal (same grain size as the graphite) were more reactive than the graphite.

9776. Sihvonen, V. **The kinetics of the Boudouard reaction.** *Ann. acad. sci. Fennicae* **33A**, No. 13, 1-14(1931).—*C.A.* **25**, 5069.

The chem. heat of adsorption of CO on carbon at the limiting pressure of CO in the case of the reaction $C + CO_2 = 2CO$ was estimated to be 17 kcal. A noticeable desorption began between 1400° and 1500°.

9777. Smith, David F. and Gudmundsen, Austin. **Mechanism of combustion of individual particles**

of solid fuels. *Ind. Eng. Chem.* **23**, 277-85 (1931).—*C.A.* **25**, 4684.

The specific surface-reaction rate for carbon spheres burned in dry and moist air was a complex function of the particle size. It was enormously larger for a small particle than for a large one. The temp. of the surface increased as the particle was reduced in size. For the same air velocity and same surface temp., a small particle had a higher sp. surface reaction rate than did a large one. Carbon spheres of surface area 70 to 10 mm^2 burned faster in moist air. An increase in surface temp., for particles in dry air, increased the reaction rate, i.e., the temp. coeff. was positive. An increase in surface temp. for particles burned in wet air at low velocities decreased the reaction rate.

9778. Broom, W.E.J. and Travers, Morris W. **Reactions between carbon and certain gases.** *Proc. Roy. Soc.* (London) **A135**, 512-37(1932).—*C.A.* **26**, 3427.

A continuously operating Sprengel pump for evacuating a reaction vessel to 10^{-4} mm Hg and collecting the gas removed was described. The equil. const $K = P_{CO}/P_{CO_2}$ was detd. at 746°C to be 0.225 on coconut charcoal and sugar charcoal that had not been heated above 1000°C. The sugar charcoal after being heated *in vacuo* to 1170°C gave the const. *K* about 0.36. Kinetic equations were derived for the rate of reaction of CO_2 with carbon to form CO if it was assumed that the first step involved formation of a C-oxygen complex and one mol. of CO, the second step the decompn. of the complex into CO and carbon.

9779. Burke, S.P. and Schumann, T.E.W. **Kinetics of a type of heterogeneous reactions. II. The mechanism of the combustion of lump fuels.** *Ind. Eng. Chem.* **24**, 451-3(1932).—*C.A.* **26**, 2845.

A math. theory of the combustion of lump fuel limited to a single piece of solid fuel was developed. The theory was in general agreement with recent exptl. results on fuel combustion.

9780. Dolch, M. and Kollwitz, J. **The reaction of water vapor upon glowing coke. Contribution to the oxidation of coal.** *Braunkohle* **31**, 607-10, 628-32, 645-9(1932).—*C.A.* **26**, 5735.

In studying effects of rate of steam flow upon compn. of gas formed, the reaction $C + H_2O = CO + H_2$ with bituminous cokes were found more rapid, and the reaction $C + 2H_2O = CO_2 + 2H_2$ with brown-coal cokes. With cokes of intermediate coals, this distinction was not noted.

9781. Dolch, M. and Schindler, R. **Change of state of coalification of lignitic brown coal by heating with water under pressure.** *Braunkohle* **31**, 801-6(1932).—*C.A.* **27**, 2556.

Synthetic coalification of fuel constituents with H_2O at 300°C for 1 hr has been demonstrated but at the cost of incombustibles. Loss of O far exceeded that of C and H; 1/3 to 60% appeared as CO_2 in the gas formed, 50-20% as H_2O and the rest as solids or tar. Heating value of the coal increased 15-18%.

9782. Dolch, Paul. **Action of steam on coal. Study of superimposed equilibria.** *Z. Elektrochem.* **38**, 596-601(1932).—*C.A.* **26**, 5193.

The action of steam on coal lead to the formation of CO and H_2. The formation of CO_2 was a secondary reaction ($CO + H_2O = CO_2 + H_2$), the extent of which depended on the active coke surface. There was no evidence for the reaction $C + 2H_2O = CO + 2H_2$. Expts. with CO_2 and H_2 which were passed over coke confirmed this.

9783. Dolch, Paul. **Water-gas generation from coke and coal.** *Gas u. Wasserfach* **75**, 807-11 (1932).—*C.A.* **27**, 399.

The reaction of water vapor on carbon and the formation of CO_2 was detd. by the water-gas equil. rather than by the water-gas reaction. The degree of attainment of the water-gas equil. depended on the reactivity of the coke on which the reaction took place. No evidence was found for the direct action of water vapor according to the reaction $C + 2H_2O = CO_2 + 2H_2$. Expts. with mixts. of CO_2 and H_2 over wood charcoal at 600-1000°C indicated that CO_2 and H_2 first reacted to form CO and H_2O at about 600°C while CO_2 first began to react with carbon at about 750°C; with coke the corresponding temps. were 800° and 980°C.

9784. Sherman, Ralph A. **An experimental study of the burning characteristics of pulverized fuels.** *Proc. 3rd Intern. Conf. Bituminous Coal* **2**, 510-51(1932).—*C.A.* **26**, 4152.

The primary product that appeared in the combustion of fuel in pulverized form was CO_2. With ratios of air to coal = or > required, CO appeared only in small amts. in the initial carbonization of the coal. CO found in industrial furnaces was formed in the stream of coal and primary air and persists because of slow mixing with secondary air. The sp. surface did not have greater significance than the amt. passing 200-mesh. For equal amts. passing 200-mesh, the amt. retained on 100-mesh was markedly significant. The rates of combustion and percentages of unburned carbon varied greatly with the type of fuel.

9785. Dolch, Paul. **Surface equilibria. II. A thermodynamic measure of the activity of catalysts.** *Z. Elektrochem.* **39**, 602-7(1933).—*C.A.* **27**, 4996.

The variation of the equil. consts. of a reaction with different catalysts at different temps. was studied. The difference between the equil. const. and the reaction isochor was taken as a measure of the catalytic activity of a catalyst. The calcns. were applied to the reaction between H_2O vapor and carbon and to the contact process for the manuf. of H_2SO_4.

9786. Dolch, Paul. **Influence of reactivity of cokes upon the behavior of carbon dioxide-hydrogen mixtures at 600-1200°.** *Brennstoff-Chem.* **14**, 261-3(1933).—*C.A.* **27**, 5173.

Both bituminous coke and wood charcoal accelerated the reaction of CO_2 with H_2. Below 970°C with 3:7 mixts. and below 820°C with 34:66 mixts. with coke or charcoal, resp., solid carbon did not enter into reaction. Water-gas equil. were approached; with charcoal, equil. was reached at 750°C.

9787. Cobb, J.W. **Reactivity of pulverized fuels.** *Chaleur & ind.* **15**, No. 167, 377-86(1934).—*C.A.* **28**, 6547^5.

A plot of exptl. data for the reactivity of cokes (10 g) with CO_2 at 900°C and with steam at 1000°C was presented. It was decompd. in a column of 0.875 in. diam. in a gas stream of 20% of CO_2 flowing at 5 liter per hr. For the steam expts. the column was the same and the standard of decompn. was taken as 50% of steam at 10 liter per hr carrying 50% by vol. of N_2. The reactivity at low temps. was obtained and curves for cokes from various raw materials showed a relation between reactivity (percentage of O_2 burned) and temp.

9788. GRODZOVSKIĬ, M.K. AND CHUKHANOV, Z.F. **Gasification process for solid fuels.** *Compt. rend. acad. sci. U.R.S.S.* 3, 356-9 (in German 359) (1934); *J. Applied Chem. (U.S.S.R.)* 7, 1398-1421 (in German 1421-2) (1934).—*C.A.* 29, 320^9, 5625^9.

The gasification processes of activated carbon and coke were studied with normal and O_2-enriched air. Primary reactions were the formation of CO_2 and CO from the solid fuel. Formation of primary CO depended on the temp., the velocity and amt. of O_2 passing over the solid and upon the activity of the fuel. For complete gasification the primary CO must be rapidly enough removed to prevent further oxidation. This limiting velocity for charcoal was 1.2 m per sec. With coke large velocities repressed the reaction of carbon with CO_2 to form CO. With activated charcoal this reaction proceeded appreciably only under 0.26 m per sec.

9789. MAYERS, MARTIN A. **Mechanism of combustion of coal.** *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. 575, 17 pp. (1934).—*C.A.* **28**, 7473^2.

The ultimate limit to the attainable rating in both pulverized-coal firing and grate firing was set by the reactivity of the fuel in its coked form. With pulverized fuel this limit seldom was reached; a practical limit was set by the speed of the active burning process, which was practically independent of the characteristics of the fuel and depended only on the mech. arrangements for firing.

9790.. TERRES, E.; PATSCHEKE, G.; HOFMANN, H.; KOVACS, ST., AND LÖHR, O. **The formation of water gas and the behavior of brown coal and bituminous coal cokes and semicokes in water-gas generation.** *Gas u. Wasserfach* 77, 585-7, 628-36, 650-5, 666-9, 681-4, 703-6(1934).—*C.A.* 29, 577^7.

Cokes and semicokes from the bituminous coal and from several brown coals were prepd. at various temps. between 300° and 1200°C and gasified at slightly lower temps. in N_2-contg. H_2O vapor. Merck wood charcoal also was gasified. The water-gas analyses were used to calc. the extent of steam decompn., CO-CO_2 ratios and the water gas and Boudouard equil.; similar calcns. were made for the theoretical steam-carbon equil. at 400-1200°C with the N_2O-100% satd. with H_2O. At 1200°C the bituminous coal coke gave a steam decomp., CO-CO_2 ratios, and carbon gasification distinctly lower than the corresponding equil. values, and lower than wood charcoal.

9791. WEISS, CLARENCE B. AND WHITE, ALFRED H. **Influence of sodium carbonate upon the producer-gas reaction.** *Ind. Eng. Chem.* **26**, 83-7(1934).—*C.A.* **28**, 1506^5.

The reaction $Na_2CO_3 + 2C = 2Na + 3CO$ which proceeded to the right above 800°C was reversed when the reaction products were cooled slowly in the range 900°-750°C. The reaction was studied in a miniature gas producer consisting of a Ni tube heated in an elec. furnace. When using untreated Acheson graphite and dry air at 900°C and a time of contact of 2 secs., the exit gases contained 6.8% CO; but when the graphite contained 1% Na_2CO_3, they contained 33% CO. As little as 0.1% Na_2CO_3 gave these results. Similar results were obtained with steam-air mixts.

9792. SIHVONEN, V. **True activation energy of the desorption of the ketonic group from graphites.** *Suomen Kemistilehti* **8B**, 28 (1935).—*C.A.* 30, 2822^5.

9793. GRODZOVSKIĬ, M.K. AND CHUKHANOV, Z.F. **Gasification of solid fuel with air.** *J. Applied Chem.* (U.S.S.R.) 9, 73-81 (in German) (1936).—*C.A.* 30, 6163^7.

Charcoal, activated charcoal, coke, electrode carbon and graphite were investigated. Linear velocity of blown air was the most important variable. With high velocities the major portion of CO produced was the primary product of the reaction.

9794. CASSAN, M.H. **Experimental study of the reactivity of different varieties of carbon to water vapor and carbon dioxide.** *J. usines gaz.* 61, 275-7 (1937).

Coke, wood charcoal, or graphite was heated in a quartz tube in a dil. gas mixt. of H_2O or CO_2 in N_2. Max. deviation in the reactivity among the different carbons was observed at about 950°C. The diagram of the apparatus was given.

9795. MAYERS, MARTIN A. **Some factors affecting combustion in fuel beds.** *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. 771, 18 pp. (1937).—*C.A.* 31, 2388^9.

The available data concerning the values of various phys. and chem. consts. required for the calcn. of temps. in a burning fuel bed were discussed. The only property characteristic of a particular fuel that was important in combustion calcns. was its ignition temp. The coeff. of heat transfer between the solids of the fuel bed and the air or gas stream, the thermal cond. of the fuel bed, and the sp. rate of the combustion reaction appeared to depend almost entirely on the phys. characteristics of the fuel bed and will be affected more by the size, size distribution and porosity of the fuel in bulk than by its chem. characteristics.

9796. SEBASTIAN, J.J.S. AND MAYERS, M.A. **Coke reactivity. Determination by a modified ignition point method.** *Ind. Eng. Chem.* 29, 1118-24 (1937).—*C.A.* 31, 8888^7.

The abs. reaction rates were detd. between coke and O_2 from measurements of the time rate of temp. rise of the coke at the ignition pt. The relations between reaction rate and temp. calcd. from the results were characteristic of the cokes. The reactivity of each coke may be specified either by a line on a plot of the Arrhenius equation, or by the 2 parameters, *b* and *F*, appearing in the equation, whose values usually decrease with increasing activity. The reactivity was found to increase with decreasing temp. of carbonization of the coal.

9797. BAUKLOH, W. AND JAEGER, F. **The reduction of tungsten oxide with solid carbon and hydrogen.** *Z. anorg. allgem. Chem.* 239, 365-8 (1938).—*C.A.* 33, 934^5.

By action of solid carbon and H_2 upon W_4O_{11}, it was found that the reduction began at about 800°C with carbon and at about 450°C with H_2. In the presence of Fe the reduction began about 50°-100°C lower.

9798. CHUKHANOV, Z.F. **Combustion of carbon. I. Sequence of the processes in the combustion of aerosols of solid fuels.** *J. Tech. Phys. (U.S.S.R.)* 8, 147-61 (1938).—*C.A.* 32, 5599^9.

The oxidation of an aerosol of activated wood charcoal began at 300-500°C and the products were CO and CO_2. The oxidation proceeded normally up to 700-750°C, at which point there occurred a sharp change in the kinetics of the process, the carbon broke into flame and the formation of CO and CO_2 was greatly accelerated.

9799. CHUKHANOV, Z.F. **Combustion of carbon. II. Oxidation.** *J. Tech. Phys. (U.S.S.R.)* 8, 621-32 (1938).—*C.A.* 32, 6838^2.

The oxidation of an aerosol of activated wood charcoal, proceeding with the formation of equal amts. of CO and CO_2, was the predominant reaction up to 750°-800°C (at high O_2 concns). Above this temp. range, combustion with the formation of CO predominated. The oxidation, which at atm. pressure was but slightly dependent on the O_2 concn., proceeded within the carbon particles at a rate proportional to the wt of the particles (wt concn. of the aerosol).

9800. CHUKHANOV, Z.F. **A large-scale gas generator IGI-2.** *Novosti Tekhniki* **1938**, No. 14-15, 30-1; *Khim. Referat. Zhur.* **1**, No. 11-12, 164(1938).—*C.A.* 33, 8958^7.

The generator design was based on the fact of the primary formation of CO, and the possibility of its removal by blowing with a velocity of not less than 0.3-0.5 m/sec. The fuel was peat and sub-Moscow coal. The continuous process of gas generation was described.

9801. FISHER, C.H. **Relation between volatile matter and hydrogen-carbon ratio of coal and its banded constituents.** *Ind. Eng. Chem., Anal. Ed.* **10**, 374-8(1938).—*C.A.* 32, 7699^9.

The relation between volatile matter and the C-H ratio in coals was studied with particular attention to the petrography. Plotting the H-C ratio against volatile matter gave 2 curves; vitrains and clarains fell in one curve and fusains, durains and spores on the other. The equations representing these lines could be used to relate the C-H ratio to the volatile matter.

9802. GEER, M.R. AND YANCEY, H.F. **Expression and interpretation of the size composition of coal.** *Am. Inst. Mining Met. Engrs. Tech. Pub. No.* **948**, 20 pp.(1938).—*C.A.* 32, 6430^4.

When cumulative wt percentage was plotted *vs.* screen size, straight-line curves resulted. The slope and intercept of these lines were the consts. n and k in the equation, $R = 100 \exp(-x/k)^n$, in which R = wt percentage retained on a screen with opening of size x. Products of the standard shatter and tumbler tests of coal and coke did not conform.

9803. LAUPICHLER, F.G. **Catalytic water-gas reaction—mass transfer and catalyst activity.** *Ind. Eng. Chem.* 30, 578-86(1938).—*C.A.* 32, 4866^1.

Equations were derived for mass transfer and reaction velocity in the catalytic water-gas reaction at const. temp., which permitted calcn. of conversion rate for any given amt. of catalyst, or the amt. of catalyst required to obtain a given conversion. The effect of varying initial temp., steam-CO ratio, and flow rate were detd. The equations were useful in detg. the optimum conditions for operating catalytic converters.

9804. SCOTT, G.S. AND JONES, G.W. **Oxidation of anthracite; effect of time of contact on the concentration of oxygen in the effluent gases.** *U. S. Bur. Mines, Rept. Investigations No.* 3405, 7 pp. (1938).—*C.A.* 32, 7700^1.

When air was passed through heated anthracite, the percentage of O_2 in the effluent gases were inversely proportional to the time of contact with the heated coal at any given temp. and the oxidation was equiv. to a first-order chem. reaction. Thus, percentage of O_2 in effluent gases from a mine-fire area was of little value in predicting temp. or activity of the fire.

9805. SINKINSON, ERIC. **A new theory concerning the combustion of anthracite.** *Trans. First Annual Anthracite Conf. of Lehigh Univ. April 29-30,* **1938**, 45-52.—*C.A.* 32, 6838^4.

Anthracite ash at bright incandescence performed the role of a catalytic agent toward gases (chiefly H_2) distg. in an anthracite fire.

9806. FRANK-KAMENETSKII, D.A. **Carbon dioxide reduction.** *Compt. rend. acad. sci. U.R.S.S.* **23**, 663-5(1939).—*C.A.* 34, 4648.

The kinetics of the reduction of CO_2 by activated ash-free sugar charcoal were measured under static conditions at 600-900°C and at pressures of 50-200 mm Hg. The course of the reaction was followed by measuring the thermal cond. of the gas mixt. With a surface-cleaned carbon a measurable reaction took place at not lessthan 600°C, and between 600° and 750°C the reaction was $CO_2 + C = CO + (CO)$, where (CO) denoted a surface oxide which could be regarded as chemisorbed CO. In this temp. range the total pressure, after an initial drop, remained approx. const. From 750° to 900°C a steady increase in pressure was found which in the initial stages was not equiv. to the CO formed. No CO was formed between 400° and 600°C, and the only sign of action was an initial fall in pressure owing to activated adsorption of CO_2.

9807. HERRLIN, P. ADOLF. **Catalysis of the reaction velocity of mercury (I) ions. The equilibrium $Fe^{+++}/Fe^{++}/Hg^{++}/Hg_2^{+}/Hg$ as perchlorate**

in water solution. *Nord. Kemikermøde, Forh.* 5, 194-5(1939).—*C.A.* 38, 2872^5.

Kieselguhr and various active carbons catalyzed the attainment of equil. from either side in the reaction $2Fe(ClO_4)_2 + Hg_2(ClO_4)_2 = 2Fe(ClO_4)_3 + 2Hg$. The velocity increased with the sp. surface of the catalyzer and the initial concn. of the Fe^{++} and diminished with increasing initial concn. of Hg^+ (probably owing to adsorption). Traces of active carbon brough about equil. conditions in 1 min.

9808. KOELSCH, H. **The reaction equation for the formation of producer gas.** *Feuerungstech.* 27, 195-201, 282-8(1939).—*C.A.* 33, 8958^7; 34, 5271^9.

9809. BANGHAM, D H. AND BENNETT, J. G. **The chemistry of gasification with reference to small producers.** *Fuel* 19, 95-101(1940).—*C.A.* 34, 7581^2.

Present knowledge of steam-carbon and water-gas reactions was summarized and applied to several theories of gasification.

9810. CHUKHANOV, Z. **The burning of carbon. II.** *Fuel* 19, No. 3, 17-20, 49-50, 64-67(1940).

The oxidation of carbon with equiv. formation of CO and CO_2 preponderated at 750° to 800°C. The process of oxidation took place within the vol. of the charcoal particles. The rate of oxidation was proportional to the wt of the particles (to the concn. of the air suspension by wt) within the ranges of sizes of particles studied. The energy of activation of the oxidation of carbon in the form of activated wood charcoal under atm. conditions was 20,000 to 25,000 cal. Oxidation of CO to CO_2 distorted the primary compn. of gas.

9811. CHUKHANOV, Z. F. **Observations on the temperature regime of a coal layer in a state of gasification.** *Compt. rend. acad. sci. U.R.S.S.* 26, 346-51(1940)(in French).—*C.A.* 34, 7577^7.

The real temp. of a surface of coal and of gas below the O_2 zone was the closer to the theoretical temp. the smaller the heat flow in the layer. An increase in the velocity of the air current reduced the velocity of the upward movement of the combustion zone and at a given point reversed it into a downward movement. The combustion velocity of a coal fuel may be fairly accurately calcd. for various velocities of the air current by means of the bireactionary theory.

9812. CHUKHANOV, Z. F. **Oxidation of carbon.** *Compt. rend. acad. sci. U.R.S.S.* 28, 32-6 (1940)(in French).—*C.A.* 35, 2400^3.

At temps. below ignition the oxidation of carbon was believed to proceed according to the mechanism $C_3O_4 + C + O_2\ (gas) = 2CO + 2CO_2$. C_3O_4, a surface compd., was assumed to be the only oxide of C with a sufficiently rapid rate of production and decompn. to enter into the reaction. Corroborative exptl. evidence was given relating to the rate of oxidation of graphite and activated carbon as a function of the O_2 concn.

9813. GWOSDZ, J. **The expansion of the combustion zone in the gas producer in relation to fuel and to gas velocity.** *Brennstoff-Chem.* 21, 145-51(1940).—*C.A.* 35, 3062^8.

Gas rate, fuel reactivity, thermal cond., formation of gas in the fuel bed, progression of temp. in the combustion zone, influence of charging height, low-temp. coke, wood charcoal, and high-temp. gasification were discussed with reference data. The upper part of the reaction or combustion zone, in comparison with the lowest hot layer which constituted only a few cm of the gas path, was subject to extension depending principally upon air rate and carbon reactivity and upon steam addn.

9814. GWOSDZ, J. **Formation of an intermediate zone between the oxidizing and reducing zones in the gas producer and the behavior of steam at very high gas velocities.** *Brennstoff-Chem.* 21, 269-73(1940).—*C.A.* 36, 2117^3.

The restriction of the dimensions of the gasification zone in the small cross-draught type of producer using high gas velocities was explained by the assumption of an intermediate zone between the oxidizing and reducing zones. The greater part of the CO was formed in this intermediate zone, in which there was a gradual transition from oxidizing to reducing conditions, whereas the conversion of steam into H_2 occurred principally in the subsequent reducing zone.

9815. HOTTEL, H. C. AND STEWART, I. McC. **Space requirement for the combustion of pulverized coal.** *Ind. Eng. Chem.* 32, 719-30(1940).—*C.A.* 34, 4253^4.

The problem was attacked by combining a suitable particle-size distribution law applicable to samples of pulverized coal, the laws of burning of individual particles, and reasonable assumptions concerning the mechanism of burning particles in a cloud. The resulting relationship, expressed graphically in dimensionless terms, predicted the percentage of the original unburned carbon in the coal which passes out unburned, as a function of chamber size, firing rate, fineness of grinding, excess air, approx. flame temp., and a so-called combustion const. to be detd. experimentally.

9816. KANTOROVICH, B. **Hydrodynamic problems relative to the process of the combustion and gasification of a combustible solid.** *Comp. rend, acad. sci. U.R.S.S.* 28, 244-9(1940)(in French).—*C.A.* 35, 3059^8.

The combustion of charcoal was studied and a theoretical procedure devised for the calcn. of the effect on the total velocity of the reaction of the conditions (hydrodynamic) for bringing the O_2 to the reacting surface.

9817. KURIN, N. P. AND NOVGORODOVA, E. M. **The catalytic oxidation of nitrogen. III. Investigation of the catalytic activity of activated carbon.** *Izvest. Tomsk. Ind. Inst.* 60, No. 3, 61-78(1940); *Khim. Referat. Zhur.* 1940, No. 9, 62.–*C.A.* 37, 2144^6.

Catalytic oxidation of NO was investigated in the presence of activated carbon at 25°, 50°, 100° and 150°C at velocities of 200, 400, 800, 1200 and 1600 (vol. of gas per unit vol. of catalyst per hr) and at initial concns. of NO (in the dry gas mixt.) equal to 1.5, 3.6 and 10 vol. %. With the initial concn. of NO equal to 15 vol. % and a temp. of 25°C, increasing the vol. velocity from 200 to 1600 decreased the degree of oxidation from 37.6 to 27.9. A further increase in the initial concn. of NO resulted in a slower increase in α total. A kinetic equation, $-dC_{NO}/dt = KC^2_{NO}/(1 + bC_{NO_2})$, was derived for the oxidation process of NO into NO_2 under the condition mentioned with a large excess of O_2 (as compared with NO).

9818. Leye, Alexander R. **Gasification with steam and oxygen. A method for calculating results and extent of reforming.** *Gas- u. Wasserfach* **83**, 669-72, 688-91(1940).—*C.A.* 35, 3062^6.

A method was developed for calcg. the volumetric compn. of a generator or reformed gas, based on the knowledge of the fuel compn. and the gasification media, such as steam or air; with the help of dimensionless factors for the fuel, gasification media, etc. Examples were given for coke water gas, continuous gasification with steam and O_2 and the reforming of methane and hydrogenation gas as well as the production of gas for synthetic purposes. Calcd. values agreed with those found in practice.

9819. Mayers, M. A. and Landau, H. G. **Ignition in beds of solid fuel.** *Ind. Eng. Chem.* **32**, 563-8(1940).—*C.A.* 34, 3901^7.

A nomograph was designed for calcn. of the rate at which fuel could be ignited in pure underfeed burning when the characteristics of the fuel bed are known. Better values were obtained for the relation between the air flow rate and the rate of the combustion reaction, and between air flow rate and the rate of heat transfer between the gases and solids of the fuel bed than had heretofore been available.

9820. Predvoditelev, A. S. **Combustion of a carbon particle in a current of gas.** *J. Tech. Phys.* (U.S.S.R.) **10**, 1311-23(1940).—*C.A.* 35, 3059^8.

The combustion of a carbon particle in a current of gas was examd. analytically with the following assumptions: (1) the gas flow could be described by a potential function, (2) O_2 reached the surface of carbon particle through the process of forced diffusion, (3) combustion on the surface occurred in such a way that the diffusional flow always remained equal to the specific speed of combustion, (4) the combustion reaction was of the first order, (5) on the equipotential surface, passing through the intersection point of gas flow with carbon particle the concn. of O_2, was equal to the outside concn.

9821. Schwab, Georg-Maria and Lober, Friedrich. **The halogen-transporting action of carbon.** *Z. physik. Chem.* **A186**, 321-47(1940).—*C.A.* 35, 1691^5.

The action of Br_2 on $CHCl_3$ and on H_2 with activated carbon (Carbotox ACS) as the catalyst was studied in the gaseous phase in a dynamic app. The bromination of $CHCl_3$ began at approx. 180°C, reached thermodynamic equil. at approx. 350°C, and at 500°C was again immeasurably slow. The bromination of H_2 in an empty tube of Supremax glass was homogeneous above 500°C. With carbon as catalyst the velocity was measurable at 120°C and rose as a monotone function of the temp. to 220°C.

9822. Strickland-Constable, R. F. **The oxidation of carbon.** *Fuel* **19**, 89-93(1940).—*C.A.* 34, 7574.

The process of combustion on grates was discussed from present knowledge of the equil. conditions obtained at grate temps. The mechanism and theory of the carbon oxidation process were reviewed.

9823. Balandin, A. A. and Patrikeev, V. V. **Activated carbon as a catalyst in the hydrogenation of halogen derivatives by means of hydrogen.** *J. Gen. Chem.* (U.S.S.R.) **11**, 225-31 (1941).—*C.A.* 35, 7937^9.

Pure activated carbon was a catalyst at 200-500°C for the reaction $RHal + H_2 = RH + HHal$. The amt. of halogen substituted by H_2 in the presence of activated carbon at 400°C was as follows for the compds. investigated: PhBr, 3.0%; $CHCl_3$, 18.2%; BuBr, 42.0%; Me_3CCl, 51.0%; and $CH_2{:}CHCH_2Cl$, 58.0%. Addn. of H_2 or HCl to the double bond did not occur.

9824. Balandin, A. A. and Patrikeev, V. A. **Catalytic capacity of activated charcoal. Reactions between hydrogen and organic halides.** *Acta Physiochim. U.R.S.S.* **15**, 281-92(1941)(in German).—*C.A.* 37, 4959^1.

Several aliphatic and aromatic halides were passed at about 400°C over activated charcoal contg. 1-2% KOH. The extent of dehalogenation of org. halide was detd. from the amt. of AgCl formed: for PhBr at 350°C, 0.8%, at 475°, 18.2%; for $CHCl_3$, 1.6 at 350°, 42.2 at 425°; BuBr, 0.6 at 325°, 64.0 at 425°, 66.9 at 450°; allyl chloride, 21 at 375°, 58 at 400°; tert-BuCl, 19.8 at 375°, 51 at 400°. These data gave const. energies of activation. The desorption of HCl from the charcoal in a H_2 stream at 425°C was a 1st-order reaction, 93% complete in 2 hrs, 99 in 3 hrs, $k = 1.44$ min.$^{-1}$.

9825. Budnikov, P. P. and Krech, E. I. **Calcium sulfate as the source for preparation of chloro derivatives of sulfur. I. Chlorination of calcium sulfate in the presence of reducing agents. II. Chlorination of calcium sulfate under optimal conditions.** *J. Applied Chem.* (U.S.S.R.) 14, 747-54, 755-65(1941).—*C.A.* 37, 2893^3.

$CaSO_4$ + 4C (charcoal) was chlorinated at 225-850°C. $CaSO_4$ began to decompose at 345°C with evolution of Cl derivatives of S. Optimum temperature was 725°C, at which there was obtained a 96.2% yield. At 850°C the yield was 97.5% under the same condition. At 740-50°C the best mixture was $CaSO_4$-3C. At this composition the maximum yields were from carbon black or charcoal. Calculation showed that reduction of $CaSO_4$ by C to CaS and reaction of Cl_2 with $CaSO_4$ were endothermic.

9826. Danulat, F. **Pressure-gasification of solid fuels with oxygen.** *Gas- u. Wasserfach* 84, 549-52(1941).—*C.A.* 36, 4315^6.

Predried lump or briquetted brown coal was gasified with O_2 and steam under a pressure of 20-30 atm. Cooling the crude gas and recovering CO_2 by scrubbing with H_2O under pressure yielded a town gas contg. 23% of CH_4. Typical operating data were tabulated.

9827. MARKOVSKII, L. YA. **Catalytic agents for the production of carbon disulfide from the elements.** *Compt. rend. acad. sci. U.R.S.S.* 31, 350-1(1941)(in English).—*C.A.* 37, 821^7.

Sulfates and carbonates of Na, K, Ca, Fe, Ni, Mn, and Cu were tested for their catalytic activity in the production of CS_2 by passing S vapor through charcoal. Only Na and K proved very effective. Optima were 3-4% of Na or K as carbonates or sulfates. The formation of CS_2 passed through intermediate stages consisting of the formation and decomposition of fairly stable surface sulfides.

9828. SCOTT, G. S. AND JONES, G. W. **Effect of particle size on the rate of oxidation of anthracite.** *U. S. Bur. Mines, Rept. Investigations* 3546, 15 pp.(1941).—*C.A.* 35, 3060^8.

For sizes larger than 20-mesh, the initial rate of oxidation was directly proportional to the superficial surface area (150-350°C). For smaller sizes, the initial rate increased more slowly than increase in the surface area and appeared to reach a max. beyond which further subdivision of the particles had no effect. For temps. of 150, 200 and 250°, the rate of oxidation decreased regularly with time (or with increase in the amt. of O_2 consumed) for all sizes tested. At 300° and 350°C, for sizes under 20 mesh, the rate of oxidation decreased regularly with increase in amt. of O_2 consumed.

9829. TRAUSTEL, SERGEI. **Combustion [of coal-dust fuel] in suspension.** *Feuerungstech.* **29**, 1-6, 25-31, 49-60(1941).—*C.A.* 36, 1463^5.

The exchange of heat and material was analyzed mathematically and the results of theoretical investigations on the ignition and combustion time were given. The theoretical considerations were extended to high-speed combustion and to the effect of limited reactivity of the fuel.

9830. TRAUSTEL, SERGEI. **Practical calculation of gasification equilibria.** *Feuerungstech.* 29, 105-14(1941).—*C.A.* 36, 3932^5.

Even when the dimensions of the fuel bed, the phys. and chem. properties of the fuel, and the temp., compn. and rate of flow of the gasification medium were known, it was not possible to calc. in advance to what extent equil. would be attained. Two missing factors were: (*a*) the reactivity of the fuel, expressed as a purely physicochem. quantity, e.g., $kg/m^2/sec$; and (*b*) the material transfer figures between gas and solid material in a static fuel bed.

9831. TRAUSTEL, SERGEI. **Combustion of solid fuels.** *Feuerungstech.* 29, 225-9(1941).—*C.A.* 37, 2160^2.

The phys. phenomena in combustion, primary reactions of the combination of carbon with O_2, gasification, and rate of disintegration of the solid phase by the combustion reaction were discussed.

9832. TRAUSTEL, SERGEI. **Minimum contact time in externally heated reaction tubes.** *Gas- u. Wasserfach* **84**, 389-91(1941).—*C.A.* 37, 6841^6.

Reaction velocity in an externally heated tube contg. finely divided solid fuel was fixed by chem. and phys. "resistances". For the limiting case a min. contact time could be calcd. on a purely phys. basis. Chem. influences made themselves felt in a longer reaction period. The use of the temp. at the center of the charge as the reaction temp. might frequently lead to erroneous conclusions.

9833. TRAUSTEL, SERGEI AND REUTER, A. **Conversion of gases in the reduction zone of a gas producer.** *Feuerungstech* 29, 159-61(1941).—*C.A.* 36, 3932^9.

Equations derived for calcg. the gasification products at various degrees of conversion were applied to the case of the gasification of carbon with O_2 and steam under pressure. A calcn. was made for gasification under pressure with simultaneous washing out of CO_2.

9834. VULIS, L. A. AND VITMAN, L. A. **Reduction of carbon dioxide in a carbon channel.** *J. Tech. Phys.* (U.S.S.R.) **11**, 509-18(1941).—*C.A.* 35, 6502^7.

Preheated CO_2 flowed through a cylinder of electrode carbon of uniform temp. (900° to 1150°C), varying in length (34, 52, 57, 85 and 95 mm) and inner diam. (4-6 mm); standard condition of the canal surface was attained by preliminary heating in N_2 for 1.5 to 2 hrs. The compn. of the gas leaving the canal plotted against the gas output showed the reaction $C + CO_2 = 2CO$ to be of the first order, with an activation energy $E = 59$ kcal/mole and $k_o = 3 \times 10^9$ cm/sec. Comparison with the reaction between carbon and O_2 led to the conclusion that the carbon + CO_2 reaction had a negligible velocity below 900°C.

9835. ANON. **Sulfur removal.** *Report of the Institution of Gas Engineers' Committee of Inquiry. Gas World* **117**, 435-8(1942).—*C.A.* 37, 249^5.

The 3 available processes for reducing the organic-S to 10 grains per 100 ft^3 were the active carbon process, the oil-washing process, and the catalytic process of the Gas Light & Coke Co. With a suitable catalyst under proper temp. conditions it was possible to reduce the S-content of gas from 25 to 1 grain per 100 ft^3. The organic-S compounds in all supplies of town gas should be reduced to 10 grains per 100 ft^3 before distributing.

9836. FUCHS, WALTER AND SANDHOFF, A. G. **Theory of coal pyrolysis.** *Ind. Eng. Chem.* 34, 567-71(1942).—*C.A.* 36, 3026^7.

Aliphatic C—C linkages were first to break, C—H linkages were severed next as the temp. of 600°C was approached and exceeded; aromatic C—C linkages did not break readily in the temp. range of coal carbonization. In the range, 400-700°C, O-contg. complexes and other heterocyclic structures broke away from the coal (or semicoke) mols.

9837. GUILLIER, RENNE. **Some by-products of the saltpeter industry.** *Anales 1° congr. panamer.*

ing., minas y geol. 5, 2033-9(1942).—*C.A.* 45, 9815*g*.

The I_2 was recovered by elimination with vegetable carbon forming iodinated carbon, which after washing and drying at 100°C was distd., liberating the I_2 at 200°C. This shortened the storage and eliminated the H_3BO_3 in the washings. Decompn. of $NaNO_3$ now only utilized to 17% as fertilizer was suggested according to $6NaNO_3 + Al_2(SO_4)_3 = 3Na_2SO_3 + Al_2O_3 + 6NO_2 + 1\ 1/2\ O_2$.

9838. Hamai, Senzo; Hayashi, Shiro; Shimamura, Kiyoshi, and Igarashi, Hiroshi. **Physico-chemical investigation of catalytic mechanisms. IV. The Fischer-Tropsch synthesis of hydrocarbons. (Experimental series I.)** *Bull. Chem. Soc. Japan* 17, 166-71(1942).—*C.A.* 41, 4366*g*.

The reaction vessel of Terex glass was made double-walled, so that the gas mixt. ($CO + 2H_2$) led in could be preheated. The catalyst was made of Co, CeO_2, ThO_2, B_2O_3, and diatomaceous earth. The reaction was run at 200°C at the rate of flow 4 liters/hr. The reaction products were collected in two traps, condensed by water and solid CO_2-C_2H_5OH mixt., resp. In the initial stage CH_4 formation predominated, cutting down the oil formation, but as time proceeded side reactions other than oil formation were inhibited.

9839. Kobayashi, Ichiro. **Catalytic decomposition of coal light oil.** *Bull. Inst. Phys. Chem. Research* (Tokyo) 21, 311-20(1942).—*C.A.* 43, 7664*e*.

The decompn. of light oil (150°-300°C) obtained by liquefaction of Kawakami coal was studied in the presence of active charcoal catalysts. With increasing temp. the yield decreased, and the low-boiling fractions and quantity of gas increased. When the catalyst (contg. 5% K_2CO_3 + 1% KCl) was added, the quantity of H_2 in the gas increased with increasing temp., and the yield of acid oil decreased.

9840. Ogura, Toyojiro and Nagai, Horoyuki. **Reaction between methane and carbon dioxide.** *J. Soc. Chem. Ind. Japan* 45, 170-3(1942).—*C.A.* 43, 1944*h*.

The reaction of CH_4 and CO_2 in various proportions at 500-1200°C under ordinary pressure in the presence of Co or Ni catalysts was studied on exptl. and semi-industrial scales. The reaction was accelerated by using good catalysts and also by raising the temp. When there was insufficient CO_2, deposition of carbon was noticed. This was prevented by the addn. of steam to the mixed gas.

9841. Ota, Nobuto. **Water gas by the reaction of methane and carbon dioxide. II. Methods of preventing carbon formation on the catalyst.** *J. Soc. Chem. Ind. Japan* 45, 284-90 (1942).—*C.A.* 43, 1944*g*.

The formation of carbon on catalysts was prevented by selecting a suitable catalyst, and also by (a) elevating the reaction temp., (b) taking excess CO_2, or (c) adding H_2O to the reacting gas. When 30% excess CO_2 was used with the CH_4, the reaction proceeded smoothly at 800°C with a Ni-kieselguhr catalyst without any other admixture. Similar results were obtained with a gas having 30% H_2O (based on CH_4) at 700°C or 10% H_2O at 800°C.

9842. Pearl, Irwin A. and Benson, Henry K. **Catalytic oxidation of sulfite waste liquor by atmospheric oxygen.** *Ind. Eng. Chem.* 34, 436-8(1942).—*C.A.* 36, 2718^2.

When sulfite waste liquor was discharged into sea water, the immediate chem. O_2 demand was the only O_2 demand of consequence. At room temp. the aeration of 10% waste liquor in a tower by introduction of the air through a Carborundum block at the base of the tower had no effect upon its sulfite content; small quantities of $CuSO_4$, $FeSO_4$, $Co_2(SO_4)_3$, $Mn_2(SO_4)_3$ and $NiSO_4$ had no effect. Aeration in the presence of Pt, Fe_2O_3, Cr_2O_3, CuO or MnO_2 could materially reduce the O_2 demand, but the acid soln. dissolved the oxides and the catalysts soon disappeared from the porous pellets acting as carriers. Activated carbon was an effective catalyst for the oxidation of the chem. oxidizable compds. in the waste liquor.

9843. Schunck, Rezsö. **The production of benzene from coal gas.** *Magyar Mernök-es Epitesz-Egylet Közlönye* 76, 161-6(1942).—*C.A.* 39, 1281^9.

An Hungarian plant for the recovery and purification of benzene was described. The benzene was adsorbed from the coal gas (illuminating gas) on activated carbon. The plant capacity was 275,000 m^3 of the coal gas daily. Methods of testing both the crude and the purified benzene were described.

9844. Bente, Paul F. and Walton, James H. **The catalytic activity of activated nitrogenous carbons.** *J. Phys. Chem.* 47, 133-48(1943).—*C.A.* 37, 3911^3.

The catalytic activities of several nitrogenous carbons and one sugar carbon were compared by measuring their effects on the rate of decompn. of H_2O_2, the rate of oxidation of hydroquinone in various solvents, and the rate of oxidation of alk. potassium urate. The optimum temp. of activation was found to be 875°C. The carbons could be arranged in the same order of decreasing activity for all 3 reactions. The carbon prepd. from hexamethylenetetramine showed exceptional catalytic activity. KCN (0.001 N) inhibited all 3 reactions on the nitrogenous carbon but not on the sugar carbon. B.E.T. surface areas of the carbons ranged from 2000 to 600 m^2/g, but did not give a direct correlation with the catalytic activities.

9845. Bente, Paul F. and Walton, James H. **Effect of active nitrogen and of certain nitrogen compounds on catalytic properties of carbon.** *J. Phys. Chem.* 47, 329-37(1943).—*C.A.* 37, 5641^1.

The catalytic activities of carbons prepd. from lactose and from naturally occurring org.-N compds. were tested on the decompn. of H_2O_2 and on the oxidation of hydroquinone and K urate. Lactose carbon treated with active N_2 and NO showed a decreased activity. NH_3 caused a promotion which equaled that of carbon from org.-N compds. This effect was not due to retention of NH_3. Treatment at high temps. with N_2O caused a large promotion without any N-fixation.

9846. Bray, J. L., and Howard, R. E. **Hydrogenation of coal at high temperatures.** *Purdue Univ., Eng. Expt. Sta. Bull., Research Ser. No.* **90**, 55 pp. (1943).—*C.A.* **38**, 3448^5.

The hydrogenation of Indiana fourth-seam coal was investigated without the use of vehicles or catalysts in the range from 750° to 1060°F and at pressures up to 4500 lbs/in^2. The reaction bomb was constructed of a pearlitic Mn steel and was operated as a const.-vol. batch system. Data were given for the variation of gas compn. with time for various temps., and the equil. values of gas compn. were detd. The presence of H_2 appeared to modify tremendously the ordinary destructive distn. of coal, and the volatile matter distd. from the coal was ultimately reduced to CH_4 by a combination of cracking and hydrogenation.

9847. Fong, T. C. and Ragatz, R. A. **The action of carbonate catalysts in the carburization of steel.** *Trans. Am. Soc. Metals*, preprint No. 17, 25 pp. (1943).—*C.A.* **37**, 6620^4.

The evolution of CO_2 from plain charcoal and from charcoal mixts. with carbonates of Na, Ba or Ca was studied. The catalytic activity induced by Na_2CO_3 or $BaCO_3$ was sustained even after the percentage evolution of CO_2 had leveled off to a const. value. Effective functioning of a carbonate catalyst required a carbonate which reacted directly with carbon and which had a low dissocn. pressure.

9848. Imada, Fumio and Ono, Teisuke. **Studies on carbon. VII. Sulfonation.** *Technol Repts. Kyushu Imp. Univ.* **18**, 76-80 (1943).—*C.A.* **43**, 5572*d*.

By passing vaporized CS_2 and S with a stream of N_2 over active charcoal at 800-1100°C for 1 to 3.5 hrs, the equil. $CS_2 \rightleftarrows C + S_2$ was studied. The reaction proceeded mainly from left to right up to 1000°C for 1.5 hrs and reversed its direction after this point.

9849. Jäppelt, A. and Klaus, J. **The distillation of tar and tar fractions in the presence of surface-active coke.** *Oel u. Kohle* **39**, 569-74 (1943).—*C.A.* **38**, 2187^8.

The tar obtained by low-temp. carbonization of Upper Silesian gas coke and fractions from this tar were distd. in the presence of different grades of coke dust with varying surface activity; the coke had been activated by steam in the course of its production by low-temp. carbonization. The surface activity of the coke dusts was measured by detg. the heat of wetting with C_6H_6. Tar and coke dust, both anhyd., were mixed in a kneading machine and the briquets were distd. without cracking, with steam as heating medium. The yield and quality of the distillate depended on the magnitude of the internal surface of the coke dust used.

9850. Oza, Trambaklal Mohanlal and Shah, M. S. **The mechanism of the action of charcoal on KNO_3. II. Study of the reactions.** *J. Indian Chem. Soc.* **20**, 261-70 (1943).—*C.A.* **38**, 2258^7.

Charcoal reacted in different stages: (*1*) $4KNO_3 + 2C \rightarrow 4KNO_2 + 2CO_2$, (*2*) $4KNO_2 + 3C \rightarrow 2K_2CO_3 + CO_2 + 2N_2$ and (*3*) the flash reaction $KNO_3 + KNO_2 + 2C \rightarrow K_2CO_3 + CO_2 + N_2$. (*2*) was the major reaction and proceeded through the dissocn. of the KNO_2 produced in reaction (*1*) into K_2O, NO and N_2O_4. This was followed by a chain of vigorous reactions between the NO and N_2O_4 with charcoal, and the union of the CO_2 produced with the K_2O. In the flash stage, reaction (*3*), KNO_2 was produced from KNO_3 by reduction with charcoal, or by direct rupture into KNO_2 and O_2. The reaction chain, initiated by KNO_2, proceeded rapidly and charcoal burned with a flash in the mixt. of NO and O_2.

9851. Rideal, Eric K. **The mechanism of catalytic hydrogenation.** *Chemistry & Industry* **1943**, 335-8.—*C.A.* **38**, 15^7.

A metallic catalyst was covered with a monolayer of chemisorbed H_2 which was adsorbed without appreciable energy of activation. Further changes in H_2 retention with temp. were due to soln. of H_2 in the metal, or "activated diffusion". The methods of photoelec. thresholds and the change in contract potential caused by the presence of a monolayer were used to study the chemisorbed layer. The ortho-para H_2 conversion at a metallic surface was due to interaction between a chemisorbed and a van der Waals adsorbed species, and thus could be used as an indicator for chemisorbed H atoms. The theory of intermediate compd. formation best explained such hydrocarbon catalysis reactions as the exchange of H and D in C_2H_4 and C_3H_6, and the migration of the double bond in higher olefins under conditions when exchange occurred.

9852. Traustel, Sergei. **The calculation of gasification equilibra.** *Feuerungstech.* **31**, 111-14 (1943).—*C.A.* **40**, 5902^4.

It had been found that the calcn. of the equil. in advance was not possible, as the reactivity of the fuel and the transfer coeff. between gas and solid material in a static fuel bed were not known, and had to be estimated. A new calcn. method was developed by which systematic estimations were made. No graphic methods were required and volatile constituents of the fuel could be taken into account. The equil. consts. were detd. as a function of temp. from $\log k_p = (a/T) + b$, and the consts. a and b were given in the range from 600 to 1500°K.

9853. Chukhanov, Z. F. **Thermal regime of burning and gasification of a layer of solid fuel.** *Compt. rend. acad. sci. U.R.S.S.* **44**, 269-73 (1944).—*C.A.* **39**, 3650^2.

The heat transfer through a layer of burning fuel was studied. The flow of heat through the bed was primarily by radiation. The rate of heat flow increased with decrease in the particle size of the fuel.

9854. Funasaka, Wataru and Horikawa, Kihachiro. **Catalytic decomposition of hydrocarbon oil. I. Decomposition of cetane by alumina and silica gels.** *J. Soc. Chem. Ind. Japan*, **47**, 160-2 (1944).—*C.A.* **42**, 7010*i*.

For the catalytic decompn. of cetane the optimum reaction temp. was found at 525°C. The flow velocity of oil had no remarkable influence. The Al_2O_3 gel was more effective than silica gel and had greater ability to produce aromatic compds. The yield of cracked gasoline was approx. 20%. The gasoline contained olefins but no naphthenes. The gaseous decompn. products were also olefins. The decompg. power of active charcoal was extremely high and aromatic compds. also were formed.

9855. Griffith, R. H. and Plant, J. H. G. **Catalytic removal of organic sulfur compounds from coal gas. Recent development work of the Gas Light and Coke Company.** *Gas. J.* 244, 48-50, 54-4(1944).—*C. A.* 38, 5063^5.

A plant for the catalytic removal of org. S compds. from coal gas contained 3600 lbs of Ni subsulfide catalyst on china clay pellets in 4 vessels, each with a cubical content of 15 ft^3. The horizontal-retort gas from the oxide boxes and $C_{10}H_8$ washer was preheated to about 220°C and then passed through the catalyst vessels, usually 3, in parallel. The purified gas leaving the vessels at about 350°C was cooled in the heat exchanger and in a washer-cooler. A 2% soln. of Na_2CO_3, which was circulated through the latter, also dissolved the oxides of S. The NO was reduced at the same time from an av. concn. of 1 p.p.m. to less than 0.1.

9856. Hofmann, U. and Höper, W. **Active spots in catalysis.** *Naturwissenschaften* 32, 225-6 (1944).—*C. A.* 40, 2377^9.

The carbon Thermax was heated to 1300°C and was then shown to be of spherical grains 3500 A. in diam. Each grain had 10^6 graphite crystals of 30 A. each. After 24 hrs graphitizing at 3000°C the grain size was the same, but only 1 to 3 graphite crystals were found. The adsorption of methylene blue was the same with the 2 products. The activity of the 2 types of catalyst in the formation of HBr was detd. at 150°C. The no. of active spots on individual crystals did not seem to be related to the no. of graphite crystals present.

9857. Hulburt, Hugh M. **Chemical processes in continuous-flow systems. Reaction kinetics.** *Ind. Eng. Chem.*, 36, 1012-17(1944).

Data on flow systems furnished kinetic information as reliable as that from static expts. The analysis was applicable rigorously only for homogeneous reactions in long tubes. It failed if the mechanism of reaction changed with the pattern or velocity of flow, as when surface reactions controlled the rate. If adsorption reached equil., it was possible to express the reaction velocity as a function of the bulk phase concns. through the adsorption isotherm. At fast flow rates, however, diffusion radially to the reactor or catalyst surface will be rate controlling and the analysis must then be revised.

9858. Ramat, Auguste. **Use of adsorption in the purification and dehydration of gases.** *Chimie & industrie* 52, 64-7(1944).—*C. A.* 40, 2701^2.

The principles of the purification and dehydration of gases by adsorption was explained. The more important industrial applications (debenzolation and desulfuration of illuminating gas, drying of air, dehydration, and purification of CO_2) were discussed.

9859. Areshidze, Kh. I. **Investigation of hydroaromatic hydrocarbons in Mirzaan gasoline, 95°-122°C fraction by dehydrogenation catalysis.** *Doklady Akad. Nauk S.S.S.R.* 50, 193-6 (1945).—*C. A.* 43, 4838*i*.

The petroleum fraction was freed of aromatic hydrocarbons by 99% H_2SO_4 and the fraction b. 95°-122°C was subjected to catalytic dehydrogenation over Pt-carbon at 300-5°C. The aromatic content of the product (detd. by 30 min. shaking with 99% H_2SO_4) was 26.6 vol. %. The resulting sulfonates were hydrolyzed and the hydrocarbons identified as: trace of C_6H_6, toluene, EtPh, *m*-xylene and *o*- and *p*-xylenes.

9860. Bailar, John C. Jr. and Work, J. B. **The role of catalysis in the preparation and reactions of some Co(III) and Cr(III) amines.** *J. Am. Chem. Soc.* 67, 176-9(1945).—*C. A.* 39, 1366^5.

Many reactions in which N was coordinated to Co or Cr were particularly susceptible to catalysis by charcoal. It seemed to be immaterial whether the N was NO_2, a primary amine, or NH_3. SiO_2 and Raney Ni also were effective, but charcoal seemed to be most suitable for practical purposes. In the presence of charcoal, aq. NH_3 displaced both Cl from cis-$[Co(en)_2Cl_2]^+$, giving preponderantly the trans product, $[Co(en)_2(NH_3)_2]^{+++}$. $[Cr(en)_3]Cl_3$ was readily prepd. by the reaction of hydrated $CrCl_3$ and hydrated $C_2H_4(NH_2)_2$ in the presence of charcoal. In the presence of charcoal, $NaNO_2$ reacted with $[Cr(NH_3)_6]^{+++}$ and aq. NH_3 reacted with $[Co(NO_2)_6]^{---}$ to give $[Co(NO_2)_3(NH_3)_3]$.

9861. Chukhanov, Z. F. **Thermal regime of semicoking, burning, and gasification of particles in a solid fuel. II.** *Compt. rend. acad. sci. U.R.S.S.* 47, 185-9; *Doklady Akad. Nauk S.S.S.R.* 47, 190-4(1945).—*C. A.* 40, 4863^7.

Criteria were proposed for assessing the relative importance of heat exchange in a fuel bed due to conduction, convection, and radiation. The dependence of these functions on temp., gas velocity and compn., particle size and particle cond. was shown. Thermal control of the system by means of the most favorable method, usually convection, may be effected by the adoption of appropriate conditions.

9862. Dulou, R. **Catalysis by nonmetallic adsorbents.** *Chimie & industrie* 54, 396-403 (1945).—*C. A.* 40, 5985^9.

9863. Pshezhetskiĭ, S. Ya. **Theory of the diffusion retardation of heterogeneous catalytic reactions.** *J. Phys. Chem.* (U.S.S.R.) 19, 376-81(1945).—*C. A.* 40, 1726^1.

When a gas mixt. traversed a bed of catalyst, the concn. of the reaction product in the outgoing gas depended on the rate of diffusion of the reaction product from the interior of the catalyst grain to its surface and on the rate of diffusion of this product from the grain surface into the gas current. A formal theory was given for both these rates. The difference between the apparent and the true reaction consts. was proportional to the velocity of gas flow and to the square of the grain diam.

9864. Roginskiĭ, S. Z. **Poisoning of catalysts.** *Compt. rend. acad. sci. U.R.S.S.* 47, 478-81; *Doklady Akad. Nauk S.S.S.R.* 47, 497-500(1945). —*C.A.* 40, 4942^{6}.

Basic peculiarities of the isotherms of catalyst poisoning of broad nonuniform surfaces were discussed.

9865. Roĭter, V. A.; Gaukhman, S. S.; Pisarzhevskaya, N. P., and Gvaliya, T. M. **Kinetics and mechanism of catalytic conversion of carbon monoxide.** *J. Applied Chem.* (U.S.S.R.) 18, 439-49(1945)(English summary). —*C.A.* 40, 4593^{6}.

The dependence of yield of CO conversion to H_2 and CO_2 in the presence of H_2O was studied with the following factors: space velocity, total and partial pressures of the components, between 400° and 500°C over K-carbon catalyst and Fe oxide catalyst of "nitrogen" type. A new theory for the K-carbon catalyst proposed the following scheme: $2KOH + CO = K_2CO_3 + H_2$; $K_2CO_3 + H_2O = 2KOH + CO_2$, with summary result: $CO + H_2O = H_2 + CO_2$. In case of the Fe catalysts there was evidence for considerable effect of the following reaction sequence; $2CO = CO_2 + C$; $C + 2H_2O = CO_2 + 2H_2$.

9866. Anon. **Removal of organic sulfur compounds from gases.** *Gas Research Board*, No. 24; *Gas J.* **248**, 1102, 1107, 1154, 1159(1946). —*C.A.* **41**, 4292*b*.

Use of active charcoal as a support for the Cu-Cr catalyst rendered it more active for removal of org. S from gas at high space velocities than did alumina. The optimum temp. for use of the activated carbon was 270°C, although the variation in performance over the range 250°-300°C was not great. Nickel hydroxide, pptd. without carrier or binder and contg. 1-2% S as sulfate to inhibit the synthesis of CH_4, was effective in completely adsorbing traces of H_2S from gas at 150°C, until it had adsorbed 9.9% of its wt of S. The addn. of 1% to the reagent allowed the temp. to be raised to 200°C, but then only 7.5% of S was adsorbed. The amt. of Ni hydroxide required to adsorb the org. S compds. remaining after the first conversion stage would be only 3-4 lb per million ft^3 of water gas treated. In preliminary expts. on the removal of org. S before the removal of H_2S, a Cu-Cr catalyst was used.

9867. Arthur, J. R. **The combustion of carbon monoxide.** *Bull. Brit. Coal Utilisation Research Assoc.* **10**, 129-34(1946).—*C.A.* 40, 6282^{4}.

The more important factors in the high-temp. oxidation of CO were reviewed.

9868. Avramenko, L. I. **The reaction between hydrogen atoms and carbon.** *J. Phys. Chem.* (U.S.S.R.) 20, 1299(1946)(in Russian).—*C.A.* 41, 2998*f*.

H atoms produced in a glowing discharge reacted at 100°C with soot. The reaction product showed a band at 4317A. indicating CH radicals.

9869. Frost, A. V. and Lapin, Yu. P. **Dehydrogenation of cyclohexane and the structure of the active centers of dehydrogenating catalysts.** *Vestnik Moxkov. Univ.* 1946, 95-103.—*C.A.* 42, 6630*a*.

Catalysts were prepd. by impregnating the carrier with $PdCl_2$ until colorless, filtering, drying at 120°C and reducing 2 hrs in a stream of H_2 at 400°C. Dehydrogenation was carried out at 320°C, rate of flow 0.1 ml cyclohexane/min. On active charcoal (3 g) with an ash content 1.4%, Pd 0.0119, 0.0042, 0.0015, 0.0006, 0.00017 g/g charcoal the conversion was 41, 65, 16, 5, 2.5%, resp. Pd (0.0002 to 0.12 g/g cryst. MgO) had a surface of 58.5 m^2/g by adsorption of stearic acid in CCl_4 and only one kind of active center.

9870. Grekhnev, M. A. **Dehydrogenation of isoborneol with a copper catalyst made without reduction in hydrogen.** *J. Applied Chem.* (U.S.S.R.) 19, 1271-6(1946)(in Russian).—*C.A.* 41, 7214*i*.

With a catalyst prepd. by impregnating charcoal with a 50% soln. of $Cu(NO_3)_2$, drying and heating at 550°C, the amt. of H_2 liberated from isoborneol in 2.5 hrs at 200°C was about 98% of theory; catalysts heated to 500 and 400°C gave only about 92 and 86%, resp. Heating the catalyst on charcoal resulted in partial reduction to Cu which progressed further in the course of the reaction. Addn. of KOH was more effective than NaOH, the latter more effective than CaO. Addn. of 0.1% $Ba(NO_3)_2$ to the $Cu(NO_3)_2$ soln. promoted the reaction particularly in the initial stages and shortened its completion.

9871. Key, A. and Eastwood, A. H. **45th report of the Joint Research Committee of the Gas Research Board and the University of Leeds. The removal of sulfur compounds from coal gas and synthesis gas at atmospheric pressure.** *Gas Research Board, Copyright Pub. No.* 14/4, 42 pp.(1946).—*C.A.* 43, 3169*i*.

A catalyst composed of Cu sulfide and Cr oxide supported on active carbon or activated Al_2O_3 would effect a 98% reduction in the org. S content of a water gas contg. 15 grains per 100 ft^3 when the gas was passed over it at a high space velocity and at 250°C. A total of 3 treatments was required to reduce the S concn. to 0.002 grains per 100 ft^3 with removal of the H_2S, which was formed after each treatment. The catalyst was inactive when used for the treatment of coal gas below 400°C, owing to the presence in the gas of certain unsatd. compds., particularly those of the C_2H_2 type. By treatment of the coal gas with a Ni sulfide or Mo sulfide catalyst at 300°C and at a space velocity of 6000 vol. of gas per vol. of catalyst space per hr, the C_2H_2 was removed.

9872. Kobozev, N. I. **Catalase action of various catalysts. The catalytic activity and**

structure. *Acta Physicochim. U.R.S.S.* 21, 469-518(1946)(in English).—*C.A.* 41, 2309*h*.

The action of catalase and of other catalysts capable of speeding up the evolution of O_2 from H_2O_2 was analyzed on the basis of 3 reactions. The deduced true activities per active center at 0°C in relative units for the various catalysts were: MoO_4^-, CrO_4^-, WO_4^- and I^-, 0.1; Fe^{+++}, 1.0; $Cr_2O_7^-$, 11.0; Fe^{+++} on charcoal, 100; hemin, 50 to 650; hemin on charcoal, 800; catalase, 5×10^8; Fe_3O_4 and MnO_2, 10^4; and Pt-black sol, 10^6. The model of an intermediate complex holding the 2 O atoms was deduced in which thermodynamic repulsion between the O atoms decreased as the total amt. of supporting material to which the active centers were attached increased.

9873. Kobozev, N. I. **The ensemble and aggravation principles in catalysis. II. The aggravation principle and structural classification of catalysts.** *Acta Physicochim. U.R.S.S.* 21, 943-57(1946)(in English).—*C.A.* 41, 2308*h*.

The smallest cluster of atoms still possessing catalytic properties was termed the "active element" and was denoted by Φ. Φ frequently coincided with some chem. element. "Aggravation" of active element-formation might involve attachment of any mol. groups that were catalytically non-specific. "Association" of active elements might involve: $n\,\Phi \rightarrow (\Phi)_n$, $\Phi_1 + \Phi_2 \rightarrow (\Phi_1\Phi_2)$, or $\Phi + a \rightarrow \Phi\,[a]$. Specific examples included ensembles of chromate ions, phytin, fructose diphosphate, and thyroxine. Activators and promotors might serve as true activators of ensembles, and also as stabilizers of $(\Phi)_n$ without altering their structure and activity. The adsorption of hemin on charcoal was not merely its fixation on the surface, but also a further aggravation of Φ by the surface.

9874. Kobozev, N. I. and Zubovich, I. A. **Specific effects of micro amounts of heavy metals on the rate of oxidation catalysis.** *Compt. rend. acad. sci. U.R.S.S.* 52, 131-4 (1946).—*C.A.* 41, 1540*d*.

Various catalysts were prepd. by simultaneous or successive adsorption on sugar charcoal (surface area approx. 200 m^2/g) from soln. of the salts. In each case the concn. of the first metal was held at 0.1% of the final catalyst, and that of the 2nd metal was varied: Fe^{+++}, Cu^{++}; Cu^{++}, Fe^{+++}; Fe^{+++}, Ag^+. The activity of the resulting catalyst was measured by detg. the no. of g mol. of substrate transformed per min. The activity of one metal was strongly affected by the addn. of micro amts. of another, and this effect was about the same for catalase (decompn. of H_2O_2) or oxidase (oxidation of Na_2SO_3) except that catalase was inhibited whereas oxidase was enhanced.

9875. Lapin, Yu. P. and Frost, A. V. **Investigation of the active centers of dehydrogenating catalysts in the reaction of dehydrogenation of cyclohexane.** *Compt. rend. acad. sci. U.R.S.S.* 53, 801-3(1946)(in English).—*C.A.* 41, 4027*i*.

Charcoal (a porous carrier) and cryst. MgO (nonporous) with Pd and Ni were used. The catalysts were prepd. by the adsorption of $PdCl_2$ from a soln. with subsequent reduction to Pd at 400°C. The curve of specific activity in the dehydrogenation of cyclohexane with a Pd catalyst on charcoal showed a decline, then a rise to max., with subsequent decline as the ratio of the catalyst-covered area to total area of the carrier was increased. The max. of specific activity corresponded to 2 atoms of Pd in an active center.

9876. Liberman, A. L. and Kazanskiĭ, B. A. **Hydrogenation of dimedon.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* 1946, 77-82(in Russian).—*C.A.* 42, 5861*c*.

Dimedon in aq. suspension of Pt black did not adsorb H_2 at any significant rate and addn. of HCl did not improve it; a somewhat greater hydrogenation rate was observed in AcOH, but this rapidly dwindled to 0. Dimedon and an aq. suspension of platinized carbon also did not adsorb H_2; addn. of a little H_2PtCl_6, however, led to theoretical adsorption of H_2.

9877. Mozingo, Ralph. **Palladium catalysts.** *Org. Syntheses* 26, 77-82(1946).—*C.A.* 41, 644*h*.

Details were given of the prepn. of Pd on $BaSO_4$, of 5 or 10% Pd on carbon (Darco G-60), and of $PdCl_2$ on carbon.

9878. Pshezhetskiĭ, S. Ya. and Rubinshteĭn, R. N. **Progress of heterogeneous catalytic reactions in a stream. I. General equations. A heat-insulated** system. *J. Phys. Chem.* (U.S.S.R.) 20, 1421-34(1946)(in Russian).—*C.A.* 41, 2972*e*.

A general quant. theory was given for the steady state of heterogeneous reactions taking place when a gas streamed through a bed of catalyst. The rate of the over-all reaction could be detd. by the rate of the actual reaction process, by the rate of diffusion toward the catalyst, or by that within the grains of the catalyst.

9879. Reznik, Delia. **Production of pulverulent solid fuels from vegetable matter.** *Industria y quim. (Argentina)* 8, 328-42(1946).—*C.A.* 41, 3599*c*.

Com. powd. charcoal was made suitable for use as fuel by impregnating with 10-20% asphalt as an aq. emulsion and heating to 250-300°C in air to granulate and to oxidize the asphalt. This improved combustibility, ignition temp., flame length, calorific value, and bulk d.

9880. Szczeniowski, Boleslaw. **Theoretical analysis of combustion gases.** *Rev. trimestr. can.* 32, 196-223, 294-327(1946).—*C.A.* 42, 1720*c*.

Under certain conditions, and with a no. of arbitrary assumptions, general equations were set up which related the wt % of the constituents of various fuels to the amt. of O_2 required for combustion. Equations were derived for combustion of gases, liquids, and solids, with O_2 and N_2 in various proportions to each other and to the fuel, and by taking into account dissocn. Combustion diagrams for various cases were shown.

9881. TODES, O. M. **The kinetics of exothermal catalytic reactions in a current. I. Theory of reaction on a long contact layer.** *Acta Physicochim. U.R.S.S.* 21, 689-704(1946)(in English).—*C.A.* 41, 1537*c*.

Two types of thermal regimes in flowing systems of exothermal reactions on a long catalyst layer were possible, analogous to the "quiet reaction" and "combustion" regimes for homogeneous reactions. At low concns. with first-order reactions, the reaction occurred with a small heating effect over a considerable distance along the reaction vessel. Above the crit. concn., defined as a function of activation energies and catalyst properties, there were two sharply different reaction zones: (1) a narrow zone of steady combustion, where the reaction proceeded at a high velocity and heating up, (2) beyond this zone the combustion went to completion with a small heating effect.

9882. WINN, HUGH; SHELTON, J. REID, AND TURNBULL, DAVID. **Role of carbon in oxidation of GR-S vulcanizates.** *Ind. Eng. Chem.* 38, 1052-6(1946).—*C.A.* 40, 7690^4.

Carbon black was a catalyst of this oxidation, but the increased rate of absorption of O_2 with increase in the proportion of carbon black was a function of surface area. The particular furnace-process carbon blacks studied were only 55% as active as channel carbon black in promoting oxidation. The linear stage of O_2 absorption involved 2 types of reaction with the remaining oxidizable centers: (1) a reaction with centers not under catalytic influence, and (2) a reaction catalyzed by carbon black.

9883. BOGATSKII, D. P. **Reduction of nickel oxides with solid carbon in connection with their dissociation.** *Bull. acad. sci.* (U.R.S.S.), *Classe sci. tech.* 1947, 105-12(in Russian).—*C.A.* 41, 5367*d*.

Thermograms of NiO_2 heated with carbon black (pure soot from CO) showed a first endothermal min. at 115-20°C corresponding to dissocn. of NiO_2, occurring at a somewhat lower temp. than in the absence of carbon; dissocn. of NiO began at 320-90°C, with formation of a solid soln. with Ni_2O and oxidation of carbon. With a mixt. of NiO and carbon, dissocn. of NiO with simultaneous oxidation of carbon occurred at about 200-20°C; reduction of NiO by CO formed from carbon took place to some extent at 450-500°C. With a mixt. of Ni_2O and carbon, strongly endothermal reduction became noticeable at 585-600°C, going over into exothermal reduction by CO; above 700°C reduction of Ni_2O by solid carbon, with regeneration of CO, again became predominant owing to scarcity of CO; at still higher temp., reduction by CO set in once more. The metal obtained at high temp. by reduction with carbon was coarsely cryst. and much less reactive than the powdery Ni obtained by reduction with H_2 at low temp.

9884. BORESKOV, G. K. **Effect of heat and material transfer on the rate of contact reactions.** *Khim. Prom.* 1947, No. 8, 1-6, No. 9, 5-11.—*C.A.* 43, 3698*g*.

The phys. reactions were divided into 3 main groups: (1) exchange reaction between the gas flowing in channels formed by the granular catalyst and the surfaces of these granules; (2) material and heat transfer within the granules of the catalyst, and (3) heat transfer between the granules of the catalyst in a direction normal to the plane of the internal heat transfer. For slow catalytic reactions where the rate of reaction on the inner surfaces did not vary materially from the rate of reaction on the outer surface, the most favorable was a fine-pore structure. For medium-rate reactions where the rate on the inner surfaces was noticeably slower than on the outer, but where the transfer to the outer surface did not materially affect the overall rate, the preferred structure of the granules was capillary, in which the diam. of the capillaries equaled the length of the mean free path. For high-rate reactions, the preferred structure of the catalyst was the same as for medium-rate, but the capillaries need not extend too deep inward.

9885. CHARTROU. **Processes for the hydrogenation and treatment of hydrocarbons of I. G. Farbenindustrie.** *Bull. assoc. franc. techniciens petrole.* No. 61, 23-59(1947).—*C.A.* 41, 6689*c*.

The I. G. Farbenind. industrial-scale processes were reviewed relating to two-stage catalytic hydrogenation of coal and lignite, aromatization of the hydrogenated product, dehydrogenation, hydroforming, manuf. of isoöctane, alkylation, catalytic cracking, and refining of paraffin wax, etc.

9886. EVANS, ALWYN G. AND MEADOWS, G. W. **Catalytic oxidation of sulfur dichloride by oxygen.** *Trans. Faraday Soc.* 43, 667-74(1947).—*C.A.* 42, 4082*i*.

The oxidation of SCl_2 by dry air was detd. with activated charcoal as a catalyst. The catalyst was prepd. by shaking 1300 g of charcoal in a soln. contg. 200 g of $CaCl_2.8H_2O$ in 2 liters of water. The mixt. was filtered, washed with 250 ml alc., followed by 200 ml ether, and dried at 100°C in an oven. The oxidation was investigated at 193°, 238°, and 320°C, and the equil. const. detd. for each temp. The max. yield of $SOCl_2$ was obtained by using a SCl_2/O_2 ratio of 2. SO_2Cl_2 did not react with I_2 or KI, but under the conditions used, it underwent hydrolysis; i.e., 1 mol. of SO_2Cl_2 liberated four equivs. of acid.

9887. FANO, UGO. **A possible contributing mechanism of catalysis.** *J. Chem. Phys.* 15, 845 (1947).—*C.A.* 42, 1112*b*.

Types of catalytic mechanism were considered in which the mass of the catalyst was important. The mechanism suggested was probably not the main factor in catalysis, but it might be one of several concurrent factors of comparable importance.

9888. FOSTER, JOHN F. AND VORUM, DONALD A. **The mechanism of water-gas reaction. Report on experimental work done for the A.G.A.** *Gas World* 127, 259-64(1947).—*C.A.* 41, 6692*h*.

Exptl. work was started on a cylindrical generator with a cross-sectional area of 1 ft^2 and an internal height of 46 in. The primary objective was to characterize the fuel bed of the generator as completely as possible with respect to temps., gas compn. occurring at fixed times, locations, and rates of material flow. Plots of CO/CO_2 ratios against either time or distance above grates failed to show regularity, and were not subject to interpretation until more data were available. Rapid and accurate detn. of the steam content of the gases in the fuel bed was necessary for the study of the progress of gasification in the generator.

9889. Ghosh, J. C.; Bhattacharyya, S. K.; Muthanna, M. S., and Mitra, C. R. **Electrolytic reactions on porous carbon anodes. I. Preparation of *p*-benzoquinone by the oxidation of benzene.** *Current Sci.* **16**, 87(1947).—*C.A.* **41**, 4725*c*.

Thick-walled porous carbon tubes closed at the bottom were soaked in a soln. of $K_3Fe(CN)_6$. After being dried in an oven they were used as anodes in 2% H_2SO_4 contg. $K_3Fe(CN)_6$ as a catalyst. Diffusion of benzene through the tube under certain but undefined conditions gave 51% current efficiency in conversion to *p*-benzoquinone.

9890. Ghosh, J. C.; Bhattacharyya, S. K.; Rao, M. R. A.; Muthanna, M. S., and Patnaik, R. B. **Electrolytic reactions on porous carbon anodes. II. Preparation of chlorobenzene from benzene.** *Current Sci.* **16**, 87-8(1947).—*C.A.* **41**, 4725*d*.

C_6H_6 was recycled through a porous carbon anode into a bath of monochloracetic acid in concd. HCl. At c.d. 0.026 amp./cm^2 and 38°C current efficiencies were 33, 68, and 89% with I_2, $FeCl_3$, and cyanuric acid as catalysts, resp.

9891. Ghosh, J. C.; Bhattacharyya, S. K.; Muthanna, M. S., and Patankar, A. D. **Electrolytic reactions on porous carbon anodes. III. Preparation of ethylene chlorohydrin and ethylene glycol from ethylene.** *Current Sci.* **16**, 88(1947).—*C.A.* **41**, 4725*e*.

Ethylene was fed to a porous carbon tube anode at a rate of 57 ml/hr/cm^2 of anode surface. With a c.d. of 0.023 amp./cm^2 and in 10% NaCl soln. both ethylene chlorohydrin and ethylene glycol were formed. The current efficiency on chlorohydrin was 91% at 1°C and 1.1% at 91°C, while the efficiency on glycol was 5.4% at 1°C and 16.5% at 91°C.

9892. Ghosh, J. C.; Bhattacharyya, S. K.; Muthanna, M. S., and Parikh, R. K. **Electrolytic reactions on porous carbon anodes. IV. Preparation of chloral from alcohol.** *Current Sci.* **16**, 88(1947).—*C.A.* **41**, 4725*f*.

Alc. was introduced through a porous carbon anode into a bath of satd. NaCl soln. at 100°C to yield chloral, which distd. off. At a c.d. of 0.04 amp./cm^2 and with an anode impregnated with 6.5% by wt of cyanuric acid, the current efficiency on chloral was 33.4%. Besides chloral and chloral alcoholate, monochloracetic acid and aldehyde and ethyl acetate were obtained as by-products in yields depending on conditions.

9893. Glushnev, V. E. and Vasil'ev, S. F. **Catalytic desulfurization of reforming gasoline with phosphoric acid and zinc chloride.** *Izvest. Acad. Nauk S.S.S.R., Otdel. Tekh. Nauk* **1947**, 829-33.—*C.A.* **43**, 8125*d*.

Catalytic desulfurization of distillate from a high-S petroleum was investigated by using H_3PO_4 on activated carbon, $ZnCl_2$ on activated carbon, H_2SO_4, and activated carbon. The distillate used in the expts. had S-content 0.42% before washing, 0.40% after washing with alkali soln., and octane no. 64.5. After catalytic treatment, percentage of S, octane no., and yield of gasoline (wt %) were, resp.: H_3PO_4 on activated carbon, 0.15, 74, 91; $ZnCl_2$ on activated carbon, 0.17, 71, 89.3; H_2SO_4, 0.19, 65.5, 85; activated carbon, 0.40, 65, 94.

9894. Iley, R. and Riley, H. L. **Preparation of colorless Carborundum.** *Nature* **160**, 468(1947).—*C.A.* **42**, 434*b*.

Carbon was deposited on fused Si in electrically heated concentric Vitreosil tubes (0.4 in. internal diam.). C_2H_4 satd. with H_2O was passed through the tube at 1200°C (measured by a Pt/PtRh thermocouple) at a rate of 25 liter/hr. In 1 expt., which lasted several hrs, in addn. to the carbon deposit a white fluffy moldlike growth formed on the center part of the outer surface of the inner tube. X-ray powder photographs showed this to be a microcryst. cubic Carborundum.

9895. Kinney, Corliss R. **Sources of acetic acid obtained by oxidation of coal.** *J. Am. Chem. Soc.* **69**, 284-9(1947).—*C.A.* **41**, 3275*g*.

The coal (1 g) was oxidized with 25 ml concd. HNO_3 and 20 g $Na_2Cr_2O_7$ or $K_2Cr_2O_7$ by refluxing 0.5 hr and then distg. as long as acid was formed. Data were given for a large no. of coals, sucrose, cotton and wood cellulose, a variety of lignins, humus, and various phenols. The structures in coal which yield AcOH on oxidation were largely decompd. by carbonizing at 500°C. The yield of AcOH from bituminous coals had a direct relation to the amount of CH_4 produced on carbonization.

9896. Kitaĭgorodskiĭ, I. I.; Sentyurin, G. G., and Rishina, V. A. **Reduction of sodium sulfate in glass manufacture.** *Glass Ind.* **28**, 636(1947).—*C.A.* **43**, 7203*e*.

Addn. of several times the quantity of wood charcoal theoretically required to reduce the Na_2SO_4 in the glass batch contg. sand 72.35, Al_2O_3 1.89, chalk 10.50, MgO 3.50, borax 2.46, Na_2SO_4 37.82 parts, when heated to 1100°C, left much sulfate unreduced. Further test-melts were made at 1100°C, 1200°C, 1300°C, and 1350°C, with wood charcoal, electrode carbon, anthracite, coke, and SiC. The 1:1 mixt. of wood charcoal and coke gave the best reduction.

9897. Lewis, Warren K. **Kinetics of the reactions of steam and carbon dioxide with carbon.** *Chem. Eng. News* **25**, 2815-18(1947).—*C.A.* **41**, 7212*e*.

The advantages of the powder-bed technique for the producer-gas and water-gas reactions were described.

9898. MUSAEV, I. A. AND GAL'PERN, G. D. **Platinized carbon in hydrogenation and dehydrogenation of hydrocarbons.** *Bull. acad. sci. U.R.S.S., Classe sci. tech.* 1947, 805-8(in Russian).—*C.A.* 42, 1484*h*.

The catalyst was prepd. by impregnating 70 g active carbon with a satd. soln. contg. 65 g $H_2PtCl_6.6H_2O$, drying the next day on a water bath, and reducing in a stream of electrolytic H_2 6 hrs at 150°C then 6 hrs at 200°-210°C, and finally heating to 310°C. It was effective in practically complete hydrogenation of C_6H_6 to cyclohexane at any temp. between 50° and 180°C at rates of feeding of 3.6 and 7.2 ml/hr, H_2 3.51 liter/hr.

9899. NADZIAKIEWICZ, JULIAN. **The influence of mild hydrogenation on the coking properties of some coals of the Polish coal basin.** *Biul. Inst. Nauk.-Badawczego Przemyslu Weglow.* (Katowice) No. 2, Komun. No. 20, 1-42(1947) (English summary).—*C.A.* 46, 4769*f*.

Eight kinds of noncoking and poorly coking coal were hydrogenated in a rotary autoclave at 400°C under an initial H_2 pressure of 80-100 atm., in the absence of oil and catalysts. The hydrogenated coal had good coking properties, agglutinating power, and a wide plasticity range (up to 263°C). The H_2 consumption reached 1.67%, based on dry coal. The material balance and yield of reaction products were tabulated.

9900. ODELL, WILLIAM W. **Gasification of solid fuels in Germany by the Lurgi, Winkler, and Leuna slagging-type gas-producer processes.** *U. S. Bur. Mines, Inform. Circ.* No. 7415, 46 pp.(1947).—*C.A.* 42, 1040*a*.

Operating data relative to 3 processes employing free O_2 as a gasmaking fluid were discussed. The Winkler and Lurgi processes were adapted for use in gasifying fuels at temps. below their ash-softening points and required a highly reactive fuel.

9901. SHUIKIN, N. I.; NOVIKOV, S. S., AND TULUPOVA, E. D. **Effect of unsaturated hydrocarbons on the dehydrogenating properties of platinum catalysts.** *Bull. acad. sci. U.R.S.S., Classe sci. chim.* 1947, 89-95(in Russian).—*C.A.* 42, 4437*a*.

Mixts. of a de-aromatized gasoline fraction were subjected to prolonged dehydrogenations at 300-305°C on a 5% Pt catalyst on activated charcoal, 50 cm high, 48 g, rate of flow 1 ml/min. The activity of the catalyst before, during, and after the runs was tested by the yields of dehydrogenation of cyclohexane. Marked inactivation was brought about by 1-ethyl-1-cyclopentene. Cyclohexene alone, in a slow H_2 stream, left the activity of the catalyst unchanged.

9902. TOTZEK, FRIEDRICH. **Gasification of coal by the Koppers-Totzek process.** *Stahl u. Eisen* 66/67, 363(1947).—*C.A.* 43, 5923*g*.

The most satisfactory results were obtained with an air-steam or an O_2-steam mixt. at about 1200°C, by using the fuels in dust form and in suspension. Fuels used in the exptl. generator included lignite dust, lignite-coke dust, anthracite dust, and coke dust. Up to 95% gasification was obtained with a high concn. of CO and H_2 in the gas. It was suggested that the gas be used instead of coke in metallurgical processes.

9903. VICKERY, R. C. AND EDWARDS, R. W. **Reduction of arsenic trioxide by carbon and carbon monoxide.** *Metallurgia* 36, 3-6(1947).—*C.A.* 41, 5367*b*.

The prepn. of elemental As by sublimation from a mixt. of As_2O_3 and charcoal rarely yielded more than 65% of the theoretical: $2\ As_2O_3 + 3\ C \rightarrow 4\ As + 3\ CO_2$. Replacement of As_2O_3 by As compds. of lower vapor pressure is being studied. The use of CO as a reducing agent indicated that As_2O_3 was reduced by CO at about 60°C. At such low temps., however, a protective coating of As appeared to be formed on the As_2O_3 particle surfaces; on removal of this protection by volatilization at higher temps., reduction appeared to be almost instantaneous and complete.

9904. VOORTHUIJSEN, J. J. B. VAN EIJK VAN. **The isomerization equilibriums of the butanes, pentanes, hexanes, and heptanes.** *Rec. trav. chim.* 66, 322-34(1947).—*C.A.* 42, 439*f*.

The isomerization equil. for the butanes were detd. by passing butane and HCl over $AlCl_3$ (on "Norit CC") at 100, 150, and 200°C. For the higher alkanes the detn. was made in an autoclave: 100 g hydrocarbon, 5-10 g $AlCl_3$ (sublimed through active carbon at 250°C), HCl and H_2 were heated for 24 hrs as high as 80°C. The products were analyzed by fractionation. Neopentane was not produced under these conditions, and neoheptane failed to isomerize. The results for the heptanes deviated considerably from the thermodynamic predictions.

9905. WICKE, E. **Importance of surface diffusion for the effectiveness of porous catalysts. I. Surface diffusion at normal pressures.** *Angew. Chem.* B19, 57-61(1947).—*C.A.* 42, 442*d*.

The ratio of actual reaction velocity to the max. possible one was evaluated numerically for values obtained on commercially active carbons. Conclusions applied to ammonia synthesis brought out the fact that the effectiveness of a catalyst could be improved by the choice of catalyst carriers that possessed particularly good surface diffusion and in this way acted somewhat like promoters.

9906. BARGONE, A. AND RINALDI, F. **The equilibrium of the decarburization reaction from the point of view of the thermodynamics of real systems.** *Ann. triestini cura univ. Trieste*, Ser. 2, 18, 125-38(1948-49).—*C.A.* 46, 6908*d*.

Calcns. of the reaction FeO + C = Fe + CO took into account the variation of heat capacity and of entropy with temp. The reaction was endothermic throughout the temp. range used in steel-making.

9907. CSUROS, ZOLTAN. **New principles in catalysis. Selectivity.** *Magyar Kem. Lapja* 3, 29-37(1948).—*C.A.* 43, 8832*a*.

Selective hydrogenation of cinnamic aldehyde was investigated with colloidal Pd as catalyst and of BzH and *o*-, *p*-, and *m*-hydroxybenzaldehyde in the presence of Pd catalyst pptd. on animal charcoal. The amt. of catalyst could det. the compds. obtained in hydrogenation.

9908. Dubrisay, René and Favart, Michel. **Catalytic action of carbon impregnated with silver in oxidation reactions.** *Compt. rend.* 226, 900-1(1948).—*C.A.* 42, 4436*h*.
Active carbon was metallized by adsorption of the nitrates of Ag, Cu, Pb, and the hydroxides of Ag and Cu in the ratio of 0.035 g of metal to 10 g carbon. Each of these mixts. was heated for 12 hrs at 100°C before use. None of the catalysts was active in the oxidation of MeOH or EtOH. Air satd. with toluene was passed over 50 g of catalyst at a rate of 5 liter per hr. At 250°C, only the Ag catalyst was more active than the carbon alone, and yields of 15-18.3% benzoic acid were obtained. When the toluene was carefully freed of S by means of $AlCl_3$, the yield dropped to 0.35%, but if CS_2 was added to the extent of 2% the yield increased to 26%.

9909. Foster, John F. **Production of water gas from pulverized coal. A continuous process.** *Ind. Eng. Chem.* 40, 586-92(1948).—*C.A.* 42, 4328*d*.
The rate of production of water gas by reaction between pulverized coal and steam, flowing continuously through a vertical, externally heated alloy tube, depended upon the chem. activity of the fuel, the rate of fuel feed, the rate of steam supply, the temp., and the dimensions of the tube. An empirical equation was presented, indicating the effect of these variables on gas production. This equation was used to est. the capacity of continuous water-gas equipment of com. size.

9910. Gordon, E. **Catalytic isomerization of vegetable oils.** *Bull. mens. ITERG* 1948, No. 11, 38-40.—*C.A.* 43, 2791*i*.
Conjugated double bonds were created in linseed oil by heating it at temps. between 180° and 200°C with Ni catalysts on a support of active carbon.

9911. Guerin, Henri and Bastick, Jack. **The catalytic oxidation of arsine.** *Compt. rend.* 226, 1732-3(1948).—*C.A.* 42, 7647f.
Mixts. of AsH_3 and O_2 were allowed to reach equil. in the presence of a porous catalyst at 0°C. With coconut charcoal as catalyst, the products were As_2H_2, and As_4H_2 (if the original O_2 to AsH_3 ratio by vol. was less than 0.2), As (if the ratio was between 0.4 and 1), and As_2O_3 (if ratio was between 1 and 2). Oxidation of As_2O_3 to As_2O_5 was not complete, even with excess O_2. With activated Al_2O_3 as catalyst, As and As_2O_3 were produced, but no lower hydrides. With silica gel only As_2O_3 was formed.

9912. Hottel, H. C.; Williams, G. C., and Satterfield, C. N. **Generalized thermodynamics of high-temperature combustion.** *Trans. Am. Soc. Mech. Engrs.* 70, 667-76(1948).—*C.A.* 42, 7152*e*.
A method of expressing the thermodynamic properties of the four-component system in a dimensionless form was given that permitted putting the whole system onto a simple set of charts for easy engineering use. The present data had particular value in calcg. flame temps. and in solving the performance of liquid-fuel rocket power plants. An example of the latter application was given.

9913. Iley, R. and Riley, H. L. **Deposition of carbon on vitreous silica.** *J. Chem. Soc.* 1948, 1362-6.—*C.A.* 43, 2833*a*.
Deposition of carbon from CH_4, C_3H_8, C_4H_{10}, C_2H_4, and C_6H_6 at 800-1300°C was studied by aspirating the gases through the annular opening between 2 vitreosil tubes. Three types of carbon, vitreous and columnar, soft black pulverulent, and filamentous, were found arranged zonally from hotter to cooler ends. Crystallite size, as detd. by x-ray diffraction, ranges from about 15 × 30 to 25 × 40A. At temps. of 1200-1300°C a soft fine-grained white carborundum was observed, of sufficiently perfect crystn. to afford sharp back-reflections.

9914. Joshi, M. L.; Gulati, K. C., and Bhushan, Bharat. **Production of synthetic liquid fuel (petroleum) from molasses.** *Indian Minerals* 2, 112-19(1948).—*C.A.* 43, 9422*e*.
Molasses was pyrolyzed to give liquid fuel. The best ratio of molasses and lime (34.7% available CaO) was 100:44 parts; the optimum temp. for the reaction was 450-480°C. The crude oil contained 32.5% gasoline and 27.5% kerosene; the recovery was 11-12% of the wt of the molasses. The gasoline was unstable and a gum formed. NH_3, pitch, K_2CO_3, K_2SO_4, and coke were obtained as by-products.

9915. Leidheiser, Henry Jr. and Gwathmey, Allan T. **The selective deposition of carbon on the (111) face of a nickel crystal in the catalytic decomposition of carbon monoxide.** *J. Am. Chem. Soc.* 70, 1206(1948).—*C.A.* 42, 4435*i*.
An electrolytically polished monocryst. sphere of Ni was exposed to CO at 550°C for 10 hrs. The carbon deposited selectively on the (111) faces as the catalytic reaction occurred. Similar results were obtained in CO-H_2 mixts. when the CO was in excess, but when the CO was present in only low concns., rearrangement of the surface occurred selectively on some faces.

9916. Mizuno, Shigeru. **Activated carbon electrodes for the electrolytic synthesis of hydrogen peroxide. I. Conditions necessary for the electrode production.** *Bull. Tokyo Inst. Technol.* 13, 102-7(1948).—*C.A.* 44, 10549*f*.
The electrodes were 50 mm diam. and 80 mm high with a conical hole in center. The wall thickness of the electrode were thinner at the lower than upper part. The material was made by electrolytic synthesis from activated carbon, wood charcoal, and pitch coke in the proportions 3:5:2, baked at 950°C. The flow resistance of the electrode to gas should be 15-100 cm H_2O at 10 liter/min.

9917. Mizuno, Shigeru. **Activated carbon electrodes for the electrolytic synthesis of hydrogen peroxide. II. Physicochemical properties of the electrodes.** *Bull. Tokyo Inst. Technol.* 13, 108-11(1948).—*C.A.* 44, 10549*h*.

The half-cell potential of the activated carbon electrode in 20% KOH was higher than the calcd. value of the 1 atm. O_2 reversible potential. It dropped with time but did not reach an equil. value in 96 hrs. The potential was directly connected with the activity and the results of electrolysis. The adsorption of O_2 was measured on degassed electrodes and was represented by the equation $x = a \log t + b$, where x was the amt. adsorbed, t the time, and a and b consts.

9918. Newman, L. L. **Oxygen in the production of hydrogen or synthesis gas.** *Ind. Eng. Chem.* 40, 559-582(1948).

Low-cost synthesis gas required the use of lower priced generator fuels, which could best be gasified in continuous internally heated processes using O_2. Part, if not all, of the energy requirements for O_2 production could be obtained from the heat evolved in the synthesis reactors. The principal processes included: Winkler, gasifying fines in a fixed fluidized bed; Koppers, gasifying pulverized coal in suspension; Lurgi, gasifying fines in a fixed bed under pressure; Thyssen-Galocsy and Leuna, gasifying lump fuel and disposing of the ash as a molten slag. American requirements may best be satisfied by gasification processes using pulverized fuel in suspension.

9919. Novikov, S. S.; Rubinshteĭn, A. M., and Shuĭkin, N. I. **Stability of the catalytic properties and of the structure of platinized carbon in heat-treatment.** *Doklady Akad. Nauk S.S.S.R.* 62, 345-8(1948).—*C.A.* 43, 1249*e*.

Constancy of the catalytic activity of a 20% Pt catalyst on active carbon, independently of the length of heat-treatment at 300°C, up to 639 hrs, was ascertained by dehydrogenation of cyclohexane to C_6H_6 at 300°C, space velocity 0.41/liter catalyst/hr. Under the same conditions, both the crystal lattice const. and the grain size of the Pt (~56A.) remained practically unchanged. Regeneration of a catalyst, heat-treated over 300°C, restored the original activity and left the crystal size unchanged, i.e., no recrystn. took place even at red glow.

9920. Parry, V. F.; Wagner, E. O.; Koth, A. W., and Goodman, J. B. **Gasification of subbituminous coal and lignite in externally heated retorts.** *Ind. Eng. Chem.* 40, 627-41 (1948).

The theory of the annular retort and mechanism of gasification therein were presented. CO and H_2 could be made at rates of 65 to 70 $ft^3/hr/ft^2$ of heated surface in retorts heated to 1900°F. Internally heated processes make 1000 to 8600 ft^3 of CO and H_2/ft^2, while the externally heated processes make 1000 to 2300 ft^3. Various grades of water gas having ratios of H_2 to CO ranging from 1.9 to 10 were made in the pilot plants, but lowest-cost gases and highest efficiency and capacity were attained in making gases of 2.0 to 2.5 ratio.

9921. Patrikeev, V. V. and Liberman, A. L. **Causes of the high catalytic activity of one platinum catalyst preparation.** *Doklady Akad. Nauk S.S.S.R.* 62, 87-90(1948).—*C.A.* 43, 475*c*.

The hydrogenation of ketones was carried out in glacial AcOH soln. (100 ml per 2.8 g dimedone), at 22-4°C, with 5 different catalyst prepns.: (I) Platinized carbon (1 g with 20% Pt), activated with 2 ml aq. soln. of H_2PtCl_6 (0.3 g Pt/ml) introduced after flushing with H_2; (II) With activated (non-platinized) carbon, and H_2PtCl_6 introduced as above, no reaction with H_2 took place during the 1st 21-22 min., whereupon the reaction started suddenly and was complete in 8-8 1/2 hrs; (III) With 0.2 g Pt black and H_2PtCl_6 introduced as above, absorption of H_2 began immediately but slowed down rapidly, in 3 hrs about 740 ml H_2 were absorbed; (IV) With only 2 ml of the H_2PtCl_6 soln. (without solid catalyst), there was an induction period of about 18 min., whereafter the reaction did proceed, but at a substantially slower rate; (V) With platinized carbon alone, no reaction occurred for 5 hrs, but got under way immediately at any stage on addn. of H_2PtCl_6.

9922. Pelipetz, M.; Kuhn, E. M.; Friedman, S., and Storch, H. H. **Effect of catalysts on the hydrogenolysis of coal.** *Ind. Eng. Chem.* 40, 1259-64(1948).—*C.A.* 42, 6079*d*.

The effect of various catalysts on the production of liquid products during the hydrogenation of coal was investigated with regard to increasing the "oil" fraction. Tin was found to be the best catalyst in the primary cracking of coal and Zn-Sb alloy the best in the hydrogenolysis of asphaltenes. A 3-component catalyst consisting of 0.5% Sn and 0.5% Zn-Sb gave good results. Increasing the amt. of Sn and Zn-Sb to 2.0% did not improve the degree of liquefaction materially.

9923. Roginskii, S. Z. **Poisoning of a catalyst by blocking.** *J. Phys. Chem.* (U.S.S.R.), 22, 655-67(1948).—*C.A.* 42, 7608*d*.

Adsorption of a poison on an inhomogeneous catalyst surface could have various effects on the activity of the catalyst: (1) equal adsorption on spots of different activities; in this case the surface appeared homogeneous; (2) preferential adsorption on the most active spots; and (3) preferential adsorption on the least active spots; small adsorbed amts. affected the activity little but great amts. suppressed it.

9924. Roginskii, S. Z. **Blocking of catalysts at a correlated distribution of the catalyst poison.** *J. Phys. Chem.* (U.S.S.R.) 22, 669-82 (1948).—*C.A.* 42, 7608*f*.

If the adsorption of the poison on a given surface spot depended on the catalytic activity of this spot, the effect of the poison was a function of this dependence. Various instances were treated mathematically.

9925. Rubinshteĭn, A. M.; Minachev, Kh. M., and Shuikin, N. I. **Hydrogenation of benzene on platinized carbon of low platinum content.** *Doklady Akad. Nauk S.S.S.R.* 62, 497-9(1948).—*C.A.* 43, 1249*g*.

X-ray studies were made of a series of catalysts prepd. under identical conditions but with the Pt content decreasing from 20% to 0.1%. With increasing diln. of Pt the (222) plane reflection disappeared first, followed in order by (022), (113), and (002); the reflection on the (111) plane persisted throughout, and was only weakened at the lowest Pt content. The activities of this series of catalysts, expressed in percentage of conversion in hydrogenation of C_6H_6, remain const. = 100% with 4-1% Pt and decrease only slightly (to about 90%) with 0.5-0.1% Pt.

9926. STEEGMULLER, E. **Catalysis and polymerization.** *Monde ind.* 74, 11-19(1948).—*C.A.* 44, 6712*e*.

The phenomena of catalysis and polymerization and the relation between the two were outlined briefly. The effect of temp. and pressure on the polymerization of C_2H_2, C_2H_4, iso-C_4H_8, and styrene were discussed, and the catalytic action of active carbon, Pt, Co, Fe, Ni, Cu, $AlCl_3$, CuCl, and $ZnCl_2$ on C_2H_2, of $AlCl_3$, BF_3, H_2SO_4, and H_3PO_4, on C_2H_4, and of Floridin (an activated silicate), $AlCl_3$, H_2SO_4, and BF_3 on iso-C_4H_8 were described.

9927. SZÁDECZKY-KARDOSS, ELEMÉR. **Cokability of black coals and lignites.** *Univ. Tech. Sci., Sopron, Pubs. Dept. Mining Met.* 17, 170-5 (1948-49)(in German).—*C.A.* 46, 2269*f*.

Investigation of various Hungarian lignites (originating from Borsod and Várpalota) showed that xylites and periblinites affected melting and smelting qualities of coal favorably and induced the formation of coke of good quality. Cokability was a typical peculiarity of coals derived from a thick wood and bark tissue woven closely and thickly together. When this tissue became loose and mixed up with oxidized org. particles, the cokability of the coal was gradually lessened. Excess of resinites decreased the cokability even in the case of xylites, xylovitrites, and periblinites. Coked brown coals resulted in a coarse, compact coke with metallic luster showing no baking ability.

9928. WRIGHT, C. C.; BARCLAY, K. M., AND MITCHELL, R. F. **Production of hydrogen and synthesis gas by the oxygen gasification of solid fuel.** *Ind. Eng. Chem.* 40, 592-600 (1948).—*C.A.* 42, 4329*d*.

Test data were presented on the gasification of rice and barley sizes of anthracite and of lump coke in a com. producer gas plant, slightly modified to blast the bed continuously with O_2-steam mixts. instead of the usual air-steam mixt. These results for over-all C, O, and steam consumption for synthesis-gas production compared favorably with any fixed-bed, fluid-bed, or coal-suspension process thus far developed to com. operation. The economics of the O_2 gasification of solid fuels in fixed beds hinged largely upon the cost of the solid fuel suitable for the process and upon the cost of O_2, the relative efficiency as compared with other processes, and the capital charges.

9929. ANDREEV, E. A. AND KAVTARADZE, N. N. **Catalytic oxidation of phosphine in the adsorbed layer on active carbon with addition of copper compounds.** *Problemy Kinetiki i Kataliza, Akad. Nauk S.S.S.R.* 6, 293-305 (1949).—*C.A.* 47, 5776*i*.

On plain active carbon (grain size 1.5-2.5 mm, ash content 8%, area 410 m^2/g), outgassed at 320°C, adsorption of PH_3 at 18°C, under 109 mm Hg, was rapid, and the desorption complete and extremely fast. In contrast, on carbon impregnated with $CuSO_4$ (4% Cu), adsorption of PH_3 was slower, and desorption only partial; a fraction of the PH_3 was chemisorbed. The difference between the total adsorption of PH_3 on carbon with Cu and without Cu corresponded to the irreversibly adsorbed amt. On carbon with Cu, moistened with 0.43% H_2O, the adsorption of PH_3 was decreased by an amt. equiv. to the amt. of H_2O. Pretreatment of the C/Cu with H_2 (at 280°C) suppressed the activated adsorption of PH_3 at room temp. completely; subsequent treatment with O_2 regenerated the activated-adsorption capacity.

9930. BOGATSKIĬ, D. P. **Calcination and reduction of nickel hydrosilicates by carbon.** *Izvest. Akad. Nauk S.S.S.R., Otdel Tekh. Nauk* **1949**, 1512-25.—*C.A.* 45, 9435*c*.

The reduction of silicate minerals of Ni by carbon was studied experimentally. The heating and calcination tests showed that: (1) The process of reduction of Ni from its silicate-oxide minerals was highly endothermic and proceeded to a marked degree in the high-temp. region, in contrast to the reduction of nickelous oxide. (2) Reduction by carbon began in the higher-temp. region in contrast to processes with H_2 or CO. Hygroscopic and constitutional water was removed completely at the beginning of the reduction process. (3) Reduction of the Ni hydrosilicates by carbon was much slower than that of nickelous oxide. (4) Reduction of the Ni silicate-oxides was not complete up to their sintering temp.

9931. BREITENBACH, J. W. AND PREUSSLER, H. **Influence of activated carbon on styrene polymerization.** *J. Polymer Sci.* 4, 751-4(1949).—*C.A.* 44, 6193*e*.

Eight different active-charcoal prepns. (air-dried at 200°C) were placed into reaction bottles contg. styrene at room temp. under N_2; the reaction bottles were freed of gases and sealed *in vacuo*. The samples were polymerized by heating in a const. temp. bath for 3 hrs at 90°C with continuous shaking. Al-charcoal decreased the rate of polymerization. Those having much retarding effect also decreased the intrinsic viscosity of the polymers. Expts. were carried out with a charcoal sample which was heated for a considerable time at 600°C under H_2 before introducing it into the reaction bottles. The results of these tests indicated that charcoal had only a limited retarding effect.

9932. BRINKLEY, STUART R. JR. AND LEWIS, BERNARD. **Combustion gases—equilibrium composition and thermodynamic properties.** *Chem. Eng. News* 27, 2540-1(1949).—*C.A.* 43, 8119*f*.

A table of equil. compn. and thermodynamic properties at equil. of the 4-component system, C, H, O, and N was described. Application of the table to combustion problems was sought.

9933. BRINKMAN, G. **Chemical character and catalytic behavior of activated carbon.** *Angew. Chem.* 61, 378-83(1949).—*C.A.* 44, 418*i*.

The chem. nature of activated carbon was detd. by the presence of surface groups that exhibited basic or acid behavior. The groups were detd. by measurements of sorption of strong acids or alkalies. The catalytic activity of active carbon in the decompn. of H_2O_2 depended on the chem. nature of the surface. By detg. the half-time value of catalytic activity under definite exptl. conditions, small changes in surface conditions of active carbons were evaluated. Several other catalytic reactions were discussed.

9934. CREMER, E. **Forces of adsorption and heterogeneous catalysis.** *J. chim. phys.* 46, 411-19 (1949).—*C. A.* 44, 1778*a*.

Deviations from the Langmuir adsorption formula were explained on the hypothesis that a surface had centers with different heats and adsorption (λ_i). Adsorption began at centers with high energy. The no. of centers, z_i having a given λ_i was $z_i = Cc^{-\lambda_i/R\beta a}$, where R was the gas const., γ a quantity characteristic of the disorder of the surface with the dimensions of temp., and β the degree of adsorbability of the substance adsorbed and c is its concn. The no. of active catalytic centers increased exponentially with λ_i.

9935. CSUROS, ZOLTÁN AND GERGELY, EDITH (NEE POPPER). **Catalysts. III. Effect of the amount of palladium and platinum catalysts on the rate of hydrogenation of ethylene carboxylic acids.** *Hung. Acta Chim.* 1, No. 4/5, 1-26(1949).—*C. A.* 44, 4764*h*.

Semimicro hydrogenation expts. were made on (1) Pd catalyst pptd. on bone char, (2) colloidal Pd catalyst, (3) Pt catalyst pptd. on bone char, (4) colloidal Pt catalyst; *trans*-Cinnamic acid, *cis*-citraconic anhydride, *trans*-mesaconic acid, *cis*-maleic anhydride, *trans*-fumaric acid, *cis*-angelic acid, and *trans*-tiglic acid dissolved in EtOH served as standard solns. for catalysts pptd. on bone char. The relative adsorption of H_2 by Pd catalysts pptd. on bone char and the hydrogenation-time graphs of ethylene derivs. with *trans* configuration showed min. and max. at identical amts. of catalysts.

9936. CSUROS, ZOLTÁN AND SELLO, ISTVÁN. **Catalysts. IV. Catalytic hydrogenation of compounds containing a carbonyl group.** *Hung. Acta Chim.* 1, No. 4/5, 27-44(1949).—*C. A.* 44, 4765*e*.

Methylhexenone, crotonaldehyde, BzH, benzal acetone, and phenylacetaldehyde were hydrogenated in the presence of colloidal Pd or Pt and also of Pd on bone char. At ordinary pressure and room temp. the CO group of aliphatic aldehydes and ketones could not by hydrogenated by the above catalysts in EtOH nor in glacial AcOH. Phenylacetaldehyde could be hydrogenated with Pd on bone char or with colloidal Pd at ordinary pressure. Although the hydrogenation velocity was larger with Pd on bone char than with colloidal Pd, those compds. that could not be satd. with colloidal Pd could not be hydrogenated with Pd on bone char.

9937. CSUROS, ZOLTÁN; GÉCZY, ISTVÁN, AND LENGYEL, AGNES (NEÉ FARAGO). **Catalysts. V. Heterogeneous catalytic autoxidation of benzaldehyde.** *Hung. Acta Chim.* 1, No. 4/5, 1-26 (1949).—*C. A.* 44, 4766*a*.

The catalysts were Pt black, Pt on bone char, Pd on bone char, Pd on $BaSO_4$, and Pt on $BaSO_4$; the strongest catalytic effects were observed with Pt black and Pd on $BaSO_4$. Bone char exerted a strong antioxygen effect on the autoxidation of BzH. The changes of the velocity of autoxidation with changing amts. of Pt black and Pd on $BaSO_4$ followed a max.-min. curve, the latter catalyst seemed to be better than the former. The activity of the catalyst Pd on $BaSO_4$ seemed to increase with Pd content even if prepd. identically.

9938. DUNOYER, JEAN MICHEL. **Experimental study of the kinetics of a gas-solid reaction.** *Compt. rend.* 229, 205-7(1949).—*C. A.* 43, 8820*b*.

The reaction $MoO_3 + H_2 \rightarrow MoO_2 + H_2O$ was studied with good contact between gas and solid in the range 375°-450°C. The reaction rate was slow and further reduction did not occur. At const. temp. the reaction obeyed the expression $N = N_0 \exp(-H't)$, where N represented the no. of moles at time t, N_0 original no. of moles, and H' a const.

9939. GLENN, RICHARD A. **Effects of temperature on the hydrogenation of certain bituminous coals.** *Fuel* 28, No. 2, 32-40(1949).—*C. A.* 43, 2404*d*.

The following bituminous coals were hydrogenated with Adkins Ca-Cu-chromite catalyst, Pocahontas No. 3 and High Splint Seams Coals at 400°C and High Splint and Illinois No. 6 Seam Coals at 325°C. The gases produced were measured and analyzed. The liquid products were rehydrogenated 3 times with Raney Ni and distd. The production of petr.-ether-sol. products with Adkins catalyst was quite sensitive to temp. with a max. at or near 350°C, and was greatest for medium-rank coals.

9940. GREENSFELDER, B. S.; VOGE, H. H., AND GOOD, G. M. **Catalytic and thermal cracking of pure hydrocarbons. Mechanisms of reaction.** *Ind. Eng. Chem.* 41, 2573-84(1949).—*C. A.* 44, 2211*c*.

New data on cracking over pure silica gel, pure alumina, and activated carbon showed that there were 2 broad classes of cracking reactions, namely, a free-radical, thermal type, and a carbonium ion, acid-activated type. Activated carbon caused *n*-hexadecane to crack at over 50 times the thermal rate to more satd. products of higher av. mol. wt. This was explained by thermal cracking on the surface followed by quenching of large radicals by addn. of H atoms to form large paraffins.

9941. IMADA, FUSAO. **Carbons. XIX and XX. The active center and electromotive force.** *Kogaku Iho, Kyushu Univ.* 20, 48-60(1949).—*C. A.* 47, 5820*a*.

The catalytic activity of active carbon which was the main component of anode mixts., was responsible for the e.m.f. of the dry air-cell. This e.m.f. was measured on dry air-cells with various kinds of active carbon as depolarizer. The e.m.f. was almost proportional to the no. of active centers in the carbon and was also affected by the rate of O_2 supply.

9942. Kiperman, S. L. and Temkin, M. I. **Magnetic properties of iron-carbon catalysts.** *Problemy Kinetiki i Kataliza* 6, 206-9(1949).—*C.A.* 47, 5744*g*.

Carbon (from sucrose, burned at 700-800°C) of surface area 94 m^2/g, was impregnated with ether solns. of $Fe(CO)_5$ and decompd. The catalyst had approx. the same catalytic activity for decompn. of NH_3. The magnetic susceptibility x per 1 g Fe was measured on catalysts with different Fe contents (different surface coverages α). If the Fe were present in the form of isolated atoms, the susceptibility should be $x = NBn(n + 2)/3kTA$, where N = Avogadro's no., B = Bohr's magneton, $n = 4$ = no. of unpaired electrons, A = at. wt., i.e. $x = 1.78 \times 10^{-4}$. Actually measured values, even at high α (up to 0.104) were considerably higher than the max. possible x for paramagnetic Fe.

9943. Kitaĭgorodskiĭ, I. I.; Sentyurin, G. G., and Rishina, V. A. **Glass forming in a sulfate charge.** *Steklo i Keram.* 6, No. 1, 3-4(1949). —*C.A.* 43, 5913*i*.

Mixts. of Na_2SO_4 and SiO_2 with mol. ratios of SiO_2/Na_2O ranging from 1 to 4 were heated for 1 hr at 600°, 700°, 800°, 900°, 1000°, and 1100°C in presence of graphitized electrode carbon, coke, coal, activated carbon, charcoal, and $Si(C_6H_5)_4$. Electrode carbon proved the most resistant against combustion.

9944. Kobozev, N. I. and Lebedev, V. P. **Structure of disperse supports of catalysts from the viewpoint of the theory of active ensembles.** *Zhur. Fiz. Khim.* 23, 1483-94(1949).—*C.A.* 44, 2835*i*.

The "migration area" Δ of a catalyst support was identified with that fraction of the area of a face of a microcrystal which was not in contact with another crystal, i.e. available for adsorption. If l was the edge of the microcrystal (supposed to be a cube), S the available surface per g, and d the d. of the support, $l = (6\Delta/Sd)^{1/3}$. The fraction of surface which was unavailable was $k = (6 - Sld)/6$. If S_1 was the available surface of 1 ml of support, for all these samples $S_1 = 1350(1-k)$ m^2; apparently, the total surface of all samples was about 1350 m^2/cc. The energy F of formation of disperse support was connected with k by the equation $F = RT\ln[(1-k)/k]$; F was - 1000 to + 800 cal for the supports studied.

9945. Kobozev, N. I. and Reshetovskaya, N. A. **Active ensembles of platinum in oxidation-reduction and hydrogenation processes.** *Zhur. Fiz. Khim.* 23, 388-405(1949).—*C.A.* 43, 6062*b*.

A chloroplatinate was deposited on active carbon or Al_2O_3 and used as catalyst. From the variation of the catalytic activity A with the degree of coverage α, the no. n of Pt atoms in the active "ensemble" and the area S of the "migration cell" were calcd. In decompn. of H_2O_2 n was 1 and 4 + 6(on carbon and Al_2O_3); in oxidation of H_2 1(on carbon and Al_2O_3) and 6(on Al_2O_3); in hydrogenation of maleic acid and PhOH 2 and 6 (on carbon); and in reduction of *p*-nitrophenol and picric acid 1 and 5 (on carbon).

9946. Mayland, B. J. and Hays, George E. **Thermodynamic study of synthesis-gas production from methane.** *Chem. Eng. Progress* 45, 452-8 (1949).—*C.A.* 43, 7200*a*.

The general thermodynamic equations were presented. With these equations, a chart was prepd. for detg. an equil. mixt., outside the carbon-deposition boundary, at pressures from 1 to 21.4 atms., temps. from 1200 to 2500°F, and H_2 to CO ratios from 1.75 to 2.25. The equil. calcns. for the adiabatic reaction of methane and O_2 and of CH_4 and air to give synthesis gas were also presented. In order to obtain final equil. temps. in the region of 2350°F, which were necessary to attain equil. without the use of a catalyst, a considerable excess of O_2 was required.

9947. Mizuno, Shigeru. **The electrolytic synthesis of hydrogen peroxide. II. On the electrolysis conditions.** *J. Electrochem. Soc. Japan* 17, 288-90(1949).—*C.A.* 44, 6305*d*.

H_2O_2, prepd. by the electrolytic reduction of O_2 flowing over an activated carbon cathode immersed in NaOH soln., was prevented from decompn. by keeping the soln. at temps. below 20°C. Higher c.d. and uniformity of O_2 flow gave higher elec. efficiency for the prepn. of H_2O_2.

9948. Novikov, S. S.; Rubinshteĭn, A. M.; Shuĭkin, N. I., and Mel'nikova, Z. Ya. **Causes of the instability of palladium catalysts in dehydrogenation catalysis.** *Doklady Akad. Nauk S.S.S.R.* 68, 1049-51(1949).—*C.A.* 44, 916*f*.

Identical samples of Pd on carbon and of Pd on silica gel were (a) subjected to prolonged heat-treatment in H_2, (b) used in dehydrogenation of cyclohexane at 300°C, 0.3 liter/hr/liter, (c) used in dehydrogenation of a mixt. of 90% cyclohexane with 10% 1-ethyl-1-cyclopentene, under the same conditions. The Pd-carbon catalyst had an initial activity by about 35% lower than the corresponding Pt-carbon catalyst; in (a), the activity of Pd-carbon fell faster than that of Pt-carbon, but became stabilized at about 2/3 of the initial activity. The activity of Pd on silica gel was still lower than that of Pd-carbon, but it did not change in treatment (a). Immediately after deposition on carbon, Pd showed the lattice const. of the hydride, 4.04A., which did not change on prolonged treatment (a). Pd on SiO_2 had a normal lattice.

9949. Orchin, Milton and Wender, Irving. **Apparatus for measuring gas absorption or evolution during organic reactions.** *Anal. Chem.* 21, 875-6(1949).—*C.A.* 43, 8749*h*.

Magnetic stirring and the use of a serum stopper for the injection of liquids were features of this new design. A sample of *p*-cyclohexylanisole was quantitatively dehydrogenated in this app. It was recommended for detg. the amt. of O_2 absorbed by coal, for the detn. of $LiAlH_4$, and the extent of its reducing action.

9950. Roy, A. N. and Howard, H. C. **Molecular size and shape of some primary degradation products of a bituminous coal.** *J. Phys. & Colloid Chem.* 53, 1033-42(1949).—*C.A.* 44, 816*c*.

Degradation by hydrogenation of a Pittsburgh Seam bituminous coal in the presence of a Cu-Cr oxide catalyst was studied in the range 300°-350°C, at 1800 p.s.i.g. cold H_2 pressure and a 24-hr reaction period. The min. temp. found for obtaining satisfactory yields of benzene-sol. material was 325°C. Fractionation of the degradation products was investigated by fractional pptn. and fractional soln.

9951. RUBINSHTEĬN, A. M.; MINACHEV, KH. M., AND SHUĬKIN, N. I. **Blocking of the active centers of platinized carbon by products of deep decomposition of hydrocarbons.** *Doklady Akad. Nauk S.S.S.R.* 67, 287-90(1949).—*C.A.* 43, 7802*a*.

In the hydrogenation of C_6H_6 in excess H_2 at 170-2°C at the space velocity 0.06 liter/liter catalyst/hr, on catalysts contg. from 4.0 down to 0.03% Pt, some reaction took place even at the smallest Pt content. The fall of the initial rate during the run was in inverse ratio to the Pt content. Similarly, in the dehydrogenation of cyclohexane, in a weak stream of H_2, at 300-2°C and 0.3 liter cyclohexane/liter catalyst/hr, the activity of catalysts with 4.0-0.25% Pt showed no marked differences; from 0.25% Pt down, the activity fell sharply. The stability of the catalysts fell sharply from Pt $< 0.5\%$ down. X-ray diagrams showed that the cryst. structure of the Pt was preserved down to 0.03%, but that lattice defects increased with decreasing Pt content.

9952. RUDAKOV, G. A.; BORISOVA, N. P.; EMEL'YANOVA, O. A.; EROSHEVSKII, I. G.; KOMSHILOV, N. F.; MAKAROVA, A. N.; MERLIS, N. M., AND KHOMENKO, Z. S. **Irreversible catalysis and catalytic dehydrogenation of some hydrocarbons on activated carbon.** *Zhur. Priklad. Khim.* (J. Applied Chem.) 22, 180-98 (1949).—*C.A.* 43, 5656*h*.

Pure dipentene, passed at 410-50°C over water-vapor activated charcoal, reacted according to: $3C_{10}H_{16} \rightarrow C_{10}H_{20}$ (*p*-menthane) + $2C_{10}H_{14}$ (*p*-cymene). The reaction occurred at a considerably higher temp. than on Pd (130°C) and on Ni (280°C). No reaction occurs on crushed quartz at 420°C. Δ_3-Carene, on activated charcoal at 410-30°C, reacted as above with the same products. α-Pinene at 350° and 420°C on activated charcoal was completely isomerized into alloöcimen which, in turn, was cyclized into a mixt. of α- and β-pyronene. On crushed quartz, at 550-600°C, *p*-menthane also under went pyrolysis, but considerably more slowly than on activated charcoal, and the yield of aromatic hydrocarbons was much lower.

9953. SBORGI, U. AND GIOVANNINI, E. **Carbon disulfide from methane and sulfur.** *Chimica e industria* (Milan) 31, 391(1949).—*C.A.* 46, 9811*g*.

An industrial method for prepg. CS_2 employed the reactions $CH_4 + 4S = CS_2 + 2H_2S$ and $CH_4 + 2S = CS_2 + 2H_2$. The first reaction occurred at 600°-900°C with W, Mo, or Cr catalysts. Yields with different catalysts and compn. of resultant gases was reported; CS_2 yields of 20-30% were obtained.

9954. SHERWOOD, PETER W. **High-pressure hydrogenation of carbonaceous matter. I. Introduction.** *Petroleum Refiner* 28, No. 12, 97-101(1949).—*C.A.* 44, 4223*g*.

The status of the high-pressure hydrogenation of coal, including its history, and flow diagrams for two basic processes were presented.

9955. TOPPER, YALE J. **Note on the synthesis of succinic acid labeled in the carboxyl position with radioactive carbon.** *J. Biol. Chem.* 177, 303-4(1949).—*C.A.* 43, 2861*i*.

Succinic acid was prepd. by hydrogenation with Pt-charcoal of acetylenedicarboxylic acid which had been labeled with C^{14} at one carboxyl by reaction of $C^{14}O_2$ with dilithium acetylide soln. The yield of C^{14} succinic acid relative to the original $BaC^{14}O_3$ was 11%.

9956. WELLER, SOL; PELIPETZ, MICHAEL G.; KUHN, M.; FRIEDMAN, SAM, AND CLARK, E. L. **Hydrogenation of coal in batch autoclaves with coke-oven gas.** *Ind. Eng. Chem.* 41, 972-3 (1949).—*C.A.* 43, 5171*d*.

The cost of H_2 was a major item in coal hydrogenation. Therefore, substitution of coke-oven gas for hydrogen was tried. The coal used was Pittsburgh-seam, high-volatile A bituminous coal. Fifty g powd. coal was placed in a 1.2-liter rotating autoclave with glass liner together with 0.5 g powd. tin and 0.275 g NH_4Cl. When a vehicle was employed, 70 g heavy oil from coal hydrogenation was added. Hydrogenation was carried out at 450-465°C and at 660-2120 lbs/in^2 total initial pressure for at least 1 hr.

9957. BASU, A.N. AND GLENN, R.A. **Restricted hydrogenolysis of high-sulfur coal from Assam, India.** *J. Sci. Ind. Research* 9B, No. 3, 64-7 (1950).—*C.A.* 44, 9135*a*.

A very high S-coal (C 75.1, H 5.5, N 1.1, S 7.5, O 9.1, and ash 1.7%) was hydrogenated in the presence of Ca-Cu-chromite catalyst. H_2 at 1800 p.s.i. increased to 3300 p.s.i. at 375°C. While essentially complete conversion of the coal to sol. products was observed and 80% of C and N originally present was recovered in the hydrogenation oils, only 15% of the O and S was converted.

9958. BATCHELDER, H.R. AND STERNBERG, J.C. **Thermodynamic study of coal gasification—applicable to suspension gasification of pulverized coal.** *Ind. Eng. Chem.* 42, 877-82 (1950).—*C.A.* 44, 6602*h*.

Equations were developed for the continuous gasification of coal with O_2 and superheated steam under the conditions of thermal balance, reaction equil. according to the equation $CO + H_2O = CO_2 + H_2$, and other simplifying assumptions. Graphical presentation of the soln. of these equations for two different coals under various operating conditions showed certain trends which were expected to hold in practice.

9959. BROWN, CALLAWAY. **Equilibrium at low pressure in the reduction of barium oxide by carbon.** *J. Chem. Phys.* 18, 1311-13(1950).—*C.A.* 45, 933*h*.

The reduction of BaO by carbon was described and analyzed critically. Exploratory results at 950°C indicated equil. at CO pressures below 100 μ with Ba vapor pressures in the range 0.1 to 0.3 μ. The resulting value for the free energy of formation of BaO was −114,000 cal per mole.

9960. CHENEY, HARRY A.; MCALLISTER, S.H.; FOUNTAIN, E.B.; ANDERSON, JOHN, AND PETERSON, W.H. **Butylene from ethylene. Cobalt-carbon catalyst.** *Ind. Eng. Chem.* 42, 2580-6 (1950).—*C.A.* 45, 3794*d*.

C_2H_4 was polymerized to C_4H_8 over a Co-charcoal catalyst at temps. below 150 C and pressures at 1-100 atm. The polymer consisted of olefins with an even no. of C atoms and was mostly straight-chain. The catalyst was poisoned by CO, O, COS, H_2S, and C_2H_2; other normal C_2H_4 contaminants had no effect on the activity.

9961. FALKUM, E. AND GLENN, R.A. **Coal-hydrogenation-process studies. II. Effects of temperature on the restricted hydrogenolysis of a Spitsbergen coal with Adkins catalyst.** *Fuel* 29, No. 8, 178,84(1950).—*C.A.* 44, 8619*d*.

The effect of temp. on the hydrogenation of a Spitsbergen coal with Adkins catalyst in the absence of a vehicle was studied. This coal was an Arctic coal contg. 5% ash and about 44% volatile matter and a H-content of 6.3% based on ash- and moisture-free coal. The hydrogenations were made in a specially designed rocking-type autoclave equipped with a cold-head receiver for 72 hrs with a cold H_2 pressure of 1750-1800 p.s.i. The effects of temp. on the primary hydrogenation products were presented graphically. Three different temp. effects were distinguishable.

9962. GARCIA-CONDE, J.R. **The effect of partial hydrogenation, and of mixtures, on the coking properties of coal.** *Combustibles* (Zavagoza) 10, No. 51, 10-14(1950).—*C.A.* 45, 5909*e*.

Coals of poor coking quality were improved by mixt. with products of their partial hydrogenation. This reaction was effected by heating with 1,2,3, 4-tetrahydronaphthalene in an autoclave at 400°C, max. pressure being 25.5 atm. Coals from Barnsley and Parkgate seams of the Thurcroft Mine (England) were used. The quality of the cokes was measured as "microhardness" by rotating 16-25-mesh material in tubes with steel balls under standard conditions (125 revolutions at 25 r.p.m.) and measuring the amt. retained on 25 and 72 mesh.

9963. GAULT, HENRY; MARCU, LIVIU, AND RITTER, ROGER. **The catalytic cracking (reforming) of gaseous hydrocarbon mixtures.** *Bull. soc. chim. France* 1950, 596-7.—*C.A.* 45, 3151*f*.

The cracking (reforming) of com. propane over activated alumina was studied by using two methods of combustion, viz. with and without an open flame. The propane and enough air to burn a fraction of the hydrocarbon were introduced into a tube contg. alumina. In the first case the combustion was aided by means of a heated spiral thus causing open combustion. In the second case, the surface of the catalyst was cooled sufficiently to prevent the appearance of an open flame. The "open-flame" method favored production of CO_2 and in the presence of excess propane, caused the formation of carbon deposits.

9964. GLENN, R.A.; BASU, A.N.; WOLFARTH, J.S., AND KATZ, M. **Coal-hydrogenation-process studies. I. The role of coal sulfur in the hydrogenation of coal.** *Fuel* 29, No. 7, 149-59 (1950).—*C.A.* 44, 7510*d*.

Three coal samples ranging in S content from 0.83 to 4.37% selected from a single mine in the Pittsburgh Seam were subjected to a restricted hydrogenolysis at 375° and 350°C with the Adkins catalyst, a cold H_2 pressure of 1800 p.s.i., and no vehicle in a specially designed autoclave provided with a cold-head receiver. The initial products were measured and analyzed and the distillate oils were resolved further through C_5H_{12} extn. followed by chromatography on alumina. The greatest conversion of coal to C_6H_6-sol. products was observed for the low-S coal instead of the high-S coals as expected, the conversion of the low-S coal to C_6H_6-sol. products being complete at both 350° and 375°C.

9965. GUNTHARD, HS. H.; KOHLER, M.; PFISTER, H.R.; AUERSWALD, H., AND MESSIKOMMER, B. **The calculation of adsorbers.** *Helv. Chim. Acta* 33, 1118-26(1950).—*C.A.* 44, 10442*d*.

Linear differential equations and their solutions were used to describe heterogeneous catalytic reactions occurring in reaction tubes on adsorbent surfaces: (1) adsorption equil. instantaneously with no chem. reaction (2) adsorption equil. instantaneously with the sorbate undergoing a heterogeneous first-order reaction; (3) adsorption equil. as a reversible moderate-rate reaction; (4) adsorption equil. as a rate process simultaneous with a first-order chem. reaction.

9966. HANSCH, CORWIN; SCOTT, CARLETON, AND KELLER, HOWARD. **Catalytic synthesis of benzofurans. Chromium catalysts for cyclodehydrogenation of *o*-alkylphenols.** *Ind. Eng. Chem.* 42, 2114-17 (1950).—*C.A.* 45, 1991*i*.

The vapor-phase catalytic dehydrocyclization was studied at 550°C with *o*-EtC_6H_4OH, *o*-$Me_2CHC_6H_4OH$, *o*-allylphenol, and thymol with Pd on charcoal, Cr on charcoal, Cr-Cu on charcoal, Cr-Zr on charcoal, and Cr-Cu on silica gel. The liquid reaction products were condensed and the phenolic constituents sepd. and fractionally distd.

9967. HANSEN, CHRISTIAN J. **Low-temperature tar from bituminous coal and its further treatment.** *Brennstoff-Chem.* 31, 308-17(1950).—*C.A.* 45, 846*h*.

Five conditions that must be met by a satisfactory low-temp. carbonization process were: (1) applicability to all kinds and sorts of coal, suitable for low-temp. carbonization, (2) manuf. of strong semicoke in suitable size, (3) maintenance of suitable cracking conditions throughout the system and uniform temp. conditions to give the highest possible tar uniformity, (4) a satisfactory throughput at the desired temp., (5) smooth and trouble-free oven operation.

9968. HEINEMANN, HENRY. **Petroleum-type hydrocarbons from sugar cane.** *Petroleum Refiner* 29, No. 2, 111-14 (1950).—*C.A.* 44, 5571*e*.

Sugar cane in the form of 1-in. cubes was converted to bituminous materials, CO_2, CH_4, H_2O, phenols, phenol carboxylic acids, and coal by heating in a closed Aminco-type bomb for 5 hrs at 250°F and then for 5 hrs at 625°F in the presence of 750 ml 1 *N* NaOH per 100 g. The yield of bituminous material varied directly with the quantity of alkali used. The bituminous matter can be repeatedly hydrogenated in the bomb at 750°F with an initial H_2 pressure of 1000 p.s.i.g. with a molybdenum oxide or sulfide catalyst, the product extd. with CCl_4, and the ext. distd. to produce gasoline 3, middle oil 16, and lubricating oil 6% based on sugar cane. Analytical data indicated that the hydrocarbons were formed from the sucrose, hemicellulose, and cellulose content of sugar cane, while the asphalt was derived from the lignin.

9969. KING, R.O.; DURAND, E.J., AND ALLAN, A.B. **The oxidation, ignition, and detonation of fuel vapors and gasses. XV. The concentration of finely divided carbon in town gas-air mixtures required to induce severe knocking combustion.** *Can. J. Research* **28F**, 177-88(1950).—*C.A.* **44**, 8615*h*.

Engine expts. at 800 r.p.m. and 9:1 C.R. were made with Toronto town gas as the fuel, with and without added graphite dust. The engine remained substantially free of carbon with town gas fuel after 50 hrs' running. When graphite dust was injected at the rate of 1.5 mg per stroke, equiv. to 180 grains per 100 ft^3, severe knocking occurred, with a reduction in brake horse power (B.H.P.) from 1.54 to 1.32 (14%). The extent of knocking corresponding to this decrease in power was indicated by a graph of C.F.R. engine results which gave audible knock at C.R. of 4.6, "standard knock" at C.R. of 5.27 and severe knock at C.R. of 6.8 with a 9% decrease in power.

9970. KING, R.O.; DURAND, E.J., AND ALLAN, A.B. **The oxidation, decomposition, ignition, and detonation of fuel vapors and gases. XVI. Benzene as a knocking fuel in conditions promoting the formation of finely divided carbon.** *Can. J. Research* **28F**, 308-14(1950).—*C.A.* **45**, 1331*e*.

Benzene, a non-knocking fuel in ordinary engine operation, became a knocking fuel in a modified CFR engine under operating conditions such that the vapor-air mixt. became impregnated with finely divided carbon. Carburation was such that liquid drops of C_6H_6 were in the vapor-air mixt., and carbon was formed by impingement of burning C_6H_6 on relatively cool surfaces. The engine was run abnormally cool to avoid surface ignition. The audibility of knock varied over a wide range while intensity as measured by the knock meter was "standard."

9971. KODAMA, SHINJIRO; TARAMA, KIMIO; KATO, SHIICHIRO, AND HAYAKAWA, SHUICHI. **The rate of the thermal decomposition of methane. III. Mechanism of the thermal decomposition of methane.** *J. Chem. Soc. Japan, Pure Chem. Sect.* **71**, 89-93(1950).—*C.A.* **45**, 4538*b*.

The activation and deactivation of CH_4, the effect of the surface of the reaction vessel and the chain reaction mechanism were studied. The initial rate consts. at the various conditions were calcd. The agreement between the calcd. and exptl. results concerning the effect of the initial pressure of CH_4, reaction temp., the surface/vol. ratio of the reaction vessel, the carbon produced by the CH_4 decompn. and the addn. of H_2 was satisfactory.

9972. KRAUSE, A. **Catalytic properties of coal and charcoals.** *Przemysl Chem.* **29**, 377-83 (1950).—*C.A.* **46**, 6916*e*.

The catalytic properties of coal, coke, lampblack, animal and other charcoals, and graphite in the reactions of decompn. of H_2O_2 and peroxidative oxidation of formic acid and of indigo carmine were compared. Graphite was inactive, and the activity of the other substances appeared to depend on their Fe, Ca, and Mg contents, and on their adsorptive power.

9973. KUKHARENKO, T.A. **An investigation of the composition and properties of bituminous coals by hydrogenating them below their decomposition temperatures.** *J. Applied Chem. U.S.S.R.* **23**, 655-63(1950)(Engl. translation); *Zhur. Priklad. Khim.* **23**, 620-30(1950).—*C.A.* **46**, 11634*a*.

A 0.5-kg sample of coal ground to 0.25 mm was hydrogenated in a 2-liter revolving autoclave for 2 hrs below the decompn. temps. (320-380°C) and at 72-105 atms. Long-flaming coal acquired clinkering capacity with loss of O as H_2O from functional groups. The methoxyl no. dropped from 6.84% for the original coal to 3.47% for the 1st stage of hydrogenation and 3.28% for the 2nd. Gas coal improved in coking properties with little change in ultimate analysis and a slight decrease in volatiles. Coking, medium lean, and lean coals underwent simplification of the complex org. compds. with the addn. of H.

9974. KUKHARENKO, T.A. AND MATVEEVA, I.I. **Investigating the nature of noncoking coals by hydrogenating them below their decomposition temperatures.** *J. Applied Chem. U.S.S.R.* **23**, 773-9(1950)(Engl. translation).—*C.A.* **46**, 11634*c*.

Coal, lying between brown and bituminous coal, was hydrogenated to acquire the coking capacity of good coking coal at 60-100 atm. and 350-380°C. The C increased 3% without change in the H. The total volatile and functional groups decreased. The compn. of the humic acids was unchanged, but the amt. decreased. The yield of primary tar was doubled (from 7-10 to 14-20%); the semicoke increased (74-78%), but the gas + losses decreased (6.69 to 1.77%).

9975. MEAD, JAMES F. AND HOWTON, DAVID R. **Quantitative hydrogenation of unsaturated fatty acid derivatives.** *Anal. Chem.* **22**, 1204-5(1950).—*C.A.* **45**, 983*f*.

Hydrogenation of less than mg amts. in the Barcroft-Warburg app. with 10% Pt on charcoal catalyst, and dissolving the sample in 96% alc. gave precision adequate for detg. the no. of C=C double bonds and distinguished between small amts. of Me oleate, linoleate, and linolenate. The slight soly. of H_2 in 96% alc. probably introduced no great error.

9976. MINACHEV, KH. M. AND SCHUĬKIN, N.I. **Hydrogenation of cyclenes and alkenes on low-percent platinized carbon.** *Doklady Akad. Nauk S.S.S.R.* **72**, 61-3(1950).—*C.A.* **44**, 7785*i*.

Charcoal platinized with as little as 0.5% Pt hydrogenated very effectively 1-methylcyclopentene, 1-ethylcyclopentene, 1-octene, and $Me_3CCMe{:}CH_2$.

9977. Mizuno, Shigeru. **Studies on the electrolytic synthesis of hydrogen peroxide. III. The mechanism of the electrolytic synthesis.** *J. Electrochem. Soc. Japan* 18, 48-50(1950).—*C.A.* 45, 3259*a*.

The rate of decompn. of H_2O_2 by activated carbon electrodes was measured. In the prepn. of H_2O_2 by the electrolytic reduction of O_2 flowing over an activated carbon cathode immersed in NaOH or KOH soln. the observed deviation from the theoretical efficiency was explained by taking into consideration the measured rate of decompn. of the product (H_2O_2).

9978. Mizuno, Shigeru; Yamada, Daiju, and Yasukawa, Saburo. **Electrolytic synthesis of hydrogen peroxide. IV. V. VI.** *J. Electrochem. Soc. Japan* 18, 80-1, 116-17, 167-9 (1950). —*C.A.* 45, 7451*a*.

H_2O_2, produced in NaOH or KOH soln. by the electrolytic reduction of O_2 flowing over an activated carbon cathode immersed in the soln., was detd. Powd. $Ba(OH)_2.8H_2O$ crystals (200-250 mesh) were added to the soln. (after the electrolysis), and the ppt. thus obtained, $BaO_2.8H_2O$, was added slowly to H_2O (contg. metaphosphoric acid or solium silicate as a stabilizer of H_2O_2) through which CO_2 gas was bubbling, whereby the BaO_2 was decompd. and H_2O_2 reproduced. The temp. of the liquid was kept at 15-20°C, and the $BaO_2.8H_2O$ added at such a rate that the liquid was always weakly alk.

9979. Mizutani, Kyuichi and Yamashita, Kasane. **Manufacture of vinyl chloride resins. I. Synthesis of vinyl chloride in the vapor phase in the presence of hydrogen.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 41-8(1950) (English summary).—*C.A.* 46, 2332*i*.

Into a tube contg. 80 ml $HgCl_2$ adsorbed on activated charcoal (50 g/liter) were passed at 190-200°C C_2H_2 and HCl gases (in a ratio of 1.0-1.2 to 1.0) mixed with 20% H_2(which did not affect the reaction) at 75-100 ml/min. In 2 hrs CH_2:CHCl was obtained in 98.7% yield. The catalyst, however, aged rather rapidly; the $HgCl_2$ was reduced to HgCl (or even to Hg) and a resinous substance was formed on the charcoal.

9980. Mizutani, Kyuichi and Yamashita, Kasane. **Manufacture of vinyl chloride resins. VI. Adsorption of the catalyst for the synthesis of vinyl chloride. VII. Effect of various metallic chlorides added to the catalyst of mercuric chloride and active charcoal. VIII. Catalytic action with silica gel and alumina as carriers.** *Repts. Govt. Chem. Ind. Research Inst. Tokyo* 45, 235-45, 246-51, 271-80 (1950). —*C.A.* 46, 2333*e*.

The best catalyst was prepd. by dipping activated carbon in 4-12% $HgCl_2$ at 70°C for 2 hrs (adsorption 80-95%). The catalyst adsorbed HCl less as the temp. was raised from 50° to 175°C, at which temp. the $HgCl_2$ tended to sublime. The adsorption of C_2H_2 decreased up to 140°C and thereafter increased. With the addn. of $AlCl_3$ ($MgCl_2$ or $BaCl_2$ less effectively) to the $HgCl_2$-C catalyst the adsorption of $HgCl_2$ on carbon was increased, prolonging the life of the catalyst. Catalyzed by $HgCl_2$ loaded on silica gel, CH_2:CHCl was produced at 80°C in 80-90% yield, but the catalyst did not last long because of violet sublimation of $HgCl_2$ occurring locally.

9981. Norris, T.H. and Ruben, S. **Kinetics of the isotopic exchange reaction between carbon monoxide and carbon dioxide.** *J. Chem. Phys.* 18, 1595-1600 (1950).—*C.A.* 45, 6029*f*.

The rate of the exchange reaction between CO and CO_2 was studied, with C^{14} as a tracer. The reaction, whose velocity in a quartz vessel was convenient for study between 800° and 900°C, appeared to follow the rate law: Rate = $k(pCO)^{0.73}(pCO_2)^{0.85}$. The apparent activation energy was 77 kcal. The reaction was accelerated by added N_2 but not A. Packing increased the rate only slightly, giving no indication of a primarily heterogeneous reaction. A probable mechanism was a bimol. exchange between the two reactants adsorbed on the catalyst surface.

9982. Novikov, S.S.; Lapshina, Z. Ya., and Shuikin, N.I. **Hydrogenation of benzene and dehydrogenation of cyclohexane on nickel catalysts on activated carbon.** *Doklady Akad. Nauk S.S.S.R.* 74, 77-9 (1950).—*C.A.* 45, 29*d*.

Hydrogenation of C_6H_6 at a space velocity of 0.06 liter /liter catalyst/hr, at 180°C, and dehydrogenation of cyclohexane at 0.3, 300°C, were investigated with catalysts prepd. by impregnation of active carbon with a soln. of 47 g $(HCO_2)_2Ni$/liter, and decompn. from 250° to 670°C. Catalysts heated at 350°C were also tested after repeated impregnation with $(HCO_2)_2Ni$, and repeated decompn. at 350°C. At low space velocities hydrogenation was practically complete with all catalysts; highest activity was found with catalysts with Ni crystallities of the size of about 40A. In contrast, the activity in dehydrogenation was found to increase with the Ni crystallite size up to 80A. The activity in dehydrogenation was highest with catalysts decompd. at 450°C; higher decompn. temp. lowered the activity, whereas sintering in vacuo at 800°C increased it considerably owing to a 1.5-fold increase of the Ni grain size.

9983. Roĭter, V.A. **Role of transfer phenomena in catalysis on porous contacts.** *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1950, 576-81. —*C.A.* 45, 6030*c*.

Conditions on a porous catalyst grain were approximated by a model, wherein the catalyst was carried on a diaphragm sepg. the reaction space into 2 compartments. The reacting gas mixt. was first allowed to flow on both sides of the diaphragm, then the flow was stopped on one side, but continued on the other; the 1st side thus became a closed space. The stationary concn. c_h in that closed space, different from the stationary c_o on the flow side, corresponded to the concn. in the center of a catalyst granule of a radius equal to the thickness of the diaphragm. In the general case of N spherical granules of radius r and vol. v, in a gas stream of mean concn. c_o and rate of flow V, the rate of reaction was $W = -dx/dt = kNvVf(c)$. Along an infinitely thin layer of thickness dr, where the concn. could be considered const. $dW = -kNS_oV/f(c)dr$, where S_o = external surface area of each granule, $dv = NS_odr$. The amt. reacted was compensated by diffusion, which gave $d^2c/dr^2 = (kV/D)f(c)$, where D = effective diffusion coeff.

9984. RUBINSHTEĬN, A.M.; MINACHEV, KH. M., AND SHUĬKIN, N.I. **Distribution of platinum in a platinized carbon catalyst.** *Doklady Akad. Nauk S.S.S.R.* 71, 1073-5 (1950).—*C.A.* 44, 6249*i*.

The Pt content was detd. by transmittance to x-rays of sections, taken at different depths, of cubes of platinized charcoal of 10.2-3.2 mm side. Although the amt. of Pt was highest in the outermost layer of each grain, it was also found in deeper layers; e.g., in a cube of 10.2 mm side, the ratio of the amts. of Pt found in layers 0-1.2, 1.2-2.4, 2.4-3.7, and 3.7-4.9 mm deep, was 6.7:3.6:1.1:1, and in a 4.1 mm cube, at 0-0.85, 0.85-1.6, and 1.6-2.4 mm below the surface, the ratio was 2.4:1.2:1.

9985. SAKIKAWA, NORIYUKI. **Organic geochemical reactions. II. Catalytic actions of minerals on the dehydration and polymerization of humic acid.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 71, 298-300(1950).—*C.A.* 45, 4424*f*.

Some minerals contained in the ashes of coals, such as Fe oxides, Fe sulfide, silica, Al_2O_3 or some clays acted as effective catalyzers in the dehydration of humic acid and polymerization of humin. Humic acid was easily dehydrated to humin by heating at 200°C and it then changed to humus coal at 300°C. Humic acid and humin were not only contained in young coals, but also in bituminous coals. It was, therefore, concluded that coals could be formed by the catalytic actions of minerals without high temp. as hitherto supposed.

9986. SAKIKAWA, NORIYUKI. **Organic geochemical reactions. III. Effects of ash on the properties of coal.** *J. Chem. Soc. Japan, Pure Chem. Sect.* 71, 300-3 (1950).—*C.A.* 45, 4424*g*.

Coals having high caking properties contained much S and this caking property was attributed to the bitumens contained in the coal formed by the natural hydrogenation of coal with H_2S or other hydrogen compds. in the presence of iron sulfide as a catalyst. Catalytic action of pyrite in the hydrogenation of coal was tested and found to be effective as MoS_3 or $ZnCl_2$. Effect of pyrite on the caking property of coal during coke formation was found to be rather effective.

9987. SCHWABE, K. **The electrolytic chlorination of spent sulfite liquor.** *Monatsh.* 81, 609-12 (1950).—*C.A.* 45, 1884*i*.

Spent sulfite liquor, purified over a cationic resin, lowered the anode (Pt) potential to about 500 mv. (*vs.* sat. calomel electrode) in pure NaCl soln., and to 250 mv. in *N* HCl. The depolarization amounted to almost 1000 mv. in *N* KOH plus 2 *N* KCl soln. Graphite and Pt anodes behaved alike. The spent sulfite liquor (S 8.01, OCH_3 9.10, NH_3 4.29, ash 0.84% on a dry basis), decalcified with $(NH_4)_2CO_3$, was chlorinated in a diaphragm cell with graphite anodes at a discharge potential below that of Cl. In alk. electrolytes(*N* KOH, 2 *N* KCl) two fractions resulted.

9988. SHIODA, RIICHI. **The carbonization of lignite.** *J. Fuel Soc. Japan.* 29, 7-15(1950).—*C.A.* 46, 3236*g*.

A new plant with an internal heating system was constructed, in which the hot gas, prepd. in a sep. furnace, was supplied for heating. In this system, besides the sensible heat of the gas some heat of combustion was also utilizable, which was liberated from the partial combustion of the charged lignite with O_2 included in the heating gas. The results obtained from actual operation, however, showed that the charges were not uniformly carbonized and the system of self-coking without a heating gas was also tried during the whole period except starting.
