SOLAR - GEOPHYSICAL DATA

CONTENTS

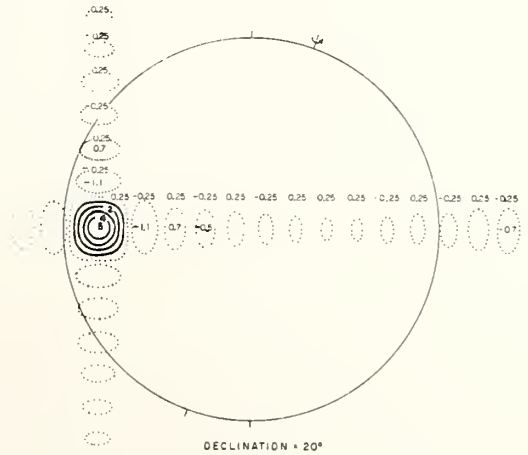
9.1 cm Spectroheliograms

The microwave spectroheliograms obtained at the Radioscience Laboratory of the Stanford University, Stanford, California (N 37°24', W 122°11') are presented.

The maps show the disk distribution of solar radio emission at a wavelength of 9.1 cm by means of radioisophotes, or lines of constant brightness temperature. The contour interval, which varies from map to map, is usually about 80,000°K, and is determined after the map is drawn by reference to the measured flux density of the whole sun. A circle shows the photosphere; a correction has been applied for the variation of the sun's semi-diameter, so that the photospheric circle is reproduced with a constant diameter of 5 cm. This is an integral submultiple of the IAU standard of 15 cm used on the full size originals, which are available as Stanford Radio Astronomy Institute Publications.

A full description of the Stanford microwave spectroheliograph has been given by Bracewell and Swarup (IRE Trans., Vol. AP 9, January 1961). With this instrument the sun is scanned along approximately fifteen parallel lines from west to east, and from the resulting records the maps are carefully prepared by hand. A positional accuracy of better than $\pm$ 1 minute of arc in the location of bright features is maintained.

At the zenith, the beam of the instrument is circular with a beamwidth of 3.1 minutes of arc. At a declination δ on the meridian the beamwidths are 3.1 minutes east-west and 3.1 sec $(38.^{\circ}2 - \delta)$ north-south. To illustrate the magnitude and position of the subsidary lobes surrounding the beam, the theoretical response to a point source is given below.



Further details are given in the above mentioned reference. The response to a source of finite size is the convolution of this pattern with the source distribution. The subsidary lobes may be reduced by smoothing the maps but this would also widen the primary beam. A simple procedure for smoothing is to average four adjacent values situated at the corner of a rectangle with sides parallel to the scanning direction and 0.8 beamwidths long (R. N. Bracewell, "Correcting noise maps for beamwidth", Radio Noise Spectrum, ed. D. H. Menzel, pp. 141-150, Harvard 1960).

The descriptive text was published separately, November 1960.

COMMERCE - STANDARDS - BOULDER

These flare reports are addenda to the August 1960 flares published in CRPL-F 193 Part B, September 1960.

CAPRI G	ANACAPRI - GERMAN
CAPRI S	ANACAPRI - SWEDISH
GOOD HOPE	ROYAL OBSERVATORY, CAPE OF GOOD HOPE
KIEV*	KIEV UNIVERSITY
KODAIKNAL	KODAIKANAL
KRASNYA	KRASNAYA PAKHRA
LOCKHEED	LOS ANGELES
MOSCOW-G	MOSCOW - GAISH
R O EDIN	ROYAL OBSERVATORY, EDINBURGH
R O HERST	GREENWICH ROYAL OBSERVATORY, HERSTMONCEUX
SAC PEAK	SACRAMENTO PEAK
SCHAUINS	SCHAUINSLAND
USNRL	UNITED STATES NAVAL RESEARCH LABORATORY

SAC PEAK: ALL VALUES IN MAX. INT. COLUMN ARE ARBITRARY UNITS (0-40) NOT PERCENT OF CONTINUOUS SPECTRUM.

E - LESS THAN & - PLUS
D - GREATER THAN - - MINUS
U - APPROXIMATE □ - NOT REPORTED

LOCKHEED OBSERVATIONS: ALL VALUES IN THE MAXIMUM INTENSITY COLUMN ARE ARBITRARY UNITS ON A SCALE OF 10 TO 40 - NOT PERCENT OF THE CONTINUOUS SPECTRUM.

( ) represent disturbed values. All times are Universal time (U.T.).

Note: From Oct. 25-30 the quality figures are not as disturbed as the magnetic indices suggest they should be. Blanketing sporadic-E was prevalent in the North Pacific area from Oct. 25 through Oct. 29, at the height of the magnetic storm. This could explain quality remaining fair. Vertical incidence data indicate lowered maximum usable frequencies but not complete blackout during the last week of October.
