- 36 37 Certain commercial equipment, instruments, software, or materials, commercial or non-commercial, are identified in
- this paper in order to specify the experimental procedure adequately. Such identification does not imply
- 38 recommendation or endorsement of any product or service by NIST, nor does it imply that the materials or
- 39 equipment identified are necessarily the best available for the purpose.
- 40 There may be references in this publication to other publications currently under development by NIST in
- 41 accordance with its assigned statutory responsibilities. The information in this publication, including concepts and
- 42 methodologies, may be used by federal agencies even before the completion of such companion publications. Thus,
- 43 until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain
- 44 operative. For planning and transition purposes, federal agencies may wish to closely follow the development of
- 45 these new publications by NIST.
- 46 Organizations are encouraged to review all draft publications during public comment periods and provide feedback
- 47 to NIST. Many NIST cybersecurity publications, other than the ones noted above, are available at
- 48 https://csrc.nist.gov/publications.

#### 49 Authority

- 50 This publication has been developed by NIST in accordance with its statutory responsibilities under the Federal
- 51 Information Security Modernization Act (FISMA) of 2014, 44 U.S.C. § 3551 et seq., Public Law (P.L.) 113-283.
- 52 NIST is responsible for developing information security standards and guidelines, including minimum requirements
- 53 54 for federal information systems, but such standards and guidelines shall not apply to national security systems
- without the express approval of appropriate federal officials exercising policy authority over such systems. This
- 55 guideline is consistent with the requirements of the Office of Management and Budget (OMB) Circular A-130.
- 56 57

Nothing in this publication should be taken to contradict the standards and guidelines made mandatory and binding

- 58 on federal agencies by the Secretary of Commerce under statutory authority. Nor should these guidelines be 59
- interpreted as altering or superseding the existing authorities of the Secretary of Commerce, Director of the OMB, or
- 60 any other federal official. This publication may be used by nongovernmental organizations on a voluntary basis and
- 61 is not subject to copyright in the United States. Attribution would, however, be appreciated by NIST.

#### 88 Abstract

- 89 The macOS Security Compliance Project (mSCP) provides resources that system administrators,
- 90 security professionals, security policy authors, information security officers, and auditors can
- 91 leverage to secure and assess macOS desktop and laptop system security in an automated way.
- 92 This publication introduces the mSCP and gives an overview of the resources available from the
- 93 project's GitHub site, which is continuously curated and updated to support each new release of
- 94 macOS. The GitHub site provides practical, actionable recommendations in the form of secure
- baselines and associated rules. This publication also describes use cases for leveraging the mSCP
- 96 content. Updates from the previous version of this publication mainly involve the new mSCP
- 97 capability to create a custom benchmark by tailoring a baseline.

#### 98 Keywords

- 99 Apple; baseline; configuration management; endpoint device security; macOS; macOS Security
- 100 Compliance Project (mSCP); operating system security; security compliance.

### 101 Reports on Computer Systems Technology

- 102 The Information Technology Laboratory (ITL) at the National Institute of Standards and
- 103 Technology (NIST) promotes the U.S. economy and public welfare by providing technical
- 104 leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test
- 105 methods, reference data, proof of concept implementations, and technical analyses to advance
- 106 the development and productive use of information technology. ITL's responsibilities include the
- 107 development of management, administrative, technical, and physical standards and guidelines for
- 108 the cost-effective security and privacy of other than national security-related information in
- 109 federal information systems. The Special Publication 800-series reports on ITL's research,
- 110 guidelines, and outreach efforts in information system security, and its collaborative activities
- 111 with industry, government, and academic organizations.

### 113 Supplemental Content

- 114 The mSCP's GitHub site is at <u>https://github.com/usnistgov/macos\_security#readme</u>, and the
- 115 project documentation wiki is at https://github.com/usnistgov/macos\_security/wiki.

#### 116 **Trademark Information**

117 All registered trademarks or trademarks belong to their respective organizations.

#### 118 Call for Patent Claims

- 119 This public review includes a call for information on essential patent claims (claims whose use
- 120 would be required for compliance with the guidance or requirements in this Information
- 121 Technology Laboratory (ITL) draft publication). Such guidance and/or requirements may be
- directly stated in this ITL Publication or by reference to another publication. This call also
- 123 includes disclosure, where known, of the existence of pending U.S. or foreign patent applications
- relating to this ITL draft publication and of any relevant unexpired U.S. or foreign patents.
- 125 ITL may require from the patent holder, or a party authorized to make assurances on its behalf,126 in written or electronic form, either:
- a) assurance in the form of a general disclaimer to the effect that such party does not hold
   and does not currently intend holding any essential patent claim(s); or
- b) assurance that a license to such essential patent claim(s) will be made available to
   applicants desiring to utilize the license for the purpose of complying with the guidance
   or requirements in this ITL draft publication either:
- i. under reasonable terms and conditions that are demonstrably free of any unfair
   discrimination; or
- ii. without compensation and under reasonable terms and conditions that aredemonstrably free of any unfair discrimination.
- 136 Such assurance shall indicate that the patent holder (or third party authorized to make assurances
- 137 on its behalf) will include in any documents transferring ownership of patents subject to the
- assurance, provisions sufficient to ensure that the commitments in the assurance are binding on
- the transferee, and that the transferee will similarly include appropriate provisions in the event of
- 140 future transfers with the goal of binding each successor-in-interest.
- 141 The assurance shall also indicate that it is intended to be binding on successors-in-interest
- 142 regardless of whether such provisions are included in the relevant transfer documents.
- 143 Such statements should be addressed to: <a href="mailto:applesec@nist.gov">applesec@nist.gov</a>

#### 194 Acknowledgments

- 195 The authors wish to thank Jason Blake, Blair Heiserman, and Stephanie Roberts from NIST;
- 196 Allen Golbig from Jamf; Dan Brodjieski, Gary Gapinski, Elyse Anderson, and Joshua Glemza
- 197 from NASA; and Jamie Richardson and Chris Stone from Apple for their contributions to the
- 198 mSCP. The authors appreciate Bob McSulla and Ryan Jaynes from Tenable for developing audit
- 199 files based on the mSCP, testing the baselines for different macOS versions, and contributing to
- 200 Appendix C. The authors also thank Isabel Van Wyk from NIST for editing the document.
- 201 Finally, portions of this document are based on content from the mSCP Wiki, so the work of all
- 202 Wiki contributors is appreciated.

#### 203 **1. Introduction**

- 204 The National Institute of Standards and Technology (NIST) has traditionally published secure
- 205 configuration guides for Apple desktop/laptop operating system versions as prose-based Special
- 206 Publications (SPs), such as NIST SP 800-179, Revision 1, *Guide to Securing Apple macOS 10.12*
- 207 *Systems for IT Professionals: A NIST Security Configuration Checklist.* In order to provide 208 security configuration guidance to organizations more guickly and in a machine-consumable
- security configuration guidance to organizations more quickly and in a machine-consumable
   format, NIST established the open-source macOS Security Compliance Project (mSCP). NIST
- no longer produces SP guidance documents for each macOS release; instead, the mSCP.
- 211 continuously curates and updates machine-consumable macOS guidance. The latest macOS
- security baseline content is maintained and updated on the mSCP GitHub page [1].
- 213 Security baselines are groups of settings used to configure a system to meet a target level or set
- of requirements or to verify that a system complies with requirements. The mSCP seeks to
- simplify the macOS security development cycle by reducing the amount of effort required to
- 216 implement security baselines. This collaboration between federal agencies minimizes duplicate
- effort that would otherwise be needed for these agencies to administer individual security
- 218 baselines. Additionally, the secure baseline content provided is easily extensible by other parties
- 219 to implement their own security requirements.
- 220 Organizations using mSCP content, particularly security baseline examples, should take a risk-
- based approach for selecting the appropriate settings and defining values that consider the
- context under which the baseline will be utilized.

### 223 **1.1.** Purpose and Scope

- The purpose of this document is to introduce the mSCP to broader audiences. This document provides a high-level overview of the mSCP, its components, and some common use cases. It refers readers to the online project documentation for in-depth technical information and use instructions. This document is intended to be independent of macOS version releases; updates will be released as needed when there are substantial changes to the mSCP. Updates from the previous release of this document mainly involve the new mSCP capability to create a custom benchmark by tailoring a baseline.
- The information in this document regarding the details of the mSCP GitHub site is accurate as of the time of publication. Readers seeking the latest detailed information on mSCP content or the
- content itself should visit the <u>mSCP GitHub page</u> and <u>wiki</u>.
- 234 Organizations that need to reference a NIST SP to demonstrate how they are complying with
- 235 United States Government mandates for adopting secure configurations for their macOS devices
- may reference this SP instead of its deprecated predecessors, such as SP 800-179 or SP 800-179,
- 237 Revision 1.

### 238 **1.2.** Audience

- 239 This document and the mSCP GitHub site are intended for system administrators, security
- 240 professionals, policy authors, privacy officers, and auditors who have responsibilities involving

241 macOS security. Additionally, vendors of device management, security, configuration

- assessment, and compliance tools that support macOS may find this document and the GitHub
- site to be helpful.

# **1.3.** Relevance to NIST SP 800-70 and the National Checklist Program

245 The security baselines from the mSCP GitHub page are included in the National Checklist

246 Program. NIST SP 800-70, Revision 4 [2], explains that federal agencies are required to use

247 appropriate security configuration checklists from the National Checklist Program when

248 available. Part 39 of the Federal Acquisition Regulations, Section 39.101 paragraph (c) states,

- 249 In acquiring information technology, agencies shall include the
- appropriate information technology security policies and requirements,
- 251 including use of common security configurations available from the
- 252 National Institute of Standards and Technology's website at
- 253 <u>https://checklists.nist.gov</u>. Agency contracting officers should consult
- with the requiring official to ensure the appropriate standards are
- 255 incorporated.
- 256 **1.4.** Document Structure
- 257 The remaining sections and appendices of this document are as follows:
- Section 2 provides an overview of the project, including what its goals are and how its content can be used.
- Section 3 explains the major components of the mSCP and provides pointers to additional information on component usage.
- The References section lists the references for the document.
- Appendix A briefly discusses how mSCP can help meet the needs of people in several roles.
- Appendix B provides examples of how a security professional might use mSCP content.
- Appendix C contains an example of how an assessment tool vendor could leverage mSCP content.
- Appendix D lists selected acronyms and abbreviations used in this document.
- 269

### 270 **2. Project Description**

- 271 The mSCP is an open-source project that provides a programmatic approach to generating and
- using macOS security configuration baselines. The project's content can be used to create
- 273 customized security baselines of technical security controls by leveraging a library of rules, with
- each rule mapped to requirements in one or more existing security standards, regulations, or
- frameworks. This approach provides versioning and consistency of the content. Unifying and
- standardizing macOS baseline efforts via the mSCP means that updating security guidance is
- simplified and radically accelerated, even as new versions of macOS are introduced annually.
- 278 The mSCP started in August 2019 as a collaboration among operational IT security staff from
- 279 NIST, the National Aeronautics and Space Administration (NASA), the Defense Information
- 280 Systems Agency (DISA), and the Department of Energy's (DOE) Los Alamos National
- Laboratory (LANL).<sup>1</sup> The mSCP sought to map macOS settings to NIST SP 800-53, Revision 4
- 282 [3] with an extensible, modern approach to security guidance that could be used by any
- 283 organization (e.g., government, enterprise, education) that needs to adhere to security compliance
- 284 frameworks and policy.
- As of this writing, the configuration settings represent guidance and best practices from NIST SP
- 286 800-53, Revision 5 [4]; NIST SP 800-171, Revision 2 [5]; the macOS DISA Security Technical
- 287 Implementation Guide (STIG) [6]; the Committee on National Security Systems (CNSS)
- 288 Instruction (CNSSI) Number 1253 [7]; the Center for Internet Security (CIS) Critical Security
- 289 Controls Version 8 [8]; and internal organizational security guidance from NIST, NASA, and
- 290 LANL.

# 291 **2.1. Project Goals**

292 Apple releases a new macOS version every year, and generally, agencies and organizations must

- 293 wait for guidance or accept risk before deploying the new macOS version. Most agencies or
- 294 organizations must create their own internal security configuration, which delays the deployment
- of the new macOS version or new hardware that only supports the new macOS version. The
- 296 mSCP assists organizations in upgrading sooner. Generally, the technical security settings in
- 297 macOS do not drastically change from release to release, with only a handful of new settings
- being introduced. By pursuing a rules-based approach, mSCP rules that remain applicable can be reused and incorporated into guidance for the latest macOS version. This enables quicker
- adoption of new security features that are not offered in prior versions of macOS.
- 301 The goals of the mSCP are to:
- Develop recommended security baselines using a risk-based approach
- Normalize and accelerate annual adoption of the new operating system and hardware by
   providing guidance to meet the security needs of new operating systems at the earliest
   availability
- Reduce worldwide efforts in creating annual guidance by unifying and consolidating
   compliance efforts into a single project

<sup>&</sup>lt;sup>1</sup> See <u>https://github.com/usnistgov/macos\_security#authors</u> for a current list of project contributors.

- Develop a methodology to foster collaboration between baseline authors, reducing
   overhead and redundancy
- Establish a unified approach for the configuration and assessment of controls across
   multiple sources and tools
- Enable the customization of existing content and the creation of new content, including
   creating custom baselines in order to meet organization-specific security requirements

# 316 2.2. mSCP Content Use

317 mSCP content can be used by any organization to assist in setting and assessing the security

318 configuration of macOS systems. Security baselines can map to existing guidance or controls,

such as those in NIST SP 800-53, Revision 5 [4], or they can be customized to meet an

320 organization's specific needs. In mSCP terminology, a security baseline is represented as a

321 *baseline file* that designates the rules for meeting a specific set of requirements. The mSCP

322 provides a library of *rules* that are macOS settings. Each rule is mapped to a requirement within

323 a security standard or framework. Baseline files and rules comprise much of the mSCP's content.

- The mSCP offers several example baselines with descriptions adapted from Federal Information
   Processing Standards (FIPS) 199 [9], such as:
- The *SP 800-53, Revision 5 low baseline* is a defined map of controls to secure a system defined as a low-impact information system. The loss of confidentiality, integrity, or availability could be expected to have a limited adverse effect on organizational operations, organizational assets, or individuals.
- The *SP 800-53, Revision 5 moderate baseline* is a defined map of controls to secure a system defined as a moderate-impact information system. The loss of confidentiality, integrity, or availability could be expected to have a serious adverse effect on organizational operations, organizational assets, or individuals.
- The *SP 800-53, Revision 5 high baseline* is a defined map of controls to secure a system defined as a high-impact information system. The loss of confidentiality, integrity, or availability could be expected to have a severe or catastrophic adverse effect on organizational operations, organizational assets, or individuals.
- Organizations using any baseline example should take a risk-based approach for selecting the appropriate settings and organizationally defined values depending on the context under which the baseline will be applied. Organizations can tailor any of the baselines to include controls specific to their needs and to produce evidence of control enforcement. Additional information on baseline customization can be found in SP 800-70 [2], which discusses the importance of customizing and testing baselines before applying them to a production system.
- The mSCP provides scripts that can be used with baselines for several purposes, including thefollowing:
- Creating scripts and profiles for configuring macOS

Provide device management and security tool vendors, auditors, and Apple insight into customer security configuration needs

- Generating a mapping between security standards, regulations, frameworks, etc.
- Producing human-readable documentation in a variety of formats
- Customizing existing baselines
- 350 mSCP content can also be used to generate Security Content Automation Protocol (SCAP)
- 351 content for automated security compliance scans. The SCAP generated follows the SCAP 1.3
- 352 specification [10]. The generation of SCAP content uses an Extensible Stylesheet Language
- 353 Transformations (XSLT) file to create an Extensible Configuration Checklist Description Format
- 354 (XCCDF) checklist document with an accompanying Open Vulnerability and Assessment
- 355 Language (OVAL) document.
- 356 The XCCDF and OVAL documents are bundled into an SCAP data stream collection document
- 357 with accompanying files that include Common Platform Enumeration (CPE) dictionary [11]
- 358 information and an Open Checklist Interactive Language (OCIL) document. This creates an
- 359 SCAP 1.3 document that validates using the NIST SCAP Content Validation Tool<sup>2</sup> and can be
- 360 used by SCAP tools on macOS. More information on SCAP content generation is available at the
- 361 <u>project wiki</u>.

<sup>&</sup>lt;sup>2</sup> See <u>https://csrc.nist.gov/projects/security-content-automation-protocol/scap-releases/scap-1-3</u>.

### 363 **3. mSCP Components**

364 This section provides an overview of several components of the mSCP: security baseline files,

365 configuration profiles and scripts, content generation scripts, customization capabilities, and

directories. More information about all of these is available at the <u>GitHub wiki</u>.

# 367 **3.1. Baselines and Benchmarks**

368 The mSCP includes both baselines and benchmarks. A baseline is a catalog of recommended

369 configuration settings, not a checklist or benchmark, and should be customized based on the

370 organization's risk profile. Implementing every item is not likely to be possible or sensible in

371 many operational scenarios. Baselines can be used to assist in the creation of security

benchmarks. A *benchmark* differs from a baseline in that it defines values in addition to a set of

373 controls. Benchmarks are published by organizations that have made risk-based decisions, such

as DISA and CIS. Organizations can also define their own benchmark. These values are called

375 Organization-Defined Values (ODVs), and they exist throughout the baselines and can be set

376 during customization.

# 377 3.2. Security Baseline Files

378 In the mSCP, a security baseline is defined in a Yet Another Markup Language (YAML) file. A 379 YAML file is a human-readable file format commonly used by configuration files where data are

380 stored and/or transmitted. A baseline YAML file consists of the following required fields:

- **381** title A human-readable name for the baseline
- description A short description of the baseline, including its use case and target operating system (OS) version
- **authors** Developers of the baseline
- **985** profile The security content portion of the baseline
- 386 section A keyword for organizing settings
- 387 **rules** The names of the rule files that are a part of this baseline
- 388 The following code provides a partial example of a YAML file that illustrates the use of these

389 fields (with field names bolded):

390 391 392 393 394 395 396 397 398 399 400 401 402	<pre>title: "Apple macOS 11 (Big Sur) Test Baseline" description:   This guide describes the prudent actions to take when securing a macOS 11 system against the Test Baseline. authors:    ===  Joe Doe NIST  === profile:     - section: "Authentication"     rules:         - auth_pam_login_smartcard_enforce         - auth_pam_su_smartcard_enforce</pre>
403 404 405 406 407 408 409	<pre>- auth_pam_sudo_smartcard_enforce - auth_smartcard_allow - section: "Auditing" rules: - audit_acls_files_configure - audit_acls_files_mode_configure - audit_acls_folder_wheel_configure</pre>
410	Fig. 1. Security Baseline YAML File.
411	3.2.1. Rule File Composition
412 413	A YAML rule file is broken down into the following subsections. This list and the following example are from the Rules section of the $\underline{mSCP \text{ wiki}}$ .
414	• <b>id</b> – The <b>id</b> should match the file name without the yaml file extension.
415	• <b>title</b> – The title is a human-readable title of the rule.
416 417	• <b>discussion</b> – The discussion should provide a concise description of the intended use of the rule.
418 419	• <b>check</b> – Every rule will have a check. A shell-based check should be able to validate and check most rules.
420	• <b>result</b> – Expected results from the check.
421 422	• <b>fix</b> – The fix will appear in a document when generated. If a fix includes [source,bash], the fix will be used for generating the script to enforce the rule.
423 424 425 426	• <b>references</b> – The references include a Common Configuration Enumeration (CCE) identifier and a mapping of the security frameworks, guidance, and individual controls that have been mapped to the rule. See the official repository of NIST CCEs [12] for more information.
427	• <b>macOS</b> – The validated macOS version for this rule.
428 429 430	• <b>odv</b> – If a rule supports the ODV functionality, then the odv section should be present. At a minimum, this field should contain a hint (provides a description when tailoring a baseline) and a default value that replaces the \$ODV variable.

- tags Tags are keywords used to categorize and identify related rules, and they can be
   added to or modified as needed. Tags can also be used to make index-based searching of
   the rules faster and easier.
- **severity** The severity level specified in the DISA STIG, if applicable.
- mobileconfig The mobileconfig and mobileconfig\_info subsections are related. If
   mobileconfig is set to true, the information required for creating the mobileconfig
   configuration profile is required in the mobileconfig\_info area.
- 438 The following code provides a notional example of a YAML rule file (with field names bolded):

```
id: sysprefs_screensaver_timeout_enforce
title: "Enforce Screen Saver Timeout"
discussion: |
439
440
441
442
         The screen saver timeout _MUST_ be set to $ODV seconds or a shorter length
443
444
       of time.
445
         This rule ensures that a full session lock is triggered within no more than
446
       $ODV seconds of inactivity.
447
448
449
450
451
452
453
       check:
          /usr/bin/osascript -1 JavaScript << EOS
          function run() {
            let timeout =
       ObjC.unwrap($.NSUserDefaults.alloc.initWithSuiteName('com.apple.screensaver')
          .objectForKey('idleTime'))
454
            if ( timeout <= $ODV ) {
454
455
456
457
458
459
              return("true")
            } else {
              return("false")
            }
         }
460
         ÉOS
461
462
       result:

### 512 **3.2.2. Rule File Categories**

513 The mSCP organizes YAML files in the rules directory into the following subdirectories, each 514 of which corresponds to a category of settings:

- 515  $audit OpenBSM^3$
- **auth** Smartcard authentication
- icloud Apple's iCloud/Apple ID service
- **os** Rules to configure the operating system that do not fit into the other categories
- **pwpolicy** Password policy

system\_settings or sysprefs – Settings controlled within the System Settings or
 System Preferences application

522 The rules directory also includes a **supplemental** subdirectory, which contains additional

523 information that supports the guidance provided by the baselines. Supplemental content contains

524 information for rules that are not part of an existing baseline but could be beneficial for certain 525 use cases. Supplemental content may not have mappings and may not contain the YAML rule

525 use cases. Supplemental content may not have mappings and may not contain the YAML rule 526 file check and fix sections mentioned in Section 3.2.1. Supplemental content can be added to

enhance baselines where organizational requirements are different than the system baseline

528 requirements.

<sup>&</sup>lt;sup>3</sup> See OpenBSM at <u>https://github.com/openbsm/openbsm</u>.

# 529 **3.3.** Configuration Profiles and Scripts

- 530 When an mSCP YAML file is processed, it yields a configuration script and/or configuration
- 531 profile (mobileconfig file) as outputs. Both are used to apply configuration settings to a system.
- 532 A configuration profile is an Extensible Markup Language (XML) formatted file with a
- 533 mobileconfig extension that contains a configuration payload. macOS can automatically
- 534 configure itself based on a mobileconfig file's contents upon execution. Configuration profiles
- offer a convenient, Apple-supported mechanism for applying security settings to a macOS
- environment. Additionally, they can be cryptographically signed to ensure integrity and
- authenticity. These factors make configuration profiles the preferred vehicle for configuration
- delivery. However, mobileconfig files cannot modify all macOS settings, so a configuration
- 539 script is needed for those settings that are not supported. See the developer <u>documentation page</u>
- 540 for an example configuration profile and brief descriptions of its properties.
- 541 A *configuration script* is a shell script that directly manipulates operating system files. The script
- 542 content is derived from all YAML rule files that have a mobileconfig value of false and
- 543 belong to the specified baseline. The YAML rule file must contain the fix section in order to
- 544 generate its corresponding configuration script entry.

# 545 **3.4.** Content Generation Scripts

- 546 The mSCP provides several types of scripts for generating baselines, human-readable guidance,
- 547 baseline compliance checkers, and other types of content. Each script is described below.

### 548 **3.4.1. Generate Baseline Script**

- 549 The generate\_baseline.py Python script compiles a list of security rules into a single baseline
- 550 YAML file. It can be used to modify an existing security baseline or create a new one. See the
- 551 <u>wiki</u> for additional information.

### 552 **3.4.2. Generate Guidance Script**

- 553 The generate\_guidance.py script can produce human-readable guidance and generate the 554 macOS Security Compliance Tool, which is a Z shell script.
- 555 The generate\_guidance.py script takes a baseline file and produces a human-readable guide
- 556 with information from the YAML rules files. The script can create documentation in several
- 557 formats but always generates an AsciiDoc file. AsciiDoc (.adoc) is a plain text format that uses
- 558 markup conventions for traditional document formatting and organization. AsciiDoc files are
- 559 easily transformable into many other formats via the generate\_guidance.py script, including
- 560 HTML, PDF, and Excel. The Excel format is particularly useful for quickly viewing all of the
- 561 rules of a baseline, and it contains all of the data in the YAML rules files.
- 562 The generate\_guidance.py script can also create configuration profiles (mobileconfig files)
- and the macOS Security Compliance Tool. Using the -s argument, the generate\_guidance.py
- 564 script will generate an org. {baseline}.audit.plist file and another script, the macOS
- 565 Security Compliance Tool, that can check and remediate compliance settings. The audit.plist

- 566 file can be used to set an exemption to organizational rules for approved users so that compliance
- 567 checks can succeed without findings. To create an exemption for a rule, the exempt field should
- 568 be set to true and an exempt\_reason should be added.
- 569 See the <u>wiki</u> for more information on the generate\_guidance.py script.

#### 570 **3.4.3. macOS Security Compliance Tool**

- 571 The {baseline}\_compliance.sh script runs interactively by default. It can evaluate a system's
- 572 conformance to a baseline or remediate any incorrectly configured settings. Alternatively, the
- 573 script can autonomously assess a system with the -check argument or automatically remediate 574 baseline settings with -fix.
- 575 The lines below provide an example of the results of running the script:

```
576 Thu Jan 21 15:09:41 UTC 2021 auth_pam_login_smartcard_enforce passed (Result:
577 2, Expected: {integer: 2})
578 Thu Jan 21 15:09:41 UTC 2021 auth_smartcard_allow passed (Result: 1,
579 Expected: {integer: 1})
580 Thu Jan 21 15:09:41 UTC 2021 auth_pam_sudo_smartcard_enforce passed (Result:
581 2, Expected: {integer: 2})
582 Thu Jan 21 15:09:41 UTC 2021
583 auth_smartcard_certificate_trust_enforce_moderate passed (Result: 2,
584 Expected: {integer: 2})
585 Thu Jan 21 15:09:41 UTC 2021 auth_smartcard_enforce has an exemption (Reason:
586 Broken Reader)
```

587

- Fig. 3. Compliance Script Sample Output.
- 588 For more information on the macOS Security Compliance Tool script, see the <u>wiki</u>.

### 589 **3.4.4. SCAP Generation Script**

- 590 The SCAP generation script, generate\_scap.py can generate an SCAP 1.3 document, XCCDF
- 591 document, or OVAL file. The script builds content from available tags within the YAML files
- and does not need to be pointed to a baseline file.
- 593 For more information, see the <u>wiki</u>.

### 594 **3.4.5. Generate Mapping Script**

595 The generate\_mapping.py script allows for the quick creation of custom rules and baselines for

a compliance framework not published by the mSCP. The script requires a user-created comma-

- separated values (CSV) file containing control identifiers that maps to a new framework (CSV
- column 1) from another already defined by the project (CSV column 2). By default, the script is
- designed to map a framework to the NIST SP 800-53, Revision 5 [4] set of controls. Adding the
- -f argument allows for mapping to another supported framework. See the <u>wiki</u> for more
- 601 information on the generate\_mapping.py script.

### 602 **3.5.** Customization

Organizations should make the risk-based decision on what controls and rules to use and how to apply them, as stated by NIST SP 800-53, Revision 5 controls PL-10 and PL-11. Customization allows organizations to generate their own customized content outside of that provided by the project. Additionally, it allows them to add content for internal-only controls, which are not suitable for inclusion in a global baseline. Customization primarily takes place within the custom folder. Here are examples of customizations supported by mSCP:

- Baselines: A baseline folder can be included within the custom folder to create customized baselines that fit an organization's needs. These baseline files may include rule, section, and template customization (discussed below). An existing baseline can be configured to create a custom benchmark. Additionally, it is possible to customize an included benchmark, but in doing so, it may no longer be compliant with the original requirements of that benchmark.
- 615 Rules: Existing rules can have their setting values overridden via the custom folder 616 instead of modifying the mSCP-supplied rule file. New rules can be created and added to existing baselines or to user-defined baselines. Organizations can create their own 617 discussions, checks, results, fixes, and mappings of rules to security frameworks not 618 included in the project. In order to override an existing rule, the custom rule file name 619 620 must match an existing rule so that the generate\_guidance.py script will pick up the 621 new values. New rules not included in mSCP must be listed in the baseline YAML file 622 specified when running generate\_guidance.py. Additional information on custom 623 rules can be found in an article written by mSCP contributor Allen Golbig [13].
- Sections: Custom sections can be used to organize existing or custom YAML rule files.
   Sections defined in the custom folder must be included in a baseline YAML file in order to be used by generate\_guidance.py.
- Templates: Custom templates can be used to define new template structures for the
   project and affect the organization and appearance of generated documentation. The
   template files must match the name of an existing template and will override that
   template when running generate\_guidance.py.
- 631
   Logos: An organization can include a custom logo when running the
   632 generate\_guidance.py script by using the -1 argument to point to an image file.
- Tailoring: The generate\_baseline.py script allows for a baseline to be tailored using the -t argument. During the tailoring process, the script will prompt for each control containing an ODV to have its values customized. If a value is not supplied to a control with an ODV, it will use the default value in the rule file. Refer to Appendix C for an example of tailoring with ODVs.

# 638 **3.6. Directories**

- 639 mSCP source code releases available on the <u>mSCP GitHub</u> include the following directories:
- **baselines** Contains the defined YAML baseline files

641 642	•	<b>build</b> – Holds scripts, documents, and configuration profiles generated by running scripts
643 644	٠	<b>custom</b> – Used for creating customized baselines, rules, sections, or templates to meet an organization's requirements
645	٠	includes – Contains the YAML-based libraries required for running the scripts
646	٠	rules – Contains YAML rule files with one rule per file
647	٠	scripts – Contains the content generation scripts and their required files
648 649 650	•	<b>sections</b> – Defines the sections that correlate to the directories in the rules folder; each section has its own YAML file that contains the section name and description as it will appear in the generated guide, which is human-readable documentation
651	•	templates – Includes AsciiDoc templates for generating an AsciiDoc guide

#### 695 Appendix A. mSCP User Roles

- 696 The mSCP was designed to meet the needs of different security roles. These perspectives are
- 697 briefly examined below.
- 698 Security policy authors define the policies for their organizations. The customization and ease
- of extensibility offered by the mSCP facilitate new content creation. Policy authors will need to
- familiarize themselves with the YAML rule file format described in Section 3.2.1. Of particular
- interest is the ability to map rules directly to references. Additionally, the generate mapping
- script (Section 3.4.5) enhances portability between compliance frameworks.
- 703 System administrators and security professionals are responsible for configuring the systems 704 under their purview. They implement the guidance issued by security policy authors. Security 705 professionals may wish to generate baselines (Section 3.4.1), guidance (Section 3.4.2), and 706 configuration using the macOS Security Compliance Tool (Section 3.4.3).
- 707 Auditors approach macOS security compliance from a validator perspective, seeking proof that
- a system is configured in the required way. They are more interested in system setting
- documentation and compliance evidence than technical tools, such as configuration scripts. Both
- of these needs can be met by mSCP tools. The generate guidance script (Section 3.4.2) provides
- the necessary documentation in a variety of formats, including HTML, PDF, and Excel. The
- macOS Security Compliance Tool (Section 3.4.3) assesses a system and produces a log of the
- results. Additionally, some auditors may be interested in examining YAML rule content directly
- 714 (Section 3.2.1).
- 715 **Information security officers** have a variety of goals but are ultimately responsible for ensuring
- that systems are configured according to their organizational requirements. To accomplish this,
- they need policy documentation (Section 3.4.2) and the results of compliance scans (Section
- 7183.4.3). Information security officers may also be responsible for reviewing the security rules
- proposed by the policy authors. If this is the case, they may be interested in YAML rule file
- 720 components (Section 3.2.1).

# 721 Vendors of device management, security, configuration assessment, and compliance tools

- can produce a series of audit files based on mSCP content to support different macOS versions
- and associated security baselines. These audit files are maintained, tested, published, and
- supported by the tool vendors. Tool customers can download and import the content into the tool
- to assess the state of their system against a particular baseline in an automated way.
- 726 Specific audit files of the mSCP by tool vendors are described on the project wiki page. This
- 727 content will be updated as contributing tool vendors develop new audit content.

# 728 Appendix B. Example of mSCP Usage by a Security Professional

- 729 This appendix provides examples of how a security professional might use mSCP content.
- 730 People in other roles might perform some of the same actions. The examples illustrated below
- 731 were accurate at the time of publication, but see the <u>mSCP wiki</u> for up-to-date usage guidance.
- 732 Note that the mSCP scripts are not meant to replace enterprise-class configuration and
- 733 management tools. Configurations should be tested on development systems before being
- 734 deployed on end users' systems.

#### 735 Preparing to use mSCP

- All project components are available from the mSCP GitHub page [1] by navigating to
- 737 Releases and downloading the latest source code revision for the desired macOS version.
- Alternatively, the project source code can be downloaded via git, as the example below
- 739 illustrates.

740 741

Fig. 4. Downloading the mSCP code.

742

- mSCP components rely on prerequisite software listed on the <u>Getting Started page</u>, and any
- 744 missing software must be installed.

### 745 Changing code branches and generating a baseline

- 746 After obtaining a copy of the source code, change the directory to the mSCP git folder,
- 747 macos\_security.

748 749

Fig. 5. Changing the directory to the mSCP git folder.

- 750
- 751 Next, select the appropriate code branch that corresponds to the target OS version. Then choose a
- baseline and use the generate\_baseline.py script to create a baseline YAML file. The

- example below illustrates these steps for the NIST SP 800-53, Revision 5 moderate baseline for
- 754 macOS Big Sur.

•••	🚞 macos_security — -zsh — 96×24	
[testuser@Test macos_security Branch 'big_sur' set up to t Switched to a new branch 'bi	% git checkout big_sur rack remote branch 'big_sur' from 'origin'. g_sur'	]
<pre>[testuser@Test macos_security   testuser@Test macos_security</pre>	% ./scripts/generate_baseline.py -k 800-53r5_moderate %	1

755 756

Fig. 6. Changing code branches and generating a baseline.

757

### 758 Creating the macOS Security Compliance Tool and configuration profiles

- 759 Using the generate\_guidance.py script, create the macOS Security Compliance Tool and
- 760 configuration profiles. The example below illustrates this, continuing from the previous example.

761 762

Fig. 7. Generating the compliance checker script and configuration profiles.

763

#### 764 **Running a compliance scan**

As the example below shows, the macOS Security Compliance Tool is typically run with administrator privileges so that it can access all of the settings.

	🔴 🔴 🌒 💼 macos_security — -zsh — 102×24
767	testuser@Test macos_security % sudo ./build/800-53r5_moderate/800-53r5_moderate_compliance.sh
768	Fig. 8. Running the compliance checker script.

#### 769

The example below shows the main menu presented by the macOS Security Compliance Tool.

771 772

Fig. 9. Selecting "Run New Compliance Scan" from the main menu.

773

777 778

779

- 774 Selecting option 2, "Run New Compliance Scan," from the main menu launches the scan. The
- example below shows output from the scan, which in this case reflects numerous rule failures,
- each indicating a deviation from the expected configuration.

Fig. 10. Compliance scan output.

780 Selecting option 1, "View Last Compliance Report," from the main menu displays a summary of

- the compliance report results. The example below depicts results indicating that 30 tests passed
- and 108 tests failed for an overall score of 21.74 % compliant.

Fig. 11. Viewing a compliance report.

#### 786 Fixing non-compliant settings

787 Selecting option 3, "Run Commands to remediate non-compliant settings," begins the process of

fixing non-compliant settings discovered during a previous compliance scan. The example below

789 illustrates the disclaimer to be reviewed and accepted before fixes are initiated. This disclaimer

790 indicates the potential risk in applying fixes.

Fig. 12. Disclaimer for non-compliant settings remediation.

After the disclaimer statement is accepted, the fixes are applied to the system, as the examplebelow illustrates.

798

#### Appendix C. Example of Creating a Benchmark Using ODVs 799

800 This appendix provides an example of tailoring a baseline to create a custom benchmark using

801 the generate\_baseline.py script. The screenshot below illustrates the first step to creating a

802 benchmark.

803 804

Fig. 14. Generate baseline command.

805

806 The -t option for generate\_baseline.py is used to customize the specified baseline. The script prompts for a name for the benchmark being created, as the example below shows.

807

808 809

Fig. 15. Prompt for benchmark name.

810

811 Next, for each rule that exists in the specified starting baseline, the script asks if it should be

812 included in the custom benchmark. An example is shown below.

> scripts — generate\_baseline.py -t -k 800-53r5\_moderate — 80×10 Enter a name for your tailored benchmark or press Enter for the default value (8 00-53r5\_moderate):800-53r5\_custom The inclusion of any given rule is a risk-based-decision (RBD). While each rule is mapped to an 800-53 control, deploying it in your organization should be par t of the decision-making process. You will be prompted to include each rule, and for those with specific organizat ional defined values (ODV), you will be prompted for those as well. Would you like to include the rule for "audit\_acls\_files\_configure" in your benc hmark? [Y/n/all/?]: Y

813 814

Fig. 16. Prompt for rule file inclusion.

- 816 Entering a "?" in response to a rule being included will display a description of that rule, as
- 817 illustrated below.

scripts — generate\_baseline.py -t -k 800-53r5\_moderate — 80×12
 Would you like to include the rule for "audit\_acls\_folders\_configure" in your be nchmark? [Y/n/all/?]: ?
Rule Details:
The audit log folder \_MUST\_ not contain access control lists (ACLs).
 Audit logs contain sensitive data about the system and users. This rule ensures that the audit service is configured to create log folders that are readable and writable only by system administrators in order to prevent normal users from re ading audit logs.
 Would you like to include the rule for "audit\_acls\_folders\_configure" in your be nchmark? [Y/n/all]:

818

819

Fig. 17. Display rule description.

820

821 If a rule accepts an ODV, the script asks the user to enter their own value or use the default value 822 displayed. The example below illustrates this.

```
    scripts — generate_baseline.py -t -k 800-53r5_moderate — 80×12
    Would you like to include the rule for "audit_folders_mode_configure" in your be nchmark? [Y/n/all/?]: y
    Would you like to include the rule for "audit_records_processing" in your benchm ark? [Y/n/all/?]: y
    Would you like to include the rule for "audit_retention_configure" in your benchm mark? [Y/n/all/?]: y
    See man audit_control for possible values.
    Enter the ODV for "audit_retention_configure" or press Enter for the recommended value (7d): 5d
    Writing custom rule for audit_retention_configure to include value 5d
    Would you like to include the rule for "audit_settings_failure_notify" in your b enchmark? [Y/n/all/?]:
```

Fig. 18. Rule prompting for an ODV.

825

#### 826 Appendix D. Example of mSCP Usage by an Assessment Tool Vendor

- 827 This appendix provides an example of how an assessment tool vendor converted mSCP content
- 828 to their tool's proprietary format so that their tool could perform compliance checks against
- 829 mSCP baselines and rules. Refer to the mSCP GitHub wiki page for the most current list of tool
- 830 vendors and associated content that will support the mSCP baselines.
- 831 This example is for Tenable, Inc. They automated the conversion of mSCP YAML rules into
- 832 their .audit format using Python and YAML libraries. Programmatically approaching this
- 833 conversion allows for faster future releases and greater consistency, and it also maintains the
- 834 integrity of the source content. Because the YAML content is all command-driven, it is
- 835 converted to Tenable's CMD\_EXEC check type for use with the Unix plugin. The YAML rules
- 836 have a "tags" section that was used to create unique audit profiles related to common
- 837 frameworks. An example of these profiles can be seen in the audit file naming convention:
- 838 NIST\_macOS\_Big\_Sur\_800-171\_v1.4.0.audit
- 839 NIST\_macOS\_Catalina\_800-53r5\_high\_v1.5.0.audit •
- 840 See Tenable's research highlight for more details.

841 The following example shows a YAML-to-audit-check conversion. The content has been

842 condensed and abbreviated for the purposes of comparison:

#### 843 **mSCP YAML**

#### 918 Appendix F. Change Log

- 919 In March 2023, the following changes were made to this report:
- Made minor editorial changes throughout the report to improve clarity and usability
- Reformatted all content and revised front matter to follow the latest NIST technical report template
- Merged the content of the Executive Summary into Section 1 and deleted the Executive
   Summary section
- Section 1.1 Summarized updates from the previous release
- Section 3.1 Added a new subsection to define and discuss baselines and benchmarks
- 927
   Section 3.2.1 Updated descriptions to match the project wiki and changed the example rule file to one with an ODV
- Section 3.4.4 Changed from OVAL generation script to SCAP generation script
- 930 Section 3.5 Added discussion on tailoring baselines and benchmarks using the generate\_baseline.py script and ODVs
- Appendix C Created a new appendix showing an example of how to tailor a baseline to create a custom benchmark
